- HomogeneousSupportServingPlmn - Homogeneous Support Serving PLMN - MME includes IMS Voice over PS support of TAs of the serving PLMN when evaluating Homogeneous voice over PS support.

Default

HomogeneousSupportServingPlmn

Name

homogeneousVopsSrvccCapa - Homogeneous Voice over PS SRVCC Capability

Syntax

```
--gParmName homogeneousVopsSrvccCapa --gParmValue <string>
```

Description

MME provides Homogeneous-Support-of-IMS-Voice-Over-PS-Sessions towards HSS according to specific requirements: TAs support for IMS voice over PS (separate activation parameter controlling whether to include all TAIs MME globally, or all TAIs on the serving PLMN), voice over PS support for the UE (on svcAgreementProfile) and checking or not checking the UE SRVCC capability (separate parameter on svcAgreementProfile).

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

hssInitiatedCallTrace - HSS initiated call trace

Syntax

```
--gParmName hssInitiatedCallTrace --gParmValue <string>
```

Description

Support HSS initiated call trace or not.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

hssNorReduction - HSS NOR reduction

Syntax

```
--gParmName hssNorReduction --gParmValue <string>
```

Description

When set to yes: if MME selects the same PGW as in ULA/IDR from HSS, MME does not send NOR to HSS. when set to no: MME sends NOR to HSS for this case.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

hssRestorationMode - HSS Restoration Mode

Syntax

--gParmName hssRestorationMode --gParmValue <string>

Description

Defines how HSS restoration is performed after HSS unavailability. The HSS restoration should only be enabled i.e. set to values other than 'HssRestorationNone' with MME only configurations.

List

- HssRestorationAutomatic - HSS Restoration Automatic - HSS restoration is performed automatically when MME detects available HSS link.
- HssRestorationManual - HSS Restoration Manual - HSS restoration is performed manually by the operator.
- HssRestorationNone - HSS Restoration None - HSS restoration is not performed.

Default

HssRestorationNone

Name

hssUlrReduction - HSS ULR reduction

Syntax

--gParmName hssUlrReduction --gParmValue <string>

Description

When set to yes: if UE attaches with valid local GUTI and MME has IMSI and subscription data, MME does not send ULR to HSS. when set to no: MME sends ULR to HSS for this case.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

hssUnavailabilityContinueN26 - HSS Unavailability Continue N26

Syntax

--gParmName hssUnavailabilityContinueN26 --gParmValue <string>

Description

Defines whether the MME continues the procedure when HSS is unavailable and the UE moves from 5GS via N26 to the MME, and the MME has available security context or

mapped security context and thus the MME is able to continue serving the UE without new authentication on EPS.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

hssUnavailFailedPercentTriggerBlacklisting - HSS unavailable failed percentage triggering blacklisting

Syntax

```
--gParmName hssUnavailFailedPercentTriggerBlacklisting --gParmValue <string>
```

Description

Percentage of failed MME attempted dialogs triggering blacklisting.

Type / Range

Integer in the range of 1 to 100

Default

50

Name

ignoreSGSapMMInfo - IgnoreSGSapMMInfo

Syntax

```
--gParmName ignoreSGSapMMInfo --gParmValue <string>
```

Description

IgnoreSGSapMMInfo.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

imeiOperatorPolicyAccessRestriction - IMEI Operator Policy Access Restriction

Syntax

```
--gParmName imeiOperatorPolicyAccessRestriction --gParmValue <string>
```

Description

Enables IMEI based operator policy for access restrictions based on provisioned criteria.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

imeiOperatorPolicyAuthenticationDisabled - imeiTac Based Authentication

Syntax

```
--gParmName imeiOperatorPolicyAuthenticationDisabled --gParmValue  
<string>
```

Description

authentication to be enabled/disabled for a particular TAC, whereas entire network it might be running. Similarly based on TAC, IMSI Combination.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

imeiOperatorPolicyEirCheckDisabled - IMEI Operator Policy EIR Check Disabled

Syntax

```
--gParmName imeiOperatorPolicyEirCheckDisabled --gParmValue <string>
```

Description

Enables IMEI based operator policy to disable EIR check of UEs matching the provisioned criteria.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

immediateLrrDuringMtLr - Immediate LRR During MT-LR

Syntax

```
--gParmName immediateLrrDuringMtLr --gParmValue <string>
```

Description

If the MME needs to send a LRR related to an emergency call event and there is an ongoing MT-LR procedure, this parameter controls whether the LRR is to be sent immediately when the event occurs or later after the MT-LR procedure completes. When enabled, the LRR is sent immediately.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

imsEmergencySupportIndication - IMS emergency support indication

Syntax

```
--gParmName imsEmergencySupportIndication --gParmValue <string>
```

Description

Enable/Disable IMS voice enabled check for IMS emergency support indication.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

imsilmeiLookupFail - IMSI IMEI Lookup Fail

Syntax

```
--gParmName imsiImeiLookupFail --gParmValue <string>
```

Description

Parameter imsilmeiLookupFail controls APN Override feature with the values 'UseDefault and Reject. By default this parameter shall be disabled.

List

- Reject - Reject value means reject the attach/PDN connection regardless of any provisioned APN in the IMSI/IMEI table
- UseDefault - Use Default - Use Default value means if there is a wildcard APN provided by the HSS then it will be used with the UE-requested APN if applicable, else use the default APN in the HSS if it exists as correction APN.

Default

UseDefault

Name

imsiPagingInAllMmeServingAreas - IMSI paging in all MME serving areas

Syntax

--gParmName imsiPagingInAllMmeServingAreas --gParmValue <string>

Description

Allow IMSI paging in all MME serving areas?.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

inclEmerNumListImsAllowed - Include Emergency Number List When IMS Allowed

Syntax

--gParmName inclEmerNumListImsAllowed --gParmValue <string>

Description

Parameter controls whether MME includes the UE the Emergency Number List for a UE that has EPS-Network-Feature-Support with IMS-voice-over-PS allowed, but EPS-Network-Feature-Support emergency call is not allowed on the MME. When Emergency Number list is included it uses the Serving PLMN Emergency Profile information for the Emergency Number List.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

inclExt2InEPSQoSIEs - Include extended 2 in EPS QoS IEs

Syntax

--gParmName inclExt2InEPSQoSIEs --gParmValue <string>

Description

Enable/Disable inclusion of extended-2 octets in EPS QoS IEs.

List

- No - Boolean value of no.

- Yes - Boolean value of yes.

Default

No

Name

inclExt2InNegotiatedQoSIEs - Include extended 2 in negotiated QoS IEs

Syntax

```
--gParmName inclExt2InNegotiatedQoSIEs --gParmValue <string>
```

Description

Enable/Disable inclusion of extended-2-octets in R99 negotiated QoS IE.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

includeActiveApnAvpInUlrAfterRsr - Include active-apn AVP in ULR after RSR

Syntax

```
--gParmName includeActiveApnAvpInUlrAfterRsr --gParmValue <string>
```

Description

Include active-apn AVP with PGW information in ULR after RSR.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

includeEcgidPlaInFailure - Include ECGID in PLA in failure

Syntax

```
--gParmName includeEcgidPlaInFailure --gParmValue <string>
```

Description

Supports inclusion of ECGID in PSLR even if MME as not able to get UE location.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

includeExtUeIndexInPagingMsg - Include Extended UE Identity Index in PAGING message

Syntax

--gParmName includeExtUeIndexInPagingMsg --gParmValue <string>

Description

If this parameter is set to 'Yes' then the MME shall include the Extended UE Identity Index IE in PAGING messages.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

Yes

Name

includeHrIAAlways - Include Handover Restriction List Always

Syntax

--gParmName includeHrIAAlways --gParmValue <string>

Description

When enabled, MME shall include the Handover Restriction List IE in S1AP messages irrespective of EPLMN, forbidden TA or forbidden LA provisioning. If EPLMN and forbidden TA and LA are not provisioned then MME shall only include the serving PLMN IE in the HRL IE.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

includeMapped3gppQciToUe - Include mapped 3GPP QCI value to UE

Syntax

--gParmName includeMapped3gppQciToUe --gParmValue <string>

Description

When set to yes, the 3GPP QCI value mapped from the operator defined QCI value will be included in the activate default bearer context request, activate dedicated bearer context request, and modify bearer context request messages sent to the UE. this applies to both default and dedicated bearers.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

includeMappedGummei - Include mapped GUMMEI

Syntax

--gParmName includeMappedGummei --gParmValue <string>

Description

This command is only applicable for WMM deployed as a combo. this command enables/disables inclusion of the mapped GUMMEI in S1-AP S1 SETUP RESPONSE message and S1-MME CONFIGURATION UPDATE message. the inclusion of the mapped GUMMEI facilitates eNB to select the same physical node supporting the combo MME/SGSN when UE is moving between 2G/3G and LTE area served by the same combo MME/SGSN.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

includeNblotSmsServiceStatus - Include CIOT SMS service status

Syntax

--gParmName includeNbIotSmsServiceStatus --gParmValue <string>

Description

Include SMS services status IE in attach accept and TAU accept message if MME fails to set up SMS for CIOT UEs and MME only accepts EPS attach only.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

Yes

Name

includeNeighborListInTailList - Include neighbor list in TAI list

Syntax

```
--gParmName includeNeighborListInTailList --gParmValue <string>
```

Description

Indicates whether the MME includes (Yes) the provisioned set of neighbor TAIs in the list of TAIs that is sent to the UE when the UE registers at the MME (Attach or TAU). If this parameter is set to 'No', the MME only includes the last seen TAI in the list of TAIs sent to the UE.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

Yes

Name

includeRanapTli - Include RANAP TLI

Syntax

```
--gParmName includeRanapTli --gParmValue <string>
```

Description

Enables RANAP TLI in RAB assignment request to RNC triggered by GGSN PDP context modification.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

Yes

Name

includeServingNetworkS11ie - Include serving network S11 IE

Syntax

```
--gParmName includeServingNetworkS11ie --gParmValue <string>
```

Description

BSM to control whether the serving network IE is included in the modify bearer request when the PLMN has changed.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

includeServingPlmnRateControl - support Serving Plmn Rate Control function

Syntax

--gParmName includeServingPlmnRateControl --gParmValue <string>

Description

With this parameter enable, Serving PLMN Rate Control will be supported

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

includeT3448Timer - include T3448 timer in overload situation

Syntax

--gParmName includeT3448Timer --gParmValue <string>

Description

support T3448 timer for overload control with limited data transfer. T3448 used for limited UE transfer data over CIOT Control Plane Optimization during timer run. With this parameter, T3448 is allowed to be used in CMM.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

includeUliCrSessModBrr - ULI Inclusion in Create Session And Mod Brr Msg

Syntax

--gParmName includeUliCrSessModBrr --gParmValue <string>

Description

Parameter controls inclusion of 'ULI for SGW' IE in Create Session and Modify Bearer Request message that is sent to SGW. By default, the flag shall be set to Yes. When flag is set to 'No', MME will not include the IE in Create Session and Modify Bearer Request message that is sent to SGW.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

Yes

Name

includeUliForSgsn - Include ULI for SGSN

Syntax

```
--gParmName includeUliForSgsn --gParmValue <string>
```

Description

This flag is used to enable/disable inclusion of the user location information IE in associated GTP messages over the Gn interface to the GGSN. no - indicates that the ULI IE is not included. yes (default) - indicates that the ULI IE is included.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

Yes

Name

inhibitPeerSrsResponses - Inhibit Peer SRS Responses

Syntax

```
--gParmName inhibitPeerSrsResponses --gParmValue <string>
```

Description

This parameter provides the ability on the NR10 client side to inhibit NR10 responses from being sent by the peer NR10 server. When set to true, responses to update requests and delete requests are inhibited. This parameter applies to both AMF and MME NR10 functionality.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

Yes

Name

initialAttachIndicationInUlr - Initial attach indication in ULR

Syntax

```
--gParmName initialAttachIndicationInUlr --gParmValue <string>
```

Description

Initial attach indication flag.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

Yes

Name

interPlmnTauAttach - Inter PLMN TAU attach

Syntax

```
--gParmName interPlmnTauAttach --gParmValue <string>
```

Description

If it is set to yes then MME shall check per PLMN provisioning whether inter-plmn S10/S3/Gn message can be sent. by default, the feature is disabled.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

ipAddrInclusion - IP Address Inclusion

Syntax

```
--gParmName ipAddrInclusion --gParmValue <string>
```

Description

Parameter controls inclusion of same IP address type as the destination address used in the IP header in the Create Session Request message. By default, the flag shall be disabled.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

ipv4v6sgsn - IPv4v6 SGSN

Syntax

```
--gParmName ipv4v6sgsn --gParmValue <string>
```

Description

A value of yes indicates release 8 SGSN and above. a value of no indicates pre-release 8 SGSN.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

ipv6SelectionAllowedOnGn - IPv6 Selection Allowed on Gn

Syntax

```
--gParmName ipv6SelectionAllowedOnGn --gParmValue <string>
```

Description

Use this parameter to allow IPV6 support on Gn-C.

List

- OFF - OFF
- ON - ON

Default

OFF

Name

iratGnMobilityQoSParametersUpdate - IRAT Gn mobility QoS parameters update

Syntax

```
--gParmName iratGnMobilityQoSParametersUpdate --gParmValue <string>
```

Description

Indicates whether MME sends modifybearercmd to SGW at the end of TAU when QoS parameters in S6ad ULA are different than those in Gn contextresponse.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

Yes

Name

iratMobilityWithOtherPlmnAllowed - IRAT mobility with other PLMN allowed

Syntax

```
--gParmName iratMobilityWithOtherPlmnAllowed --gParmValue <string>
```

Description

IRAT mobility with other PLMN allowed.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

Yes

Name

iratS3mobilityQosParametersUpdate - IRAT S3 mobility QoS parameters update

Syntax

--gParmName iratS3mobilityQosParametersUpdate --gParmValue <string>

Description

Indicates whether MME sends modifybearercmd to SGW at the end of TAU when QoS parameters in S6ad ULA are different than those in S3 contextresponse.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

iuAlgsSelection - new algs support in lu interface

Syntax

--gParmName iuAlgsSelection --gParmValue <string>

Description

Customer is claiming that UIA1 and UEA1 is compromised already, thus, supporting UIA2 and UEA2 in 3G is needed. The parameter will control to use a configured preference list of algs or not. If the parameter is setting to Yes, then a preference list of algs needed to be configured by customer, SGSN will based on both UE capability and configured preference list to inform RNC the selected algs. If the parameter is set to No, then existing function is unchanged i.e. continue with UIA1/UEA1.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

keepGbrWhenEnbFails - Keep GBR when eNB fails

Syntax

```
--gParmName keepGbrWhenEnbFails --gParmValue <string>
```

Description

Indicates whether (Yes), or not (No), all the GBR bearers associated with an eNB are deactivated when the S1-MME link to that eNB fails.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

keepGbrWhenPagingFails - Keep GBR when paging fails

Syntax

```
--gParmName keepGbrWhenPagingFails --gParmValue <string>
```

Description

Indicates whether (Yes), or not (No), the GBR bearers of the UE are deactivated if paging fails to locate the UE.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

keepSameSgw - Keep the Same SGW

Syntax

```
--gParmName keepSameSgw --gParmValue <string>
```

Description

Keep the Same SGW during IRAT Mobility from 4G (in case of SGSN)

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

keepUpCioTUEs1Bearer - Keep UP CIOT UE S1-U bearer

Syntax

--gParmName keepUpCioTUEs1Bearer --gParmValue <string>

Description

Enable keeping of a S1-U bearer of a UE supporting UP CloT moves into a TAI that does not support UP CloT optimization and S1-U data transfer.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

Yes

Name

lawfulInterceptMtLrNoEsmlc - lawful Intercept MT_LR no E-SMLC

Syntax

--gParmName lawfulInterceptMtLrNoEsmlc --gParmValue <string>

Description

This is for MT_LR client type lawful Intercept service do not contact E-SMLC for UE location information. If yes, when MME receives mobile terminated location request with client type=lawfulInterceptService, and activateLcsClientTypeLawfullInterceptServices is set, the MME contacts the eNB for UE current E-CGI information. This information is sent back to the GMLC. The MME does not contact the E-SMLC to obtain any UE location information. If no, nothing changes and keep existing function (i.e. MME contacts E-SMLC to obtain UE location)

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

lcsapNumberOfResetsWithoutAckForAlarm - LCSAP number of resets without ack for alarm

Syntax

--gParmName lcsapNumberOfResetsWithoutAckForAlarm --gParmValue
<string>

Description

LCSAP number of resets without ack for alarm.

Type / Range

Integer in the range of 1 to 5

Default

3

Name

limitS1apConnEst - Limit S1AP conn est

Syntax

```
--gParmName limitS1apConnEst --gParmValue <string>
```

Description

The parameter is used to limit the sending of the S1AP CONNECTION ESTABLISHMENT INDICATION message to establish UE-associated logical S1-connection if the logical connection is already established. the UE-associated logical S1-connection would be established by the MME if the MME sends S1AP DOWNLINK NAS TRANSPORT before sending the S1AP CONNECTION ESTABLISHMENT INDICATION message.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

linkAlarmCustomize - Link alarm customize

Syntax

```
--gParmName linkAlarmCustomize --gParmValue <string>
```

Description

If the global parameter is set to 'Yes', customized severity levels in the linkalarmcfg is used to set the alarm severity for links and interfaces. if the global parameter is set to 'No', customization of link alarm severity is not supported.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

localIimeiTacRejectionList - Local IMEI-TAC Rejection List

Syntax

```
--gParmName localIimeiTacRejectionList --gParmValue <string>
```

Description

Enables the functionality to provision IMEI-TAC rejection list locally in the MME. When a UE whose IMEI-TAC is included in the list attempts to attach in the MME, the MME rejects the attempt with a provisioned EMM cause code.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

locallyProvisionedSgwPgw - Locally provisioned SGW or PGW

Syntax

```
--gParmName locallyProvisionedSgwPgw --gParmValue <string>
```

Description

Test switch to provision sgw idx in range from 241 to 256.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

locallyProvisionedSgwPgwTopon - Locally provisioned S/PGW Topological Selection

Syntax

```
--gParmName locallyProvisionedSgwPgwTopon --gParmValue <string>
```

Description

Enables topological S/PGW selection for locally provisioned S/PGW.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

locationReportingForUeWithLppsupportOnly - Location reporting for UE with LPP support only

Syntax

```
--gParmName locationReportingForUeWithLppsSupportOnly --gParmValue  
<string>
```

Description

This flag indicates whether LCS will be supported for UEs with or without LPP capability. when flag is enabled only UEs that indicated LPP support can perform LCS procedure. this flag is used in conjunction with the other LCS feature activation fields. those fields apply as well. UE indicates support of LPP capability in the UE network capability IE of the attach request and/or TAU request message.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

logEcgiReceivedInWriteReplaceWarningMessage - Log ECGI Received In Write Replace
Warning Message

Syntax

```
--gParmName logEcgiReceivedInWriteReplaceWarningMessage --gParmValue  
<string>
```

Description

Parameter controls feature activation GPARAM flag. By default, flag shall be disabled. When enabled, MME shall log eCGI that is received in Write-Replace-Warning-Response Message from eNB.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

longestGtDigitsMatch - Longest GT Digits Match

Syntax

```
--gParmName longestGtDigitsMatch --gParmValue <string>
```

Description

This parameter allows or denies whether the SCCP is able to route on the longest GT digits match

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

Yes

Name

lowPriorityAccess - Low priority access

Syntax

```
--gParmName lowPriorityAccess --gParmValue <string>
```

Description

Activate the low access priority capabilities on MME.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

lowPriorityTrafficDdnThrottling - Low priority traffic DDN throttling

Syntax

```
--gParmName lowPriorityTrafficDdnThrottling --gParmValue <string>
```

Description

Throttling of DDN requests for the low priority traffic.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

lraUli - LRA ULI

Syntax

```
--gParmName lraUli --gParmValue <string>
```

Description

Enable/Disable LRA-ULI.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

ltePgwlIsolation - LTE PGW isolation

Syntax

```
--gParmName ltePgwlIsolation --gParmValue <string>
```

Description

Setting to yes enables PGW isolation feature on MME. setting to no disables PGW isolation feature on MME.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

lteSgwIsolation - LTE SGW isolation

Syntax

```
--gParmName lteSgwIsolation --gParmValue <string>
```

Description

Setting to yes enables SGW isolation feature on MME. setting to no disables SGW isolation feature on MME.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

maintainErab - Maintain ERAB

Syntax

```
--gParmName maintainErab --gParmValue <string>
```

Description

When set to yes, MME will maintain E-RAB that are not successfully switched in the core network during the E-RAB modification indication procedure. when set to no, MME will

release/deletee-rab that are not successfully switched in the core network during the E-RAB modification indication procedure.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

maskedImeIsV - Masked IMEISV

Syntax

```
--gParmName maskedImeIsV --gParmValue <string>
```

Description

Masked IMEISV in S1AP messages.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

maxCid - Max CID

Syntax

```
--gParmName maxCid --gParmValue <string>
```

Description

Max CID.

Type / Range

Integer in the range of 1 to 16,383

Default

15

Name

maxEcgiAgeEmerMtLrNoEsmlc - Maximum time interval in seconds for requesting eCGI for emergency MT-LR

Syntax

```
--gParmName maxEcgiAgeEmerMtLrNoEsmlc --gParmValue <string>
```

Description

If the parameter is set to 0 with the global feature activation parameter `emermtlrnoesmlc` is yes, MME page ECM-IDLE UE and send eCGI information or send location-reporting control information for ECM. if the parameter is set to a non-zero value, when MME gets MT-LR request, MME will check the difference between MME stored eCGI timestamp of the UE and time received MT-LR. if the time difference is less than provisioned value, then the MME reports stored eCGI information to GMLC. if time difference is greater than the provisioned value, then MME will request current eCGI either via paging or location report control depends UE status.

Type / Range

Integer in the range of 0 to 180

Default

0

Name

`maxEcgiAgeLawfulInterceptMtLrNoEsmc` - Max ECGI age lawful intercept MT_LR_no E-SMLC

Syntax

```
--gParmName maxEcgiAgeLawfulInterceptMtLrNoEsmc --gParmValue <string>
```

Description

Maximum time interval in seconds for requesting eCGI for lawful intercept MT-LR. If the parameter is set to 0 with the global feature activation parameter `lawfulInterceptMtLrNoEsmc` is yes, MME page ECM-IDLE UE and send eCGI information or send location-reporting control information for ECM_connected UE. if the parameter is set to a non-zero value, when MME gets MT-LR request, MME will check the difference between MME stored eCGI timestamp of the UE and time received MT-LR. if the time difference is less than provisioned value, then the MME reports stored eCGI information to GMLC. if time difference is greater than the provisioned value (or equal provisioned value), then MME will request current eCGI either via paging or location report control depends UE status

Type / Range

Integer in the range of 0 to 180 in units of Second

Default

0

Name

`maxEcgiAgePlmnOperMtLrNoEsmc` - Max ECGI age PLMN operator MT_LR no E-SMLC

Syntax

```
--gParmName maxEcgiAgePlmnOperMtLrNoEsmc --gParmValue <string>
```

Description

Maximum time interval in seconds for requesting eCGI for PLMN Operator MT-LR. If the parameter is set to 0 with the global feature activation parameter `plmnOperatorMtLrNoEsmc` is yes, MME page ECM-IDLE UE and send eCGI information or

send location-reporting control information for ECM_connected UE. if the parameter is set to a non-zero value, when MME gets MT-LR request, MME will check the difference between MME stored eCGI timestamp of the UE and time received MT-LR. if the time difference is less than provisioned value, then the MME reports stored eCGI information to GMLC. if time difference is greater than the provisioned value ((or equal provisioned value), then MME will request current eCGI either via paging or location report control depends UE status

Type / Range

Integer in the range of 0 to 180 in units of Second

Default

0

Name

maxEcgiAgeValueAddedMtLrNoEsmlc - Max ECgi age value added MT_LR no E-SMLC

Syntax

--gParmName maxEcgiAgeValueAddedMtLrNoEsmlc --gParmValue <string>

Description

Maximum time interval in seconds for requesting eCGI for value Added service MT-LR. If the parameter is set to 0 with the global feature activation parameter valueAddedMtLrNoEsmlc is yes, MME page ECM-IDLE UE and send eCGI information or send location-reporting control information for ECM_connected UE. if the parameter is set to a non-zero value, when MME gets MT-LR request, MME will check the difference between MME stored eCGI timestamp of the UE and time received MT-LR. if the time difference is less than provisioned value, then the MME reports stored eCGI information to GMLC. if time difference is greater than the provisioned value (or equal provisioned value), then MME will request current eCGI either via paging or location report control depends UE status

Type / Range

Integer in the range of 0 to 180 in units of Second

Default

0

Name

maxEnbsPagedDuringMinorOverload - Maximum eNBs paged during minor overload

Syntax

--gParmName maxEnbsPagedDuringMinorOverload --gParmValue <string>

Description

The parameter specifies the maximum number of eNBs paged for a single page attempt when a minor overload condition is present.

Type / Range

Used for maximum number of eNBs paged for a single page attempt.

Default

600

Name

maxMmeUeRadioCapLength - Maximum MME Ue Radio Capability Length

Syntax

--gParmName maxMmeUeRadioCapLength --gParmValue <string>

Description

Maximum Ue Radio Capability Length Supported on the MME. Default is 8192. Setting this value to 24576 or 49152 enables storage of Radio capability length greater than 8192 bytes in the RCIS if RCIS is available

Type / Range

Integer in the range of 8,192 or 24,576 or 49,152

Default

8192

Name

maxNumberWarningAreasEcgi - Max number warning areas ecgi

Syntax

--gParmName maxNumberWarningAreasEcgi --gParmValue <string>

Description

Maximum number of warning areas (ecgi) that can be includes in S1AP WRITE-REPLACE WARNING REQUEST or S1AP KIL-REQUEST messages sent to eNB.

Type / Range

Integer in the range of 1 to 9,000

Default

4000

Name

maxTaRelativeCapacity - Max TA relative capacity

Syntax

--gParmName maxTaRelativeCapacity --gParmValue <string>

Description

Used to select to send to the eNB the maximum or minimum MME relative capacity of provisioned MME relative capacities of TAs supported by an eNB to the eNB in S1-AP SETUP RESPONSE message and in MME CONFIGURATION UPDATE message.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

mdt - Minimization of drive tests

Syntax

--gParmName mdt --gParmValue <string>

Description

Activation/deactivation minimization of drive tests.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

measInfoldUsage - measInfold use in PM

Syntax

--gParmName measInfoIdUsage --gParmValue <string>

Description

This parameter describes the type of measInfold parameter to add to PM files.

List

- none - No measInfold - The parameter is not included in PM file.
- serviceAndCategory - Service and Category - The parameter is set to Service and Category in the PM file.

Default

none

Name

minFqdnLabelMatching - minFqdnLabelMatching

Syntax

--gParmName minFqdnLabelMatching --gParmValue <string>

Description

Enable applying minimum matching fqdn labels between SGW and PGW fqdn(s) during SPGW pair selection. When gParm is enabled, the MME use configuration from fqdnLabelMatchProfile and fqdnLabelMatchUut to further resolve min fqdn label matching per Service Combination and subscribed UE Usage Type

List

- No - Boolean value of no.

- Yes - Boolean value of yes.

Default

No

Name

mmeAdditionalMsisdn - MME Additional MSISDN

Syntax

```
--gParmName mmeAdditionalMsisdn --gParmValue <string>
```

Description

GPARM parameter mmeAdditionalMsisdn controls the support for Additional MSISDN by MME. By default the parameter shall be no. When GPARM parameter mmeAdditionalMsisdn is yes, the MME shall inform HSS that it supports the A-MSISDN feature by setting the corresponding feature bit of the Feature List AVP in the Update Location Request, Insert Subscriber Data Answer and Delete Subscriber Data Answer commands.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

mmeApnNiExtension - MME APN NI extension

Syntax

```
--gParmName mmeApnNiExtension --gParmValue <string>
```

Description

No (default) - for MME, disable the extension of the APN NI with configurable length of MSISDN digits. yes - for MME, enable the extension of the APN NI with configurable length of MSISDN digits.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

mmeOverloadMmRejectionNasCc - MME overload MM rejection NAS CC

Syntax

```
--gParmName mmeOverloadMmRejectionNasCc --gParmValue <string>
```

Description

EMM NAS cause code to be sent in the mobility management reject messages (Attach reject, TAU reject and service reject) due to any MME overload or throttling of MM procedures. valid values are 2-3,5-26,35,39-40,42,95-101,111 per annex a of TS 24.301.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

22

Name

mmeOverloadPlaResult - MME overload PLA result

Syntax

--gParmName mmeOverloadPlaResult --gParmValue <string>

Description

Select diameter result to be sent in Slg provide subscriber location answer when MME is in major or critical overload.

List

- 3004 - Too Busy - 3004 - DIAMETER_TOO_BUSY.
- 4002 - Out of Space - 4002 - DIAMETER_OUT_OF_SPACE.
- 4224 - Positioning Denied - 4224 - DIAMETER_ERROR_POSITIONING_DENIED.
- 4225 - Positioning Failed - 4225 - DIAMETER_ERROR_POSITIONING_FAILED.
- 5006 - Resources Exceeded - 5006 - DIAMETER_RESOURCES_EXCEEDED.

Default

4224 - Positioning Denied

Name

mmePgwQueryEmptyflagRr - MME PGW QUERY EMPTYFLAG RR

Syntax

--gParmName mmePgwQueryEmptyflagRr --gParmValue <string>

Description

No (default) - disable the MME to support NAPTR RR with " (empty) flag for PGW selection.
yes - enable the MME to support NAPTR RR with " (empty) flag for PGW selection.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

mmeProseAuthorizationSupport - Public safety proximity services

Syntax

--gParmName mmeProseAuthorizationSupport --gParmValue <string>

Description

Public safety proximity services.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

mmeSgwQueryEmptyflagRr - MME SGW Query Empty Flag

Syntax

--gParmName mmeSgwQueryEmptyflagRr --gParmValue <string>

Description

This parameter is used to enable MME handling of reception of S-NAPTR RR with empty flag. By default, the capability disabled. If the parameter is set to 'Yes' then the capability is enabled.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

mocnAccurateLoc - P-GW/GGSN enhancement with 3G MOCN setup for location update.

Syntax

--gParmName mocnAccurateLoc --gParmValue <string>

Description

In 3G MOCN setup, during SRNS relocation procedure or EUTRAN-to-UTRAN PS handover, it is possible that the PLMN ID received in RAU after relocation is not identical to the PLMN ID that the target SGSN learns with the GTP:FORWARD_RELOCATION_REQ message. Activate this parameter to force a GTP:UPDATE_PDP_CONTEXT message that updates PGW/GGSN with the correct PLMN ID. SGSN Multi Operator Core Network (3G MOCN) needs to be activated for this functionality.

List

- OFF - OFF
- ON - ON

Default

OFF

Name

monitoringConfigFailureSendNor - Monitoring Config Failure Send Nor

Syntax

```
--gParmName monitoringConfigFailureSendNor --gParmValue <string>
```

Description

Specifies whether the MME is to send a Notification Report to the HSS if a monitoring event cannot be configured at the MME (3GPP R14 functionality).

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

monitoringEventsDeletionByUla - Monitoring Events Deletion by ULA

Syntax

```
--gParmName monitoringEventsDeletionByUla --gParmValue <string>
```

Description

Parameter controls detection and deletion of monitoring event configuration AVPs received in ULA. When parameter is enabled, upon receiving one or more Monitoring-Event-Configuration AVP(s) in the ULA, the MME shall start the detection of the Monitoring events indicated in those AVP(s), if not already started, and shall stop the detection and delete the previous monitoring events (if any) which are not indicated in those AVP(s). If there is a failure when starting the detection (e.g. maximum resources exceeded), the MME shall not store the failed configuration(s) and shall send a notification of those events whose configuration have failed. If the Subscription-Data AVP is received in the ULA but it does not contain any Monitoring-Event-Configuration AVP(s), the MME shall stop the detection and delete all stored monitoring event configurations (if any).

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

monteCommFailRanUeInact - monteCommFailRanUeInact

Syntax

--gParmName monteCommFailRanUeInact --gParmValue <string>

Description

Specifies whether the MME is to send a T6a:RIR Communication Failure Event Report if the RAN requests UE S1 release due to UE Inactivity.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

mscLoadBalance - MSC load balance

Syntax

--gParmName mscLoadBalance --gParmValue <string>

Description

Configure MSC load balance algorithm.

List

- IMSI Hash - Assign UEs based on hash derived from the UE IMSI.
- Round Robin - Round-Robin - Use round robin assignment of UEs.

Default

Round Robin

Name

mscSelMultipleCsCoreSuppt - MSC selection of Multiple CS Core network

Syntax

--gParmName mscSelMultipleCsCoreSuppt --gParmValue <string>

Description

GPARAM will control the feature flag. By default the global parameter shall be false/disabled.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

mScVlrReselection - MSC VLR reselection

Syntax

--gParmName mScVlrReselection --gParmValue <string>

Description

Enable/disable alternate MSC selection if location update times out or MSC rejects the request with reject cause 'congestion'.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

mSisdNHomeGwWithCc - MSISDN Based Home GW selection with CC

Syntax

--gParmName mSisdNHomeGwWithCc --gParmValue <string>

Description

MSISDN based home GW selection with CC(charging characteristic)

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

mUltipleIwsSupport - Multiple IWS support

Syntax

--gParmName mUltipleIwsSupport --gParmValue <string>

Description

CLI command to control the support for multiple IWSs between ALU MME and 3rd party IWS.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

multiPra - Multiple PRAs

Syntax

```
--gParmName multiPra --gParmValue <string>
```

Description

Enables support for -multiple Presence Reporting Areas (PRAs) per PDN connection in the MME, -multiple IP address segments per PRA identifier for Dual connectivity segment based reporting in the MME.

Restrictions

gParm praRel145 required to be set to 'Yes'.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

multiPraOperationEnbsEcgis - Multiple PRA Operation eNBs and ECGIs

Syntax

```
--gParmName multiPraOperationEnbsEcgis --gParmValue <string>
```

Description

Enables the functionality to enter multiple eNBs and ECGIs with a single command addressing a Presence Reporting Area.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

multiPraOperationTacsEnabled - Multiple PRA Operation with TACs Enabled

Syntax

```
--gParmName multiPraOperationTacsEnabled --gParmValue <string>
```

Description

Enables the functionality to enter multiple Tracking Areas with a single command addressing a Presence Reporting Area.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

multiSimSupport - Multi SIM Support

Syntax

```
--gParmName multiSimSupport --gParmValue <string>
```

Description

GPARM controls support for MultiSim with YES or NO flag with a default value of NO. When the parameter is set to YES the MME will drop an MT-LR if it only contains an MSISDN for the location query. With the default value setting of NO, the CMM will allow an MT-LR that contains only an MSISDN as the identifier

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

n26DirectFwd - n26DirectFwd

Syntax

```
--gParmName n26DirectFwd --gParmValue <string>
```

Description

Indicates whether direct data forwarding is enabled or disabled on n26 handover.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

n26IndirectFwd - n26IndirectFwd

Syntax

```
--gParmName n26IndirectFwd --gParmValue <string>
```

Description

Indicates whether indirect data forwarding is enabled or disabled on n26 handover.

List

- disabled - Indirect forwarding is disabled for n26 handover
- enabled - Indirect forwarding is enabled for n26 handover

Default

enabled

Name

n26iwk - N26iwk - N26 interworking

Syntax

--gParmName n26iwk --gParmValue <string>

Description

Enables N26 interworking.

List

- OFF - OFF
- ON - ON

Default

OFF

Name

nasNonDeliveryIndicationEsmDataTransfer - Enable NAS Non Delivery Indication for ESM Data Transfer

Syntax

--gParmName nasNonDeliveryIndicationEsmDataTransfer --gParmValue <string>

Description

Enable NAS Non Delivery Indication for ESM Data Transfer

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

nasTokensToCompare - NAS tokens to compare

Syntax

--gParmName nasTokensToCompare --gParmValue <string>

Description

The number of NAS tokens to compare in determining whether a UE is authenticated in a handover scenario from UTRAN/GERAN to LTE.

Type / Range

Integer in the range of 2 to 5

Default

3

Name

nbIotEmmTimerIncr - CIOT EMM timer increment

Syntax

```
--gParmName nbIotEmmTimerIncr --gParmValue <string>
```

Description

This value is added to the timers in 10.2.2 of 24.301 for CIOT UE.

Type / Range

Integer in the range of 0 to 240

Default

0

Name

nbIotEsmTimerIncr - CIOT ESM timer increment

Syntax

```
--gParmName nbIotEsmTimerIncr --gParmValue <string>
```

Description

This value is added to the timers in 10.3.2 of 24.301 for CIOT UE.

Type / Range

Integer in the range of 0 to 180

Default

0

Name

nbIotOlAtMinorOverload - NB-IOT Overload Control At Minor Overload

Syntax

```
--gParmName nbIotOlAtMinorOverload --gParmValue <string>
```

Description

If the parameter is Yes, the MME will perform NB-IOT overload control when the MME starts experiencing minor overload. If the parameter is No, the MME would not take any NB-IOT overload control action until the MME starts experiencing major overload.

List

- No - Boolean value of no.

- Yes - Boolean value of yes.

Default

No

Name

nbIotPagingTimerIncr - CIOT paging timer increment

Syntax

```
--gParmName nbIotPagingTimerIncr --gParmValue <string>
```

Description

This value is added to paging response timer for CIOT UE.

Type / Range

Integer in the range of 0 to 240

Default

0

Name

nbIotRatTypeToHss - NBIOT RAT Type to HSS

Syntax

```
--gParmName nbIotRatTypeToHss --gParmValue <string>
```

Description

If the global parameter is set to 'Yes' then MME shall send NB-IoT RAT Type to HSS. If the global parameter is set to 'No', then MME shall send EUTRAN RAT Type to HSS.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

Yes

Name

noClrRejForMissingClrFlags - No CLR Reject for Missing CLR-Flags

Syntax

```
--gParmName noClrRejForMissingClrFlags --gParmValue <string>
```

Description

Parameter controls rejecting CLR for Missing CLR-Flags AVP. By default the flag shall be disabled. When enabled MME will not reject CLR with Diameter Unable to Comply if CLR-Flags AVP is missing.

List

- No - Boolean value of no.

- Yes - Boolean value of yes.

Default

No

Name

nonDdnPagingTauCollision - Non DDN paging TAU collision

Syntax

--gParmName nonDdnPagingTauCollision --gParmValue <string>

Description

Enable MME to treat TAU request without active flag as a paging response and re-establish bearers if TAU is received while MME is paging a UE.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

nonEmergencyPdnConnAsNewPdnConnAtAttach - Non-emergency PDN connection as new PDN connection at attach

Syntax

--gParmName nonEmergencyPdnConnAsNewPdnConnAtAttach --gParmValue <string>

Description

MME support to treat non-emergency PDN connection as a new PDN connection at attach.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

nrBasedGwSelectionSgsn - NR Capability based GW selection

Syntax

--gParmName nrBasedGwSelectionSgsn --gParmValue <string>

Description

This parameter enables SGSN selecting GW using NR capability of the UE. When this parameter is enabled, SGSN selects NR capable GW if NR capability is supported at the

UE. If the parameter is setting to Yes, then a fixed tag=5gc will be added to pre-rel8 DNS query or rel8 DNS with service +nc-nr. If the parameter is set to No, then existing function is unchanged i.e. no changes for DNS query of 5G NSA UEs.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

nrCcDoubleS1PsAck - Normal release cause for double S1 connections and path switch request ack

Syntax

--gParmName nrCcDoubleS1PsAck --gParmValue <string>

Description

If this parameter is set to 'Yes' then the cause IE of S1AP UE CONTEXT RELEASE COMMAND is set to 'Normal release' for the following cases.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

nriLength - Length of Network Resource Identifier, LEN

Syntax

--gParmName nriLength --gParmValue <string>

Description

This parameter defines the length of Network Resource Identifier (NRI) in the CMM SGSN. Possible values are 0, 5, 6 and 7.

Type / Range

Integer in the range of 0 or 5 to 7

Default

0

Name

nrPriorityOverSmf - NC-NR priority over SMF

Syntax

```
--gParmName nrPriorityOverSmf --gParmValue <string>
```

Description

When this parameter is enabled, then the MME gives priority to NC-NR capable gw against combo PGW-C capable gw when multiple candidates, each serving only one of these service parameters are retrieved by DNS query

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

nullNri - Null network resource identifier

Syntax

```
--gParmName nullNri --gParmValue <string>
```

Description

This parameter defines the null network resource identifier, 255 ... not defined (default) 0 to 31 ... valid values.

Type / Range

Integer in the range of 0 to 31 or 255

Default

255

Name

numIpsPerPgwFqdn - Supported number of IPs per PGW FQDN

Syntax

```
--gParmName numIpsPerPgwFqdn --gParmValue <string>
```

Description

Sets the maximum number of IPv4 and IPv6 addresses per PGW FQDN. Only 2 values are supported (2 or 8). When set to '2' or '8', as many as 2 or 8 IPv4 and 2 or 8 IPv6 addresses are supported per PGW FQDN.

Type / Range

Indicates maximum number of IPv4s and IPv6s supported per PGW FQDN: 2 or 8.

Default

2

Name

obtainPgwFqdnEps5gsMob - obtainPgwFqdnEps5gsMob

Syntax

```
--gParmName obtainPgwFqdnEps5gsMob --gParmValue <string>
```

Description

Current parameter enables performing PGW FQDN lookup when PGW FQDN isn't available during EPS to 5GS mobility

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

ocCallTraceContinue - OC call trace continue

Syntax

```
--gParmName ocCallTraceContinue --gParmValue <string>
```

Description

Indicates whether or not call trace will continue (YES), or be suspended (NO), on a CPPS when the CPPS is in a major or critical overload condition.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

ocSendOverloadStartAndStopToEnbs - Overload control send overload start and stop messages to eNBs

Syntax

```
--gParmName ocSendOverloadStartAndStopToEnbs --gParmValue <string>
```

Description

A value of yes indicates the MME will send overload start and overload stop messages to eNBs as part of overload control. a value of no indicates the MME will not send overload start and overload stop messages.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

octetEncodingSupport - Octet Encoding Support

Syntax

```
--gParmName octetEncodingSupport --gParmValue <string>
```

Description

Parameter controls support for Octet Encoding for the Indication IE contained within messages sent over the S11 interface. By default the flag shall be disabled. When the flag is enabled, MME shall only encode the first three bytes of indication flags.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

odbBitsSupport - ODB Bits Support

Syntax

```
--gParmName odbBitsSupport --gParmValue <string>
```

Description

Parameter controls feature activation. By default the GPARM flag is off. When the feature is activated, MME upon receiving ODB AVP in ULA/IDR from HSS, shall set the following 2 bits: hssPxy_SupportedFeatureList_ODBHplmnApn and hssPxy_SupportedFeatureList_ODBVplmnApn regardless of homer vs. homer, and regardless of value of odb_all_apn and odb_hplmn_apn bits in ServiceAgreementProfile

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

overrideEnhEmmCcCreateSessRespUserAuthFail - Override Enh EMM Cause Code Create Session Response User Auth Fail

Syntax

```
--gParmName overrideEnhEmmCcCreateSessRespUserAuthFail --gParmValue  
<string>
```

Description

This parameter controls whether to use restNasMappingProfile provisioning for Create Session Request cause code #72 or #92. By default, flag shall be disabled. When this parameter is enabled, restNasMappingProfile shall be used.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

overrideVaa - APN Override regardless the VAA parameter value

Syntax

```
--gParmName overrideVaa --gParmValue <string>
```

Description

This parameter controls the APN override functionality of network identifier for roamer subscribers. When this parameter is ON the relevant functionality is decoupled from the value of the VAA parameter. When this value is OFF the relevant functionality continues to work as currently (i.e. coupled with the value of the VAA parameter)

List

- OFF - OFF
- ON - ON

Default

OFF

Name

pagingAfterInterRatRedirection - Paging After Inter Rat Redirection

Syntax

```
--gParmName pagingAfterInterRatRedirection --gParmValue <string>
```

Description

Parameter controls MME to allow paging to continue upon receiving a DDN after handling of an UE context release request with cause inter-rat-redirection, By default the flag shall be disabled. When enabled, MME upon receiving a DDN after handling of an UE context release request with cause inter-rat-redirection, MME shall allow paging to continue.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

pagingGapFailCountTrigger - Paging Gap Fail Count Trigger

Syntax

```
--gParmName pagingGapFailCountTrigger --gParmValue <string>
```

Description

Parameter Paging Gap Fail Count Trigger indicates the number of failed paging operations that start the paging gap timer.

Type / Range

Integer in the range of 1 to 5

Default

3

Name

pagingOptimizationInHenb - Paging optimization in home eNB

Syntax

```
--gParmName pagingOptimizationInHenb --gParmValue <string>
```

Description

Is paging optimization supported for the home eNB?.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

pagingOptimizationInMme - Paging optimization in MME

Syntax

```
--gParmName pagingOptimizationInMme --gParmValue <string>
```

Description

A value of y indicates that paging optimization is supported for the MME.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

Yes

Name

pagingOverloadPrevention - Paging Overload Prevention

Syntax

```
--gParmName pagingOverloadPrevention --gParmValue <string>
```

Description

Parameter controls feature activation. By default the flag shall be always enabled.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

Yes

Name

pagingUponTadsReceived - Paging Upon T-ADS Received

Syntax

```
--gParmName pagingUponTadsReceived --gParmValue <string>
```

Description

Parameter controls paging upon receiving T-ADS from HSS in IDR message. By default, flag shall be disabled. When enabled, MME upon receiving T-ADS in IDR message from HSS when UE is in either registered or in idle state, shall respond with Insert Subscriber-Data Answer (with IMS-Voice-Over-PS Sessions-Supported (1) and shall immediately starts paging the UE.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

passiveOffload - Passive offload

Syntax

```
--gParmName passiveOffload --gParmValue <string>
```

Description

MME is in passive offload mode or not.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

passiveUelbOfLoadRate - UELB Off-Load Rate

Syntax

--gParmName passiveUelbOfLoadRate --gParmValue <string>

Description

For Passive UELB this parameter specifies the per CPPS of load rate

Type / Range

Integer in the range of 10 to 1000

Default

80

Name

pcmdSheddingDuringOverload - PCMD shedding during overload

Syntax

--gParmName pcmdSheddingDuringOverload --gParmValue <string>

Description

Control flag for PCMD shedding during overload. this flag can be used to determine MME behavior related to PCMD during CPU overload.

List

- Do not drop PCMD during overload - Do not drop PCMD during overload.
- Drop PCMD to OAM during overload - Drop PCMD to OAM during overload.
- Drop all PCMD in major overload - Drop all PCMD in major overload (includes eNB PCMD and PCMD to OAM).
- Drop all PCMD in minor overload - Drop all PCMD in minor overload (includes eNB PCMD and PCMD to OAM).

Default

Do not drop PCMD during overload

Name

pcscfRecovery - PCSCF recovery

Syntax

--gParmName pcscfRecovery --gParmValue <string>

Description

Configure P-CSCF recovery or not.

List

- mode1 - With mode 1 option, MME will utilize bit 31 in IDR flags that shall be used for p-cscf recovery, and it shall be carried in private extension IE. in addition, with this option MME shall send modify bearer request to SGW.
- mode2 - IMME shall utilize bit 8 in IDR flags AVP for p-cscf recovery and MME shall use feature bit 16 in supported features AVP. MME with this option shall disconnect PDN connection with NAS cause CNode reactivation required and shall send DSReq to SGW.
- mode3 - Supports 3GPP specified PCO based P-CSCF restoration.
- none - With none option, if MME receives bit in IDR flags AVP for p-cscf recovery it shall be ignored by MME and will continue with the ongoing procedure.

Default

none

Name

pdnConnEstEnhSupport - PDN Connection Re-establishment after SGW Change with Roamers and Voice Enhancements

Syntax

```
--gParmName pdnConnEstEnhSupport --gParmValue <string>
```

Description

Parameter controls enabling or disabling the support for enhancements to PDN Connection Re-establishment after SGW change with Roamers and Voice feature. By default this parameter shall be disabled.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

pdnDifferentApnOi - PDN connection for a different APN OI

Syntax

```
--gParmName pdnDifferentApnOi --gParmValue <string>
```

Description

This parameter is used to enable/disable MME to set up a second PDN connection with a different APN OI for APN when UE already has a PDN connection for the same APN.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

Yes

Name

pdnHoS11ApnFormulation - PDN Handover S11 APN Formulation

Syntax

--gParmName pdnHoS11ApnFormulation --gParmValue <string>

Description

Defines how the MME forms the APN-OI of the APN IE on S11 Create Session Request towards the SGW, when the MME receives a 'Handover' PDN Connectivity Request from the UE. When set to 'Yes', the MME uses enhanced logic to utilise either the possibly provisioned override PLMN id, the PLMN id obtained from the UE's IMSI or the UE's requested APN-OI. When set to 'No' (default), the MME uses the Destination-Realm as received from the HSS indicating the selected PGW of the PDN to set the APN-OI on S11 CSR.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

pdnReestablishSgwChange - PDN reestablish SGW change

Syntax

--gParmName pdnReestablishSgwChange --gParmValue <string>

Description

All PDN connections for each UE shall be always examined for PDN-reestablishment after every SGW change.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

pdnRejectDueToSubscriptionEsmCc - ESM cause for PDN rejected due to subscription

Syntax

--gParmName pdnRejectDueToSubscriptionEsmCc --gParmValue <string>

Description

ESM cause code in PDN connection reject message when PDN connection request is rejected due to subscription.

Type / Range

Integer in the range of 8, 26-39, 41-47, 49-60, 65-66, 81, 95-101, 111-113

Default

32

Name

pdnReleaseNrSecRatRestriction - Release PDN connection due to NR as Secondary RAT restriction

Syntax

--gParmName pdnReleaseNrSecRatRestriction --gParmValue <string>

Description

Allow MME to release a PDN Connection for a DCNR capable UE after MME determines UE is restricted access for NR as a Secondary RAT.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

pgwAddrOnS6aAndPgwFinding - PGW Address on S6a and PGW Finding

Syntax

--gParmName pgwAddrOnS6aAndPgwFinding --gParmValue <string>

Description

pgwAddrOnS6aAndPgwFinding parameter has two purposes for e.g. VoLTE - VoWifi handovers: it -controls which received PGW IP address(es) the MME uses, when the MME sends the selected PGW information inside the MIP6-Agent-Info AVP on the S6a NOR and the S6a ULR (Active-APN AVP(s)). -controls how the MME finds the PGW for the PDN when the MME receives Attach Request or PDN Connectivity Request with Request type Handover and establishes the PDN with Create Session Request.

List

- csrHss - Create Session Response returned IP(s) or HSS given PGW IP(s) - On S6a NOR/ULR, the MME uses the IP address(es) returned by the SGW on Create Session Response. When sending Create Session Request for a PDN after receiving Attach Request or PDN Connectivity Request with Request type "Handover", the MME uses the PGW IP address(es) from the HSS for the PDN and does not perform any DNS query.
- dns - DNS given PGW IP(s) - On S6a NOR/ULR, the MME uses the PGW IP address(es) received from the DNS. When sending Create Session Request for a PDN after receiving Attach Request or PDN Connectivity Request with Request type "Handover", the MME uses the DNS to find the PGW address to use for the PDN.

Default

dns

Name

pgwApnGtpOvlControlSupport - APN Level Overload Control Support

Syntax

--gParmName pgwApnGtpOvlControlSupport --gParmValue <string>

Description

When enabled the MME shall support APN level overload control functionality, whenever overload information is provided on APN level from the PGW.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

pgwIsolationFaultThreshold - PGW isolation fault threshold

Syntax

--gParmName pgwIsolationFaultThreshold --gParmValue <string>

Description

This command is used to provision PGW fault threshold for the PGW isolation. if the number of the PGW faults (remote peer not responding cause received in the S11/S4 create session response) exceed the provisioned threshold in a provisioned duration timer then WMM will isolate the PGW from the selection to new PDN connection for provisionable duration.

Type / Range

Integer in the range of 1 to 1000

Default

50

Name

pgwPlmnIdExclusionSupport - PGW plmn ID exclusion support

Syntax

--gParmName pgwPlmnIdExclusionSupport --gParmValue <string>

Description

Enable/Disable exclusion of PGW PLMN ID AVP when PGW FQDN is present in NOR.

List

- No - Boolean value of no.

- Yes - Boolean value of yes.

Default

No

Name

pgwRestartNotification - PGW restart notification

Syntax

```
--gParmName pgwRestartNotification --gParmValue <string>
```

Description

If it is yes, then MME/S4-SGSN sends support of PGW restart notification indication in node feature IE of GTPv2 echo request and echo response. if it is no, then MME will not indicate the support of PGW restart notification to the SGW.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

pgwSelectionRestrictedToCollocatedGgsnPgw - PGW Selection Restricted To Collocated GGSN/PGW

Syntax

```
--gParmName pgwSelectionRestrictedToCollocatedGgsnPgw --gParmValue <string>
```

Description

Parameter controls MME support for Configuration Control for Restriction of PGW Selection to Collocated GGSN/PGW during IRAT Mobility scenario. By default, flag shall be disabled. When enabled, restriction for gp-service for roamer and gn-service for homer shall be removed. This shall apply to Gateway Mode Selection 2.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

pgwSelectionWithNonNcSmf - PGW Selection With Non nc-smf

Syntax

```
--gParmName pgwSelectionWithNonNcSmf --gParmValue <string>
```

Description

Parameter controls feature activation. By default the flag shall be disabled. When enabled, MME shall support preferring PGW(s) which specifically have a non nc-smf tagged service type for non N1 mode UEs. In other words, with the new gParm enabled, MME shall enforce associating LTE only UE with non-combo PGW. This feature shall be applied only for gateway mode selection 2.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

pgwSelectionWithSnaptr - PWG selection with snaptr

Syntax

--gParmName pgwSelectionWithSnaptr --gParmValue <string>

Description

Enable/Disable support for PGW selection with snaptr.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

plmnCtrlPreferGw - plmn level control of preferred Gw

Syntax

--gParmName plmnCtrlPreferGw --gParmValue <string>

Description

PLMN Level Control of Preferred Gateway. Customer preferred control of GW type selection. This gParm is to control this feature. When this plmnCtrlpreferGw parameter is set, then PLMN level Control of Preferred Gateway will be enable. If the parameter is false (default value), then S4 SGSN keeps existing behaviour.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

plmnOperMtLrNoEsmc - PLMN operator MT_LR no E-SMLC

Syntax

--gParmName plmnOperMtLrNoEsmc --gParmValue <string>

Description

MT_LR client type PLMN Operator Service do not contact E-SMLC for UE location information. If yes, when MME receives mobile terminated location request with client type=plmnOperatorServices, and activateLcsClientTypePlmnOperatorServices is set, the MME contacts the eNB for UE current E-CGI information. This information is sent back to the GMLC. The MME does not contact the E-SMLC to obtain any UE location information. If no, nothing changes and keep existing function (i.e. MME contacts E-SMLC to obtain UE location for this MT-LR type) .

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

plmnS6dSelection - PLMN level s6d&Gr selection

Syntax

--gParmName plmnS6dSelection --gParmValue <string>

Description

When rel8 architecture enable, S4-SGSN always selects HSS. With this feature enable, PLMN level control to select either S6d/Gr will be controlled by operators. Also fallback from s6d to Gr could be also controlled by operators. When this parameter set to true (yes), then above mentioned two parameters can be configured by operator/PLMN level. If the parameter set to false (no, default), then SGSN keeps the same as current. When this feature is enable, then SG01236 is not used.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

pmFileToFluentd - Send PM File to Fluentd

Syntax

```
--gParmName pmFileToFluentd --gParmValue <string>
```

Description

This parameter controls the functionality for sending PM XML file to fluentd.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

pMtuDiscoveryS1IPv6 - Path MTU Discovery for IPv6 S1/M3 links

Syntax

```
--gParmName pMtuDiscoveryS1IPv6 --gParmValue <string>
```

Description

Controls Path MTU Discovery for IPv6 S1/M3 links. no (default) - disable Path MTU Discovery
yes - enable Path MTU Discovery

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

powerSavingsMode - Power savings mode

Syntax

```
--gParmName powerSavingsMode --gParmValue <string>
```

Description

Support for UE power saving mode.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

pradClpv4 - Presence Reporting Area Dual Connectivity IPv4

Syntax

```
--gParmName praDcIpv4 --gParmValue <string>
```

Description

Activates customized Presence Reporting Area (PRA) functionality for dual connectivity. When dual connectivity is applied for a UE, presence reporting is used to inform the SGW/PGW/PCRF (upon request) whether the UE currently uses a 5G gNB (UE is inside) or not (UE is outside). The gNBs use IPv4 addressing. MME uses a customized schema in analyzing whether a provided RAN IPv4 user plane endpoint belongs to an eNB or a gNB.

List

- dcPralpv4Disabled - DC PRA IPv4 Reporting Disabled - Dual Connectivity Presence Reporting for IPv4 addresses is disabled.
- dcPralpv4Basic - DC PRA IPv4 Reporting Basic - MME sends all Dual Connectivity IPv4 address based reports. MME sends initially what is the UE status when the PRA action is requested from the SGW/PGW/PCRF, and also all changes on the status. "Inside" means that 5G gNB is currently used by the UE, and "outside" means that 5G gNB is currently not used.
- dcPralpv4OptIdleConn - DC PRA IPv4 Reporting Optimized Idle Connected - MME does not send Dual Connectivity IPv4 address based initial report, if the initial status is 'outside'. MME sends initially what is the UE status only if the status is initially 'inside' when the PRA action is requested from the SGW/PGW/PCRF. If the initial status is 'outside', MME does not report that and only reports the very first 'inside'. After the initial status the MME sends changes on the status. 'Inside' means that 5G gNB is currently used by the UE, and 'outside' means that 5G gNB is currently not used. MME supports three separate timers for optimizing PRA reporting. MME starts timer whenever it first receives new RAN endpoints, no timer is previously running and PRA status would be changed due to the new endpoints. Timer is stopped when MME receives different new RAN endpoints or UE context is released. MME sends the PRA report towards the SGW/PGW when timer expires or is stopped if reporting is still required i.e. status differs from previous reported and the UE is still ECM-CONNECTED. Note: when PRA action is received from another MME on Forward Relocation Request/ Context Response, the MME always sends the first report under the new MME even with this setting selected.

Default

dcPralpv4Disabled

Name

praDcIpv6Prefix - PRA DC IPv6 Prefix

Syntax

```
--gParmName praDcIpv6Prefix --gParmValue <string>
```

Description

Activate the Presence Reporting Area functionality to report on dual connectivity with IPv6 prefixes. MME detects the dual connectivity usage based on provisioned IPv6 address

prefixes. The functionality uses CN predefined PRAs. The MME reports via PRA reporting that a UE is inside the area when the MME detects that the gNB user plane IP address is covered by the provisioned IPv6 address prefix i.e. UE is using dual connectivity with a 5G gNB. The UE is outside the area when the gNB user plane IP address is not covered by the provisioned IPv6 address prefix i.e. UE is not using dual connectivity with a 5G gNB.

List

- **dcPralpv6PrefixBasic** - DC PRA IPv6 Prefix Basic - MME sends all Dual Connectivity IPv6 prefix based reports. MME sends initially what is the UE status after the PRA action has been requested from the SGW/PGW/PCRF, and also all changes after that on the status. 'Inside' means that 5G gNB is currently used by the UE, and 'outside' means that 5G gNB is currently not used.
- **dcPralpv6PrefixDisabled** - DC PRA IPv6 Prefix Disabled - Dual Connectivity Presence Reporting Area based on IPv6 prefixes is disabled.
- **dcPralpv6PrefixSingleTimer** - DC PRA IPv6 Prefix Single Timer - MME does not send Dual Connectivity IPv6 prefix based initial report, if the initial status is 'outside'. MME sends initially what is the UE status only if the status is initially 'inside' when the PRA action is requested from the SGW/PGW/PCRF. If the initial status is 'outside', MME does not report that and only reports the very first 'inside'. After the initial status the MME sends changes on the status. 'Inside' means that 5G gNB is currently used by the UE, and 'outside' means that 5G gNB is currently not used. MME supports a single timer for optimizing PRA reporting for all PRA ids of the UE. MME starts the timer whenever it first receives new RAN endpoints, no timer is previously running and PRA status would be changed due to the new endpoints. Timer is stopped when MME receives different new RAN endpoints to update the status back to previous or UE context is released. The timer is restarted if it was running and the MME receives new endpoints changing the status of a different PRA id of the same UE. MME sends the PRA report towards the SGW/PGW when timer expires or is stopped if reporting is still required i.e. status of any PRA differs from previous reported. Note: when PRA action is received from another MME on Forward Relocation Request/Context Response, the MME always sends the first report under the new MME even with this setting selected.

Default

dcPralpv6PrefixDisabled

Name

praDcSegment - PRA Dual connectivity segment reporting

Syntax

```
--gParmName praDcSegment --gParmValue <string>
```

Description

Activate the Presence Reporting Area functionality to report on dual connectivity utilizing a provisioned IPv6 address segment. The functionality uses CN predefined PRAs. The MME reports via PRA reporting that a UE is inside the area when the MME detects that a 5G gNB

having a provisioned IPv6 address segment is added with dual connectivity for the UE. The UE is outside the area when the corresponding 5G gNB is removed for the UE.

List

- **dcSegmentReportingDisabled** - DC Segment Reporting Disabled - Dual Connectivity Presence Area Reporting feature is disabled.
- **dcSegmentBasic** - DC Segment Basic - MME sends all Dual Connectivity IPv6 segment based reports. MME sends initially what is the UE status when the PRA action is requested from the SGW/PGW/PCRF, and also all changes on the status. 'inside' means that 5G gNB is currently used by the UE, and 'outside' means that 5G gNB is currently not used.
- **dcSegmentOpt** - DC Segment Optimized - MME does not send Dual Connectivity IPv6 segment based initial report, if the initial status is 'outside'. MME sends initially what is the UE status only if the status is initially 'inside' when the PRA action is requested from the SGW/PGW/PCRF. If the initial status is 'outside', MME does not report that and only reports the very first 'inside'. After the initial status the MME sends changes on the status. 'Inside' means that 5G gNB is currently used by the UE, and 'outside' means that 5G gNB is currently not used. On Service request the MME supports a provisioned timer to wait for any incoming E-RAB Modification Indication for a subsequent status change, and only reports the possible status change after the timer expiry. Note: when PRA action is received from another MME on Forward Relocation Request/Context Response, the MME always sends the first report under the new MME even with this setting selected.
- **dcSegmentOptIdleConn** - DC Segment Optimized Idle Connected - MME does not send Dual Connectivity IPv6 segment based initial report, if the initial status is 'outside'. MME sends initially what is the UE status only if the status is initially 'inside' when the PRA action is requested from the SGW/PGW/PCRF. If the initial status is 'outside', MME does not report that and only reports the very first 'inside'. After the initial status the MME sends changes on the status. 'Inside' means that 5G gNB is currently used by the UE, and 'outside' means that 5G gNB is currently not used. MME supports three separate timers for optimizing PRA reporting. MME starts timer whenever it first receives new RAN endpoints, no timer is previously running and PRA status would be changed due to the new endpoints. Timer is stopped when MME receives different new RAN endpoints or UE context is released. MME sends the PRA report towards the SGW/PGW when timer expires or is stopped if reporting is still required i.e. status differs from previous reported and the UE is still ECM-CONNECTED. Note: when PRA action is received from another MME on Forward Relocation Request/Context Response, the MME always sends the first report under the new MME even with this setting selected.
- **dcSegmentOptSingleTimer** - DC Segment Optimized Single Timer - MME does not send Dual Connectivity IPv6 segment based initial report, if the initial status is 'outside'. MME sends initially what is the UE status only if the status is initially 'inside' when the PRA action is requested from the SGW/PGW/PCRF. If the initial status is 'outside', MME does not report that and only reports the very first 'inside'. After the initial status the MME

sends changes on the status. 'Inside' means that 5G gNB is currently used by the UE, and 'outside' means that 5G gNB is currently not used. MME supports a single timer for optimizing PRA reporting for all PRA ids of the UE. MME starts the timer whenever it first receives new RAN endpoints, no timer is previously running and PRA status would be changed due to the new endpoints. Timer is stopped when MME receives different new RAN endpoints to update the status back to previous or UE context is released. The timer is restarted if it was running and the MME receives new endpoints changing the status of a different PRA id of the same UE. MME sends the PRA report towards the SGW/PGW when timer expires or is stopped if reporting is still required i.e. status of any PRA differs from previous reported. Note: when PRA action is received from another MME on Forward Relocation Request/Context Response, the MME always sends the first report under the new MME even with this setting selected.

Default

dcSegmentReportingDisabled

Name

praDcSingleTimerAllowedRestartCount - PRA DC Single Timer Allowed Restart Count

Syntax

--gParmName praDcSingleTimerAllowedRestartCount --gParmValue <string>

Description

Defines the number of times the MME is sequentially allowed to restart the single DC PRA optimisation timer. When the MME has already previously restarted the single optimisation timer the times allowed by this parameter and the MME still receives new RAN endpoints causing DC PRA status change (and the MME would in this case again restart the single optimisation timer without this limit), the MME stops the single optimisation timer and sends out the current status of the DC PRAs that is not yet reported towards the SGW/PGW. This parameter is only applied when global parameter PRA Dual connectivity segment reporting is set to DC Segment Optimized Single Timer.

Type / Range

Integer in the range of 0 to 50

Default

5

Name

praDormantState - PRA Dormant State Enabled

Syntax

--gParmName praDormantState --gParmValue <string>

Description

Enables the functionality to change the state of the CN predefined Presence Reporting Area (PRA) between active (i.e. normal) and dormant. In dormant PRA state, the MME suppresses any PRA status (inside/outside) reports towards the SGW/PGW. In dormant PRA state the MME still accepts and stores PRA action to request PRA status reporting. Dormant PRA state

is applicable for both 3GPP standard based PRA functionality as well as the dual connectivity segment based reporting functionality.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

praForRoamers - PRA for roamers

Syntax

--gParmName praForRoamers --gParmValue <string>

Description

When set to Yes, this parameter allows MME to support Presence Reporting Area (PRA) functionality for roaming UEs.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

praidleState - PRA Idle State

Syntax

--gParmName praIdleState --gParmValue <string>

Description

Enables Presence Reporting Area (PRA) functionality clarification change. If the UE is in ECM-IDLE state, the MME may either bring the UE into ECM-CONNECTED state, or, report based on the UE's last known location and when the UE was there.

Restrictions

gParm praRel145 required to be set to 'Yes'.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

praModifyAction - PRA Modify Action

Syntax

--gParmName praModifyAction --gParmValue <string>

Description

Controls whether the MME reports immediately 'inside'/'outside' when receiving PRA action with action value 'modify' independently of the previous report. When set to 'yes', MME always reports immediately 'inside'/'outside' even if previous report was the same. When set to 'no', MME does not report immediately 'inside'/'outside' if previous report was the same.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

Yes

Name

praModifyEnabling - PRA Modify Enabling

Syntax

--gParmName praModifyEnabling --gParmValue <string>

Description

Enables Presence Reporting Area (PRA) modify action support in the MME.

Restrictions

gParm praRel145 required to be set to 'Yes'.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

praPace - Presence Reporting Area Pace

Syntax

--gParmName praPace --gParmValue <string>

Description

The pace to send Presence Reporting Area Information towards the SGW/PGW with the standard based Presence Reporting Area functionality. This setting is applicable for both dual

connectivity segment based PRA and standard based PRA functionalities. The pace is defined in messages/second per CPPS.

Type / Range

Integer in the range of 10 to 2000

Default

50

Name

praPacing - PRA Pacing

Syntax

```
--gParmName praPacing --gParmValue <string>
```

Description

Enables Presence Reporting Area pacing functionality to ensure the surrounding network elements are not impacted by bursts of Presence Area Reporting Information.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

praRel145 - Presence Reporting Area 3GPP Rel 14-15

Syntax

```
--gParmName praRel145 --gParmValue <string>
```

Description

Enables 3GPP Release 14-15 enhancements for Presence Reporting Area functionalities: e.g. multiple PRA ids per PDN, PRA sets and PRA modify action.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

praSets - praSets

Syntax

```
--gParmName praSets --gParmValue <string>
```

Description

Enables support of Presence Reporting Area (PRA) sets in MME.

Restrictions

gParm praRel145 required to be set to 'Yes'.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

praStdSuppressInitialOut - PRA Standard Suppress Initial Out

Syntax

```
--gParmName praStdSuppressInitialOut --gParmValue <string>
```

Description

Controls whether on 3GPP Standard Presence Reporting Area (PRA) functionality the first/initial outside report is suppressed. If set to Yes and MME receives PRA action Start from SGW/PGW, MME only sends initial PRA report (PRA Information) to SGW/PGW when the UE is/has arrived inside the corresponding area. If set to No, the MME will send the initial report (PRA Information) immediately after receiving PRA action Start from SGW/PGW despite of UE being inside or outside of the corresponding area initially.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

praStdSuppression - PRA Standard Suppression

Syntax

```
--gParmName praStdSuppression --gParmValue <string>
```

Description

Enables MME suppression of too frequent PRA reports for 3GPP standard based PRA (Presence Reporting Area) functionality. If set to Yes, the MME suppresses a subsequent PRA report inside the PRA suppress time period, unless the PRA status stays the same for the PRA suppress cancel defined time period. If set to No, MME sends subsequent PRA reports according to UE mobility based on 3GPP standard definitions with no restriction to reporting frequency.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

pRau2g - PRAU timer in 2G

Syntax

--gParmName pRau2g --gParmValue <string>

Description

This parameter controls the usage of independent 2G and 3G pRau timers. If the parameter is set, then SGSN is allowed to configure pRau timer differently in 2G and 3G. If the parameter is not set, existing functionality will be used (2G and 3G with the same value for pRau timer).

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

preferDataMode - Prefer data mode

Syntax

--gParmName preferDataMode --gParmValue <string>

Description

Selection of preferred data mode when a UE subscription has APN configuration.

List

- Data over CP Preferred - Data over CP preferred.
- Data over UP Preferred - Data over UP preferred.

Default

Data over UP Preferred

Name

preferredPgwId - Preferred PGW Identifier

Syntax

--gParmName preferredPgwId --gParmValue <string>

Description

Preferred PGW identifier to determine PGW identity

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

prefGnToGGSNIpVer - IP address version-preference for transport layer

Syntax

--gParmName prefGnToGGSNIpVer --gParmValue <string>

Description

Use this parameter to control the IP address version-preference for transport layer.

List

- IPV4 - Specify trace entity of IPv4.
- IPV6 - Specify trace entity of IPv6.

Default

IPV4

Name

preRel8DomainName - Pre release 8 domain name

Syntax

--gParmName preRel8DomainName --gParmValue <string>

Description

Pre release 8 domain name.

Type / Range

Digit string of length 0 to 62 with the allowed pattern of [0-9a-zA-Z\.\-]*

Name

prometheusFormat - Prometheus Format

Syntax

--gParmName prometheusFormat --gParmValue <string>

Description

This option controls the format of the data model and notation used to report Prometheus Counters. This option is applicable in all cases i.e. either when CMM is configured to push the Prometheus Counters to PrometheusPushGW or when Prometheus Server directly scrapes the Prometheus Counters from CMM.

List

- **basicFormat** - Basic Format - The Basic Format supports the data model and notation that was initially introduced in CMM20.0 when Prometheus Server functionality was implemented.
- **advancedFormat** - Advanced Format - The Advanced Format is based on the Basic format with the following changes: 1. Instead of using Counter PIDs, the 3gpp counter name is used. 2. the **elementType** is added.

Default

basicFormat

Name

prometheusMode - Prometheus Mode

Syntax

--gParmName prometheusMode --gParmValue <string>

Description

There are two functionalities supported for Prometheus Server in order to retrieve the relevant PM Data. The first functionality is when CMM pushes the relevant PM Counters to PrometheusPushGW and then Prometheus Server scrapes the relevant PM Counters from PrometheusPushGW. The second functionality is when Prometheus Server directly scrapes the relevant PM Counters from CMM. The scope of this parameter is control which functionality will be enabled from CMM.

List

- **push** - This value is used when the Prometheus counters are pushed from CMM towards PrometheusPushGW. Prometheus Server will then scrape the PM Data from PrometheusPushGW.
- **pull** - This value is used when the Prometheus Server directly scrapes from CMM the Prometheus Counters (i.e. PrometheusPushGW is not part of the solution).

Default

push

Name

prometheusRequests - Prometheus Requests

Syntax

--gParmName prometheusRequests --gParmValue <string>

Description

This parameter defines the maximum allowed number of Prometheus Requests, in the specific Prometheus Sliding Window (defined with parameter **prometheusSlidingWindow**), that could in parallel directly scrape the relevant PM Counters from CMM. This parameter is applicable only when the functionality/option to allow Prometheus Server to directly scrape the relevant PM Counters from CMM is configured. Warning: For Nokia personnel only.

Type / Range

Integer in the range of 0 to 11

Default

10

Name

prometheusSlidingWindow - Prometheus Sliding Window

Syntax

```
--gParmName prometheusSlidingWindow --gParmValue <string>
```

Description

This parameter defines the CMM sliding window (in seconds) in which Requests from Prometheus Server to directly scrape the data from CMM are accepted. The number of parallel requests in this sliding window are defined with parameter prometheusRequests. This parameter is applicable only when the functionality/option to allow Prometheus Server to directly scrape the relevant PM Counters from CMM is configured. Warning: For Nokia personnel only.

Type / Range

Prometheus Sliding Window in seconds

Default

60

Name

provPciPvi - Provisionable PCI and PVI value supported

Syntax

```
--gParmName provPciPvi --gParmValue <string>
```

Description

Supports provisionable PCI and PVI values.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

psCsCoordination - PS CS coordination

Syntax

```
--gParmName psCsCoordination --gParmValue <string>
```

Description

PS CS coordination capability for MOCN configuration.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

pseudoRandomTlliCollisionHandling - Pseudo-random Tlli Collision Handling

Syntax

--gParmName pseudoRandomTlliCollisionHandling --gParmValue <string>

Description

When parameter is set to No existing collision handling mechanism is maintained regarding 2G Attach with random TLLI. When status is set to Yes collision handling will not be applied for a 2G Attach with Random TLLI even if is already used by an ongoing Attach procedure, as long as Attach message was received via different nsei/bvci pair. Furthermore the SGSN will silently drop a new Attach request with a random TLLI when the included random TLLI in the Attach request is already used by ongoing Attach from the same nsei/bvci pair.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

pseudoSpgwIpv4address - Pseudo SPGW IPv4 address

Syntax

--gParmName pseudoSpgwIpv4address --gParmValue <string>

Description

The SGW/PGW IPv4 address used in creating the S1-U SGW tunnel IDs to be sent to eNB in S1AP INITIAL UE CONTEXT SETUP message when MME does not use SGW or PGW for bearer creation during SDS UE attach request.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Default

0.0.0.0

Name

pseudoSpgwIpv6address - Pseudo SPGW IPv6 address

Syntax

--gParmName pseudoSpgwIpv6address --gParmValue <string>

Description

The SGW/PGW IPv6 address used in creating the S1-U SGW tunnel IDs to be sent to eNB in S1AP INITIAL UE CONTEXT SETUP message when MME does not use SGW or PGW for bearer creation during SDS UE attach request.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Default

::

Name

pseudoUeIpv4address - Pseudo UE IPv4 address

Syntax

--gParmName pseudoUeIpv4address --gParmValue <string>

Description

The UE IPv4 address to be used for an SDS UE when MME does not use SGW and PGW for bearer session setup during attach procedure.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Default

0.0.0.0

Name

pseudoUeIpv6address - Pseudo UE IPv6 address

Syntax

--gParmName pseudoUeIpv6address --gParmValue <string>

Description

The UE IPv6 address to be used for an SDS UE when MME does not use SGW and PGW for bearer session setup during attach procedure.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Default

::

Name

purFlagsAvp - PUR-Flags AVP

Syntax

--gParmName purFlagsAvp --gParmValue <string>

Description

PUR-Flags.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

Yes

Name

purgeUeWhenHandoffToEhrpd - Purge UE when UE hands off to eHRPD

Syntax

--gParmName purgeUeWhenHandoffToEhrpd --gParmValue <string>

Description

When UE hands off to eHRPD, if this global parameter is yes, MME deletes VLR and sends PUR to HSS.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

pwsRestartProcedure - PWS restart procedure

Syntax

--gParmName pwsRestartProcedure --gParmValue <string>

Description

Forwarding of PWS RESTART INDICATION message to CBC.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

qci1HoRejectionGeran - QCI1 HO Rejection GERAN

Syntax

--gParmName qci1HoRejectionGeran --gParmValue <string>

Description

When set to 'Yes', MME rejects incoming S1AP Handover Required attempts when -the handover is attempted towards 2G i.e. Handover Type is set to 'LTEtoGERAN' -the Handover Required message does NOT include SRVCC HO Indication IE -the UE currently has a dedicated bearer with QCI1 established. The MME sends Handover Preparation Failure with cause 'Handover Failure In Target EPC/eNB Or Target System' and does not proceed further with the handover. When set to 'No', MME proceeds with the handover normally.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

qci1HoRejectionUtran - QCI1 HO Rejection UTRAN

Syntax

```
--gParmName qci1HoRejectionUtran --gParmValue <string>
```

Description

When set to 'Yes', MME rejects incoming S1AP Handover Required attempts when -the handover is attempted towards 3G i.e. Handover Type is set to 'LTEtoUTRAN' -the Handover Required message does NOT include SRVCC HO Indication IE -the UE currently has a dedicated bearer with QCI1 established. The MME sends Handover Preparation Failure with cause 'Handover Failure In Target EPC/eNB Or Target System' and does not proceed further with the handover. When set to 'No', MME proceeds with the handover normally.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

qosModCollEnh - QoS Modification Collision Enhancements

Syntax

```
--gParmName qosModCollEnh --gParmValue <string>
```

Description

This parameter controls the feature activation. By default this parameter shall be set to value 'No'.

List

- No - Boolean value of no.

- Yes - Boolean value of yes.

Default

No

Name

queueUeCtxtRelUserInactivityErabModIndication - Queue UE Context Release Request User Inactivity During E-RAB Modification Indication

Syntax

```
--gParmName queueUeCtxtRelUserInactivityErabModIndication --  
gParmValue <string>
```

Description

Defines whether the MME queues an incoming S1AP UE Context Release Request with radio network cause 'user inactivity' from eNB when the MME has received S1AP E-RAB Modification Indication from the eNB and has not yet sent E-RAB Modification Confirm as response. When set to Yes, MME triggers UE Context Release Command after sending out E-RAB Modification Confirm. When set to No (default), MME drops the incoming UE Context Release Request with radio network cause 'user inactivity'.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

raiBasedDeactPdpRate - deactivation PDP rate

Syntax

```
--gParmName raiBasedDeactPdpRate --gParmValue <string>
```

Description

This parameter determines with what rate (reactivations per second) PDP context reactivations should be done during RAI-based context reactivation.

Restrictions

FNS has limitation 1-25 after PET testing

Type / Range

Integer in the range of 1 to 25

Default

18

Name

raiBasedUeHandlingEnabled - RAI based UE handling

Syntax

```
--gParmName raiBasedUeHandlingEnabled --gParmValue <string>
```

Description

RAI/RAI group based UE handling

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

ranapResetAfterSysRestart - ranapResetAfterSysRestart

Syntax

```
--gParmName ranapResetAfterSysRestart --gParmValue <string>
```

Description

Enables performing SGSN init RANAP RESET after system restart/upgrade

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

rangeDiscoverTais - Range Discover TAIs

Syntax

```
--gParmName rangeDiscoverTais --gParmValue <string>
```

Description

Feature activation for Enhanced TA Discovery Auto-Provisioning

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

rateLimitPerApn - Rate Limit Per APN

Syntax

```
--gParmName rateLimitPerApn --gParmValue <string>
```

Description

Whether the MME should enforce PLMN Rate Control per APN/PDN per 3GPP TS 23.401 CR 3486 or per PDN. The default is no rate control per PDN.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

rcvryDlsdsMaxLimitOverride - RcvryDlsdsMaxLimitOverride

Syntax

```
--gParmName rcvryDlsdsMaxLimitOverride --gParmValue <string>
```

Description

Maximum number of recovery DL SDS messages allowed to protect SRS from MME.

Type / Range

Integer in the range of systemDefault or 0 to 50,000

Default

systemDefault

Name

rcvrySrulrLimitOverride - RcvrySrulrLimitOverride

Syntax

```
--gParmName rcvrySrulrLimitOverride --gParmValue <string>
```

Description

Recovery SR ULRs allowed per second after which CPPS will start droppping recovery ULRs until rate is below limit.

Type / Range

Integer in the range of systemDefault or 0 to 1,000,000

Default

systemDefault

Name

rcvrySrulrMaxdeferCountOverride - RcvrySrulrMaxdeferCountOverride

Syntax

```
--gParmName rcvrySrulrMaxdeferCountOverride --gParmValue <string>
```

Description

Maximum number of times recovery SR ULRs can be deferred to protect MME and HSS during recovery ULR storm.

Type / Range

Integer in the range of systemDefault or 1 to 20

Default

systemDefault

Name

redirectionCommandRate - Redirection command rate

Syntax

```
--gParmName redirectionCommandRate --gParmValue <string>
```

Description

Maximum allowed rate of S102 redirection command messages.

Type / Range

Integer in the range of 0 to 50,000

Default

5000

Name

regionalSubscription - Regional subscription

Syntax

```
--gParmName regionalSubscription --gParmValue <string>
```

Description

Setting to yes activates regional subscription on the gn-sgsn. setting to no deactivates regional subscription on the gn-sgsn.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

Yes

Name

rejDtrExtendedServiceRequest - Reject Dual Transceiver Receiver Extended Service Request

Syntax

```
--gParmName rejDtrExtendedServiceRequest --gParmValue <string>
```

Description

MME shall be provisioned with GPARM flag 'rejDtrExtendedServiceRequest' to control sending UE Context Modification Request message to E-UTRAN upon receiving Extended Service Request that is attached to E-UTRAN. By default this flag shall be disabled. When

the flag is enabled, MME shall send cause code #18 (CS Domain not available) in service reject to eNodeB. When the flag is disabled, MME shall act as it did before introduction of this functionality, i.e. MME upon receiving Extended Service Request shall send UE Context Modification Request message to E-UTRAN.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

rejectAlgorithmDuringOverload - Reject algorithm during overload

Syntax

--gParmName rejectAlgorithmDuringOverload --gParmValue <string>

Description

Overload control logic with a different set of messages/procedures to shed at major and critical overload thresholds.

List

- Reject Idle User First - Overload control reject idle user initiated procedure first.
- Reject Max Signaling Load First - Overload control reject highest signaling load generating procedures first.

Default

Reject Max Signaling Load First

Name

rejectCcForGmmErrorCode11 - Reject Cause Code for GMM Error Code 11

Syntax

--gParmName rejectCcForGmmErrorCode11 --gParmValue <string>

Description

This parameter defines which Reject Cause code will be used for GMM Error Code 11.

List

- gprsServicesNotAllowed - GPRS services not allowed in this PLMN - Reject Cause: GPRS services not allowed in this PLMN
- locationAreaNotAllowed - Location Area not allowed - Reject Cause: Location Area not allowed
- noSuitableCellInLocationArea - No Suitable Cell in Location Area - Reject Cause: No Suitable Cell in Location Area

- plmnNotAllowed - PLMN not allowed - Reject Cause: PLMN not allowed
- psCsCoordinationRequired - PS CS Coordination Required - Reject Cause: ps-cs-coordination-required
- roamingNotAllowedInLocationArea - Roaming not allowed in Location Area - Reject Cause: Roaming-not-allowed-in- location -area

Default

psCsCoordinationRequired

Name

rejectCcForGmmErrorCode12 - Reject Cause Code for GMM Error Code 12

Syntax

--gParmName rejectCcForGmmErrorCode12 --gParmValue <string>

Description

This parameter defines which Reject Cause code will be used for GMM Error Code 12.

List

- gprsServicesNotAllowed - GPRS services not allowed in this PLMN - Reject Cause: GPRS services not allowed in this PLMN
- locationAreaNotAllowed - Location Area not allowed - Reject Cause: Location Area not allowed
- noSuitableCellInLocationArea - No Suitable Cell in Location Area - Reject Cause: No Suitable Cell in Location Area
- plmnNotAllowed - PLMN not allowed - Reject Cause: PLMN not allowed
- psCsCoordinationRequired - PS CS Coordination Required - Reject Cause: ps-cs-coordination-required
- roamingNotAllowedInLocationArea - Roaming not allowed in Location Area - Reject Cause: Roaming-not-allowed-in- location -area

Default

locationAreaNotAllowed

Name

rejectCcForGmmErrorCode13 - Reject Cause Code for GMM Error Code 13

Syntax

--gParmName rejectCcForGmmErrorCode13 --gParmValue <string>

Description

This parameter defines which Reject Cause code will be used for GMM Error Code 13.

List

- gprsServicesNotAllowed - GPRS services not allowed in this PLMN - Reject Cause: GPRS services not allowed in this PLMN
- locationAreaNotAllowed - Location Area not allowed - Reject Cause: Location Area not allowed
- noSuitableCellInLocationArea - No Suitable Cell in Location Area - Reject Cause: No Suitable Cell in Location Area
- plmnNotAllowed - PLMN not allowed - Reject Cause: PLMN not allowed
- psCsCoordinationRequired - PS CS Coordination Required - Reject Cause: ps-cs-coordination-required
- roamingNotAllowedInLocationArea - Roaming not allowed in Location Area - Reject Cause: Roaming-not-allowed-in- location -area

Default

roamingNotAllowedInLocationArea

Name

rejectCcForGmmErrorCode14 - Reject Cause Code for GMM Error Code 14

Syntax

--gParmName rejectCcForGmmErrorCode14 --gParmValue <string>

Description

This parameter defines which Reject Cause code will be used for GMM Error Code 14

List

- gprsServicesNotAllowed - GPRS services not allowed in this PLMN - Reject Cause: GPRS services not allowed in this PLMN
- locationAreaNotAllowed - Location Area not allowed - Reject Cause: Location Area not allowed
- noSuitableCellInLocationArea - No Suitable Cell in Location Area - Reject Cause: No Suitable Cell in Location Area
- plmnNotAllowed - PLMN not allowed - Reject Cause: PLMN not allowed
- psCsCoordinationRequired - PS CS Coordination Required - Reject Cause: ps-cs-coordination-required
- roamingNotAllowedInLocationArea - Roaming not allowed in Location Area - Reject Cause: Roaming-not-allowed-in- location -area

Default

gprsServicesNotAllowed

Name

rejectCcForGmmErrorCode15 - Reject Cause Code for GMM Error Code 15

Syntax

```
--gParmName rejectCcForGmmErrorCode15 --gParmValue <string>
```

Description

This parameter defines which Reject Cause code will be used for GMM Error Code 15.

List

- gprsServicesNotAllowed - GPRS services not allowed in this PLMN - Reject Cause: GPRS services not allowed in this PLMN
- locationAreaNotAllowed - Location Area not allowed - Reject Cause: Location Area not allowed
- noSuitableCellInLocationArea - No Suitable Cell in Location Area - Reject Cause: No Suitable Cell in Location Area
- plmnNotAllowed - PLMN not allowed - Reject Cause: PLMN not allowed
- psCsCoordinationRequired - PS CS Coordination Required - Reject Cause: ps-cs-coordination-required
- roamingNotAllowedInLocationArea - Roaming not allowed in Location Area - Reject Cause: Roaming-not-allowed-in- location -area

Default

noSuitableCellInLocationArea

Name

rejectEsrNoSrvcc - Reject ESR no SRVCC

Syntax

```
--gParmName rejectEsrNoSrvcc --gParmValue <string>
```

Description

Reject ESR requested by an ECM-CONNECTED UE with IMS voice bearer.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

rejectNodeRelocatingPeriodicTau - Reject node relocating periodic TAU

Syntax

```
--gParmName rejectNodeRelocatingPeriodicTau --gParmValue <string>
```

Description

Enable/disable MME support for enhanced handling of intermme TAU with update type periodic.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

requestPsCellInLrc - Request PS Cell in LRC

Syntax

```
--gParmName requestPsCellInLrc --gParmValue <string>
```

Description

When location reporting control procedure is used in MME, if Request PS Cell in LRC is set, then MME includes additional location information towards eNB. eNB will include the current PSCell in the report if EN-DC is activated. If Request PS Cell in LRC is not set, MME will not request additional location information under location reporting procedure as existing function, then eNB will not report PSCell in location report.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

reservedBoolParameter1 - Reserved bool parameter 1

Syntax

```
--gParmName reservedBoolParameter1 --gParmValue <string>
```

Description

This parameter is reserved for future use.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

reservedBoolParameter2 - Reserved bool parameter 2

Syntax

```
--gParmName reservedBoolParameter2 --gParmValue <string>
```

Description

This parameter is reserved for future use.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

reservedBoolParameter3 - Reserved bool parameter 3

Syntax

```
--gParmName reservedBoolParameter3 --gParmValue <string>
```

Description

This parameter is reserved for future use.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

reservedBoolParameter4 - Reserved bool parameter 4

Syntax

```
--gParmName reservedBoolParameter4 --gParmValue <string>
```

Description

This parameter is reserved for future use.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

reservedBoolParameter5 - Reserved bool parameter 5

Syntax

```
--gParmName reservedBoolParameter5 --gParmValue <string>
```

Description

This parameter is reserved for future use.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

reservedIntParameter1 - Reserved int parameter 1

Syntax

```
--gParmName reservedIntParameter1 --gParmValue <string>
```

Description

This parameter is reserved for future use.

Type / Range

Digit string of length 1 to 5

Default

0

Name

reservedIntParameter2 - Reserved int parameter 2

Syntax

```
--gParmName reservedIntParameter2 --gParmValue <string>
```

Description

This parameter is reserved for future use.

Type / Range

Digit string of length 1 to 5

Default

0

Name

reservedIntParameter3 - Reserved int parameter 3

Syntax

```
--gParmName reservedIntParameter3 --gParmValue <string>
```

Description

This parameter is reserved for future use.

Type / Range

Digit string of length 1 to 5

Default

0

Name

reservedIntParameter4 - Reserved int parameter 4

Syntax

--gParmName reservedIntParameter4 --gParmValue <string>

Description

This parameter is reserved for future use.

Type / Range

Digit string of length 1 to 5

Default

0

Name

reservedIntParameter5 - Reserved int parameter 5

Syntax

--gParmName reservedIntParameter5 --gParmValue <string>

Description

This parameter is reserved for future use.

Type / Range

Digit string of length 1 to 5

Default

0

Name

restrictPagingDuringOverload - Restrict paging during overload

Syntax

--gParmName restrictPagingDuringOverload --gParmValue <string>

Description

Restrict paging during overload.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

Yes

Name

restrictS10linksToNeighborMme - Restrict S10 links to neighbor MME

Syntax

```
--gParmName restrictS10linksToNeighborMme --gParmValue <string>
```

Description

MME support for restricting S10 to neighboring MME.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

restrictSubExtQoS - Restrict Subscribed Extended QoS

Syntax

```
--gParmName restrictSubExtQoS --gParmValue <string>
```

Description

CMM MME restricts subscribed extended QoS when UE is 5G DCNR restricted or 5G DCNR not capable. MME limits QoS to 4.29 Gbps or less when setting up or modifying default, GBR, or non-GBR bearer(s).

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

retransCsSvcNotifyOnNasNonDeliveryRadioConnLost - Retransmit CS Service Notify NAS Non-Delivery Radio Conn Lost

Syntax

```
--gParmName retransCsSvcNotifyOnNasNonDeliveryRadioConnLost --  
gParmValue <string>
```

Description

Current gParm enables treating NAS Non-Delivery Indication msg carrying cause 'radio connection with ue lost' the same as if cause were 'S1 intra system Handover triggered', or 'X2 Handover triggered' for SGs downlink service operation. When parameter is enabled, then when receiving NAS Non Delivery Indication (cause=radio connection with ue lost) the MME will expect to receive X2 Handover safeguarded by timer, at expiration of which the CS Service Notification will be resent

List

- No - Boolean value of no.

- Yes - Boolean value of yes.

Default

No

Name

retriesForDcNrUes - Retries for DCNR Capable UE

Syntax

--gParmName retriesForDcNrUes --gParmValue <string>

Description

Number of retries selecting PGW-C(s) during PDN Connectivity procedure upon receiving GTP error or timeout from gateway for DCNR Capable UEs.. For example, MME will send its first attempt to the PGW, if it receives no response within a certain period of time, the MME will retransmit the same request to the SGW/PGW and if/when it gets an error back from the SGW then it will move on to select the next best gateway to try. Assuming there is only one PGW in the sub-area, this means that the MME will perform round 2 (look for +ue entries but not find any) and then round 3 (look for _nc-nr entries, where it will find many to choose from). The next MME attempt will then be to a nearby +nc-nr PGW.

Type / Range

Integer in the range of 0 to 4

Default

0

Name

retriesForUutUes - Retries For UUT UEs

Syntax

--gParmName retriesForUutUes --gParmValue <string>

Description

Number of retries selecting PGW-C(s) during PDN Connectivity procedure upon receiving GTP error or timeout from the gateway for UUT UE(s) For example, MME will send its first attempt to the PGW, if it receives no response within a certain period of time, the MME will retransmit the same request to the SGW/PGW and if/when it gets an error back from the SGW then it will move on to select the next best gateway to try. Assuming there is only one PGW in the sub-area, this means that the MME will perform round 2 (look for +ue<uut> entries but not find any) and then round 3 (look for _nc-nr entries, where it will find many to choose from). The next MME attempt will then be to a nearby +nc-nr PGW.

Type / Range

Integer in the range of 0 to 4

Default

0

Name

retrieveCellId - Retrieve cell id

Syntax

--gParmName retrieveCellId --gParmValue <string>

Description

Yes - enable retrieval of ECGI from the eNB to be included in the LSC-AP location request message sent to the E-SMLC when MME is triggered either by GMLC or by HSS to get UE location. the retrieval of the ECGI applies to all client types. no (default) - disable the retrieval and MME sends the ECGI that was received in the most recent S1-AP message.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

retrieveUeLocation - Retrieve UE location

Syntax

--gParmName retrieveUeLocation --gParmValue <string>

Description

This flag determines whether UE location information is retrieved from the eNB. no (default) - indicates that the operator policy is to use the last known user location information. yes - indicates that the WMM operator policy is to use the location reporting procedure (23.401 section 5.9.1) to retrieve the ECGI from the eNB.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

retryPagingForSgsPageRequest - Retry paging for SGs page request

Syntax

--gParmName retryPagingForSgsPageRequest --gParmValue <string>

Description

A value of yes indicates that the MME will perform additional page attempts for each SGs page request received until the UE responds or all page attempts in the paging policy have been exhausted. a value of no indicates that the MME will perform only one page attempt for

each SGs page request received. if needed, the MSC must trigger additional page attempts with new SGs page requests.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

rfspIndexSelectionOption - RFSP Index Selection Option

Syntax

```
--gParmName rfspIndexSelectionOption --gParmValue <string>
```

Description

When this parameter is enabled, then the MME enables using rfspSelOption option, available in SvcAgreementProfile, to decide the way for assigning RFSP Index for the UE

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

rfspIndexValImeiTac - Support RFSP Index Value

Syntax

```
--gParmName rfspIndexValImeiTac --gParmValue <string>
```

Description

GPARM controls the feature activation. By default the parameter shall be disabled. When parameter is enabled, MME shall validate the TAC received in IMEI against provisioned TAC entry and if there is a match, MME shall apply the provisioned RFSP value.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

rfspInS4Sgsn - support RFSP in S4 SGSN

Syntax

```
--gParmName rfspInS4Sgsn --gParmValue <string>
```

Description

support RFSP in S4 SGSN

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

rfspOverridelmeilmsi - RFSP Override by IMEI TAC and IMSI

Syntax

```
--gParmName rfspOverrideImeiImsi --gParmValue <string>
```

Description

RFSP Override by IMEI TAC and IMSI, giving priority to IMEI TAC

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

roamerQosForWpsUserSupport - Roamer QoS Profile for WPS User Support

Syntax

```
--gParmName roamerQosForWpsUserSupport --gParmValue <string>
```

Description

Parameter controls feature activation flag. By default, flag shall be disabled, when enabled MME shall support provisioned Roamer QoS Profile for WPS user.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

roamQciSuppt - Roam QCI Support

Syntax

```
--gParmName roamQciSuppt --gParmValue <string>
```

Description

Upon setting the parameter to TRUE, MME shall check the received inbound roamer GBR QCI value and if the received GBR QCI value is 2, it shall be rejected. With the Default value setting of FALSE, MME shall work as it had before the introduction of this feature.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

roamQosOvdForRan - Roamer QoS Override for RAN

Syntax

```
--gParmName roamQosOvdForRan --gParmValue <string>
```

Description

When this parameter is on, locally configured QoS for Roamers is sent only towards RAN. The default value shall be off.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

rsrUlrPercentForCtrlPlaneServiceReq - Percentage of control-plane service req that MME sends ULR

Syntax

```
--gParmName rsrUlrPercentForCtrlPlaneServiceReq --gParmValue <string>
```

Description

Percentage of control-plane service request that MME sends ULR due to HSS reset.

Type / Range

Integer in the range of 0 to 100

Default

100

Name

rsrUlrPercentForDdnServiceRequest - Percentage of ddn service req that MME sends ULR

Syntax

```
--gParmName rsrUlrPercentForDdnServiceRequest --gParmValue <string>
```

Description

Parameter controls percentage of ddn service req that MME sends ULR

Type / Range

Integer in the range of 0 to 100

Default

100

Name

rsrUlrPercentForServiceReq - Percentage of MO Service Req that MME sends ULR and UE-Act-Ind

Syntax

```
--gParmName rsrUlrPercentForServiceReq --gParmValue <string>
```

Description

Percentage of MO Service Request that MME sends S6a ULR to HSS, and sends SGs UE-Activity-Indication to MSC/VLR due to HSS Reset; MT Service Request (following Paging) does not trigger ULR due to HSS reset.

Type / Range

Integer in the range of 0 to 100

Default

0

Name

rsrVlrScanPercentWithoutOverload - (Reset Subscriber Request) Vlr Scan Percentage Without Overload

Syntax

```
--gParmName rsrVlrScanPercentWithoutOverload --gParmValue <string>
```

Description

When Reset Subscriber Request(RSR)including Subscription-Data or Subscription-Data-Deletion AVP is received in CPPS, VLR scan is triggered in CPPS to find VLR entries that match the RSR user-ids and/or reset-ids AVPs. This VLR scan is triggered periodically to avoid system overload. When the system is not in overload, the number of scanned entries per period is defined in this gParm as percentage of 50000(which is hardcoded). The allowed percentages are [10, 20, ... , 90, 100]. Warning: For Nokia personnel only.

Type / Range

Integer in the range of 10 or 20 or 30 or 40 or 50 or 60 or 70 or 80 or 90 or 100

Default

100

Name

rsrVlrScanPercentWithOverload - (Reset Subscriber Request) Vlr Scan Percentage With Overload

Syntax

--gParmName rsrVlrScanPercentWithOverload --gParmValue <string>

Description

When Reset Subscriber Request(RSR)including Subscription-Data or Subscription-Data-Deletion AVP is received in CPPS, VLR scan is triggered in CPPS to find VLR entries that match the RSR user-ids and/or reset-ids AVPs. This VLR scan is triggered periodically to avoid system overload. If the system is in overload, VLR scan is postponed for the next period. If VLR scan is postponed for 5 consecutive times, VLR scan is triggered in the next period, but the number of scanned entries is reduced. The percentage of the scanned entries is defined in this gParm as percentage of 25000(which is hardcoded). The allowed percentages are [10, 20, ... , 90, 100]. Note that 'rsrVlrScanPercentWithOverload * 25000' must be smaller than 'rsrVlrScanPercentWithoutOverload * 50000'. Warning: For Nokia personnel only.

Type / Range

Integer in the range of 10 or 20 or 30 or 40 or 50 or 60 or 70 or 80 or 90 or 100

Default

100

Name

s102 - S102

Syntax

--gParmName s102 --gParmValue <string>

Description

MME to send S102 redirection command to the IWS obtained from the SRS in case of UE recovery if the UE previously registered with CIOT IWS.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

s1021xRttRcidInSlr - S102 CIOT RCID in SLR

Syntax

--gParmName s1021xRttRcidInSlr --gParmValue <string>

Description

Include CIOT reference cell ID in Slg subscriber location report message.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

s10InterPlmnRelocationQci1Only - S10 Inter PLMN Relocation QCI-1 Only

Syntax

--gParmName s10InterPlmnRelocationQci1Only --gParmValue <string>

Description

Parameter controls feature activation GPARM flag. By default, flag shall be disabled. When enabled, source MME upon receiving inter plmn handover request from eNB will find target MME from TAC reported by eNB, will send forward relocation request to target MME. Target MME upon receiving forward location request will check for the presence of QCI-1 bearer and if QCI-1 bearer is not present target MME shall reject the handover with cause value handover reject target not allowed. Additionally, for TAU, upon receiving context request without QCI-1, Context Response reject with a cause code Target access restricted for the subscriber shall be sent.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

s10mobilityQosParametersUpdate - Inter MME S10 mobility QoS parameters update

Syntax

--gParmName s10mobilityQosParametersUpdate --gParmValue <string>

Description

Indicates whether MME sends modifybearercmd to SGW at the end of TAU when QoS parameters in S6ad ULA are different than those in S10 Context Response or Forward Relocation

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

s11CauseRsrcUnavailPdnDelInSr - S11 Cause Resource Unavailable PDN Delete Session Request in Service Request

Syntax

--gParmName s11CauseRsrcUnavailPdnDelInSr --gParmValue <string>

Description

Parameter controls MME sending Delete Session Request to SGW upon receiving Modify Bearer Response with 'Resources not available'. By default the flag shall be disabled.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

s11ipAddressLoadBalancer - S11 IP Address Load Balancer

Syntax

--gParmName s11ipAddressLoadBalancer --gParmValue <string>

Description

Parameter when enabled prevents MME from creating an S11 link/MO directly to an S11 load balancer. An IP is determined to be a load balancer if the MME has received a Create Session Response with a sender F-TEID for ctrl plane specifying a different IP address than the IP header. If we subsequently receive a Create Session Response from an LB IP and FTEID matches the IP header, an S11 link/MO will not be created. By default, the flag shall be disabled.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

s11sendCidfDuringS1ho - S11 send CIDF during S1HO

Syntax

--gParmName s11sendCidfDuringS1ho --gParmValue <string>

Description

To enable/disable sending of the S11 create indirect forwarding tunnel request message during an S1HO.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

Yes

Name

s11SuspendNotificationSentPerLbi - S11 suspend notification sent per LBI

Syntax

```
--gParmName s11SuspendNotificationSentPerLbi --gParmValue <string>
```

Description

Setting to yes enables S11 suspend notification sent per LBI feature. setting to no disables S11 suspend notification sent per LBI feature.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

s11uBearerSetUp - S11-U Bearer Set Up

Syntax

```
--gParmName s11uBearerSetUp --gParmValue <string>
```

Description

Enable MME to setup S11-U bearer for a UE supporting both CP and UP optimization indicates preference for UP Clot optimization but the MME is not provisioned to support UP Clot optimization.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

s11uDlDataBuffering - S11-U bearer downlink data buffering

Syntax

```
--gParmName s11uDlDataBuffering --gParmValue <string>
```

Description

Enable S11-U downlink data buffering to handle collision of downlink data with ESM procedures.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

s13retryDifferentEir - S13 retry different EIR

Syntax

```
--gParmName s13retryDifferentEir --gParmValue <string>
```

Description

When MME gets some errors from EIR (too busy, out of space, etc) or EIR does not respond, MME sends the same request to another EIR in the same PLMN or IMSI range.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

s1ResumeSecurityContextUpdate - S1 Resume Security Context Update

Syntax

```
--gParmName s1ResumeSecurityContextUpdate --gParmValue <string>
```

Description

If the parameter is set to 'Yes' then MME includes the Security Context ID in the S1AP UE CONTEXT RESUME RESPONSE message.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

s1SendAllServedPlmnsToEnb - Send all Served Plmns to Enb

Syntax

```
--gParmName s1SendAllServedPlmnsToEnb --gParmValue <string>
```

Description

When enabled, MME includes all configured home and shared PLMN IDs in the MME Served PLMNs list when MME sends S1AP Configuration Update, or in S1AP Setup Response when MME responds to eNB S1AP Setup Request.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

s1SuspendSecurityContextUpdate - S1 Suspend Security Context Update

Syntax

```
--gParmName s1SuspendSecurityContextUpdate --gParmValue <string>
```

Description

If the parameter is set to 'Yes' then MME includes the Security Context ID in the S1AP UE CONTEXT SUSPEND RESPONSE message.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

s3GnIndirectForwarding - S3 Gn indirect forwarding

Syntax

```
--gParmName s3GnIndirectForwarding --gParmValue <string>
```

Description

Indicates whether inter-rat handover using Gn or S3 always employs indirect data forwarding (ALWAYS), does not employ indirect data forwarding (NEVER), or employs indirect 4290 data forwarding for inter-plmn inter-rat handover (INTER-PLMN/RAT ONLY).

List

- Always - Indicates whether inter-rat handover using Gn or S3 always employs indirect data forwarding.
- Inter-PLMN/RAT Only - Indicates whether inter-rat handover using Gn or S3 employs indirect 4290 data forwarding for inter-plmn inter-rat handover only.

- Never - Indicates whether inter-rat handover using Gn or S3 does not employ indirect data forwarding.

Default

Always

Name

s4Func - allow SGSN S4 functionality (Gr/S6d)

Syntax

--gParmName s4Func --gParmValue <string>

Description

Use this parameter to allow SGSN S4 functionality (Gr/S6d).

List

- OFF - OFF
- ON - ON

Default

OFF

Name

s4SgsnLbo - S4 SGSN support LBO

Syntax

--gParmName s4SgsnLbo --gParmValue <string>

Description

S4 SGSN support local breakout function. With this parameter set, the feature will be enable.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

s6aDraRoamingSupported - S6ad DRA roaming supported

Syntax

--gParmName s6aDraRoamingSupported --gParmValue <string>

Description

When set to yes: use provisioned destinationrealm in remoteendpoint table only for homer. for roamer, use hard-coded 'epc.mnc###.mcc###.3gppnetwork.org' instead of provisioned destinationrealm when set to no: regular S6ad DRA.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

s6adUeTimeZoneRetrieval - S6ad UE time zone retrieval

Syntax

```
--gParmName s6adUeTimeZoneRetrieval --gParmValue <string>
```

Description

This flag is used to enable the retrieval of UE time zone information. no (default) - indicates that UE time zone retrieval is not enabled. yes - indicates that UE time zone retrieval is enabled.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

s6aFaultContinueProcedureWithAkaOptional - S6A fault continue procedure with AKA optional

Syntax

```
--gParmName s6aFaultContinueProcedureWithAkaOptional --gParmValue <string>
```

Description

This flag determines whether processing will continue without authentication when there are no active enabled S6a links for the home PLMN and it has been determined that authentication is optional. no (default) - processing will not continue without authentication. yes - processing will continue without authentication.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

s6aHssUpdateEnbCapacity - S6A HSS update eNB capacity

Syntax

```
--gParmName s6aHssUpdateEnbCapacity --gParmValue <string>
```

Description

This flag identifies how HSS links will be monitored.

List

- AllHSS - All HSS links in use are monitored.
- HomeHSS - HSS links in the home PLMN all rule are monitored.
- NoHSS - No HSS links are monitored.

Default

NoHSS

Name

s6aReportPreviousHssSelectionForHssDown - S6A Report Previous HSS Selection For HSS Down

Syntax

```
--gParmName s6aReportPreviousHssSelectionForHssDown --gParmValue  
<string>
```

Description

Parameter controls feature activation. By default, flag parameter shall be disabled. When enabled, if an HSS selection rule is found (matched) and no HSS available (all links down for hssGrp selection) report 'hssOrEirDown' even when no other HSS selection (fall-back) rule is provisioned. Else continue reporting 'noProvisionedHss' when no HSS can be found and no other available HSS selection rule is provisioned. In other words, when a single no IMSI group does not have (imsiToHss) is found with an HSS association provisioned, MME shall consider the 'noProvisionedHss'. Otherwise existing functionality shall be used, which looks at all IMSI group availability/provisioning before declaring unavailable or down.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

s6aRetryDifferentHss - S6AD retry different HSS

Syntax

```
--gParmName s6aRetryDifferentHss --gParmValue <string>
```

Description

When WMM receives certain errors from HSS (too busy, out of space, etc) or HSS does not respond, WMM sends the same request to another HSS in the same PLMN or IMSI range.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

s6dDiameter - allow SGSN S6d/Gr Selection

Syntax

--gParmName s6dDiameter --gParmValue <string>

Description

Use this parameter to allow SGSN S6d/Gr Selection.

List

- OFF - OFF
- ON - ON

Default

OFF

Name

scefHighLatencySupport - SCEF high latency communication support

Syntax

--gParmName scefHighLatencySupport --gParmValue <string>

Description

This parameter indicates to the MME whether SCEF supports buffering of MT data if UE is not reachable due to power savings.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

Yes

Name

secureHandlingOfAttachTau - Secure Handling of Attach and TAU Requests

Syntax

--gParmName secureHandlingOfAttachTau --gParmValue <string>

Description

The parameter is used to enable the secure handling of Attach and TAU Requests if these messages fail integrity checks.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

selectedPgwFormat - Selected PGW Format

Syntax

--gParmName selectedPgwFormat --gParmValue <string>

Description

selectedPgwFormat parameter controls how the MME formulates the selected PGW information inside the MIP6-Agent-Info AVP, which the MME sends on the S6a NOR and the S6a ULR (Active-APN AVP(s)). When 'selectedPgwFormat' is set to value

List

- includePgwFqdn - Include PGW FQDN - MME includes the PGW FQDN on MIP-Home-Agent-Host AVP always when available in the MME. in case of LIPA, as DNS is not applicable i.e. FQDN is not available, the MME includes the PGW IP address(es) on MIP-Home-Agent-Address AVP.
- includePgwIp - Include PGW IP - MME includes (only) the PGW IP address(es) on MIP-Home-Agent-Address AVP.
- includePgwIpFqdn - Include PGW IP FQDN - MME includes the PGW IP address(es) on MIP-Home-Agent-Address AVP. MME additionally also includes the PGW FQDN on MIP-Home-Agent-Host AVP, when the FQDN is available in the MME. in case of LIPA, as DNS is not applicable i.e. the FQDN is not available, the MME includes only the PGW IP address(es) on MIP-Home-Agent-Address AVP.

Default

includePgwFqdn

Name

selectiveVoLteEmerAllowed - Selective volte enablement feature emergency call handling

Syntax

--gParmName selectiveVoLteEmerAllowed --gParmValue <string>

Description

If selectivevolteenabled is enabled, allow/disallow IMS emergency call.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

Yes

Name

selectiveVoLteEnabled - Selective volte enablement feature

Syntax

```
--gParmName selectiveVoLteEnabled --gParmValue <string>
```

Description

Enable/Disable selective volte enablement to deny certain types of UEs access to LTE.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

sendCallRelOnSlrEmerOrigFailure - Send Call Release On SLR Emergency Call Origination Failure

Syntax

```
--gParmName sendCallRelOnSlrEmerOrigFailure --gParmValue <string>
```

Description

When the parameter is Yes, if the MME sent LRR Emergency Origination to the GMLC and did not receive a successful LRR ACK, the MME will send LRR Emergency Release when the Emergency bearer is removed or deleted. When the parameter is No, LRR Emergency Release is sent after receiving a successful LRR ACK for the LRR Emergency Origination.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

sendDdnAckWithContextNotFoundForAbnormalSgwSwitchover - Send DDN Ack with Context Not Found for Abnormal SGW Switchover

Syntax

```
--gParmName sendDdnAckWithContextNotFoundForAbnormalSgwSwitchover --  
gParmValue <string>
```

Description

Parameter controls feature activation. By default, flag shall be disabled. When enabled, MME upon getting a DDN with a CV of 254, and if the TEID is recognized but the DDN is from the wrong SGW, the MME shall respond with a DDN Ack, with a TEID of 0 (zero), with the same sequence number as in the DDN, and with a CV of 64 (context not found), back to the sending (wrong) SGW, so that SGW will know to clean up automatically.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

sendDeleteSessionReqForIntersystemRau - Send Delete Session Request for Intersystem RAU

Syntax

```
--gParmName sendDeleteSessionReqForIntersystemRau --gParmValue  
<string>
```

Description

Parameter controls sending Delete Session Request to SGW upon receiving Cancel Location Request from HSS with cancellation Type=MME Update Procedure during Gn based Inter System RAU and S3 based Inter System RAU with SGW relocation. By default the flag shall be disabled.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

sendEquivalentPlmnListOnlytoEnbInHandoverRestrictionList - Send Equivalent Plmn List Only to Enb in Handover Restriction List

Syntax

```
--gParmName sendEquivalentPlmnListOnlytoEnbInHandoverRestrictionList  
--gParmValue <string>
```

Description

Parameter controls feature activation. By default, the flag shall be disabled. When enabled, MME shall send Equivalent Plmn List only to eNB in Handover Restriction List. Sending to the UE shall be suppressed even if ePLMN List Name is provisioned. When gparm is disabled, if ePLMN List Enb is empty, ePLMN List shall be copied.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

sendEsmDummyAttachPdnRejected - Send ESM Dummy Attach PDN Rejected

Syntax

--gParmName sendEsmDummyAttachPdnRejected --gParmValue <string>

Description

MME sends Attach Accept with ESM Dummy esmMsgContainer, if PDN is Rejected and Attach is accepted, for Attach Request with PDN Connectivity Request, from an UE supporting and allowed for, registration without PDN Values: Yes - Send Attach Accept with esmMsgContainer -> ESM DUMMY message No - Send Attach Accept with esmMsgContainer -> PDN CONNECTIVITY REJECT message

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

Yes

Name

sendForbiddenTailistDCsOnly - Send forbidden TAI list for data centric CS voice only

Syntax

--gParmName sendForbiddenTailistDCsOnly --gParmValue <string>

Description

UE usage setting is data centric and voice domain preference is CS only. if sendforbiddentailistdcsonly is yes, send the forbidden TAI list.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

sendForbiddenTailListDCsPrefer - Send forbidden TAI list for data centric CS voice preferred

Syntax

--gParmName sendForbiddenTailListDCsPrefer --gParmValue <string>

Description

UE usage setting is data centric and voice domain preference is CS preferred, IMS secondary. if sendforbiddentailstdcsprefer is yes, send the forbidden TAI list.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

sendForbiddenTailListDImSOnly - Send forbidden TAI list for data centric IMS PS voice only

Syntax

--gParmName sendForbiddenTailListDImSOnly --gParmValue <string>

Description

UE usage setting is data centric and voice domain preference is IMS only. if sendforbiddentailstdimonly is yes, send the forbidden TAI list.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

sendForbiddenTailListDImSPrefer - Send forbidden TAI list for data centric IMS PS voice preferred

Syntax

--gParmName sendForbiddenTailListDImSPrefer --gParmValue <string>

Description

UE usage setting is data centric and voice domain preference is IMS preferred, CS secondary. if sendforbiddentailstdimprefer is yes, send the forbidden TAI list.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

sendForbiddenTailListNone - Selective volte enablement feature send forbidden TAI list none

Syntax

```
--gParmName sendForbiddenTailListNone --gParmValue <string>
```

Description

UE does not indicate both UE usage setting and voice domain preference. if sendforbiddentailistnone is yes, send the forbidden TAI list.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

sendForbiddenTailListVCsOnly - Send forbidden TAI list for voice centric CS voice only

Syntax

```
--gParmName sendForbiddenTailListVCsOnly --gParmValue <string>
```

Description

UE usage setting is voice centric and voice domain preference is CS only. if sendforbiddentailistvcsonly is yes, send the forbidden TAI list.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

sendForbiddenTailListVCsPrefer - Send forbidden TAI list for voice centric CS voice preferred

Syntax

```
--gParmName sendForbiddenTailListVCsPrefer --gParmValue <string>
```

Description

UE usage setting is voice centric and voice domain preference is CS preferred, IMS secondary. if sendforbiddentailistvcprefer is yes, send the forbidden TAI list.

List

- No - Boolean value of no.

- Yes - Boolean value of yes.

Default

No

Name

sendForbiddenTailListVImOnly - Send forbidden TAI list for voice centric IMS PS voice only

Syntax

```
--gParmName sendForbiddenTailListVImOnly --gParmValue <string>
```

Description

UE usage setting is voice centric and voice domain preference is IMS only. if
sendforbiddentailvimsonly is yes, send the forbidden TAI list.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

sendForbiddenTailListVImPrefer - Send forbidden TAI list for voice centric IMS PS voice
preferred

Syntax

```
--gParmName sendForbiddenTailListVImPrefer --gParmValue <string>
```

Description

UE usage setting is voice centric and voice domain preference is IMS preferred, CS secondary.
if sendforbiddentailvimprefer is yes, send the forbidden TAI list.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

sendFwdRelCancelAndHoPrepFailure - Send Forward Relocation Cancel and HO Preparation
Failure

Syntax

```
--gParmName sendFwdRelCancelAndHoPrepFailure --gParmValue <string>
```

Description

Parameter controls sending Forward Relocation Cancel and HO preparation failure message upon indirect forwarding failure at SGW. By default the flag shall be disabled

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

sendingMBR - Sending MBR

Syntax

--gParmName sendingMBR --gParmValue <string>

Description

Sending modify bearer request.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

Yes

Name

sendLtemRatTypeToScef - sendLtemRatTypeToScef

Syntax

--gParmName sendLtemRatTypeToScef --gParmValue <string>

Description

Specifies whether the MME can send the 'LTE-M' RAT to the SCEF in T6a CMR message.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

sendLtemRatTypeToSgw - sendLtemRatTypeToSgw

Syntax

--gParmName sendLtemRatTypeToSgw --gParmValue <string>

Description

Specifies whether the MME is to send the 'LTE-M' RAT Type to SGWs for UEs that are identified as LTE-M..

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

sendMappedGuami - sendMappedGuami

Syntax

```
--gParmName sendMappedGuami --gParmValue <string>
```

Description

Current parameter enables sending in S1 Setup Response mapped GUMMEI(s) pointing to the AMF GUAMI(s) for the associated PLMN(s) that coexist in both 4G and 5G at local CMM node

List

- DISABLE - Disable
- ENABLE - Enable

Default

DISABLE

Name

sendMaximumUeAvailabilityTimeInNor - Send Maximum UE Availability Time in NOR

Syntax

```
--gParmName sendMaximumUeAvailabilityTimeInNor --gParmValue <string>
```

Description

Parameter controls support for sending maximum ue availability time to hss in NOR message. By default the flag shall be disabled.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

sendNasRanCauseOnS11 - Send NAS RAN cause on S11

Syntax

```
--gParmName sendNasRanCauseOnS11 --gParmValue <string>
```

Description

Indicates whether (Yes) or not (No) to send the NAS or RAN failure indication code on the S11 interface to the SGW.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

sendNorWithPgwInfoAfterTauUla - Send NOR with PGW information after TAU ULA

Syntax

```
--gParmName sendNorWithPgwInfoAfterTauUla --gParmValue <string>
```

Description

Send NOR with PGW information after TAU ULA.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

sendPdnConnRejWithReactReq - Send PDN Connectivity Reject With CC#54 (PDN connection does not exist)

Syntax

```
--gParmName sendPdnConnRejWithReactReq --gParmValue <string>
```

Description

Parameter controls sending PDN Connectivity Reject with cause code #54 (PDN connection does not exist).. By default the flag shall be No.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

sendRabrDuringDoubleS1ServiceRequest - Send Release Access Bearer Request During Double S1 Service Request

Syntax

```
--gParmName sendRabrDuringDoubleS1ServiceRequest --gParmValue  
<string>
```

Description

When enabled, upon receiving Double S1 Service Request, MME shall release the old S1 connection before sending any Modify Bearer Request to SGW. MME shall send Release Access Bearer Request to SGW to release the old S1U connection on SGW for the UE. As a result SGW shall not send data over the old S1U to the enB during the Double S1 procedure. By default, flag shall be disabled.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

sendRabUponEcmConnectedDdn - Send RAB upon ECM-CONNECTED DDN

Syntax

```
--gParmName sendRabUponEcmConnectedDdn --gParmValue <string>
```

Description

Specifies whether MME shall send DDN ack with cause 'Unable to page UE', followed by a release access bearer (RAB) to the SGW upon the receipt of a DDN for a ECM-CONNECTED UE.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

sendRequestedApn - Send requested APN

Syntax

```
--gParmName sendRequestedApn --gParmValue <string>
```

Description

This parameter indicates to send either the UE requested APN-NI or the replacement APN-NI.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

sendSgw3gppNasRanCause - Send SGW 3GPP NAS ran cause

Syntax

--gParmName sendSgw3gppNasRanCause --gParmValue <string>

Description

Enable/disable inclusion of NAS or RAN failure indication cause code on S11 interface to SGW.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

sendSgw3gppS11cc - Send SGW 3GPP S11 cause code

Syntax

--gParmName sendSgw3gppS11cc --gParmValue <string>

Description

Sent in GTPv2 message to SGW across S11 interface. a value of 'Yes' indicates that MME shall support and send cause code 110 to SGW.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

sendUeUnreachable - Send UE UN_REACHABLE

Syntax

--gParmName sendUeUnreachable --gParmValue <string>

Description

Parameter controls MME behavior related to SGs Paging and specifically controlling if/when an SGs Paging Reject is sent (with UE_UNREACHABLE). Parameter allows customization of when an SGs Paging Reject is sent with a cause of UE_UNREACHABLE. When the global parameter flag is disabled, an SGs Paging Reject with the UE_UNREACHABLE cause is sent when the MME is unable to page the UE (i.e., due to UE inactivity or MME paging suppression).

When the global parameter flag is enabled, the MME will also send an SGs Paging Reject with the UE_UNREACHABLE when MME paging times out trying to reach the UE. By default, flag shall be disabled.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

sendUpdatedRfspReceivedInIdr - Send Updated RFSP Received in IDR

Syntax

```
--gParmName sendUpdatedRfspReceivedInIdr --gParmValue <string>
```

Description

Parameter controls sending updated Subscriber Profile ID IE to eNb in UE Context Modification message. By default, the flag shall be disabled. When enabled, MME shall send updated Subscriber Profile ID IE that it receives in IDR message from HSS to eNb in UE Context Modification message.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

serveS6dClrBySgsnOnly - Serve S6d CLR by SGSN Only

Syntax

```
--gParmName serveS6dClrBySgsnOnly --gParmValue <string>
```

Description

Current parameter controls the handling of s6d CLR (cancellation-type= initial attach procedure) with the 'S6a/S6d-Indicator' flag indicating the SGSN as the affected part of combo node. When the parameter is disabled and the UE isn't found in SGSN side, then the CLR is forwarded to the MME side for 4G detach. When the parameter is enabled then the CLR isn't forwarded to the MME side for 4G detach

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

serviceGapControlActive - Service Gap Control Active

Syntax

--gParmName serviceGapControlActive --gParmValue <string>

Description

Global Feature Flag for the Service Gap Control Feature

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

serviceGapControlSendBackoffTimer - Service Gap Control Backoff Timer

Syntax

--gParmName serviceGapControlSendBackoffTimer --gParmValue <string>

Description

Specifies whether the MME is to provide the UE with a backoff timer in case the UE access is blocked due to the Service Gap Control Feature

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

serviceModifiersWithLabelMatching - Service Modifiers with Label Matching

Syntax

--gParmName serviceModifiersWithLabelMatching --gParmValue <string>

Description

Parameter controls feature activation flag. By default, flag shall be disabled. When enabled, MME shall support the following four service combinations: +nc-nr+ue, +ue, +nc-nr, and no modifiers.

List

- No - Boolean value of no.

- Yes - Boolean value of yes.

Default

No

Name

serviceReqRateLimitOverride - ServiceReqRateLimitOverride

Syntax

```
--gParmName serviceReqRateLimitOverride --gParmValue <string>
```

Description

Number of UE initiated service requests allowed per sec per CPPS after which CPPS starts dropping service requests until rate is below limit.

Type / Range

Integer in the range of systemDefault or 0 to 6,999

Default

systemDefault

Name

serviceReqRateLimitOverrideSRS - ServiceReqRateLimitOverrideSRS

Syntax

```
--gParmName serviceReqRateLimitOverrideSRS --gParmValue <string>
```

Description

Number of service requests (that requiring SRS) allowed per sec per CPPS, after which CPPS starts rejecting service request until rate is below limit.

Type / Range

Integer in the range of systemDefault or 0 to 999

Default

systemDefault

Name

servingNodeInLRR - Serving node in LRR

Syntax

```
--gParmName servingNodeInLRR --gParmValue <string>
```

Description

If this parameter is set to 'Yes' then then MME shall include the serving node AVP in LRR of all location scenarios.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

sessionRestoration - Session Restoration

Syntax

```
--gParmName sessionRestoration --gParmValue <string>
```

Description

Enable Session Restoration

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

setCapdegradeOn2gcipherGea1 - SetCapdegradeOn2gcipherGea1

Syntax

```
--gParmName setCapdegradeOn2gcipherGea1 --gParmValue <string>
```

Description

Set 2G capacity degrade percentage for GEA1 ciphering algorithm.

Type / Range

Integer in the range of systemDefault or 0 to 100

Default

systemDefault

Name

setCapdegradeOn2gcipherGea2 - SetCapdegradeOn2gcipherGea2

Syntax

```
--gParmName setCapdegradeOn2gcipherGea2 --gParmValue <string>
```

Description

Set 2G capacity degrade percentage for GEA2 ciphering algorithm.

Type / Range

Integer in the range of systemDefault or 0 to 100

Default

systemDefault

Name

setCapdegradeOn2gcipherGea3 - SetCapdegradeOn2gcipherGea3

Syntax

```
--gParmName setCapdegradeOn2gcipherGea3 --gParmValue <string>
```

Description

Set 2G capacity degrade percentage for GEA3 ciphering algorithm.

Type / Range

Integer in the range of systemDefault or 0 to 100

Default

systemDefault

Name

setIaiForGutiAttach - Set IAI for GUTI attach

Syntax

```
--gParmName setIaiForGutiAttach --gParmValue <string>
```

Description

Set initialattachindication in ULR for GUTI attach when UE IMSI is not received directly from the UE during the ongoing attach procedure.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

sgs - SGS

Syntax

```
--gParmName sgs --gParmValue <string>
```

Description

Recovery of 3GPP CSFB services of UE using SRS.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

sgsAssStateCsfbEmergencyCall - SGS ass state CSFB emergency call

Syntax

```
--gParmName sgsAssStateCsfbEmergencyCall --gParmValue <string>
```

Description

Configure to change the SGs association state to SGS-NULL.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

sgsLinkLock - SGS link lock

Syntax

```
--gParmName sgsLinkLock --gParmValue <string>
```

Description

Enable/Disable support of MME to change SCTP state when locking SGs links.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

sgsLiteDetachIndicationAttempts - Detach indication attempts

Syntax

```
--gParmName sgsLiteDetachIndicationAttempts --gParmValue <string>
```

Description

Configure maximum number of transmit attempts for SGsLite-IMSI-DETACH-INDICATION message.

Type / Range

Integer in the range of 1 to 5

Default

3

Name

sgsLiteLocationUpdateAttempts - Location update attempts

Syntax

```
--gParmName sgsLiteLocationUpdateAttempts --gParmValue <string>
```

Description

Configure maximum number of transmit attempts for SGsLite-LOCATION-UPDATE message.

Type / Range

Integer in the range of 1 to 5

Default

3

Name

sgsLiteUplinkDataAttempts - Uplink data attempts

Syntax

```
--gParmName sgsLiteUplinkDataAttempts --gParmValue <string>
```

Description

Configure maximum number of transmit attempts for SGsLite-UPLINK-UNITDATA message.

Type / Range

Integer in the range of 1 to 5

Default

3

Name

sgsnCsfbReturnLastPlmn - SGSN CSFB return last PLMN

Syntax

```
--gParmName sgsnCsfbReturnLastPlmn --gParmValue <string>
```

Description

Configure SGSN to support return UE to last PLMN by including the last used LTE PLMN ID into the equivalent PLMN list provided to the UE in RAU accept message.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

sgsnDiscoveryMethod - SGSN discovery method

Syntax

```
--gParmName sgsnDiscoveryMethod --gParmValue <string>
```

Description

Method used to discover SGSN IP address for inter-rat handover to UTRAN/GERAN.

List

- Use S-NAPTR Procedure - The MME shall perform a DNS S-NAPTR query to determine the IP address of the SGSN.
- Use S-NAPTR and fallback - MME falls back to pre-rel8 query if MME receives NAPTR records with missing interfaces.
- Use pre-Rel8 FQDN - The MME shall perform a DNS query with pre-rel 8 FQDN determine the IP address of the SGSN.

Default

Use S-NAPTR Procedure

Name

sgsnId - SGSN ID

Syntax

```
--gParmName sgsnId --gParmValue <string>
```

Description

This parameter defines the SGSN identifier, SGID. Possible identifier values range from 1 to 31. 0 means not used.

Type / Range

Integer in the range of 0 to 31

Default

15

Name

sgsnInformImplicitlyDetachedUEs - SGSN informs Implicitly Detached UEs

Syntax

```
--gParmName sgsnInformImplicitlyDetachedUEs --gParmValue <string>
```

Description

This parameter controls if the SGSN shall take action to inform UEs that have been implicitly detached due to PAPS reset that their MM context has been lost.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

sgsnIntPreIuGbSessionResiliency - SGSN support for Internal Preparation for Iu Gb Session Resiliency

Syntax

```
--gParmName sgsnIntPreIuGbSessionResiliency --gParmValue <string>
```

Description

Enable SGSN support for Internal Preparation for Lu Gb Session Resiliency. Warning: For Nokia personnel only.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

sgsnIpAddrCmpSgwSel - SGSN IP Address Comparison During SGW Selection

Syntax

```
--gParmName sgsnIpAddrCmpSgwSel --gParmValue <string>
```

Description

Current gParm enables S4 SGSN recognizing that same SGW has been selected during inter-PLMN mobility (RAU and handover) by comparing the IP addresses of the source and target SGW(s).

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

sgsnIpv4AddressForUserTraffic - SGSN IPv4 address for user traffic

Syntax

```
--gParmName sgsnIpv4AddressForUserTraffic --gParmValue <string>
```

Description

SGSN IPv4 address for user traffic to support the SGSN context acknowledge message sent from the MME during a gn/gp SGSN to MME TAU

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Default

127.0.0.1

Name

sgsnMonLogSheddingDuringOverload - Monitor Logs Shedding During Overload

Syntax

```
--gParmName sgsnMonLogSheddingDuringOverload --gParmValue <string>
```

Description

This parameter handles shedding of SGSN Monitoring Logs during overload in PAPS. Warning: For Nokia personnel only.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

Yes

Name

sgsnNumberSending - SGSN Number Sending

Syntax

```
--gParmName sgsnNumberSending --gParmValue <string>
```

Description

This parameter is to control sending SGSN number to HSS via diameter to HSS. By default, this parameter is set to No, which means Not Send.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

sgsnPoolId - SGSN pool ID

Syntax

```
--gParmName sgsnPoolId --gParmValue <string>
```

Description

This parameter defines the SGSN pool identifier. Possible values range from 0 to 3.

Type / Range

Integer in the range of 0 to 3

Default

0

Name

sgsnUseCclnApnForR8DnsPgw - SGSN use of Charging Characteristics in APN for R8 DNS query for P-GW selection

Syntax

```
--gParmName sgsnUseCcInApnForR8DnsPgw --gParmValue <string>
```

Description

Defines if SGSN will add Charging Characteristics in APN for Rel-8 DNS query for P-GW selection. - 'No' (default) CC is not added - 'Yes' CC added when APN is in the apnList and marked to use CC for Rel-8 DNS P-GW selection

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

sgsSvMscPreference - SGS Sv MSC preference

Syntax

```
--gParmName sgsSvMscPreference --gParmValue <string>
```

Description

Configure UE assignment preference for MSC supporting both SGs and Sv interface.

List

- All UE - MME uses the MSCs supporting SGs and Sv interface only for the SRVCC capable UEs and these MSC are excluded for the UEs that do not support SRVCC.
- SRVCC UE Only - MME will use these MSC for both SRVCC capable and SRVCC not capable UEs.

Default

All UE

Name

sgwIsolationFaultThreshold - SGW isolation fault threshold

Syntax

```
--gParmName sgwIsolationFaultThreshold --gParmValue <string>
```

Description

This command is used to provision SGW fault threshold for the SGW isolation. if the number of the SGW faults (number of S11/S4 create session response timeouts) exceed the provisioned threshold in a provisioned duration timer then WMM will isolate the SGW from the selection for provisionable duration.

Type / Range

Integer in the range of 1 to 1000

Default

50

Name

sgwRelocationOnMbrFailure - SGW relocation on MBR failure

Syntax

```
--gParmName sgwRelocationOnMbrFailure --gParmValue <string>
```

Description

Enable SGW relocation if MME times out waiting for SGW response to modify bearer requests or modify access bearer request.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

sgwRelocationRestriction - SGW relocation restriction

Syntax

```
--gParmName sgwRelocationRestriction --gParmValue <string>
```

Description

If the feature is activated then, MME shall not perform SGW relocation for TAU request, X2 HO, S1HO and MME relocations.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

sgwSelectionWithSnaptr - SGW selection with snaptr

Syntax

```
--gParmName sgwSelectionWithSnaptr --gParmValue <string>
```

Description

Enable/Disable support for SGW selection with snaptr.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

sgwSelForHomeRoutedGwSelMode - SGW Selection for GW Selection Mode 1

Syntax

--gParmName sgwSelForHomeRoutedGwSelMode --gParmValue <string>

Description

Parameter controls feature activation flag. By default the flag shall be disabled. When enabled MME shall then if the UE is a home-routed roamer, the s8-gtp order and preference for each of the SGW candidates will be used to determine which SGW to select instead of the order and preference for s5-gtp, and also the selection of an SGW that supports only s8-gtp and not s5-gtp will be supported.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

sgwToEnblpv4v6TransportLayerAddress - SGW IPv4v6 Transport Layer Address IP Type

Syntax

--gParmName sgwToEnblpv4v6TransportLayerAddress --gParmValue <string>

Description

MME passes SGW S1-u IPv4v6 Transport Layer Address to the eNB/gNB if it received this IP Type from the SGW and this parameter is set to YES. Otherwise MME matches S1-C IP Address Type and passes it to the eNB/gNB.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

shortDataService - Short data service

Syntax

--gParmName shortDataService --gParmValue <string>

Description

Enable/disable short data service at MME level.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

signalingOnlyUe - Signaling only UE

Syntax

--gParmName signalingOnlyUe --gParmValue <string>

Description

Enable/disable feature 'MME support for UE with signalling connections only.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

singlePdpPerApnSgsn - SGSN allows one PDP Per APN

Syntax

--gParmName singlePdpPerApnSgsn --gParmValue <string>

Description

This parameter enables restriction the number of active PDPs towards same APN to one. When the parameter is not set (by default), the UE may have multiple active PDP(s) towards same APN. When the parameter is set, then UE is allowed having only one active PDP towards same APN.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

singleThreadOlcSheddingEffectiveness - Single Thread OLC Shedding Effectiveness

Syntax

--gParmName singleThreadOlcSheddingEffectiveness --gParmValue
<string>

Description

When enabled, OLC will determine the effectiveness of shedding during a single thread CPU overload. If shedding is ineffective, then OLC will turn shedding off, else the shedding will continue. This feature applies to IPDS and CPPS.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

skipSubscriptionData - Skip subscription data

Syntax

```
--gParmName skipSubscriptionData --gParmValue <string>
```

Description

HSS may skip subscription data in the ULA if subscription data has not changed since last successful update.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

skipUlrForSgsnToMmeTau - Skip ULR for SGSN to MME Tracking Area Update

Syntax

```
--gParmName skipUlrForSgsnToMmeTau --gParmValue <string>
```

Description

Parameter controls sending NOR message to HSS at the end of SGSN to MME TAU procedure (applies to both Gn and S3 SGSN) instead of ULR, for the case where subscription data is already available in MME. By default the flag shall be disabled

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

slgRetryLrrEmergencySameDra - SLG Retry LRR Emergency Same DRA

Syntax

```
--gParmName slgRetryLrrEmergencySameDra --gParmValue <string>
```

Description

This parameter will control MME to retry the same DRA/GMLC when MME receives Diameter error 3002 (DIAMETER_UNABLE_TO_DELIVER). If the parameter is enabled, MME will retry the diameter message in SLG the same DRA for LRR related with emergency. If the parameter is disabled, MME will keep existing function (i.e. no retry). By default, the parameter is disabled.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

slrEmergencyInitiationDedicatedBearer - SLR emergency initiation based on dedicated bearer

Syntax

```
--gParmName slrEmergencyInitiationDedicatedBearer --gParmValue  
<string>
```

Description

SLR emergency initiation based on dedicated bearer.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

slrSenderDuringHandover - SLR sender during handover

Syntax

```
--gParmName slrSenderDuringHandover --gParmValue <string>
```

Description

Specifies whether the source or target MME sends the SLR to the GMLC during handover. the default is the target MME.

List

- Source MME - The source MME shall send SLR during handover.

- Target MME - The target MME shall send SLR during handover.

Default

Target MME

Name

smfPgwSelSupport - SMF Combo PGW-C Selection support

Syntax

--gParmName smfPgwSelSupport --gParmValue <string>

Description

Selection of combo PGW-C is done using only HSS subscription information as criteria, without considering UE N1 mode support

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

smsInMme - SMS in MME

Syntax

--gParmName smsInMme --gParmValue <string>

Description

Activate the SMS in MME feature. This feature enables the possibility to deploy the SMS service without the use of the CS domain.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

sourceMmeRelocSgsDetach - Source MME reloc send SGs detach

Syntax

--gParmName sourceMmeRelocSgsDetach --gParmValue <string>

Description

This flag controls whether the source MME for a SGS associated UE (i.e. a combined attach UE) will send an SGs detach message to the MSC/VLR following a successful relocation. yes - source MME sends a SGs detach message to the MSC/VLR following a successful relocation

no - source MME do not sends a SGs detach message to the MSC/VLR following a successful relocation.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

Yes

Name

spcmdSheddingDuringOverload - SPCMD Shedding During Overload

Syntax

--gParmName spcmdSheddingDuringOverload --gParmValue <string>

Description

This parameter handles shedding of SGSN PCMD records during overload in PAPS

List

- Do not drop SPCMD during overload - Do not drop SPCMD during overload
- Drop SM SPCMD in major overload - Drop SM related SPCMD records in major overload
- Drop all SPCMD in critical overload - Drop all SPCMD records in critical overload (SM and MM related)

Default

Do not drop SPCMD during overload

Name

srvcc - SRVCC

Syntax

--gParmName srvcc --gParmValue <string>

Description

MME support of SRVCC with the parameters obtained from the SRS.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

srvccCollSendDbrCc110 - SRVCC Collision Send Del brr response

Syntax

```
--gParmName srvccCollSendDbrCc110 --gParmValue <string>
```

Description

Global Parameter flag 'srvccCollSendDbrCc110' controls the feature activation. By default the flag shall be disabled. When enabled, MME shall support sending Delete Bearer Response with Cause Code 110 during SRVCC collision.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

srvccForAllImsEme - SRVCC for all IMS EME

Syntax

```
--gParmName srvccForAllImsEme --gParmValue <string>
```

Description

Use the srvccforallimseme to ensure all UEs making an IMS emergency call (and supporting SRVCC) will be allowed to perform SRVCC.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

staticGwSelection - STATIC GGSN/GW SELECTION

Syntax

```
--gParmName staticGwSelection --gParmValue <string>
```

Description

StaticGwSelection shall be used to control static GGSN/GW selection for SGSN. When it's set, then the new function f52070-01 (configured GWs) will apply. Otherwise, exist function will be used.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

stdPraActionAddProcs - Standard PRA Action Additional Procedures

Syntax

```
--gParmName stdPraActionAddProcs --gParmValue <string>
```

Description

Enables MME to react upon received PRA action for standard PRA, when MME receives new PRA action from SGW/PGW during 5GS to EPS mobility, or during PDN setup for a PDN being handed over from ePDG. Applied when Enable Presence Reporting Area functionality is set to Yes. For modify action also the PRA Modify Enabling parameter must be set to Yes.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

stdsNotifyResponse - Stds notify response

Syntax

```
--gParmName stdsNotifyResponse --gParmValue <string>
```

Description

Standards specified MME behavior upon receiving notify response from HSS.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

stopWarningIndication - Stop warning indication

Syntax

```
--gParmName stopWarningIndication --gParmValue <string>
```

Description

Sending of STOP WARNING MESSAGE TO the CBC.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

subscriberDataExtraction - Subscriber Data Extraction

Syntax

```
--gParmName subscriberDataExtraction --gParmValue <string>
```

Description

Enable/disable periodic subscriber data extraction

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

supportAlternateGwReselection - Support alternate gw reselection feature

Syntax

```
--gParmName supportAlternateGwReselection --gParmValue <string>
```

Description

If enabled, the feature does not check the source bit of cause IE received in create session response for reselection of GW on failures instead MME uses the cause code to determine GW reselection.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

supportApnCorrection - Support APN correction

Syntax

```
--gParmName supportApnCorrection --gParmValue <string>
```

Description

Configure whether or not APN correction is enabled.

List

- No - Boolean value of no.

- Yes - Boolean value of yes.

Default

No

Name

supportAsstData - Support Assistance Data

Syntax

--gParmName supportAsstData --gParmValue <string>

Description

Parameter controls the support for Assistance Data for Recommended Cells info that MME receives info in the S1 CONTEXT RELEASE COMPLETE message shall store it in the VLR and shall include the IE in the paging message. The IE in UE CONTEXT RELEASE COMPLETE that contains the info is 'Information on Recommended Cells' and eNBs for Paging. The info from this IE shall be stored in VLR until a new UE CONTEXT RELEASE COMPLETE message is received. The contents of this IE shall be used to populate Assistance Data for Recommended Cells IE of the Assistance Data for Paging of S1AP PAGING. By default the flag shall be disabled.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

supportCatM1b - Support category M1 CE mode b UE

Syntax

--gParmName supportCatM1b --gParmValue <string>

Description

Support category M1 CE mode b UE.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

supportCmasRestriction - Support cmas restriction

Syntax

--gParmName supportCmasRestriction --gParmValue <string>

Description

Feature activation per MME.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

supportCppsAutoPersonalityChange - Support CPPS Auto Personality Change

Syntax

```
--gParmName supportCppsAutoPersonalityChange --gParmValue <string>
```

Description

Parameter controls whether CMM changes CPPS personality between EMMS and AMMS based on 4G and 5G traffic load.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

supportCsgChangeReporting - Support CSG change reporting

Syntax

```
--gParmName supportCsgChangeReporting --gParmValue <string>
```

Description

Is support for CSG change reporting to be provided?.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

supportDedicatedBearerUli - Support dedicated bearer ULI

Syntax

```
--gParmName supportDedicatedBearerUli --gParmValue <string>
```

Description

Enable or disable ULI enhancement for dedicated bearer activation, update and delete bearer response messages.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

supportDelayedNor - Support delayed NOR

Syntax

```
--gParmName supportDelayedNor --gParmValue <string>
```

Description

Delay NOR when the HSS is unavailable.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

supportDelayedUlr - Support delayed ULR

Syntax

```
--gParmName supportDelayedUlr --gParmValue <string>
```

Description

Delay ULR when the HSS is unavailable.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

supportDfltBearerOperDefQci - Support Default Bearer Operator Defined Qci

Syntax

```
--gParmName supportDfltBearerOperDefQci --gParmValue <string>
```

Description

Enable or Disable the support for Default Bearers to use Operator Defined QClis

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

supportDnsSrv - Support DNS SRV

Syntax

--gParmName supportDnsSrv --gParmValue <string>

Description

MME support for service (SRV) resource records (RR) for MME DNS discovery of MME/PGW/SGW/SGSN.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

supportDupAppProtDnsRec - Support Duplicate 'app-protocol' DNS Records

Syntax

--gParmName supportDupAppProtDnsRec --gParmValue <string>

Description

When this parameter is enabled, the MME does not discard DNS records carrying multiple app-protocol entries of the same app-protocol value, and the MME assumes that the record supports the superset of the supported services across the multiple app-protocol entries.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

supportEdrxRelatedRat - Support eDRX Related RAT

Syntax

```
--gParmName supportEdrxRelatedRat --gParmValue <string>
```

Description

Parameter controls eDRX related RAT support by MME. By default the flag shall be disabled. When the gparm is off existing behavior (i.e. if eDRX-Cycle-Length-Withdrawal is provided the edrx cycle length is removed for both nb-iot and e-utran). If the gparm is enabled, then the only edrx-cycle length deleted will be what the AVP specified. By default, the flag shall be disabled.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

supportForAiMLFunctionalities - Support for AI/ML functionalities in CMM

Syntax

```
--gParmName supportForAiMLFunctionalities --gParmValue <string>
```

Description

This global parameter can be used to enable or disable Artificial Intelligence and Machine Learning (AIML) capabilities in a CMM. By default the global parameter should be disabled (set to No). The AIML functionalities are only applicable to CNF based CMMs, hence, this parameter should always be disabled in VNF based CMMs. When enabled, the Machine Learning Intelligence Service (MLIS) will setup client-server connections with call processing pods for data streaming. When enabled, MLIS pod will collect necessary data to serve AIML algorithms/models in the CMM.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

supportFullUeRestoration - Full 4G SRS Restoration

Syntax

```
--gParmName supportFullUeRestoration --gParmValue <string>
```

Description

If this gparm is enabled full UE Contexts will be stored in the Backup. Restorations will take place on the Full UE Contents. This feature allows rolling update of DBS for 4G in Containers

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

supportIimeiDigitValidation - Support IMEI digit validation

Syntax

--gParmName supportIimeiDigitValidation --gParmValue <string>

Description

This command enables/disables IMEI validation.

List

- allow - Validate IMEI and if invalid do not store in VLR and continue request (or in case IMEI is required procedure is rejected).
- no - IMEI validation is not done.
- reject - Validate IMEI and if invalid reject request.

Default

no

Name

supportImsIimeiApnEnh - Support IMS IIMEI APN enhancement

Syntax

--gParmName supportImsIimeiApnEnh --gParmValue <string>

Description

Parameter controls feature activation. By default the parameter shall be disabled. When enabled, MME shall use the replacement APN NI in the DNS query. Replacement APN NI shall be sent in the Create Session Request towards SGW. QoS and other parameters shall be used from the subscription data. In addition, MME shall send the NOR message with default APN context identifier

List

- EnhDisable - Disabled - Parameter controls feature activation. When EnhDisable is enabled, feature shall be disabled.
- EnhEnableDefault - Enable and use default APN context ID - When EnhEnableDefault is enabled, MME shall send NOR message with default APN context identifier
- EnhEnableSuppress - Enable and Suppress NOR - When EnhEnableSuppress is enabled, MME shall suppress the NOR

Default

EnhDisable

Name

supportMmeSrvcc - MME Supporting 5G-SRVCC

Syntax

--gParmName supportMmeSrvcc --gParmValue <string>

Description

Enables the MME functionality to act in the intermediary role of the MME_SRVCC (MME supporting 5G-SRVCC) to perform the 5G-SRVCC handover for regular voice calls from NG-RAN/5GS to 3GPP UTRAN/CS domain.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

supportMmeSrvccEmergency - Support MME_SRVCC Emergency

Syntax

--gParmName supportMmeSrvccEmergency --gParmValue <string>

Description

Enables the MME functionality to act in the intermediary role of the MME_SRVCC (MME supporting 5G-SRVCC) to perform the 5G-SRVCC handover for emergency calls from NG-RAN/5GS to 3GPP UTRAN/CS domain.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

supportModifyAccessBearerRequest - Support modify access bearer request

Syntax

--gParmName supportModifyAccessBearerRequest --gParmValue <string>

Description

Support for S11 modify access bearer request message.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

supportMsisdnInEcrMsg - Support MSISDN in ECR message

Syntax

```
--gParmName supportMsisdnInEcrMsg --gParmValue <string>
```

Description

When set to yes, MME shall populate MSISDN AVP in the ECR message towards EIR that is sent across S13/S13' interface as part of ME identity check procedure.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

supportNonhomeTaiLaiMapping - Support Non-home TAI/LAI Mapping

Syntax

```
--gParmName supportNonhomeTaiLaiMapping --gParmValue <string>
```

Description

Feature activation for Non-home TAI/LAI Mapping

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

supportOrigTimeStampMaxWait - Support Origination Time Stamp and Maximum Wait Time IE

Syntax

```
--gParmName supportOrigTimeStampMaxWait --gParmValue <string>
```

Description

Parameter controls support for Origination Time stamp and Maximum Wait Time IE inclusion in Create Session Request message. By default this flag shall be disabled. When enabled,

MME shall include Origination Time stamp and Maximum Wait Time IEs in Create Session Request that is sent on S11 message to gateways.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

supportQoSOverride - Support QoS Override

Syntax

--gParmName supportQoSOverride --gParmValue <string>

Description

Parameter controls the feature activation. By default this shall be disabled. When enabled, MME shall support HSS/P-GW QoS Parameter Override for home subscribers

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

supportReattachRequired - Support reattach required

Syntax

--gParmName supportReattachRequired --gParmValue <string>

Description

Enables/Disables the ability to detach the UE based on the bit 'Reattach-Required' bit received from HSS.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

supportSbcAccessControl - Support SBC access control

Syntax

--gParmName supportSbcAccessControl --gParmValue <string>

Description

When support SBc access control set to yes, access control list for SBc provisioned on the MMERmtEndPtCfg is used for access control of SBc.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

supportSdsUeRestoration - Support SDS UE restoration

Syntax

```
--gParmName supportSdsUeRestoration --gParmValue <string>
```

Description

When enabled, MME supports sending data for SDS UEs to SRS.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

supportSessionRestoration - Support session restoration

Syntax

```
--gParmName supportSessionRestoration --gParmValue <string>
```

Description

Support session restoration or not.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

supportSgsnOperDefQci - Support SGSN Operator Defined QCI

Syntax

```
--gParmName supportSgsnOperDefQci --gParmValue <string>
```

Description

Defines if SGSN supports the provisioned Operator Defined QCI. Up to 32 SGSN supported Operator Defined QCI can be defined via CLI oprDefQciToRel99QoSMapping

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

supportSignalingOnlyUeRestoration - Support signaling only UE restoration

Syntax

```
--gParmName supportSignalingOnlyUeRestoration --gParmValue <string>
```

Description

When enabled, MME supports sending data for signaling-only UEs to SRS.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

supportTwoUeBearersForDualPdnType - Support two UE bearers for dual PDN type

Syntax

```
--gParmName supportTwoUeBearersForDualPdnType --gParmValue <string>
```

Description

Support two PDN connections to the same APN if the value is 'false', then 2 PDN connections to the same APN shall not be allowed.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

supportUeRestorationContextDeletion - Support UE restoration context deletion

Syntax

```
--gParmName supportUeRestorationContextDeletion --gParmValue <string>
```

Description

Enables/Disables UE restoration context deletion functionality on MME.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

suppressRegisteredLai - Suppress Registered LAI

Syntax

```
--gParmName suppressRegisteredLai --gParmValue <string>
```

Description

If the feature is enabled (Yes) then MME shall not include the Registered LAI IE in the S1AP INITIAL CONTEXT SETUP and UE CONTEXT MODIFICATION REQUEST messages

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

suppressSendingAltGnGgsnAddress - Suppress Sending Alternate Gn GGSN Address

Syntax

```
--gParmName suppressSendingAltGnGgsnAddress --gParmValue <string>
```

Description

MME shall be provisioned with a global parameter flag that controls sending two IEs (Alternative GGSN Address for control Plane and the Alternative GGSN Address for user traffic IEs) in forward relocation message and context response message during handover scenario. By default, the flag shall be disabled.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

supptIMSIIMEIAPNconv - Support IMSI IMEI APN conversion

Syntax

--gParmName supptIMSIIMEIAPNconv --gParmValue <string>

Description

Support IMSI IMEI APN conversion.

List

- deActivated - Specify support IMSI / IMEI APN conversion type of deactivate.
- imeiPriority - IMEI priority - Specify support IMSI / IMEI APN conversion type of IMEI priority.
- imsiPriority - IMSI priority - Specify support IMSI / IMEI APN conversion type of IMSI priority.

Default

deActivated

Name

switchPdnToLipa - Switch PDN to LIPA

Syntax

--gParmName switchPdnToLipa --gParmValue <string>

Description

Enables MME to dis-connect a LIPA enabled PDN Connection and to re-establish it when UE in idle mode performs a TAU in a LIPA area. MME detaches UE with 're-attach required' to trigger UE to re-establish the PDN connection in the LIPA area.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

t6aDiamOverloadControl - T6A diam overload control

Syntax

--gParmName t6aDiamOverloadControl --gParmValue <string>

Description

Enable(Yes)/disable(No) T6A overload control.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

t6aRetryDifferentScef - T6A retry different SCEF

Syntax

```
--gParmName t6aRetryDifferentScef --gParmValue <string>
```

Description

When MME gets some errors from SCEF (too busy, out of space, etc) or SCEF does not respond, MME sends the same request to another SCEF in the same PLMN.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

tappingActivated - Status of MME/SGSN Tapping functionality

Syntax

```
--gParmName tappingActivated --gParmValue <string>
```

Description

This parameter controls the activated/deactivated status of MME/SGSN Tapping

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

tauDdnCollision - TAU DDN collision

Syntax

```
--gParmName tauDdnCollision --gParmValue <string>
```

Description

Configure MME handling TAU request collision with an ongoing DDN procedure.

List

- Fail DDN - This option preserves the current behavior (i.e. behavior supported until WM8.1.0)). MME sends DDN failure with cause #89 and proceed with TAU.

- Re Page - MME stops paging and proceeds with the TAU request. after TAU is complete and S1 release done, MME pages the UE. MME uses the provisioned paging procedure just as original page used.
- Treat as SR - MME treats the TAU request without the "Active flag" set in the EPS update IE as a TAU request with the "Active flag" set and sends S1AP INITIAL UE CONTEXT REQUEST to set up the bearers. this option basically eliminates the need to page the UE.

Default

Fail DDN

Name

tauRateLimitOverride - TauRateLimitOverride

Syntax

--gParmName tauRateLimitOverride --gParmValue <string>

Description

SGSN to MME IRAT TAUs allowed per sec after which MME start dropping SGSN to MME IRAT TAUs until rate is below limit.

Type / Range

Integer in the range of systemDefault or 0 to 14,999

Default

systemDefault

Name

tauSgsUnknownLaiEmmCause - TAU SGs Unknown LAI EMM Cause

Syntax

--gParmName tauSgsUnknownLaiEmmCause --gParmValue <string>

Description

The parameter is used to provision EMM cause code to be sent to UE combined TAU request if MME fails to select MSC due to LAI to TAI to MSC mapping provisioning errors.

Type / Range

Integer in the range of 2 or 16 to 18 or 22

Default

16

Name

teidToSgsn - Tunnel endpoint identifier data to SGSN

Syntax

--gParmName teidToSgsn --gParmValue <string>

Description

Tunnel endpoint identifier data II information element parameters to support the SGSN context acknowledge message sent from the MME during a gn/gp SGSN to MME TAU enum takes all zero and all ones.

List

- All Ones - Specify all ones.
- All Zeros - Specify all zeros.

Default

All Ones

Name

threegAttachRateLimitOverride - ThreegAttachRateLimitOverride

Syntax

```
--gParmName threegAttachRateLimitOverride --gParmValue <string>
```

Description

3G attaches allowed per sec per PAPS after which PAPS start dropping attaches until rate is below limit.

Type / Range

Integer in the range of 0 to 5,000

Default

900

Name

threegAttachRateLimitOverrideAtIpds - 3G Attach Rate Limit Override

Syntax

```
--gParmName threegAttachRateLimitOverrideAtIpds --gParmValue <string>
```

Description

3G Attaches allowed per sec per PAPS after which PAPS start dropping attaches until rate is below limit at IPDS

Type / Range

Integer in the range of 0 to 15,000

Default

10000

Name

threegControlMsgLimit - 3G control message limit

Syntax

```
--gParmName threegControlMsgLimit --gParmValue <string>
```

Description

3G control messages per second without ciphering. Warning: For Nokia personnel only.

Type / Range

Integer in the range of 1 to 30,000

Default

15700

Name

threegIsauRateLimitOverride - ThreegIsauRateLimitOverride

Syntax

```
--gParmName threegIsauRateLimitOverride --gParmValue <string>
```

Description

Number of 3G ISRAUs allowed per sec per PAPS, after which PAPS starts dropping 3G ISRAUs until rate is below limit.

Type / Range

Integer in the range of 0 to 5,000

Default

1500

Name

threegIsauRateLimitOverrideAtIpds - 3G Isau Rate Limit Override

Syntax

```
--gParmName threegIsauRateLimitOverrideAtIpds --gParmValue <string>
```

Description

Number of 3G ISRAUs allowed per sec per CPPS, after which CPPS starts dropping 3G ISRAUs until rate is below limit at IPDS

Type / Range

Integer in the range of 0 to 20,000

Default

15000

Name

timeBasedAuthFrequency - Time Based Authentication Frequency

Syntax

```
--gParmName timeBasedAuthFrequency --gParmValue <string>
```

Description

Parameter controls feature activation. By default, the flag shall be disabled. When enabled, MME shall support time-based authentication in accordance with new option(s) defined in UE PLMN Services and IMSI Range Services configuration.

List

- No - Boolean value of no.

- Yes - Boolean value of yes.

Default

No

Name

timeZoneUpdateRate - Time zone update rate

Syntax

```
--gParmName timeZoneUpdateRate --gParmValue <string>
```

Description

Configure time zone update rate.

Type / Range

Integer in the range of 30 to 7,200

Default

50

Name

timeZoneUpdateThrottling - Time zone update throttling

Syntax

```
--gParmName timeZoneUpdateThrottling --gParmValue <string>
```

Description

Activate controlling the rate of time zone updates to PGW due to DST change.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

tmsiBasedNriMscSelection - TMSI based NRI MSC selection

Syntax

```
--gParmName tmsiBasedNriMscSelection --gParmValue <string>
```

Description

When set to yes enables the capability to map NRI in TMSI received from the UE to a MSC so that SGs update location is sent to the same MSC as UE was registered with previously to avoid dual VLR registrations. enabling of this feature also requires an operator to provision a non-broadcasting LAC and also NRI for each provisioned MSC. when set to no disables the feature.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

topologicalLabelMatchingForS8pgwSelection - Topological label matching for S8 PGW selection

Syntax

```
--gParmName topologicalLabelMatchingForS8pgwSelection --gParmValue <string>
```

Description

This parameter controls whether or not topological label matching is used to compare the selected SGW FQDN labels with the candidate S8 PGW FQDN labels when selecting a PGW candidate for roaming. when the topological label matching for S8 PGW selection parameter is set to false, the MME will not attempt to use label matching to select the PGW but instead use just the DNS order and preference values. when the parameter is set to true, the MME will use the same label matching algorithm used for S5 PGW selection for S8 PGW selection. when this parameter is set to true, it is up to the service provider to ensure that the labels provided in the SGW and PGW FQDNs are consistent so that label matching will be effective. in particular, the SGW and PGW FQDN values provisioned in the DNS server for MNC and MCC must match.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

topologicalSGWselectionIRAT - Topological SGW Selection IRAT

Syntax

```
--gParmName topologicalSGWselectionIRAT --gParmValue <string>
```

Description

Performs topological matching of SGW to PGW for iRAT TAU and GW Selection Mode 2, when the PGW FQDN had been derived from the PGW IP address, even when pre-existing APNs for the bearers have PLMNs that don't match the UE's selected PLMN

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

tracAreaRelativeCapacity - Trac area relative capacity

Syntax

```
--gParmName tracAreaRelativeCapacity --gParmValue <string>
```

Description

Enable/disable feature to MME support of configuration of MME relative capacity.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

trafloadCombPgw3XUe - Traffic Load to Combo PGW-C for 3X capable UE

Syntax

```
--gParmName trafloadCombPgw3XUe --gParmValue <string>
```

Description

This parameter controls percentage (0% - 100%) of traffic that shall be sent to combo PGW-C for 3X UE(s) eligible using combo PGW-C. If parameter is set to 0%, then MME shall not send any traffic to combo PGW-C.

Type / Range

Integer in the range of 0 to 100

Default

0

Name

trafloadCombPgwN1Ue - Traffic Load to Combo PGW-C for N1 capable UE

Syntax

```
--gParmName trafloadCombPgwN1Ue --gParmValue <string>
```

Description

This parameter controls percentage (0% - 100%) of traffic that shall be sent to combo PGW-C for N1 UE(s) eligible using combo PGW-C. If parameter is set to 0%, then MME shall not send any traffic to combo PGW-C.

Type / Range

Integer in the range of 0 to 100

Default

0

Name

treatGbrTauActiveTau - Treat GBR TAU active TAU

Syntax`--gParmName treatGbrTauActiveTau --gParmValue <string>`**Description**

Enable(Yes)/disable(No) the feature during TAU request with GBR bearers present regardless of active flag value. if set to yes, then MME shall check to determine whether an ECM-IDLE UE has any GBR bearers when TAU request is received. if yes, MME shall treat the TAU request as though TAU request is received with active flags set regardless of active flags setting in the received TAU request and bring up all the bearers. this feature applies to both relocating and non-relocating TAU.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

treatIratTauActiveTau - Treat inter TAU active TAU

Syntax`--gParmName treatIratTauActiveTau --gParmValue <string>`**Description**

Controls to determine whether or not the active flag is treated as if it were set whenever interrta TAU requests are processed.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

treatMip6AgentInfoInIdrAsOneEntity - Treat MIP6Agent-Info in IDR as one Entity

Syntax`--gParmName treatMip6AgentInfoInIdrAsOneEntity --gParmValue <string>`**Description**

GPARM controls the support for treating the MIP6-Agent-Info in IDR as one entity rather than individually modifiable elements. When the GPARM is enabled MME will treat MIP6-Agent-Info in IDR as one entity, By default this shall be disabled.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

twogAttachRateLimitOverride - TwogAttachRateLimitOverride

Syntax

```
--gParmName twogAttachRateLimitOverride --gParmValue <string>
```

Description

2G attaches allowed per sec per PAPS after which PAPS start dropping attaches until rate is below limit.

Type / Range

Integer in the range of 0 to 5,000

Default

1000

Name

twogControlMsgLimit - 2G control message limit

Syntax

```
--gParmName twogControlMsgLimit --gParmValue <string>
```

Description

2G control messages per second without ciphering. Warning: For Nokia personnel only.

Type / Range

Integer in the range of 1 to 30,000

Default

14000

Name

twogDataMsgLimit - 2G data message limit

Syntax

```
--gParmName twogDataMsgLimit --gParmValue <string>
```

Description

2G data messages per second without ciphering. Warning: For Nokia personnel only.

Type / Range

Integer in the range of 1 to 120,000

Default

55000

Name

twogGnThroughput - 2G Gn throughput

Syntax

```
--gParmName twogGnThroughput --gParmValue <string>
```

Description

2G Gn throughput (Mbps). Warning: For Nokia personnel only.

Type / Range

Integer in the range of 1 to 600

Default

220

Name

twogImpactOfCipherring - 2G impact of cipherring

Syntax

```
--gParmName twogImpactOfCipherring --gParmValue <string>
```

Description

2G impact of cipherring (%). Warning: For Nokia personnel only.

Type / Range

Integer in the range of 0 to 100

Default

20

Name

twogIsauRateLimitOverride - TwogIsauRateLimitOverride

Syntax

```
--gParmName twogIsauRateLimitOverride --gParmValue <string>
```

Description

Number of 2G ISRAUs allowed per sec per PAPS, after which PAPS starts dropping 2G ISRAUs until rate is below limit.

Type / Range

Integer in the range of 0 to 5,000

Default

1800

Name

twogMaxPktsConcurrentDataPresence - 2G max packets concurrent data presence

Syntax

--gParmName twogMaxPktsConcurrentDataPresence --gParmValue <string>

Description

Max 2G control packets due to concurrent 2G data presence. Warning: For Nokia personnel only.

Type / Range

Integer in the range of 0 to 50,000

Default

4900

Name

twogUeThroughput - 2G UE throughput

Syntax

--gParmName twogUeThroughput --gParmValue <string>

Description

2G UE throughput (Mbps). Warning: For Nokia personnel only.

Type / Range

Integer in the range of 1 to 600

Default

220

Name

twothreegAttachRateLimitOverride - TwothreegAttachRateLimitOverride

Syntax

--gParmName twothreegAttachRateLimitOverride --gParmValue <string>

Description

Number of 2G and 3G ISRAUs allowed per sec per CPPS, after which CPPS starts dropping 2G and 3G attaches until rate is below limit.

Type / Range

Integer in the range of systemDefault or 0 to 699

Default

systemDefault

Name

ubrRejCauseDuringIratRedirect - UBR Reject Cause During Interrat-Redirection

Syntax

--gParmName ubrRejCauseDuringIratRedirect --gParmValue <string>

Description

A user specified GTPv2 cause to be used within the Update Bearer Response sent back to the SGW, when the Update Bearer Request is received during an interratt-redirection scenario.

Type / Range

29.274 reject Cause value. Integer value in the range of 64 to 127.

Default

94

Name

ueCtxUpdateInPatchLoadSupport - Support for UE Context Update Over NR10 in Patch Loads

Syntax

--gParmName ueCtxUpdateInPatchLoadSupport --gParmValue <string>

Description

Support for UE Context Update over NR10 in patch loads

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

Yes

Name

ueEnbServingCellChangeReporting - UE eNB serving cell change reporting

Syntax

--gParmName ueEnbServingCellChangeReporting --gParmValue <string>

Description

Indicates whether UE eNB serving cell change reporting is enabled or not the default is no, indicating UE eNB serving cell change reporting is not enabled.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

ueReachTAdsInSupportedFeaturesAvp - UE reach T-ADS in supported features AVP

Syntax

--gParmName ueReachTAdsInSupportedFeaturesAvp --gParmValue <string>

Description

A value of yes indicates that MME shall send UE-reachability-Notification and T-ADS data retrieval in the in the supported-features AVP, in the feature-list AVP, by setting bits 26 and 27 of the feature-list flags.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

Yes

Name

ueSrvccCapabilityHss - UE SRVCC Capability HSS

Syntax

--gParmName ueSrvccCapabilityHss --gParmValue <string>

Description

This parameter controls the value of the UE-SRVCC-Capability AVP the MME sends towards the HSS. UE-SRVCC-Capability AVP is absent when the UE does not include MS network capability IE. MME sends UE-SRVCC-Capability AVP as 'UE-SRVCC-NOT-SUPPORTED' when the UE does not support 'SRVCC to GERAN/UTRAN capability' on MS network capability, or MME does not support SRVCC for the UE according to provisioning (as part of svcAgreementProfile). MME sends UE-SRVCC-Capability AVP as 'UE-SRVCC-SUPPORTED' if the MME supports SRVCC for the UE according to provisioning, and the UE supports 'SRVCC to GERAN/UTRAN capability' on MS network capability.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

ueUnreachableMsgSgsEdrxPsmCause - SGs cause code UE unreachable

Syntax

--gParmName ueUnreachableMsgSgsEdrxPsmCause --gParmValue <string>

Description

Use 'UE unreachable' instead of the default 'UE temporarily unreachable' as cause code with SGs cause IE in SGs interface

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

uliEnhancement - ULI enhancement

Syntax

--gParmName uliEnhancement --gParmValue <string>

Description

Indicates whether ULI enhancement is enabled or not the default is no, indicating ULI enhancement is not enabled.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

uliHomeRoutedUe - ULI home routed UE

Syntax

--gParmName uliHomeRoutedUe --gParmValue <string>

Description

This flag determines whether ULI will be included for home routed UEs. no - ULI will not be included for home routed UEs. yes (default) - ULI will be included for home routed UEs.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

Yes

Name

uliInS11messagesWithSgwRelocation - Enable ULI in S11 messages with SGW relocation

Syntax

--gParmName uliInS11messagesWithSgwRelocation --gParmValue <string>

Description

A value of yes for the parameter shall indicate that the WMM will include the ULI (ECGI+TAI) for S11 messages with SGW relocation. a value of no for the parameter shall indicate that existing, 29.274 standards based IE inclusion policy shall apply.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

unconditionallyAddHrIe - Unconditionally Add HRL IE

Syntax

```
--gParmName unconditionallyAddHrIe --gParmValue <string>
```

Description

When enabled, MME shall unconditionally include the Handover Restriction List IE in all S1AP messages as described within 3GPP specifications.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

upper20BitHenbGwRouting - Upper 20-Bit henb GW routing

Syntax

```
--gParmName upper20BitHenbGwRouting --gParmValue <string>
```

Description

Enable/disable non-standard usage of upper 20 bits of the received 28-bit henb ID to route to the henb GW.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

use3gppImsiHashForSgs - Use 3GPP IMSI Hash for SGs

Syntax

```
--gParmName use3gppImsiHashForSgs --gParmValue <string>
```

Description

Specifies whether the CMM is to use the 3GPP IMSI Hash Algorithm specified in TS 23.236 for UE distribution to MSCs via the SGs interface. The default is no. When this field is set to no, the CMM shall use its proprietary IMSI hash algorithm.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

useExplicitDetach - Use explicit detach

Syntax

```
--gParmName useExplicitDetach --gParmValue <string>
```

Description

Indicates whether explicit detach is used (and the MME pages the UE as part of the explicit detach procedure), or whether an implicit detach is used (and the MME does not page the UE).

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

useFailopenProfile - Use failopen profile

Syntax

```
--gParmName useFailopenProfile --gParmValue <string>
```

Description

Enable the use of the failopen profile for attach and PDN connectivity procedures, used for home subscribers and roamers considered as homers.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

useHplmnforSgsInterface - Use Home PLMN For SGs Interface

Syntax

```
--gParmName useHplmnforSgsInterface --gParmValue <string>
```

Description

MME shall be provisioned with GPARM 'useHplmnforSgsInterface' flag. By default, this flag shall be disabled. When the flag is enabled, MME shall always use home plmn of the specific UE towards MSS across SGs interface.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

useLocalDnsHost - Use Local DNS Host

Syntax

```
--gParmName useLocalDnsHost --gParmValue <string>
```

Description

Use local DNS host.

List

- mme - MME will use local DNS file
- mmeS4sgsn - MME,S4SGSN - MME and S4 SGSN will use local DNS file
- none - No elements will use local DNS file
- s4sgsn - S4 SGSN - S4 SGSN will use DNS file

Default

none

Name

useModifiedSbcAsn1 - Use Modified 29.168 SBC ASN.1

Syntax

```
--gParmName useModifiedSbcAsn1 --gParmValue <string>
```

Description

Parameter controls the GPARM flag. By default, this flag shall be disabled. When the flag is enabled, MME shall use the modified version of 29.168 ASN.1.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

useMTUpathdiscoveryforDFflag - use MTU path discovery for DF flag

Syntax

--gParmName useMTUpathdiscoveryforDFflag --gParmValue <string>

Description

This parameter indicates whether to use MTU path discovery to set the DF flag for IP for S1-MME. If it is set to yes, then DF flag will be set if MTU path discovery is enabled. If it is set to no, then the DF flag will not be set, even if MTU path discovery is enabled.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

Yes

Name

useNon3gppEmergencyPolicy - Use Non-3GPP NW provided Policies for emergency calls

Syntax

--gParmName useNon3gppEmergencyPolicy --gParmValue <string>

Description

This parameter is used to enable MME to include the Non-3GPP NW provided policies IE in the Attach Request and TAU Request message. By default the IE is not included.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

usePcmdZstdCompression - Use PCMD zstd compression

Syntax

--gParmName usePcmdZstdCompression --gParmValue <string>

Description

When this is set to Yes, zstd compression is applied at PCMD files under /data-pcmd/ directory. When this is No, gzip compression is applied instead.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

Yes

Name

useTopologicalLabelMatchingAlways - Use Topological Label Matching Always

Syntax

```
--gParmName useTopologicalLabelMatchingAlways --gParmValue <string>
```

Description

Provisioned Parameter 'UseTopologicalLabelMatchingAlways' for Gateway selection controls whether topological matching shall be used to select SGW and PGW, regardless of whether SGW/PGW FQDN MNC/MCC identifies UE PLMN or Serving PLMN or MME Home PLMN or some other PLMN, during Attach Request procedures and to select a PGW during PDN Connectivity Request procedures. By default, GPARAM shall be disabled. GPARAM is valid only for GW selection mode 2 and shall not have any effect if GW selection Mode 1 is enabled.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

valueAddedMtLrNoEsmLc - Value added MT_LR no E-SMLC

Syntax

```
--gParmName valueAddedMtLrNoEsmLc --gParmValue <string>
```

Description

MT_LR client type value-added do not contact E-SMLC for UE location information. If yes, when MME receives mobile terminated location request with client type=valueAdded, and activateLcsClientTypeValueAddedServices is set, the MME contacts the eNB for UE current E-CGI information. This information is sent back to the GMLC. The MME does not contact the E-SMLC to obtain any UE location information. If no, nothing change and keep existing function (i.e. MME contacts E-SMLC to obtain UE location for this MT-LR type).

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

vdpForbiddenTailListOnVdpProfile - VDP Forbidden TAI List on VDP Profile

Syntax

--gParmName vdpForbiddenTailListOnVdpProfile --gParmValue <string>

Description

Defines whether the VDP Profile associated Forbidden TAI List is sent according to global parameters or VDP Profile level parameters. When set to Yes, and MME finds a matching VDP Profile for the UE, the MME sends VDP profile associated Forbidden TAI List for UEs according to VDP Profile level settings for UE's usage type and Voice Domain Preference, i.e. parameters Data Centric CS Voice Only Send Forbidden TAI List, Data Centric CS Voice Preferred Send Forbidden TAI List, etc. MME ignores global parameters Send forbidden TAI list for data centric CS voice only, Send forbidden TAI list for data centric CS voice preferred, etc. When a) set to Yes and MME does not find a matching VDP Profile for the UE, or b) when set to No, MME sends VDP profile associated Forbidden TAI List for UEs according to global parameters Send forbidden TAI list for data centric CS voice only, Send forbidden TAI list for data centric CS voice preferred, etc. MME ignores VDP profile level parameters Data Centric CS Voice Only Send Forbidden TAI List, Data Centric CS Voice Preferred Send Forbidden TAI List, etc.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

vlrAutoRecoveryPurgeCount - VLR auto recovery purge count

Syntax

--gParmName vlrAutoRecoveryPurgeCount --gParmValue <string>

Description

VLR auto recovery purge count when set to 0, the counter is disabled.

Type / Range

Integer in the range of 0 or 6 to 10

Default

0

Name

warningRetransmissions - Warning retransmissions

Syntax

--gParmName warningRetransmissions --gParmValue <string>

Description

The number of times the MME will attempt to send a S1 CMAS message to a eNB.

Type / Range

Integer in the range of 0 to 10

Default

0

Name

warningSystemLog - Warning system log

Syntax

```
--gParmName warningSystemLog --gParmValue <string>
```

Description

Warning system log.

List

- All - Log both S1 and SBC CMAS messages in warnsys log.
- None - Do not log CMAS messages in warnsys log.
- S1 Only - Only log S1 CMAS messages in warnsys log.
- SBC Only - Only log SBC CMAS messages in warnsys log.

Default

All

Name

weightedSgsImsiHash - Weighted SGs IMSI Hash

Syntax

```
--gParmName weightedSgsImsiHash --gParmValue <string>
```

Description

Specifies whether the MME is to use a weighted IMSI hash distribution for assigning UEs to an SGs MSC.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

writeReplaceWarningIndication - Write replace warning indication

Syntax

```
--gParmName writeReplaceWarningIndication --gParmValue <string>
```

Description

Enable MME sending of broadcast completed area list to the CBC.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

wusProfilesEnabled - WUS Profiles Enabled

Syntax

```
--gParmName wusProfilesEnabled --gParmValue <string>
```

Description

Specifies whether a WUS profile name referenced in UE PLMN Services and IMSI Range Services can be used. Default is No.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

x2hoInclSgwUlTeid - X2 HO include SGW ul

Syntax

```
--gParmName x2hoInclSgwUlTeid --gParmValue <string>
```

Description

Enable E-RAB to BE switched in uplink list IE in the S1AP PATH SWITCH REQUEST ACKNOWLEDGE message irrespective of SGW relocation.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

zeroOiCsrN26Tau - Set OI flag to Zero in CSR of N26 TAU

Syntax

```
--gParmName zeroOiCsrN26Tau --gParmValue <string>
```

Description

Current parameter enables setting OI flag to value zero in Create Session Request that MME sends as part of n26 Idle mobility. When this parameter is disabled, the MME sets OI flag to 1

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Modify

sysadmin, manage

List

sysadmin, manage, monitor

5.5 cmm gpsiRange

GPSI Range. Syntax, description, parameters, and roles for cmm gpsiRange command.

Syntax**Description**

Manages a GPSI range. Up to 1024 GPSI ranges can be defined.

Parameters**Name**

gpsiRangeListName - GPSI Range

Syntax

```
--gpsiRangeListName <string>
```

Description

Name of the list consisting of one more GPSI ranges.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

startGpsi - Start of the GPSI range

Syntax

--startGpsi <digits>

Description

Start of the GPSI range

Class

Required key.

Type / Range

Digit string of length 5 to 15

Name

endGpsi - End GPSI

Syntax

--endGpsi <digits>

Description

End of the GPSI Range

Class

Required key.

Type / Range

Digit string of length 5 to 15

Roles**Create**

5.6 cmm gpsiRangeList

GPSI Range List . Syntax, description, parameters, and roles for cmm gpsiRangeList command.

Syntax

Description

List for GPSI ranges. Up to 32 GPSI Range List may be created. Each list may contain up to 1024 GPSI Ranges.

Parameters

Name

name - List Name

Syntax

--name <string>

Description

GPSI ranges list name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

5.7 cmm gtAnalysis

GT analysis. Syntax, description, parameters, and roles for cmm gtAnalysis command.

Syntax

Description

Use this command to configure, list and show SCCP Global Title (GT) analysis.

Parameters

Name

gtald - GT analysis digits identifier

Syntax

--gtald <digits>

Description

Use this parameter to specify GT analysis,digits. Give as many digits from the beginning of the global title as are needed to find the analysis result.In case that you are trying to add an analysis, with the same numbering plan, the same nature of address and the same prefix of digits with an already existing analysis, please check that longestGtDigitsMatch is set to Yes (through cmm gParm show longestGtDigitsMatch).If not, please set it, and audit mechanism will heal the issue.

Class

Required key.

Type / Range

Digit string of length 1 to 24 with the allowed pattern of [0-9]*

Name

numberingPlan - Numbering plan

Syntax

--numberingPlan <list-item>

Description

Use this parameter to specify the numbering plan for the global title. Cases, numberingPlan 0 unknown numberingPlan 1 ISDN,Telephony (Rec. E.164,E.163) ISDN,telephone network numberingPlan 2 spare numberingPlan 3 Data (Rec. X.121) , data network numberingPlan 4 Telex (Rec. F.69) , telex network numberingPlan 5 Maritime Mobile (Rec. E.210, E.211) , maritime mobile telephone network numberingPlan 6 Land Mobile (Rec. E.212) , mobile telephone network (Mobile Subscriber Identity) numberingPlan 7 ISDN,Mobile (Rec. E.214) , ISDN,mobile telephone network (Mobile Global Title) numberingPlan 8 to 14 spare numberingPlan 15 reserved

Class

Required key.

List

- 1 - Specifies the global title numbering plan of 1.
- 6 - Specifies the global title numbering plan of 6.

- 7 - Specifies the global title numbering plan of 7.

Name

gtResultId - Identifier to GT analysis result

Syntax

--gtResultId <integer>

Description

Use this parameter to specify the record number of the Global Title Translation Result File (GTRFIL). It can get values from the range presented in the dynamic parameter guides. The analysis result of the global title has to be created before it can be referred to from the analysis tree. So, check the available records through cmm gtAnalysisResult list command.

Class

Required on create.

Type / Range

Integer in the range of 1 to 10,239

Name

atf - Analysis type filter

Syntax

--atf <list-item>

Description

output GT analyses that have the same analysis type as is mentioned in the analysis result

Class

Optional.

List

- ALL - All.
- TRUNCATED - Truncated.

Default

ALL

Name

gti - Gti

Syntax

--gti <integer>

Description

Use this parameter to specify the global title indicator for the specific ss7 standard. ITU Cases, gti 0 no global title is included in the address gti 1 the global title only includes the nature of address indicator gti 2 the global title only includes the translation type gti 3 the global title includes the translation type, numbering plan and encoding scheme gti 4 the

global title includes the translation type, numbering plan, encoding scheme and nature of address indicator gti 5 to 7 spare (international) gti 8 to 14 spare (national) gti 15 reserved for expansion ANSI Cases, gti 0 no global title is included in the address gti 1 the global title includes the translation type, numbering plan and encoding scheme gti 2 the global title includes the translation type gti 3 to 4 not specified in the USA gti 5 to 7 spare (international) gti 8 to 14 spare (national) gti 15 reserved for expansion

Class

Optional.

Type / Range

Integer in the range of 1 to 15

Default

4

Name

last - Last global title element to be analysed

Syntax

--last <list-item>

Description

Use this parameter to specify the last element of the called global title that you want to be analysed. use this parameter when all necessary information can not be given for some reason. cases, last GTI the analysis tree only contains the global title indicator values. numbers are not given, and they are not analysed. last TT the analysis tree contains the global title indicator values and the translation type values. other data is not analysed. last NP the analysis tree contains the global title indicator values, the translation type values and the numbering plan. other data is not analysed. last NAI the analysis tree contains all parameters of the root. last DIG the analysis tree contains all parameters and numbers of the root.

Class

Optional.

List

- DIG - Specify DIG as last global title element to be analyzed.
- GTI - Specify GTI as last global title element to be analyzed.
- NAI - Specify NAI as last global title element to be analyzed.
- NP - Specify NP as last global title element to be analyzed.
- TT - Specify TT as last global title element to be analyzed.

Default

DIG

Name

nai - Nature of address indicator

Syntax

--nai <integer>

Description

Use this parameter to specify the nature of address indicator. Cases: nai 0 spare nai 1 subscriber number nai 2 reserved for national use nai 3 national significant number nai 4 international number nai 5 to 127 spare

Class

Optional.

Type / Range

Integer in the range of 0 to 127

Default

4

Name

nle - Number length

Syntax

--nle <integer>

Description

output GT analyses which has the same digit amount with the set number length

Class

Optional.

Type / Range

Integer in the range of 0 to 24

Default

0

Name

ss7Standard - Ss7Standard

Syntax

--ss7Standard <list-item>

Description

Use this parameter to specify the global title standard (ss7 standard). Allowed values, ANSI,ITU

Class

Optional.

List

- ANSI - Specify SS7 variant of american national standards institute.

- ITU - Specify SS7 variant of international telecommunication union - telecommunications.

Default

ITU

Name

translationType - Translation type

Syntax`--translationType <integer>`**Description**

Use this parameter to specify the translation type. The recommended parameter values depend on the standard and on the values of GTI you give. ITU Cases, translationType 0 translation type is not used. In the SGSN, this is the only supported value. translationType 1 to 127 can be defined for use between networks translationType 128 to 254 can be defined for internal use in the network translationType 255 reserved for expansion ANSI Cases, translationType 0 reserved translationType 1 981 telecommunications credit cards translationType 2 14 digit calling card translationType 3 cellular nationwide roaming service translationType 4 global title point code translationType 5 calling name delivery translationType 6 to 31 can be defined for use between networks translationType 32 to 222 spare translationType 223 to 252 can be defined for internal use in the network translationType 253 14 digit calling card translationType 254 can be defined for internal use in the network

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

0

5.8 cmm gtAnalysisResult

GT analysis result. Syntax, description, parameters, and roles for `cmm gtAnalysisResult` command.

Syntax

Description

Use this command to configure, list and show (GT) global title translation result records.

Parameters

Name

gtResultId - GT analysis result identifier

Syntax

--gtResultId <integer>

Description

Use this parameter to specify the global title translation result record to be created with the parameter value, which is a decimal numeral greater than 0. you can specify a given number value for the GT result index with the GT result number parameter. this parameter supports creating similar translation results in different signalling points in any order if external tools are used for data generating and maintaining.it will be mapped to GTR file.

Class

Required key.

Type / Range

Integer in the range of 1 to 10,239

Name

primaryDpc - Primary destination point code

Syntax

--primaryDpc <integer>

Description

Use this parameter to specify the primary destination point code. please, check that this destination point code has been configured through `cmm sccpsignallingpoint` list, and that the signallingnetwork is the same as the given primarynetwork. you must give the primarynetwork parameter before the primarydpc parameter.

Class

Required on create.

Type / Range

Integer in the range of 1 to 16,777,215

Name

primaryNetwork - Primary signalling network

Syntax

--primaryNetwork <list-item>

Description

Use this parameter to specify the primary signalling network. cases, IN0 international network number 0 IN1 international network number 1 NA0 national network number 0 NA1 national network number 1.

Class

Required on create.

List

- IN0 - International network number 0.
- IN1 - International network number 1.
- NA0 - National network number 0.
- NA1 - National network number 1.

Name

backup - Backup subsystem indication

Syntax

--backup <list-item>

Description

Use this parameter to specify the existence of the subsystems individual backups in the global title translation result. Allowed values: true, false

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

issn - Input subsystem for backup

Syntax

--issn <integer>

Description

Use this parameter to specify the subsystem for which the individual backup is created. please, check that this subsystem number has been configured through cmm sccpsubsystem list.

Class

Optional.

Type / Range

Integer in the range of 0 to 254

Default

0

Name

loadSharing - Load sharing

Syntax

--loadSharing <list-item>

Description

Use this parameter to specify the use of load sharing. you can add records for load sharing results through cmm gtloadsharingnet create command. Allowed values: true, false

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

overwr - Overwrite method

Syntax

--overwr <list-item>

Description

Use this parameter to specify the overwrite method. you can use this parameter with the GT result number parameter for handling the situations, where you have defined the GT result index value of an existing record for the global title translation result record to be created. you can overwrite the global title translation result record if the record is not associated with any global title analysis. with this parameter you can define a predetermined way for handling any possible overwriting situation. Allowed values: true, false

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

priGtmd - Primary GT modification data id for called

Syntax

--priGtmd <integer>

Description

Use this parameter to specify the primary modification data record, which you use to modify or replace the existing global title in the called address. used in load sharing case to modify or replace called GT address. please, check that this GT modification data record has been configured through cmm gtmodificationdata list. you cannot give this parameter unless the value of the RI primary parameter is GT (route on gt). 0 default, id to primary GT modification called data not exists.

Class

Optional.

Type / Range

Integer in the range of 0 to 256

Default

0

Name

priGtmg - Primary GT modification data id for calling

Syntax

--priGtmg <integer>

Description

Use this parameter to specify the primary modification data record, which you use to modify or replace the existing global title in the calling address. used in load sharing case to modify or replace calling GT address. please, check that this GT modification data record has been configured through cmm gtmodificationdata list. 0 default, id to primary GT modification calling data not exists.

Class

Optional.

Type / Range

Integer in the range of 0 to 256

Default

0

Name

primaryPrio - Primary priority for load sharing

Syntax

--primaryPrio <list-item>

Description

Use this parameter to specify the primary priority for a load sharing destination. if you give the primaryprio parameter, you must indicate the load sharing later by setting loadsharing as true.

Class

Optional.

List

- 1 - Specify load sharing priority of 1.
- 2 - Specify load sharing priority of 2.

Default

1

Name

primaryRi - Primary routing indicator

Syntax

--primaryRi <list-item>

Description

Use this parameter to specify the primary routing indicator. Allowed values: SSN (route on ssn) , GT (route on gt)

Class

Optional.

List

- GT - Global title - Specify routing indicator of global title.
- SSN - Subsystem number - Specify routing indicator of subsystem number.

Default

SSN

Name

primarySsn - Primary subsystem number

Syntax

--primarySsn <integer>

Description

Use this parameter to specify the primary subsystem number. please, check that this subsystem number has been configured through cmm sccpsubsystem list. you must give the primarynetwork and primarydpc parameters before giving the primaryssn parameter.

Class

Optional.

Type / Range

Integer in the range of 0 to 254

Default

0

Name

primaryWeight - Primary Weight

Syntax

--primaryWeight <integer>

Description

Use this parameter to specify the weight for the Primary destination

Class

Optional.

Type / Range

Integer in the range of 1 to 255

Default

1

Name

rdpc - Replicative destination point code

Syntax

--rdpc <integer>

Description

Use this parameter to specify the replicative destination point code. please, check that this destination point code has been configured through cmm sccpsignallingpoint list, and that the signallingnetwork is the same as the given rnet. you must give the rnet parameter before the rdpc parameter.

Class

Optional.

Type / Range

Integer in the range of 0 to 16,777,215

Default

0

Name

rnet - Replicative network

Syntax

--rnet <list-item>

Description

Use this parameter to specify the replicative signalling network. cases, IN0 international network number 0 IN1 international network number 1 NAO national network number 0 NA1 national network number 1.

Class

Optional.

List

- " - No signalling network - No signalling network.
- IN0 - Signalling network IN0 - Signalling network IN0.
- IN1 - Signalling network IN1 - Signalling network IN1.
- NAO - Signalling network NAO - Signalling network NAO.
- NA1 - Signalling network NA1 - Signalling network NA1.

Default

""

Name

rssn - Replicative subsystem

Syntax

--rssn <integer>

Description

Use this parameter to specify the replicative subsystem number. please, check that this subsystem number has been configured through cmm sccpsubsystem list. you must give the rnet and rdpc parameters before giving the rssn parameter.

Class

Optional.

Type / Range

Integer in the range of 0 to 254

Default

0

Name

secGtmd - Secondary GT modification data id for called

Syntax

--secGtmd <integer>

Description

Use this parameter to specify the secondary modification data record, which you use to modify or replace the existing global title in the called address. used in load sharing case to modify or replace called GT address. please, check that this GT modification data record has been configured through cmm gtmodificationdata list. you cannot give this parameter unless the value of the RI secondary parameter is GT (route on gt). 0 default, id to secondary GT modification called data not exists.

Class

Optional.

Type / Range

Integer in the range of 0 to 256

Default

0

Name

secGtmg - Secondary GT modification data id for calling

Syntax

--secGtmg <integer>

Description

Use this parameter to specify the secondary modification data record, which you use to modify or replace the existing global title in the calling address. used in load sharing case to modify or replace calling GT address. please, check that this GT modification data record has been configured through cmm gtmodificationdata list. 0 default, id to secondary GT modification calling data not exists.

Class

Optional.

Type / Range

Integer in the range of 0 to 256

Default

0

Name

secondaryDpc - Secondary destination point code

Syntax

--secondaryDpc <integer>

Description

Use this parameter to specify the secondary destination point code. please, check that this destination point code has been configured through cmm sccpsignallingpoint list, and

that the signallingnetwork is the same as the given secondarynetwork. you must give the secondarynetwork parameter before the secondarydpc parameter.

Class

Optional.

Type / Range

Integer in the range of 0 to 16,777,215

Default

0

Name

secondaryNetwork - Secondary signalling network

Syntax

--secondaryNetwork <list-item>

Description

Use this parameter to specify the secondary signalling network. cases, IN0 international network number 0 IN1 international network number 1 NAO national network number 0 NA1 national network number 1.

Class

Optional.

List

- " - No signalling network - No signalling network.
- IN0 - Signalling network IN0 - Signalling network IN0.
- IN1 - Signalling network IN1 - Signalling network IN1.
- NAO - Signalling network NAO - Signalling network NAO.
- NA1 - Signalling network NA1 - Signalling network NA1.

Default

"

Name

secondaryPrio - Secondary priority for load sharing

Syntax

--secondaryPrio <list-item>

Description

Use this parameter to specify the secondary priority for a load sharing destination. if you give the secondaryprio parameter, you must indicate the load sharing later by setting loadsharing as true.

Class

Optional.

List

- 0 - No load sharing priority - No load sharing priority.
- 1 - Load sharing priority 1 - Load sharing priority 1.
- 2 - Load sharing priority 2 - Load sharing priority 2.

Default

0

Name

secondaryRi - Secondary routing indicator

Syntax

--secondaryRi <list-item>

Description

Use this parameter to specify the secondary routing indicator. Allowed values: SSN (route on ssn), GT (route on gt)

Class

Optional.

List

- " - No routing indicator - No routing indicator.
- GT - Routing indicator GT - Routing indicator GT.
- SSN - Routing indicator SSN - Routing indicator SSN.

Default

""

Name

secondarySsn - Secondary subsystem number

Syntax

--secondarySsn <integer>

Description

Use this parameter to specify the secondary subsystem number. please, check that this subsystem number has been configured through cmm sccpsubsystem list. you must give the secondarynetwork and secondarydpc parameters before giving the secondaryssn parameter.

Class

Optional.

Type / Range

Integer in the range of 0 to 254

Default

0

Name

secondaryWeight - Secondary Weight

Syntax

--secondaryWeight <integer>

Description

Use this parameter to specify the weight for the Secondary destination

Class

Optional.

Type / Range

Integer in the range of 1 to 255

Default

1

Name

special - Special indication

Syntax

--special <list-item>

Description

Use this parameter to specify whether the global title translation result contains a special treatment for the global title translated parameter. Allowed values: true, false

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

5.9 cmm gtLoadSharingNet

GT analysis Load Sharing Net. Syntax, description, parameters, and roles for cmm gtLoadSharingNet command.

Syntax**Description**

Use this command to configure, list and show Load Sharing Net records for a specific (GT) global title translation result record.

Parameters**Name**

gtLoadSharingNetId - GT analysis load sharing net identifier

Syntax

--gtLoadSharingNetId <integer>

Description

Use this parameter to specify the load sharing net record number for the specific (GT) global title translation result record.

Class

Required key.

Type / Range

Integer in the range of 3 to 32

Name

gtResultId - GT analysis result identifier

Syntax

--gtResultId <integer>

Description

Use this parameter to specify the (GT) global title translation result record. please check that this record exists through cmm gtanalysisresult list command.

Class

Required key.

Type / Range

Integer in the range of 1 to 10,239

Name

ldpc - Destination point code for load sharing

Syntax

--ldpc <integer>

Description

Use this parameter to specify the destination point code used in the load sharing result. please, check that this destination point code has been configured through cmm sccpsignallingpoint list, and that the signallingnetwork is the same as the given lnet. you must give the lnet parameter before the ldpc parameter.

Class

Required on create.

Type / Range

Integer in the range of 1 to 16,777,215

Name

lnet - Network for load sharing

Syntax

--lnet <list-item>

Description

Use this parameter to specify the signalling network used in the load sharing result cases, IN0 international network number 0 IN1 international network number 1 NAO national network number 0 NA1 national network number 1.

Class

Required on create.

List

- IN0 - International network number 0.
- IN1 - International network number 1.
- NAO - National network number 0.
- NA1 - National network number 1.

Name

lgtmd - GT modification data id for called

Syntax

--lgtmd <integer>

Description

Use this parameter to specify the modification data record, which you use to modify or replace the existing global title in the called address. used in load sharing case to modify or replace called GT address. please, check that this GT modification data record has been configured through cmm gtmodificationdata list. you cannot give this parameter unless the value of the RI parameter is GT (route on gt). 0 default, id to GT modification called data not exists.

Class

Optional.

Type / Range

Integer in the range of 0 to 256

Default

0

Name

lgtmg - GT modification data id for calling

Syntax

--lgtmg <integer>

Description

Use this parameter to specify the modification data record, which you use to modify or replace the existing global title in the calling address. used in load sharing case to modify or replace calling GT address. please, check that this GT modification data record has been configured through cmm gtmodificationdata list. you cannot give this parameter unless the value of the RI parameter is GT (route on gt). 0 default, id to GT modification calling data not exists.

Class

Optional.

Type / Range

Integer in the range of 0 to 256

Default

0

Name

lprio - Priority for load sharing

Syntax

--lprio <list-item>

Description

Use this parameter to specify the priority level for the load sharing destination.

Class

Optional.

List

- 0 - No load sharing priority - No load sharing priority.
- 1 - Load sharing priority 1 - Load sharing priority 1.
- 2 - Load sharing priority 2 - Load sharing priority 2.

Default

0

Name

lri - Routing indicator for load sharing

Syntax`--lri <list-item>`**Description**

Use this parameter to specify the routing indicator used in the load sharing result. Allowed values: SSN (route on ssn) , GT (route on gt)

Class

Optional.

List

- " - No routing indicator - No routing indicator.
- GT - Routing indicator GT - Routing indicator GT.
- SSN - Routing indicator SSN - Routing indicator SSN.

Default

""

Name

lssn - Subsystem number for load sharing

Syntax`--lssn <integer>`**Description**

Use this parameter to specify the new subsystem, which is the primary result of the global title translation. please, check that this subsystem number has been configured through cmm sccpsubsystem list. you must give the lnet and ldpc parameters before giving the lssn parameter.

Class

Optional.

Type / Range

Integer in the range of 0 to 254

Default

0

Name

lweight - Weight for load sharing

Syntax

--lweight <integer>

Description

Use this parameter to specify the weight for the load sharing destination.

Class

Optional.

Type / Range

Integer in the range of 1 to 255

Default

1

5.10 cmm gtModificationData

GT modification data. Syntax, description, parameters, and roles for **cmm gtModificationData** command.

Syntax**Description**

Use this command to configure, list and show (GT) global title modification data records. Note: Record 0 is a dummy record and it cannot be modified or removed.

Parameters

Name

gtModificationDataId - GT modification data id

Syntax

--gtModificationDataId <integer>

Description

Use this parameter to specify the id to the GT modification data record. it will be mapped to GTM file.

Class

Required key.

Type / Range

Integer in the range of 0 to 256

Name

digits - Digits

Syntax

--digits <digits>

Description

Use this parameter to specify the digit string to be added to the original global title.

Class

Required on create.

Type / Range

Digit string of length 1 to 24 with the allowed pattern of [0-9]*

Name

adp - Add digits pointer

Syntax

--adp <integer>

Description

Use this parameter to specify the digits pointer to be added.

Class

Optional.

Type / Range

Integer in the range of 0 to 24

Default

0

Name

ddc - Delete digits count

Syntax

--ddc <integer>

Description

Use this parameter to specify the number of digits to be deleted from an existing global title digit string.

Class

Optional.

Type / Range

Integer in the range of 0 to 24

Default

0

Name

ddp - Delete digits pointer

Syntax

--ddp <integer>

Description

Use this parameter to specify the digits pointer to be deleted.

Class

Optional.

Type / Range

Integer in the range of 0 to 24

Default

0

Name

gti - Gti

Syntax

--gti <integer>

Description

Use this parameter to specify the global title indicator for the specific SS7 standard. ITU cases, gti 0 no global title is included in the address gti 1 the global title only includes the nature of address indicator gti 2 the global title only includes the translation type gti 3 the global title includes the translation type, numbering plan and encoding scheme gti 4 the global title includes the translation type, numbering plan, encoding scheme and nature of address indicator gti 5 to 7 reserved for international use gti 8 to 14 reserved for national use gti 15 reserved for extension ANSI cases, gti 0 no global title is included in the address gti 1 the global title includes the translation type, numbering plan and encoding scheme

gti 2 the global title includes the translation type gti 3 to 4 not specified in the USA gti 5 to 7 reserved for international use gti 8 to 14 reserved for national use gti 15 reserved for extension.

Class

Optional.

Type / Range

Integer in the range of 1 to 4

Default

4

Name

nai - Nature of address indicator

Syntax

--nai <integer>

Description

Use this parameter to specify the nature of address indicator. cases, nai 0 spare nai 1 subscriber number nai 2 reserved for national use nai 3 national significant number nai 4 international number nai 5 to 127 spare.

Class

Optional.

Type / Range

Integer in the range of 0 to 127

Default

4

Name

numberingPlan - Numbering plan

Syntax

--numberingPlan <integer>

Description

Use this parameter to specify the numbering plan for the global title. cases, numberingplan 0 unknown numberingplan 1 ISDN,Telephony (Rec. E.164,E.163) , ISDN,telephone network numberingplan 2 spare numberingplan 3 data (Rec. X.121) , data network numberingplan 4 telex (Rec. F.69) , telex network numberingplan 5 maritime mobile (Rec. E.210, E.211) , maritime mobile telephone network numberingplan 6 land mobile (Rec. E.212) , mobile telephone network (Mobile subscriber identity) numberingplan 7 ISDN,Mobile (Rec. E.214) , ISDN, mobile telephone network (Mobile global title) numberingplan 8 to 14 spare numberingplan 15 reserved.

Class

Optional.

Type / Range

Integer in the range of 0 to 15

Default

1

Name

ss7Standard - Ss7Standard

Syntax

--ss7Standard <list-item>

Description

Use this parameter to specify the global title standard (ss7 standard). allowed values, ANSI , ITU.

Class

Optional.

List

- ANSI - Specify SS7 variant of american national standards institute.
- ITU - Specify SS7 variant of international telecommunication union - telecommunications.

Default

ITU

Name

translationType - Translation type

Syntax

--translationType <integer>

Description

Use this parameter to specify the translation type. the recommended parameter values depend on the standard and on the values of GTI you give. ITU cases, translationtype 0 translation type is not used. in the SGSN, this is the only supported value. translationtype 1 to 127 can be defined for use between networks translationtype 128 to 254 can be defined for internal use in the network translationtype 255 reserved for expansion ANSI cases, translationtype 0 reserved translationtype 1 981 telecommunications credit cards translationtype 2 14 digit calling card translationtype 3 cellular nationwide roaming service translationtype 4 global title point code translationtype 5 calling name delivery translationtype 6 to 31 can be defined for use between networks translationtype 32 to 222 spare translationtype 223 to 252 can be defined for internal use in the network translationtype 253 14 digit calling card translationtype 254 can be defined for internal use in the network.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

0

5.11 cmm gtpProfile

GTP Profile. Syntax, description, parameters, and roles for `cmm gtpProfile` command.

Syntax**Description**

This command is used to administer a GTP Profile and includes parameters for defining message attempts and timers.

Parameters**Name**

name - GTP profile name

Syntax

--name <string>

Description

Unique name for this GTP profile.

Restrictions

GTP profile with label = default always exists, it cannot be deleted, but can be update.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Name

bearerResourceCommandT3 - Bearer resource command timeout T3

Syntax

--bearerResourceCommandT3 <integer>

Description

Max wait time for bearer resource command.

Class

Optional.

Type / Range

Integer 100...60000, step 100 in units of Millisecond

Default

3000

Name

changeNotificationResponseT3 - Change notification response timeout T3

Syntax

--changeNotificationResponseT3 <integer>

Description

Max wait time for change notification response.

Class

Optional.

Type / Range

Integer 100...60000, step 100 in units of Millisecond

Default

3000

Name

ciotDIS1APMsgTunnelingN3 - N3 Downlink S1APMessage Tunneling message

Syntax

--ciotDlS1APMsgTunnelingN3 <integer>

Description

Maximum number of attempts to send the Downlink S1APMessage Tunneling message.

Class

Optional.

Type / Range

Integer in the range of 1 to 5

Default

2

Name

ciotDIS1APMsgTunnelingT3 - DL S1AP message tunneling timeout waiting for ACK message

Syntax

--ciotDlS1APMsgTunnelingT3 <integer>

Description

Max wait time for an ACK message to an Downlink S1APMessage Tunneling message.

Class

Optional.

Type / Range

Integer in the range of 100 to 3,000 in units of Millisecond

Default

500

Name

contextReqT3 - Context request timeout T3 waiting for response

Syntax

--contextReqT3 <integer>

Description

Max wait time for a response of a context request message (29.060).

Class

Optional.

Type / Range

Integer 100...60000, step 100 in units of Millisecond

Default

3000

Name

contextRspT3 - Context response timeout T3 waiting for ack

Syntax

--contextRspT3 <integer>

Description

Max wait time for a response to a context response message (29.060).

Class

Optional.

Type / Range

Integer 100...60000, step 100 in units of Millisecond

Default

3000

Name

createFwdTunnelResponseT3 - Create forward tunnel response timeout T3

Syntax

--createFwdTunnelResponseT3 <integer>

Description

Max wait time for create forward tunnel response.

Class

Optional.

Type / Range

Integer 100...60000, step 100 in units of Millisecond

Default

3000

Name

createIndirectDataFwdTunnelT3 - Create indirect data forward tunnel timeout T3

Syntax

--createIndirectDataFwdTunnelT3 <integer>

Description

Max wait time for create indirect data forward tunnel response.

Class

Optional.

Type / Range

Integer 100...60000, step 100 in units of Millisecond

Default

3000

Name

createSessResponseT3 - Create session response timeout T3

Syntax

--createSessResponseT3 <integer>

Description

Max wait time for create session response.

Class

Optional.

Type / Range

Integer 100...60000, step 100 in units of Millisecond

Default

3000

Name

createT3 - Create response timeout T3

Syntax

--createT3 <integer>

Description

Max wait time for a response of a create PDP context request message (29.060).

Class

Optional.

Type / Range

Integer 100...60000, step 100 in units of Millisecond

Default

3000

Name

deleteBearerCommandT3 - Delete bearer command timeout T3

Syntax

--deleteBearerCommandT3 <integer>

Description

Max wait time for delete bearer command.

Class

Optional.

Type / Range

Integer 100...60000, step 100 in units of Millisecond

Default

3000

Name

deleteIndirectDataFwdTunnelT3 - Delete indirect data forward tunnel timeout T3

Syntax

--deleteIndirectDataFwdTunnelT3 <integer>

Description

Max wait time for delete indirect data forward tunnel response.

Class

Optional.

Type / Range

Integer 100...60000, step 100 in units of Millisecond

Default

3000

Name

deletePdnConnSetResponseT3 - Delete PDN connection set response timeout T3

Syntax

--deletePdnConnSetResponseT3 <integer>

Description

Max wait time for delete PDN connection set response.

Class

Optional.

Type / Range

Integer 100...60000, step 100 in units of Millisecond

Default

3000

Name

deleteSessResponseT3 - Delete session response timeout T3

Syntax

--deleteSessResponseT3 <integer>

Description

Max wait time for delete session response.

Class

Optional.

Type / Range

Integer 100...60000, step 100 in units of Millisecond

Default

3000

Name

deleteT3 - Delete response timeout T3

Syntax

--deleteT3 <integer>

Description

Max wait time for a response to a delete PDP context request message (29.060).

Class

Optional.

Type / Range

Integer 100...60000, step 100 in units of Millisecond

Default

3000

Name

description - GTP profile description

Syntax

--description <string>

Description

GTP profile description.

Class

Optional.

Type / Range

Digit string of length 0 to 80 with the allowed pattern of [0-9a-zA-Z\.\- _:@]*

Default

"

Name

echoRequests - Echo requests

Syntax

--echoRequests <integer>

Description

(N3-REQUESTS) the total number of echo request messages to be transmitted without receiving a corresponding echo response message after receiving at least one echo response from an endpoint.

Class

Optional.

Type / Range

Integer in the range of 5 to 20

Default

9

Name

fwdContextT3 - Forward context ack timeout T3

Syntax

--fwdContextT3 <integer>

Description

Max wait time for a response to a forward context message (29.060).

Class

Optional.

Type / Range

Integer 100...60000, step 100 in units of Millisecond

Default

3000

Name

identificationT3 - Identification response timeout T3

Syntax

--identificationT3 <integer>

Description

Max wait time for a response of an identification request message (29.060).

Class

Optional.

Type / Range

Integer 100...60000, step 100 in units of Millisecond

Default

3000

Name

modifyAccessBearersResponseT3 - Modify access bearers response timeout T3

Syntax

--modifyAccessBearersResponseT3 <integer>

Description

Max wait time for modify access bearers response.

Class

Optional.

Type / Range

Integer 100...60000, step 100 in units of Millisecond

Default

3000

Name

modifyBearerCommandT3 - Modify bearer command timeout T3

Syntax

--modifyBearerCommandT3 <integer>

Description

Max wait time for modify bearer command.

Class

Optional.

Type / Range

Integer 100...60000, step 100 in units of Millisecond

Default

3000

Name

modifyBearerResponseT3 - Modify bearer response timeout T3

Syntax

--modifyBearerResponseT3 <integer>

Description

Max wait time for modify bearer response.

Class

Optional.

Type / Range

Integer 100...60000, step 100 in units of Millisecond

Default

3000

Name

n3BearerResourceCommand - N3 bearer resource command attempts

Syntax

--n3BearerResourceCommand <integer>

Description

Max number of attempts to send bearer resource command.

Class

Optional.

Type / Range

Integer in the range of 1 to 5

Default

3

Name

n3ChangeNotificationRequest - N3 change notification request attempts

Syntax

--n3ChangeNotificationRequest <integer>

Description

Max number of attempts to send change notification request.

Class

Optional.

Type / Range

Integer in the range of 1 to 5

Default

3

Name

n3ContextReq - N3 context request attempts

Syntax

--n3ContextReq <integer>

Description

Max number of attempts to send a context request message (29.060).

Class

Optional.

Type / Range

Integer in the range of 1 to 5

Default

3

Name

n3ContextRsp - N3 context response attempts

Syntax

--n3ContextRsp <integer>

Description

Max number of attempts to send a context response message (29.060).

Class

Optional.

Type / Range

Integer in the range of 1 to 5

Default

3

Name

n3Create - N3 create request attempts

Syntax`--n3Create <integer>`**Description**

Max number of attempts to send a create request message (29.060).

Class

Optional.

Type / Range

Integer in the range of 1 to 5

Default

3

Name

n3CreateFwdTunnelRequest - N3 create forward tunnel request attempts

Syntax`--n3CreateFwdTunnelRequest <integer>`**Description**

Max number of attempts to send create forward tunnel request.

Class

Optional.

Type / Range

Integer in the range of 1 to 5

Default

3

Name

n3CreateIndirectDataFwdTunnel - N3 create indirect data forward tunnel attempts

Syntax`--n3CreateIndirectDataFwdTunnel <integer>`**Description**

Max number of attempts to send create indirect data forward tunnel request.

Class

Optional.

Type / Range

Integer in the range of 1 to 5

Default

3

Name

n3CreateSessRequest - N3 create session request attempts

Syntax

--n3CreateSessRequest <integer>

Description

Max number of attempts to send create session request.

Class

Optional.

Type / Range

Integer in the range of 1 to 5

Default

3

Name

n3Delete - N3 delete request attempts

Syntax

--n3Delete <integer>

Description

Max number of attempts to send a delete request message (29.060).

Class

Optional.

Type / Range

Integer in the range of 1 to 5

Default

3

Name

n3DeleteBearerCommand - N3 delete bearer command attempts

Syntax

--n3DeleteBearerCommand <integer>

Description

Max number of attempts to send delete bearer command.

Class

Optional.

Type / Range

Integer in the range of 1 to 5

Default

3

Name

n3DeleteIndirectDataFwdTunnel - N3 delete indirect data forward tunnel attempts

Syntax

--n3DeleteIndirectDataFwdTunnel <integer>

Description

Max number of attempts to send delete indirect data forward tunnel request.

Class

Optional.

Type / Range

Integer in the range of 1 to 5

Default

3

Name

n3DeletePdnConnSetResponse - N3 delete PDN conn set req attempts

Syntax

--n3DeletePdnConnSetResponse <integer>

Description

Max number of attempts to send delete PDN connection set request.

Class

Optional.

Type / Range

Integer in the range of 1 to 5

Default

3

Name

n3DeleteSessRequest - N3 delete session request attempts

Syntax

--n3DeleteSessRequest <integer>

Description

Max number of attempts to send delete session request.

Class

Optional.

Type / Range

Integer in the range of 1 to 5

Default

3

Name

n3FwdContext - N3 forward context attempts

Syntax

--n3FwdContext <integer>

Description

Max number of attempts to send a forward context message (29.060).

Class

Optional.

Type / Range

Integer in the range of 1 to 5

Default

3

Name

n3Identification - N3 identification request attempts

Syntax

--n3Identification <integer>

Description

Max number of attempts to send an identification request message.

Class

Optional.

Type / Range

Integer in the range of 1 to 5

Default

3

Name

n3ModifyAccessBearersRequest - N3 modify access bearers request attempts

Syntax

--n3ModifyAccessBearersRequest <integer>

Description

Max number of attempts to send modify access bearers request.

Class

Optional.

Type / Range

Integer in the range of 1 to 5

Default

3

Name

n3ModifyBearerCommand - N3 modify bearer command attempts

Syntax

--n3ModifyBearerCommand <integer>

Description

Max number of attempts to send modify bearer command.

Class

Optional.

Type / Range

Integer in the range of 1 to 5

Default

3

Name

n3ModifyBearerRequest - N3 modify bearer request attempts

Syntax

--n3ModifyBearerRequest <integer>

Description

Max number of attempts to send modify bearer request.

Class

Optional.

Type / Range

Integer in the range of 1 to 5

Default

3

Name

n3ReleaseAccessBearersRequest - N3 release access bearers request attempts

Syntax

--n3ReleaseAccessBearersRequest <integer>

Description

Max number of attempts to send release access bearers request.

Class

Optional.

Type / Range

Integer in the range of 1 to 5

Default

3

Name

n3RelocationCancel - N3 relocation cancel attempts

Syntax

--n3RelocationCancel <integer>

Description

Max number of attempts to send a relocation cancel message (29.060).

Class

Optional.

Type / Range

Integer in the range of 1 to 5

Default

3

Name

n3RelocationCmpl - N3 forward relocation complete attempts

Syntax

--n3RelocationCmpl <integer>

Description

Max number of attempts to send a relocation complete message (29.060).

Class

Optional.

Type / Range

Integer in the range of 1 to 5

Default

3

Name

n3RelocationReq - N3 forward relocation request attempts

Syntax

--n3RelocationReq <integer>

Description

Max number of attempts to send relocation request message (29.060).

Class

Optional.

Type / Range

Integer in the range of 1 to 5

Default

3

Name

n3ResumeNotification - N3 resume notification attempts

Syntax

--n3ResumeNotification <integer>

Description

Max number of attempts to send resume notification.

Class

Optional.

Type / Range

Integer in the range of 1 to 5

Default

3

Name

n3SrvccCancelNotification - N3 srvcc cancel notification attempts

Syntax

--n3SrvccCancelNotification <integer>

Description

Max number of attempts to send srvcc cancel notification.

Class

Optional.

Type / Range

Integer in the range of 1 to 5

Default

3

Name

n3SrvccRequest - N3 srvcc request attempts

Syntax

--n3SrvccRequest <integer>

Description

Max number of attempts to send srvcc request.

Class

Optional.

Type / Range

Integer in the range of 1 to 5

Default

3

Name

n3SuspendNotification - N3 suspend notification attempts

Syntax

--n3SuspendNotification <integer>

Description

Max number of attempts to send suspend notification.

Class

Optional.

Type / Range

Integer in the range of 1 to 5

Default

3

Name

n3Update - N3 update request attempts

Syntax

--n3Update <integer>

Description

Max number of attempts made by GTP-C to send a update request message (29.060).

Class

Optional.

Type / Range

Integer in the range of 1 to 5

Default

3

Name

numTransmits - Number of retransmits

Syntax

--numTransmits <integer>

Description

Number of transmits. if an acknowledgment is not sent in the time frame specified in the GTP message response timer, this value is the total number of times to transmit the message.

Class

Optional.

Type / Range

Integer in the range of 1 to 5

Default

3

Name

releaseAccessBearersResponseT3 - Release access bearers response timeout T3

Syntax

--releaseAccessBearersResponseT3 <integer>

Description

Max wait time for release access bearers response.

Class

Optional.

Type / Range

Integer 100...60000, step 100 in units of Millisecond

Default

3000

Name

relocationCancelT3 - Relocation cancel response timeout T3

Syntax

--relocationCancelT3 <integer>

Description

Max wait time for a response of a relocation cancel message (29.060).

Class

Optional.

Type / Range

Integer 100...60000, step 100 in units of Millisecond

Default

3000

Name

relocationCmplT3 - Relocation complete ack timeout T3

Syntax

--relocationCmplT3 <integer>

Description

Max wait time for a response to a relocation complete message (29.060).

Class

Optional.

Type / Range

Integer 100...60000, step 100 in units of Millisecond

Default

3000

Name

relocationReqT3 - Relocation request timeout T3 waiting for response

Syntax

--relocationReqT3 <integer>

Description

Max wait time for a response of a relocation request message (29.060).

Class

Optional.

Type / Range

Integer 100...60000, step 100 in units of Millisecond

Default

3000

Name

resumeNotificationAckT3 - Resume notification acknowledge timeout T3

Syntax

--resumeNotificationAckT3 <integer>

Description

Max wait time for resume notification acknowledge.

Class

Optional.

Type / Range

Integer 100...60000, step 100 in units of Millisecond

Default

3000

Name

retransTimerT3 - Retransmit timer T3

Syntax

--retransTimerT3 <integer>

Description

The time to wait for acknowledgment of a message.

Class

Optional.

Type / Range

Integer 100...60000, step 100 in units of Millisecond

Default

3000

Name

sendEchoOnFailure - Send echo requests on failure

Syntax

--sendEchoOnFailure <list-item>

Description

Controls sending echo requests when no GTP-C non-echo response messages are received for a period of time.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

sendEchoTimerT3 - Send echo request timer T3

Syntax

--sendEchoTimerT3 <integer>

Description

The periodic interval for sending echo requests on interfaces that support GTP communications.

Class

Optional.

Type / Range

Integer value of 60000...10800000, step 100 in units of Millisecond

Default

60000

Name

sendPeriodicEcho - Send periodic echo requests

Syntax

--sendPeriodicEcho <list-item>

Description

Controls sending of periodic echo requests on enabled links.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

srvccCancelAckT3 - Srvcc cancel acknowledge timeout T3

Syntax

--srvccCancelAckT3 <integer>

Description

Max wait time for srvcc cancel acknowledge.

Class

Optional.

Type / Range

Integer 100...60000, step 100 in units of Millisecond

Default

3000

Name

srvccResponseT3 - Srvcc response timeout T3

Syntax

--srvccResponseT3 <integer>

Description

Max wait time for srvc response.

Class

Optional.

Type / Range

Integer 100...60000, step 100 in units of Millisecond

Default

3000

Name

suspendAckT3 - Suspend acknowledge timeout T3

Syntax

--suspendAckT3 <integer>

Description

Max wait time for suspend acknowledge.

Class

Optional.

Type / Range

Integer 100...60000, step 100 in units of Millisecond

Default

3000

Name

updateT3 - Update response timeout T3

Syntax

--updateT3 <integer>

Description

Max wait time for a response to a update PDP context request message (29.060).

Class

Optional.

Type / Range

Integer 100...60000, step 100 in units of Millisecond

Default

3000

Name

waitEchoTimerT3 - Wait for echo response timer T3

Syntax

--waitEchoTimerT3 <integer>

Description

Specifies the time to wait for an echo response to be received before retransmitting the echo request message. the total time to wait for an echo response (N3-REQUESTS * T3-RESPONSE) should be less than the periodic time (Send echo request timer) used to send the echo request message.

Class

Optional.

Type / Range

Integer 1000...600000, step 100 in units of Millisecond

Default

6000

5.12 cmm gtpRestartCount

GTP Restart Count. Syntax, description, parameters, and roles for cmm gtpRestartCount command.

Syntax**Description**

Command to modify GTP link Restart Counter information. The GTP Restart Count Status command can used list and show the MME restart counter, and peer restart counter data.

Parameters**Name**

mmeRestart - MME Restart Counter

Syntax

--mmeRestart <integer>

Description

The local MME restart counter, as described in 29.274. MME restart counter applies to all GTP interfaces, not a specific linkIndex.

Class

Required on create.

Type / Range

Integer in the range of 0 to 255

Roles**Modify**

sysadmin, manage

5.13 cmm gtpRestartCountStatus

GTP Restart Count Status. Syntax, description, parameters, and roles for cmm gtpRestartCountStatus command.

Syntax**Description**

This command can be used to list the link Index; the MME restart counter; and peer restart counter for all the GTP links of a specified link Interface Type. This command can be used to show the the MME restart counter and peer restart counter for a specific GTP link Index. The GTP Restart Count command is used to modify the MME restart counter.

Parameters**Name**

linkInterfaceType - Link Interface type

Syntax

--linkInterfaceType <list-item>

Description

Link Interface Type applies only to the list and show operations. When included in the list operation, all links of this interface type will be listed. When included in the show operation, a link Index is expected so only the specific link Index for that interface type will be shown.

Class

Required key.

List

- s11 - Specify the S11 interface to an SGW.

Default

s11

Name

linkIndex - Link Index

Syntax

--linkIndex <integer>

Description

Link Index from the list operation, or from cmm multiLink or cmm linkAdmin commands

Class

Required key.

Type / Range

Integer in the range of 0 to 4,294,967,295

Name

gtpRestart - GTP Restart Counter

Syntax

--gtpRestart <integer>

Description

Peer GTP Restart Recovery Counter. Peer node type relates to the link Interface Type (e.g. SGW is the peer node for the S11interfaceType)

Class

Read only.

Type / Range

Integer in the range of 0 to 255

Name

mmeRestart - MME Restart

Syntax

--mmeRestart <integer>

Description

MME GTP Restart Recovery Counter

Class

Read only.

Type / Range

Integer in the range of 0 to 255

Roles

Show

sysadmin, manage, monitor

List

sysadmin, manage, monitor

5.14 cmm gtpTimer

gtpTimer. Syntax, description, parameters, and roles for cmm gtpTimer command.

Syntax

Description

Configure, list and show GTP timers.

Parameters

Name

gtptmrInUse - IN USE flag for GTP timer profile, INUSE

Syntax

--gtptmrInUse <list-item>

Description

This parameter specifies whether a specific GTP timer profile is currently in use. it is used in cases where operator wishes to disable a specific timer profile without deactivating the whole feature.

Class

Optional, not filterable on list.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

gtptmrN3CreSesReqCounter - N3-response timer of create session response, N3CS

Syntax

--gtptmrN3CreSesReqCounter <integer>

Description

This parameter defines the value for the counter that holds the maximum number of attempts made by the GPRS tunneling protocol V2 (GTPv2) to send a create session request message. the values range from 1 to 7 seconds in 1 second steps.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 7

Default

5

Name

gtptmrN3ModBeaReqCounter - N3-request counter for GTPv2 modify bearer request, N3MB

Syntax

--gtptmrN3ModBeaReqCounter <integer>

Description

This parameter defines the value for the counter that holds the maximum number of attempts made by the GPRS tunneling protocol v2 (GTPv2) to send a modify bearer request message. the values range from 1 to 7 seconds in 1 second steps.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 7

Default

5

Name

gtptmrN3PdpCreReqCounter - N3-requests counter for create PDP context requests, N3CRE

Syntax

--gtptmrN3PdpCreReqCounter <integer>

Description

This parameter defines the value for the counter that holds the maximum number of attempts made by the GPRS tunnelling protocol (GTP) to send a create PDP context request message. the values range from 1 to 7 seconds in 1 second steps.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 7

Default

5

Name

gtptmrN3PdpUpdReqCounter - N3-request counter for update PDP context requests, N3UPD

Syntax

--gtptmrN3PdpUpdReqCounter <integer>

Description

This parameter defines the value for the counter that holds the maximum number of attempts made by the GPRS tunnelling protocol (GTP) to send an update PDP context request message. the values range from 1 to 7 seconds in 1 second steps.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 7

Default

5

Name

gtptmrPrName - GTP timer profile name, TMRPR

Syntax

--gtptmrPrName <string>

Description

This parameter defines a short name for a GTP timer profile.

Class

Optional, not filterable on list.

Type / Range

Digit string of length 0 to 6 with the allowed pattern of [0-9a-zA-Z\._:-]*

Default

""

Name

gtptmrT3CreSesRespTimer - T3-response timer of create session response in seconds, T3CS

Syntax

--gtptmrT3CreSesRespTimer <integer>

Description

This parameter defines the value for the timer that holds the maximum waiting time for a create session response message to a create session request message. the values range from 1 to 10 seconds in 1 second steps.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 10

Default

3

Name

gtptmrT3ModBeaRespTimer - T3-response timer of modify bearer response in seconds, T3MB

Syntax

--gtptmrT3ModBeaRespTimer <integer>

Description

This parameter defines the value for the timer that holds the maximum waiting time for a modify bearer response message to a modify bearer request message. the values range from 1 to 10 seconds in 1 second steps.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 10

Default

3

Name

gtptmrT3PdpCreRespTimer - N3-requests counter for create PDP context requests, T3CRE

Syntax

--gtptmrT3PdpCreRespTimer <integer>

Description

This parameter defines the value for the timer that holds the maximum waiting time for a create PDP context response message to a create PDP context request message. the values range from 1 to 10 seconds in 1 second steps.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 10

Default

3

Name

gtptmrT3PdpUpdRespTimer - T3-response timer of update PDP context response, T3UPD

Syntax

```
--gtptmrT3PdpUpdRespTimer <integer>
```

Description

This parameter defines the value for the timer that holds the maximum waiting time for an update PDP context response message to an update PDP context request message. the values range from 1 to 10 seconds in 1 second steps.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 10

Default

3

Name

id - Id, TBLIND

Syntax

<integer>

Description

This parameter defines an id of GTP timer profile table to hold n3/t3 values.

Class

Required value.

Type / Range

Integer in the range of 1 to 6

Roles**Create**

sysadmin, manage

5.15 cmm gwNodeAdmin

Signaling Node Admin. Syntax, description, parameters, and roles for cmm gwNodeAdmin command.

Syntax

Description

Signaling Node Admin. This command is used to (1) suspend a node from node selection, (2) resume selection of a node that was previously suspended. (3) to delete a node by giving node_index. (4) when reading pgw , PGW* and SGW* fields will be filled with data (5) when reading sgw , SGW* fields will be filled with data.

Parameters

Name

sigNodeType - Node type

Syntax

--sigNodeType <list-item>

Description

Node type specifies the type of node. the nodes types supported are pgw and sgw.

Class

Required key.

List

- pgw - PDN gateway - Specify node type of packet data network gateway.
- sgw - Serving gateway - Specify node type of serving gateway.

Name

networkTechType - Network technology type

Syntax

--networkTechType <list-item>

Description

Network technology type of node.

Class

Required key.

List

- lte - This selection provides node status maintained by the MME.

Name

nodeIndex - Node index

Syntax

--nodeIndex <integer>

Description

Node index.

Class

Required key.

Type / Range

Integer in the range of 1 to 10,000

Name

nodeAdminState - Node admin state

Syntax

--nodeAdminState <list-item>

Description

Specified current admin state.

Class

Optional.

List

- delete - To delete the entity. this is a special case as it is a command.
- resume - To resume the entity.
- suspend - To suspend the entity.
- unknown - This is not a valid value during update.

Name

numberOfTimeoutFailure - Number of timeout failure

Syntax

--numberOfTimeoutFailure <integer>

Description

Number of timeout failure.

Class

Read only.

Type / Range

Integer in the range of 0 to 65,535

Name

pgwApnNi - PGW APN NI

Syntax

--pgwApnNi <string>

Description

APN of a node.

Class

Read only.

Type / Range

Digit string of length 0 or 1 to 62

Name

pgwFqdn - PGW FQDN

Syntax

--pgwFqdn <string>

Description

FQDN of the node.

Class

Read only.

Type / Range

Digit string of length 0 or 1 to 128

Name

pgwNodeIpAddress1 - PGW IP address 1

Syntax

--pgwNodeIpAddress1 <string>

Description

IP address 1 of a node.

Class

Read only.

Type / Range

Digit string of length 0 or 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

pgwNodeIpAddress2 - PGW IP address 2

Syntax

--pgwNodeIpAddress2 <string>

Description

IP address 2 of a node.

Class

Read only.

Type / Range

Digit string of length 0 or 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

remainingTimeSuspendState - Remaining time in suspend state

Syntax

--remainingTimeSuspendState <string>

Description

Remaining Time in Suspend state. If manually suspended it will indicate Manually Suspended. If in resumed state it will be 0. If automatically suspended it will indicate the remaining time in minutes

Class

Read only.

Type / Range

Digit string of length 0 or 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

sgwFqdn - SGW FQDN

Syntax

--sgwFqdn <string>

Description

FQDN of the node of SGW.

Class

Read only.

Type / Range

Digit string of length 0 or 1 to 128

Name

sgwNodeIpAddress1 - SGW IP address 1

Syntax

--sgwNodeIpAddress1 <string>

Description

IP address 1 of a node.

Class

Read only.

Type / Range

Digit string of length 0 or 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

sgwNodeIpAddress2 - SGW IP address 2

Syntax

--sgwNodeIpAddress2 <string>

Description

IP address 2 of a node.

Class

Read only.

Type / Range

Digit string of length 0 or 2 to 39 with the allowed pattern of [0-9a-f\.:]*

5.16 cmm gwPool

GW pool. Syntax, description, parameters, and roles for cmm gwPool command.

Syntax**Description**

GW pool.

Parameters**Name**

gwPoolName - GW pool name

Syntax

--gwPoolName <string>

Description

GW pool name.

Class

Required key.

Type / Range

Digit string of length 1 to 20 with the allowed pattern of [0-9a-zA-Z\._ :]*

Name

gwType - PGW or SGW

Syntax

--gwType <list-item>

Description

PGW or SGW.

Class

Required on create.

List

- pgw - PDN gateway - Specify node type of packet data network gateway.
- sgw - Serving gateway - Specify node type of serving gateway.

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Modify

sysadmin, manage

5.17 cmm gwPoolMap

GW pool map. Syntax, description, parameters, and roles for cmm gwPoolMap command.

Syntax**Description**

GW pool map.

Parameters**Name**

gwPoolName - GW pool name

Syntax

--gwPoolName <string>

Description

GW pool name.

Class

Required key.

Type / Range

Digit string of length 1 to 20 with the allowed pattern of [0-9a-zA-Z\._ :]*

Name

ip - GW IP

Syntax

--ip <string>

Description

GW ip.

Class

Required key.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

5.18 cmm gwts

GW-TS. Syntax, description, parameters, and roles for cmm gwts command.

Syntax**Description**

This command is used to administer a GW-TS and includes parameters for defining the GW-TS ID, minimum number of TCP connections, and the GW-TS preference.

Parameters

Name

name - GW-TS name

Syntax

--name <string>

Description

GW-TS name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

gwtsId - GW-TS ID

Syntax

--gwtsId <integer>

Description

GW-TS ID.

Class

Required on create, not modifiable.

Type / Range

Integer in the range of 1 to 128

Name

minTcpConns - Minimum TCP connections

Syntax

--minTcpConns <integer>

Description

Minimum number of TCP connections required on a GW-TS for normal operation.

Class

Optional.

Type / Range

Integer in the range of 1 to 8

Default

2

Name

preference - Preference

Syntax

--preference <integer>

Description

Preference for a GW-TS.

Class

Optional.

Type / Range

Integer in the range of 1 to 1000

Default

1

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

5.19 cmm gwtsNodeAdmin

GWTS Node Admin. Syntax, description, parameters, and roles for cmm gwtsNodeAdmin command.

Syntax**Description**

GWTS Node Administration. This command is used to lock/unlock the GWTS node.

Parameters**Name**

gwtsName - GWTS node name

Syntax

--gwtsName <string>

Description

GWTS node name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

gwtsId - GWTS ID

Syntax

--gwtsId <integer>

Description

GWTS ID.

Class

Read only.

Type / Range

Integer in the range of 1 to 128

Default

1

Name

nodeAdminState - Node admin state

Syntax

--nodeAdminState <list-item>

Description

Specified current admin state.

Class

Optional.

List

- lock - To lock the entity.
- shutdown - To shutdown the entity.
- unlock - To unlock the entity.

Default

unlock

Name

nodeOperState - Node operation state

Syntax

--nodeOperState <list-item>

Description

Node operation state.

Class

Read only.

List

- disabled - Specify operational state of disabled.
- enabled - Specify operational state of enabled.
- unknown - Specify operational state of unknown.

Default

unknown

Roles**Show**

sysadmin, manage, monitor

Modify

sysadmin, manage

5.20 cmm gwtsRmtEndPtMap

GW-TS to Remote End Point. Syntax, description, parameters, and roles for cmm gwtsRmtEndPtMap command.

Syntax**Description**

This command is used to associate a GW-TS with a Remote End Point.

Parameters**Name**

gwtsName - GW-TS name

Syntax

--gwtsName <string>

Description

GW-TS name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

sgsLtRmtEndPtName - SGS lite remote end point name

Syntax

--sgsLtRmtEndPtName <string>

Description

Remote end point name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

5.21 cmm heartbeat

Heartbeat. Syntax, description, parameters, and roles for cmm heartbeat command.

Syntax**Description**

Heartbeat.

Parameters

Name

label - Label

Syntax

--label <string>

Description

Just need a parameter for the operation.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Roles

Modify

sysadmin, manage

5.22 cmm highPriArpGroup

High Priority ARP Group. Syntax, description, parameters, and roles for cmm highPriArpGroup command.

Syntax

Description

Customized Group users (IMSI) have higher ARP priorities than the default all users. If an IMSI is configured under this cli. SGSN will assign ARP 1 to it, also PVI, PCI and Queue should be configured.

Parameters

Name

entryId - Entry ID

Syntax

--entryId <integer>

Description

Defines the order i.e. precedence of the entry

Class

Required key.

Type / Range

Integer in the range of 1 to 1000

Name

plmnName - Home PLMN Name

Syntax

--plmnName <string>

Description

Home PLMN parameter set connected to the IMSI digits

Class

Required key.

Type / Range

Digit string of length 1 to 15 with the allowed pattern of [0-9a-zA-Z\.\-_:]*

Name

maxMsin - Maximum MSIN

Syntax

--maxMsin <digits>

Description

The maximum IMSI MSIN value.

Class

Optional.

Type / Range

Digit string of length 0 or 9 to 10

Default

9999999999

Name

minMsin - Minimum MSIN

Syntax

--minMsin <digits>

Description

The minimum IMSI MSIN value.

Class

Optional.

Type / Range

Digit string of length 0 or 9 to 10

Default

0000000000

Name

preLevel - Pre-emption Level

Syntax

--preLevel <integer>

Description

This parameter specifies the pre-emption capability of the requested radio bearer. This capability corresponds to the Pre-emption Capability IE in the ARP attribute of the radio bearer (see 3GPP TS 25.413). The default value for PCI shall be 1 (may trigger pre-emption). If it's configured as 0, SGSN Will send it to radio as 0 (shall not trigger pre-emption).

Class

Optional.

Type / Range

Integer in the range of 0 to 1

Default

1

Name

preVulnerability - Pre-emption Vulnerability

Syntax

--preVulnerability <integer>

Description

This parameter specifies the pre-emption vulnerability of the requested radio bearer. This vulnerability corresponds to the Pre-emption Vulnerability IE in the ARP attribute of the radio bearer. For details, see 3GPP TS 25.413. The default value of PVI shall be 0 (not pre-emptable). If it's configured as 1, SGSN will send it to radio as 1 (pre-emptable).

Class

Optional.

Type / Range

Integer in the range of 0 to 1

Default

0

Name

queue - Queue

Syntax

--queue <integer>

Description

Queuing Allowed. This parameter specifies whether a radio bearer setup request can be included in the resource allocation queue. This parameter corresponds to the Queuing

Allowed IE in the ARP attribute of the radio bearer. For details, see 3GPP TS 25.413. The default value shall be 1 (queuing allowed). if it's configured to 0, SGSN Will send 0 to RNC (queuing not allowed).

Class

Optional.

Type / Range

Integer in the range of 0 to 1

Default

1

Roles**Create**

sysadmin, manage

5.23 cmm highTrafficCell

highTrafficCell. Syntax, description, parameters, and roles for **cmm highTrafficCell** command.

Syntax

Description

Configure, list and show distribution of cells. Use this command to add, interrogate or remove high traffic cell location in the PAPS. The count of possible high traffic cells is limited, that is, only the most important cells can be defined to be the high traffic cells.

Parameters

Name

cellIdentity - Cell identity

Syntax

--cellIdentity <integer>

Description

This parameter defines the cell number.

Class

Required on create, not filterable on list.

Type / Range

Integer in the range of 0 to 65,535

Name

lac - Location area code

Syntax

--lac <integer>

Description

This parameter defines the LAC number.

Class

Required on create, not filterable on list.

Type / Range

Integer in the range of 1 to 65,533

Name

mcc - Mobile country code

Syntax

--mcc <digits>

Description

This parameter defines the MCC number.

Class

Required on create, not filterable on list.

Type / Range

Digit string of length 3

Name

mnc - Mobile network code

Syntax

--mnc <digits>

Description

This parameter defines the MNC number.

Class

Required on create, not filterable on list.

Type / Range

Digit string of length 2 to 3

Name

papsIndex - PAPS index

Syntax

--papsIndex <integer>

Description

This parameter defines the PAPS to which the high traffic cell is located.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 0 to 19, 255 for invalid

Default

255

Name

id - Id

Syntax

<integer>

Description

High traffic cell id.

Class

Required value.

Type / Range

Integer in the range of 1 to 100

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

5.24 cmm hoCellIdRestrictionList

Handover Cell Identity Restriction List for MME. Syntax, description, parameters, and roles for cmm hoCellIdRestrictionList command.

Syntax

Description

Administer Handover Cell Identity Restriction List

Parameters

Name

name - Cell Identity Restriction List name

Syntax

--name <string>

Description

Identifies the name of the Cell Identity Restriction List.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

listInterface - List of Interfaces

Syntax

--listInterface <list-item>

Description

Identify the interface used for cell id based handover.

Class

Required on create, not modifiable.

List

- n26 - n26 Interface between MME and AMF - Cell identifier based handover over N26 interface between target MME and Source AMF

Name

listType - List Type

Syntax

--listType <list-item>

Description

Identify if the Cell Identity restriction list is of type allow or deny list.

Class

Optional.

List

- allow - Allow Handover Cell Ids list - Identify the list of Cell Ids from which handover is allowed
- deny - Deny Handover Cell Ids list - Identify the list of Cell Ids from which handover is denied

Default

allow

5.25 cmm hoCellIdRestrictionListItem

Handover Cell ID Restriction List. Syntax, description, parameters, and roles for cmm hoCellIdRestrictionListItem command.

Syntax**Description**

Administers addition (or deletion) of cell id to the handover cell id restriction list. MME supports up to 16 cell id restriction lists with a maximum number of 10k cell ids. A list can have up to 10k cell ids resulting in one possible list since maximum numbers of cell ids allowed is used.

Parameters

Name

hoCellIdRestrictionListName - Handover Cell ID Restriction List Name

Syntax

--hoCellIdRestrictionListName <string>

Description

Name of the handover cell id restriction list.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

cellIdName - Cell Identifier Name

Syntax

--cellIdName <string>

Description

Name of the cell id.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

5.26 cmm homeAccessList

home access list. Syntax, description, parameters, and roles for cmm homeAccessList command.

Syntax

Description

Configure, list and show home access list.

Parameters

Name

homeAccessListId - Home access list id

Syntax

--homeAccessListId <integer>

Description

Home access list identifier.

Class

Required key.

Type / Range

Integer in the range of 1 to 1000

Name

alName - Access list name

Syntax

--alName <string>

Description

Access list name.

Class

Optional.

Type / Range

Digit string of length 0 to 15 with the allowed pattern of [0-9a-zA-Z\.\-:]*

Default

""

Roles

Create

sysadmin, manage

Show

5.27 cmm homeSubscriberGroup

home subscriber group. Syntax, description, parameters, and roles for cmm homeSubscriberGroup command.

Syntax

Description

Configure, list and show SGSN home subscribers.

Parameters

Name

homeSubscriberGroupId - Home subscriber group id

Syntax

--homeSubscriberGroupId <integer>

Description

Home subscriber group identifier.

Class

Required key.

Type / Range

Integer in the range of 1 to 5,000

Name

homeAccessListId - Home access list id

Syntax

--homeAccessListId <integer>

Description

Home access list identifier.

Class

Required on create, not modifiable.

Type / Range

Integer in the range of 1 to 1000

Name

accessRights - Access rights

Syntax

--accessRights <list-item>

Description

Access rights of subscriber group. possible values, norights ... no rights
2groamgeranandutran ... 2G roaming allowed with GERAN and UTRAN
3groamgeranandutran ... 3G roaming allowed with GERAN and UTRAN
2gand3groamgeranandutran ... 2G and 3G roaming allowed with GERAN and UTRAN
2groamgeran ... 2G roaming allowed with GERAN 3groamgeran ... 3G roaming allowed
with GERAN 2groamutran ... 2G roaming allowed with UTRAN 3groamutran ... 3G roaming
allowed with UTRAN 2gand3groamgeran ... 2G and 3G roaming allowed with GERAN
2gand3groamutran ... 2G and 3G roaming allowed with UTRAN.

Class

Optional.

List

- 2gAnd3gRoamGeran - 2G and 3G roaming allowed with GERAN - 2G and 3G roaming allowed with GERAN.
- 2gAnd3gRoamGeranAndUtran - 2G and 3G roaming allowed with GERAN and UTRAN - 2G and 3G roaming allowed with GERAN and UTRAN.
- 2gAnd3gRoamUtran - 2G and 3G roaming allowed with UTRAN - 2G and 3G roaming allowed with UTRAN.
- 2gRoamGeran - 2G roaming allowed with GERAN - 2G roaming allowed with GERAN.
- 2gRoamGeranAndUtran - 2G roaming allowed with GERAN and UTRAN - 2G roaming allowed with GERAN and UTRAN.
- 2gRoamUtran - 2G roaming allowed with UTRAN - 2G roaming allowed with UTRAN.
- 3gRoamGeran - 3G roaming allowed with GERAN - 3G roaming allowed with GERAN.
- 3gRoamGeranAndUtran - 3G roaming allowed with GERAN and UTRAN - 3G roaming allowed with GERAN and UTRAN.
- 3gRoamUtran - 3G roaming allowed with UTRAN - 3G roaming allowed with UTRAN.
- noRights - No rights - No rights.

Default

noRights

Name

imsi - IMSI

Syntax

--imsi <digits>

Description

Imsi.

Class

Optional.

Type / Range

Digit string of length 0 to 15

Default

""

5.28 cmm hpGwCcApn

Add APNNI (the hpwGwCc) to list. Syntax, description, parameters, and roles for cmm hpGwCcApn command.

Syntax

Description

Add APNNI (the hpwGwCc) to list

Parameters

Name

hpGwCcApnListName - Access point name - network identifier

Syntax

--hpGwCcApnListName <string>

Description

Access point name - network identifier

Class

Required key.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

apnNi - Access point name - network identifier

Syntax

--apnNi <string>

Description

Access point name - network identifier

Class

Required key.

Type / Range

Digit string of length 1 to 62 with the allowed pattern of [0-9a-zA-Z\._]*

Roles**Create**

5.29 cmm hpGwCcApnList

MSISDN based home GW selection with CC list. Syntax, description, parameters, and roles for cmm hpGwCcApnList command.

Syntax**Description**

MSISDN based home GW selection with CC list

Parameters

Name

name - create apnNI list

Syntax

--name <string>

Description

create apnNI list

Class

Required key.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Roles

Create

5.30 cmm hplmnToVplmnSnssaiMap

Home PLMN to Visited PLMN Snssai Map. Syntax, description, parameters, and roles for cmm hp_lmnToVp_lmnSnssaiMap command.

Syntax

Description

UE Home PLMN Slices mapping to Visited PLMN Slices used at UE initial registration or during idle or connected mode mobility 5G to 5G or 4G to 5G, when NSSF is not deployed or NSSF is deployed but operator setting is to use local configuration or NSSF is deployed but does not return Nssai mapping or returns an error.

Parameters

Name

hplmnToVplmnSnssaiMappingListName - Home PLMN to Visited PLMN SNSSAI Mapping List Name

Syntax

--hplmnToVplmnSnssaiMappingListName <string>

Description

Identifies the Home PLMN to Visited PLMN Snssai Mapping list name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Name

hSliceServiceType - Slice Service Type

Syntax

--hSliceServiceType <integer>

Description

The UE home PLMN S-NSSAI Slice Service Type (SST).

Class

Required key.

Type / Range

5G Slice Service Type

Name

hSliceDifferentiator - Slice Differentiator

Syntax

--hSliceDifferentiator <string>

Description

The UE home PLMN S-NSSAI Slice Differentiator (SD). Each slice must have SST and SD is optional. A SST may have multiple SDs.

Class

Required key.

Type / Range

Identifies Slice Differentiator (SD)

Name

vsnsaiName - Visited PLMN SNSSAI

Syntax

--vsnsaiName <string>

Description

Identifies the name of the Visited PLMN S-NSSAI that maps to the allowed Home PLMN S-NSSAI.

Class

Required on create.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

5.31 cmm hplmnToVplmnSnssaiMappingList

Home PLMN to Visited PLMN Snssai Mapping List Name. Syntax, description, parameters, and roles for cmm hplmnToVplmnSnssaiMappingList command.

Syntax**Description**

Identifies the name of the Home PLMN to Visited PLMN Snssai Mapping List

Parameters**Name**

name - Name of Snssai mapping list

Syntax

--name <string>

Description

Identifies the name of the Home PLMN to Visited PLMN Snssai Mapping List

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Roles

5.32 cmm hssGrp

HSS Group Profile. Syntax, description, parameters, and roles for cmm hssGrp command.

Syntax

Description

This command is used to administer an HSS Group Profile and includes parameters for defining the HSS name, the HSS order in the group, and the weight used in the load balancing algorithm.

Parameters

Name

hssGrpListName - HSS group profile name

Syntax

--hssGrpListName <string>

Description

HSS group profile name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

hssOrderId - HSS order in group

Syntax

--hssOrderId <integer>

Description

HSS order in group.

Class

Required key.

Type / Range

Integer in the range of 1 to 16

Name

hssName - HSS name

Syntax

--hssName <string>

Description

HSS name specified in remote end point configuration.

Class

Required on create, not modifiable.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

lbWeight - Weight for load balancing

Syntax

--lbWeight <integer>

Description

Weight for load balancing algorithm.

Class

Optional.

Type / Range

Integer in the range of 0 to 100

Default

0

Roles**Create**

sysadmin, manage

Show

5.33 cmm hssGrpList

HSS Group Profile List. Syntax, description, parameters, and roles for cmm hssGrpList command.

Syntax

Description

This command is used to administer an HSS Group Profile List and includes the definition of the HSS Group Profile Name. This name is used to define an HSS/DRA set used in load balancing or in default primary/secondary/n-ary selection.

Parameters

Name

name - HSS group profile name

Syntax

--name <string>

Description

HSS group profile name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Roles

Create

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

5.34 cmm hssRestoration

HSS Restoration. Syntax, description, parameters, and roles for cmm hssRestoration command.

Syntax

Description

Trigger manually the process to restore normal services for UEs impacted by HSS unavailability period. A single restoration process may be ongoing at a time. Restoration Start action restarts the restoration process with new parameters, if the Start action is performed during an already ongoing process. By default an action is targeted to all impacted UEs. The command is blocked during ISSU.

Parameters

Name

action - Action

Syntax

--action <list-item>

Description

Define the HSS restoration process action.

Class

Required key.

List

- start - Starts the HSS restoration process.
- stop - Stops the HSS restoration process.

Name

maxDuration - Maximum Duration

Syntax

--maxDuration <integer>

Description

Defines the maximum duration of the HSS restoration process. After reaching the maximum duration of time before having all targeted UEs status restored back to normal, the MME will stop the restoration process. The remaining UEs will remain in their non-restored state.

Class

Optional.

Type / Range

Integer in the range of 10 to 300 in units of Minute

Default

60

Name

rate - Rate

Syntax

--rate <integer>

Description

Defines the rate of the restoration (UEs/sec).

Class

Optional.

Type / Range

Integer in the range of 10 to 1000

Default

100

Name

targetUes - Target UEs

Syntax

--targetUes <list-item>

Description

Defines the target UEs for the HSS restoration process in the MME.

Class

Optional.

List

- all - Triggers the restoration process for all impacted UEs: -detaches of UEs that are attached with the help of the failopen profile and -deactivation of failopen profile APN configuration based PDN for UEs that also have PDNs that are not marked as failopen PDNs.
- failopenDetach - Failopen Detach - Triggers the detaches of UEs that are attached with the help of the failopen profile.
- failopenPdnDeactivation - Failopen PDN Deactivation - Triggers the deactivation of failopen profile APN configuration based PDN for UEs that also have PDNs that are not marked as failopen PDNs.

Default

all

Roles

Modify

sysadmin, manage

5.35 cmm hssRestorationStats

HSS Restoration Statistics. Syntax, description, parameters, and roles for cmm hssRestorationStats command.

Syntax

Description

Displays the statistics of the HSS Restoration process.

Parameters

Name

action - Action

Syntax

--action <list-item>

Description

The HSS restoration process action.

Class

Read only.

List

- start - Starts the HSS restoration process.
- stop - Stops the HSS restoration process.

Name

additionalStatus - Additional Status

Syntax

--additionalStatus <string>

Description

Provides additional status information for a failure.

Class

Read only.

Type / Range

Digit string of length 0 to 255

Name

maxDuration - Maximum Duration

Syntax

--maxDuration <integer>

Description

The maximum duration of the HSS restoration process.

Class

Read only.

Type / Range

Integer in the range of 10 to 300 in units of Minute

Name

rate - Rate

Syntax

--rate <integer>

Description

The rate of the HS restoration process (UEs/sec).

Class

Read only.

Type / Range

Integer in the range of 10 to 1000

Name

status - Status

Syntax

--status <list-item>

Description

The status of the HSS restoration.

Class

Read only.

List

- completed - Restoration process is completed.
- running - Restoration process is running.
- stopped - Restoration process is stopped.
- maxDurationReachedNotFinished - Maximum duration reached not finished - The defined maximum duration time has been reached without finishing the HSS restoration process.

- failed - Restoration process has failed to complete due to an error.

Name

targetUes - Target UEs

Syntax

--targetUes <list-item>

Description

Defines the target UEs for the HSS restoration process in the MME.

Class

Read only.

List

- all - Triggers the restoration process for all impacted UEs: -detaches of UEs that are attached with the help of the failopen profile and -deactivation of failopen profile APN configuration based PDN for UEs that also have PDNs that are not marked as failopen PDNs.
- failopenDetach - Failopen Detach - Triggers the detaches of UEs that are attached with the help of the failopen profile.
- failopenPdnDeactivation - Failopen PDN Deactivation - Triggers the deactivation of failopen profile APN configuration based PDN for UEs that also have PDNs that are not marked as failopen PDNs.

Roles**List**

sysadmin, manage, monitor

5.36 cmm httpProfile

HTTP parameters profile. Syntax, description, parameters, and roles for cmm httpProfile command.

Syntax**Description**

Command to create, modify and delete HTTP profile.

Parameters**Name**

name - HTTP profile name for SBI

Syntax

--name <string>

Description

HTTP profile name for SBI.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

clientAutoRedirect - HTTP/2 Client Automatic Redirect Enable

Syntax

--clientAutoRedirect <list-item>

Description

This flag enables and disables HTTP/2 client automatic redirection upon receiving an HTTP/2 response with status code 307 Temporary Redirect. When enabled, automatic redirection triggered by status code 307 is performed. When disabled, automatic redirection is not performed, and the HTTP/2 transaction is considered failed.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

clientRestartTimer - Client Restart Timer

Syntax

--clientRestartTimer <integer>

Description

This parameter provisions a restart timer (in seconds) for SBI connections where CMM is the HTTP Client. When the timer is set and expires CMM will gracefully shutdown the connection. Setting this parameter to 0 disables this functionality. The parameter does not apply to NR10 interface connections.

Class

Optional.

Type / Range

Integer in the range of 0 or 300 to 3,600 in units of Second

Default

0

Name

headerTableSize - Header Table Size

Syntax`--headerTableSize <integer>`**Description**

Header table size parameter in the HTTP connection setup. A value of 0 means that HPACK Dynamic Compression is OFF.

Class

Optional.

Type / Range

Integer in the range of 0 to 32,768

Default

4096

Name

initialWindowSize - HTTP Initial Window Size

Syntax`--initialWindowSize <integer>`**Description**

Value of the Initial Window Size parameter in the HTTP connection setup.

Class

Optional.

Type / Range

Initial HTTP window size

Default

16384

Name

inputRateLimiting - HTTP/2 connection level input rate limiting enable

Syntax`--inputRateLimiting <list-item>`**Description**

This flag enables and disables HTTP/2 connection level input (ingress) rate limiting. When enabled, input rate limiting using HTTP/2 response status code 429 is performed. When disabled, connection level input rate limiting is not performed.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

maxConcurrentStreams - HTTP Maximum Concurrent Streams

Syntax

--maxConcurrentStreams <integer>

Description

Value of the Maximum Concurrent Streams parameter in the HTTP connection setup.

Class

Optional.

Type / Range

Integer in the range of 1 to 32,768

Default

100

Name

maxHeaderListSize - HTTP Maximum Header List Size

Syntax

--maxHeaderListSize <integer>

Description

Value of the Maximum Header List Size parameter in the HTTP connection setup.

Class

Optional.

Type / Range

Integer in the range of 1 to 32,768

Default

2000

Name

refusedStreamHandling - Refused Stream Handling

Syntax

--refusedStreamHandling <list-item>

Description

This parameter defines how AMF handles the reception of a HTTP2 Stream Reset (RST_STREAM) with Error REFUSED_STREAM (0x7) in the SBI interfaces when acting as a HTTP Client. The parameter can have following values: None: Reset messages for Refused Streams are ignored; Link Error: Reset messages for Refused Streams are handled as link error for the specific Stream.

Class

Optional.

List

- linkError - Link Error - Stream Reset is handled as Link Error
- none - Stream Reset is not handled

Default

none

Name

serverRestartTimer - Server Restart Timer

Syntax

--serverRestartTimer <integer>

Description

This parameter provisions a restart timer (in seconds) for SBI connections where CMM is the HTTP Server. When the timer is set and expires CMM will gracefully shutdown the connection. Setting this parameter to 0 disables this functionality. The parameter does not apply to NR10 interface connections.

Class

Optional.

Type / Range

Integer in the range of 0 or 300 to 3,600 in units of Second

Default

0

Name

serverStreamLifetime - Server Stream Lifetime

Syntax

--serverStreamLifetime <integer>

Description

Maximum default Lifetime of a HTTP/2 Server stream. Note that in certain occasions such as namf-mt ue-reachind and namf-loc provide-pos-info/provide-loc-info the timer may be overwritten/extended by call processing.

Class

Optional.

Type / Range

Integer in the range of 6 to 30 in units of Second

Default

6

Name

timerToWaitForSettingsFrameWithAck - Timer to wait for SETTINGS frame with ack

Syntax

--timerToWaitForSettingsFrameWithAck <integer>

Description

Timer started after sending SETTINGS frame for the reception of SETTINGS frame with ack.
Time unit millisecond with 100 as granularity.

Class

Optional.

Type / Range

Integer in the range of 100 to 60,000 in units of Millisecond

Default

2000

5.37 cmm httpProxy

HTTP Proxy. Syntax, description, parameters, and roles for cmm httpProxy command.

Syntax

Description

This command is used to manage HTTP Proxies. Up to 64 Proxies can be created.

Parameters

Name

name - Name

Syntax

--name <string>

Description

Name of the HTTP Proxy.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

reportedName - Reported Name

Syntax

--reportedName <string>

Description

The name used as the HTTP Proxy identity in PM and PCMD reports.

Class

Required on create.

Type / Range

Digit string of length 1 to 96 with the allowed pattern of [0-9a-zA-Z\.\-_:]*

Name

capacity - Capacity

Syntax

--capacity <integer>

Description

Relative capacity of the HTTP Proxy.

Class

Optional.

Type / Range

Integer in the range of 0 to 65,535

Default

65535

Name

enable - Enable

Syntax

--enable <list-item>

Description

When HTTP Proxy is enabled it is considered candidate for new Requests When disabled only ongoing sessions are served until completion

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

fqdn - Fully Qualified Domain Name

Syntax

--fqdn <string>

Description

FQDN of HTTP Proxy. If HTTP Proxy is provisioned with FQDN and nfEndpointListName is not provisioned then DNS A/AAAA query will be triggered for IP resolution and standard ports will be used (80 for HTTP and 443 for HTTPS) Up to 2 IPv6 addresses will be selected with higher priority (as long as AMF interface also supports IPv6). Otherwise up to 2 IPv4 endpoints will be selected.

Class

Optional.

Type / Range

Digit string of length 0 to 96 with the allowed pattern of [0-9a-zA-Z\.\-_:]*

Default

""

Name

fqdnPort - FQDN Port

Syntax

--fqdnPort <integer>

Description

Port to be used when HTTP proxy address is given as FQDN and resolved via DNS A/AAAA query. When set to '0' default ports are used (80 for scheme http and 443 for https)

Class

Optional.

Type / Range

Integer in the range of 0 to 65,535

Default

0

Name

httpScheme - HTTP Scheme

Syntax

--httpScheme <list-item>

Description

Defines use of HTTP or HTTPS towards HTTP Proxy. When HTTPS is selected Proxy's FQDN must be provided

Class

Optional.

List

- http - The schema of Hypertext Transfer Protocol.
- https - The schema of Hypertext Transfer Protocol Secure.

Default

https

Name

nfIpEndPointListName - NF End Point IP List Name

Syntax

--nfIpEndPointListName <string>

Description

HTTP Proxy's End Point IP List Name. Up to 2 Endpoints are supported towards a HTTP Proxy which must be of same IP version. IPv6 addresses will be selected with higher priority as long as AMF interface also supports IPv6. Otherwise IPv4 endpoints will be selected. If Endpoint list is not provided FQDN must be provisioned for DNS resolution via A/AAAA query.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

"""

Name

proxyPrefix - Proxy Prefix

Syntax`--proxyPrefix <string>`**Description**

Optional deployment-specific string to be pretended to the ':path' HTTP/2 pseudo-header when sending messages to the HTTP Proxy. This string is removed by the Proxy when the message is forwarded to the next hop.

Class

Optional.

Type / Range

API Prefix as defined in 29.500. May be null otherwise shall have at least allowed character, shall not start with / and shall not end with /. When not-null, the leading / is implied and shall not be included.

Default

"""

5.38 cmm httpProxyIsolationPerCauseCodeSettings

HTTP Proxy Isolation per Status Code Settings. Syntax, description, parameters, and roles for cmm httpProxyIsolationPerCauseCodeSettings command.

Syntax

Description

Includes action for specific Cause/Status codes. Used when the action for a Causes/Status codes combination for a service needs to differentiate from the default behaviour provisioned for the relevant status class within the sbilndirectCommunicationGParams CLI.

Parameters

Name

statusCode - Status Code

Syntax

--statusCode <list-item>

Description

The HTTP Status Code

Class

Required key.

List

- 400_Bad_Request - 400 Bad Request
- 401_Unauthorized - 401 Unauthorized
- 403_Forbidden - 403 Forbidden
- 404_Not_Found - 404 Not Found
- 405_Method_Not_Allowed - 405 Method Not Allowed
- 406_Not_Acceptable - 406 Not Acceptable
- 408_Request_Timeout - 408 Request Timeout
- 409_Conflict - 409 Conflict
- 410_Gone - 410 Gone
- 411_Length_Required - 411 Length Required
- 412_Precondition_Failed - 412 Precondition Failed
- 413_Payload_Too_Large - 413 Payload Too Large
- 414_URI_Too_Long - 414 URI Too Long
- 415_Unsupported_Media_Type - 415 Unsupported Media Type
- 429_Too_Many_Requests - 429 Too Many Requests
- 500_Internal_Server_Error - 500 Internal Server Error
- 501_Not_Implemented - 501 Not Implemented
- 502_Bad_Gateway - 502 Bad Gateway

- 503_Service_Unavailable - 503 Service Unavailable
- 504_Gateway_Timeout - 504 Gateway Timeout

Name

errorCause - Error Cause

Syntax

--errorCause <string>

Description

Application Error Cause value. Used to applies string match with the Cause in the response. 'NULL' string literal has special meaning and is used to match cases where Response did not include Application Error Cause

Class

Required key.

Type / Range

SBI Application Error Cause value. Digit string of length 1 to 64 with the allowed pattern of [A-Z_]*

Name

action - Action

Syntax

--action <list-item>

Description

Action to be applied for specific status code and Error cause

Class

Optional.

List

- Isolate - Isolate the Service Instance
- KPI_Fail - KPI Fail - Increase the Failure Counter used for the Service Instance KPI
- KPI_Success - KPI Success - Increase the Success counter used for the Service Instance KPI

Default

KPI_Fail

Name

enable - Enable

Syntax

--enable <list-item>

Description

Controls whether the action is enabled or disabled. User created and System inserted actions (i.e. actions automatically created by the system during initial deployment) may be enabled or disabled but only user created actions may be deleted.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

5.39 cmm httpProxyList

HTTP Proxy List. Syntax, description, parameters, and roles for `cmm httpProxyList` command.

Syntax**Description**

List of HTTP proxies. Up to 16 HTTP Proxies lists may be defined.

Parameters**Name**

name - Name

Syntax

--name <string>

Description

Name of list

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

sysadmin, manage, monitor

5.40 cmm httpProxyListItem

HTTP Proxies. Syntax, description, parameters, and roles for cmm httpProxyListItem command.

Syntax**Description**

Adds or removes a HTTP Proxy from a HTTP proxy list with a given priority. Each list may have up to 16 HTTP Proxies. The same Proxy may be part of multiple lists. The same HTTP Proxy have different priority in different lists.

Parameters**Name**

httpProxyListName - HTTP Proxy List Name

Syntax

--httpProxyListName <string>

Description

Name of HTTP Proxy List

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

httpProxyName - HTTP Proxy Name

Syntax

--httpProxyName <string>

Description

Name of HTTP Proxy.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

priority - Priority

Syntax

--priority <integer>

Description

Priority of HTTP Proxy. Priority is only relevant for the specific HTTP Proxy list.

Class

Optional.

Type / Range

Integer in the range of 0 to 15

Default

0

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Modify

sysadmin, manage

Delete

sysadmin, manage

List

sysadmin, manage, monitor

5.41 cmm httpProxyListItemStatus

HTTP Proxy List Item Status. Syntax, description, parameters, and roles for cmm httpProxyListItemStatus command.

Syntax

Description

List the status of the HTTP Proxies included in a Proxy list

Parameters

Name

blacklisted - Blacklisted

Syntax

--blacklisted <list-item>

Description

Blacklist status

Class

Optional.

List

- blacklisted - Status Blacklisted
- kpi-blacklisted - KPI Blacklisted - Status Blacklisted due to low KPI
- nonblacklisted - Non Blacklisted - Status not Blacklisted
- unknown - Status Unknown

Name

httpProxyListName - HTTP Proxy List Name

Syntax

--httpProxyListName <string>

Description

Name of the HTTP Proxy List

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-V:@]*

Name

httpProxyName - HTTP Proxy Name

Syntax

--httpProxyName <string>

Description

Name of the HTTP Proxy

Class

Optional.

Type / Range

Digit string of length 0 to 128

Roles**List**

sysadmin, manage, monitor

5.42 cmm imeiAnalysis

imeiAnalysis. Syntax, description, parameters, and roles for cmm imeiAnalysis command.

Syntax**Description**

Configure, list and show IMEI analysis.

Parameters**Name**

apno - Feature name of APN not overridden

Syntax

--apno <list-item>

Description

Feature name of APN not overridden.

Class

Optional, not filterable on list.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

ccgb - Feature name of GB cause code set name

Syntax

--ccgb <list-item>

Description

Feature name of GB cause code set name.

Class

Optional, not filterable on list.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

cciu - Feature name of IU cause code set name

Syntax

--cciu <list-item>

Description

Feature name of IU cause code set name.

Class

Optional, not filterable on list.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

gbset - GB cause code set name for GB cause code set name feature

Syntax

--gbset <string>

Description

GB cause code set name for GB cause code set name feature.

Class

Optional, not filterable on list.

Type / Range

Digit string of length 1 to 10 with the allowed pattern of [0-9a-zA-Z\._ :]*

Default

0

Name

ggsn - Feature name of IMEI based GGSN selection

Syntax

--ggsn <list-item>

Description

Feature name of IMEI based GGSN selection.

Class

Optional, not filterable on list.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

ggsnTag - TAG identifier for new IMEI based GGSN selection for IMEI based GGSN selection feature

Syntax

--ggsnTag <string>

Description

TAG identifier for new IMEI based GGSN selection for IMEI based GGSN selection feature.

Class

Optional, not filterable on list.

Type / Range

Digit string of length 1 to 10 with the allowed pattern of [0-9a-zA-Z\._ :]*

Default

''

Name

iuset - IU cause code set name for IU cause code set name feature

Syntax

```
--iuset <string>
```

Description

IU cause code set name for IU cause code set name feature.

Class

Optional, not filterable on list.

Type / Range

Digit string of length 1 to 10 with the allowed pattern of [0-9a-zA-Z\._ :]*

Default

0

Name

pgw - Feature name of IMEI based P-GW selection

Syntax

```
--pgw <list-item>
```

Description

Feature name of IMEI based P-GW selection.

Class

Optional, not filterable on list.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

pgwTag - TAG identifier for new IMEI based P-GW selection for IMEI based P-GW selection feature

Syntax

```
--pgwTag <string>
```

Description

TAG identifier for new IMEI based P-GW selection for IMEI based P-GW selection feature.

Class

Optional, not filterable on list.

Type / Range

Digit string of length 1 to 10 with the allowed pattern of [0-9a-zA-Z\._ :]*

Default

''

Name

id - International mobile equipment identity id

Syntax

<digits>

Description

International mobile equipment identity id.

Class

Required value.

Type / Range

Digit string of length 1 to 14

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

sysadmin, manage, monitor

5.43 cmm imeiOperatorPolicy

IMEI Operator Policy. Syntax, description, parameters, and roles for cmm imeiOperatorPolicy command.

Syntax**Description**

Define IMEI operator policy. Maximum number of operator policies is 32.

Parameters**Name**

name - Name

Syntax

--name <string>

Description

The name pointing out the operator policy criteria.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

accessRestricted - Access Restricted

Syntax

--accessRestricted <list-item>

Description

Defines whether access is restricted for UEs matching the provisioned criteria.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

accessRestrictedAttachRejectCause - Access Restricted Attach Reject Cause

Syntax

--accessRestrictedAttachRejectCause <integer>

Description

Defines the Attach Reject EMM cause when IMEI based operator policy to restrict access is applied for the UE.

Class

Optional.

Type / Range

Integer in the range of 3,6-8,11-15,22,25,35,42

Default

15

Name

accessRestrictedServiceRejectCause - Access Restricted Service Reject Cause

Syntax

--accessRestrictedServiceRejectCause <integer>

Description

Defines the Service Reject EMM cause when IMEI based operator policy to restrict access is applied for the UE.

Class

Optional.

Type / Range

Integer in the range of 3,6-12,35,40,42

Default

7

Name

accessRestrictedTauRejectCause - Access Restricted TAU Reject cause

Syntax

--accessRestrictedTauRejectCause <integer>

Description

Defines the TAU Reject EMM cause when IMEI based operator policy to restrict access is applied for the UE.

Class

Optional.

Type / Range

Integer in the range of 3,6,7,9,10-12,14,15,35,40,42

Default

7

Name

authenticationDisabledPolicy - authentication disabled policy

Syntax

--authenticationDisabledPolicy <list-item>

Description

Defines whether authentication shall be disabled for the UEs matching the provisioned criteria. If policy is set to true, then authentication should be disabled for matching UE. If policy is set to false, then authentication should follow plmnSecurity. Note: disable authentication applies for optional part authentication only.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

eirCheckDisabledPolicy - EIR check disabled policy

Syntax

--eirCheckDisabledPolicy <list-item>

Description

Defines whether EIR check shall be disabled for the UEs matching the provisioned criteria.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Modify

sysadmin, manage

Delete

sysadmin, manage

List

sysadmin, manage, monitor

5.44 cmm imeiOperatorPolicyCriteria

Operator Policy Criteria. Syntax, description, parameters, and roles for cmm imeiOperatorPolicyCriteria command.

Syntax

Description

Define operator policy criteria to find UEs to apply operator policies. MME supports altogether up to 25 000 IMEI Type Approval Codes (TACs) on IMEI TAC lists. IMEI TAC ranges and lists of IMEI TACs (or any other parameters) may overlap. Both IMEI TAC range and IMEI TAC list may be included on the same search criteria. An IMEI TAC matches if the IMEI TAC can be found in either the IMEI TAC list or the IMEI TAC range. At minimum either the IMEI TAC list or the IMEI TAC range must be specified. At maximum 10000 operator policy criteria can be defined.

Parameters

Name

entryId - Entry ID

Syntax

--entryId <integer>

Description

Defines the order i.e. precedence of the entry.

Class

Required key.

Type / Range

Integer in the range of 1 to 10,000

Name

imeiOperatorPolicyName - IMEI Operator Policy Name

Syntax

--imeiOperatorPolicyName <string>

Description

The name of the operator policy to apply to the UEs matching the criteria.

Class

Required on create.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

adminState - Admin state

Syntax

--adminState <list-item>

Description

Administrative state.

Class

Optional.

List

- locked - Locked.
- unlocked - Unlocked.

Default

locked

Name

imeiTacSvListName - IMEI TAC SV List Name

Syntax

--imeiTacSvListName <string>

Description

The IMEI TAC SV List name the operator policy applies to.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

maxImeiSv - Maximum IMEI SV

Syntax

--maxImeiSv <digits>

Description

The maximum IMEI SV in range.

Class

Optional.

Type / Range

Digit string of length 2 to 2

Default

99

Name

maxImeiTac - Max IMEI TAC

Syntax

--maxImeiTac <digits>

Description

Maximum IMEI TAC for IMEI TAC range to apply operator policy to.

Class

Optional.

Type / Range

Digit string of length 0 or 8 to 8

Default

"

Name

maxMsin - Maximum MSIN

Syntax

--maxMsin <digits>

Description

The maximum IMSI MSIN value to apply operator policy to.

Class

Optional.

Type / Range

Digit string of length 0 or 8 to 10

Default

"

Name

minImeiSv - Minimum IMEI SV

Syntax

--minImeiSv <digits>

Description

The minimum IMEI SV in range.

Class

Optional.

Type / Range

Digit string of length 2 to 2

Default

00

Name

minImeiTac - Min IMEI TAC

Syntax

--minImeiTac <digits>

Description

Minimum IMEI TAC value of IMEI TAC range to apply operator policy to.

Class

Optional.

Type / Range

Digit string of length 0 or 8 to 8

Default

''

Name

minMsin - Minimum MSIN

Syntax

--minMsin <digits>

Description

The minimum IMSI MSIN value to apply operator policy to.

Class

Optional.

Type / Range

Digit string of length 0 or 8 to 10

Default

''

Name

servingPlmnName - Serving Mobile Network Name

Syntax

--servingPlmnName <string>

Description

Name that identifies the serving mobile network.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Default

''

Name

uePlmnName - UE Mobile Network Name

Syntax

```
--uePlmnName <string>
```

Description

Name that identifies the mobile network of the UE.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

5.45 cmm imeiTacRfsp

IMEI TAC RFSP. Syntax, description, parameters, and roles for cmm imeiTacRfsp command.

Syntax**Description**

This command is used to administer the TAC (Type Approval Code) and RFSP(RAT/Frequency Selection Priority) table to activate TAC/RFSP based features.

Parameters**Name**

imeiTac - Type approval code

Syntax

```
--imeiTac <digits>
```

Description

Type Approval Code of the IMEI

Class

Required key.

Type / Range

Digit string of length 8 to 8

Name

rfsp - IMEI TAC RFSP

Syntax

--rfsp <integer>

Description

IMEI TAC with associated RFSP value. Indicate to use index value for RAT/Frequency selection priority configured with the associated TAC locally in the UE home PLMN should be used

Class

Optional.

Type / Range

Integer in the range of 0 to 256

Default

1

Roles

5.46 cmm imeiTacSv

IMEI TAC SV. Syntax, description, parameters, and roles for cmm imeiTacSv command.

Syntax

Description

This command is used to administer the TAC (Type Approval Code) and SV (Software Version) table to activate TAC/SV based features. Complete maximum number of IMEI TAC SV entries on all lists is 25 000. Maximum number of IMEI TAC SV lists is 1000.

Parameters

Name

imeiTacSvListName - IMEI TAC SV List Name

Syntax

--imeiTacSvListName <string>

Description

name of the IMEI TAC SV List.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

imeiTac - Type approval code

Syntax

--imeiTac <digits>

Description

Type Approval Code of the IMEI

Class

Required key.

Type / Range

Digit string of length 8 to 8

Name

maxImeiSv - Max IMEI Software Version

Syntax

--maxImeiSv <digits>

Description

The maximum IMEI SV in range.

Class

Optional.

Type / Range

Digit string of length 2 to 2

Default

99

Name

minImeiSv - Min IMEI Software Version

Syntax

--minImeiSv <digits>

Description

The minimum IMEI SV in range.

Class

Optional.

Type / Range

Digit string of length 2 to 2

Default

00

5.47 cmm imeiTacSvList

IMEI Type Allocation Code Software Version List. Syntax, description, parameters, and roles for cmm imeiTacSvList command.

Syntax

Description

Define IMEI TAC SV list. Complete maximum number of IMEI TAC SV entries on all lists is 25 000. Maximum number of IMEI TAC SV lists is 1000.

Parameters

Name

name - IMEI TAC SV List Name

Syntax

--name <string>

Description

IMEI TAC SV List Name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Roles

Create

sysadmin, manage

5.48 cmm imeiTacSvRejectionProfile

IMEI TAC SV Rejection Profile. Syntax, description, parameters, and roles for cmm imeiTacSvRejectionProfile command.

Syntax

Description

Define IMEI TAC SV Rejection profile.

Parameters

Name

name - IMEI TAC SV Rejection Profile Name

Syntax

--name <string>

Description

Profile name defining the IMEI-TAC MME local rejection parameters.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

attachRejectCc - Attach Reject Cause Code

Syntax

--attachRejectCc <integer>

Description

Define the EMM cause code when a UE with IMEI TAC to be rejected attempts to attach.

Class

Optional.

Type / Range

Integer in the range of 3,6-8,11-15,22,25,35,42

Default

15

Name

extendedEmmCauseCurrentRatNotAllowed - Extended EMM cause IE Current RAT Not Allowed

Syntax

--extendedEmmCauseCurrentRatNotAllowed <list-item>

Description

Defines whether the MME includes the Extended EMM cause IE on the Attach Rejects and/or TAU rejects, when the Attach reject and/or TAU reject cause is set to EMM cause code 15 (No suitable cells in tracking area). When the MME includes the Extended EMM Cause IE, the MME sets it to either 'E-UTRAN not allowed' (if the UE attempts to access WB-E-UTRAN) or 'NB-IoT not allowed' (if the UE attempts to access NB-IoT).

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

imeiTacSvListName - IMEI TAC SV List Name

Syntax

--imeiTacSvListName <string>

Description

Define the IMEI TAC SV List Name for MME local rejection.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

serviceRejectCc - Service Reject Cause Code

Syntax

--serviceRejectCc <integer>

Description

Define the EMM cause code when a UE with IMEI TAC to be rejected attempts Service Request.

Class

Optional.

Type / Range

Integer in the range of 3,6-12,35,40,42

Default

7

Name

tauRejectCc - TAU Reject Cause Code

Syntax

--tauRejectCc <integer>

Description

Define the EMM cause code when a UE with IMEI TAC to be rejected attempts Tracking Area Update.

Class

Optional.

Type / Range

Integer in the range of 3,6,7,9,10-12,14,15,35,40,42

Default

7

sysadmin, manage, monitor

5.49 cmm imsiAnalysis

imsiAnalysis. Syntax, description, parameters, and roles for **cmm imsiAnalysis** command.

Syntax

Description

Configure, list and show IMSI analysis.

Parameters

Name

plmnName - Name of the PLMN parameter set connected to the IMSI digits

Syntax

--plmnName <string>

Description

This parameter indicates the name of the home PLMN of the IMSI number.

Class

Required on create, not filterable on list.

Type / Range

Digit string of length 1 to 15 with the allowed pattern of [0-9a-zA-Z\._ :]*

Name

dia - Digits to be added

Syntax

--dia <digits>

Description

Use this parameter to specify the digits to be added to the IMSI number. use this parameter only when the TYPE OF ADDRESS parameter has the GT value. this parameter is obligatory if the START POINT OF DIGITS TO BE ADDED parameter has a value other than 0.

Class

Optional, not filterable on list.

Type / Range

Digit string of length 0 to 15 with the allowed pattern of [0-9]*

Default

0

Name

ni - Network indicator

Syntax

--ni <list-item>

Description

Use this parameter to identify the type of the network. the possible values are, IN0 ... international network IN1 ... spare NAO ... national network NA1 ... reserved for national use.

Class

Optional, not filterable on list.

List

- IN0 - International network number 0.
- IN1 - International network number 1.
- NAO - National network number 0.
- NA1 - National network number 1.

Default

NA0

Name

np - Numbering plan

Syntax

--np <list-item>

Description

The numbering plan refers to the standardised numbering instructions described by the ITU-T. use this parameter only when the TYPE OF ADDRESS parameter gets the GT value. the possible values are, E164 ... the result GT address follows the ITU-T recommendation E.163/E.164 (the numbering plan for the international telephone service/the numbering plan for ISDN era). the result GT address is in international ISDN number or national (significant) number format, depending on the value of the TYPE OF NUMBER parameter. E212 ... the result GT address follows the ITU-T recommendation E.212 (the identification plan for land mobile stations). the result GT address is in IMSI or NMSI format, depending on the value of the TYPE OF NUMBER parameter. E214 ... the result GT address follows the ITU-T recommendation E.214 (the structure of the land mobile global title for the signalling connection control part). the result GT address is in mobile global title format if the value of the TYPE OF NUMBER parameter is INT. it is in NC+MSIN format if the value of the TYPE OF NUMBER parameter is NAT.

Class

Optional, not filterable on list.

List

- E164 - E.164 - Specify numbering plan of E.164.
- E212 - E.212 - Specify numbering plan of E.212.
- E214 - E.214 - Specify numbering plan of E.214.

Default

E212

Name

nrd - Number of digits to be removed

Syntax

--nrd <integer>

Description

Use this parameter to specify the number of digits to be removed from the IMSI number. Use this parameter only when the TYPE OF ADDRESS parameter has the GT value. This parameter must have the value 0 (default) if the START POINT OF DIGITS TO BE REMOVED parameter has the value 0. This parameter must have a value other than 0 if the START POINT OF DIGITS TO BE REMOVED parameter has a value other than 0. The values of START POINT OF DIGITS TO BE REMOVED and NUMBER OF DIGITS TO BE REMOVED are calculated together. As the IMSI has 15 digits the sum of these parameters should not extend 16 as it will be bigger than the length of IMSI

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 0 to 15

Default

0

Name

sad - Start point of digits to be added

Syntax

--sad <integer>

Description

Use this parameter to indicate the start point of digits to be added to the IMSI number. use this parameter only when the TYPE OF ADDRESS parameter has the GT value. if you use the DIGITS TO BE ADDED parameter, give this parameter a value other than 0.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 0 to 15

Default

0

Name

spc - Signalling point code

Syntax

--spc <integer>

Description

Use this parameter to identify a signalling point code in the signalling network.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 0 to 16,383

Default

0

Name

srd - Start point of digits to be removed

Syntax

--srd <integer>

Description

Use this parameter to define the start point of the digits to be removed from the IMSI number. use this parameter only when the TYPE OF ADDRESS parameter gets the GT value. this parameter must have a value other than 0 if the NUMBERING PLAN parameter has any other value than E212. this parameter must have the value 0 if the NUMBER OF DIGITS TO BE REMOVED parameter has the value 0. this parameter must have a value other than 0 if the NUMBER OF DIGITS TO BE REMOVED parameter has any other value than 0.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 0 to 15

Default

0

Name

toA - Identify type of RNC address

Syntax

--toA <list-item>

Description

Use this parameter to define the type of address given as the result of the analysis. the possible values are, GT ... global title SPC ... signalling point code.

Class

Optional, not filterable on list.

List

- GT - Global title address.
- SPC - Destination point code (ni + spc).

Default

GT

Name

ton - Type of number

Syntax

--ton <list-item>

Description

Use this parameter to identify the type of number for the result address. use this parameter only when the TYPE OF ADDRESS parameter gets the GT value. the possible values are, INT ... international number NAT ... national number.

Class

Optional, not filterable on list.

List

- INT - International - Specify address format as international.
- NAT - National - Specify address format as national.

Default

INT

Name

id - IMSI digits for the analysis

Syntax

<digits>

Description

Use this parameter to indicate the IMSI number for which you create the analysis. the IMSI number uniquely identifies the mobile subscriber and consists of the national mobile subscriber identifier and the mobile country code.

Class

Required value.

Type / Range

Digit string of length 1 to 15

5.50 cmm imsiGroupId

IMSI Group Identifier. Syntax, description, parameters, and roles for cmm imsiGroupId command.

Syntax

Description

Specifies an IMSI Group Identifier according to 3GPP 23.003 Section 19.9

Parameters

Name

imsiGroupIdListName - Name

Syntax

```
--imsiGroupIdListName <string>
```

Description

Internal Name for IMSI Group ID. This is used to assign the IMSI Group ID to a list.

Class

Required key.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

groupServiceId - Group Service ID

Syntax

```
--groupServiceId <integer>
```

Description

Specifies the Group Service ID portion of the IMSI Group ID. 15 Group Service IDs are supported.

Class

Required key.

Type / Range

Integer in the range of 0 to 4,294,967,294

Name

localGroup - Local Group

Syntax

```
--localGroup <string>
```

Description

Local Group portion of the IMSI Group ID

Restrictions

String length of 10 octets, where each octet is composed of two hex digits each with the allowed pattern of [0-9a-fA-F\.:/*]

Class

Required key.

Type / Range

Hexadecimal value ranging from 0 to 10 octets in length.

Name

plmnName - PLMN Name

Syntax

--plmnName <string>

Description

UE's Home PLMN

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

5.51 cmm imsiGroupIdList

IMSI Group ID List. Syntax, description, parameters, and roles for cmm imsiGroupIdList command.

Syntax**Description**

List of IMSI Group Identifiers

Parameters

Name

name - IMSI Group ID Name

Syntax

--name <string>

Description

Name of IMSI Group ID to be added to the list.

Class

Required key.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

''

Roles

Create

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

sysadmin, manage, monitor

5.52 cmm imsiList

IMSI List. Syntax, description, parameters, and roles for cmm **imsiList** command.

Syntax

Description

Define list of individual IMSIs. The IMSIs inside an IMSI list may be related to different PLMNs. A single IMSI list may contain up to 1000 IMSIs. The IMSI lists altogether may contain up to 1000 individual IMSIs. Up to 64 IMSI lists may be created.

Parameters

Name

name - Name

Syntax

--name <string>

Description

The name of the IMSI list.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

sysadmin, manage, monitor

5.53 cmm imsiRangeServices

Services based on IMSI Range within UE Network. Syntax, description, parameters, and roles for cmm imsiRangeServices command.

Syntax**Description**

This command is used to administer services based on IMSI Range within UE Network and includes parameters for defining APN QOS profiles, NAS mapping profiles, and AMBR values.

Parameters**Name**

uePlmnServicesName - Name of services based on UE network and served network

Syntax

--uePlmnServicesName <string>

Description

Name that identifies roaming agreement.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

entryId - Entry ID

Syntax

--entryId <integer>

Description

Entry ID.

Class

Required key.

Type / Range

Integer in the range of 1 to 10,000

Name

adminState - Administrative state

Syntax

--adminState <list-item>

Description

Administrative state.

Class

Optional.

List

- locked - Locked.
- unlocked - Unlocked.

Default

locked

Name

apnCorrectionAttach - APN correction during attach

Syntax

--apnCorrectionAttach <list-item>

Description

APN correction that is done during attach

Class

Optional.

List

- featureDisabled - Feature disabled - This feature is disabled.
- locallyConfigured - Locally configured - Locally configured.
- receivedFromHss - Received from HSS - Received from HSS.

Default

featureDisabled

Name

apnCorrectionStandalone - APN correction during standalone PDN connect

Syntax

--apnCorrectionStandalone <list-item>

Description

APN correction that is done during standalone PDN connectivity request.

Class

Optional.

List

- featureDisabled - Feature disabled - This feature is disabled.
- locallyConfigured - Locally configured - Locally configured.
- receivedFromHss - Received from HSS - Received from HSS.

Default

featureDisabled

Name

ciotProfileName - IoT Profile Name

Syntax

--ciotProfileName <string>

Description

Profile for IoT settings to be used in IMSI Range Service

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

"

Name

combinedAttachWithoutCsProfileName - Combined Attach without CS Profile Name

Syntax

--combinedAttachWithoutCsProfileName <string>

Description

The profile name to include parameters for combined attach without CS domain.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

"

Name

cpCIoT - CP CIOT

Syntax

--cpCIoT <list-item>

Description

Specifies whether CP CIoT is allowed for the IMSI range

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

custApn1QosprofileName - Custom APN QoS profile for roamers - 1

Syntax

--custApn1QosprofileName <string>

Description

Points to the first custom APN QoS profile for roamers.

Restrictions

This element is not applicable when the serving and UE PLMNs are the same. This element applies only to 4G.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

custApn1WpsQosprofileName - Custom APN WPS QoS profile for roamers - 1

Syntax

--custApn1WpsQosprofileName <string>

Description

Points to the first custom APN WPS QoS profile for roamers.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

custApn2QosprofileName - Custom APN QoS profile for roamers - 2

Syntax

--custApn2QosprofileName <string>

Description

Points to the second custom APN QoS profile for roamers.

Restrictions

This element is not applicable when the serving and UE PLMNs are the same. This element applies only to 4G.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

custApn2WpsQosprofileName - Custom APN WPS QoS profile for roamers - 2

Syntax

--custApn2WpsQosprofileName <string>

Description

Points to the second custom APN WPS QoS profile for roamers.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

"

Name

custApn3QosprofileName - Custom APN QoS profile for roamers - 3

Syntax

--custApn3QosprofileName <string>

Description

Points to the third custom APN QoS profile for roamers.

Restrictions

This element is not applicable when the serving and UE PLMNs are the same. This element applies only to 4G.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

"

Name

custApn3WpsQosprofileName - Custom APN WPS QoS profile for roamers - 3

Syntax

--custApn3WpsQosprofileName <string>

Description

Points to the third custom APN WPS QoS profile for roamers.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

"

Name

description - IMSIRange entry description

Syntax

--description <string>

Description

Description for IMSI range services entry.

Class

Optional.

Type / Range

Digit string of length 0 to 160 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

diamNasMappingProfileName - Diameter cause code to NAS cause code profile name

Syntax

--diamNasMappingProfileName <string>

Description

Defines all diameter cause code to NAS cause code mapping.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

"

Name

disableUeMonitoring - Disable UE Monitoring

Syntax

--disableUeMonitoring <list-item>

Description

This field specifies whether the UEs in this IMSI Range Service should not be allowed to use monitoring events.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

edrxApnListName - eDRX APN list name

Syntax

--edrxApnListName <string>

Description

eDRX APN list name.

Class

Optional.

Type / Range

Digit string of length 0 or 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Default

"

Name

edrxEnabled - eDRX enabled

Syntax

--edrxEnabled <list-item>

Description

Indicates if eDRX is enabled.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

edrxHssPtwProfileName - eDRX HSS PTW profile name

Syntax

--edrxHssPtwProfileName <string>

Description

eDRX HSS PTW profile name.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Default

default

Name

edrxModeWithPsm - eDRX mode with PSM

Syntax

--edrxModeWithPsm <list-item>

Description

eDRX mode with PSM.

Class

Optional.

List

- Both - Specifies both eDRX and PSM.
- PSM - Specifies PSM.
- eDRX - Specifies eDRX.

Default

eDRX

Name

edrxProfileName - eDRX profile name

Syntax

--edrxProfileName <string>

Description

eDRX profile name.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Default

default

Name

edrxSource - eDRX source

Syntax

--edrxSource <list-item>

Description

eDRX source.

Class

Optional.

List

- HSS - Specifies eDRX source as HSS.
- Local - Specifies eDRX source as local.

Default

Local

Name

emmInfoOverrideProfileName - EMM Info Override Profile Name

Syntax

--emmInfoOverrideProfileName <string>

Description

EMM Info Override Profile to be used for this IMSI range

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

''

Name

ePlmnListName - EPLMN list name

Syntax

--ePlmnListName <string>

Description

EPLMN list name.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

ePlmnListNameEnb - EPLMN List Name for eNB

Syntax

--ePlmnListNameEnb <string>

Description

Identifies Equivalent PLMN list name to be sent to eNB

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

"

Name

extendedEmergencyNumListName - Extended Emergency Number List Name

Syntax

--extendedEmergencyNumListName <string>

Description

Extended Emergency Number List Name

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

"

Name

externalIdSupported - External ID Supported

Syntax

--externalIdSupported <list-item>

Description

Specifies whether the MME advertises support of the External ID to the HSS.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

hoRestrictAreaListName - Handover restrict area list name

Syntax

--hoRestrictAreaListName <string>

Description

Defines the UE roaming restrict profile to be used for the service

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

"

Name

imeiTacSvListName - imeiTacSvListName

Syntax

--imeiTacSvListName <string>

Description

List containing IMEI Type Approval Codes (TAC) and Software Versions (SV) to be used for record matching.

Restrictions

An IMEI TAC/SV list name may not be populated if an MSIN subrange or a TAI List subrange is populated.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

"

Name

imsApnQosprofileName - Default IMS APN QoS profile for roamers

Syntax

--imsApnQosprofileName <string>

Description

Points to the roaming QoS profile for IMS APNs. IMS APN QoS profile name is not used when served PLMN and UE PLMN are the same. Otherwise, the default is Def-Roam-IMS-APN-QoS-Prfl.

Restrictions

This element is not applicable when the serving and UE PLMNs are the same. This element applies only to 4G.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

"

Name

imsApnWpsQosprofileName - Default IMS APN WPS QoS profile for roamers

Syntax

--imsApnWpsQosprofileName <string>

Description

Points to the roaming WPS QoS profile for IMS APNs. IMS APN WPS QoS profile name is not used when Serving PLMN equals UE PLMN or when Treat As Home Subscriber is true.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

imsLboProfileName - IMS LBO Profile Name

Syntax

--imsLboProfileName <string>

Description

The name of the IMS LBO profile.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

initialGutiAttachEirPercentage - Initial GUTI Attach EIR Percentage

Syntax

--initialGutiAttachEirPercentage <integer>

Description

Parameter controls percentage EIR checking for Initial GUTI Attach Procedure. Default value of 0 indicates no EIR checking. This field is valid when the Attach EIR Percentage Checking General Global Parameter is enabled.

Class

Optional.

Type / Range

Integer in the range of 0 to 100

Default

0

Name

initialImsiAttachEirPercentage - Initial IMSI Attach EIR Percentage

Syntax

--initialImsiAttachEirPercentage <integer>

Description

Parameter controls percentage EIR checking for Initial IMSI Attach Procedure. Default value of 0 indicates no EIR checking. This field is valid when the Attach EIR Percentage Checking General Global Parameter is enabled.

Class

Optional.

Type / Range

Integer in the range of 0 to 100

Default

0

Name

lcsOptionsProfileName - Location services options profile name

Syntax

--lcsOptionsProfileName <string>

Description

Defines location services options.

Restrictions

This element applies only to 4G.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Default

default

Name

locationBasedGatewaySelection - Location Based Gateway Selection.

Syntax

--locationBasedGatewaySelection <list-item>

Description

Specifies whether location based gateway selection is allowed for IMSI range.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

maxMsin - Maximum MSIN

Syntax

--maxMsin <digits>

Description

The maximum IMSI MSIN value.

Class

Optional.

Type / Range

Digit string of length 0 or 8 to 10

Default

"

Name

mccHmRtPgWdnsDmOvrd - MCC home routed PGW DNS domain override

Syntax

--mccHmRtPgWdnsDmOvrd <digits>

Description

Override the normal PGW domain derivation by using the given MCC and MNC values for a home routed APN.

Class

Optional.

Type / Range

Digit string of length 0 or 3

Name

minMsin - Minimum MSIN

Syntax

--minMsin <digits>

Description

The minimum IMSI MSIN value.

Class

Optional.

Type / Range

Digit string of length 0 or 8 to 10

Default

"

Name

mncHmRtPgWdnsDmOvrd - MNC home routed PGW DNS domain override

Syntax

--mncHmRtPgWdnsDmOvrd <digits>

Description

Override the normal PGW domain derivation by using the given MCC and MNC values for a home routed APN.

Class

Optional.

Type / Range

Digit string of length 0 or 2 to 3

Default

"

Name

n26IwkMmeRestrictionTaiListName - MME N26 IWK Restriction TAI List

Syntax

--n26IwkMmeRestrictionTaiListName <string>

Description

N26 interworking restriction TAI list used by MME to restrict 4G service when UE(s) move from 5G into the respective TACs in the TAI list.

Class

Optional.

Type / Range

Digit string of length 0 or 1 to 31 with the allowed pattern of [0-9a-zA-Z_\.\\-:@]*

Default

""

Name

nonImsApnQosprofileName - Default non-ims APN QoS profile for roamers

Syntax

--nonImsApnQosprofileName <string>

Description

Points to the roaming QoS profile for non IMS APNs. Non IMS APN QoS profile name is not used when served PLMN and UE PLMN are the same. Otherwise, the default is Def-Roam-NonIMS-APN-QoS-Prfl.

Restrictions

This element is not applicable when the serving and UE PLMNs are the same. This element applies only to 4G.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

nonImsApnWpsQosprofileName - Default non-ims APN WPS QoS profile for roamers

Syntax

--nonImsApnWpsQosprofileName <string>

Description

Points to the roaming QoS profile for non IMS APNs. Non IMS APN WPS QoS profile name is not used when Serving PLMN equals UE PLMN or when Treat As Home Subscriber is true.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

pgwDomainMccOverride - PGW domain name MCC override

Syntax

--pgwDomainMccOverride <digits>

Description

Override of normal PGW DNS domain derivation by using this mobility country code and the mobility network code represented by pgwdomainmncoveride.

Restrictions

1. This element is not applicable when the serving and UE PLMNs are the same. 2. If this element is present so must be pgwDomainMncOverride

Class

Optional.

Type / Range

Digit string of length 0 or 3

Name

pgwDomainMncOverride - PGW domain name MNC override

Syntax

--pgwDomainMncOverride <digits>

Description

Override of normal PGW DNS domain derivation by using this mobility network code and the mobility country code represented by pgwdomainmccoverride.

Restrictions

1. This element is not applicable when the serving and UE PLMNs are the same. 2. If this element is present so must be pgwDomainMccOverride

Class

Optional.

Type / Range

Digit string of length 0 or 2 to 3

Name

plmnSecurityProfileListName - Name of identifies profile

Syntax

--plmnSecurityProfileListName <string>

Description

Name of identifies plmnSecurityProfile, which will be used for IMSI Range

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Default

""

Name

psmApnListName - PSM APN list name

Syntax

--psmApnListName <string>

Description

PSM APN list name.

Class

Optional.

Type / Range

Digit string of length 0 or 1 to 31 with the allowed pattern of [0-9a-zA-Z_\.\\-:@]*

Default

""

Name

psmEnabled - PSM enabled

Syntax

--psmEnabled <list-item>

Description

Indicates if PSM is enabled. This field is only used if the Power Saving Mode global parameter is enabled.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

reAuthTimePeriod - Reauthentication Time Period

Syntax

--reAuthTimePeriod <integer>

Description

This field defines the time period between successive UE authentications forced by the MME. When value equals zero then the feature is disabled

Class

Optional.

Type / Range

Integer in the range of 60 to 1440 including value zero in units of Minute

Default

0

Name

restNasMappingProfileName - Access restriction to NAS cause code profile name

Syntax

--restNasMappingProfileName <string>

Description

Defines all access restriction to NAS cause code mapping.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Default

default

Name

rfspAccessRestrictionListName - Access Restriction for RFSP List Name

Syntax

--rfspAccessRestrictionListName <string>

Description

A reference to a list of RFSP values for which access is to be restricted for the UE.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Default

''

Name

separateEplmnListNasS1ap - Separate EPLMN List on NAS and S1AP

Syntax

--separateEplmnListNasS1ap <list-item>

Description

Enable sending separate Equivalent PLMN Lists to NAS and S1AP. The EPLMN Lists applied to NAS and S1AP are copied from EPLMN List Name and EPLMN List Name for eNB, respectively.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

shortDataService - Short data service

Syntax

--shortDataService <list-item>

Description

Enable SDS for an MSIN range.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

support5gSrvcc - Support 5G-SRVCC

Syntax

--support5gSrvcc <list-item>

Description

Enables the intermediary role of the MME_SRVCC (MME supporting 5G-SRVCC) for the UE for regular voice calls. The MME_SRVCC passes messages between the AMF and MSC server during 5G-SRVCC handover of voice calls from NG-RAN/5GS to 3GPP UTRAN/CS domain.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

svcAgreementProfileName - Service agreement profile name

Syntax

```
--svcAgreementProfileName <string>
```

Description

Defines the PLMN service agreement profile to be used for service.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

default

Name

taiLaiArealistName - TAI/LAI area list name

Syntax

```
--taiLaiArealistName <string>
```

Description

Defines the area in which the service agreement profile applies for the IMSI range.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

all

Name

taiListPref - TAI List Preference

Syntax

```
--taiListPref <list-item>
```

Description

Specifies which TAI list to use for the imsi Range Services record match.

Class

Optional.

List

- TAI List - TAI List.
- TAI Range List - TAI Range List

Default

TAI List

Name

taiRangeListName - TAI Range List Name

Syntax

--taiRangeListName <string>

Description

Reference to a TAI Range List

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

""

Name

taiZoneMappingListName - Zone TAI Mapping List Name

Syntax

--taiZoneMappingListName <string>

Description

TAI Zone Mapping List Name

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

""

Name

treatAsHomeSubscriber - Treat roamer as home subscriber

Syntax

--treatAsHomeSubscriber <list-item>

Description

When true, treat a roaming UE as if it were a home subscriber of the serving PLMN. This overrides the LTE Treat As Home Subscriber setting in UE PLMN Services for the given IMSI range. If Treat As Home Subscriber is true for a roaming UE, the IMS APN QoS Profile and Non-IMS APN QoS Profile fields do not take effect even if populated.

Restrictions

This element is not applicable when the serving and UE PLMNs are the same.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

ueAmbrDownLink - UE AMBR downlink bitrate

Syntax

--ueAmbrDownLink <integer>

Description

UE aggregate maximum downlink bitrate.

Restrictions

The granularity is 8 when the value is between 64 and 568. The granularity is 64 when the value is between 576 and 8640. The granularity is 100 when the value is between 8700 and 16000. The granularity is 1000 when the value is between 17000 and 128000. The granularity is 2000 when the value is between 130000 and 256000. This element is not applicable when the serving and UE PLMNs are the same.

Class

Optional.

Type / Range

Integer in the range of 0, 1-63, 64- 568, 576-8640, 8700-16000, 17000-128000, 130000-4000000000 in units of kbps

Default

0

Name

ueAmbrUpLink - UE AMBR uplink bitrate

Syntax

--ueAmbrUpLink <integer>

Description

UE aggregate maximum uplink bitrate.

Restrictions

The granularity is 8 when the value is between 64 and 568. The granularity is 64 when the value is between 576 and 8640. The granularity is 100 when the value is between 8700 and 16000. The granularity is 1000 when the value is between 17000 and 128000. The granularity is 2000 when the value is between 130000 and 256000. This element is not applicable when the serving and UE PLMNs are the same.

Class

Optional.

Type / Range

Integer in the range of 0, 1-63, 64- 568, 576-8640, 8700-16000, 17000-128000, 130000-4000000000 in units of kbps

Default

0

Name

ueAmbrUseHssValue - UE AMBR use HSS value

Syntax

--ueAmbrUseHssValue <list-item>

Description

Enable or disable locally configured uplink UE-AMBR and downlink UE-AMBR values with subscribed uplink UE-AMBR and downlink UE-AMBR values in HSS for IMSI NS.

Restrictions

This element is not applicable when the serving and UE PLMNs are the same.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Name

ueUsageType - ueUsageType

Syntax

--ueUsageType <integer>

Description

UE usage type to be assigned to UE. This field is applicable only if ueUsageSourceImsiRange in uePlmnServices is set appropriately. A value of 0 means that no UUT is assigned to the UE via IMSI Range Services.

Class

Optional.

Type / Range

UE Usage type in the range of 1 to 126 or 128 to 255, or 0 if not used.

Default

0

Name

useApnOiToDetermineHrt - Use APN-OI to Determine HRT

Syntax

--useApnOiToDetermineHrt <list-item>

Description

Current parameter enables using the APN-OI instead of the PGW FQDN to determine if a PDN Session is HRT for a roaming subscriber when applying QoS modification for a PDN session in accordance to local configuration and when sending the UE Time Zone IE in UBR and CBR Response messages. The parameter is effective only when the gParm useApnOiToDetermineHrt is also enabled.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

uutOverrideProfileName - UE Usage Type Override Profile Name

Syntax

--uutOverrideProfileName <string>

Description

Specifies profile name for assigning local UE Usage Type override

Class

Optional.

Type / Range

Digit string of length 0 or 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Default

"

Name

wusProfileName - Wake Up Signal Profile Name

Syntax

--wusProfileName <string>

Description

Specifies WUS profile to use for UEs from this IMSI Range

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

zoneCodeExtendedEmergencyNumListName - Zone Code Extended Emergency Number List
Name

Syntax

--zoneCodeExtendedEmergencyNumListName <string>

Description

Zone Code Extended Emergency Number List Name

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

5.54 cmm imsiRangeServicesPlmn

PLMN based IMSI Range Services. Syntax, description, parameters, and roles for cmm
imsiRangeServicesPlmn command.

Syntax

Description

This identifies a set of imsi-ranges for a PLMN covering all TACs

Parameters

Name

uePlmnServicesName - Services defined for an imsi-range

Syntax

--uePlmnServicesName <string>

Description

PLMN based imsi-range defined services/capabilities

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Name

entryId - imsi-range Entry ID

Syntax

--entryId <integer>

Description

imsi-range Entry ID

Class

Required key.

Type / Range

Integer in the range of 1 to 1000

Name

description - imsi-range Entry description

Syntax

--description <string>

Description

describes offered services

Class

Optional.

Type / Range

Digit string of length 0 to 160 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Default

""

Name

enhancedDualConnectivity - 5G NSA Option 3X

Syntax

--enhancedDualConnectivity <list-item>

Description

This parameter enables, for an imsi-range, 5G NSA Option 3x with enhanced capabilities which include higher bit rates, NR access restriction and S/PGW selection with NR capability

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

enhancedDualConnectivityProfileName - Enhanced Dual Connectivity Profile Name

Syntax

--enhancedDualConnectivityProfileName <string>

Description

Identifies the Enhanced Dual Connectivity Profile for NSA Option 3A/3X

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

""

Name

maxMsin - Maximum MSIN

Syntax

--maxMsin <digits>

Description

The maximum IMSI MSIN value

Class

Optional.

Type / Range

Digit string of length 8 to 10

Default

999999999

Name

minMsin - Minimum MSIN

Syntax

--minMsin <digits>

Description

The minimum IMSI MSIN value

Class

Optional.

Type / Range

Digit string of length 8 to 10

Default

000000000

Name

shutdown - Shutdown

Syntax

--shutdown <list-item>

Description

When shutdown is true, the imsi-range rule is not active

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Modify

sysadmin, manage

Delete

sysadmin, manage

List

sysadmin, manage, monitor

5.55 cmm imsiToHss

IMSI to HSS Routing. Syntax, description, parameters, and roles for cmm imsiToHss command.

Syntax

Description

This command is used to administer IMSI to HSS Routing and includes parameters for defining FQDN names, load balancing, PLMN name, subscriber database type, and IMSI MSIN values. The 'shutdown' parameter is used to enable/disable the mapping rule.

Parameters

Name

mappingId - Mapping identifier

Syntax

--mappingId <integer>

Description

Unique identifier for this mapping rule.

Class

Required key.

Type / Range

Integer in the range of 1 to 8,192

Name

mappingType - Mapping type

Syntax

--mappingType <list-item>

Description

Designates whether even IMSI values, odd IMSI values, or an optional range (minimum/maximum IMSI values) should be used.

Class

Required on create, not modifiable.

List

- ALL - All.
- EVEN - Even.
- ODD - Odd.

Name

plmnName - Mobile network name

Syntax

--plmnName <string>

Description

Name that identifies mobile network.

Class

Required on create, not modifiable.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

draDestHostFqdnName - DRA destination host name

Syntax

--draDestHostFqdnName <string>

Description

If MME does not have destination host in VLR (UE shows up for the first time), and the destination is a DRA, MME uses the value of this new field to populate destination host AVP in AIR and ULR.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

"

Name

draDestRealmFqdnName - DRA destination realm name

Syntax

--draDestRealmFqdnName <string>

Description

If MME does not have destination realm in VLR (UE shows up for the first time), and the destination is a DRA, MME uses the value of this new field to populate destination realm AVP in AIR and ULR.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

"

Name

hssGrpListName - Hss group profile name

Syntax

--hssGrpListName <string>

Description

HSS group profile name.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

"

Name

loadBalance - Load balance

Syntax

--loadBalance <list-item>

Description

Indicates load balancing options for S6ad.

Class

Optional.

List

- all - Balance load on all S6ad links based on weight.
- none - No load balancing between S65ad links.
- priority group - Balance load on all S6ad links based on group priority. the primary group is the set of HSS/DRA that have the same highest weight. the secondary group is the set of HSS/DRA that have the same second highest weight value, etc. the last N-ary group is always the group with 0 weight (if used).

Default

none

Name

maxMsin - Maximum MSIN

Syntax

--maxMsin <digits>

Description

This field is used to enter the maximum IMSI MSIN value. Note: minimum/maximum ranges must be non-overlapping.

Class

Optional.

Type / Range

Digit string of length 0 to 10

Name

minMsin - Minimum MSIN

Syntax

--minMsin <digits>

Description

This field is used to enter the minimum IMSI MSIN value. Note: minimum/maximum ranges must be non-overlapping.

Class

Optional.

Type / Range

Digit string of length 0 to 10

Name

shutdown - Shutdown

Syntax

--shutdown <list-item>

Description

Indicates if the mapping rule is active. if shutdown is true, the rule behaves as if it is deleted.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

subscriberDbType - Subscriber database type

Syntax

--subscriberDbType <list-item>

Description

Subscriber database type.

Class

Optional.

List

- EPC-Capability - Specify EPC capability.
- HLR - Specify HLR database.
- HSS - Specify HSS database.

Default

EPC-Capability

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

5.56 cmm imsiToList

IMSI to List. Syntax, description, parameters, and roles for cmm imsiToList command.

Syntax

Description

Add a new IMSI to the IMSI list.

Parameters

Name

imsiListName - IMSI List Name

Syntax

```
--imsiListName <string>
```

Description

The name of the IMSI List.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Name

imsi - IMSI

Syntax

```
--imsi <digits>
```

Description

The full IMSI including the MNC and MCC.

Class

Required key.

Type / Range

Digit string of length 9 to 15

Roles

Create

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

sysadmin, manage, monitor

5.57 cmm imsiUseLocalDns

IMSI Use Local DNS. Syntax, description, parameters, and roles for cmm imsiUseLocalDns command.

Syntax

Description

This command will be used for configuring the IMSIs which will be allowed to use local DNS for resolution.

Parameters

Name

entryId - Entry Id

Syntax

--entryId <integer>

Description

Entry Id

Class

Required key.

Type / Range

Integer in the range of 1 to 100

Name

maxMsin - Maximum MSIN

Syntax

--maxMsin <digits>

Description

The maximum IMSI MSIN value. For an IMSI the allowed length is 8-10. Under each entryId, the range of MSIN (between maxMsin and minMsin) has to be smaller than 100. The total number of MSINs under all configured entryIds can not exceed 100.

Class

Required on create.

Type / Range

Digit string of length 8 to 10

Name

mcc - Mobile Country Code

Syntax

--mcc <digits>

Description

Mobile Country Code

Class

Required on create, not modifiable.

Type / Range

Digit string of length 3 to 3 with the allowed pattern of [0-9]*

Name

minMsin - Minimum MSIN

Syntax

--minMsin <digits>

Description

The minimum IMSI MSIN. For an IMSI the allowed length is 8-10. Under each entryId, the range of MSIN (between maxMsin and minMsin) has to be smaller than 100. The total number of MSINs under all configured entryIds can not exceed 100.

Class

Required on create.

Type / Range

Digit string of length 8 to 10

Name

mnc - Mobile Network Code

Syntax

--mnc <digits>

Description

Mobile Network Code

Class

Required on create, not modifiable.

Type / Range

Digit string of length 2 to 3 with the allowed pattern of [0-9]*

Name

applicationInd - IMSI For S4 SGSN indicator

Syntax

--applicationInd <list-item>

Description

This parameter is to indicate entryId IMSI is for S4 SGSN or MME or MME and S4SGSN.

Class

Optional.

List

- mme - MME will use local DNS file
- mmeS4sgsn - MME and S4 SGSN - MME and S4 SGSN will use local DNS file
- s4sgsn - S4 SGSN - S4 SGSN will use DNS file

Default

mmeS4sgsn

Roles

5.58 cmm imsLboProfile

IMS LBO Profile. Syntax, description, parameters, and roles for cmm `imsLboProfile` command.

Syntax

Description

The profile that MME uses when the MME is locally provisioned to force local breakout for the PDN towards the IMS APN. Max 64 profiles can be created.

Parameters

Name

name - Name

Syntax

--name <string>

Description

The name of the IMS LBO profile.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

apnAmbrDI - APN AMBR Downlink

Syntax

--apnAmbrDI <integer>

Description

Aggregate maximum bit rate for downlink for the IMS APN.

Class

Optional.

Type / Range

Integer in the range of 0, 1-63, 64- 568, 576-8640, 8700-16000, 17000-128000,
130000-4000000000

Default

100000000

Name

apnAmbrUI - APN AMBR Uplink

Syntax

--apnAmbrUI <integer>

Description

Aggregate maximum bit rate for uplink for the IMS APN.

Class

Optional.

Type / Range

Integer in the range of 0, 1-63, 64- 568, 576-8640, 8700-16000, 17000-128000,
130000-4000000000

Default

100000000

Name

applyImsApnSpecificChargingCharacteristics - Apply IMS APN Specific Charging
Characteristics

Syntax

--applyImsApnSpecificChargingCharacteristics <list-item>

Description

Defines whether IMS APN Specific Charging Characteristics based on the provisioned profile is applied.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

applyLocalImsNotSubscribed - Apply Local IMS Not Subscribed

Syntax

--applyLocalImsNotSubscribed <list-item>

Description

Defines whether the MME applies the local IMS profile for the UE when the APN configuration profile on the UE HSS subscription does not include explicit IMS APN configuration.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

applyLocalImsSubscribedLboAllowed - Apply Local IMS Subscribed LBO Allowed

Syntax

--applyLocalImsSubscribedLboAllowed <list-item>

Description

Defines whether the MME applies the local IMS profile for the UE when the APN configuration profile on the UE HSS subscription includes explicit IMS APN configuration, and the VPLMN-Dynamic-Address-Allowed AVP is set to ALLOWED on the IMS APN configuration.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

applyLocalImsSubscribedLboNotAllowed - Apply Local IMS Subscribed LBO Not Allowed

Syntax

--applyLocalImsSubscribedLboNotAllowed <list-item>

Description

Defines whether the MME applies the local IMS profile for the UE when the APN configuration profile on the UE HSS subscription includes explicit IMS APN configuration, and the VPLMN-Dynamic-Address-Allowed AVP is either absent or set to NOTALLOWED on the IMS APN configuration.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

arpPriorityLevel - ARP Priority Level

Syntax

--arpPriorityLevel <integer>

Description

Allocation and retention priority, priority level for the IMS APN.

Class

Optional.

Type / Range

Integer in the range of 1 to 15

Default

15

Name

chargingCharacteristics - Charging Characteristics

Syntax

```
--chargingCharacteristics <string>
```

Description

Charging Characteristics for the IMS APN.

Class

Optional.

Type / Range

Digit string of length 4 with the allowed pattern of [0-9a-fA-F]*

Default

0000

Name

interworking5gsIndicator - Interworking 5GS Indicator

Syntax

```
--interworking5gsIndicator <list-item>
```

Description

Indicates whether the interworking between 5GS and EPS is subscribed for the IMS APN.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

pdnAddrType - PDN Address Type

Syntax

```
--pdnAddrType <list-item>
```

Description

The PDN address type for the IMS APN.

Class

Optional.

List

- ipv4 - Specify PDN address type of IPv4.
- ipv4OrIpv6 - Specify PDN address type of IPv4 or IPv6.
- ipv4v6 - Specify PDN address type of IPv4 and IPv6.

- ipv6 - Specify PDN address type of IPv6.

Default

ipv6

Name

preemptionCapability - Pre-emption Capability

Syntax

--preemptionCapability <list-item>

Description

Allocation and retention priority, pre-emption capability for the IMS APN.

Class

Optional.

List

- DISABLE - Disable
- ENABLE - Enable

Default

DISABLE

Name

preemptionVulnerability - Pre-emption Vulnerability

Syntax

--preemptionVulnerability <list-item>

Description

Allocation and retention priority, pre-emption vulnerability for the IMS APN.

Class

Optional.

List

- DISABLE - Disable
- ENABLE - Enable

Default

ENABLE

5.59 cmm integrityAlgorithm

Integrity Algorithm. Syntax, description, parameters, and roles for cmm integrityAlgorithm command.

Syntax

Description

This command sets the algorithms, in priority order, MME will use to negotiate Integrity Protection of NAS messages with the UE. At attach and TAU, the UE provides, in the UE EPS security capabilities, which integrity protection algorithms are supported. The MME will use the algorithm both supported by the UE and highest in priority in the eia integrity protection algorithm priority list. Note: per 3GPP EIA0/null Integrity Protection is not allowed - all NAS messages after authentication must be Integrity Protected - An algorithm must be chosen for 'priority-1' and 'priority-2' ('none' option is not supported) - An additional selection, 'none', can be selected for 'priority-3' - effectively truncating the list. - An algorithm cannot be used for more than one priority Note: A pre-requisite for changing values in the eea-integrity-alg is that MME aggregate service must be locked.

Parameters

Name

integrityAlgPrio1 - Priority 1 integrity algorithm

Syntax

--integrityAlgPrio1 <list-item>

Description

Most preferred integrity algorithm.

Class

Optional.

List

- aes - 128-EIA2 (AES) - Specify integrity algorithm of 128-EIA2 (AES).
- none - No algorithm selected - Specify integrity algorithm of no algorithm selected.

- snow3G - 128-EIA1 (SNOW 3G) - Specify integrity algorithm of 128-EIA1 (SNOW 3G).
- zuc - 128-EIA3 (ZUC) - Specify integrity algorithm of 128-EIA3 (ZUC).

Default

snow3G

Name

integrityAlgPrio2 - Priority 2 integrity algorithm

Syntax

--integrityAlgPrio2 <list-item>

Description

Second most preferred integrity algorithm; used if the user element does not support algorithm(s) of higher priority.

Class

Optional.

List

- aes - 128-EIA2 (AES) - Specify integrity algorithm of 128-EIA2 (AES).
- none - No algorithm selected - Specify integrity algorithm of no algorithm selected.
- snow3G - 128-EIA1 (SNOW 3G) - Specify integrity algorithm of 128-EIA1 (SNOW 3G).
- zuc - 128-EIA3 (ZUC) - Specify integrity algorithm of 128-EIA3 (ZUC).

Default

aes

Name

integrityAlgPrio3 - Priority 3 integrity algorithm

Syntax

--integrityAlgPrio3 <list-item>

Description

Third most preferred integrity algorithm; used if the user element does not support algorithm(s) of higher priority.

Class

Optional.

List

- aes - 128-EIA2 (AES) - Specify integrity algorithm of 128-EIA2 (AES).
- none - No algorithm selected - Specify integrity algorithm of no algorithm selected.
- snow3G - 128-EIA1 (SNOW 3G) - Specify integrity algorithm of 128-EIA1 (SNOW 3G).
- zuc - 128-EIA3 (ZUC) - Specify integrity algorithm of 128-EIA3 (ZUC).

Default

none

5.60 cmm intfAdmin

Signaling Interface Administration. Syntax, description, parameters, and roles for cmm intfAdmin command.

Syntax**Description**

Signaling Interface Administration.

Parameters**Name**

linkInterfaceType - Link interface type

Syntax

--linkInterfaceType <list-item>

Description

Link interface type. not all interfaces are supported. s1mme is supported in this release.

Class

Required key.

List

- gn - Specify the Gn interface to an SGSN.
- m3 - Specify the M3 interface to an eNodeB.
- n26 - Specify n26 interface to an AMF
- nr10 - Specify nr10 interface.
- rs10 - Specify the RS10 interface to an SRS.

- s10 - Specify the S10 interface to another MME.
- s102 - Specify the S102 interface to an IWF.
- s11 - Specify the S11 interface to an SGW.
- s11u - Specify S11-u interface to an SGW.
- s13 - Specify the S13 interface to an EIR.
- s16 - Specify S16 interface loop around to this SGSN.
- s1mme - Specify the S1-MME interface to an eNodeB.
- s3 - Specify the S3 interface to an SGSN.
- s4 - Specify S4 interface to an SGW.
- s6ad - Specify the S6ad interface to an HSS.
- sbc - Specify the SBc interface to a CBC..
- sgd - Specify SGd interface to an SMSC/SMS router.
- sgs - Specify the SGs interface to a GSM/UMTS MSC.
- sgslite - Specify SGs lite interface to an IWF.
- slg - Specify the Slg interface to a GMLC.
- sls - Specify the Sls interface to an E-SMLC.
- sm - Specify the sm interface to an MBMS gateway.
- sv - Specify the Sv interface to a GSM/UMTS MSC.
- t6a - Specify T6a interface to an SCEF.

Name

linkAdminState - Link admin state

Syntax

--linkAdminState <list-item>

Description

Specified current link admin state.

Class

Optional.

List

- blocked - Blocked state. this applies only to s6ad, s13, slg, sgd and t6a.
- draining - Draining state. only applies to s11.
- locked - Locked state.

- unknown - Used in special cases to report state. a link cannot be updated to unknown state.
- unlocked - UnLocked state.

Name

terminationName - TerminationName

Syntax

--terminationName <string>

Description

Termination name. this is used for s1mme alone.

Class

Optional.

Type / Range

Digit string of length 0 or 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Roles**Modify**

sysadmin, manage

5.61 cmm intfQueryPath

Signaling single link Query Path. Syntax, description, parameters, and roles for cmm intfQueryPath command.

Syntax**Description**

Signaling Link Show query sctp path.

Parameters**Name**

linkInterfaceType - Link interface type

Syntax

--linkInterfaceType <list-item>

Description

Link interface type. only SCTP interfaces are supported.

Class

Required key.

List

- m3 - Specify the M3 interface to an eNodeB.
- m3ua - Specify an M3UA interface.
- s13 - Specify the S13 interface to an EIR.
- s1mme - S1-MME - Specify the S1-MME interface to an eNodeB.
- s6ad - Specify the S6ad interface to an HSS.
- sbc - Specify the SBc interface to a CBC.
- sgd - Specify SGd interface to an SMSC/SMS router.
- sgs - Specify the SGs interface to a GSM/UMTS MSC.
- slg - Specify the SLg interface to a GMLC.
- sls - Specify the SLs interface to an E-SMLC.
- t6a - Specify T6a interface to an SCEF.

Name

linkIndex - Link index

Syntax

--linkIndex <integer>

Description

Link index from the read command.

Class

Read only.

Type / Range

Integer in the range of 0 to 4,294,967,295

Name

maxResponseSize - Max record count

Syntax

--maxResponseSize <integer>

Description

Max number of records to be returned.

Class

Optional.

Type / Range

Integer in the range of 1 to 2,000

Name

pathStat1 - Path 1 loc-ip0 rem-ip0

Syntax

--pathStat1 <list-item>

Description

Path status between local IP0 and remote IP0.

Class

Read only.

List

- not-used - Path status of not used.
- reachable - Path status of reachable.
- unknown - Path status of unknown.
- unreachable - Path status of unreachable.

Name

pathStat2 - Path 2 loc-ip0 rem-ip1

Syntax

--pathStat2 <list-item>

Description

Path status between local IP0 and remote IP1.

Class

Read only.

List

- not-used - Path status of not used.
- reachable - Path status of reachable.
- unknown - Path status of unknown.
- unreachable - Path status of unreachable.

Name

pathStat3 - Path 3 loc-ip1 rem-ip0

Syntax

--pathStat3 <list-item>

Description

Path status between local IP1 and remote IP0.

Class

Read only.

List

- not-used - Path status of not used.
- reachable - Path status of reachable.
- unknown - Path status of unknown.
- unreachable - Path status of unreachable.

Name

pathStat4 - Path 4 loc-ip1 rem-ip1

Syntax

--pathStat4 <list-item>

Description

Path status between local IP1 and remote IP1.

Class

Read only.

List

- not-used - Path status of not used.
- reachable - Path status of reachable.
- unknown - Path status of unknown.
- unreachable - Path status of unreachable.

Name

previousIndex - Previous index

Syntax

--previousIndex <integer>

Description

Previous index when specified, next available index will be returned.

Class

Optional.

Type / Range

Integer in the range of -1 or 0 to 2,147,483,647

Name

startLinkIndex - Start link index

Syntax

--startLinkIndex <integer>

Description

Start link index from the read command.

Class

Optional.

Type / Range

Integer in the range of 0 to 4,294,967,295

Roles**List**

sysadmin, manage, monitor

5.62 cmm intfSummary

Signaling Interface Link Summary Request. Syntax, description, parameters, and roles for cmm intfSummary command.

Syntax**Description**

Signaling Interface Link Summary Request.

Parameters**Name**

linkInterfaceType - Link interface type

Syntax

--linkInterfaceType <list-item>

Description

Link interface type.

Class

Required key.

List

- gn - Specify the Gn interface to an SGSN.
- m3 - Specify the M3 interface to an eNodeB.
- n26 - Specify n26 interface to an AMF
- nr10 - Specify nr10 interface.
- rs10 - Specify the RS10 interface to an SRS.
- s10 - Specify the S10 interface to another MME.
- s102 - Specify the S102 interface to an IWF.

- s11 - Specify the S11 interface to an SGW.
- s11u - Specify S11-u interface to an SGW.
- s13 - Specify the S13 interface to an EIR.
- s16 - Specify S16 interface loop around to this SGSN.
- s1mme - Specify the S1-MME interface to an eNodeB.
- s3 - Specify the S3 interface to an SGSN.
- s4 - Specify S4 interface to an SGW.
- s6ad - Specify the S6ad interface to an HSS.
- sbc - Specify the SBc interface to a CBC..
- sgd - Specify SGd interface to an SMSC/SMS router.
- sgs - Specify the SGs interface to a GSM/UMTS MSC.
- sgslite - Specify SGs lite interface to an IWF.
- slg - Specify the Slg interface to a GMLC.
- sls - Specify the Sls interface to an E-SMLC.
- sm - Specify the sm interface to an MBMS gateway.
- sv - Specify the Sv interface to a GSM/UMTS MSC.
- t6a - Specify T6a interface to an SCEF.

Name

linkAdminState - Link admin state

Syntax

--linkAdminState <list-item>

Description

Link admin state.

Class

Read only.

List

- blocked - Blocked state. this applies only to s6ad, s13, slg, sgd and t6a.
- draining - Draining state. only applies to s11.
- locked - Locked state.
- unknown - Used in special cases to report state. a link cannot be updated to unknown state.
- unlocked - UnLocked state.

Name

linkCount - Link count

Syntax

--linkCount <integer>

Description

Link count.

Class

Read only.

Type / Range

Integer in the range of 0 to 4,294,967,295

Name

linkOperationState - Link operation state

Syntax

--linkOperationState <list-item>

Description

Link operation state.

Class

Read only.

List

- disabled - Disabled state of the link.
- enabled - Enable state of the link.
- unknown - Unknown state of the link. this can not be used during query.

Name

poolId - poolId

Syntax

--poolId <integer>

Description

IPDS Pool ID - If chosen only the count of interface links on the specified IPDS will be output. This parameter is only applicable for Multi-IPDS instantiations and requires linkInterfaceType option to display results on any Pool Id greater than 0

Class

Read only.

Type / Range

Integer in the range of 0 to 31

Name

terminationName - TerminationName

Syntax

--terminationName <string>

Description

Termination name. it is used for s1mme only.

Class

Optional.

Type / Range

Digit string of length 0 or 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Roles**List**

sysadmin, manage, monitor

5.63 cmm issuCanaryConfig

ISSU Canary Configuration. Syntax, description, parameters, and roles for cmm issuCanaryConfig command.

Syntax**Description**

Use this command to define the canary configuration to be used when running a canary test for each supported POD type.

Parameters**Name**

poolType - pool type

Syntax

--poolType <list-item>

Description

Pool Type - Only CPPS pool type is allowed

Class

Required key.

List

- CPPS - Control Plane Processing Service - Control Plane Processing Service.

- DBS - Database service - Database service.
- IPDS - IP director service - IP director service.
- NECC - Network element cluster controller - Network element cluster controller.

Name

personality - personality

Syntax

--personality <list-item>

Description

This field determines whether the CPPS serves 4g or 5g traffic.

Class

Required key.

List

- - - None Personality
- EMMS - EMMS Personality
- AMMS - AMMS Personality

Default

-

Name

imsiRangeCount - Count of Test IMSI Range

Syntax

--imsiRangeCount <integer>

Description

The count of test IMSI range. When setting this parameter to non-zero value, IMSI Range Start must be also set.

Restrictions

When setting this parameter to non-zero value, IMSI Range Start must be also set. To set this parameter to 0, IMSI Range Start must be also set to empty ('').

Class

Optional.

Type / Range

Integer in the range of 0 to 128

Default

0

Name

imsiRangeStart - IMSI Range Start for Canary Test IMSIs

Syntax

--imsiRangeStart <digits>

Description

First IMSI of test IMSI range. When setting this parameter, IMSI Range Count must be also set to a valid value.

Restrictions

To set this parameter, IMSI Range Count must be also set to a valid value. To clear this parameter (i.e. set it to empty), IMSI Range Count must be also set to 0.

Class

Optional.

Type / Range

Digit string of length 0 or 15

Default

""

Name

max4gUeCnt - Max 4G UE count

Syntax

--max4gUeCnt <integer>

Description

Maximum 4G UE count for this canary instance (where applicable).

Class

Optional.

Type / Range

Integer in the range of 0 to 50,000

Default

1000

Name

max5gUeCnt - Max 5G UE count

Syntax

--max5gUeCnt <integer>

Description

Maximum 5G UE count for this canary instance (where applicable).

Class

Optional.

Type / Range

Integer in the range of 0 to 50,000

Default

1000

Name

mode - mode

Syntax**Description**

This field determines the CPPS mode

Class

Optional.

Type / Range

Digit string of length 1 to 255

Name

poolId - Pool ID

Syntax**Description**

Pool ID of the canary instance

Class

Optional.

Type / Range

Digit string of length 1 to 255

Name

poolMemberId - Pool Member Id

Syntax**Description**

Pool member id of the canary instance'

Class

Optional.

Type / Range

Digit string of length 1 to 255

Name

softwareVersion - Software version

Syntax**Description**

Software version of the canary instance

Class

Optional.

Type / Range

Digit string of length 1 to 255

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Modify

sysadmin, manage

Delete

sysadmin, manage

List

sysadmin, manage, monitor

5.64 cmm issuCanaryStatus

ISSU Canary status. Syntax, description, parameters, and roles for `cmm issuCanaryStatus` command.

Syntax**Description**

Interrogate the system for any services running in canary mode and display information.

Parameters**Name**

personality - personality

Syntax

--personality <list-item>

Description

This field determines whether the CPPS serves 4g or 5g traffic.

Class

Read only.

List

- - - None Personality
- EMMS - EMMS Personality
- AMMS - AMMS Personality

Default

-

Name

poolId - Pool ID

Syntax

--poolId <integer>

Description

Pool ID of the canary instance

Class

Read only.

Type / Range

Integer in the range of 0 to 4,294,967,295

Name

poolMemberId - Pool Member Id

Syntax

--poolMemberId <integer>

Description

Pool member id of the canary instance

Class

Read only.

Type / Range

Integer in the range of 0 to 4,294,967,295

Name

poolType - Pool Type

Syntax

--poolType <list-item>

Description

AMF/MME pod type

Class

Read only.

List

- CPPS - Control Plane Processing Service - Control Plane Processing Service.
- DBS - Database service - Database service.
- IPDS - IP director service - IP director service.
- NECC - Network element cluster controller - Network element cluster controller.

Name

softwareVersion - Software version

Syntax

--softwareVersion <string>

Description

Software version of the canary instance

Class

Read only.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Roles**List**

sysadmin, manage, monitor

5.65 cmm iuCipheringAlg

Preferred lu Ciphering Algorithm . Syntax, description, parameters, and roles for cmm iuCipheringAlg command.

Syntax**Description**

This command sets lu algorithms in priority order, SGSN will use it to negotiate encryption alg with the UE. At UE attach/Rau, the UE provides, in the UE network capability IE, which encryption algorithms in 3G are supported. SGSN will send the selected algs to RNC in priority order. The algorithm should be both supported by the UE and highest priority in the configured UEA encryption algorithm priority list

Parameters**Name**

iuCipheringAlgPrio1 - Priority 1 lu ciphering algorithm

Syntax

--iuCipheringAlgPrio1 <list-item>

Description

Most preferred lu ciphering algorithm

Class

Optional.

List

- kasumi - UEA1 (Kasumi) - Specify ciphering of UEA1 (Kasumi).
- noCiphering - UEA0(no ciphering) - Specify ciphering of UEA0 (no encryption)
- none - No Algorithm Selected
- snow3G - UEA2 (SNOW 3G) - Specify ciphering of UEA2 (SNOW 3G).

Default

snow3G

Name

iuCipheringAlgPrio2 - Priority 2 lu ciphering algorithm

Syntax

--iuCipheringAlgPrio2 <list-item>

Description

Second preferred lu ciphering algorithm

Class

Optional.

List

- kasumi - UEA1 (Kasumi) - Specify ciphering of UEA1 (Kasumi).
- noCiphering - UEA0(no ciphering) - Specify ciphering of UEA0 (no encryption)
- none - No Algorithm Selected
- snow3G - UEA2 (SNOW 3G) - Specify ciphering of UEA2 (SNOW 3G).

Default

kasumi

Name

iuCipheringAlgPrio3 - Priority 3 lu ciphering algorithm

Syntax

--iuCipheringAlgPrio3 <list-item>

Description

3rd preferred lu ciphering algorithm, used if the user element does not support algorithm(s) of higher priority

Class

Optional.

List

- kasumi - UEA1 (Kasumi) - Specify ciphering of UEA1 (Kasumi).
- noCiphering - UEA0(no ciphering) - Specify ciphering of UEA0 (no encryption)
- none - No Algorithm Selected
- snow3G - UEA2 (SNOW 3G) - Specify ciphering of UEA2 (SNOW 3G).

Default

none

Roles

Show

sysadmin, manage, monitor

Modify

sysadmin, manage

sysadmin, manage, monitor

5.66 cmm iuIntegrityAlg

Preferred lu Integrity Algorithm. Syntax, description, parameters, and roles for cmm iuIntegrityAlg command.

Syntax

Description

This command sets lu algorithms in priority order, SGSN will use it to negotiate Integrity alg with the UE. At UE attach/Rau, the UE provides, in the UE network capability IE, which integrity algorithms in 3G are supported. The SGSN will send the algs to RNC in priority order. The algorithm should be both supported by the UE and highest priority in the configured UIA integrity algorithm priority list

Parameters

Name

iuIntegrityAlgPrio1 - Priority 1 lu integrity algorithm

Syntax

--iuIntegrityAlgPrio1 <list-item>

Description

Most preferred lu integrity algorithm

Class

Optional.

List

- kasumi - UIA1 (Kasumi) - Specify Integrity of UIA1 (Kasumi).
- none - No Algorithm Selected
- snow3G - UIA2 (SNOW 3G) - Specify Integrity of UIA2 (SNOW 3G).

Default

snow3G

Name

iuIntegrityAlgPrio2 - Priority 2 lu integrity algorithm

Syntax

--iuIntegrityAlgPrio2 <list-item>

Description

Second preferred lu integrity algorithm

Class

Optional.

List

- kasumi - UIA1 (Kasumi) - Specify Integrity of UIA1 (Kasumi).
- none - No Algorithm Selected
- snow3G - UIA2 (SNOW 3G) - Specify Integrity of UIA2 (SNOW 3G).

Default

kasumi

5.67 cmm kafkaBroker

Kafka Broker. Syntax, description, parameters, and roles for cmm kafkaBroker command.

Syntax

Description

This command is used to add or delete IPs or FQDNs for a Kafka Broker.

Parameters

Name

name - Broker Name

Syntax

--name <string>

Description

This is the name of the Kafka Broker

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

brokerPort - Kafka Broker Port

Syntax

--brokerPort <integer>

Description

The parameter defines the Kafka Broker Port.

Class

Required on create.

Type / Range

Integer in the range of 1,024 to 65,535

Name

brokerFqdn - Kafka Broker FQDN

Syntax

--brokerFqdn <string>

Description

The parameter defines the Kafka Broker FQDN. The number of the Kafka Broker FQDNs could be up to 18.

Restrictions

Either the Broker FQDN or the Broker IP must be set

Class

Optional.

Type / Range

Digit string of length 0 to 255 with the allowed pattern of [A-Za-z0-9.-]

Default

""

Name

brokerIp - Kafka Broker IP

Syntax

--brokerIp <string>

Description

The parameter defines the Kafka Broker IP. The number of the Kafka Broker IPs could be up to 18.

Restrictions

Either the Broker FQDN or the Broker IP must be set

Class

Optional.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Default

0.0.0.0

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Modify

sysadmin, manage

Delete

sysadmin, manage

List

sysadmin, manage, monitor

5.68 cmm kafkaBrokerList

Kafka Broker List. Syntax, description, parameters, and roles for cmm kafkaBrokerList command.

Syntax

Description

This command is used to create, modify and delete the Kafka Broker List so as to send the relevant data to an external Kafka cluster. The functional area in scope as well as the Kafka topic needs to be provided. The security parameters are used to define the level of the communication.

Parameters

Name

area - Functional Area

Syntax

--area <list-item>

Description

This parameter defines the functional area for the communication between Kafka Producer and Kafka Broker

Class

Required key.

List

- FM - FM defines the Alarm area
- PM - PM defines the Performance Management (counters) area
- LOG - LOG defines the Logging area

Name

topic - Kafka Topic Name

Syntax

--topic <string>

Description

This parameter defines the name of the Kafka Topic

Restrictions

logical key, shall be unique

Class

Required on create.

Type / Range

Digit String of length 1 to 255 with the allowed pattern [a-zA-Z0-9._-]

Name

oamTlsProfileName - OAM TLS Profile

Syntax

```
--oamTlsProfileName <string>
```

Description

This parameter contains the profile for TLS. It contains the certificate names needed for establishing secure communication.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

"

Name

securityProtocol - Security Protocol with Kafka broker

Syntax

```
--securityProtocol <list-item>
```

Description

This parameter defines the security protocol for the communication between Kafka Producer and Kafka Broker

Class

Optional.

List

- PLAINTEXT - PLAINTEXT would be the protocol to communicate with brokers
- SSL - SSL would be the protocol to communicate with brokers

Default

PLAINTEXT

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Modify

sysadmin, manage

Delete

sysadmin, manage

List

sysadmin, manage, monitor

5.69 cmm kafkaBrokerListItem

Kafka Broker List Item. Syntax, description, parameters, and roles for cmm kafkaBrokerListItem command.

Syntax**Description**

Adds or removes a Kafka Broker to a Kafka Broker List

Parameters**Name**

kafkaBrokerListArea - Kafka Broker List Area

Syntax

--kafkaBrokerListArea <list-item>

Description

Kafka Broker List Area

Class

Required key.

List

- FM - FM defines the Alarm area
- PM - PM defines the Performance Management (counters) area
- LOG - LOG defines the Logging area

Name

kafkaBrokerName - Kafka Broker Name

Syntax

--kafkaBrokerName <string>

Description

Kafka Broker Name

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Roles

Create

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

sysadmin, manage, monitor

5.70 cmm lai

Location Area Identifier. Syntax, description, parameters, and roles for cmm lai command.

Syntax

Description

This command is used to define a location area in a given mobile network and includes a parameter to indicate whether CSFB is supported for the associated LAI.

Parameters

Name

plmnName - Mobile network name

Syntax

--plmnName <string>

Description

Name that identifies mobile network.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

lac - Location area code

Syntax

--lac <integer>

Description

Location area code.

Class

Required key.

Type / Range

Integer in the range of 1 to 65,535

Name

csfbSupported - CSFB supported

Syntax

--csfbSupported <list-item>

Description

Boolean flag to indication whether or not CSFB is supported for this LAI.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Modify

sysadmin, manage

Delete

sysadmin, manage

List

sysadmin, manage, monitor

5.71 cmm laiList

List of LAIs. Syntax, description, parameters, and roles for cmm laiList command.

Syntax

Description

This command is used to administer a list of LAIs and includes parameters for defining the Location Area Code and Served Mobile Network Name.

Parameters

Name

areaListName - Name of LAI list

Syntax

--areaListName <string>

Description

Name of LAI list.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

servedPlmnName - Served mobile network name

Syntax

--servedPlmnName <string>

Description

Label for served PLMN.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

lac - Location area code

Syntax

--lac <integer>

Description

Location area code.

Class

Required key.

Type / Range

Integer in the range of 1 to 65,535

Roles

Create

sysadmin, manage

Show

sysadmin, manage, monitor

Modify

sysadmin, manage

Delete

sysadmin, manage

List

sysadmin, manage, monitor

5.72 cmm laiMscMapping

LAI to MSC Mapping. Syntax, description, parameters, and roles for `cmm laiMscMapping` command.

Syntax

Description

This command is used to administer an LAI to MSC Mapping and includes parameters for defining the Mobile Network Name, Location Area Code, and MSC Server ID.

Parameters

Name

plmnName - Mobile network name

Syntax

--plmnName <string>

Description

Name that identifies mobile network.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

lac - Location area code

Syntax

--lac <integer>

Description

Location area code.

Class

Required key.

Type / Range

Integer in the range of 1 to 65,535

Name

mscSrvId - MSC ID

Syntax

--mscSrvId <integer>

Description

The ID of the MSC server this LAI maps to.

Class

Required key.

Type / Range

Integer in the range of 1 to 128

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

sysadmin, manage, monitor

5.73 cmm laiOfHomeAccessList

LAI of home access list. Syntax, description, parameters, and roles for cmm laiOfHomeAccessList command.

Syntax**Description**

LAI home access list relation.

Parameters

Name

mcc - MCC

Syntax

--mcc <digits>

Description

MCC digits of broadcasted PLMN.

Class

Required key.

Type / Range

Digit string of length 3

Name

mnc - MNC

Syntax

--mnc <digits>

Description

MNC digits of broadcasted PLMN.

Class

Required key.

Type / Range

Digit string of length 2 to 3

Name

lac - LAC

Syntax

--lac <integer>

Description

Location area code.

Class

Required key.

Type / Range

Integer in the range of 1 to 65,533

Name

homeAccessListId - Home access list id

Syntax

--homeAccessListId <integer>

Description

Home access list identifier. this parameter should match parameter homeaccesslistid of table homeaccesslist.

Class

Required key.

Type / Range

Integer in the range of 1 to 1000

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

sysadmin, manage, monitor

5.74 cmm laiOfVisitorAccessList

SGSN LAI of visitor access list. Syntax, description, parameters, and roles for cmm laiOfVisitorAccessList command.

Syntax**Description**

SGSN LAI visitor access list relation.

Parameters**Name**

mcc - MCC

Syntax

--mcc <digits>

Description

MCC digits of broadcasted PLMN.

Class

Required key.

Type / Range

Digit string of length 3

Name

mnc - MNC

Syntax

--mnc <digits>

Description

MNC digits of broadcasted PLMN.

Class

Required key.

Type / Range

Digit string of length 2 to 3

Name

lac - LAC

Syntax

--lac <integer>

Description

Location area code.

Class

Required key.

Type / Range

Integer in the range of 1 to 65,533

Name

visitorAccessListId - Visitor access list id

Syntax

--visitorAccessListId <integer>

Description

Visitor access list identifier. this parameter should match parameter visitoraccesslistid of table visitoraccesslist.

Class

Required key.

Type / Range

Integer in the range of 1 to 1000

Roles

Create

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

sysadmin, manage, monitor

5.75 cmm laiOfVlr

SGSN LAI of VLR. Syntax, description, parameters, and roles for cmm laiOfVlr command.

Syntax

Description

SGSN LAI VLR relation.

Parameters

Name

mcc - MCC

Syntax

--mcc <digits>

Description

MCC digits of broadcasted PLMN.

Class

Required key.

Type / Range

Digit string of length 3

Name

mnc - MNC

Syntax

--mnc <digits>

Description

MNC digits of broadcasted PLMN.

Class

Required key.

Type / Range

Digit string of length 2 to 3

Name

lac - LAC

Syntax

--lac <integer>

Description

Location area code.

Class

Required key.

Type / Range

Integer in the range of 1 to 65,533

Name

vlrId - VlrId

Syntax

--vlrId <integer>

Description

VLR index.

Class

Required key.

Type / Range

Integer in the range of 0 to 199

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

sysadmin, manage, monitor

5.76 cmm lapPagingPriProfile

Low Access Priority Paging Priority Profile. Syntax, description, parameters, and roles for cmm lapPagingPriProfile command.

Syntax

Description

Administer Low Access Priority Paging Priority Profile.

Parameters

Name

name - Low access priority paging profile name

Syntax

--name <digits>

Description

Defines the LAP paging profile name.

Class

Required key.

Type / Range

Digit string of length 1 to 1 with the allowed pattern of [1-8]*

Name

description - Description

Syntax

--description <string>

Description

Profile description.

Class

Optional.

Type / Range

Digit string of length 0 to 160 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

"

Name

lapPagingPriLevel - LAP paging priority level

Syntax

--lapPagingPriLevel <list-item>

Description

LAP paging priority level.

Class

Optional.

List

- PrioLevel0 - Priority level 0 - Priority level 0. No paging priority is set.
- PrioLevel1 - Priority level 1 - Priority level 1. Highest Paging priority.
- PrioLevel2 - Priority level 2 - Priority level 2.
- PrioLevel3 - Priority level 3 - Priority level 3.
- PrioLevel4 - Priority level 4 - Priority level 4.
- PrioLevel5 - Priority level 5 - Priority level 5.
- PrioLevel6 - Priority level 6 - Priority level 6.
- PrioLevel7 - Priority level 7 - Priority level 7.
- PrioLevel8 - Priority level 8 - Priority level 8. Lowest Paging Priority.

Default

PrioLevel0

5.77 cmm lboImsiRangeServices

LBO IMSI Range Services. Syntax, description, parameters, and roles for cmm lboImsiRangeServices command.

Syntax

Description

This command is used to administer Local Breakout IMSI Range Services and includes parameters for defining the roaming network name, an LBO APN white list, and IMSI MSIN values. The 'shutdown' parameter is used to enable/disable the APN white list for an IMSI series.

Parameters

Name

uePlmnServicesName - Name of services based on UE network and served network

Syntax

--uePlmnServicesName <string>

Description

Name that identifies roaming network.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

entryId - Entry ID

Syntax

--entryId <integer>

Description

Entry ID.

Class

Required key.

Type / Range

Integer in the range of 1 to 10,000

Name

apnWhiteListName - APN white list name

Syntax

--apnWhiteListName <string>

Description

It is used to assign a LBO APN white list to a roaming partner network.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

apn-all

Name

description - IMSIRange entry description

Syntax

--description <string>

Description

Description for IMSI range services entry.

Class

Optional.

Type / Range

Digit string of length 0 to 160 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

maxMsin - Maximum MSIN

Syntax

--maxMsin <digits>

Description

The maximum IMSI MSIN value.

Class

Optional.

Type / Range

Digit string of length 0 or 8 to 10

Default

"

Name

minMsin - Minimum MSIN

Syntax

--minMsin <digits>

Description

The minimum IMSI MSIN value.

Class

Optional.

Type / Range

Digit string of length 0 or 8 to 10

Default

..

Name

shutdown - Shutdown

Syntax

--shutdown <list-item>

Description

It is used to disables the APN white list for an IMSI series.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

5.78 cmm lboPgWSelectionApn

LBO PGW Selection Supplementary APN. Syntax, description, parameters, and roles for cmm lboPgWSelectionApn command.

Syntax

Description

This command is used to provision a tag to be suffixed to an APN FQDN for the selection of PGW for a roamer UE LBO PDN connection based on the PDN type requested.

Parameters

Name

uePlmnServicesName - Name of Services based on UE Network and Served Network

Syntax

--uePlmnServicesName <string>

Description

Name that identifies roaming network

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

pdnType - Pdn Type

Syntax

--pdnType <list-item>

Description

Pdn Type

Class

Required key.

List

- ipv4 - Specify PDN type of IPv4.
- ipv4v6 - Specify PDN type of IPv4 / IPv6.
- ipv6 - Specify PDN type of IPv6.

Name

apnNi - Supplementary Access Point Name

Syntax

--apnNi <string>

Description

The parameter configures the tag to be added to the APN NI as a suffix in the FQDN used in the S-NAPTR query for the selection of roamer UE LBO PDN connection.

Class

Required on create.

Type / Range

Digit string of length 1 to 62 with the allowed pattern of [0-9a-zA-Z\.\-]*

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Modify

sysadmin, manage

Delete

5.79 cmm lcsOptionsProfile

Location Services Options Profile. Syntax, description, parameters, and roles for cmm lcsOptionsProfile command.

Syntax**Description**

This command is used to administer a Location Services Options Profile and includes parameters for defining options for handling HSS EPS Location Data Requests in IDR, horizontal and vertical accuracy, response time, and operator and value added services. A default profile, named 'default', is provided.

Parameters**Name**

name - Profile name

Syntax

--name <string>

Description

Location services options profile name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\.\-:@]*

Name

description - Description

Syntax

--description <string>

Description

Profile description.

Class

Optional.

Type / Range

Digit string of length 0 to 160 with the allowed pattern of [0-9a-zA-Z_\.\-:@]*

Default

"

Name

edrxPsmDelayedLocReqAllow - Mobile-Terminated location request delayed location request allowed

Syntax

--edrxPsmDelayedLocReqAllow <list-item>

Description

Allow LCS mobile terminated location request for delayed location reporting when a UE is unreachable due to eDRX or PSM.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

epsStateLocInfoReq - Report UE state/location information if requested

Syntax

--epsStateLocInfoReq <list-item>

Description

Select options for handling HSS EPS location data request in IDR.

Class

Optional.

List

- ECGI and TAI Only - MME will indicate to the HSS in ULR and IDA that MME supports the EPS state/location. when HSS sends IDR requesting EPS location information then MME only sends the current ECGI and TAI information to the HSS. in this case MME does not run LCSAP procedures to obtain UE location.
- Not Supported - If this option is selected then MME will not indicate to the HSS that MME supports EPS state/location retrieval in ULR and IDA.
- UE Geolocation - MME will indicate to the HSS in ULR and IDA that MME supports the EPS state/location. when HSS sends IDR requesting EPS location information then MME runs the LCSAP procedures to obtain UE location and sends the obtained UE geo-location in IDA along with the most recent ECGI and TAI.

Default

Not Supported

Name

horizontalAccuracy - Horizontal accuracy

Syntax

--horizontalAccuracy <integer>

Description

Horizontal accuracy parameter in the location request.

Class

Optional.

Type / Range

Integer in the range of 0 to 127

Default

20

Name

lawfulInterceptServices - Lawful Intercept location services

Syntax

--lawfulInterceptServices <list-item>

Description

Allow/reject a location request by LCS client of type lawful intercept services.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

operatorServices - Operator services LCS client type

Syntax

--operatorServices <list-item>

Description

Allow/reject a location request by LCS client of type operator services.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

responseTime - Response time

Syntax

--responseTime <list-item>

Description

Response time parameter in the location request.

Class

Optional.

List

- Delay Tolerant - Specify response time of delay tolerant.
- Low Delay - Specify response time of low delay.

Default

Low Delay

Name

valueAddedServices - Value added services LCS client type

Syntax

--valueAddedServices <list-item>

Description

Allow/reject a location request by LCS client of type value added services.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

verticalAccuracy - Vertical accuracy

Syntax

--verticalAccuracy <integer>

Description

Vertical accuracy parameter in the location request.

Class

Optional.

Type / Range

Integer in the range of 0 to 127

Default

20

Name

verticalRequested - Vertical requested

Syntax

--verticalRequested <list-item>

Description

Vertical requested parameter in the location request.

Class

Optional.

List

- Requested - Specify vertical requested.
- Not Requested - Specify vertical not requested.

Default

Not Requested

5.80 cmm ldapAuthRoleMapping

LDAP Authorizaiton Role Mapping. Syntax, description, parameters, and roles for cmm
ldapAuthRoLeMapping command.

Syntax

Description

This command allows mapping of External LDAP Authorization Roles to the Internal CMM Roles. Maximum number of entries supported shall be 50.

Parameters

Name

name - Name

Syntax

--name <string>

Description

Name

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

ldapExternalRole - LDAP External Role Name

Syntax

```
--ldapExternalRole <string>
```

Description

LDAP External Role Name

Class

Required key.

Type / Range

Digit string of length 1 to 100 with the allowed pattern of [0-9a-zA-Z\._-\$]*

Name

rbacRole - RBAC Role

Syntax

```
--rbacRole <list-item>
```

Description

The internal RBAC Role Allowed

Class

Required on create.

List

- Admin - Admin Role
- Configurator - Configurator Role
- LI - Lawful Intercept - Lawful Intercept Role
- Monitor - Monitor Role
- SecAdmin - Security Admin - Security Admin Role

Roles**Create**

5.81 cmm linkAdmin

Signaling Link Admin. Syntax, description, parameters, and roles for cmm linkAdmin command.

Syntax

Description

Signaling Link Admin.

Parameters

Name

linkInterfaceType - Link interface type

Syntax

```
--linkInterfaceType <list-item>
```

Description

Link interface type.

Class

Required key.

List

- gn - Specify the Gn interface to an SGSN.
- m3 - Specify the M3 interface to an eNodeB.
- n26 - Specify n26 interface to an AMF
- nr10 - Specify nr10 interface.
- rs10 - Specify the RS10 interface to an SRS.
- s10 - Specify the S10 interface to another MME.
- s102 - Specify the S102 interface to an IWF.
- s11 - Specify the S11 interface to an SGW.
- s11u - Specify S11-u interface to an SGW.
- s13 - Specify the S13 interface to an EIR.
- s16 - Specify S16 interface loop around to this SGSN.
- s1mme - Specify the S1-MME interface to an eNodeB.
- s3 - Specify the S3 interface to an SGSN.
- s4 - Specify S4 interface to an SGW.

- s6ad - Specify the S6ad interface to an HSS.
- sbc - Specify the SBc interface to a CBC..
- sgd - Specify SGd interface to an SMSC/SMS router.
- sgs - Specify the SGs interface to a GSM/UMTS MSC.
- sgslite - Specify SGs lite interface to an IWF.
- slg - Specify the Slg interface to a GMLC.
- sls - Specify the Sls interface to an E-SMLC.
- sm - Specify the sm interface to an MBMS gateway.
- sv - Specify the Sv interface to a GSM/UMTS MSC.
- t6a - Specify T6a interface to an SCEF.

Name

linkIndex - Link index

Syntax

--linkIndex <integer>

Description

Link index from the read command

Class

Required key.

Type / Range

Integer in the range of 0 to 4,294,967,295

Name

linkAdminState - Link admin state

Syntax

--linkAdminState <list-item>

Description

Specified current link admin state.

Class

Required on create.

List

- blocked - Blocked state. this applies only to s6ad, s13, slg, sgd and t6a.
- draining - Draining state. only applies to s11.
- locked - Locked state.

- unknown - Used in special cases to report state. a link cannot be updated to unknown state.
- unlocked - UnLocked state.

Name

alarmState - Alarm state

Syntax

--alarmState <list-item>

Description

Specifies alarm state.

Class

Read only.

List

- critical - Critical alarm.
- major - Major alarm.
- minor - Minor alarm.
- none - No alarm.
- unknown - Unknown.

Name

forceFlag - Force flag

Syntax

--forceFlag <list-item>

Description

When you are locking last link on S6ad, use this flag to be true to lock or block the S6ad link unconditionally. linkadminstate must be entered when force is entered.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Name

linkAvailState - Link available state

Syntax

--linkAvailState <list-item>

Description

Specifies link available state.

Class

Read only.

List

- degraded - Degraded.
- dependency - Dependency.
- none - None.
- unknown - Unknown.

Name

linkIdentifier - Link identifier

Syntax

```
--linkIdentifier <string>
```

Description

Link information.

Class

Read only.

Type / Range

Digit string of length 0 or 1 to 255

Name

linkInUseState - Link inuse state

Syntax

```
--linkInUseState <list-item>
```

Description

Link inuse state.

Class

Read only.

List

- in-use - Specify link in use state of in use.
- not-applicable - Specify link in use state of not application.
- not-used - Specify link in use state of not used.

Name

linkOperationState - Link operation state

Syntax

```
--linkOperationState <list-item>
```

Description

Link operation state requested. valid values are locked, unlocked, draining or blocked.

Class

Read only.

List

- disabled - Disabled state of the link.
- enabled - Enable state of the link.
- unknown - Unknown state of the link. this can not be used during query.

Name

linkPlmnType - PLMN type of the link

Syntax

--linkPlmnType <list-item>

Description

Specifies PLMN type of the link. only applies to S6ad.

Class

Read only.

List

- home - Specify link PLMN type of home.
- not-applicable - Specify link PLMN type of not applicable.
- not-home - Specify link PLMN type of not home.

Name

linkProcState - Link procedural state

Syntax

--linkProcState <list-item>

Description

Specifies link procedural state.

Class

Read only.

List

- init req - Init request - Init request.
- initing - Initiating.
- none - None.
- not init - Not init.

- not-applicable - Not-applicable.
- report - Report.
- term - Term.

Name

localIp1 - Local IP1

Syntax

--localIp1 <string>

Description

Local IP1.

Class

Read only.

Type / Range

Digit string of length 0 or 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

localIp2 - Local IP2

Syntax

--localIp2 <string>

Description

Local IP2.

Class

Read only.

Type / Range

Digit string of length 0 or 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

poolId - poolId

Syntax

--poolId <integer>

Description

IPDS Pool ID - ID will only be 0 for non Multi-IPDS instantiations.

Class

Read only.

Type / Range

Integer in the range of 0 to 31

Name

remotelp1 - Remote IP1

Syntax

```
--remoteIp1 <string>
```

Description

Remote IP1.

Class

Read only.

Type / Range

Digit string of length 0 or 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

remotelp2 - Remote IP2

Syntax

```
--remoteIp2 <string>
```

Description

Remote IP2.

Class

Read only.

Type / Range

Digit string of length 0 or 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

terminationName - TerminationName

Syntax

```
--terminationName <string>
```

Description

Termination name. this is used for s1mme alone. this field is part of input for optional key fields. this field cannot be updated.

Class

Read only.

Type / Range

Digit string of length 0 or 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Roles**Show**

sysadmin, manage, monitor

Modify

sysadmin, manage

5.82 cmm linkAlarmCfg

linkAlarmCfg. Syntax, description, parameters, and roles for cmm linkAlarmCfg command.

Syntax

Description

Administer Link Alarm Severity for MME.

Parameters

Name

linkInterfaceType - Link interface type

Syntax

```
--linkInterfaceType <list-item>
```

Description

Link interface type.

Class

Required key.

List

- gn - Specify the Gn interface to an SGSN.
- m3 - Specify the M3 interface to an eNodeB.
- n26 - Specify n26 interface to an AMF
- nr10 - Specify nr10 interface.
- rs10 - Specify the RS10 interface to an SRS.
- s10 - Specify the S10 interface to another MME.
- s102 - Specify the S102 interface to an IWF.
- s11 - Specify the S11 interface to an SGW.
- s11u - Specify S11-u interface to an SGW.
- s13 - Specify the S13 interface to an EIR.
- s16 - Specify S16 interface loop around to this SGSN.
- s1mme - Specify the S1-MME interface to an eNodeB.
- s3 - Specify the S3 interface to an SGSN.
- s4 - Specify S4 interface to an SGW.

- s6ad - Specify the S6ad interface to an HSS.
- sbc - Specify the SBc interface to a CBC..
- sgd - Specify SGd interface to an SMSC/SMS router.
- sgs - Specify the SGs interface to a GSM/UMTS MSC.
- sgslite - Specify SGs lite interface to an IWF.
- slg - Specify the Slg interface to a GMLC.
- sls - Specify the Sls interface to an E-SMLC.
- sm - Specify the sm interface to an MBMS gateway.
- sv - Specify the Sv interface to a GSM/UMTS MSC.
- t6a - Specify T6a interface to an SCEF.

Name

absoluteLinkLossExcessiveAlarm - Absolute Link Loss Excessive Alarm

Syntax

--absoluteLinkLossExcessiveAlarm <integer>

Description

This parameter indicates the absolute number of unavailable Links necessary to trigger the Excessive Links Lost Alarm. This parameter applies to S1, S11-U and S11 only.

Class

Optional.

Type / Range

Integer in the range of 5 to 100

Default

100

Name

aggrSeverity - Aggregate severity

Syntax

--aggrSeverity <list-item>

Description

Aggregate severity.

Class

Optional.

List

- critical - Critical alarm.
- major - Major alarm.

- minor - Minor alarm.
- none - No alarm.

Default

critical

Name

individualSeverity - Individual severity

Syntax

--individualSeverity <list-item>

Description

Individual severity.

Class

Optional.

List

- critical - Critical alarm.
- major - Major alarm.
- minor - Minor alarm.
- none - No alarm.

Default

major

Name

percentLinkLossAlarm - Percentage of Link Loss Alarm

Syntax

--percentLinkLossAlarm <integer>

Description

This parameter specifies the percentage of unavailable links at which to raise a critical interface alarm. This parameter applies to S1, S11-U and S11 only.

Class

Optional.

Type / Range

Integer in the range of 5 to 100 in units of %

Default

20

5.83 cmm linkQueryDetail

Signaling single link Query Detail. Syntax, description, parameters, and roles for cmm linkQueryDetail command.

Syntax

Description

Signaling Link Show query link detail.

Parameters

Name

linkInterfaceType - Link interface type

Syntax

--linkInterfaceType <list-item>

Description

Link interface type. default to s6ad.

Class

Required key.

List

- m3 - Specify the M3 interface to an eNodeB.
- m3ua - Specify an M3UA interface.
- s13 - Specify the S13 interface to an EIR.
- s1mme - S1-MME - Specify the S1-MME interface to an eNodeB.
- s6ad - Specify the S6ad interface to an HSS.
- sbc - Specify the SBc interface to a CBC.

- sgd - Specify SGd interface to an SMSC/SMS router.
- sgs - Specify the SGs interface to a GSM/UMTS MSC.
- slg - Specify the SLg interface to a GMLC.
- sls - Specify the SLs interface to an E-SMLC.
- t6a - Specify T6a interface to an SCEF.

Name

linkIndex - Link index

Syntax

--linkIndex <integer>

Description

Link index from the read command. default to first enabled link.

Class

Required key.

Type / Range

Integer in the range of 0 to 4,294,967,295

Name

linkDetailCode - Link detail

Syntax

--linkDetailCode <integer>

Description

Link detail code from the read command. default to 1.

Class

Required key.

Type / Range

Integer in the range of 0 to 65,535

Name

detailOutputLineNumber - Detail output line number

Syntax

--detailOutputLineNumber <string>

Description

Detail output line number as output.

Class

Required key.

Type / Range

Digit string of length

Name

detailOutput - Link details

Syntax

--detailOutput <string>

Description

Link details.

Class

Read only.

Type / Range

Digit string of length

Roles**List**

sysadmin, manage, monitor

5.84 cmm linkQueryPath

Signaling single link Query Path. Syntax, description, parameters, and roles for cmm linkQueryPath command.

Syntax**Description**

Signaling Link Show query sctp path.

Parameters**Name**

linkInterfaceType - Link interface type

Syntax

--linkInterfaceType <list-item>

Description

Link interface type. only SCTP interfaces are supported. default to s6ad.

Class

Required key.

List

- m3 - Specify the M3 interface to an eNodeB.
- m3ua - Specify an M3UA interface.
- s13 - Specify the S13 interface to an EIR.
- s1mme - S1-MME - Specify the S1-MME interface to an eNodeB.
- s6ad - Specify the S6ad interface to an HSS.
- sbc - Specify the SBc interface to a CBC.
- sgd - Specify SGd interface to an SMSC/SMS router.
- sgs - Specify the SGs interface to a GSM/UMTS MSC.
- slg - Specify the SLg interface to a GMLC.
- sls - Specify the SLs interface to an E-SMLC.
- t6a - Specify T6a interface to an SCEF.

Name

linkIndex - Link index

Syntax

--linkIndex <integer>

Description

Link index to read. default to first enabled link.

Class

Required key.

Type / Range

Integer in the range of 0 to 4,294,967,295

Name

localIp1 - Local IP1

Syntax

--localIp1 <string>

Description

Local IP1.

Class

Read only.

Type / Range

Digit string of length 0 or 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

localPort1 - LocalPort1

Syntax

```
--localPort1 <integer>
```

Description

Local port 1.

Class

Read only.

Type / Range

Integer in the range of 0 to 65,535

Name

pathIndex - Path number

Syntax

```
--pathIndex <integer>
```

Description

Path index.

Class

Read only.

Type / Range

Integer in the range of 0 to 3

Name

remotelp1 - Remote IP1

Syntax

```
--remoteIp1 <string>
```

Description

Remote IP1.

Class

Read only.

Type / Range

Digit string of length 0 or 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

remotePort1 - RemotePort1

Syntax

```
--remotePort1 <integer>
```

Description

Remote port 1.

Class

Read only.

Type / Range

Integer in the range of 0 to 65,535

Roles**List**

sysadmin, manage, monitor

5.85 cmm localDnsHostFile

Local DNS Host File. Syntax, description, parameters, and roles for cmm localDnsHostFile command.

Syntax**Description**

This command creates a DB entry of local DNS host file to be loaded into openssl. The local DNS host file is used as resolution for S-GW (TAI), P-GW (APN), and MME/S4 SGSN

Parameters**Name**

name - Local DNS Host File Name

Syntax

--name <string>

Description

Name of the DB entry. Not applicable for the list operation

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Name

hostFile - Local DNS Host File

Syntax

--hostFile <string>

Description

Absolute path of local DNS host file. Example: /tmp/localdnshostfile

Class

Required on create.

Type / Range

Digit string of length 1 to 100 with the allowed pattern of [0-9a-zA-Z\._&(),/]*

Name

content - DNS Local Host File Content

Syntax

--content <string>

Description

DNS Local Host File Content

Class

Read only.

Type / Range

String of length 0 to 512

Name

lineNumber - Content Line Number

Syntax

--lineNumber <integer>

Description

Content Line Number

Class

Read only.

Type / Range

Integer in the range of 0 to 1,000

Roles**Create**

sysadmin, manage

Delete

sysadmin, manage

List

sysadmin, manage, monitor

5.86 cmm localEndPtCfg

Local End Point Configuration. Syntax, description, parameters, and roles for cmm localEndPtCfg command.

Syntax

Description

This command is used to administer a Local End Point Configuration and includes parameters for defining the interface name, label, and port, DSCP code, and SCTP inbound and outbound streams. The 'shutdown' parameter is used to enable/shutdown the interface. The 'shutdown' parameter does not apply to AIML_DATA_STREAM - AIML Data Stream interface

Parameters

Name

interfaceName - Interface name

Syntax

--interfaceName <list-item>

Description

Interface name.

Class

Required key.

List

- GB - Specify gb interface to a BSC.
- GN - Specify the Gn interface to an SGSN.
- GNGGSN - Specify Gn interface to a GGSN.
- M3 - Specify the M3 interface to an eNodeB.
- N26 - Specify N26 interface
- RS10 - Specify RS10 interface to an SRS.
- S10 - Specify the S10 interface to another MME.
- S102 - Specify S102 interface to an IWF.
- S11 - Specify the S11 interface to an SGW.
- S11U - Specify S11u interface to a SGW.
- S13 - Specify the S13 interface to an EIR.
- S16 - Specify S16 interface loop around to this SGSN.
- S1MME - Specify the S1-MME interface to an eNodeB.
- S1MME_2 - Specify 2nd S1MME interface to an eNodeB.
- S1MME_3 - Specify 3rd S1MME interface to an eNodeB.
- S1MME_4 - Specify 4th S1MME interface to an eNodeB.
- S1MME_5 - Specify 5th S1MME interface to an eNodeB.

- S1MME_6 - Specify 6th S1MME interface to an eNodeB.
- S1MME_7 - Specify 7th S1MME interface to an eNodeB.
- S1MME_8 - Specify 8th S1MME interface to an eNodeB.
- S1MME_9 - Specify 9th S1MME interface to an eNodeB.
- S3 - Specify S3 interface from the MME to an SGSN.
- S3SGSN - Specify S3 interface from the SGSN to an SGSN.
- S4 - Specify the S4 interface to an SGW.
- S6A - Specify the S6a interface to an HSS.
- SBC - Specify the SBc interface to a CBC.
- SGD - Specify the SGd interface to an SMSC/SMS router.
- SGS - Specify the SGs interface to a GSM/UMTS MSC.
- SGS_LITE - Specify SGs lite interface to an IWF.
- SLG - Specify the SLg interface to a GMLC.
- SLS - Specify the SLs interface to an E-SMLC.
- SV - Specify the Sv interface to a GSM/UMTS MSC.
- Sm - Specify the sm interface to an MBMS gateway.
- T6A - Specify T6a interface to an SCEF.
- X1_1 - Specify X1_1 interface to an ADMF.
- X2 - Specify X2 interface to a DF2.
- SBI_NR10 - Specify SBI_NR10 interface.
- SBI_NR10_2 - SBI_NR_10_2 - Specify SBI_NR10_2 interface.
- SBI_NR10_3 - Specify the SBI_NR10_3 interface.
- SBI_NR10_4 - Specify the SBI_NR10_4 interface.
- SBI_NR10_5 - Specify the SBI_NR10_5 interface.
- SBI_NR10_6 - Specify the SBI_NR10_6 interface.
- SBI_NR10_7 - Specify the SBI_NR10_7 interface.
- SBI_NR10_8 - Specify the SBI_NR10_8 interface.
- SBI_NR10_9 - Specify the SBI_NR10_9 interface.
- SBI_NR10_10 - Specify the SBI_NR10_10 interface.
- SBI_NR10_11 - Specify the SBI_NR10_11 interface.
- SBI_NR10_12 - Specify the SBI_NR10_12 interface.

- SBI_NR10_13 - Specify the SBI_NR10_13 interface.
- SBI_NR10_14 - Specify the SBI_NR10_14 interface.
- SBI_NR10_15 - Specify the SBI_NR10_15 interface.
- SBI_NR10_16 - Specify the SBI_NR10_16 interface.
- AIML_DATA_STREAM - AIML Data Stream - Specify the AIML interface.

Name

avRequested - Number of authentication vectors

Syntax

--avRequested <integer>

Description

Authentication vector requested. this field is only used with the S6ad interface.

Restrictions

This element is only applicable when interfaceName is S6A.

Class

Optional.

Type / Range

Integer in the range of 0 to 5

Default

3

Name

comboIndication - Combo indication

Syntax

--comboIndication <list-item>

Description

This parameter enables system when running as a combo MME/SGSN configuration to use s6ad to connect to the HSS for both MME and SGSN.

Restrictions

1. This element is only applicable when interfaceName is S6A. 2. comboIndication is only valid when the system is running as a combo MME/SGSN and SGSN is running as S4-SGSN or both Gn/S4-SGSN. When enabled, MME or SGSN shall set the combo flag when communicating with the HSS. 3. comboIndication can be modified only when shutdown is set to true.

Class

Optional.

List

- false - Boolean value of false.

- true - Boolean value of true.

Default

false

Name

description - Interface description

Syntax

--description <string>

Description

Description for interface.

Class

Optional.

Type / Range

Digit string of length 0 to 160 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

"

Name

dscpCode - DSCP code

Syntax

--dscpCode <list-item>

Description

DSCP code.

Class

Optional.

List

- AF11 - Assured forwarding 11.
- AF12 - Assured forwarding 12.
- AF13 - Assured forwarding 13.
- AF21 - Assured forwarding 21.
- AF22 - Assured forwarding 22.
- AF23 - Assured forwarding 23.
- AF31 - Assured forwarding 31.
- AF32 - Assured forwarding 32.
- AF33 - Assured forwarding 33.
- AF41 - Assured forwarding 41.

- AF42 - Assured forwarding 42.
- AF43 - Assured forwarding 43.
- BE - BE.
- CS1 - Class selector 1.
- CS2 - Class selector 2.
- CS3 - Class selector 3.
- CS4 - Class selector 4.
- CS5 - Class selector 5.
- CS6 - Class selector 6.
- CS7 - Class selector 7.
- EF - Expedited forwarding.
- voiceAdmit - Voice Admit

Default

AF41

Name

httpProfileName - HTTP Profile Name for SBI

Syntax

--httpProfileName <string>

Description

HTTP Profile Name for SBI local endpoint

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

"

Name

immRspPref - Immediate response preferred

Syntax

--immRspPref <list-item>

Description

Whether to include "Immediate response preferred" AVP in AIR.

Restrictions

This element is only applicable when interfaceName is S6A.

Class

Optional.

List

- Dynamic - Include when WMM needs authentication vector for current procedure.
- No - Always do not include "Immediate response preferred.
- Yes - Always include "Immediate response preferred.

Default

No

Name

interfaceLabel - Interface label

Syntax

--interfaceLabel <string>

Description

Interface label.

Class

Read only.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

"

Name

interfacePort - Interface port

Syntax

--interfacePort <integer>

Description

This parameter assigns local sctp port number, and local tcp port for SBI interfaces. For SBI interfaces, if port is 0 and tlsEncrypted is true, port 443 is used. if port is 0 and tlsEncrypted is false, port 80 is used

Class

Optional.

Type / Range

Integer in the range of 0 or 1,024 to 65,535

Default

0

Name

multiHomed - Multi home

Syntax

--multiHomed <list-item>

Description

This enables/disables sctp multihomed at the given local termination.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

protocolProfileName - Interface profile name

Syntax

--protocolProfileName <string>

Description

Interface profile name.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

"

Name

sctpInboundStreams - SCTP inbound streams

Syntax

--sctpInboundStreams <integer>

Description

SCTP inbound streams. this field is only used with the S6ad interface.

Restrictions

This element is only applicable when interfaceName is S6A.

Class

Optional.

Type / Range

Integer in the range of 1 to 10

Default

1

Name

sctpOutboundStreams - SCTP outbound streams

Syntax

--sctpOutboundStreams <integer>

Description

SCTP outbound streams. this field is only used with the S6ad interface.

Restrictions

This element is only applicable when interfaceName is S6A.

Class

Optional.

Type / Range

Integer in the range of 1 to 10

Default

1

Name

shutdown - Shutdown

Syntax

--shutdown <list-item>

Description

When it is true, indicates that interface is shutdown.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

tlsProfileName - TLS Profile Name for SBI

Syntax

--tlsProfileName <string>

Description

TLS Profile Name for SBI local endpoint

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

"

5.87 cmm locationGatewayApn

Location Gateway APN List. Syntax, description, parameters, and roles for cmm locationGatewayApn command.

Syntax**Description**

Configure, list and show APN lists.

Parameters**Name**

apnNi - APN Network Identifier

Syntax

--apnNi <string>

Description

APN Network Identifier

Class

Required key.

Type / Range

Digit string of length 1 to 62 with the allowed pattern of [0-9a-zA-Z\.\-]*

Name

locationGw - Location Based PGW Selection

Syntax

--locationGw <list-item>

Description

Location Based PGW Selection

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

5.88 cmm lteQosPolicySet

LTE QoS Policy set configuration. Syntax, description, parameters, and roles for cmm lteQosPolicySet command.

Syntax

Description

Configure, list and show LTE QoS Policy set parameters.

Parameters

Name

apnAmbrDL - APN aggregate maximum bit rate for downlink in kbps

Syntax

--apnAmbrDL <integer>

Description

This parameter defines the aggregated maximum bit rate for non-guaranteed bit rate for downlink per APN in kbps. the values range from 0 to 168000 with variable increment.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 0 to 168,000

Default

50

Name

apnAmbrUL - APN aggregate maximum bit rate for uplink in kbps

Syntax

--apnAmbrUL <integer>

Description

This parameter defines the aggregated maximum bit rate for non-guaranteed bit rate for uplink per APN in kbps. the values range from 0 to 46000 with variable increment.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 0 to 46,000

Default

50

Name

arpGbr - Allocation/retention priority for GBR

Syntax

--arpGbr <integer>

Description

This parameter defines allocation and retention priority for guaranteed bit rate. the value range from 1 to 15.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 15

Default

14

Name

arpNGbr - Allocation/retention for non-gbr

Syntax

--arpNGbr <integer>

Description

This parameter defines allocation and retention priority for non-guaranteed bit rate. the value range from 1 to 15.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 15

Default

14

Name

gbrDl - Guaranteed bit rate for downlink in kbps

Syntax

--gbrDl <integer>

Description

This parameter defines the guaranteed bit rate for downlink in kbps. the values range from 0 to 168000 with variable increment.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 0 to 168,000

Default

120

Name

gbrUL - Guaranteed bit rate for uplink in kbps

Syntax

--gbrUL <integer>

Description

This parameter defines the guaranteed bit rate for uplink in kbps. the values range from 0 to 46000 with variable increment.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 0 to 46,000

Default

50

Name

mbrDL - Maximum bit rate for downlink in kbps

Syntax

--mbrDL <integer>

Description

This parameter defines the maximum bit rate for downlink in kbps. the values range from 0 to 168000 with variable increment.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 0 to 168,000

Default

120

Name

mbrUL - Maximum bit rate for uplink in kbps

Syntax

--mbrUL <integer>

Description

This parameter defines the maximum bit rate for uplink in kbps. the values range from 0 to 46000 with variable increment.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 0 to 46,000

Default

50

Name

pciGbr - ARP pre-emption capability information for GBR

Syntax

--pciGbr <list-item>

Description

This parameter defines arp pre-emption capability information for guaranteed bit rate.

Class

Optional, not filterable on list.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

pciNGbr - ARP pre-emption capability information for non-gbr

Syntax

--pciNGbr <list-item>

Description

This parameter defines arp pre-emption capability information for non-guaranteed bit rate.

Class

Optional, not filterable on list.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

pviGbr - ARP pre-emption vulnerability information for GBR

Syntax

--pviGbr <list-item>

Description

This parameter defines arp pre-emption vulnerability information for guaranteed bit rate.

Class

Optional, not filterable on list.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

pviNGbr - ARP pre-emption vulnerability information for non-gbr

Syntax

--pviNGbr <list-item>

Description

This parameter defines arp pre-emption vulnerability information for non-guaranteed bit rate.

Class

Optional, not filterable on list.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

qci1 - LTE QoS class identifier 1

Syntax

--qci1 <list-item>

Description

This parameter defines the QoS class identifier 1.

Class

Optional, not filterable on list.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

qci2 - LTE QoS class identifier 1

Syntax

--qci2 <list-item>

Description

This parameter defines the QoS class identifier 2.

Class

Optional, not filterable on list.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

qci3 - LTE QoS class identifier 3

Syntax

--qci3 <list-item>

Description

This parameter defines the QoS class identifier 3.

Class

Optional, not filterable on list.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

qci4 - LTE QoS class identifier 4

Syntax

--qci4 <list-item>

Description

This parameter defines the QoS class identifier 4.

Class

Optional, not filterable on list.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

qci5 - LTE QoS class identifier 5

Syntax

--qci5 <list-item>

Description

This parameter defines the QoS class identifier 5.

Class

Optional, not filterable on list.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

qci6 - LTE QoS class identifier 6

Syntax

--qci6 <list-item>

Description

This parameter defines the QoS class identifier 6.

Class

Optional, not filterable on list.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

qci7 - LTE QoS class identifier 7

Syntax

```
--qci7 <list-item>
```

Description

This parameter defines the QoS class identifier 7.

Class

Optional, not filterable on list.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

qci8 - LTE QoS class identifier 8

Syntax

```
--qci8 <list-item>
```

Description

This parameter defines the QoS class identifier 8.

Class

Optional, not filterable on list.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

qci9 - LTE QoS class identifier 9

Syntax

```
--qci9 <list-item>
```

Description

This parameter defines the QoS class identifier 9.

Class

Optional, not filterable on list.

List

- false - Boolean value of false.

- true - Boolean value of true.

Default

false

Name

ueAmbrDl - UE aggregate maximum bit rate for downlink in kpbs

Syntax

--ueAmbrDl <integer>

Description

This parameter defines the UE-aggregated maximum bit rate for non-guaranteed bit rate for downlink. the values range from 0 to 168000 with variable increment.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 0 to 168,000

Default

120

Name

ueAmbrUl - UE aggregate maximum bit rate for uplink in kpbs

Syntax

--ueAmbrUl <integer>

Description

This parameter defines the UE-aggregated maximum bit rate for non-guaranteed bit rate for uplink. the values range from 0 to 46000 with variable increment.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 0 to 46,000

Default

50

Name

id - Id of LTE QoS policy set number

Syntax

<integer>

Description

Id of LTE QoS policy set number.

Class

Required value.

Type / Range

Integer in the range of 1 to 6

sysadmin, manage, monitor

5.89 cmm lteQosPolicySetDefault

LTE QoS Policy default set configuration. Syntax, description, parameters, and roles for cmm lteQosPolicySetDefault command.

Syntax**Description**

Configure and show LTE QoS Policy default set parameters.

Parameters**Name**

apnAmbrDL - APN aggregate maximum bit rate for downlink in kbps

Syntax

--apnAmbrDL <integer>

Description

This parameter defines the aggregated maximum bit rate for non-guaranteed bit rate for downlink per APN in kbps. the values range from 0 to 168000 with variable increment.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 0 to 168,000

Default

50

Name

apnAmbrUl - APN aggregate maximum bit rate for uplink in kbps

Syntax

--apnAmbrUl <integer>

Description

This parameter defines the aggregated maximum bit rate for non-guaranteed bit rate for uplink per APN in kbps. the values range from 0 to 46000 with variable increment.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 0 to 46,000

Default

50

Name

arpGbr - Allocation/retention priority for GBR

Syntax

--arpGbr <integer>

Description

This parameter defines allocation and retention priority for guaranteed bit rate. the value range from 1 to 15.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 15

Default

14

Name

arpNGbr - Allocation/retention for non-gbr

Syntax

--arpNGbr <integer>

Description

This parameter defines allocation and retention priority for non-guaranteed bit rate. the value range from 1 to 15.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 15

Default

14

Name

gbrDL - Guaranteed bit rate for downlink in kbps

Syntax

--gbrDL <integer>

Description

This parameter defines the guaranteed bit rate for downlink in kbps. the values range from 0 to 168000 with variable increment.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 0 to 168,000

Default

120

Name

gbrUL - Guaranteed bit rate for uplink in kbps

Syntax

--gbrUL <integer>

Description

This parameter defines the guaranteed bit rate for uplink in kbps. the values range from 0 to 46000 with variable increment.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 0 to 46,000

Default

50

Name

mbrDL - Maximum bit rate for downlink in kbps

Syntax

```
--mbrDl <integer>
```

Description

This parameter defines the maximum bit rate for downlink in kbps. the values range from 0 to 168000 with variable increment.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 0 to 168,000

Default

120

Name

mbrUl - Maximum bit rate for uplink in kbps

Syntax

```
--mbrUl <integer>
```

Description

This parameter defines the maximum bit rate for uplink in kbps. the values range from 0 to 46000 with variable increment.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 0 to 46,000

Default

50

Name

pciGbr - ARP pre-emption capability information for GBR

Syntax

```
--pciGbr <list-item>
```

Description

This parameter defines arp pre-emption capability information for guaranteed bit rate.

Class

Optional, not filterable on list.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

pciNGbr - ARP pre-emption capability information for non-gbr

Syntax

--pciNGbr <list-item>

Description

This parameter defines arp pre-emption capability information for non-guaranteed bit rate.

Class

Optional, not filterable on list.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

pviGbr - ARP pre-emption vulnerability information for GBR

Syntax

--pviGbr <list-item>

Description

This parameter defines arp pre-emption vulnerability information for guaranteed bit rate.

Class

Optional, not filterable on list.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

pviNGbr - ARP pre-emption vulnerability information for non-gbr

Syntax

--pviNGbr <list-item>

Description

This parameter defines arp pre-emption vulnerability information for non-guaranteed bit rate.

Class

Optional, not filterable on list.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

qci1 - LTE QoS class identifier 1

Syntax

--qci1 <list-item>

Description

This parameter defines the QoS class identifier 1.

Class

Optional, not filterable on list.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

qci2 - LTE QoS class identifier 1

Syntax

--qci2 <list-item>

Description

This parameter defines the QoS class identifier 2.

Class

Optional, not filterable on list.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

qci3 - LTE QoS class identifier 3

Syntax

--qci3 <list-item>

Description

This parameter defines the QoS class identifier 3.

Class

Optional, not filterable on list.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

qci4 - LTE QoS class identifier 4

Syntax

--qci4 <list-item>

Description

This parameter defines the QoS class identifier 4.

Class

Optional, not filterable on list.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

qci5 - LTE QoS class identifier 5

Syntax

--qci5 <list-item>

Description

This parameter defines the QoS class identifier 5.

Class

Optional, not filterable on list.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

qci6 - LTE QoS class identifier 6

Syntax

--qci6 <list-item>

Description

This parameter defines the QoS class identifier 6.

Class

Optional, not filterable on list.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

qci7 - LTE QoS class identifier 7

Syntax

--qci7 <list-item>

Description

This parameter defines the QoS class identifier 7.

Class

Optional, not filterable on list.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

qci8 - LTE QoS class identifier 8

Syntax

--qci8 <list-item>

Description

This parameter defines the QoS class identifier 8.

Class

Optional, not filterable on list.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

qci9 - LTE QoS class identifier 9

Syntax

--qci9 <list-item>

Description

This parameter defines the QoS class identifier 9.

Class

Optional, not filterable on list.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

ueAmbrDL - UE aggregate maximum bit rate for downlink in kpbs

Syntax

--ueAmbrDL <integer>

Description

This parameter defines the UE-aggregated maximum bit rate for non-guaranteed bit rate for downlink. the values range from 0 to 168000 with variable increment.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 0 to 168,000

Default

120

Name

ueAmbrUl - UE aggregate maximum bit rate for uplink in kpbs

Syntax

--ueAmbrUl <integer>

Description

This parameter defines the UE-aggregated maximum bit rate for non-guaranteed bit rate for uplink. the values range from 0 to 46000 with variable increment.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 0 to 46,000

Default

50

Name

id - Id of default LTE QoS policy set number

Syntax

config

Description

Just type 'config' here.

Class

Required value.

List

- config - Specify LTE QoS policy default of config.

5.90 cmm lteTo2G3GQosMapping

LTE 2G3G QoS Mapping. Syntax, description, parameters, and roles for cmm lteTo2G3GQosMapping command.

Syntax

Description

This command is used to administer LTE 2G3G QoS Mapping and includes parameters for defining AMBR and ARP values, and traffic classes and QCI values for background, conversational, interactive, and streaming. A default profile is provided.

Parameters

Name

name - LTE 2G3G QoS mapping name

Syntax

--name <string>

Description

LTE 2G3G QoS mapping name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Name

apnAmbrDownLink - APN AMBR downlink

Syntax

--apnAmbrDownLink <integer>

Description

Configures apn AMBR for downlink rate in kilobits per second.

Restrictions

Valid bit rates are as follows... if in range 0-63 multiple of 1 kbps, if in the range 64..568 must be a multiple of 8 kbps, if in the range 576..8640 must be a multiple of 64 kbps, if in the range 8700..16000 must be a multiple of 100 kbps, if in the range 17000..128000 must be a multiple of 1 Mbps, if in the range 130000..256000 must be a multiple of 2 Mbps

Class

Optional.

Type / Range

Integer in the range of 0, 1-63, 64-568, 576-8640, 8700-16000, 17000-128000, 130000-256000, 260000-500000, 510000-1500000, 1600000-4000000000

Default

256000

Name

apnAmbrUpLink - APN AMBR uplink

Syntax

--apnAmbrUpLink <integer>

Description

Configures apn AMBR for uplink rate in kilobits per second.

Restrictions

Valid bit rates are as follows... if in range 0-63 multiple of 1 kbps, if in the range 64..568 must be a multiple of 8 kbps, if in the range 576..8640 must be a multiple of 64 kbps, if in the range 8700..16000 must be a multiple of 100 kbps, if in the range 17000..128000 must be a multiple of 1 Mbps, if in the range 130000..256000 must be a multiple of 2 Mbps

Class

Optional.

Type / Range

Integer in the range of 0, 1-63, 64-568, 576-8640, 8700-16000, 17000-128000, 130000-256000, 260000-500000, 510000-1500000, 1600000-4000000000

Default

256000

Name

arpHValue - ArpH value

Syntax

--arpHValue <integer>

Description

ArpH value indicates a high priority (H) value to use for ARP translations.

Class

Optional.

Type / Range

Integer in the range of 1 to 13

Default

1

Name

arpMValue - ArpM value

Syntax

--arpMValue <integer>

Description

ArpM value indicates a medium priority (M) value to use for ARP translations.

Class

Optional.

Type / Range

Integer in the range of 2 to 14

Default

2

Name

backgroundQci - Background QCI

Syntax

--backgroundQci <integer>

Description

Configures background qci.

Class

Optional.

Type / Range

Integer in the range of 1 to 9

Default

9

Name

conversationalSpeechQci - Conversational speech QCI

Syntax

--conversationalSpeechQci <integer>

Description

Configures conversationalspeech qci.

Class

Optional.

Type / Range

Integer in the range of 1 to 9

Default

1

Name

conversationalUnknownHighDelayQci - ConversationalUnknownHighDelay QCI

Syntax

--conversationalUnknownHighDelayQci <integer>

Description

Configures conversationalunknownhighdelay qci.

Class

Optional.

Type / Range

Integer in the range of 1 to 9

Default

2

Name

conversationalUnknownLowDelayQci - ConversationalUnknownLowDelay QCI

Syntax

--conversationalUnknownLowDelayQci <integer>

Description

Configures conversationalunknownlowdelay qci.

Class

Optional.

Type / Range

Integer in the range of 1 to 9

Default

3

Name

description - Description

Syntax

--description <string>

Description

Description.

Class

Optional.

Type / Range

Digit string of length 0 to 80 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

"

Name

includeR11QosExtensionsGn - Include R11 QoS extensions Gn

Syntax

--includeR11QosExtensionsGn <list-item>

Description

Configures in the MME to include/exclude r1 QoS in SGSN context response or forward relocation request over the Gn interface..

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

includeR7QosExtensionsGn - Include R7 QoS extensions Gn

Syntax

```
--includeR7QosExtensionsGn <list-item>
```

Description

Configures in the MME to include/exclude r7 QoS in SGSN context response or forward relocation request over the Gn interface..

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

interactiveThp1NonSignalingQci - InteractiveTHP1NonSignaling QCI

Syntax

```
--interactiveThp1NonSignalingQci <integer>
```

Description

Configures interactivethp1nonsignaling qci.

Class

Optional.

Type / Range

Integer in the range of 1 to 9

Default

6

Name

interactiveThp1SignalingQci - InteractiveTHP1Signaling QCI

Syntax`--interactiveThp1SignalingQci <integer>`**Description**

Configures interactivethp1signaling qci.

Class

Optional.

Type / Range

Integer in the range of 1 to 9

Default

5

Name

interactiveThp2SignalingQci - InteractiveTHP2Signaling QCI

Syntax`--interactiveThp2SignalingQci <integer>`**Description**

Configures interactivethp2signaling qci.

Class

Optional.

Type / Range

Integer in the range of 1 to 9

Default

7

Name

interactiveThp3SignalingQci - InteractiveTHP3Signaling QCI

Syntax`--interactiveThp3SignalingQci <integer>`**Description**

Configures interactivethp3signaling qci.

Class

Optional.

Type / Range

Integer in the range of 1 to 9

Default

8

Name

obtainUeAmbr - Obtain UE-AMBR

Syntax`--obtainUeAmbr <integer>`**Description**

Obtain UE-AMBR indicates the rule to use to obtain the local UE-AMBR. entering "0", you designate the "calculate rule" which means that the MME software implements the algorithm specified in annex e of TS 23.401 to derive a local value for the parameter 5361 until the subscribed value can be obtained from the HSS. by entering a number between 1 and 50,000, the MME software uses the provisioned value until the subscribed value can be obtained from the HSS.

Class

Optional.

Type / Range

Integer in the range of 0 to 50,000

Default

0

Name

qci1QosProfileName - Qci1 QoS profile name

Syntax`--qci1QosProfileName <string>`**Description**

This is the traffic class profile name for QCI value 1. it must be entered together with qci1trafficclass.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

qci1-default

Name

qci1TrafficClass - Qci1 trafficclass

Syntax`--qci1TrafficClass <list-item>`**Description**

Qci1 trafficclass.

Class

Optional.

List

- Background - Traffic class type of background.
- Conversational - Traffic class type of conversational.
- Interactive - Traffic class type of interactive.
- Streaming - Traffic class type of streaming.

Default

Conversational

Name

qci2QosProfileName - Qci2 QoS profile name

Syntax

--qci2QosProfileName <string>

Description

This is the traffic class profile name for QCI value 2. it must be entered together with qci2trafficclass.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

qci2-default

Name

qci2TrafficClass - Qci2 trafficclass

Syntax

--qci2TrafficClass <list-item>

Description

Qci2 trafficclass.

Class

Optional.

List

- Background - Traffic class type of background.
- Conversational - Traffic class type of conversational.

- Interactive - Traffic class type of interactive.
- Streaming - Traffic class type of streaming.

Default

Conversational

Name

qci3QosProfileName - Qci3 QoS profile name

Syntax

--qci3QosProfileName <string>

Description

This is the traffic class profile name for QCI value 3. it must be entered together with qci3trafficclass.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

qci3-default

Name

qci3TrafficClass - Qci3 trafficclass

Syntax

--qci3TrafficClass <list-item>

Description

Qci3 trafficclass.

Class

Optional.

List

- Background - Traffic class type of background.
- Conversational - Traffic class type of conversational.
- Interactive - Traffic class type of interactive.
- Streaming - Traffic class type of streaming.

Default

Conversational

Name

qci4QosProfileName - Qci4 QoS profile name

Syntax

```
--qci4QosProfileName <string>
```

Description

This is the traffic class profile name for QCI value 4. it must be entered together with qci4trafficclass.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

qci4-default

Name

qci4TrafficClass - Qci4 trafficclass

Syntax

```
--qci4TrafficClass <list-item>
```

Description

Qci4 trafficclass.

Class

Optional.

List

- Background - Traffic class type of background.
- Conversational - Traffic class type of conversational.
- Interactive - Traffic class type of interactive.
- Streaming - Traffic class type of streaming.

Default

Streaming

Name

qci5QosProfileName - Qci5 QoS profile name

Syntax

```
--qci5QosProfileName <string>
```

Description

This is the traffic class profile name for QCI value 5. it must be entered together with qci5trafficclass.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

qci5-default

Name

qci5TrafficClass - Qci5 trafficclass

Syntax

--qci5TrafficClass <list-item>

Description

Qci5 trafficclass.

Class

Optional.

List

- Background - Traffic class type of background.
- Conversational - Traffic class type of conversational.
- Interactive - Traffic class type of interactive.
- Streaming - Traffic class type of streaming.

Default

Interactive

Name

qci6QosProfileName - Qci6 QoS profile name

Syntax

--qci6QosProfileName <string>

Description

This is the traffic class profile name for QCI value 6. it must be entered together with qci6trafficclass.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

qci6-default

Name

qci6TrafficClass - Qci6 trafficclass

Syntax

```
--qci6TrafficClass <list-item>
```

Description

Qci6 trafficclass.

Class

Optional.

List

- Background - Traffic class type of background.
- Conversational - Traffic class type of conversational.
- Interactive - Traffic class type of interactive.
- Streaming - Traffic class type of streaming.

Default

Interactive

Name

qci7QosProfileName - Qci7 QoS profile name

Syntax

```
--qci7QosProfileName <string>
```

Description

This is the traffic class profile name for QCI value 7. it must be entered together with qci7trafficclass.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

qci7-default

Name

qci7TrafficClass - Qci7 trafficclass

Syntax

```
--qci7TrafficClass <list-item>
```

Description

Qci7 trafficclass.

Class

Optional.

List

- Background - Traffic class type of background.
- Conversational - Traffic class type of conversational.
- Interactive - Traffic class type of interactive.
- Streaming - Traffic class type of streaming.

Default

Interactive

Name

qci8QosProfileName - Qci8 QoS profile name

Syntax

--qci8QosProfileName <string>

Description

This is the traffic class profile name for QCI value 8. it must be entered together with qci8trafficclass.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Default

qci8-default

Name

qci8TrafficClass - Qci8 trafficclass

Syntax

--qci8TrafficClass <list-item>

Description

Qci8 trafficclass.

Class

Optional.

List

- Background - Traffic class type of background.
- Conversational - Traffic class type of conversational.
- Interactive - Traffic class type of interactive.
- Streaming - Traffic class type of streaming.

Default

Interactive

Name

qci9QosProfileName - Qci9 QoS profile name

Syntax

--qci9QosProfileName <string>

Description

This is the traffic class profile name for QCI value 9. it must be entered together with qci9trafficclass.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

qci9-default

Name

qci9TrafficClass - Qci9 trafficclass

Syntax

--qci9TrafficClass <list-item>

Description

Qci9 trafficclass.

Class

Optional.

List

- Background - Traffic class type of background.
- Conversational - Traffic class type of conversational.
- Interactive - Traffic class type of interactive.
- Streaming - Traffic class type of streaming.

Default

Background

Name

qosMappingHighDelayThr - QoS mapping highdelay threshold

Syntax

--qosMappingHighDelayThr <integer>

Description

QoS mapping highdelay threshold is used to distinguish between the conversational_unknown_highdelay and conversational_unknown_lowdelay cases. the R99

QoS transfer delay parameter is compared to this threshold value. if it is equal to or greater than this threshold then it is considered "high delay". otherwise it is "low delay". range is 10 - 400 in millisec.

Class

Optional.

Type / Range

Integer in the range of 10 to 400

Default

150

Name

streamingSpeechQci - StreamingSpeech QCI

Syntax

--streamingSpeechQci <integer>

Description

Configures streamingspeech qci.

Class

Optional.

Type / Range

Integer in the range of 1 to 9

Default

4

Name

streamingUnknownQci - StreamingUnknown QCI

Syntax

--streamingUnknownQci <integer>

Description

Configures streamingunknown qci.

Class

Optional.

Type / Range

Integer in the range of 1 to 9

Default

4

5.91 cmm m3uaLinkInfo

M3UA Link Info. Syntax, description, parameters, and roles for cmm m3uaLinkInfo command.

Syntax

Description

M3UA Link Info.

Parameters

Name

link - M3UA link

Syntax

--link <string>

Description

Use this parameter to specify the signalling links you wish to interrogate. if you wish to interrogate all existing signalling links, leave this parameter out.

Class

Optional.

Type / Range

Digit string of length 0 to 30 with the allowed pattern of `^(1203[0-1]|120[0-2][0-9]|1[0-1][0-9][0-9][0-9][1-9][0-9][0-9][0-9][1-9][0-9][0-9][1-9][0-9][0-9])([,-](1203[0-1]|120[0-2][0-9]|1[0-1][0-9][0-9][0-9][1-9][0-9][0-9][0-9][1-9][0-9][0-9][1-9][0-9][0-9]))*`
\$

Name

state - Link state queried

Syntax

--state <list-item>

Description

Use this parameter to specify the state of the signalling links you wish to interrogate. allowed values unavailable, available. only links with the specified state are displayed.

Class

Optional.

List

- available - Available.
- unavailable - Unavailable.

Roles

List

sysadmin, manage, monitor

5.92 cmm m3uaLinkSetInfo

M3UA Link Set Info. Syntax, description, parameters, and roles for cmm m3uaLinkSetInfo command.

Syntax

Description

M3UA Link Set Info.

Parameters

Name

network - Signalling network

Syntax

--network <list-item>

Description

Use this parameter to specify the symbolic name of the signalling network. allowed values IN0,IN1,NA0,NA1.

Class

Required on create.

List

- IN0 - International network number 0.
- IN1 - International network number 1.

- NAO - National network number 0.
- NA1 - National network number 1.

Name

spc - Signalling point code

Syntax

--spc <string>

Description

Use this parameter to specify the signalling point codes of those signalling points where the signalling link sets, whose state data you wish to output, lead to.

Class

Optional.

Type / Range

Digit string of length 0 to 30 with the allowed pattern of (1203[0-1]|120[0-2][0-9]|1[0-1][0-9][0-9][0-9]|1[1-9][0-9][0-9][0-9]|1[1-9][0-9][0-9]|1[1-9][0-9][0-9]|1[1-9][0-9][0-9])([,,-](1203[0-1]|120[0-2][0-9]|1[0-1][0-9][0-9][0-9]|1[1-9][0-9][0-9][0-9]|1[1-9][0-9][0-9]|1[1-9][0-9][0-9]))*

Roles**List**

sysadmin, manage, monitor

5.93 cmm m3uaProfile

M3UA Profile. Syntax, description, parameters, and roles for cmm m3uaProfile command.

Syntax**Description**

Administer M3UA Profile.

Parameters**Name**

name - M3UA profile name

Syntax

--name <string>

Description

M3UA profile name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Name

assoMaxRetrans - Max association retrans

Syntax

--assoMaxRetrans <integer>

Description

Maximum association retransmissions.

Class

Optional.

Type / Range

Integer in the range of 1 to 50

Default

10

Name

cookieLife - Cookie life

Syntax

--cookieLife <integer>

Description

Valid cookie life time frame in units of seconds.

Class

Optional.

Type / Range

Integer in the range of 5 to 120 in units of Second

Default

60

Name

description - Description

Syntax

--description <string>

Description

Profile description.

Class

Optional.

Type / Range

Digit string of length 0 to 160 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

"

Name

hbInterval - Heartbeat interval

Syntax

--hbInterval <integer>

Description

Heartbeat interval in units of seconds.

Class

Optional.

Type / Range

Integer in the range of 1 to 300 in units of Second

Default

30

Name

maxInitRetrans - Max init retrans

Syntax

--maxInitRetrans <integer>

Description

Maximum initial retransmissions.

Class

Optional.

Type / Range

Integer in the range of 1 to 25

Default

8

Name

mtuSize - MTU Size

Syntax

--mtuSize <integer>

Description

Maximum transmission unit size in bytes.

Class

Optional.

Type / Range

Integer in the range of 512 to 9000 in units of Byte

Default

1500

Name

pathMaxRetrans - Max path retrans

Syntax

--pathMaxRetrans <integer>

Description

Maximum path retransmissions.

Class

Optional.

Type / Range

Integer in the range of 1 to 25

Default

5

Name

rtoInitValid - RTO initial value

Syntax

--rtoInitValid <integer>

Description

Initial retransmission timeout in units of ms.

Class

Optional.

Type / Range

Integer in the range of 10 to 10,000 in units of Millisecond

Default

300

Name

rtoMax - RTO maximum

Syntax

--rtoMax <integer>

Description

Maximum retransmission timeout in units of ms.

Class

Optional.

Type / Range

Integer in the range of 20 to 60,000 in units of Millisecond

Default

400

Name

rtoMin - RTO minimum

Syntax

--rtoMin <integer>

Description

Minimum retransmission timeout in units of ms.

Class

Optional.

Type / Range

Integer in the range of 10 to 5,000 in units of Millisecond

Default

50

Name

sackFreq - SACK frequency

Syntax

--sackFreq <integer>

Description

SCTP acknowledgment frequency.

Class

Optional.

Type / Range

Integer in the range of 1 to 5

Default

2

Name

sackPeriod - SACK period

Syntax

--sackPeriod <integer>

Description

SCTP acknowledgment period in units of ms.

Class

Optional.

Type / Range

Integer in the range of 0 to 500 in units of Millisecond

Default

200

5.94 cmm m3uaRouteSetInfo

M3UA Route Set Info. Syntax, description, parameters, and roles for cmm m3uaRouteSetInfo command.

Syntax**Description**

M3UA Route Set Info.

Parameters**Name**

network - Signalling network

Syntax

--network <list-item>

Description

Use this parameter to specify the symbolic name of the signalling network. allowed values IN0,IN1,NA0,NA1.

Class

Required on create.

List

- IN0 - International network number 0.
- IN1 - International network number 1.
- NA0 - National network number 0.
- NA1 - National network number 1.

Name

spc - Signalling point code

Syntax

--spc <string>

Description

Use this parameter to specify the signalling point codes of the signalling points where the signalling route sets, whose state data you wish to output, lead to. if you wish to interrogate the state data on the signalling route sets leading to all existing signalling points, leave this parameter out.

Class

Optional.

Type / Range

Digit string of length 0 to 30 with the allowed pattern of (1203[0-1]|120[0-2][0-9]|1[0-1][0-9][0-9][0-9][1-9][0-9][0-9][0-9][1-9][0-9][0-9][1-9][0-9][0-9])([,-](1203[0-1]|120[0-2][0-9]|1[0-1][0-9][0-9][0-9][1-9][0-9][0-9][0-9][1-9][0-9][0-9][1-9][0-9][0-9]))*

Roles

List

sysadmin, manage, monitor

5.95 cmm m3uaSpLoadSharingInfo

M3UA Signalling Point Load Sharing info. Syntax, description, parameters, and roles for cmm m3uaSpLoadSharingInfo command.

Syntax

Description

M3UA Signalling Point Load Sharing info.

Parameters

Name

network - Signalling network

Syntax

--network <list-item>

Description

Use this parameter to specify the symbolic name of the signalling network. allowed values IN0,IN1,NA0,NA1.

Class

Required on create.

List

- IN0 - International network number 0.
- IN1 - International network number 1.
- NA0 - National network number 0.
- NA1 - National network number 1.

Name

opc - Originator point code

Syntax

--opc <string>

Description

Use this parameter to specify the originator point of STP messages.

Class

Optional.

Type / Range

Digit string of length 0 to 30 with the allowed pattern of (1203[0-1]|120[0-2][0-9]|1[0-1][0-9][0-9][0-9][1-9][0-9][0-9][0-9][1-9][0-9][0-9][1-9][0-9][0-9])([,-](1203[0-1]|120[0-2][0-9]|1[0-1][0-9][0-9][0-9][1-9][0-9][0-9][0-9][1-9][0-9][0-9][1-9][0-9][0-9]))*

Name

spc - Signalling point code

Syntax

--spc <string>

Description

Use this parameter to specify the signalling point code of the signalling point the load sharing of which you wish to interrogate.

Class

Optional.

Type / Range

Digit string of length 0 to 30 with the allowed pattern of (1203[0-1]|120[0-2][0-9]|1[0-1][0-9][0-9][0-9]|1[1-9][0-9][0-9][0-9]|1[1-9][0-9][0-9][0-9]|1[1-9][0-9][0-9][0-9])([,,-](1203[0-1]|120[0-2][0-9]|1[0-1][0-9][0-9][0-9]|1[1-9][0-9][0-9][0-9]|1[1-9][0-9][0-9][0-9]))*

Roles

List

sysadmin, manage, monitor

5.96 cmm maintenance

maintenance. Syntax, description, parameters, and roles for cmm maintenance command.

Syntax

Description

Configure and list maintenance.

Parameters

Name

offload - Offload

Syntax

--offload <list-item>

Description

With this parameter, you can activate the phase of the multipoint offloading process manually or start the automated offloading process. Possible values are: 1 ... activate offloading phase 1. 2 ... activate offloading phase 2. AUTO ... start automated offloading.

Class

Optional, not filterable on list.

List

- 1 - Phase 1 - Activate offloading phase 1.
- 2 - Phase 2 - Activate offloading phase 2.
- AUTO - Automated - Start automated offloading.

Default

AUTO

Name

rat - Radio access type

Syntax`--rat <list-item>`**Description**

This parameter defines the access type (automated or manual) multipoint offloading procedure. possible values are GB ... GB interface IU ... IU interface ALL ... all interfaces.

Class

Optional, not filterable on list.

List

- ALL - All interfaces.
- GB - Gb interface.
- IU - Iu interface.

Default

ALL

Name

type - Type

Syntax`--type <list-item>`**Description**

This parameter defines whether offload subscribers or Remove SGSN for maintenance (as described in f50106-01 SGSN support for Remove SGSN for Maintenance. Possible values are: OFFL ... Offload Subscribers. MAINT ... Remove SGSN for Maintenance (default). IOFFL ... IMSI Based Offloading

Class

Optional, not filterable on list.

List

- IOFFL - Offload specific subscribers specified with IMSI
- MAINT - Offload all SUBS.
- OFFL - Offload number of subscribers specified in OFFLCOUNT.

Default

MAINT

Name

id - Maintenance id

Syntax

<list-item>

Description

Just type 'SGSN' here.

Class

Required value.

List

- SGSN - Specify maintenance identifier of SGSN.

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

sysadmin, manage, monitor

5.97 cmm maintForPaps

maintForPaps. Syntax, description, parameters, and roles for **cmm maintForPaps** command.

Syntax**Description**

Configure and show PAPS maintenance.

Parameters**Name**

blockForMaint - Blocking for maintenance

Syntax

--blockForMaint <list-item>

Description

With this parameter you can set all PAPS to the blocked state or unblock all PAPS for normal use. Cannot be issued with massDetach. Possible values are: ACT ... Block all PAPS for maintenance DACT ... Unblock all PAPS for normal use OFF ... Not used parameter

Class

Optional, not filterable on list.

List

- OFF - Not used parameter.
- ACT - Active - Block all PAPS for maintenance.
- DACT - Deactive - Unblock all PAPS for normal use.

Default

OFF

Name

massDetach - Mass detach

Syntax

--massDetach <list-item>

Description

With this parameter you can start or cancel the execution of mass detach. cannot be issued with blockformaint. possible values are START ... start mass detach CANCEL ... cancel mass detach OFF ... not used parameter.

Class

Optional, not filterable on list.

List

- OFF - Not used parameter.
- CANCEL - Cancel mass detach.
- START - Start mass detach.

Default

OFF

Name

rat - Radio access type

Syntax

--rat <list-item>

Description

This parameter defines the access type for the mass detach or (automated or manual) multipoint offloading procedure. possible values are GB ... GB interface IU ... IU interface ALL ... all interfaces NA ... not applicable parameter.

Class

Optional, not filterable on list.

List

- ALL - All interfaces.
- GB - Gb interface.
- IU - Iu interface.
- NA - Not applicable - Not applicable parameter.

Default

NA

Name

id - Maintforpaps id

Syntax

<integer>

Description

PAPS unit index.

Class

Required value.

Type / Range

Integer in the range of 0 to 19

Roles**Create**

sysadmin, manage

5.98 cmm mapAddrAnalysis

MAP Address Analysis. Syntax, description, parameters, and roles for cmm mapAddrAnalysis command.

Syntax

Description

Use this command to configure, list and show network entity address analysis records for determining the best MAP version and virtual MSC,VLR addresses (optional) as well as the standard of the TCAP (optional), the standard of the SCCP address (optional), and the standard of the object identifier (optional).

Parameters

Name

gtDigits - GT digits

Syntax

--gtDigits <digits>

Description

Use this parameter to specify the global title address of the network entity.

Class

Required key.

Type / Range

Digit string of length 1 to 15

Name

spc - Spc

Syntax

--spc <integer>

Description

Use this parameter to specify the signalling point code of the network entity.you must give the ni parameter before the spc parameter.

Class

Required key.

Type / Range

Integer in the range of 1 to 16,777,215

Name

ni - Network indicator

Syntax

--ni <list-item>

Description

Use this parameter to specify the value that identifies the type of the network. cases, IN0 international network number 0 IN1 international network number 1 NAO national network number 0 NA1 national network number 1.

Class

Required key.

List

- IN0 - International network number 0.
- IN1 - International network number 1.
- NAO - National network number 0.
- NA1 - National network number 1.

Name

resAddressIndex - Result address index

Syntax

--resAddressIndex <integer>

Description

Use this parameter to specify the result address pair index, on the basis of which the analysis is to be carried out. please, check that this result record has been configured through cmm mapaddranalysisresaddr list.

Class

Required on create.

Type / Range

Integer in the range of 0 to 9

Name

resNumber - Result record number

Syntax

--resNumber <integer>

Description

Use this parameter to specify the result record number, on the basis of which the analysis is to be carried out. please, check that this result record has been configured through cmm mapaddranalysisresult list.

Class

Required on create.

Type / Range

Integer in the range of 0 to 254

Name

np - Numbering plan

Syntax

--np <list-item>

Description

Use this parameter to specify the numbering plan for the global title address. cases, E164 ISDN,telephony E212 land mobile E214 ISDN,mobile.

Class

Optional.

List

- E164 - E.164 - Specify numbering plan of E.164.
- E212 - E.212 - Specify numbering plan of E.212.
- E214 - E.214 - Specify numbering plan of E.214.

Default

E164

Name

obid - Standard of object identifier

Syntax

--obid <list-item>

Description

Use this parameter to specify the standard that is used in the object identifiers in the result of the current analysis. allowed values, ANSI , ITU.

Class

Optional.

List

- ANSI - Specify standards type of american national standards institute.
- ITU - Specify standards type of international telecommunication union.

Default

ITU

Name

resAddressName - Result address name

Syntax

--resAddressName <string>

Description

Use this parameter to specify the result address pair name, on the basis of which the analysis is to be carried out. you do not have to specify this, specify just resaddressindex.

Class

Read only.

Type / Range

Digit string of length 1 to 15 with the allowed pattern of [0-9a-zA-Z\._ :]*

Name

resName - Result record name

Syntax

--resName <string>

Description

Use this parameter to specify the result record name, on the basis of which the analysis is to be carried out. you do not have to specify this, specify just resnumber.

Class

Read only.

Type / Range

Digit string of length 1 to 24 with the allowed pattern of [0-9a-zA-Z\._ :]*

Name

sccp - Standard of SCCP addresses

Syntax

--sccp <list-item>

Description

Use this parameter to specify the standard that is used in the SCCP addresses in the result of the current analysis. allowed values, ANSI , ITU.

Class

Optional.

List

- ANSI - Specify standards type of american national standards institute.
- ITU - Specify standards type of international telecommunication union.

Default

ITU

Name

tcap - Standard of TCAP

Syntax

--tcap <list-item>

Description

Use this parameter to specify the standard that is used in the TCAP in the result of the current analysis. allowed values, ANSI , ITU.

Class

Optional.

List

- ANSI - Specify standards type of american national standards institute.
- ITU - Specify standards type of international telecommunication union.

Default

ITU

Name

toA - Type of address

Syntax

--toA <list-item>

Description

Use this parameter to specify the type of address. allowed values, GT (global title address) , DPC (destination point code).

Class

Optional.

List

- DPC - Destination point code - Specify address type of destination point code.
- GT - Global title - Specify address type of global title.

Default

GT

Name

toN - Type of number

Syntax

--toN <list-item>

Description

Use this parameter to specify the country format for the global title address. cases, INT international NAT national.

Class

Optional.

List

- INT - International - Specify address format as international.
- NAT - National - Specify address format as national.

Default

INT

Roles

5.99 cmm mapAddrAnalysisResAddr

MAP Address Analysis Result Address. Syntax, description, parameters, and roles for cmm mapAddrAnalysisResAddr command.

Syntax

Description

Use this command to configure, list and show the result address pairs for the network entity address analysis.

Parameters

Name

resAddressIndex - Result address index

Syntax

--resAddressIndex <integer>

Description

Use this parameter to specify the result address pair index, on the basis of which the analysis is to be carried out.

Class

Required key.

Type / Range

Integer in the range of 0 to 9

Name

resAddressName - Result address name

Syntax

--resAddressName <string>

Description

Use this parameter to specify the result address pair name, on the basis of which the analysis is to be carried out.

Class

Required on create.

Type / Range

Digit string of length 1 to 15 with the allowed pattern of [0-9a-zA-Z\._ :]*

Name

mscDigits - MSC address

Syntax

--mscDigits <digits>

Description

Use this parameter to specify the virtual MSC address in E164 format.

Class

Optional.

Type / Range

Digit string of length 1 to 18

Default

0

Name

mscTon - Type of MSC address

Syntax

--mscTon <list-item>

Description

Use this parameter to specify the country format of virtual MSC address.

Class

Optional.

List

- INT - International - Specify address format as international.
- NAT - National - Specify address format as national.

Default

INT

Name

vlrDigits - VLR address

Syntax

--vlrDigits <digits>

Description

Use this parameter to specify the virtual VLR address in E164 format.

Class

Optional.

Type / Range

Digit string of length 1 to 18

Default

0

Name

vlrTon - Type of VLR address

Syntax

--vlrTon <list-item>

Description

Use this parameter to specify the country format of virtual VLR address.

Class

Optional.

List

- INT - International - Specify address format as international.
- NAT - National - Specify address format as national.

Default

INT

5.100 cmm mapAddrAnalysisResult

MAP Address Analysis Result. Syntax, description, parameters, and roles for cmm mapAddrAnalysisResult command.

Syntax

Description

Use this command to configure, list and show the result records of the network entity address analysis.

Parameters

Name

result - Result record number

Syntax

--result <integer>

Description

Use this parameter to specify the result record number.

Class

Required key.

Type / Range

Integer in the range of 0 to 254

Name

name - Result record name

Syntax

--name <string>

Description

Use this parameter to specify the name for the result record.

Class

Required on create.

Type / Range

Digit string of length 1 to 24 with the allowed pattern of [0-9a-zA-Z\._:-]*

Name

extension - Extensions in use

Syntax

--extension <list-item>

Description

Use this parameter to specify the extension status in use. allowed values, y (Yes) , n (No).

Class

Optional.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

Yes

5.101 cmm mapApplicationContextDefault

MAP application context default. Syntax, description, parameters, and roles for cmm mapApplicationContextDefault command.

Syntax**Description**

Use this command to modify or show the application-context-specific default MAP version, the default use of the 0x1647 alarm, and the default use of the 0x2646 alarm.

Parameters**Name**

applicationContext - MAP application context id

Syntax

--applicationContext <list-item>

Description

Use this parameter to specify the application context. this parameter is associated with each dialogue established by a MAP user, that is, it identifies the reason for the MAP communication between two network elements.

Class

Required key.

List

- anyTimeEnquiry - Any time enquiry - Any time enquiry.
- anyTimeInfoHandling - Any time information handling - Any time information handling.
- authenticationFailureReport - Authentication failure report - Authentication failure report.
- callCompletion - Call completion - Call completion.
- equipmentMngt - Equipment management - Equipment management.
- gprsLocationUpdate - GRPS location update - GRPS location update.
- handoverControl - Handover control - Handover control.
- imsiRetrieval - IMSI retrieval - IMSI retrieval.
- infoRetrieval - Information retrieval - Information retrieval.
- interVlrInfoRetrieval - Inter VLR information retrieval - Inter VLR information retrieval.
- locationCancellation - Location cancellation - Location cancellation.
- locationInfoRetrieval - Location information retrieval - Location information retrieval.
- locationSvcEnquiry - Location svc enquiry - Location svc enquiry.
- locationSvcGateway - Location svc gateway - Location svc gateway.
- mmEventReporting - MM event reporting - MM event reporting.
- msPurging - MS purging - MS purging.
- mwdMngt - MWD management - MWD management.
- networkFunctionalSs - Network functional ss - Network functional ss.
- networkLocUp - Network loc up - Network loc up.
- networkUnstructuredSs - Network unstructured ss - Network unstructured ss.
- reporting - Reporting.
- reset - Reset.
- roamingNumberEnquiry - Roaming number enquiry - Roaming number enquiry.

- shortMsgAlert - Short message alert - Short message alert.
- shortMsgGateway - Short message gateway - Short message gateway.
- shortMsgMORelay - Short message mobile origination relay - Short message mobile origination relay.
- shortMsgMTRelay - Short message mobile termination relay - Short message mobile termination relay.
- sslInvocationNotification - SS invocation notification - SS invocation notification.
- subscriberDataMngt - Subscriber data management - Subscriber data management.
- subscriberDataModificationNotif - Subscriber data modification - Subscriber data modification.
- subscriberInfoEnquiry - Subscriber information enquiry - Subscriber information enquiry.
- tracing - Tracing.

Name

alarm1 - Alarm 1

Syntax

--alarm1 <list-item>

Description

Use this parameter to specify the OPERATION TIMER EXPIRY (0x1647) alarm status. allowed values, ALLOWED , DENIED.

Class

Optional.

List

- ALLOWED - Specify default MAP alarm of allowed.
- DENIED - Specify default MAP alarm of denied.

Default

ALLOWED

Name

alarm2 - Alarm 2

Syntax

--alarm2 <list-item>

Description

Use this parameter to specify the PROTOCOL ROUTING FAILURE (0x2646) alarm status. allowed values, ALLOWED , DENIED.

Class

Optional.

List

- ALLOWED - Specify default MAP alarm of allowed.
- DENIED - Specify default MAP alarm of denied.

Default

ALLOWED

Name

extensionInUse - Extension in use

Syntax

--extensionInUse <list-item>

Description

Use this parameter to specify the extension status in use.

Class

Optional.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

Yes

Name

mapVersion - MAP version

Syntax

--mapVersion <list-item>

Description

Use this parameter to specify the MAP version used. each version is used for communicating with a particular network in the chosen application context. cases, 1 2 3 4 DENIED.

Class

Optional.

List

- 1 - Specify MAP default version of 1.
- 2 - Specify MAP default version of 2.
- 3 - Specify MAP default version of 3.
- 4 - Specify MAP default version of 4.
- DENIED - Specify MAP default version of denied.

Default

3

5.102 cmm mapApplicationContextResult

MAP Application Context Result. Syntax, description, parameters, and roles for cmm mapApplicationContextResult command.

Syntax**Description**

Use this command to configure, list and show the application context data for the result records of the network entity address analysis.

Parameters**Name**

result - Result record number

Syntax`--result <integer>`**Description**

Use this parameter to specify the result record number of the specific application context.

Class

Required key.

Type / Range

Integer in the range of 1 to 254

Name

applicationContext - Application context

Syntax`--applicationContext <list-item>`

Description

Use this parameter to specify the application context. this parameter is associated with each dialogue established by a MAP user, that is, it identifies the reason for the MAP communication between two network elements.

Class

Required key.

List

- anyTimeEnquiry - Any time enquiry - Any time enquiry.
- anyTimeInfoHandling - Any time information handling - Any time information handling.
- authenticationFailureReport - Authentication failure report - Authentication failure report.
- callCompletion - Call completion - Call completion.
- equipmentMngt - Equipment management - Equipment management.
- gprsLocationUpdate - GRPS location update - GRPS location update.
- handoverControl - Handover control - Handover control.
- imsiRetrieval - IMSI retrieval - IMSI retrieval.
- infoRetrieval - Information retrieval - Information retrieval.
- interVlrInfoRetrieval - Inter VLR information retrieval - Inter VLR information retrieval.
- locationCancellation - Location cancellation - Location cancellation.
- locationInfoRetrieval - Location information retrieval - Location information retrieval.
- locationSvcEnquiry - Location svc enquiry - Location svc enquiry.
- locationSvcGateway - Location svc gateway - Location svc gateway.
- mmEventReporting - MM event reporting - MM event reporting.
- msPurging - MS purging - MS purging.
- mwdMngt - MWD management - MWD management.
- networkFunctionalSs - Network functional ss - Network functional ss.
- networkLocUp - Network loc up - Network loc up.
- networkUnstructuredSs - Network unstructured ss - Network unstructured ss.
- reporting - Reporting.
- reset - Reset.
- roamingNumberEnquiry - Roaming number enquiry - Roaming number enquiry.
- shortMsgAlert - Short message alert - Short message alert.

- shortMsgGateway - Short message gateway - Short message gateway.
- shortMsgMORElay - Short message mobile origination relay - Short message mobile origination relay.
- shortMsgMTRelay - Short message mobile termination relay - Short message mobile termination relay.
- sslInvocationNotification - SS invocation notification - SS invocation notification.
- subscriberDataMngt - Subscriber data management - Subscriber data management.
- subscriberDataModificationNotif - Subscriber data modification - Subscriber data modification.
- subscriberInfoEnquiry - Subscriber information enquiry - Subscriber information enquiry.
- tracing - Tracing.

Name

alarm1 - Alarm 0x1647

Syntax

--alarm1 <list-item>

Description

Use this parameter to specify the OPERATION TIMER EXPIRY (0x1647) alarm status. allowed values, ALLOWED , DENIED.

Class

Optional.

List

- ALLOWED - Specify MAP alarm of allowed.
- DEF - Default - Specify MAP alarm of default.
- DENIED - Specify MAP alarm of denied.

Default

ALLOWED

Name

alarm2 - Alarm 0x2646

Syntax

--alarm2 <list-item>

Description

Use this parameter to specify the PROTOCOL ROUTING FAILURE (0x2646) alarm status. allowed values, ALLOWED , DENIED.

Class

Optional.

List

- ALLOWED - Specify MAP alarm of allowed.
- DEF - Default - Specify MAP alarm of default.
- DENIED - Specify MAP alarm of denied.

Default

ALLOWED

Name

mapVersion - MAP version

Syntax

--mapVersion <list-item>

Description

Use this parameter to specify the MAP version used. each version is used for communicating with a particular network in the chosen application context. cases, 1 2 3 4 DENIED.

Class

Optional.

List

- 1 - Specify MAP version of 1.
- 2 - Specify MAP version of 2.
- 3 - Specify MAP version of 3.
- 4 - Specify MAP version of 4.
- DEF - Default - Specify MAP version of default.
- DENIED - Specify MAP version of denied.

Default

3

5.103 cmm mapDefaultParameter

MAP default Parameters. Syntax, description, parameters, and roles for cmm mapDefaultParameter command.

Syntax

Description

Use this command to modify, list and show the SCCP return option, the abort in overload control, the standard of the TCAP (optional), the standard of the SCCP address (optional), the standard of the object identifier (optional), and the number of authentication sets 1 and 2.

Parameters

Name

parmName - Parameter Name

Syntax

--parmName <list-item>

Description

'Use this parameter to specify the name of parameter. Cases, SCCP, When SCCP return is activated, messages sent to the network are returned in case of a routing failure. That is, if the SCCP message cannot be routed further, it is returned to the sender. A message can be sent back from the SCCP layer of any signalling transfer point or destination. Messages can also be sent back to TCAP users from the SCCP layer of the originating network element (local return). Local return is always active. The parmValue of this parameter is either Yes (SCCP return is on) or No (SCCP return is off). OLC, If an overload condition is detected while handling the TC begin message received from the network (that is, a MAP dialogue is to be initiated), the dialogue is not accepted and nothing is sent back to the network. This means that the remote network element is not informed by default about the rejection of the dialogue. Use this parameter to force the network element to send a notification (TC U Abort) to the initiating network element in the case of an overload situation. The parmValue of this parameter is either Yes (notification sending is on) or No (notification sending is off). TCAP, This parameter indicates the standard used in the TCAP as default if no network entity address analysis is created, or if the standard is given as default in the network entity address analysis. The specific parmValue can have the following values, ANSI (ANSI standard) , ITU (ITU standard). ADDR, This parameter indicates the standard used in the SCCP addresses as default if no network entity address analysis is created, or if the standard is given as default in the network entity address analysis. The specific parmValue can have the

following values, ANSI (ANSI standard) , ITU (ITU standard). OBID, This parameter indicates the standard used in the object identifiers as default if no network entity address analysis is created, or if the standard is given as default in the network entity address analysis. The specific parmValue can have the following values: ANSI (ANSI standard) , ITU (ITU standard). NAS1, Use this parameter to define the number of authentication sets in the case of MAP version 1. The specific parmValue can have range from 1 to 5. NAS2 , Use this parameter to define the number of authentication sets in the case of MAP version 2. The specific parmValue can have range from 1 to 4.

Class

Required key.

List

- addr - standard of SCCP addresses - Standard that is used in the SCCP addresses in the result of the current analysis.
- nas1 - number of authentication sets 1 - Define the number of authentication sets in the case of MAP version 1.
- nas2 - number of authentication sets 2 - Define the number of authentication sets in the case of MAP version 2.
- obid - standard of object identifier - Standard that is used in the object identifiers in the result of the current analysis.
- olc - abort in overload control - Send a notification (TC-U-Abort) to the initiating network element in the case of an overload situation.
- sccp - SCCP return option - When SCCP return is activated, messages sent to the network are returned in case of a routing failure.
- tcap - standard of TCAP - Standard that is used in the TCAP in the result of the current analysis.

Name

parmValue - Parameter Value

Syntax

--parmValue <string>

Description

Use this parameter to specify the value of parameter, according to the name of the parameter.

Class

Optional.

Type / Range

Digit string of length 1 to 15 with the allowed pattern of [0-9a-zA-Z\._:-]*

The parmValue string is based on the parmName parameter:

Name

addr - standard of SCCP addresses

Syntax

--parmName addr --parmValue <string>

Description

Standard that is used in the SCCP addresses in the result of the current analysis.

List

- ANSI - Specify standards type of american national standards institute.
- ITU - Specify standards type of international telecommunication union.

Default

ITU

Name

nas1 - number of authentication sets 1

Syntax

--parmName nas1 --parmValue <string>

Description

Define the number of authentication sets in the case of MAP version 1.

Type / Range

Integer in the range of 1 to 5

Default

4

Name

nas2 - number of authentication sets 2

Syntax

--parmName nas2 --parmValue <string>

Description

Define the number of authentication sets in the case of MAP version 2.

Type / Range

Integer in the range of 1 to 5

Default

4

Name

obid - standard of object identifier

Syntax

--parmName obid --parmValue <string>

Description

Standard that is used in the object identifiers in the result of the current analysis.

List

- ANSI - Specify standards type of american national standards institute.
- ITU - Specify standards type of international telecommunication union.

Default

ITU

Name

olc - abort in overload control

Syntax

--parmName olc --parmValue <string>

Description

Send a notification (TC-U-Abort) to the initiating network element in the case of an overload situation.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

sccp - SCCP return option

Syntax

--parmName sccp --parmValue <string>

Description

When SCCP return is activated, messages sent to the network are returned in case of a routing failure.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

Yes

Name

tcap - standard of TCAP

Syntax

```
--parmName tcap --parmValue <string>
```

Description

Standard that is used in the TCAP in the result of the current analysis.

List

- ANSI - Specify standards type of american national standards institute.
- ITU - Specify standards type of international telecommunication union.

Default

ITU

5.104 cmm matchApn

Match APN List. Syntax, description, parameters, and roles for cmm matchApn command.

Syntax**Description**

This command is used to administer a Match APN List, assigning a match method to an APN NI.

Parameters**Name**

matchApnNi - APN NI

Syntax

```
--matchApnNi <string>
```

Description

APN NI to be matched.

Class

Required key.

Type / Range

Digit string of length 1 to 62 with the allowed pattern of [0-9a-zA-Z\.\-]*

Name

matchMethod - Match method

Syntax

--matchMethod <list-item>

Description

Configure IMS alias selection that applies and covers ims prefix, ims suffix, ims anywhere and ims match in an APN NI.

Class

Optional.

List

- AnyWhere - Match any where - Match IMS anywhere also covers IMS prefix and IMS suffix in an APN NI.
- Exact - Match exact - Match exact IMS covers exact IMS match without any additional characters in an APN NI.
- Prefix - Match prefix - Match prefix IMS covers IMS prefix in an APN NI.
- Suffix - Match suffix - Match suffix IMS covers IMS suffix in an APN NI.

Default

AnyWhere

sysadmin, manage, monitor

5.105 cmm mbmsAdmin

mbmsAdmin. Syntax, description, parameters, and roles for cmm mbmsAdmin command.

Syntax

Description

MBMS Administration. Only supported operation is Modify. Output goes to the master.log.

Parameters

Name

mbmsType - MBMS type

Syntax

--mbmsType <list-item>

Description

MbmsType.

Class

Required key.

List

- mce - Specify MBMS type of mce.
- session - Specify MBMS type of session.
- table - Specify MBMS type of table.
- tmgi - Specify MBMS type of tmgi.

Name

mbmsOp - MBMS operation

Syntax

--mbmsOp <list-item>

Description

Mbms operation to perform.

Class

Required key.

List

- delete - Specify MBMS operation of list.
- dump - Specify MBMS operation of list.
- list - Specify MBMS operation of list.

Name

linkIndex - Link index

Syntax

--linkIndex <integer>

Description

Link index from the read command

Class

Required on create.

Type / Range

Integer in the range of 0 to 4,294,967,295

Name

flowId - FlowId

Syntax

--flowId <integer>

Description

Flow identifier.

Class

Optional.

Type / Range

Integer in the range of 0 to 65,535

Name

mbmsTable - MBMS table identifier

Syntax

--mbmsTable <list-item>

Description

MBMS table identifier.

Class

Optional.

List

- all - Specify MBMS table type of all.
- m3conn - Specify MBMS table type of m3conn.
- sessdb - Specify MBMS table type of sessdb.

Name

sessionId - MBMS session identifier

Syntax

--sessionId <integer>

Description

MBMS session identifier.

Class

Optional.

Type / Range

Integer in the range of 0 to 65,535

Name

tmgi - TMGI

Syntax

--tmgi <string>

Description

TMGI value as string of digits. TMGI must be 12 digits long with the format SSSSSSPPPPPP. SSSSSS is a six-digit hexadecimal service ID between 000000 and FFFFFFFF. PPPPPP is six-digit PLMN (MCC+MNC). for two-digit MNC, use f for the last digit.

Class

Optional.

Type / Range

Digit string of length 12 to 12 with the allowed pattern of [0-9a-fA-F]{12}

Roles**Modify**

sysadmin, manage

5.106 cmm mmeforcelpChange

MME force IP address Change. Syntax, description, parameters, and roles for cmm mmeforceIpChange command.

Syntax**Description**

Use this cli to manage the MME forced UE IP change operations in TA region (for example, initiate MME forced IP change, terminate forced IP change and interrogate the status of forced UE IP change in specific TA region) . Note: list command shows the status of the last mass detach operation. It is proposed to use list command without filtering.

Parameters**Name**

regionListName - regionListName

Syntax

--regionListName <string>

Description

Name that identifies region

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

forceIpTask - Force IP Change Task

Syntax

--forceIpTask <list-item>

Description

Force IP Change Task. Show is used only when performing a query of the Force IP Change procedure.

Class

Required key.

List

- start - Start MME Force IP Change
- stop - Stop MME Force IP Change
- show - Show MME Force IP Change

Name

detachStatus - Detach Status

Syntax

--detachStatus <string>

Description

Shows current status of the mass detach operation

Class

Read only.

Type / Range

Digit string of length 0 to 64

Roles**Create**

sysadmin, manage

List

sysadmin, manage, monitor

5.107 cmm mmeGrpDcnId

Dedicated Core Network Identifier. Syntax, description, parameters, and roles for cmm mmeGrpDcnId command.

Syntax**Description**

This command is used to provision DCN ID to a MME group. All MMEs in a MME group will support the same set of DNC IDs.

Parameters**Name**

mmeGrpName - MME Group Name

Syntax

--mmeGrpName <string>

Description

MME group to whom the DCN IDs are provisioned.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

dcnId - Dedicated Core Network Identifier

Syntax

--dcnId <integer>

Description

Provision DCN ID supported by the MME group. A maximum of 32 DCN IDs can be provisioned for a MME group.

Class

Required key.

Type / Range

Integer in the range of 1 to 126 or 128 to 65,535

Roles

Create

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

sysadmin, manage, monitor

5.108 cmm mmeGrpNode

MME Group Node. Syntax, description, parameters, and roles for cmm mmeGrpNode command.

Syntax

Description

This command is used to administer an MME Group Node and includes parameters for defining the relative MME capacity for use in the eNB MME selection algorithm, automatically adjusting the relative capacity, the MME code, the MME group identifier, and node type.

Parameters

Name

plmnName - Mobile network name

Syntax

--plmnName <string>

Description

Name that identifies mobile network.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

mmeGi - MME group ID

Syntax

--mmeGi <integer>

Description

The MME group identifier.

Class

Required key.

Type / Range

Integer in the range of 0 to 65,535

Name

mmeC - MME CODE

Syntax

--mmeC <integer>

Description

The MME code (that is, the node ID) of the MME within the group.

Class

Required key.

Type / Range

Integer in the range of 0 to 255

Name

autoAdjustCap - Auto adjusts relative capacity

Syntax

--autoAdjustCap <list-item>

Description

Indicates whether or not the MME automatically adjusts the value of the relative capacity according to the number of active MAF blades in the enabled and unlocked states. this field can only be provisioned if the home MME field is checked (true).

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

capacity - Relative capacity

Syntax

--capacity <integer>

Description

Value for the relative MME capacity for use in the eNB MME selection algorithm. this field is only significant if the auto adjusts relative capacity field is unchecked. this field can also only be provisioned if home MME is checked (true).

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

5

Name

localName - Local name

Syntax

--localName <string>

Description

A name that identifies this node. when this is the home MME, this is a required field and it is highly recommended that the local name match the switch name.

Class

Optional.

Type / Range

Digit string of length 0 to 32 with the allowed pattern of [0-9a-zA-Z\.\-:]*

Default

"

Name

nodeType - Node type

Syntax

--nodeType <list-item>

Description

Indicates for the node type.

Class

Not modifiable.

List

- Home Network - Specify node type of home network.
- Other Network - Specify node type of other network.
- Shared Network - Specify node type of shared network.

Default

Other Network

Name

numProtCPPS - Total number of protection CPPS

Syntax

--numProtCPPS <integer>

Description

This parameter is the number of the CPPS in the system that are protection CPPS. This is also considered the k value in the n+k sparing arrangement. This is only used when autoAdjustCap is TRUE.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

0

Name

s10Ip - S10 IP

Syntax

--s10Ip <string>

Description

S10 IP address.

Class

Not modifiable.

Type / Range

Digit string of length 0 or 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Default

0.0.0.0

Roles

Create

sysadmin, manage

5.109 cmm mmeGrpTai

MME Group to TAI List. Syntax, description, parameters, and roles for cmm mmeGrpTai command.

Syntax

Description

This command is used to administer the MME Group to TAI List and includes parameters to define the MME group ID and Tracking Area Code for the associated network.

Parameters

Name

servedPlmnName - Mobile network name

Syntax

--servedPlmnName <string>

Description

Name that identifies mobile network (alternate key).

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

mmeGi - MME group ID

Syntax

--mmeGi <integer>

Description

MME group ID.

Class

Required key.

Type / Range

Integer in the range of 0 to 65,535

Name

tac - Tracking area code

Syntax

--tac <integer>

Description

Tracking area code.

Class

Required key.

Type / Range

Integer in the range of 1 to 65,535

Roles**Create**

sysadmin, manage

5.110 cmm mmePlmnStatistic

MME PLMN Statistic. Syntax, description, parameters, and roles for cmm mmePlmnStatistic command.

Syntax**Description**

This command would be used to enable/disable as well to configure the functionality for the M169 Measurement Group.

Parameters**Name**

entryId - Entry Id

Syntax

--entryId <integer>

Description

PlmnStatistic identifier.

Class

Required key.

Type / Range

Integer in the range of 1 to 24

Name

plmnType - PLMN Type

Syntax

--plmnType <list-item>

Description

PLMN Type allowed values. Includes ALL PLMNs (Home, Roaming, Specific PLMNs), HOME (home plmns), ROAMING (roaming PLMNs), Specific PLMN IDs

Class

Required on create.

List

- ALL - All PLMNs. Includes HOME and ROAMING PLMNs
- HOME - Home PLMNs. This is the serving PLMNs (i.e. home + share)
- ROAMING - Roaming PLMNs
- PLMNID - Specific PLMN id. Includes only one specific PLMN id (MCC+MNC).
- EMERGENCY - Emergency cases

Name

mcc - MCC

Syntax

--mcc <digits>

Description

Mobile country code.

Class

Optional.

Type / Range

Digit string of length 0 or 3

Default

''

Name

mnc - MNC

Syntax

--mnc <digits>

Description

Mobile network code.

Class

Optional.

Type / Range

Digit string of length 0 or 2 to 3

Default

""

Roles**Create**

5.111 cmm mmeUePageFanoutControl

MME 4G UE paging fanout overload control parameters. Syntax, description, parameters, and roles for cmm mmeUePageFanoutControl command.

Syntax**Description**

This command is used to set thresholds for 4G UE paging fan-out overload control

Parameters**Name**

msgRateToSafetyNetThreshold - Message rate to total allowed message rate (Safety Net) threshold

Syntax

--msgRateToSafetyNetThreshold <integer>

Description

Threshold used for CMM total message to total allowed message rate (Safety Net), in conjunction with other parameters under this command above which to trigger paging restriction

Class

Optional.

Type / Range

Integer in the range of 0 to 100

Default

60

Name

pageFanoutToTotalMsgThreshold - UE paging fanout to total message rate threshold

Syntax

--pageFanoutToTotalMsgThreshold <integer>

Description

Threshold used for UE paging fan-out (number of ENBs contacted) contribution to total CMM message rate, in conjunction with other parameters under this command above which to trigger paging restriction

Class

Optional.

Type / Range

Integer in the range of 0 to 100

Default

50

Name

pagingFanoutThreshold - Paging fanout threshold

Syntax

--pagingFanoutThreshold <integer>

Description

Threshold used for UE paging fan-out (number of ENBs contacted) in conjunction with other parameters under this command above which to trigger paging restriction

Class

Optional.

Type / Range

Integer in the range of 0 to 100

Default

25

5.112 cmm mscNri

MSC NRI. Syntax, description, parameters, and roles for `cmm mscNri` command.

Syntax

Description

This command is used to associate a Network Resource Identifier with a Mobile Switching Center.

Parameters

Name

mscSrvId - MSC ID

Syntax

--mscSrvId <integer>

Description

Mobile switching center identifier.

Class

Required key.

Type / Range

Integer in the range of 1 to 128

Name

nri - Network resource identifier for the MSC

Syntax

--nri <integer>

Description

Network resource identifier for the MSC.

Restrictions

There can be a maximum of 8 NRI values per MSC.

Class

Required key.

Type / Range

Integer in the range of 0 to 1,023

5.113 cmm mscServer

MSC Server. Syntax, description, parameters, and roles for `cmm mscServer` command.

Syntax

Description

This command is used to administer a Mobile Switching Center (MSC) Server and includes parameters for defining MSC offload, remote endpoint configurations, and to designate an MSC for maintenance mode.

Parameters

Name

mscSrvId - MSC ID

Syntax

--mscSrvId <integer>

Description

Unique MSC identifier.

Class

Required key.

Type / Range

Integer in the range of 1 to 128

Name

currentOffloadPercentage - Percentage of UEs offloaded

Syntax

--currentOffloadPercentage <integer>

Description

Percentage of UEs offloaded.

Class

Read only.

Type / Range

Integer in the range of 0 to 100

Name

lpaSmsOnlyUe - LPA SMS only UE

Syntax

--lpaSmsOnlyUe <list-item>

Description

Designate a MSC for the SMS only LPA UE.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

maintenanceMode - Maintenance mode

Syntax

--maintenanceMode <list-item>

Description

Designate a MSC into maintenance mode.

Restrictions

This field cannot be true during insert

Class

Optional.

List

- false - Boolean value of false.

- true - Boolean value of true.

Default

false

Name

mscOffload - MSC offload start or cancel

Syntax

--mscOffload <list-item>

Description

Start or cancel an MSC offload.

Class

Optional.

List

- offloadCancel - Offload cancel - Offload cancel.
- offloadNotIssued - Offload not issued - Offload not issued.
- offloadStart - Offload start - Offload start.

Default

offloadNotIssued

Name

mscSrvE164Address - MSC E.164 address

Syntax

--mscSrvE164Address <digits>

Description

The MSC's E.164 address.

Class

Optional.

Type / Range

Digit string of length 0 to 15

Default

"

Name

mscVlrRegSubs - Current VLR registered subscribers in this MSC

Syntax

--mscVlrRegSubs <integer>

Description

Current VLR registered subscribers. this is only valid during maintenance mode is true.

Class

Read only.

Type / Range

Integer in the range of 0 to 2,147,483,647

Name

mscVlrRegSubsAtOffloadStart - VLR registered subscribers when offload started

Syntax

--mscVlrRegSubsAtOffloadStart <integer>

Description

VLR registered subscribers when offload started.

Class

Read only.

Type / Range

Integer in the range of 0 to 2,147,483,647

Name

name - MSC name

Syntax

--name <string>

Description

Unique MSC name.

Class

Optional.

Type / Range

Digit string of length 1 to 64 with the allowed pattern of [0-9a-zA-Z\.\-:]*

Name

nonBroadCastLac - Non broadcast LAC

Syntax

--nonBroadCastLac <integer>

Description

The command is used to provision a location area code (LAC) for non-broadcasting LAI that is need to be included in SGsAP-LOCATION-UPDATE-REQUEST if MME determines that the serving MSC/VLR is changed. the MCC and MNC of the LAI is set to the MCC and MNC of the MSC/VLR. when the MSC/VLR receives SGsAP-LOCATION-UPDATE-REQUEST message with the specific LAI value, the MSC/VLR may retrieve the MM context from the HLR.

Class

Optional.

Type / Range

Integer in the range of 0 to 65,535

Default

65534

Name

offloadDuration - Duration of offload in minutes

Syntax

--offloadDuration <integer>

Description

Duration of offload in minutes.

Class

Optional.

Type / Range

Integer in the range of 10 to 300 in units of Minute

Default

60

Name

offloadEndTime - Offload end time

Syntax

--offloadEndTime <string>

Description

Offload end time.

Class

Read only.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

offloadPercentage - Percentage of UEs to be offloaded

Syntax

--offloadPercentage <integer>

Description

Percentage of UEs to be offloaded.

Class

Optional.

Type / Range

Integer in the range of 10 to 100

Default

100

Name

offloadRate - Offload rate

Syntax

--offloadRate <integer>

Description

Offload rate.

Class

Optional.

Type / Range

Integer in the range of 10 to 5,000

Default

50

Name

offloadStartTime - Offload start time

Syntax

--offloadStartTime <string>

Description

Offload start time.

Class

Read only.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

offloadStatus - Offload status

Syntax

--offloadStatus <string>

Description

Offload status.

Class

Read only.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

offloadStatusString - Offload status string

Syntax

--offloadStatusString <string>

Description

Offload status string.

Class

Read only.

Type / Range

Digit string of length 0 to 64

Name

sctpProfileName - SCTP profile name

Syntax

--sctpProfileName <string>

Description

Empty string or valid sctpprofile.name.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

''

Name

sgsEndPt1 - SGS endpoint 1

Syntax

--sgsEndPt1 <string>

Description

SGS name specified in remote end point configuration.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

''

Name

sgsEndPt10 - SGS Endpoint 10

Syntax

--sgsEndPt10 <string>

Description

SGS name specified in remote end point configuration.

Restrictions

[0-9a-zA-Z\._:@]

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

sgsEndPt11 - SGS Endpoint 11

Syntax

--sgsEndPt11 <string>

Description

SGS name specified in remote end point configuration.

Restrictions

[0-9a-zA-Z\._:@]

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

sgsEndPt12 - SGS Endpoint 12

Syntax

--sgsEndPt12 <string>

Description

SGS name specified in remote end point configuration.

Restrictions

[0-9a-zA-Z\._:@]

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

sgsEndPt13 - SGS Endpoint 13

Syntax

--sgsEndPt13 <string>

Description

SGS name specified in remote end point configuration.

Restrictions

[0-9a-zA-Z\.\-_:@]

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

sgsEndPt14 - SGS Endpoint 14

Syntax

--sgsEndPt14 <string>

Description

SGS name specified in remote end point configuration.

Restrictions

[0-9a-zA-Z\.\-_:@]

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

sgsEndPt15 - SGS Endpoint 15

Syntax

--sgsEndPt15 <string>

Description

SGS name specified in remote end point configuration.

Restrictions

[0-9a-zA-Z\.\-_:@]

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

sgsEndPt16 - SGS Endpoint 16

Syntax

--sgsEndPt16 <string>

Description

SGS name specified in remote end point configuration.

Restrictions

[0-9a-zA-Z\._:@]

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

sgsEndPt17 - SGs Endpoint 17

Syntax

--sgsEndPt17 <string>

Description

SGS name specified in remote end point configuration.

Restrictions

[0-9a-zA-Z\._:@]

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

sgsEndPt18 - SGS Endpoint 18

Syntax

--sgsEndPt18 <string>

Description

SGS name specified in remote end point configuration.

Restrictions

[0-9a-zA-Z\._:@]

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

sgsEndPt19 - SGS Endpoint 19

Syntax

--sgsEndPt19 <string>

Description

SGS name specified in remote end point configuration.

Restrictions

[0-9a-zA-Z\._:@]

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

sgsEndPt2 - SGS endpoint 2

Syntax

--sgsEndPt2 <string>

Description

SGS name specified in remote end point configuration.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

"

Name

sgsEndPt20 - SGS Endpoint 20

Syntax

--sgsEndPt20 <string>

Description

SGS name specified in remote end point configuration.

Restrictions

[0-9a-zA-Z\._:@]

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

sgsEndPt21 - SGS Endpoint 21

Syntax

--sgsEndPt21 <string>

Description

SGS name specified in remote end point configuration.

Restrictions

[0-9a-zA-Z\._:@]

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

sgsEndPt22 - SGS Endpoint 22

Syntax

--sgsEndPt22 <string>

Description

SGS name specified in remote end point configuration.

Restrictions

[0-9a-zA-Z\._:@]

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

sgsEndPt23 - SGS Endpoint 23

Syntax

--sgsEndPt23 <string>

Description

SGS name specified in remote end point configuration.

Restrictions

[0-9a-zA-Z\._:@]

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

sgsEndPt24 - SGS Endpoint 24

Syntax

--sgsEndPt24 <string>

Description

SGS name specified in remote end point configuration.

Restrictions

[0-9a-zA-Z\._:@]

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

sgsEndPt25 - SGS Endpoint 25

Syntax

--sgsEndPt25 <string>

Description

SGS name specified in remote end point configuration.

svEndPt6 - Sv endpoint 6

Syntax

--svEndPt6 <string>

Description

Sv name specified in remote end point configuration.

Restrictions

[0-9a-zA-Z\.\-_:@]

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

svEndPt7 - Sv endpoint 7

Syntax

--svEndPt7 <string>

Description

Sv name specified in remote end point configuration.

Restrictions

[0-9a-zA-Z\.\-_:@]

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

svEndPt8 - Sv endpoint 8

Syntax

--svEndPt8 <string>

Description

Sv name specified in remote end point configuration.

Restrictions

[0-9a-zA-Z\._:@]

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

svEndPt9 - Sv endpoint 9

Syntax

--svEndPt9 <string>

Description

Sv name specified in remote end point configuration.

Restrictions

[0-9a-zA-Z\._:@]

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

weight - weight

Syntax

--weight <integer>

Description

Relative MSC weight compared to other MSCs defined in the mscServer translation. This value applies only if cmm gparmWeightedSgslmsiHash is true.

Class

Optional.

Type / Range

Integer in the range of 1 to 100

Default

50

5.114 cmm mscToIws

MSC to IWS. Syntax, description, parameters, and roles for cmm mscToIws command.

Syntax**Description**

This command is used to administer an IWS Mobile Switching Center (MSC) and includes parameters for defining heartbeat, IP address, and ISDN number.

Parameters**Name**

name - MSC to IWS name

Syntax

--name <string>

Description

Unique MSC to IWS name.

Class

Required key.

Type / Range

Digit string of length 1 to 64 with the allowed pattern of [0-9a-zA-Z\.\-:]*

Name

msclwsSrvID - MSC server ID

Syntax

--mscIwsSrvID <integer>

Description

MSC to IWS server ID.

Class

Required on create, not modifiable.

Type / Range

Integer in the range of 0 to 16,777,215

Name

htBt - Heart beat

Syntax

--htBt <list-item>

Description

Indicates whether or not to do heart beat.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

htBtTmOut - Heart beat time out

Syntax

--htBtTmOut <integer>

Description

Heart beat time out value.

Class

Optional.

Type / Range

Integer in the range of 1 to 300

Default

15

Name

ip1XCslws - 1x CS IWS IP

Syntax

--ip1XCslws <string>

Description

1x CS IWS IP address.

Class

Optional.

Type / Range

Digit string of length 0 or 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Default

0.0.0.0

Name

isdnNumber - ISDN number

Syntax

--isdnNumber <digits>

Description

ISDN number.

Class

Optional.

Type / Range

Digit string of length 0 to 15

Default

''

Roles**Create**

5.115 cmm msgRetries

Number of Message Retransmissions. Syntax, description, parameters, and roles for cmm msgRetries command.

Syntax

Description

This command is used to assign the number of retransmissions used for NAS procedure messages.

Parameters

Name

msgName - Message name

Syntax

--msgName <list-item>

Description

NAS procedure name.

Class

Required key.

List

- ActDedBrr - Number of activate dedicated bearer requests transmitted without receiving a corresponding response.
- ActDefBrr - Number of activate default bearer requests transmitted without receiving a corresponding response.
- Attach - Number of attach procedures transmitted without receiving a corresponding response.
- AuthRquest - Number of authentication requests transmitted without receiving a corresponding response.
- DactBrr - Number of deactivate bearer requests transmitted without receiving a corresponding response.
- ESMInfo - Number of ESM information requests transmitted without receiving a corresponding response.
- GUTIRelocation - Number of globally unique temporary identity relocation procedures transmitted without receiving a corresponding response.
- IdentityCom - Number of identity procedure requests transmitted without receiving a corresponding response.

- ModifyBrr - Number of modify bearer requests transmitted without receiving a corresponding response.
- NetDetach - Number of network initiated detach procedures transmitted without receiving a corresponding response.
- Ns10 - Number of retries to deliver messages across the SGs interface to the designated end point. the total number of attempts to deliver a message is the number of retries plus 1.
- Ns102 - Ns102.
- Ns12 - Number of retries to deliver messages across the SGs interface to the designated end point. the total number of attempts to deliver a message is the number of retries plus 1.
- Ns8 - Number of retries to deliver messages across the SGs interface to the designated end point. the total number of attempts to deliver a message is the number of retries plus 1.
- Ns9 - Number of retries to deliver messages across the SGs interface to the designated end point. the total number of attempts to deliver a message is the number of retries plus 1.
- SGSN Attach Accept - Reserved for future use.
- SGSN Auth Ciph Request - Reserved for future use.
- SGSN Deactivate PDP Cxt - Reserved for future use.
- SGSN Detach Request - Reserved for future use.
- SGSN Identity Request - Reserved for future use.
- SGSN Rau Accept - Reserved for future use.
- SecurityMode - Number of security mode requests transmitted without receiving a corresponding response.
- TAU - Number of tracking area update procedure transmitted without receiving a corresponding response.

Name

msgNumRetries - Number of retransmissions

Syntax

--msgNumRetries <integer>

Description

Number of retries.

Class

Optional.

Type / Range

Integer in the range of 1 to 4

Roles

Show

sysadmin, manage, monitor

Modify

sysadmin, manage

List

sysadmin, manage, monitor

5.116 cmm muaAssociation

M3UA Association. Syntax, description, parameters, and roles for `cmm muaAssociation` command.

Syntax

Description

Use this command to configure, list and show M3UA association that can be added to an association set.

Parameters

Name

`muaAssociationId` - M3UA association identifier

Syntax

```
--muaAssociationId <integer>
```

Description

M3UA association identifier.

Class

Required key.

Type / Range

Integer in the range of 0 to 27168

Name

`associationInUnitIndex` - Association in unit index

Syntax

```
--associationInUnitIndex <integer>
```

Description

Use this parameter to specify the index of the VM in which the association resides: decimal number 0 ... 1

Class

Required on create, not modifiable.

Type / Range

Integer in the range of 0 to 1

Name

associationInUnitType - Association in unit type

Syntax

--associationInUnitType <list-item>

Description

Use this parameter to specify the type of the VM in which the association resides: IPDS .. IP director unit.

Class

Not modifiable.

List

- IPDS - Internet protocol director service.

Default

IPDS

Name

destinationPort - Destination port

Syntax

--destinationPort <integer>

Description

identify destination SCTP port number decimal number 1 ... 65535 default for client is IANA specified port (2905) default for server is IANA specified port (2905)

Class

Optional.

Type / Range

Integer in the range of 1 to 65,535

Default

2905

Name

m3uaProfileName - M3UA profile name

Syntax

--m3uaProfileName <string>

Description

Specify M3UA profile name.

Restrictions

There must exist a record in m3uaProfile with this name

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Default

default

Name

primaryDestinationIpv4v6Address - primary Destination Ipv4/Ipv6 Address

Syntax

```
--primaryDestinationIpv4v6Address <string>
```

Description

identify primary destination IP address: IPV4 address: dotted decimal integer (##.##.##) IPV6 address: colon hexadecimal integer (##::##)

Class

Optional.

Type / Range

Digit string of length 0 or 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Default

0.0.0.0

Name

primaryDestinationIpv4v6Netmask - primary Destination Ipv4/Ipv6 Netmask

Syntax

```
--primaryDestinationIpv4v6Netmask <integer>
```

Description

identify netmask length: decimal number 1 ... 128 default is 8

Class

Optional.

Type / Range

Integer in the range of 1 to 128

Default

8

Name

primarySourceIpv4v6Address - primary Source Ipv4/Ipv6 Address

Syntax

--primarySourceIpv4v6Address <string>

Description

identify primary source IP address: IPv4 address: dotted decimal integer (#.#.#.#) IPv6
address: colon hexadecimal integer (#: #:: #: #)

Restrictions

There must exist a record in servicelp with this source IP and pool_type of
associationInUnitType

Class

Optional.

Type / Range

Digit string of length 0 or 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Default

0.0.0.0

Name

secondaryDestinationIpv4v6Address - secondary Destination Ipv4/Ipv6 Address

Syntax

--secondaryDestinationIpv4v6Address <string>

Description

identify secondary destination IP address: IPv4 address: dotted decimal integer (#.#.#.#)
IPv6 address: colon hexadecimal integer (#: #:: #: #)

Class

Optional.

Type / Range

Digit string of length 0 or 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Default

0.0.0.0

Name

secondaryDestinationIpv4v6Netmask - secondary Destination Ipv4/Ipv6 Netmask

Syntax

--secondaryDestinationIpv4v6Netmask <integer>

Description

identify netmask length: decimal number 1 ... 128 default is 8

Class

Optional.

Type / Range

Integer in the range of 1 to 128

Default

8

Name

secondarySourceIpv4v6Address - secondary Source Ipv4/Ipv6 Address

Syntax

--secondarySourceIpv4v6Address <string>

Description

identify secondary source IP address: IPV4 address: dotted decimal integer (###.###) IPV6 address: colon hexadecimal integer (###:###:###)

Restrictions

There must exist a record in servicelp with this source IP and pool_type of associationInUnitType

Class

Optional.

Type / Range

Digit string of length 0 or 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Default

0.0.0.0

Name

sourcePort - Source port

Syntax

--sourcePort <integer>

Description

identify source SCTP port number decimal number 1 ... 65535 default for client is IANA specified port (2905) default for server is IANA specified port (2905)

Class

Optional.

Type / Range

Integer in the range of 1 to 65,535

Default

2905

Roles

5.117 cmm muaAssociationList

M3UA Association List. Syntax, description, parameters, and roles for cmm muaAssociationList command.

Syntax

Description

Configure, list and show M3UA association list.

Parameters

Name

muaAssociationSetId - M3UA association set identifier

Syntax

--muaAssociationSetId <integer>

Description

M3UA association set identifier the number is the record number of a certain association set in the association set configuration file (S3FILE).

Restrictions

record with this id must exist in muaAssociationSet. Max number of list entries per muaAssociationSet is 32.

Class

Required key.

Type / Range

Integer in the range of 0 to 12000

Name

muaAssociationId - M3UA association identifier

Syntax

--muaAssociationId <integer>

Description

M3UA association identifier specifies a single association within an association set.

Restrictions

record with this id must exist in muaAssociation

Class

Required key.

Type / Range

Integer in the range of 0 to 27168

Name

associationState - Association state

Syntax

--associationState <list-item>

Description

Specifies the state of the association. the following abbreviations are used to describe the state of the association: DOWN the SCTP association is set down by user INACT ... the remote peer at the ASP is available but application traffic is stopped (only management messages are allowed) ACT the remote peer at the ASP is available and application traffic is active.

Class

Optional.

List

- ACT - Active - Active.
- DOWN - Down.
- INACT - Inactive - Inactive.

Default

ACT

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Modify

sysadmin, manage

Delete

sysadmin, manage

List

sysadmin, manage, monitor

5.118 cmm muaAssociationSet

M3UA Association Set. Syntax, description, parameters, and roles for cmm muaAssociationSet command.

Syntax

Description

Configure, list and show M3UA association set.

Parameters

Name

muaAssociationSetId - M3UA association set identifier

Syntax

--muaAssociationSetId <integer>

Description

M3UA association set identifier.

Class

Required key.

Type / Range

Integer in the range of 0 to 12000

Name

associationSetName - Identify association set name

Syntax

--associationSetName <string>

Description

Use this parameter to specify the name of the association set that you want to create: 1 ...
16 characters.

Restrictions

associationSetName must be unique within muaAssociationSet. When modifying associationSetName it must be the only parameter to be modified during that operation.

Class

Required on create.

Type / Range

Digit string of length 1 to 16 with the allowed pattern of [0-9a-zA-Z\.\-_:]*

Name

sctpRole - Identify role

Syntax

--sctpRole <list-item>

Description

Use this parameter to specify the role of the association set: c ... client s ... server.

Class

Required on create.

List

- C - Client - Specify SCTP role of client.
- S - Server - Specify SCTP role of server.

Name

activationDelay - Activation delay

Syntax

--activationDelay <integer>

Description

Activation delay is used in overload situations to delay the association in getting to the traffic handling state. It starts whenever there is overload in activation. 30 successive ASPUP messages can be received in less than one second. Configuring value 0 means there is no delay, and the activation of the association does not need to compete with activation of other associations that have delay more than 0. The load of a VM resulting from activations can be smoothed by having different values in different association sets.

Class

Optional.

Type / Range

Integer in the range of 0 to 30

Default

0

Name

aspMsgsInIpsp - ASP messages in IPSP

Syntax

--aspMsgsInIpsp <list-item>

Description

The parameter defines a sending of ASP messages in IPSP connection for an association set.

Class

Optional.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

aspMsgsInUse - ASP messages in use

Syntax

--aspMsgsInUse <list-item>

Description

The parameter defines application server process (ASP) messages in use for an association set.

Restrictions

If trafficMode is 1 (OVER-RIDE) then aspMsgsInUse must be Yes.

Class

Optional.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

Yes

Name

broadcastSsnmMsg - Broadcast SSNM messages

Syntax

--broadcastSsnmMsg <list-item>

Description

The parameter defines SS7 signalling network management (SSNM) messages broadcast to all application server processes (ASP) for an association set.

Class

Optional.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

firstDataStreamNum - First data stream number

Syntax

--firstDataStreamNum <integer>

Description

This parameter is defined as the number of the first data stream.

Restrictions

The value of firstDataStreamNum must be 1 if specificationVersion is 16.

Class

Optional.

Type / Range

Integer in the range of 0 to 1

Default

1

Name

hbInterval - M3UA heartbeat interval in seconds

Syntax

--hbInterval <integer>

Description

This parameter defines the time that M3UA waits until it sends the next M3UA BEAT after receiving BEAT ACK to the previous BEAT. value 0 means that the M3UA does not send M3UA heartbeat.

Class

Optional.

Type / Range

Integer in the range of 0 to 30

Default

15

Name

networkAppearance - Network appearance

Syntax

--networkAppearance <string>

Description

This parameter identifies the network appearance for a given association set [value = 0...4294967294 or '-' if networkappearance is not supported].

Class

Optional.

Type / Range

Digit string of length 1 to 10 with the allowed pattern of ([-]|[0-9]|[1-8][0-9]|9[0-9]|[1-8][0-9]{2}|9[0-8][0-9]|99[0-9]|[1-8][0-9]{3}|9[0-8][0-9]{2}|99[0-8][0-9]|999[0-9]|[1-8][0-9]{4}|9[0-8][0-9]{3}|99[0-8][0-9]{2}|999[0-8][0-9]|9999[0-9]|[1-8][0-9]{5}|9[0-8][0-9]{4}|99[0-8][0-9]{3}|999[0-8][0-9]{2}|9999[0-8][0-9]|99999[0-9]|[1-8][0-9]{6}|9[0-8][0-9]{5}|99[0-8][0-9]{4}|999[0-8][0-9]{3}|9999[0-8][0-9]{2}|99999[0-8][0-9]|999999[0-9]|[1-8][0-9]{7}|9[0-8][0-9]{6}|99[0-8][0-9]{5}|999[0-8][0-9]{4}|9999[0-8][0-9]{3}|99999[0-8][0-9]{2}|999999[0-8][0-9]|9999999[0-9]|[1-8][0-9]{8}|9[0-8][0-9]{7}|99[0-8][0-9]{6}|999[0-8][0-9]{5}|9999[0-8][0-9]{4}|99999[0-8][0-9]{3}|999999[0-8][0-9]{2}|9999999[0-8][0-9]|99999999[0-9]|[1-3][0-9]{9}|4[01][0-9]{8}|42[0-8][0-9]{7}|429[0-3][0-9]{6}|4294[0-8][0-9]{5}|42949[0-5][0-9]{4}|429496[0-6][0-9]{3}|4294967[01][0-9]{2}|42949672[0-8][0-9]|429496729[0-4])

Default

0

Name

registrationReqInUse - Registration request in use

Syntax

--registrationReqInUse <list-item>

Description

This parameter controls if dynamic routing key registration is in use.

Class

Optional.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

Yes

Name

routingContext - Routing context

Syntax

--routingContext <string>

Description

This parameter is the defined value of the routing context [value = 0...4294967294 or '-' if registrationreqinuse is yes].

Restrictions

The value of routingContext must be '-' if registrationReqInUse is Yes. The value of routingContext must be 0...4294967294 if registrationReqInUse is No.

Class

Optional.

Type / Range

Digit string of length 1 to 10 with the allowed pattern of ([-]|[0-9]|[1-8][0-9]|9[0-9]|[1-8][0-9]{2}|9[0-8][0-9]|99[0-9]|[1-8][0-9]{3}|9[0-8][0-9]{2}|99[0-8][0-9]|999[0-9]|[1-8][0-9]{4}|9[0-8][0-9]{3}|99[0-8][0-9]{2}|999[0-8][0-9]|9999[0-9]|[1-8][0-9]{5}|9[0-8][0-9]{4}|99[0-8][0-9]{3}|999[0-8][0-9]{2}|9999[0-8][0-9]|99999[0-9]|[1-8][0-9]{6}|9[0-8][0-9]{5}|99[0-8][0-9]{4}|999[0-8][0-9]{3}|9999[0-8][0-9]{2}|99999[0-8][0-9]|999999[0-9]|[1-8][0-9]{7}|9[0-8][0-9]{6}|99[0-8][0-9]{5}|999[0-8][0-9]{4}|9999[0-8][0-9]{3}|99999[0-8][0-9]{2}|999999[0-8][0-9]|9999999[0-9]|[1-3][0-9]{9}|4[01][0-9]{8}|42[0-8][0-9]{7}|429[0-3][0-9]{6}|4294[0-8][0-9]{5}|42949[0-5][0-9]{4}|429496[0-6][0-9]{3}|4294967[01][0-9]{2}|42949672[0-8][0-9]|429496729[0-4])

Default

-

Name

sctpUser - Identify user

Syntax

--sctpUser <list-item>

Description

Use this parameter to specify the SCTP user of the association set. the default value is M3UA (MTP3 USER ADAPTION LAYER) M3UA ... MTP3 user adaptation layer.

Class

Not modifiable.

List

- IUA - Specify SCTP user of IUA.
- M3UA - Specify SCTP user of M3UA.

- SGSAP - Specify SCTP user of SGSAP.

Default

M3UA

Name

specificationVersion - M3UA specification version

Syntax

--specificationVersion <integer>

Description

This parameter specifies the version of the M3UA specification. The possible values are: 5 (M3UA SPECIFICATION VERSION 05), 7 (M3UA SPECIFICATION VERSION 07), 9 (M3UA SPECIFICATION VERSION 09), 16 (M3UA SPECIFICATION VERSION 1.0 (RFC))

Restrictions

If other peers support a different version of the M3UA, then the version parameter should be changed to the same version as that of the remote peer.

Class

Optional.

Type / Range

Integer in the range of 5 or 7 or 9 or 16

Default

16

Name

tAck - Timed acknowledgement for ASPSM and ASPTM in seconds

Syntax

--tAck <integer>

Description

This parameter defines the time that M3UA waits for a response to the sent ASPSM and ASPTM message, (for instance, ASPUP ACK for the sent ASPUP, or ASPAC ACK for the sent ASPAC) before resending the message.

Class

Optional.

Type / Range

Integer in the range of 1 to 20

Default

2

Name

trafficMode - M3UA traffic mode

Syntax

--trafficMode <integer>

Description

This parameter controls how traffic is routed between SCTP associations into the association set. Values (decimal): 1 (OVER-RIDE), 2 (LOAD-SHARE)

Class

Optional.

Type / Range

Integer in the range of 1 to 2

Default

2

5.119 cmm muaLink

M3UA Signalling Link. Syntax, description, parameters, and roles for cmm muaLink command.

Syntax**Description**

Configure, list and show M3UA signalling link.

Parameters**Name**

muaLinkId - MUA signalling link id

Syntax

--muaLinkId <integer>

Description

M3UA signalling link identifier.

Class

Required key.

Type / Range

Integer in the range of 0 to 12000

Name

associationSetName - Association set name

Syntax

--associationSetName <string>

Description

Name of the M3UA association set. reference to the muaassociationset table. you can check the created association sets with the cmm muaassociationset list command.

Class

Required on create, not modifiable.

Type / Range

Digit string of length 1 to 16 with the allowed pattern of [0-9a-zA-Z\.\-_:]*

Name

linkSignallingNetwork - Link signalling network

Syntax

--linkSignallingNetwork <list-item>

Description

Use this parameter to define the signalling network.

Class

Required on create, not modifiable.

List

- IN0 - International network number 0.
- IN1 - International network number 1.
- NA0 - National network number 0.
- NA1 - National network number 1.

Name

linkSignallingPointCode - Link signalling point code

Syntax

--linkSignallingPointCode <integer>

Description

Use this parameter to define the signalling point code.

Class

Required on create, not modifiable.

Type / Range

Integer in the range of 0 to 16,777,215

Name

signallingLinkNumber - Signalling link number

Syntax

```
--signallingLinkNumber <integer>
```

Description

Use this parameter to define the signalling link number.

Class

Required on create, not modifiable.

Type / Range

Integer in the range of 0 to 12000

Name

signallingLinkSetName - Signalling link set name

Syntax

```
--signallingLinkSetName <string>
```

Description

Use this parameter to define the signalling link set name.

Class

Required on create.

Type / Range

Digit string of length 1 to 8 with the allowed pattern of [0-9a-zA-Z\._:-]*

Name

signallingLinkState - Signalling link state

Syntax

```
--signallingLinkState <list-item>
```

Description

Use this parameter to define the signalling link state.

Class

Optional.

List

- ACT - Active - Specify signaling link state of active.
- INA - Inactive - Specify signaling link state of inactive.

Default

INA

5.120 cmm muaOwnSignallingPoint

M3UA Own Signalling Point. Syntax, description, parameters, and roles for cmm muaOwnSignallingPoint command.

Syntax**Description**

Configure, list and show M3UA own signalling point.

Parameters**Name**

muaOwnSignallingPointId - MUA own signalling point id

Syntax

--muaOwnSignallingPointId <integer>

Description

Use this parameter to define M3UA own signalling point identifier.

Class

Required key.

Type / Range

Integer in the range of 0 to 12000

Name

signallingNetwork - Signalling network

Syntax

--signallingNetwork <list-item>

Description

Use this parameter to define signalling network of the own signalling point.

Class

Required on create, not modifiable.

List

- IN0 - International network number 0.
- IN1 - International network number 1.
- NA0 - National network number 0.
- NA1 - National network number 1.

Name

signallingPointCode - Signalling point code

Syntax

--signallingPointCode <integer>

Description

Use this parameter to define signalling point code of the own signalling point.

Class

Required on create, not modifiable.

Type / Range

Integer in the range of 0 to 16,777,215

Name

signallingPointName - Signalling point name

Syntax

--signallingPointName <string>

Description

Use this parameter to define the name of the own signalling point.

Class

Required on create, not modifiable.

Type / Range

Digit string of length 1 to 5 with the allowed pattern of [0-9a-zA-Z\._ :]*

Name

adpc - Additional signalling destination point code

Syntax

--adpc <integer>

Description

Use this parameter to define the additional signalling destination point code. only used when signalling point type is "PRV".

Class

Optional.

Type / Range

Integer in the range of 0 to 16,777,215

Default

0

Name

dpc - Signalling destination point code

Syntax

--dpc <integer>

Description

Use this parameter to define the signalling destination point code. only used when signalling point type is "PRV".

Class

Optional.

Type / Range

Integer in the range of 0 to 16,777,215

Default

0

Name

signallingPointType - Signalling point type

Syntax

--signallingPointType <list-item>

Description

Use this parameter to define the type of the own signalling point - SEP : the own signalling point is defined to be signalling end point, STP : the own signalling point is defined to be signalling transfer point, REC : creation of an additional signalling point that is recognized as the own point in incoming signalling messages, USP : creation of an additional signalling

point that can be set as an originating point code in user part messages, IWF : creation of an additional signalling point that supports shared use, PRV : private additional signalling point code

Class

Optional.

List

- DEL - The own signalling point is deleted.
- IWF - Creation of an additional signaling point that supports shared use.
- PRV - Private additional signaling point code.
- REC - Creation of an additional signaling point that is recognized as the own point in incoming signaling messages.
- SEP - The own signaling point is changed to or created as a signaling end point.
- STP - The own signaling point is changed to or created as a signaling transfer point.
- USP - Creation of an additional signaling point that can be set as an originating point code in user part messages.

Default

STP

Name

spcSubfields - SPC subfields

Syntax

--spcSubfields <integer>

Description

Use this parameter to define the number of subfields under the signalling point code. 1 means no subfields.

Class

Optional.

Type / Range

Integer in the range of 1 to 4

Default

1

Name

spcSubfieldsLength1 - SPC subfields length 1

Syntax

--spcSubfieldsLength1 <integer>

Description

Use this parameter to define the length of the 1st subfield in bits.

Class

Optional.

Type / Range

Integer in the range of 1 to 24

Default

14

Name

spcSubfieldsLength2 - SPC subfields length 2

Syntax

--spcSubfieldsLength2 <integer>

Description

Use this parameter to define the length of the 2nd subfield in bits.

Class

Optional.

Type / Range

Integer in the range of 0 to 24

Default

0

Name

spcSubfieldsLength3 - SPC subfields length 3

Syntax

--spcSubfieldsLength3 <integer>

Description

Use this parameter to define the length of the 3rd subfield in bits.

Class

Optional.

Type / Range

Integer in the range of 0 to 24

Default

0

Name

spcSubfieldsLength4 - SPC subfields length 4

Syntax

--spcSubfieldsLength4 <integer>

Description

Use this parameter to define the length of the 4th subfield in bits.

Class

Optional.

Type / Range

Integer in the range of 0 to 24

Default

0

Name

ss7Standard - SS7 standard

Syntax

--ss7Standard <list-item>

Description

Use this parameter to define what kind of Signalling System No.7 (SS7) is used in the own signalling point, for example the width of the signalling point code in bits and the standard that the signalling network operates according to. The possible values of this parameter are: ITU-T : for 14 bit SPC code of ITU-T SS7 standard, JAP16 : for 16 bit SPC code of Japan SS7 standard, CHI24 : for 24 bit SPC code of China SS7 standard, ANSI : for 24 bit SPC code of ANSI SS7 standard.

Class

Optional.

List

- ANSI - Specify SS7 standard of american national standards institute.
- CHI24 - Specify SS7 standard of china 24 bit point code.
- ITUT - Specify SS7 standard of international telecommunication union - telecommunication.
- JAP16 - Specify SS7 standard of japan 16 bit point code.

Default

ITUT

5.121 cmm muaRoute

M3UA route. Syntax, description, parameters, and roles for `cmm muaRoute` command.

Syntax

Description

Configure, list and show M3UA route.

Parameters

Name

`muaRouteId` - M3UA route identifier

Syntax

`--muaRouteId <integer>`

Description

M3UA route identifier.

Class

Required key.

Type / Range

Integer in the range of 0 to 12000

Name

`destinationSignallingNetwork` - Destination signalling network

Syntax

`--destinationSignallingNetwork <list-item>`

Description

Identify signalling network IN0 ... international network number 0 IN1 ... international network number 1 NAO ... national network number 0 NA1 ... national network number 1.

Class

Required on create, not modifiable.

List

- IN0 - International network number 0.
- IN1 - International network number 1.
- NA0 - National network number 0.
- NA1 - National network number 1.

Name

destinationSignallingPointCode - Destination signalling point code

Syntax

--destinationSignallingPointCode <integer>

Description

Identify the destination signalling point code: decimal number 0 ... 16777215 default is given signalling point code.

Class

Required on create, not modifiable.

Type / Range

Integer in the range of 0 to 16,777,215

Name

destinationSignallingPointName - Destination signalling point name

Syntax

--destinationSignallingPointName <string>

Description

Signalling point name: identifier 1 ... 8 characters. If signalling point code and network are already defined in muaLink, destinationSignallingPointName must be the same with signallingLinkSetName of the related muaLink.

Class

Required on create, not modifiable.

Type / Range

Digit string of length 1 to 8 with the allowed pattern of [0-9a-zA-Z\.\-_:]*

Name

loadSharingStatus - Load sharing status

Syntax

--loadSharingStatus <list-item>

Description

Identify load sharing status: A: load is shared between all available routes having the highest equal priority D: traffic is routed to only one available route having the highest priority (note that if there is more than one route with same priority it is unpredictable which one will carry the load) U: load is shared evenly between all available links of the maximum two available

routes (combined link set) having the highest equal priority default is deny load sharing between signalling routes.

Class

Optional.

List

- A - Load is shared between all available routes having the highest equal priority.
- D - Traffic is routed to only one available route having the highest priority (note that if there is more than one route with same priority it is unpredictable which one will carry the load).
- U - Load is shared evenly between all available links of the maximum two available routes (combined link set) having the highest equal priority .

Default

D

Name

restrictionStatus - Restriction status

Syntax

--restrictionStatus <list-item>

Description

Identify restriction status: n ... no restrictions p ... use as STP toward cluster denied s ... use as STP denied r ... a interface a subgroup of an MTP function, where, for example, the STP function has been prevented over interface a to both directions. t ... test routing via level 3 l ... test routing via transmission loop i ... inverted view of AOPC this restricted route has to connect to the own additional signalling point. m ... management cluster default is no restrictions.

Class

Optional.

List

- I - Inverted view of AOPC.
- L - Test routing via transmission loop.
- M - Management cluster.
- N - No restrictions.
- P - Use as STP toward cluster denied.
- R - A interface.
- S - Use as STP denied.
- T - Test routing via level 3.

Default

N

Name

routeParamSetName - M3UA route parameter set name

Syntax`--routeParamSetName <string>`**Description**

Identify signalling route set parameter set name: itut ... ITU-T for signalling parameters defined by ITU (International telecommunications union) in Q.703 and Q.704 ainterface ... a INTERFACE for a interface e.g. between MSC and BSC btnr146 ... BTNR 146 for signalling parameters defined by BTNR (British telecommunications network requirement) ansit111 ... ANSI T111 for signalling parameters defined by ANSI (American national standards institute) in T1.111 and T1.114 japanrtc ... JAPAN TTC for signalling parameters defined by TTC (Telecommunication technology committee) in JT.Q703 and JT.Q704 japanrtt ... JAPAN NTT for signalling parameters defined by NTT (Nippon telegraph and telecommunication corporation) in JT.Q703 and JT.Q704 ietfm3ua ... IETF M3UA for routes using IP type signalling links defined by IETF (Internet engineering task force) or ... use own created set name (in routeparamset).

Restrictions

a record must exist in routeParamSet with name of routeParamSetName

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Default

itut

5.122 cmm muaService

M3UA Service. Syntax, description, parameters, and roles for cmm muaService command.

Syntax

Description

Configure, list and show M3UA service.

Parameters

Name

muaServiceId - MUA service id

Syntax

```
--muaServiceId <integer>
```

Description

M3UA service identifier.

Class

Required key.

Type / Range

Integer in the range of 0 to 255

Name

serviceForOwnUserPart - Service for own user part

Syntax

```
--serviceForOwnUserPart <list-item>
```

Description

Use this parameter to indicate whether service exists for the user parts of own signalling point.

Class

Required on create.

List

- false - Boolean value of false.
- true - Boolean value of true.

Name

serviceForStpMessage - Service for STP message

Syntax

--serviceForStpMessage <list-item>

Description

Use this parameter to indicate whether service exists for STP messages.

Class

Required on create.

List

- false - Boolean value of false.
- true - Boolean value of true.

Name

serviceIndicatorIndex - Service indicator index

Syntax

--serviceIndicatorIndex <integer>

Description

Use this parameter to define an index for the service you want to create: 0 SNM ... signalling network management messages, 1 SNT ... signalling network testing and maintenance messages, 2 SNTA ... ANSI - signalling network testing and maintenance messages, 3 SCCP ... signalling connection control part.

Class

Required on create, not modifiable.

Type / Range

Integer in the range of 0 to 3

Name

serviceIndicatorName - Service indicator name

Syntax

--serviceIndicatorName <list-item>

Description

Use this parameter to define a name for the service you want to create: recommended names for some indexes 0 SNM ... signalling network management messages, 1 SNT ... signalling network testing and maintenance messages, 2 SNTA ... ANSI - signalling network testing and maintenance messages, 3 SCCP ... signalling connection control part.

Class

Required on create.

List

- SNM - Signaling network management messages - recommended index 0.
- SNT - Signaling network testing and maintenance messages. recommended index 1.

- SNTT1 - Signaling network testing and maintenance messages. recommended index 2.
- SCCP - Signaling connection control part. recommended index 3.

Name

serviceSignallingNetwork - Service signalling network

Syntax

--serviceSignallingNetwork <list-item>

Description

Use this parameter to define the signalling network where the service you want to create, will exist.

Class

Required on create, not modifiable.

List

- IN0 - International network number 0.
- IN1 - International network number 1.
- NA0 - National network number 0.
- NA1 - National network number 1.

5.123 cmm muaSignallingRoute

M3UA signalling route. Syntax, description, parameters, and roles for `cmm muaSignallingRoute` command.

Syntax

Description

Configure, list and show M3UA signalling route.

Parameters

Name

muaSignallingRouteId - Id

Syntax

--muaSignallingRouteId <integer>

Description

M3UA signalling route identifier.

Class

Required key.

Type / Range

Integer in the range of 0 to 12000

Name

signallingRoutePriority - Signalling route priority

Syntax

--signallingRoutePriority <integer>

Description

Identify signalling route priority: decimal number 0 ... 7 priority 7 is highest (for primary route) and 0 lowest. load is shared between routes with highest equal priority.

Class

Required on create.

Type / Range

Integer in the range of 0 to 7

Name

signallingTransferNetwork - Signalling transfer network

Syntax

--signallingTransferNetwork <list-item>

Description

Identify signalling network IN0 ... international network number 0 IN1 ... international network number 1 NAO ... national network number 0 NA1 ... national network number 1 if you give some other value than given signalling network, it means that you are creating signalling route set to the adjacent SP, utilizing direct route belonging to some other signalling route set leading to the same physical SP. if signalling route set is leading to the

adjacent SP and there is not any other signalling route sets leading to the same SP, signalling transfer point network must be same as given signalling point network.

Class

Required on create, not modifiable.

List

- IN0 - International network number 0.
- IN1 - International network number 1.
- NA0 - National network number 0.
- NA1 - National network number 1.

Name

signallingTransferPointCode - Signalling transfer point code

Syntax

--signallingTransferPointCode <integer>

Description

Identify signalling point code: decimal number 0 ... 16777215 default is given signalling point code.

Class

Required on create, not modifiable.

Type / Range

Integer in the range of 0 to 16,777,215

Name

signallingTransferPointName - Signalling transfer point name

Syntax

--signallingTransferPointName <string>

Description

identify signalling point name: identifier 1 ... 8 characters Default is given signalling point name.

Class

Read only.

Type / Range

Digit string of length 1 to 8 with the allowed pattern of [0-9a-zA-Z\.\-_:]*

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

List

sysadmin, manage, monitor

5.124 cmm muaSignallingRouteList

M3UA Signalling Route List. Syntax, description, parameters, and roles for cmm muaSignallingRouteList command.

Syntax

Description

Use this command to configure, list and show M3UA signalling route set. If the signalling point code and network of muaSignallingRouteId are the same as those of the muaRouteId, the created route is a direct route. Else, the created route is an indirect route.

Parameters

Name

muaRouteId - M3UA route identifier

Syntax

- -muaRouteId <integer>

Description

M3UA route identifier muaRoute identifier where the created signalling route set is leading.

Restrictions

record with this id must exist in muaRoute. Max number of list entries per muaRoute is 8.

Class

Required key.

Type / Range

Integer in the range of 0 to 12000

Name

muaSignallingRouteId - M3UA signalling route identifier

Syntax

--muaSignallingRouteId <integer>

Description

M3UA signalling route identifier.

Restrictions

record with this id must exist in muaSignallingRoute

Class

Required key.

Type / Range

Integer in the range of 0 to 12000

Name

signallingRouteActivationAllowed - Signalling route activation allowed

Syntax

--signallingRouteActivationAllowed <list-item>

Description

Allow the activation of a signalling route, i.e. used to remove the state ACTIVATION DENIED from the signalling route. this command is needed, for example, in situation when the user wants to be able to activate a new signalling route that has been automatically set on state UA-AD (Unavailable-Activation denied).

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

signallingRouteState - Signalling route state

Syntax

--signallingRouteState <list-item>

Description

Identify state change: ACT ... activate INA ... inactivate with the state change INA, a signalling route which is in the state 'executing', 'spare' or 'unavailable' can be inactivated. with the state change ACT, an inactivated signalling route can be activated. on the basis of the signalling route priority, the signalling route is set in the 'executing', 'spare', or 'unavailable' state. if load sharing is prohibited, the route is only activated if its priority is higher than that of the signalling route which is currently in use.

Class

Optional.

List

- ACT - Activate - Specify state change activate.
- INA - Inactivate - Specify state change inactivate.

Default

ACT

Roles**Create**

5.125 cmm multiLink

Signaling Multiple Link Show. Syntax, description, parameters, and roles for cmm multiLink command.

Syntax**Description**

Signaling Multiple Link Show.

Parameters**Name**

linkInterfaceType - Link interface type

Syntax

--linkInterfaceType <list-item>

Description

Link interface type. default to s6ad.

Class

Required key.

List

- gn - Specify the Gn interface to an SGSN.
- m3 - Specify the M3 interface to an eNodeB.
- n26 - Specify n26 interface to an AMF
- nr10 - Specify nr10 interface.
- rs10 - Specify the RS10 interface to an SRS.
- s10 - Specify the S10 interface to another MME.
- s102 - Specify the S102 interface to an IWF.
- s11 - Specify the S11 interface to an SGW.
- s11u - Specify S11-u interface to an SGW.
- s13 - Specify the S13 interface to an EIR.
- s16 - Specify S16 interface loop around to this SGSN.
- s1mme - Specify the S1-MME interface to an eNodeB.
- s3 - Specify the S3 interface to an SGSN.
- s4 - Specify S4 interface to an SGW.
- s6ad - Specify the S6ad interface to an HSS.
- sbc - Specify the SBc interface to a CBC..
- sgd - Specify SGd interface to an SMSC/SMS router.
- sgs - Specify the SGs interface to a GSM/UMTS MSC.
- sgslite - Specify SGs lite interface to an IWF.
- slg - Specify the Slg interface to a GMLC.
- sls - Specify the Sls interface to an E-SMLC.
- sm - Specify the sm interface to an MBMS gateway.
- sv - Specify the Sv interface to a GSM/UMTS MSC.
- t6a - Specify T6a interface to an SCEF.

Name

alarmState - Alarm state

Syntax

--alarmState <list-item>

Description

Specifies alarm state.

Class

Read only.

List

- critical - Critical alarm.
- major - Major alarm.
- minor - Minor alarm.
- none - No alarm.
- unknown - Unknown.

Name

linkAdminState - Link admin state

Syntax

--linkAdminState <list-item>

Description

Specified current link admin state.

Class

Optional.

List

- blocked - Blocked state. this applies only to s6ad, s13, slg, sgd and t6a.
- draining - Draining state. only applies to s11.
- locked - Locked state.
- unknown - Used in special cases to report state. a link cannot be updated to unknown state.
- unlocked - UnLocked state.

Name

linkAlarm - Link alarmed or not

Syntax

--linkAlarm <list-item>

Description

If false query returns all links. if true query returns only alarmed links.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Name

linkAvailState - Link available state

Syntax

```
--linkAvailState <list-item>
```

Description

Specifies link available state.

Class

Read only.

List

- degraded - Degraded.
- dependency - Dependency.
- none - None.
- unknown - Unknown.

Name

linkIdentifier - Link identifier

Syntax

```
--linkIdentifier <string>
```

Description

Link information.

Class

Read only.

Type / Range

Digit string of length 0 or 1 to 255

Name

linkInUseState - Link inuse state

Syntax

```
--linkInUseState <list-item>
```

Description

Link inuse state.

Class

Read only.

List

- in-use - Specify link in use state of in use.
- not-applicable - Specify link in use state of not application.
- not-used - Specify link in use state of not used.

Name

linkOperationState - Link operation state

Syntax

--linkOperationState <list-item>

Description

Link operation state.

Class

Optional.

List

- disabled - Disabled state of the link.
- enabled - Enable state of the link.
- unknown - Unknown state of the link. this can not be used during query.

Name

linkPlmnType - PLMN type of the link

Syntax

--linkPlmnType <list-item>

Description

Specifies PLMN type of the link. only applies to S6ad.

Class

Read only.

List

- home - Specify link PLMN type of home.
- not-applicable - Specify link PLMN type of not applicable.
- not-home - Specify link PLMN type of not home.

Name

linkProcState - Link procedural state

Syntax

--linkProcState <list-item>

Description

Specifies link procedural state.

Class

Read only.

List

- init req - Init request - Init request.
- initing - Initiating.
- none - None.
- not init - Not init.
- not-applicable - Not-applicable.
- report - Report.
- term - Term.

Name

localIp1 - Local IP1

Syntax

--localIp1 <string>

Description

Local IP1.

Class

Read only.

Type / Range

Digit string of length 0 or 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

localIp2 - Local IP2

Syntax

--localIp2 <string>

Description

Local IP2.

Class

Read only.

Type / Range

Digit string of length 0 or 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

macroEnbId - Macro eNB id

Syntax

--macroEnbId <integer>

Description

Macro eNB identifier as specified in TS 36.413 v8.6.1.

Class

Optional.

Type / Range

Integer in the range of 0 to 1,048,575

Name

maxResponseSize - Max record count

Syntax

--maxResponseSize <integer>

Description

Max number of records to be returned.

Class

Optional.

Type / Range

Integer in the range of 1 to 100

Name

mcc - Mobile country code

Syntax

--mcc <digits>

Description

3-digit number used to represent the mobile country code.

Class

Optional.

Type / Range

Digit string of length 0 or 3

Name

mnc - Mobile network code

Syntax

--mnc <digits>

Description

Digits used to represent mobile network code.

Class

Optional.

Type / Range

Digit string of length 0 or 2 to 3

Name

poolId - IPDS Pool ID

Syntax

--poolId <integer>

Description

IPDS Pool ID - If chosen only the links on the specified IPDS will be output. The IPDS Pool ID will only be 0 for non Multi-IPDS instantiations. The default is ALL IPDS pools

Class

Read only.

Type / Range

Integer in the range of 0 to 31

Name

previousIndex - Previous index

Syntax

--previousIndex <integer>

Description

Previous index when specified next available index will be returned.

Class

Optional.

Type / Range

Integer in the range of -1 or 0 to 2,147,483,647

Name

queryRmtIp - Query Remote IP address

Syntax

--queryRmtIp <string>

Description

IP address used to query for a link whose remote IP address matches the specified IP for non-diameter and non-sgslite links

Class

Read only.

Type / Range

Digit string of length 0 or 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

remotelp1 - Remote IP1

Syntax

--remoteIp1 <string>

Description

Remote IP1.

Class

Read only.

Type / Range

Digit string of length 0 or 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

remotelp2 - Remote IP2

Syntax

--remoteIp2 <string>

Description

Remote IP2.

Class

Read only.

Type / Range

Digit string of length 0 or 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

startLinkIndex - Start link index

Syntax

--startLinkIndex <integer>

Description

Start link index from the read command.

Class

Optional.

Type / Range

Integer in the range of 0 to 4,294,967,295

Name

terminationName - TerminationName

Syntax

--terminationName <string>

Description

Termination name. this is used for s1mme alone.

Class

Optional.

Type / Range

Digit string of length 0 or 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Roles**List**

sysadmin, manage, monitor

5.126 cmm multipleHomePlmn

Multiple Home Plmn. Syntax, description, parameters, and roles for cmm multipleHomePlmn command.

Syntax**Description**

This command is used to configure an existing network as an multiple home plmn network and includes parameters for defining the serving and multiple home network names

Parameters**Name**

servedPlmnName - Serving Mobile Network

Syntax

--servedPlmnName <string>

Description

Name that identifies serving network.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

multipleHomePlmnName - Multiple Home Plmn Network name

Syntax

--multipleHomePlmnName <string>

Description

Name that identifies equivalent network.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

sysadmin, manage, monitor

5.127 cmm multiPraOperation

Multi PRA Operation. Syntax, description, parameters, and roles for `cmm multiPraOperation` command.

Syntax**Description**

Manage multiple areas associated with a Presence Reporting Area Identifier. The ranges inside the list cannot overlap. Exclude ranges must be inside an include range and cannot overlap with an include range, i.e. lower (or upper) bound cannot be the same on both include and exclude range. MME supports up to 1500 TAs, 3500 macro eNBs, 3500 home eNBs and 10500 ECGIs per each CN predefined PRA, with the limit of 50000 of the combined number of TAs, eNBs, and ECGIs.

Parameters**Name**

praid - Presence Reporting Area Identifier

Syntax

--praid <integer>

Description

Presence Reporting Area Identifier associated with the area.

Class

Required key.

Type / Range

Integer in the range of 8,388,608 to 16,777,215

Name

plmnName - Mobile Network name

Syntax

--plmnName <string>

Description

A name that identifies mobile network.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

areaType - Area Type

Syntax

--areaType <list-item>

Description

The area type to be administered related to the Presence Reporting Area.

Class

Required key.

List

- ecgi - E-UTRAN Cell Global Identifier area type.
- homeENbId - Home eNB Identifier - Home eNB Identifier area type.
- macroENbId - Macro eNB Identifier - Macro eNB Identifier area type.
- tac - Tracking Area Code - Tracking Area Code area type.

Default

tac

Name

includeList - Include List

Syntax

--includeList <string>

Description

The list of area identifier ranges in decimal or hexadecimal format) to include in the Presence Reporting Area. The ranges inside the list cannot overlap. Exclude ranges must be inside an include range and cannot overlap with an include range, i.e. lower (or upper) bound cannot be the same on both include and exclude range. Single numbers are allowed. Lower bound and upper bound are inclusive in the range(s). Ranges are separated by comma. Lower bound and upper bound is delimited by a dash. Hexadecimal must be prefix by 0x or 0X.

Class

Required on create.

Type / Range

Digit string of length 0 to 100 with the allowed pattern of '[0-9a-fA-FxX,-]+'

Name

action - Action

Syntax

--action <list-item>

Description

Defines the action to perform on the PRA area lists.

Class

Optional.

List

- delete - Delete of items from PRA areas.
- insert - Insert of items into PRA areas.

Default

insert

Name

excludeList - Exclude List

Syntax

--excludeList <string>

Description

The list of area identifier ranges (in decimal or hexadecimal format) to exclude from the Presence Reporting Area. The ranges inside the list cannot overlap. Exclude ranges must be inside an include range and cannot overlap with an include range, i.e. lower (or upper) bound cannot be the same on both include and exclude range. Single numbers are allowed. Lower bound and upper bound are inclusive in the range(s). Ranges are separated by comma. Lower bound and upper bound is delimited by a dash. Hexadecimal must be prefix by 0x or 0X.

Class

Optional.

Type / Range

Digit string of length 0 to 100 with the allowed pattern of '[0-9a-fA-FxX,-]+'

Roles**Modify**

sysadmin, manage

5.128 cmm multiTacOperation

Multi TAC Operation. Syntax, description, parameters, and roles for cmm multiTacOperation command.

Syntax

Description

Update an attribute(s) on a set of TACs. Define the set of TACs by plmnName,minTac,maxTac OR plmnName,tacListName OR plmnName,allTac. Maximum number of TACs in the set shall be limited to 2000.

Parameters

Name

plmnName - Mobile network name

Syntax

--plmnName <string>

Description

Mobile network in defining set of TACs to update.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

allTac - All tracking area

Syntax

--allTac <list-item>

Description

Define set of TACs to update to be all TACs in a given mobile network.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Name

ciotEmmRegisteredWithoutPdn - Enable EMM-REGISTERED without PDN connection for C-IOT UE

Syntax

--ciotEmmRegisteredWithoutPdn <list-item>

Description

Enable EMM-REGISTERED without PDN connection for C-IOT UE.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

dcnrSupported - DCNR Supported

Syntax

--dcnrSupported <list-item>

Description

Whether DCNR Supported is set.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

emergencySupported - Emergency supported

Syntax

--emergencySupported <list-item>

Description

Indicates if emergency is supported. only allowed if IMS supported is true.

Class

Optional.

List

- false - Boolean value of false.

- true - Boolean value of true.

Name

emmlInfoOverride - EMM info override

Syntax

--emmlInfoOverride <list-item>

Description

Flag defining whether the emmlInfo message should be overridden with profile information in the emmlInfoOverrideTacSv table.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

esmlcIdentity1 - ESMC identity 1

Syntax

--esmlcIdentity1 <digits>

Description

First TAI to E-SMLC (Evolved serving mobile location center) mapping.

Class

Optional.

Type / Range

Digit string of length 0 or 1 to 3

Name

esmlcIdentity2 - ESMC identity 2

Syntax

--esmlcIdentity2 <digits>

Description

Second TAI to E-SMLC (Evolved serving mobile location center) mapping.

Class

Optional.

Type / Range

Digit string of length 0 or 1 to 3

Name

esmlcIdentity3 - ESMC identity 3

Syntax

--esmlcIdentity3 <digits>

Description

Third TAI to E-SMLC (Evolved serving mobile location center) mapping. The E-SMLC is used for emergency services.

Class

Optional.

Type / Range

Digit string of length 0 to 3

Name

esmlcIdentity4 - ESMC identity 4

Syntax

--esmlcIdentity4 <digits>

Description

Fourth TAI to E-SMLC (Evolved serving mobile location center) mapping. The set of 4 ESMC are used for emergency services.

Class

Optional.

Type / Range

Digit string of length 0 to 3

Name

imsSupported - IMS supported

Syntax

--imsSupported <list-item>

Description

Indicates if IMS is supported.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Name

lcsEntryId - Location services entry id

Syntax

--lcsEntryId <integer>

Description

Unique id for this association of E-SMLC to tracking area and location services type. this field is used as the priority when MME TAI selection algorithm matching location services type is primarysecondary.

Class

Optional.

Type / Range

Integer in the range of 1 to 6

Name

lcsType - Location services type

Syntax

--lcsType <list-item>

Description

Specifies the location services type associated with ESMLC for this tracking area.

Class

Optional.

List

- LawfullIntercept - Lawful interception location services - Lawful interception location services.
- Operator - Operator location services - Operator location services.
- Value Added - Value added location services - Value added location services.

Name

liSelectionAlgorithm - Lawful Intercept location services selection algorithm

Syntax

--liSelectionAlgorithm <list-item>

Description

Indicates for the set of lawful intercept location services ESMLCs (Evolved serving mobile location center) whether they will load share or function as primary/secondary.

Class

Optional.

List

- LoadShare - Load share - Load share.
- PrimarySecondary - Primary / secondary - Function as primary / secondary.

Default

PrimarySecondary

Name

maxTac - Max tracking area code

Syntax

--maxTac <integer>

Description

Maximum TAC value in defining set of TACs to update, used with mintac.

Class

Optional.

Type / Range

Integer in the range of 1 to 65,535

Name

minTac - Min tracking area code

Syntax

--minTac <integer>

Description

Minimum TAC value in defining set of TACs to update, used with maxtac.

Class

Optional.

Type / Range

Integer in the range of 1 to 65,535

Name

mmeRelCapacity - MME relative capacity

Syntax

--mmeRelCapacity <integer>

Description

Provision MME relative capacity per tracking area.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Name

mtEdtCp - mtEdtCp

Syntax

```
--mtEdtCp <list-item>
```

Description

Mobile-Terminated Early Data Transfer over Control Plan

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

mtEdtUp - MT EDT User Plane

Syntax

```
--mtEdtUp <list-item>
```

Description

Mobile Terminated Early Data Transfer over User Plane

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

nbiotSmsWithoutCombinedAttach - Enable SMS without combined Attach For NB-IOT UE

Syntax

```
--nbiotSmsWithoutCombinedAttach <list-item>
```

Description

Enable SMS without combined Attach For NB-IOT UE

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

nonEmerEsmlcIdentity - Non-Emergency ESMLC identifier

Syntax

--nonEmerEsmlcIdentity <digits>

Description

Indicates the ESMLC being provisioned for a given tracking area and non-emergency location services type.

Class

Optional.

Type / Range

Digit string of length 0 or 1 to 3

Name

operSelectionAlgorithm - Operator location services selection algorithm

Syntax

--operSelectionAlgorithm <list-item>

Description

Indicates for the set of operator location services ESMLCs (Evolved serving mobile location center) whether they will load share or function as primary/secondary.

Class

Optional.

List

- LoadShare - Load share - Load share.
- PrimarySecondary - Primary / secondary - Function as primary / secondary.

Name

selectionAlgorithm - Selection algorithm

Syntax

--selectionAlgorithm <list-item>

Description

Indicates for the set of ESMLCs, (Evolved serving mobile location center) whether they will load share or function as primary/secondary.

Class

Optional.

List

- LoadShare - Load share - Load share.
- PrimarySecondary - Primary / secondary - Function as primary / secondary.

Name

sgwPoolId - SGW pool ID

Syntax

--sgwPoolId <string>

Description

ID for a serving gateway pool.

Class

Optional.

Type / Range

Digit string of length 0 to 20

Name

supportedRatType - Supported RAT type for this TAC

Syntax

--supportedRatType <list-item>

Description

Supported RAT type for this TAC. it can only be wbeutran or nbiot.

Class

Optional.

List

- nbiot - Narrow band internet of things - Specify type of narrow band internet of things.
- wbeutran - Wide band EUTRAN - Specify type of wide band EUTRAN.

Default

wbeutran

Name

tacListName - Tracking area list

Syntax

--tacListName <string>

Description

Define set of TACs to update to be all TACs in given tracking area list.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

timeZoneName - Time zone name

Syntax

--timeZoneName <list-item>

Description

Provides time zone names that correspond to the region selected.

Class

Optional.

List

- Africa/Abidjan - Timezone for africa/abidjan UTC offset of +00:00.
- Africa/Accra - Timezone for africa/accra UTC offset of +00:00.
- Africa/Addis_Ababa - Timezone for africa/addis_ababa UTC offset of +03:00.
- Africa/Algiers - Timezone for africa/algiers UTC offset of +01:00.
- Africa/Asmara - Timezone for africa/asmara UTC offset of +03:00.
- Africa/Asmera - Timezone for africa/asmera UTC offset of +03:00.
- Africa/Bamako - Timezone for africa/bamako UTC offset of +00:00.
- Africa/Bangui - Timezone for africa/bangui UTC offset of +01:00.
- Africa/Banjul - Timezone for africa/banjul UTC offset of +00:00.
- Africa/Bissau - Timezone for africa/bissau UTC offset of +00:00.
- Africa/Blantyre - Timezone for africa/blantyre UTC offset of +02:00.
- Africa/Brazzaville - Timezone for africa/brazzaville UTC offset of +01:00.
- Africa/Bujumbura - Timezone for africa/bujumbura UTC offset of +02:00.
- Africa/Cairo - Timezone for africa/cairo UTC offset of +02:00.
- Africa/Casablanca - Timezone for africa/casablanca UTC offset of +00:00.
- Africa/Ceuta - Timezone for africa/ceuta UTC offset of +01:00.
- Africa/Conakry - Timezone for africa/conakry UTC offset of +00:00.
- Africa/Dakar - Timezone for africa/dakar UTC offset of +00:00.
- Africa/Dar_es_Salaam - Timezone for africa/dar_es_salaam UTC offset of +03:00.
- Africa/Djibouti - Timezone for africa/djibouti UTC offset of +03:00.
- Africa/Douala - Timezone for africa/douala UTC offset of +01:00.
- Africa/El_Aaiun - Timezone for africa/el_aaiun UTC offset of +00:00.

- Africa/Freetown - Timezone for africa/freetown UTC offset of +00:00.
- Africa/Gaborone - Timezone for africa/gaborone UTC offset of +02:00.
- Africa/Harare - Timezone for africa/harare UTC offset of +02:00.
- Africa/Johannesburg - Timezone for africa/johannesburg UTC offset of +02:00.
- Africa/Juba - Timezone for africa/juba UTC offset of +03:00.
- Africa/Kampala - Timezone for africa/kampala UTC offset of +03:00.
- Africa/Khartoum - Timezone for africa/khartoum UTC offset of +03:00.
- Africa/Kigali - Timezone for africa/kigali UTC offset of +02:00.
- Africa/Kinshasa - Timezone for africa/kinshasa UTC offset of +01:00.
- Africa/Lagos - Timezone for africa/lagos UTC offset of +01:00.
- Africa/Libreville - Timezone for africa/libreville UTC offset of +01:00.
- Africa/Lome - Timezone for africa/lome UTC offset of +00:00.
- Africa/Luanda - Timezone for africa/luanda UTC offset of +01:00.
- Africa/Lubumbashi - Timezone for africa/lubumbashi UTC offset of +02:00.
- Africa/Lusaka - Timezone for africa/lusaka UTC offset of +02:00.
- Africa/Malabo - Timezone for africa/malabo UTC offset of +01:00.
- Africa/Maputo - Timezone for africa/maputo UTC offset of +02:00.
- Africa/Maseru - Timezone for africa/maseru UTC offset of +02:00.
- Africa/Mbabane - Timezone for africa/mbabane UTC offset of +02:00.
- Africa/Mogadishu - Timezone for africa/mogadishu UTC offset of +03:00.
- Africa/Monrovia - Timezone for africa/monrovia UTC offset of +00:00.
- Africa/Nairobi - Timezone for africa/nairobi UTC offset of +03:00.
- Africa/Ndjamena - Timezone for africa/ndjamena UTC offset of +01:00.
- Africa/Niamey - Timezone for africa/niamey UTC offset of +01:00.
- Africa/Nouakchott - Timezone for africa/nouakchott UTC offset of +00:00.
- Africa/Ouagadougou - Timezone for africa/ouagadougou UTC offset of +00:00.
- Africa/Porto-Novo - Timezone for africa/porto-novo UTC offset of +01:00.
- Africa/Sao_Tome - Timezone for africa/sao_tome UTC offset of +00:00.
- Africa/Timbuktu - Timezone for africa/timbuktu UTC offset of +00:00.
- Africa/Tripoli - Timezone for africa/tripoli UTC offset of +02:00.
- Africa/Tunis - Timezone for africa/tunis UTC offset of +01:00.

- Africa/Windhoek - Timezone for africa/windhoek UTC offset of +02:00.
- America/Adak - Timezone for america/adak UTC offset of -10:00.
- America/Anchorage - Timezone for america/anchorage UTC offset of -09:00.
- America/Anguilla - Timezone for america/anguilla UTC offset of -04:00.
- America/Antigua - Timezone for america/antigua UTC offset of -04:00.
- America/Araguaina - Timezone for america/araguaina UTC offset of -03:00.
- America/Argentina/Buenos_Aires - Timezone for america/argentina/buenos_aires UTC offset of -03:00.
- America/Argentina/Catamarca - Timezone for america/argentina/catamarca UTC offset of -03:00.
- America/Argentina/ComodRivadavia - Timezone for america/argentina/comodrivadavia UTC offset of -03:00.
- America/Argentina/Cordoba - Timezone for america/argentina/cordoba UTC offset of -03:00.
- America/Argentina/Jujuy - Timezone for america/argentina/jujuy UTC offset of -03:00.
- America/Argentina/La_Rioja - Timezone for america/argentina/la_rioja UTC offset of -03:00.
- America/Argentina/Mendoza - Timezone for america/argentina/mendoza UTC offset of -03:00.
- America/Argentina/Rio_Gallegos - Timezone for america/argentina/rio_gallegos UTC offset of -03:00.
- America/Argentina/Salta - Timezone for america/argentina/salta UTC offset of -03:00.
- America/Argentina/San_Juan - Timezone for america/argentina/san_juan UTC offset of -03:00.
- America/Argentina/San_Luis - Timezone for america/argentina/san_luis UTC offset of -03:00.
- America/Argentina/Tucuman - Timezone for america/argentina/tucuman UTC offset of -03:00.
- America/Argentina/Ushuaia - Timezone for america/argentina/ushuaia UTC offset of -03:00.
- America/Aruba - Timezone for america/aruba UTC offset of -04:00.
- America/Asuncion - Timezone for america/asuncion UTC offset of -03:00.
- America/Atikokan - Timezone for america/atikokan UTC offset of -05:00.
- America/Atka - Timezone for america/atka UTC offset of -10:00.

- America/Bahia - Timezone for america/bahia UTC offset of -03:00.
- America/Bahia_Banderas - Timezone for america/bahia_banderas UTC offset of -06:00.
- America/Barbados - Timezone for america/barbados UTC offset of -04:00.
- America/Belem - Timezone for america/belem UTC offset of -03:00.
- America/Belize - Timezone for america/belize UTC offset of -06:00.
- America/Blanc-Sablon - Timezone for america/blanc-sablon UTC offset of -04:00.
- America/Boa_Vista - Timezone for america/boa_vista UTC offset of -04:00.
- America/Bogota - Timezone for america/bogota UTC offset of -05:00.
- America/Boise - Timezone for america/boise UTC offset of -07:00.
- America/Buenos_Aires - Timezone for america/buenos_aires UTC offset of -03:00.
- America/Cambridge_Bay - Timezone for america/cambridge_bay UTC offset of -07:00.
- America/Campo_Grande - Timezone for america/campo_grande UTC offset of -03:00.
- America/Cancun - Timezone for america/cancun UTC offset of -05:00.
- America/Caracas - Timezone for america/caracas UTC offset of -04:00.
- America/Catamarca - Timezone for america/catamarca UTC offset of -03:00.
- America/Cayenne - Timezone for america/cayenne UTC offset of -03:00.
- America/Cayman - Timezone for america/cayman UTC offset of -05:00.
- America/Chicago - Timezone for america/chicago UTC offset of -06:00.
- America/Chihuahua - Timezone for america/chihuahua UTC offset of -07:00.
- America/Coral_Harbour - Timezone for america/coral_harbour UTC offset of -05:00.
- America/Cordoba - Timezone for america/cordoba UTC offset of -03:00.
- America/Costa_Rica - Timezone for america/costa_rica UTC offset of -06:00.
- America/Creston - Timezone for america/creston UTC offset of -07:00.
- America/Cuiaba - Timezone for america/cuiaba UTC offset of -03:00.
- America/Curacao - Timezone for america/curacao UTC offset of -04:00.
- America/Danmarkshavn - Timezone for america/danmarkshavn UTC offset of +00:00.
- America/Dawson - Timezone for america/dawson UTC offset of -08:00.
- America/Dawson_Creek - Timezone for america/dawson_creek UTC offset of -07:00.
- America/Denver - Timezone for america/denver UTC offset of -07:00.
- America/Detroit - Timezone for america/detroit UTC offset of -05:00.
- America/Dominica - Timezone for america/dominica UTC offset of -04:00.

- America/Edmonton - Timezone for america/edmonton UTC offset of -07:00.
- America/Eirunepe - Timezone for america/eirunepe UTC offset of -05:00.
- America/El_Salvador - Timezone for america/el_salvador UTC offset of -06:00.
- America/Ensenada - Timezone for america/ensenada UTC offset of -08:00.
- America/Fort_Nelson - Timezone for america/fort_nelson UTC offset of -07:00.
- America/Fort_Wayne - Timezone for america/fort_wayne UTC offset of -05:00.
- America/Fortaleza - Timezone for america/fortaleza UTC offset of -03:00.
- America/Glace_Bay - Timezone for america/glance_bay UTC offset of -04:00.
- America/Godthab - Timezone for america/godthab UTC offset of -03:00.
- America/Goose_Bay - Timezone for america/goose_bay UTC offset of -04:00.
- America/Grand_Turk - Timezone for america/grand_turk UTC offset of -04:00.
- America/Grenada - Timezone for america/grenada UTC offset of -04:00.
- America/Guadeloupe - Timezone for america/guadeloupe UTC offset of -04:00.
- America/Guatemala - Timezone for america/guatemala UTC offset of -06:00.
- America/Guayaquil - Timezone for america/guayaquil UTC offset of -05:00.
- America/Guyana - Timezone for america/guyana UTC offset of -04:00.
- America/Halifax - Timezone for america/halifax UTC offset of -04:00.
- America/Havana - Timezone for america/havana UTC offset of -05:00.
- America/Hermosillo - Timezone for america/hermosillo UTC offset of -07:00.
- America/Indiana/Indianapolis - Timezone for america/indiana/indianapolis UTC offset of -05:00.
- America/Indiana/Knox - Timezone for america/indiana/knox UTC offset of -06:00.
- America/Indiana/Marengo - Timezone for america/indiana/marengo UTC offset of -05:00.
- America/Indiana/Petersburg - Timezone for america/indiana/petersburg UTC offset of -05:00.
- America/Indiana/Tell_City - Timezone for america/indiana/tell_city UTC offset of -06:00.
- America/Indiana/Vevay - Timezone for america/indiana/vevay UTC offset of -05:00.
- America/Indiana/Vincennes - Timezone for america/indiana/vincennes UTC offset of -05:00.
- America/Indiana/Winamac - Timezone for america/indiana/winamac UTC offset of -05:00.

- America/Indianapolis - Timezone for america/indianapolis UTC offset of -05:00.
- America/Inuvik - Timezone for america/inuvik UTC offset of -07:00.
- America/Iqaluit - Timezone for america/iqaluit UTC offset of -05:00.
- America/Jamaica - Timezone for america/jamaica UTC offset of -05:00.
- America/Jujuy - Timezone for america/jujuy UTC offset of -03:00.
- America/Juneau - Timezone for america/juneau UTC offset of -09:00.
- America/Kentucky/Louisville - Timezone for america/kentucky/louisville UTC offset of -05:00.
- America/Kentucky/Monticello - Timezone for america/kentucky/monticello UTC offset of -05:00.
- America/Knox_IN - Timezone for america/knox_in UTC offset of -06:00.
- America/Kralendijk - Timezone for america/kralendijk UTC offset of -04:00.
- America/La_Paz - Timezone for america/la_paz UTC offset of -04:00.
- America/Lima - Timezone for america/lima UTC offset of -05:00.
- America/Los_Angeles - Timezone for america/los_angeles UTC offset of -08:00.
- America/Louisville - Timezone for america/louisville UTC offset of -05:00.
- America/Lower_Princes - Timezone for america/lower_princes UTC offset of -04:00.
- America/Maceio - Timezone for america/maceio UTC offset of -03:00.
- America/Managua - Timezone for america/managua UTC offset of -06:00.
- America/Manaus - Timezone for america/manuel UTC offset of -04:00.
- America/Marigot - Timezone for america/marigot UTC offset of -04:00.
- America/Martinique - Timezone for america/martinique UTC offset of -04:00.
- America/Matamoros - Timezone for america/matamoros UTC offset of -06:00.
- America/Mazatlan - Timezone for america/mazatlan UTC offset of -07:00.
- America/Mendoza - Timezone for america/mendoza UTC offset of -03:00.
- America/Menominee - Timezone for america/menominee UTC offset of -06:00.
- America/Merida - Timezone for america/merida UTC offset of -06:00.
- America/Metlakatla - Timezone for america/metlakatla UTC offset of -09:00.
- America/Mexico_City - Timezone for america/mexico_city UTC offset of -06:00.
- America/Miquelon - Timezone for america/miquelon UTC offset of -03:00.
- America/Moncton - Timezone for america/moncton UTC offset of -04:00.
- America/Monterrey - Timezone for america/monterrey UTC offset of -06:00.

- America/Montevideo - Timezone for america/montevideo UTC offset of -03:00.
- America/Montreal - Timezone for america/montreal UTC offset of -05:00.
- America/Montserrat - Timezone for america/montserrat UTC offset of -04:00.
- America/Nassau - Timezone for america/nassau UTC offset of -05:00.
- America/New_York - Timezone for america/new_york UTC offset of -05:00.
- America/Nipigon - Timezone for america/nipigon UTC offset of -05:00.
- America/Nome - Timezone for america/nome UTC offset of -09:00.
- America/Noronha - Timezone for america/noronha UTC offset of -02:00.
- America/North_Dakota/Beulah - Timezone for america/north_dakota/beulah UTC offset of -06:00.
- America/North_Dakota/Center - Timezone for america/north_dakota/center UTC offset of -06:00.
- America/North_Dakota/New_Salem - Timezone for america/north_dakota/new_salem UTC offset of -06:00.
- America/Ojinaga - Timezone for america/ojinaga UTC offset of -07:00.
- America/Panama - Timezone for america/panama UTC offset of -05:00.
- America/Pangnirtung - Timezone for america/pangnirtung UTC offset of -05:00.
- America/Paramaribo - Timezone for america/paramaribo UTC offset of -03:00.
- America/Phoenix - Timezone for america/phoenix UTC offset of -07:00.
- America/Port-au-Prince - Timezone for america/port-au-prince UTC offset of -05:00.
- America/Port_of_Spain - Timezone for america/port_of_spain UTC offset of -04:00.
- America/Porto_Acre - Timezone for america/porto_acre UTC offset of -05:00.
- America/Porto_Velho - Timezone for america/porto_velho UTC offset of -04:00.
- America/Puerto_Rico - Timezone for america/puerto_rico UTC offset of -04:00.
- America/Rainy_River - Timezone for america/rainy_river UTC offset of -06:00.
- America/Rankin_Inlet - Timezone for america/rankin_inlet UTC offset of -06:00.
- America/Recife - Timezone for america/recife UTC offset of -03:00.
- America/Regina - Timezone for america/regina UTC offset of -06:00.
- America/Resolute - Timezone for america/resolute UTC offset of -06:00.
- America/Rio_Branco - Timezone for america/rio_branco UTC offset of -05:00.
- America/Rosario - Timezone for america/rosario UTC offset of -03:00.
- America/Santa_Isabel - Timezone for america/santa_isabel UTC offset of -08:00.

- America/Santarem - Timezone for america/santarem UTC offset of -03:00.
- America/Santiago - Timezone for america/santiago UTC offset of -03:00.
- America/Santo_Domingo - Timezone for america/santo_domingo UTC offset of -04:00.
- America/Sao_Paulo - Timezone for america/sao_paulo UTC offset of -02:00.
- America/Scoresbysund - Timezone for america/scoresbysund UTC offset of -01:00.
- America/Shiprock - Timezone for america/shiprock UTC offset of -07:00.
- America/Sitka - Timezone for america/sitka UTC offset of -09:00.
- America/St_Barthelemy - Timezone for america/st_barthelemy UTC offset of -04:00.
- America/St_Johns - Timezone for america/st_johns UTC offset of -03:30.
- America/St_Kitts - Timezone for america/st_kitts UTC offset of -04:00.
- America/St_Lucia - Timezone for america/st_lucia UTC offset of -04:00.
- America/St_Thomas - Timezone for america/st_thomas UTC offset of -04:00.
- America/St_Vincent - Timezone for america/st_vincent UTC offset of -04:00.
- America/Swift_Current - Timezone for america/swift_current UTC offset of -06:00.
- America/Tegucigalpa - Timezone for america/tegucigalpa UTC offset of -06:00.
- America/Thule - Timezone for america/thule UTC offset of -04:00.
- America/Thunder_Bay - Timezone for america/thunder_bay UTC offset of -05:00.
- America/Tijuana - Timezone for america/tijuana UTC offset of -08:00.
- America/Toronto - Timezone for america/toronto UTC offset of -05:00.
- America/Tortola - Timezone for america/tortola UTC offset of -04:00.
- America/Vancouver - Timezone for america/vancouver UTC offset of -08:00.
- America/Virgin - Timezone for america/virgin UTC offset of -04:00.

Name

vaSelectionAlgorithm - Value added location services selection algorithm

Syntax

--vaSelectionAlgorithm <list-item>

Description

Indicates for the set of value added location services ESMLCs (Evolved serving mobile location center) whether they will load share or function as primary/secondary.

Class

Optional.

List

- LoadShare - Load share - Load share.
- PrimarySecondary - Primary / secondary - Function as primary / secondary.

Roles**Modify**

sysadmin, manage

5.129 cmm nationalApn

National APN. Syntax, description, parameters, and roles for cmm nationalApn command.

Syntax**Description**

National APN.

Parameters

Name

plmnName - Mobile network name

Syntax

--plmnName <string>

Description

Name that identifies served mobile network.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

apnNi - Access point name - network identifier

Syntax

--apnNi <string>

Description

Access point name.

Class

Required key.

Type / Range

Digit string of length 1 to 62 with the allowed pattern of [0-9a-zA-Z\._]*

Roles

Create

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

5.130 cmm nbiPing

nbiPing. Syntax, description, parameters, and roles for cmm nbiPing command.

Syntax

Description

Ping Command.

Parameters

Name

pingTarget - Ping target

Syntax

--pingTarget <string>

Description

Ping target can be IP address or DNS name.

Class

Required key.

Type / Range

Digit string of length 1 to 128 with the allowed pattern of [0-9a-zA-Z\.\-_:]*

Name

idx - Index

Syntax

--idx <integer>

Description

Index number for output

Class

Required key.

Type / Range

Integer in the range of 0 to 255

Name

byPassRouting - By pass routing

Syntax

--byPassRouting <list-item>

Description

Send the ping request to a host on a directly attached network by passing routing table.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

doNotFragment - Do not fragment

Syntax

--doNotFragment <list-item>

Description

Do not fragment specifies that request should not be fragmented.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

pingCount - Count

Syntax

--pingCount <integer>

Description

Number of ping requests to the host.

Class

Optional.

Type / Range

Integer in the range of 1 to 10,000

Default

5

Name

pingInterval - Interval

Syntax

--pingInterval <integer>

Description

Interval in seconds between ping.

Class

Optional.

Type / Range

Integer in the range of 1 to 10,000

Default

1

Name

pingOutput - Ping output

Syntax

--pingOutput <string>

Description

Ping output.

Class

Read only.

Type / Range

Digit string of length

Name

pingPattern - Pattern

Syntax

--pingPattern <string>

Description

16 byte string to be included in the ping.

Class

Optional.

Type / Range

Digit string of length 0 or 1 to 16 with the allowed pattern of [0-9a-fA-F]*

Default

0

Name

pingRptType - Ping report type

Syntax

--pingRptType <list-item>

Description

Valid values are rapid and normal.

Class

Optional.

List

- normal - Specify ping report type of normal.
- rapid - Specify ping report type of rapid.

Default

normal

Name

pingSize - Size

Syntax

--pingSize <integer>

Description

Size in bytes of ping requests.

Class

Optional.

Type / Range

Integer in the range of 1 to 65,507

Default

56

Name

pingSourceIp - Source IP address

Syntax

--pingSourceIp <string>

Description

Source IP address to be used for ping request.

Class

Optional.

Type / Range

Digit string of length 0 or 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Default

0.0.0.0

Name

pingTimeOut - Timeout

Syntax

--pingTimeOut <integer>

Description

Timeout in sec.

Class

Optional.

Type / Range

Integer in the range of 1 to 100

Default

5

Name

timeToLive - Time to live

Syntax

--timeToLive <integer>

Description

Time to live TTL value in ping request.

Class

Optional.

Type / Range

Integer in the range of 1 to 255

Default

64

Name

typeOfService - Type of service

Syntax

--typeOfService <integer>

Description

Type of service bits in the IP header.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

0

Roles**List**

sysadmin, manage, monitor

5.131 cmm nbiTraceroute

nbiTraceroute. Syntax, description, parameters, and roles for cmm nbiTraceroute command.

Syntax

Description

Traceroute Command.

Parameters

Name

trTarget - Traceroute target

Syntax

--trTarget <string>

Description

Traceroute target can be IP address or DNS name.

Class

Required key.

Type / Range

Digit string of length 1 to 128 with the allowed pattern of [0-9a-zA-Z\.\-_:]*

Name

idx - Index

Syntax

--idx <integer>

Description

Index number for output

Class

Required key.

Type / Range

Integer in the range of 0 to 255

Name

trNoDns - DNS reverse lookup allowed

Syntax

--trNoDns <list-item>

Description

Do not perform a DNS reverse-lookup name. by default a DNS lookup is performed.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

trOutput - Traceroute output

Syntax

--trOutput <string>

Description

Traceroute output.

Class

Read only.

Type / Range

Digit string of length

Name

trSourceIp - Source IP address

Syntax

--trSourceIp <string>

Description

Source IP address to be used for traceroute request.

Class

Optional.

Type / Range

Digit string of length 0 or 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

trTos - Type of service

Syntax

--trTos <integer>

Description

Type of service bits in the IP header.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

0

Name

trTtl - Time to live

Syntax

--trTtl <integer>

Description

Time to live TTL value in tr request.

Class

Optional.

Type / Range

Integer in the range of 1 to 255

Default

15

Name

trWaitTime - Wait time

Syntax

--trWaitTime <integer>

Description

Interval in seconds between tr.

Class

Optional.

Type / Range

Integer in the range of 1 to 60,000

Default

5000

Roles**List**

sysadmin, manage, monitor

5.132 cmm nbNbrGParams

NodeB Neighbor GParams. Syntax, description, parameters, and roles for cmm nbNbrGParams command.

Syntax

Description

Global parameters for creating and maintaining a NodeB neighbor map

Parameters

Name

cmGparmName - Parameter Name

Syntax

--cmGparmName <list-item>

Description

Global parameters for creating and maintaining a NodeB neighbor map

Class

Required key.

List

- gnbMapLocalRestoration - gNB Map Local Restoration - Specifies whether AMMS utilizes a locally stored copy of the neighbor gNB map rather than regenerating it following a restart or scale-out.
- gnbNeighborContUpdate - gNB Neighbor Continual Update - Specifies whether the gNB neighbor map shall continue to be updated after initial generation has completed.
- gnbNeighborGenInterval - gNB Neighbor Generation Interval - gNB neighbor map generation interval in days. 0 means the map is not created.
- gnbNeighborMinWeightCutoff - gNB Neighbor Minimum Weight Cutoff - Specifies the minimum weight that a system-discovered gNB pair must have to be considered as neighboring. The weight cutoff ranges from 0% to 100% by 1% increments.
- gnbNeighborPairMaxInterval - gNB Neighbor Pair Maximum Interval - Defines the maximum interval between successive idle UE access to the AMF to be used for the identification of neighboring gNB pairs.
- gnbNeighborSampleRate - gNB Neighbor Sample Rate - When creating or updating the gNB neighbor map, this value defines the percentage of UE accesses that are used.
- prioritizedUeHistoryCount - Prioritize UE History Count - Specifies the number of gNB from the UE history that are prioritized to the head of the paging set for Neighbor Level Paging Method. After the prioritized gNB(s), the remainder of the paging set is

Name

cmGparmValue - Parameter Value

Syntax

--cmGparmValue <string>

Description

Value of parameter

Class

Required on create.

Type / Range

Digit string of length 0 to 64

The cmGparmValue string is based on the cmGparmName parameter:

Name

gnbMapLocalRestoration - gNB Map Local Restoration

Syntax

--cmGparmName gnbMapLocalRestoration --cmGparmValue <string>

Description

Specifies whether AMMS utilizes a locally stored copy of the neighbor gNB map rather than regenerating it following a restart or scale-out.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

gnbNeighborContUpdate - gNB Neighbor Continual Update

Syntax

--cmGparmName gnbNeighborContUpdate --cmGparmValue <string>

Description

Specifies whether the gNB neighbor map shall continue to be updated after initial generation has completed.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

gnbNeighborGenInterval - gNB Neighbor Generation Interval

Syntax

```
--cmGparmName gnbNeighborGenInterval --cmGparmValue <string>
```

Description

gNB neighbor map generation interval in days. 0 means the map is not created.

Type / Range

Integer in the range of 0 to 100

Default

0

Name

gnbNeighborMinWeightCutoff - gNB Neighbor Minimum Weight Cutoff

Syntax

```
--cmGparmName gnbNeighborMinWeightCutoff --cmGparmValue <string>
```

Description

Specifies the minimum weight that a system-discovered gNB pair must have to be considered as neighboring. The weight cutoff ranges from 0% to 100% by 1% increments.

Type / Range

Integer in the range of 0 to 100

Default

0

Name

gnbNeighborPairMaxInterval - gNB Neighbor Pair Maximum Interval

Syntax

```
--cmGparmName gnbNeighborPairMaxInterval --cmGparmValue <string>
```

Description

Defines the maximum interval between successive idle UE access to the AMF to be used for the identification of neighboring gNB pairs.

Type / Range

Integer in the range of 0 to 30,000 in units of Second

Default

60

Name

gnbNeighborSampleRate - gNB Neighbor Sample Rate

Syntax

```
--cmGparmName gnbNeighborSampleRate --cmGparmValue <string>
```

Description

When creating or updating the gNB neighbor map, this value defines the percentage of UE accesses that are used.

Type / Range

Integer in the range of 0 to 100

Default

0

Name

prioritizedUeHistoryCount - Prioritize UE History Count

Syntax

```
--cmGparamName prioritizedUeHistoryCount --cmGparamValue <string>
```

Description

Specifies the number of gNB from the UE history that are prioritized to the head of the paging set for Neighbor Level Paging Method. After the prioritized gNB(s), the remainder of the paging set is

Type / Range

Integer in the range of 1 to 5

Default

5

5.133 cmm networkFunctionInstance

Network Function Instance. Syntax, description, parameters, and roles for cmm networkFunctionInstance command.

Syntax

Description

This command is used to create a new NF instance other than AMF and modify and delete an existing NF instance.

Parameters

Name

instanceId - Network Function Instance Identifier

Syntax

--instanceId <string>

Description

Uniquely identifies a network function. The instance ID is a UUID represented as a URN (string format). The operator must obtain the UUID from the NF configuration data. It is used for NF selection when NF discovery is based on target-nf-instance-id or preferred-nf-instances. Also may be used by AMF call processing when NF is selected with different criterions but NF Instance Id has to be stored for further usage. For example, a SMF may be selected based on DNN and S-NSSAI but the selected SMF instance Id for each PDU must be stored in UE Context as defined in 3GPP TS 29.518 (UeContext-->sessionContextList[x]-->hsmfId) The UUID must have the following string format: '8 hex digits-4 hex digits-4 hex digits-4 hex digits-12 hex digits'. Example: '4947a69a-f61b-4bc1-b9da-47c9c5d14b64'

Class

Required key.

Type / Range

Digit string of length 36 to 36 with the allowed pattern of [0-9a-fA-F]{8}\-[0-9a-fA-F]{4}\-[0-9a-fA-F]{4}\-[0-9a-fA-F]{4}\-[0-9a-fA-F]{12}

Default

No default

Name

nfType - Network Function Type

Syntax

--nfType <list-item>

Description

Specifies the type of Network Function. Used to match the NF discovery 'target-nf-type' Parameter. Note: while the NFType CBCF and AMF is available in the CLI they are not relevant. A CBCF it is never Discovered from AMF thus not related to local provisioning, while locally provisioned remote AMFs are created via rmtAmfInstance command.

Class

Required on create, not modifiable.

List

- 5GEIR - 5G EIR - The network function type of 5G-Equipment Identity Register.
- AMF - Access and Mobility Manager Function - The network function type of Access and Mobility Manager Function.
- AUSF - Authentication Server Function - The network function type of Authentication Server Function.
- CBCF - Cell Broadcast Centre Function - The network function type of Cell Broadcast Centre Function
- CHF - Charging Function - The network function type of Charging Function
- GMLC - Gateway Mobile Location Center - The network function type of Gateway Mobile Location Center.
- LMF - Location Management Function - The network function type of Location Management Function.
- NRF - Network Repository Function - The network function type of Network Repository Function.
- NSSAAF - Network Slice Specific Authentication and Authorization Function - The network function type of Network Slice Specific Authentication and Authorization Function
- NSSF - Network Slice Selection Function - The network function type of Network Slice Selection Function.
- NWDAF - Network Data Analytics Function - The network function type of NWDAF.
- PCF - Policy Control Function - The network function type of Policy Control Function.
- SMF - Session Management Function - The network function type of Session Management Function.
- SMSF - Short Message Service Function - The network function type of Short Message Service Function.
- UDM - Unified Data Manager - The network function type of Unified Data Manager.
- UDSF - Unstructured Data Storage Function - The network function type of Unstructured Data Storage Function.

Name

plmnName - PLMN Name

Syntax

--plmnName <string>

Description

Name of the PLMN. Must be set to CMM's own Home PLMN. Currently it is not allowed to be set to a Shared PLMN. Also not allowed to be set to Roaming PLMN (PLMN type 'Other') as local provisioning is not relevant for NF in different PLMNs

Class

Required on create.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Name

amfTaiListName - AMF TAI List Name

Syntax

--amfTaiListName <string>

Description

This parameter is pointer to a list of TAIs served by the SMF or the I-SMF. Used for NF selection when SMF discovery is based on tai or preferred-tai AMF may use TAI list (if provisioned for UE PLMN/serving PLMN combination) to select an SMF serving a set of TAIs. If the list is not provisioned then it is assumed that SMF serves all the TAIs in the serving PLMN. AMF uses TAI list to select an I-SMF serving a set of TAIs. If the list is not provisioned then it is assumed that I-SMF serves all the TAI in the serving PLMN. AMF also uses TAI list in SMF selection when I-SMF functionality is activated in the AMF and the preferred TAI is used for SMF selection for UE PLMN/serving PLMN combination. Note: The parameter is relevant only for SMF but named amfTaiListName to indicate that this list relevant for CMM AMF functions and distinguish from taiList command which is used for CMM's AMF functions

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Name

capacity - Relative capacity of the NF

Syntax

--capacity <integer>

Description

Relative capacity of the NF as defined in NFProfile level in 29.510. It is used for load balancing among NFs with equal Priority. As per 29.510 this parameter is used to deduce the NF Service instance Capacity when -and only when- the relevant information is not available on Service Instance level. However since locally provisioned Service instances always have a default capacity value this parameter has no effect for load balancing Service Requests (only relevant for Default Notifications)

Class

Optional.

Type / Range

Integer in the range of 0 to 65,535

Default

65535

Name

defaultNetworkFunction - Default Network Function

Syntax`--defaultNetworkFunction <list-item>`**Description**

The parameter is used to identify a NF treated as a default NF. If the AMF can not select a NF for a selection rule then the AMF will select the NF if provisioning allows the selection of a default NF (controlled via amfUePlmnServices defaultXXXSelection where 'XXX' is the relevant NF Type)

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

defaultNotificationSubscriptionListName - Default Notification Subscription List Name

Syntax`--defaultNotificationSubscriptionListName <string>`**Description**

References a list which links to NFs Default notification subscription Endpoints. Refers to the 3GPP TS 29.510 NFProfile-->defaultNotificationSubscriptions. This is relevant for GMLC and LMF. The list can be added either in NF Instance level or Service instance level. For GMLC only NF Instance level is relevant as GMLC has no services.

Class

Optional.

Type / RangeDigit string of length 0 to 31 with the allowed pattern of `[0-9a-zA-Z\.\_:@]*`**Default**

""

Name

dnnListName - Data Network List Name

Syntax

--dnnListName <string>

Description

The list consists of the DNN supported by the SMF. It is used for SMF selection based on dnn query parameter. All DNNs included in this list are assumed to support all the S-NSSAIs the SMF supports (i.e. not possible to define DNN per S-NSSAI). If a DNN list is not provisioned then it is assumed that the SMF supports all the DNNs. Note: DNN should be provisioned in the complete format (i.e. including the DNN-OI) when amfGParams --amfGparamName alwaysSendDnnWithOperatorIdentifier is enabled

Restrictions

This parameter is only applicable to SMF. All other NF types ignore this parameter if provisioned.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

emergencyServices - Emergency Services

Syntax

--emergencyServices <list-item>

Description

This parameter defines if the NF supports emergency services. This parameter is relevant only for GMLC and LMF.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

enable - Enable NF

Syntax

--enable <list-item>

Description

The parameter is used to enable use of the provisioned instance of a NF. If not enabled the NF will not be considered as candidate for selection.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

fqdn - FQDN

Syntax

--fqdn <string>

Description

The NF's FQDN. This is relevant only if all services of the NF use the same port/fqdn and the FQDN or nfEndPointListName information is not given in NF Service instance level. If both the FQDN and the Endpoints are provided, the Request URI is constructed with the FQDN but the IPs/port are deduced by the Endpoint list (i.e. no DNS query is issued) unless the endpoints include only Port in which case the port is deduced from the endpoint list and the IP is resolved via DNS query. Note: DNS resolution is not supported for NSSF and NNS resolution is not performed in case of Indirect communication with SCP. In that case the SCP is expected to resolve the IP of the FQDN

Restrictions

The FQDN parameter is for future use. The FID f20031-01 ignores this parameter.

Class

Optional.

Type / Range

Digit string of length 96 with the allowed pattern of [0-9a-zA-Z.-]*

Name

gpsiRangeListName - GPSI Range List

Syntax

--gpsiRangeListName <string>

Description

Name of the list consisting of GPSI ranges supported by NF. A NF without GPSI Range List is assumed to support all GPSIs. Relevant for PCF discovery based on gpsi when amfUePlmnServices - useGpsiForPcfSelection is true

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Name

groupId - UDM or AUSF Group ID

Syntax

--groupId <string>

Description

The GroupId the NF belongs to. Used for UDM and AUSF selection based on the Group ID (e.g. inter-AMF mobility). AMF stores the GroupId of the selected UDM or AUSF in the UE's context (e.g. when selection is based on SUPI due to absence of the GroupId) Note: This parameter is supported for AUSF and UDM starting CMM 22.0. In prior releases this parameter is not used. 3GPP also has defined groupId for PCF however CMM currently does not support using Group ID for PCF selection.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Default

""

Name

locality - Location of the Network Function

Syntax

--locality <string>

Description

This parameter is used to indicate location of the NF like geographical location, data center name, etc. When set, if the locality of the NF matches the locality of the own AMF (amfInstance --locality) the NF is selected with highest priority (if all other criterions are also met). If own AMF has not be provisioned with locality this parameter has no effect.

Class

Optional.

Type / Range

Digit string of length 0 to 64

Default

""

Name

nfIpEndPointListName - NF End Point IP List Name

Syntax

```
--nfIpEndPointListName <string>
```

Description

References a list which links to NFs endpoints (i.e. IP port combination). This parameter is relevant only if all services of the NF use the same port/fqdn and the fqdn or nfEndPointListName information is not given in NF Service instance level. Up to two endpoints per IP version can be provisioned. If both the FQDN and the Endpoints List are provided, the Request URI is constructed including the FQDN but the IPs and port are deduced by the Endpoint list (i.e. no DNS is query) unless the endpoints include only Port in which case the port is deduced from the endpoint list and the IP is resolved via DNS query.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

nfServicePersistence - NF Service Persistence

Syntax

```
--nfServicePersistence <list-item>
```

Description

When this value is True, it indicates that the different service instances of a same NF Service in this NF instance, supporting a same API version, are capable to persist their resource state in shared storage and therefore these resources are available after a new NF service instance supporting the same API version is selected by a NF Service Consumer. Otherwise, it indicates that the NF Service Instances of a same NF Service are not capable to share resource state inside the NF Instance. Currently this parameter is supported only for NRF ignored for all other NF Types. When set to True in NRF CMM will not create a new registration but will update existing when selecting new Management Service within the same NRF

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

nfServicesListName - NF Service List

Syntax

--nfServicesListName <string>

Description

The lists consists of the services supported by the NF. References a list which links to the NFs service instances the NF has. A NF may be provisioned to have multiple service instances for same or different service type.

Restrictions

This list must contain the services of the NF type.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

""

Name

nrfHeartBeatTimer - Heartbeat Timer Proposed From AMF To The NRF

Syntax

--nrfHeartBeatTimer <integer>

Description

Time in seconds expected between 2 consecutive heart-beat messages from the AMF to the NRF. When present the AMF will use this value in the registration request. NRF is allowed to override this value in the response.

Restrictions

This field is relevant only for NRF networkFunctionInstances

Class

Optional.

Type / Range

Integer in the range of 0 or 10 to 3,600 in units of Second

Default

60

Name

nsildListName - NSI ID List Name

Syntax

--nsiIdListName <string>

Description

References the list with the NSIs the NF belongs to. If not given NF is expected to belong to all NSIs. Only relevant for SMF selection from locally provisioned NFs when NSI is provided by NSSF.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

pgwFqdn - PGW FQDN

Syntax

--pgwFqdn <string>

Description

FQDN of PGW-C for combo SMF+PGW-C. Used for SMF selection during 4G-->5G mobility.

Class

Optional.

Type / Range

Digit string of length 96 with the allowed pattern of [0-9a-zA-Z.-]*

Default

"

Name

pgwFqdnListName - PGW FQDN List Name

Syntax

--pgwFqdnListName <string>

Description

Name of list of FQDNs of PGW-C for combo SMF+PGW-C. Used for SMF selection during 4G to 5G mobility.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

preferredNfTypeListName - Preferred NF Type List Name

Syntax

--preferredNfTypeListName <string>

Description

Name of the list that includes the NFs Types for which this NRF is preferred . When selecting NRF, CMM first checks if a list of preferred NF Types exists and includes the target NF. If so the corresponding NRF(s) are shortlisted first . Otherwise all NRF are considered valid candidates and selected based on priority, capacity etc.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

""

Name

priority - NF Priority

Syntax

--priority <integer>

Description

Relative Priority of the NF as defined in NFProfile level in 29.510. It is used for shortlisting candidate NFs. As per 29.510 this parameter is used to deduce the NF Service instance Priority when -and only when- the relevant information is not available on Service Instance level. However since locally provisioned Service instances always have a default priority value this parameter has no effect for shortlisting load balancing Service Requests (only relevant for Default Notifications)

Class

Optional.

Type / Range

Integer in the range of 0 to 65,535

Default

1

Name

routingIndicator - Routing Indicator

Syntax

--routingIndicator <digits>

Description

Routing Indicator, consisting of 1 to 4 decimal digits assigned by the home network operator and provisioned in the USIM, that allow together with the Home Network Identifier to route

network signalling with SUCI to AUSF and UDM instances capable to serve the subscriber. Each decimal digit present in the Routing Indicator shall be regarded as meaningful (e.g. value 012 is not the same as value 12). If a NF supports multiple Routing Indicators then they can be added in the Routing Indicator list referenced in the routingIndicatorListName parameter. If this parameter is set to one zero decimal digit (0) or four zero decimal digits (0000) then the NF supports all routing indicators.

Class

Optional.

Type / Range

Used for Routing Indicator which consists of 1 to 4 digits.

Default

0000

Name

routingIndicatorListName - Routing Indicator List Name

Syntax

```
--routingIndicatorListName <string>
```

Description

The Name of the Routing Indicator List. This list includes the Routing Indicators the NF serves. If the list is not provided or is empty and the routingIndicator is also set to digit 0 then the NF supports all routing indicators.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

snssaiListName - S-NSSAI List

Syntax

```
--snssaiListName <string>
```

Description

This list consists of the S-NSSAI the NF belongs to. Relevant only for slice specific NFs (NRF, PCF, SMF, NSSAAF). If a list is not provisioned then it is assumed that the NF supports all the S-NSSAI. When assigned to NRF this parameter is used to select Slice Specific NRF for SMF selection when NSSF is not used.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

supiRangeListName - SUPI Range list

Syntax

--supiRangeListName <string>

Description

Name of the list consisting of SUPI ranges supported by NF such as UDM, AUSF, PCF, NSSAAF and SMF (the later is Nokia Proprietary). The AMF selects NF based on the SUPI of the UE and SUPI range supported by the NF. Note that there is a difference in the logical interpretation of the absence of this list: in local UDM and AUSF selection absence of SUPI ranges list indicates that all SUPIs are supported while in SMF selection absence of SUPI ranges list indicates that this SMF does not pertain to any specific SUPI.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

v2xAllowed - V2X Allowed

Syntax

--v2xAllowed <list-item>

Description

Specifies whether the Network Function Instance supports v2x. This currently is applicable only for a PCF.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

5.134 cmm networkTrace

Network Trace. Syntax, description, parameters, and roles for cmm networkTrace command.

Syntax

Description

Specifies Network Trace (Tapping) specifications. This data is to assign local and remote addresses for the Network Trace agent.

Parameters

Name

hostName - Internal host name

Syntax

--hostName <string>

Description

Customer defined VM identifier.

Class

Required key.

Type / Range

Digit string of length 1 to 255

Name

localNtwkTracelp - Local trace IP address

Syntax

```
--localNtwkTraceIp <string>
```

Description

Local Network Trace address.

Class

Required on create, not modifiable.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

remoteNtwkTraceIp - Remote Trace IP address

Syntax

```
--remoteNtwkTraceIp <string>
```

Description

Remote Network Trace address.

Class

Required on create, not modifiable.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

destinationPort - Destination port

Syntax

```
--destinationPort <integer>
```

Description

Destination port

Class

Optional.

Type / Range

Integer in the range of 1,024 to 65,535

Default

5000

Name

endPoint - Remote endpoint

Syntax

```
--endPoint <string>
```

Description

Remote endpoint for the http connection

Class

Optional.

Type / Range

Digit string of length 0 to 255

Name

hep3MsgBundling - HEP3 Message Bundling

Syntax

--hep3MsgBundling <list-item>

Description

Choose if multiple HEP3 msgs need to be bundled into TCP/HTTP msgs

Class

Optional.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

Yes

Name

noTLS - Transport Layer Security

Syntax

--noTLS <list-item>

Description

Disables TLS

Class

Optional.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

oamTlsProfileName - OAM TLS Profile

Syntax

--oamTlsProfileName <string>

Description

This parameter contains the profile for TLS. It contains the certificate names needed for establishing secure communication.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

"

Name

sourcePort - Source port

Syntax

--sourcePort <integer>

Description

Source port

Class

Optional.

Type / Range

Integer in the range of 1,024 to 65,535

Default

5000

Roles**Create**

5.135 cmm nfIpEndPoint

NF IP Endpoint. Syntax, description, parameters, and roles for cmm nfIpEndPoint command.

Syntax

Description

This command is used to create an IP endpoint. The created IP endpoint can be provisioned to a NF instance or NF service instance other than AMF

Parameters

Name

name - Name

Syntax

--name <string>

Description

Name of the nflpEndpoint.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

ipAddress - IP Address

Syntax

--ipAddress <string>

Description

Provision IPv4 or IPv6 address.

Class

Optional.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Default

0.0.0.0

Name

port - TCP Port

Syntax

--port <integer>

Description

TCP port to be used for HTTP/TCP connection. Note: The port is not applicable if nflpEndpoint is configured to a networkFunctionInstance.

Class

Optional.

Type / Range

Integer in the range of 1 to 65,535

Default

8080

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

5.136 cmm nflpEndpointList

NF IP Endpoint List. Syntax, description, parameters, and roles for cmm nflpEndpointList command.

Syntax**Description**

Create a list for nflpEndpoints. A maximum of 256 lists can be created. Each list can consist of a maximum of 16 nflpEndpoints

Parameters**Name**

name - List Name

Syntax

--name <string>

Description

List name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

sysadmin, manage, monitor

5.137 cmm nfIpEndpoints

NF IP Endpoints. Syntax, description, parameters, and roles for `cmm nfIpEndpoints` command.

Syntax**Description**

Add or delete a nfIpEndPoint to the named list. A maximum of 4 IPv4 and/or IPv6 nfIpEndpoints can be added.

Parameters**Name**

nfIpEndPointListName - Name of the List

Syntax

--nfIpEndPointListName <string>

Description

Specify name of the NF IP endpoint list.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

nfIpEndPointName - NF IP Endpoint Name

Syntax

--nfIpEndPointName <string>

Description

NF IP Endpoint Name

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

sysadmin, manage, monitor

5.138 cmm nfServiceInstance

Network Service Instance Identifier.. Syntax, description, parameters, and roles for cmm nfServiceInstance command.

Syntax**Description**

This command is used to create a NF service instance and to modify and delete an existing NF service instance. For nfServiceInstances referring to own AMF, up to 16 service instances of the same service Type may be defined.

Parameters**Name**

name - Service Instance Identifier

Syntax

--name <string>

Description

The name of the service instance. It must be unique within CMM. Note: This is the key identifier of the Service instance used to reference the service when e.g. to adding to list. This is not the NFProfile-->nfServices [x]-->serviceInstanceId. This information, which may be used in various cases when NF is discovered via NRF (e.g. stored UeContext-->sessionContextList[x]-->smfServiceInstanceId) is currently not stored or provisioned for locally configured NF and thus the relevant use cases are not supported for locally configured NFs. This parameter is neither the nfProfile-->nfServices [x]-->serviceName Enumeration (e.g. nrrf-nfm, nausf-auth) which defines the type of the service. The Service type is deduced from the service parameter

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

service - Service Name

Syntax

--service <list-item>

Description

Name of the service offered by a NF. Note: Nudm_EventExposure and Nsmf_EventExposure may be provisioned but are currently not used by AMF. Also Namf_EventExposure, Namf_Location, Namf_MT and not relevant when provisioning remote AMF as CMM is the producer but never the consumer of these services.

Class

Required on create, not modifiable.

List

- N5g_eir_EquipmentIdentityCheck - 5GEIR Equipment Identity Check Service - The network function service type of 5GEIR Equipment Identity Check Service.
- Namf_Communication - AMF Communication Service - The network function service type of AMF Communication Service.
- Namf_EventExposure - AMF Event Exposure Service - The network function service type of AMF Event Exposure Service.
- Namf_Location - AMF Location Service - The network function service type of AMF Location Service.
- Namf_MT - AMF Mobile Terminated Service - The network function service type of AMF Mobile Terminated Service.
- Nausf_UEAuthentication - AUSF Authentication Service - The network function service type of AUSF Authentication Service.

- Nchf_ConvergedCharging service - The network function service type of Converged Charging Service.
- Nlmf_Location - LMF Location Service - The network function service type of LMF Location Service.
- Nnrf_AccessToken - NRF Access Token Request Service - The network function service type of NRF Access Token Request Service.
- Nnrf_NFDiscovery - NRF Network Function Discovery Service - The network function service type of NRF Network Function Discovery Service.
- Nnrf_NFManagement - NRF Network Function Management Service - The network function service type of NRF Network Function Management Service
- Nnssaaf_NSSAA - Nssaaf_Network Slice Specific Authentication and Authorization services - The network function service type of NSSAAF Network slice Specific Authentication and Authorization Service.
- Nnssf_NSSAIAvailability - NSSF Network Slice Availability Update Service - The network function service type of NSSF Network Slice Availability Update Service
- Nnssf_NSSelection - NSF Network Slice Selection Service - The network function service type of NSF Network Slice Selection Service.
- Nnwdaf_AnalyticsInfo - NWDAF Analytics Info Service - The Network Data Analytics Function Analytics Info Service
- Nnwdaf_EventsSubscription - NWDAF Events Subscription Service - The Network Data Analytics Function Events Subscription Service
- Npcf_AMPolicyControl - AM Policy Control service - The network function service type of AM Policy Control service.
- Npcf_UEPolicyControl - PCF UE Policy Control Service - The network function service type of PCF UE Policy Control Service.
- Nsmf_EventExposure - Nsmf Event Exposure - he network function service type of Nsmf Event Exposure Service
- Nsmf_PDUSession - SMF PDU Session Service - The network function service type of SMF PDU Session Service.
- Nsmsf_SMSservice - SMSF SM Service - The network function service type of SMSF SM Service.
- Nudm_EventExposure - UDM Event Exposure Services - The network function service type of UDM Event Exposure Services.
- Nudm_SubscriberDataManagement - UDM subscriber Data Management Service - The network function service type of UDM subscriber Data Management Service.
- Nudm_UEContextManagement - UDM UE Context Management Service - The network function service type of UDM UE Context Management Service.

- Nudsf_DataRepository - UDSF Data Repository Service - The network function service type of UDSF Data Repository Service.

Name

allowedNfDomainListName - Allowed NF Domain List Name

Syntax

--allowedNfDomainListName <string>

Description

The list with the NF domains the Service Instance is accessible to. When a list is provisioned, the AMF will add the NF domains included in the list in the the allowedNfDomains IE in the NF Service Registered to the NRF.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Default

""

Name

allowedNfTypeListName - Allowed NF Type List Name

Syntax

--allowedNfTypeListName <string>

Description

The list with the NF types the Service Instance is accessible to. When a list is provisioned, the AMF will add the NF types included in the list in the the allowedNfTypes IE in the NF Service Registered to the NRF.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Default

""

Name

allowedPlmnListName - Allowed PLMN List Name

Syntax

--allowedPlmnListName <string>

Description

The list with the PLMNs the Service Instance is accessible to. When a list is provisioned, the AMF will add the PLMNs included in the list in the the allowedPlmns IE in the NF Service Registered to the NRF.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

allowedSnssaiListName - Allowed S-NSSAI List Name

Syntax

--allowedSnssaiListName <string>

Description

The list with the S-NSSAIs the Service Instance is accessible to. When a list is provisioned, the AMF will add the S-NSSAIs included in the list in the the allowedNssais IE in the NF Service Registered to the NRF.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

apiMinorVersion - API Minor Version

Syntax

--apiMinorVersion <integer>

Description

For Service Instances belonging to remote Network functions this parameter defines the minor API version the AMF will use to encode messages as a Consumer. This parameter has no usage for Service Instances belonging to own AMF as the version for own Services is defined via sbiVersionProducerControlProfile CLI. Default value is 0

Class

Optional.

Type / Range

Integer in the range of 0 to 127

Default

0

Name

apiPatchVersion - API Patch Version

Syntax

--apiPatchVersion <integer>

Description

For Service Instances belonging to remote Network functions this parameter defines the Patch API version the AMF will use to encode messages as a Consumer. This parameter has no usage for Service Instances belonging to own AMF as the version for own Services is defined via sbiVersionProducerControlProfile CLI. Default value is 0

Class

Optional.

Type / Range

Integer in the range of 0 to 127

Default

0

Name

apiPrefix - API Prefix

Syntax

--apiPrefix <string>

Description

Optional path segment(s) used to construct the {apiRoot} variable of the different API URIs.

Class

Optional.

Type / Range

API Prefix as defined in 29.500. May be null otherwise shall have at least allowed character, shall not start with / and shall not end with /. When not-null, the leading / is implied and shall not be included.

Default

""

Name

apiVersionInUri - Service version

Syntax

--apiVersionInUri <list-item>

Description

Version of the service instance to be used in the URI for accessing the API. For Service Instances belonging to remote Network functions this parameter defines the Major API version the AMF will use to encode messages as a Consumer. For Service Instances belonging to own AMF this parameter defines the Major API version the AMF will use to encode messages as a Producer. Default value is v1

Class

Optional.

List

- v1 - Version 1
- v2 - Version 2
- v3 - Version 3
- v4 - Version 4

Default

v1

Name

capacity - Capacity

Syntax

--capacity <integer>

Description

Relative capacity of the NF as defined in NFService level in 3GPP TS 29.510. It is used for load balancing among NF Service instances with equal Priority. As per TS 29.510 this parameter supersedes the capacity given in NF level.

Class

Optional.

Type / Range

Integer in the range of 0 to 65,535

Default

65535

Name

defaultNotificationSubscriptionListName - Default Notification Subscription Name

Syntax

--defaultNotificationSubscriptionListName <string>

Description

Parameter to configure pointer to the Default Notification Subscriptions Endpoints. Refers to the 3GPP TS 29.510 NFProfile nfServices[x] defaultNotificationSubscriptions. The list can be added either in NF Instance level and/or Service instance level. For remote AMFs it must

be set in Service Instance as NF level is not supported. For GMLC only NF Instance level is relevant as GMLC has no services. If the list is given in both NF and service Instance level they are considered complementary (i.e. one does not supersede the other). Note: Though Default Notification Subscription can be placed within Service instance they do not relate to the service offered by the service instance as this is a Consumer interface while service instances represent Producer interfaces and attributes.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

fqdn - FQDN

Syntax

--fqdn <string>

Description

The NF Service Instance fqdn. When set, it supersedes the FQDN or nfEndPointListName given in NF level (networkFunctionInstance). If both the FQDN and the Endpoints are provided, the Request URI is constructed with the FQDN but the IPs/port are deduced by the Endpoint list (i.e. no DNS query issued) unless the endpoints include only Port in which case the port is deduced from the endpoint list and the IP is resolved via DNS query. Note: DNS resolution is not supported for NSSF and DNS resolution is not performed in case of Indirect communication with SCP. In that case the SCP is expected to resolve the IP of the FQDN. In case the NF Service Instance belongs to the own AMF, this FQDN is used as the fqdn of the relevant NFService of the NFProfile registered to NRF.

Class

Optional.

Type / Range

Digit string of length 96 with the allowed pattern of [0-9a-zA-Z.-]*

Name

httpScheme - HTTP Scheme

Syntax

--httpScheme <list-item>

Description

The scheme the Service instance supports (equivalent to 29.510 NFProfile-->nfServices[x]-->scheme) Note: In case of direct communication (model A), the scheme must match the scheme supported from the relevant consumer interface(s) in CMM. In case of indirect communication (model C), it must align to the setting of the relevant

sbiHttpProxySettingsProfile --targetNfScheme. Otherwise this service instance will never be considered as candidate.

Class

Optional.

List

- http - The schema of Hypertext Transfer Protocol.
- https - The schema of Hypertext Transfer Protocol Secure.

Default

https

Name

interPlmnFqdn - Inter PLMN FQDN

Syntax

--interPlmnFqdn <string>

Description

Inter PLMN FQDN to get the listening IP address of the service. This parameter does not have any use for Service instances related to remote NFs. It is only relevant for service instances belonging to CMM's AMF own Service Instances

Class

Optional.

Type / Range

Digit string of length 96 with the allowed pattern of [0-9a-zA-Z.-]*

Name

nfIpEndPointListName - NF End Point IP List Name

Syntax

--nfIpEndPointListName <string>

Description

This parameter points to list of pointers to IPv4 and/or IPv6 endpoints (i.e. IP port combination) of the NF or NF service instance. The list may contain 1 to 4 endpoints. When set, it supersedes the FQDN or nfEndPointListName given in NF level via networkFunctionInstance command. If both the FQDN and the Endpoints List is provided, the Request URI is constructed including the FQDN but the IPs and port are deduced by the Endpoint list (i.e. no DNS query issued) unless the endpoints include only Port in which case the port is deduced from the endpoint list and the IP is resolved via DNS query.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

""

Name

oauthCanary - OAuth Canary

Syntax

--oauthCanary <list-item>

Description

When this parameter is enabled and oauthRequired is also enabled the service instance will check the validity of the Access Tokens received in Requests and will produce OAuth related counters but will accept Requests that do not include Tokens or have invalid Tokens.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

oauthRequired - OAuth2.0 Required

Syntax

--oauthRequired <list-item>

Description

When this parameter is enabled oauthRequired OAuth based authorization is enforced in the Service Requests received by this service instance when general support of OAuth as a producer is also enabled in AMF.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

priority - Service Priority

Syntax

--priority <integer>

Description

Indicates priority relative to other services of the same type on a NF. Lower values indicate a higher priority. Relative Priority of the Service Instance as defined in NFService level in 3GPP TS 29.510. It is used for shortlisting NFs. As per TS 29.510 this parameter supersedes the priority given in NF level.

Class

Optional.

Type / Range

Integer in the range of 0 to 65,535

Default

1

Name

supportedFeatures - Supported Features

Syntax

--supportedFeatures <string>

Description

A string used to indicate the features supported by an API. Each API defines the bitmask supported by an API as defined in 3GPP TS 29.510 NFProfile--> nfServices[x]-->supportedFeatures

Class

Optional.

Type / Range

Digit string of length 0 to 10 with the allowed pattern of [0-9a-fA-F]*

Default

""

5.139 cmm nfServices

NF Services instances ID list. Syntax, description, parameters, and roles for **cmm nfServices** command.

Syntax**Description**

Command to add or delete a NF Services Instance ID to the specified list. This list is provisioned to a NF.

Parameters**Name**

nfServicesListName - List Name

Syntax

--nfServicesListName <string>

Description

Specifies the name of the list consisting of NF service instance IDs. The maximum number of services instances in a list is TBD. The list name has to created by using the 5GListName command.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

nfServiceInstanceName - NF Service Instance ID

Syntax

--nfServiceInstanceName <string>

Description

Assign a NF Service Instance ID

Restrictions

The list must have at least one NF service instance ID.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Roles

5.140 cmm nfServicesList

NF Services List. Syntax, description, parameters, and roles for cmm nfServicesList command.

Syntax

Description

Create, modify and delete a NF services list.

Parameters

Name

name - List Name

Syntax

--name <string>

Description

Name of the NF services list.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Roles

Create

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

5.141 cmm ngRanInfoQuery

ngRan Info Query. Syntax, description, parameters, and roles for cmm ngRanInfoQuery command.

Syntax

Description

List the info of the ngRAN(s) corresponding to the typed IP address

Parameters

Name

amfLinkAdminState - AMF Link Admin State

Syntax

--amfLinkAdminState <list-item>

Description

Link admin state locked or unlocked

Class

Read only.

List

- blocked - Blocked State - only used for SBI_Server link types
- locked - Locked State - only used for SBI_Client, N2 and N26 links types
- unlocked - Unlocked State

Name

assignMode - Assignment Mode

Syntax

--assignMode <integer>

Description

This field depicts the assignment mode for the SNPN

Class

Optional.

Type / Range

Integer in the range of 0 to 2

Default

0

Name

information - information

Syntax

--information <string>

Description

Information about outcome of command

Class

Read only.

Type / Range

Digit string of length 0 to 256 with the allowed pattern of [0-9a-zA-Z\._:_]*

Name

linkIndex - Link index

Syntax

--linkIndex <integer>

Description

Link index.

Class

Read only.

Type / Range

Integer in the range of 0 to 4,294,967,295

Name

linkOperationState - Link Operation State

Syntax

--linkOperationState <list-item>

Description

Link operation state enabled or disabled.

Class

Read only.

List

- disabled - Disabled state of the link.

- enabled - Enable state of the link.
- unknown - Unknown state of the link. this can not be used during query.

Name

ngRanId - Global RAN Node ID

Syntax

--ngRanId <integer>

Description

Specifies Global RAN Node identifier as specified in TS 38.413

Class

Optional.

Type / Range

Integer in the range of 0 to 268,435,455

Name

ngRanIpAddress - ngRanIpAddress

Syntax

--ngRanIpAddress <string>

Description

Specifies TNLA RAN IP address

Class

Optional.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

ngRanIpAddress2 - ngRanIpAddress2

Syntax

--ngRanIpAddress2 <string>

Description

ngRan IP address 2

Class

Optional.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

ngRanName - ngRan node name

Syntax

--ngRanName <string>

Description

Specifies RAN node name

Class

Optional.

Type / Range

Digit string of length 0 or 1 to 255

Name

ngRanType - NG-RAN Type

Syntax

--ngRanType <list-item>

Description

Specifies the NG-RAN type

Class

Read only.

List

- gnb - GNB
- n3iwf - N3IWF

Name

nidValue - Nid value

Syntax

--nidValue <integer>

Description

This field depicts the Nid value of the NID for the SNPN

Class

Optional.

Type / Range

Integer in the Range 0 to 1099511627775

Default

0

Name

remotePort - Remote Port

Syntax

--remotePort <integer>

Description

Remote Port associated with the remote IP address

Class

Read only.

Type / Range

Integer in the range of 0 to 65,534

Name

sliceDifferentiator - Slice Differentiator

Syntax

--sliceDifferentiator <string>

Description

The Slice Differentiator (SD) of the S-NSSAI supported in associated TAI

Class

Read only.

Type / Range

Digit string of length 1 or 6 with the allowed pattern of \-?[0-9A-F]*

Name

sliceServiceType - Slice Service Type

Syntax

--sliceServiceType <integer>

Description

The Slice Service Type (SST) of the S-NSSAI supported in associated TAI

Class

Read only.

Type / Range

5G Slice Service Type

Name

tac - Tracking area code

Syntax

--tac <integer>

Description

Tracking area code

Class

Read only.

Type / Range

Integer in the range of 1 to 16,777,215

Name

taiMcc - TAI MCC

Syntax

--taiMcc <digits>

Description

3-digit number used to represent the mobile country code for TAI

Class

Read only.

Type / Range

Digit string of length 3

Name

taiMnc - TAI MNC

Syntax

--taiMnc <digits>

Description

Digits used to represent mobile network code for TAI

Class

Read only.

Type / Range

Digit string of length 2 to 3

Roles**List**

sysadmin, manage, monitor

5.142 cmm ngRanTaiQuery

ng-eNB TAI Query. Syntax, description, parameters, and roles for cmm ngRanTaiQuery command.

Syntax**Description**

Lists TAls of ng RAN (without slice specific info per gNB/ng-eNB) 'mcc', 'mnc' and 'ngRanId' are required input filters. If any of these are not given query will return empty list.

Parameters

Name

mcc - Mobile country code

Syntax

--mcc <digits>

Description

3-digit number used to represent the mobile country code.

Class

Required key.

Type / Range

Digit string of length 3

Name

mnc - Mobile network code

Syntax

--mnc <digits>

Description

Digits used to represent mobile network code.

Class

Required key.

Type / Range

Digit string of length 2 to 3

Name

ngRanId - Global RAN Node ID

Syntax

--ngRanId <integer>

Description

Specifies Global RAN Node identifier as specified in TS 38.413

Class

Required key.

Type / Range

Integer in the range of 0 to 268,435,455

Name

assignMode - Assignment Mode

Syntax

--assignMode <integer>

Description

This field depicts the assignment mode for the SNPN

Class

Optional.

Type / Range

Integer in the range of 0 to 2

Default

0

Name

ngRanIpAddress - RAN IP address

Syntax

--ngRanIpAddress <string>

Description

Specifies RAN IP address

Class

Read only.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

ngRanName - ngRan node name

Syntax

--ngRanName <string>

Description

Specifies RAN node name

Class

Read only.

Type / Range

Digit string of length 0 or 1 to 255

Name

ngRanType - NG-RAN Type

Syntax

--ngRanType <list-item>

Description

Specifies the NG-RAN type.

Class

Optional.

List

- gnb - GNB
- n3iwf - N3IWF

Name

nidValue - Nid value

Syntax

--nidValue <integer>

Description

This field depicts the Nid value of the NID for the SNPN

Class

Optional.

Type / Range

Integer in the Range 0 to 1099511627775

Default

0

Name

tac - Tracking area code

Syntax

--tac <integer>

Description

Tracking area code.

Class

Read only.

Type / Range

Integer in the range of 1 to 16,777,215

Name

taiMcc - TAI MCC

Syntax

--taiMcc <digits>

Description

3-digit number used to represent the mobile country code for TAI.

Class

Read only.

Type / Range

Digit string of length 3

Name

taiMnc - TAI MNC

Syntax

--taiMnc <digits>

Description

Digits used to represent mobile network code for TAI.

Class

Read only.

Type / Range

Digit string of length 2 to 3

Roles**List**

sysadmin, manage, monitor

5.143 cmm ngRanTaiSnssaiQuery

ng-eNB TAI/Snssai Query. Syntax, description, parameters, and roles for cmm ngRanTaiSnssaiQuery command.

Syntax**Description**

Displays all S-NSSAIs per TAIs of a specific ng RAN gNB/ng-eNB 'mcc', 'mnc' and 'ngRanId' are required input filters. If any of these are not given query will return empty list.

Parameters**Name**

mcc - Mobile country code

Syntax

--mcc <digits>

Description

3-digit number used to represent the mobile country code.

Class

Required key.

Type / Range

Digit string of length 3

Name

mnc - Mobile network code

Syntax

--mnc <digits>

Description

Digits used to represent mobile network code.

Class

Required key.

Type / Range

Digit string of length 2 to 3

Name

ngRanId - Global RAN Node ID

Syntax

--ngRanId <integer>

Description

Specifies Global RAN Node identifier as specified in TS 38.413

Class

Required key.

Type / Range

Integer in the range of 0 to 268,435,455

Name

assignMode - Assignment Mode

Syntax

--assignMode <integer>

Description

This field depicts the assignment mode for the SNPN

Class

Optional.

Type / Range

Integer in the range of 0 to 2

Default

0

Name

ngRanIpAddress - RAN IP address

Syntax

--ngRanIpAddress <string>

Description

Specifies RAN IP address

Class

Read only.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

ngRanName - ngRan node name

Syntax

--ngRanName <string>

Description

Specifies RAN node name

Class

Read only.

Type / Range

Digit string of length 0 or 1 to 255

Name

ngRanType - NG-RAN Type

Syntax

--ngRanType <list-item>

Description

Specifies the NG-RAN type.

Class

Optional.

List

- gnb - GNB
- n3iwf - N3IWF

Name

nidValue - Nid value

Syntax

--nidValue <integer>

Description

This field depicts the Nid value of the NID for the SNPN

Class

Optional.

Type / Range

Integer in the Range 0 to 1099511627775

Default

0

Name

sliceDifferentiator - Slice Differentiator

Syntax

--sliceDifferentiator <string>

Description

The S-NSSAI consists of a Slice Service Type (SST) and a Slice Differentiator (SD). Each slice must have SST and SD is optional. A SST may have multiple SDs.

Class

Read only.

Type / Range

Identifies Slice Differentiator (SD)

Default

FFFFFF

Name

sliceServiceType - Slice Service Type

Syntax

--sliceServiceType <integer>

Description

The S-NSSAI consists of a Slice Service Type (SST) and a Slice Differentiator (SST). Each slice must have SST and SD is optional.

Class

Read only.

Type / Range

5G Slice Service Type

Name

tac - Tracking Area Code

Syntax

--tac <integer>

Description

5G TAC. 5G TAC is 3 octets long.

Class

Read only.

Type / Range

Integer in the range of 0 to 16777215

Name

taiMcc - TAI MCC

Syntax

--taiMcc <digits>

Description

3-digit number used to represent the mobile country code for TAI.

Class

Read only.

Type / Range

Digit string of length 3

Name

taiMnc - TAI MNC

Syntax

--taiMnc <digits>

Description

Digits used to represent mobile network code for TAI.

Class

Read only.

Type / Range

Digit string of length 2 to 3

Roles**List**

sysadmin, manage, monitor

5.144 cmm ngRanTnlaQuery

NG-RAN gNB TNLA Query. Syntax, description, parameters, and roles for cmm ngRanTnlaQuery command.

Syntax

Description

Lists TNLAs of an NG-RAN gNB. 'mcc', 'mnc' and 'ngRanId' are required input filters. If any of these are not given query will return empty list.

Parameters

Name

mcc - Mobile country code

Syntax

--mcc <digits>

Description

3-digit number used to represent the mobile country code.

Class

Required key.

Type / Range

Digit string of length 3

Name

mnc - Mobile network code

Syntax

--mnc <digits>

Description

Digits used to represent mobile network code.

Class

Required key.

Type / Range

Digit string of length 2 to 3

Name

ngRanId - Global RAN Node ID

Syntax

--ngRanId <integer>

Description

Specifies Global RAN Node identifier as specified in TS 38.413

Class

Required key.

Type / Range

Integer in the range of 0 to 268,435,455

Name

alarmState - Alarm State

Syntax

--alarmState <list-item>

Description

Link alarm state.

Class

Read only.

List

- critical - Critical alarm.
- major - Major alarm.
- minor - Minor alarm.
- none - No alarm.
- unknown - Unknown.

Name

amfIpAddress - TNLA AMF IP address

Syntax

--amfIpAddress <string>

Description

Specifies TNLA AMF IP address

Class

Read only.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

amfPort - TNLA AMF port number

Syntax

--amfPort <integer>

Description

Specifies the TNLA AMF port number

Class

Read only.

Type / Range

Integer in the range of 0 to 65,535

Name

assignMode - Assignment Mode

Syntax

--assignMode <integer>

Description

This field depicts the assignment mode for the SNPN

Class

Optional.

Type / Range

Integer in the range of 0 to 2

Default

0

Name

information - Information

Syntax

--information <string>

Description

Information

Class

Read only.

Type / Range

Digit string of length 0 to 256 with the allowed pattern of [0-9a-zA-Z\._:-]*

Name

linkAdminState - Link Admin State

Syntax

--linkAdminState <list-item>

Description

Link admin state.

Class

Read only.

List

- blocked - Blocked State - only used for SBI_Server link types
- locked - Locked State - only used for SBI_Client, N2 and N26 links types
- unlocked - Unlocked State

Name

linkIndex - AMF Link Index

Syntax

--linkIndex <integer>

Description

AMF link index

Class

Read only.

Type / Range

Integer in the range of 0 to 4,294,967,295

Name

linkOperationState - Link Operation State

Syntax

--linkOperationState <list-item>

Description

Link operation state.

Class

Read only.

List

- disabled - Disabled state of the link.
- enabled - Enable state of the link.
- unknown - Unknown state of the link. this can not be used during query.

Name

ngRanIpAddress - TNLA RAN IP address

Syntax

--ngRanIpAddress <string>

Description

Specifies TNLA RAN IP address

Class

Read only.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

ngRanPort - TNLA RAN port number

Syntax

--ngRanPort <integer>

Description

Specifies the TNLA RAN port number

Class

Read only.

Type / Range

Integer in the range of 0 to 65,535

Name

ngRanType - NG-RAN Type

Syntax

--ngRanType <list-item>

Description

Specifies the NG-RAN type.

Class

Read only.

List

- gnb - GNB
- n3iwf - N3IWF

Name

nidValue - Nid value

Syntax

--nidValue <integer>

Description

This field depicts the Nid value of the NID for the SNPN

Class

Optional.

Type / Range

Integer in the Range 0 to 1099511627775

Default

0

Name

poolId - Pool Id

Syntax

--poolId <integer>

Description

IPDS Pool ID - ID will only be 0 for non Multi-IPDS instantiations.

Class

Read only.

Type / Range

Integer in the range of 0 to 31

Roles**List**

sysadmin, manage, monitor

5.145 cmm ngReset

NG Reset. Syntax, description, parameters, and roles for cmm ngReset command.

Syntax**Description**

This command will send an NG Reset with 'Reset All' message to the specified gNB to reset all the NGconnections from that gNB to the AMF.

Parameters**Name**

linkIndex - Link Index

Syntax

--linkIndex <integer>

Description

This parameter is the link index of the NG link to be Reset

Class

Required.

Type / Range

Integer in the range of 0 to 4,294,967,295

Name

ranNodeName - RAN Node Name

Syntax

--ranNodeName <string>

Description

RAN Node Name received by the AMF in the NG Setup Message. Used to identify a unique gNB.

Class

Optional.

Type / Range

ASN.1 Printable String

Roles

sysadmin, manage

6 CMM CLI commands: cmm nrfCacheAdmin - cmm sbiVersionControlProfileList

CMM CLI command descriptions: syntax, usage, parameters, and user roles.

6.1 cmm nrfCacheAdmin

NRF Cache Administration. Syntax, description, parameters, and roles for `cmm nrfCacheAdmin` command.

Syntax

Description

Command to administer NRF cache. AMF stores the NF profiles obtained from the NRF cache. The command can be used to perform one of the following: - Output NRF cache. - Flush NRF cache. The flush operation will result in deleting all the NF profile in the cache and forces AMF to query NRF to get fresh NF profile data. - Delete a NF profile from the cache. This operation requires NF instance to be specified. - Delete NF profiles of all NFs of a type. This operation requires NF instance to be specified. - Display NF profile of a NF Instance. This operation requires NF instance to be specified. - Display Isolated (a.k.a. 'blacklisted') Service Instances. This operation requires both NF instance and NF Type to be specified.

Parameters

Name

instanceId - Network Function Instance Identifier

Syntax

--instanceId <string>

Description

Uniquely identifies a network function. The instance ID has to be specified for operations to display or delete NF profile of a NF instance

Class

Optional.

Type / Range

Digit string of length 36 to 36 with the allowed pattern of [0-9a-fA-F]{8}\-[0-9a-fA-F]{4}\-[0-9a-fA-F]{4}\-[0-9a-fA-F]{4}\-[0-9a-fA-F]{12}

Name

nfType - Network Function Type

Syntax

--nfType <list-item>

Description

NF Type has to be specified for Display NF Type and Delete NF Type operations.

Class

Optional.

List

- 5GEIR - 5G EIR - The network function type of 5G-Equipment Identity Register.
- AMF - Access and Mobility Manager Function - The network function type of Access and Mobility Manager Function.
- AUSF - Authentication Server Function - The network function type of Authentication Server Function.
- GMLC - Gateway Mobile Location Center - The network function type of Gateway Mobile Location Center.
- LMF - Location Management Function - The network function type of Location Management Function.
- NRF - Network Repository Function - The network function type of Network Repository Function.
- NSSAAF - Network Slice Specific Authentication and Authorization Function - The network function type of Network Slice Specific Authentication and Authorization Function.
- PCF - Policy Control Function - The network function type of Policy Control Function.
- SEPP - Security Edge Protection Proxy - The network function type of Security Edge Protection Proxy.
- SMF - Session Management Function - The network function type of Session Management Function.
- SMSF - Short Message Service Function - The network function type of Short Message Service Function.
- UDM - Unified Data Manager - The network function type of Unified Data Manager.
- UDSF - Unstructured Data Storage Function - The network function type of Unstructured Data Storage Function.

Name

nrfBlacklist - Blacklisted services

Syntax

--nrfBlacklist <string>

Description

Blacklisted services

Class

Read only.

Type / Range

Digit string of length

Name

nrfFileName - Data File Name

Syntax

--nrfFileName <string>

Description

The data file name from the operation

Class

Read only.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Roles**Modify**

sysadmin, manage

List

sysadmin, manage, monitor

6.2 cmm nrfIsolationGeneralSettings

NRF Isolation Settings. Syntax, description, parameters, and roles for cmm nrfIsolationGeneralSettings command.

Syntax**Description**

Includes general setting related to NRF Isolation.

Parameters**Name**

service - Service

Syntax

--service <list-item>

Description

NRF service for which the settings in the other parameters apply.

Class

Required key.

List

- Nnrf_NFDiscovery - NRF Network Function Discovery Service - The network function service type of NRF Network Function Discovery Service.

Default

Nnrf_NFDiscovery

Name

action3xx - Action 3XX

Syntax

--action3xx <list-item>

Description

Default action for 3xx Status class Responses

Class

Optional.

List

- Isolate - Isolate the Service Instance
- KPI_Fail - KPI Fail - Increase the Failure Counter used for the Service Instance KPI
- KPI_Success - KPI Success - Increase the Success counter used for the Service Instance KPI

Default

KPI_Fail

Name

action4xx - Action 4XX

Syntax

--action4xx <list-item>

Description

Default action for 4XX Status class Responses

Class

Optional.

List

- Isolate - Isolate the Service Instance
- KPI_Fail - KPI Fail - Increase the Failure Counter used for the Service Instance KPI
- KPI_Success - KPI Success - Increase the Success counter used for the Service Instance KPI

Default

KPI_Success

Name

action5xx - Action 5XX

Syntax

--action5xx <list-item>

Description

Default action for 5XX Status class Responses

Class

Optional.

List

- Isolate - Isolate the Service Instance
- KPI_Fail - KPI Fail - Increase the Failure Counter used for the Service Instance KPI
- KPI_Success - KPI Success - Increase the Success counter used for the Service Instance KPI

Default

KPI_Fail

Name

actionTimeout - Action Timeout

Syntax

--actionTimeout <list-item>

Description

Action for Timeouts

Class

Optional.

List

- Isolate - Isolate the Service Instance
- KPI_Fail - KPI Fail - Increase the Failure Counter used for the Service Instance KPI
- KPI_Success - KPI Success - Increase the Success counter used for the Service Instance KPI

Default

KPI_Fail

Name

enable - Enable

Syntax

```
--enable <list-item>
```

Description

Enables/disables enhanced Service Instance Isolation functionality

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

isolationDuration - Isolation Duration

Syntax

```
--isolationDuration <integer>
```

Description

Duration (in seconds) the Isolation lasts. 0 effectively means no Isolation takes place

Class

Optional.

Type / Range

Integer in the range of 0 to 3,600

Default

300

Name

kpiIsolationThreshold - KPI Isolation Threshold

Syntax

```
--kpiIsolationThreshold <integer>
```

Description

Threshold of Success/Attempts percent under which a Service Instance will be isolated. When value is set to 0 the Service Instance is not isolated based on KPIs.

Class

Optional.

Type / Range

Integer in the range of 0 to 100

Default

90

Name

kpiMinSamples - KPI Minimum Samples

Syntax

--kpiMinSamples <integer>

Description

Minimum number of Requests that are required in order to consider Isolation for a Service Instance based on KPIs

Class

Optional.

Type / Range

Integer in the range of 1 to 1,000,000

Default

100

Name

kpiSamplingPeriod - KPI Sampling Period

Syntax

--kpiSamplingPeriod <integer>

Description

Sampling Period (in seconds) for which response success and failures are aggregated to produce KPI for specific Service Instance.

Class

Optional.

Type / Range

Integer in the range of 5 to 300

Default

30

Name

totalIsolationDuration - Total Isolation Duration

Syntax

--totalIsolationDuration <integer>

Description

Duration (in seconds) the Isolation will last when all Service Instances are isolated. When set to 0 Isolation is effectively removed from all services when all relevant Services are isolated

Class

Optional.

Type / Range

Integer in the range of 0 to 3,600

Default

60

Roles**Show**

sysadmin, manage, monitor

Modify

sysadmin, manage

List

sysadmin, manage, monitor

6.3 cmm nrflsolationPerCauseCodeSettings

NRF Isolation Per Cause Code Settings . Syntax, description, parameters, and roles for cmm nrflsolationPerCauseCodeSettings command.

Syntax**Description**

Includes action for specific Cause/Status codes. Used when the action for a Causes/Status codes combination for a service needs to differentiate from the default behaviour provisioned for the relevant status class within the nrflsolationGeneralSettings CLI.

Parameters**Name**

service - Service

Syntax

--service <list-item>

Description

NRF service for which the settings in the other parameters apply.

Class

Required key.

List

- Nnrf_NFDDiscovery - NRF Network Function Discovery Service - The network function service type of NRF Network Function Discovery Service.

Default

Nnrf_NFDiscovery

Name

statusCode - Status Code

Syntax

--statusCode <list-item>

Description

The HTTP Status Code

Class

Required key.

List

- 400_Bad_Request - 400 Bad Request
- 401_Unauthorized - 401 Unauthorized
- 403_Forbidden - 403 Forbidden
- 404_Not_Found - 404 Not Found
- 405_Method_Not_Allowed - 405 Method Not Allowed
- 406_Not_Acceptable - 406 Not Acceptable
- 408_Request_Timeout - 408 Request Timeout
- 409_Conflict - 409 Conflict
- 410_Gone - 410 Gone
- 411_Length_Required - 411 Length Required
- 412_Precondition_Failed - 412 Precondition Failed
- 413_Payload_Too_Large - 413 Payload Too Large
- 414_URI_Too_Long - 414 URI Too Long
- 415_Unsupported_Media_Type - 415 Unsupported Media Type
- 429_Too_Many_Requests - 429 Too Many Requests
- 500_Internal_Server_Error - 500 Internal Server Error
- 501_Not_Implemented - 501 Not Implemented
- 502_Bad_Gateway - 502 Bad Gateway
- 503_Service_Unavailable - 503 Service Unavailable
- 504_Gateway_Timeout - 504 Gateway Timeout

Name

errorCause - Error Cause

Syntax

--errorCause <string>

Description

Application Error Cause value. Used to applies string match with the Cause in the response. 'NULL' string literal has special meaning and is used to match cases where Response did not include Application Error Cause

Class

Required key.

Type / Range

SBI Application Error Cause value. Digit string of length 1 to 64 with the allowed pattern of [A-Z_]*

Default

"NULL"

Name

action - Action

Syntax

--action <list-item>

Description

Action to be applied for specific status code and Error cause.

Class

Optional.

List

- Isolate - Isolate the Service Instance
- KPI_Fail - KPI Fail - Increase the Failure Counter used for the Service Instance KPI
- KPI_Success - KPI Success - Increase the Success counter used for the Service Instance KPI

Default

KPI_Fail

sysadmin, manage, monitor

6.4 cmm nriConfig

nriConfig. Syntax, description, parameters, and roles for **cmm nriConfig** command.

Syntax**Description**

Show network resource information (NRI) configuration

Parameters

N/A

Roles**List**

sysadmin, manage, monitor

6.5 cmm nse

Network Service Entity. Syntax, description, parameters, and roles for **cmm nse** command.

Syntax**Description**

Configure, list and show Network Service Entity.

Parameters**Name**

nseld - Network service entity identifier

Syntax

--nseId <integer>

Description

Network service entity identifier. this parameter defines the NSE. the NSEI provides the network management functionality required for the operation of the gb interface. the NSEI is used in the SGSN and in the BSS to determine the NS-VCs that provide services to the base station system GPRS protocol (BSSGP) and the virtual connection identifiers (BVCI). the value must be the same both in the BSS and in the SGSN, and it must be unique in the SGSN. the value can range from 0 to 65535.

Class

Required key.

Type / Range

Integer in the range of 0 to 65,535

Name

localUdpPort - Local udp port

Syntax

--localUdpPort <integer>

Description

Local UDP port number the parameter is obligatory in the IP configuration and unique.

Class

Required on create.

Type / Range

Integer in the range of 50,000 to 65,535

Name

nseName - NSE name

Syntax

--nseName <string>

Description

Network service entity name use this parameter to assign a name containing 1 to 10 characters to the NSE. the first character must be a letter. the name must be unique in the SGSN. by default, the NSENAME parameter does not have a name.

Class

Required on create.

Type / Range

Digit string of length 1 to 10 with the allowed pattern of [0-9a-zA-Z\._:-]*

Name

connectionType - Connection type

Syntax

--connectionType <list-item>

Description

Connection type DYN ... dynamic IP configuration STA ... static IP configuration.

Class

Not modifiable.

List

- DYN - Dynamic - Dynamic IP configuration.
- STA - Static - Static IP configuration.

Default

DYN

Name

nseIpType - NSE IP type

Syntax

--nseIpType <list-item>

Description

Allowed IP type of the configured NSE

Class

Not modifiable.

List

- IPV4 - Allowed IP type IPv4
- IPV6 - Allowed IP type IPv6

Default

IPV4

Name

papsEndPts - Paps end points

Syntax

--papsEndPts <string>

Description

This parameter is used to define to which PAPS it is needed to create the endpoint. the value can range from 0 to 20. It is possible to enter the values of PAPS by using the ',' and '-' in order to list ranges of PAPS. If this parameter hasn't taken any value, the system shares the capacity between all the active paps. the parameter is given only in the dynamic IP configuration. all the PAPS to which it is needed to create an endpoint should be given at the same time, because it is not allowed to add individual paps to the system.

Class

Optional.

Type / Range

Digit string of length 0 to 86 with the allowed pattern of `^(?=[0-9]|1[0-9])([0-9]|1[0-9])({,19}$0?,?-?1?,?-?2?,?-?3?,?-?4?,?-?5?,?-?6?,?-?7?,?-?8?,?-?9?,?-(10)?,?-(11)?,?-(12)?,?-(13)?,?-(14)?,?-(15)?,?-(16)?,?-(17)?,?-(18)?,?-(19)?$`

Default

""

Name

sfunc - Sfunc

Syntax

--sfunc <integer>

Description

NSE special functionality 0 ... general 1 ... no RESUME-NACK bit for this NSE is on --> send RESUME-ACK.

Class

Optional.

Type / Range

Integer in the range of 0 to 1

Default

0

Name

weightMode - Weight mode

Syntax

--weightMode <integer>

Description

Configuration mode 0 ... auto balance 1 ... operator configurable.

Class

Optional.

Type / Range

Integer in the range of 0 to 1

Default

0

6.6 cmm nseDynEp

NSE dynamic endpoint. Syntax, description, parameters, and roles for cmm nseDynEp command.

Syntax

Description

Configure, list and show NSE dynamic endpoint. The purpose of nseDynEp is to modify the weights(data/ signalling) of an already configured endpoint.

Parameters

Name

nseId - NSE id

Syntax

--nseId <integer>

Description

Network service virtual connection identifier.

Class

Required key.

Type / Range

Integer in the range of 0 to 163,840

Name

papsId - PAPS id

Syntax

--papsId <integer>

Description

This parameter defines the paps id for which the weights should be configured.

Class

Required key.

Type / Range

Integer in the range of 0 to 19

Name

weightData - Local data weight

Syntax

--weightData <integer>

Description

Local data weight for scheduling priority.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Name

weightSign - Local sign weight

Syntax

--weightSign <integer>

Description

Local sign weight for scheduling priority.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Roles**Show**

sysadmin, manage, monitor

Modify

sysadmin, manage

sysadmin, manage, monitor

6.7 cmm nsildList

NSI ID List. Syntax, description, parameters, and roles for cmm nsiIdList command.

Syntax

Description

Create a list for NSI ID. Only a single list can be created.

Parameters

Name

name - Name of the list

Syntax

--name <string>

Description

Provide name of the NSSI ID list.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Roles

Create

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

sysadmin, manage, monitor

6.8 cmm nsilds

NSI ID. Syntax, description, parameters, and roles for cmm nsiIds command.

Syntax

Description

Add a NSI ID to a NSI ID list specified by a list name.

Parameters

Name

nsildListName - NSI ID List Name

Syntax

--nsiIdListName <string>

Description

Name of the NSI ID list

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

nsild - NSI ID

Syntax

--nsiId <string>

Description

NSI ID

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

sysadmin, manage, monitor

6.9 cmm nssfCacheAdmin

NSSF Cache Administration. Syntax, description, parameters, and roles for cmm nssfCacheAdmin command.

Syntax

Description

Command to administer NSSF cache. The command can be used to perform one of the following: - List NSSF cache. - Modify Cache. Either NSSF or local provisioning cache may be flushed: --> NSSF: This command is used to delete the cache and query NSSF for fresh S-NSSAI per TA data for own AMF. The AMF will issue Nnssf_NSSAIAvailability Update request immediately. -->Local provisioning: This command will recreate the local provisioned cache from the provisioning database. While cache is automatically updated whenever provisioning changes, this command may be used as a heal mechanism in case data is inconsistent.

Parameters

Name

cacheSource - Cache Source

Syntax

--cacheSource <list-item>

Description

The cache source for which the operation is applicable. Required only for cache flush operations. Not relevant for listoperation.

Class

Optional.

List

- nssf - Apply cache operation on content which is formed by information received from NSSF
- prov - Local Provisioning - Apply operation on cache content which is formed by local provisioning

Name

nssfCacheOperation - NSSF Cache Operation

Syntax

--nssfCacheOperation <list-item>

Description

Select operation of be performed on the NSSF cache.

Class

Optional.

List

- flushCache - Flush NSSF Cache - Deletes NSSF cache contents for the selected source.

Default

flushCache

Name

nssfFileName - Data File Name

Syntax

--nssfFileName <string>

Description

The data file name from the operation

Class

Read only.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Roles**Modify**

sysadmin, manage

List

sysadmin, manage, monitor

6.10 cmm nsvc

network service virtual connection. Syntax, description, parameters, and roles for cmm nsvc command.

Syntax**Description**

Configure, list and show NSVC - network service virtual connection to the network service entity.

Parameters**Name**

nsvcid - NSVC id

Syntax

--nsvcId <integer>

Description

Network service virtual connection identifier.

Class

Required key.

Type / Range

Integer in the range of 0 to 65,535

Name

nseld - NSE id

Syntax

--nseId <integer>

Description

Network service entity identifier.

Class

Required on create, not modifiable.

Type / Range

Integer in the range of 0 to 65,535

Name

nsvcName - NSVC name

Syntax

--nsvcName <string>

Description

Network service virtual connection name.

Class

Required on create.

Type / Range

Digit string of length 1 to 10 with the allowed pattern of [0-9a-zA-Z\._ :]*

Name

papsId - Unit log index

Syntax

--papsId <integer>

Description

Unit log index.

Class

Required on create, not modifiable.

Type / Range

Integer in the range of 0 to 19

Name

remoteDataWeight - Remote data weight

Syntax

--remoteDataWeight <integer>

Description

Remote data weight.

Class

Required on create.

Type / Range

Integer in the range of 0 to 255

Name

remotelpEndpoint - Remote IP endpoint

Syntax

--remoteIpEndpoint <string>

Description

Remote IP endpoint.

Class

Required on create.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

remoteSignWeight - Remote sign weight

Syntax

--remoteSignWeight <integer>

Description

Remote sign weight.

Class

Required on create.

Type / Range

Integer in the range of 0 to 255

Name

remoteUdpPort - Remote udp port

Syntax

--remoteUdpPort <integer>

Description

Remote UDP port number.

Class

Required on create.

Type / Range

Integer in the range of 0 to 65,535

Name

localUdpPort - Local udp port

Syntax

--localUdpPort <integer>

Description

Local UDP port number.

Class

Read only.

Type / Range

Integer in the range of 50,000 to 65,535

Name

nsvcStatus - User status

Syntax

--nsvcStatus <list-item>

Description

Network service virtual connection state.

Class

Optional.

List

- locked - Locked.
- unlocked - Unlocked.

Default

locked

Name

remoteIpEndpointVersion - Remote IP endpoint version

Syntax

--remoteIpEndpointVersion <list-item>

Description

Remote IP endpoint version.

Class

Read only.

List

- IPV4 - Specify trace entity of IPv4.

- IPV6 - Specify trace entity of IPv6.

6.11 cmm nsvcAdmin

network service virtual connection administration. Syntax, description, parameters, and roles for cmm nsvcAdmin command.

Syntax

Description

NSVC administration Change state of NSVCs.

Parameters

Name

state - Administrative state

Syntax

--state <list-item>

Description

Network service virtual connection administrative state.

Class

Required key.

List

- locked - Locked.
- unlocked - Unlocked.

Default

locked

Name

nseld - NSE

Syntax

--nseId <integer>

Description

Network service entity identifier.

Class

Optional.

Type / Range

Integer in the range of 0 to 65,535

Default

0

Name

papsId - PAPS identifier

Syntax

--papsId <integer>

Description

PAPS which NSVCs administrative state is changed.

Restrictions

0..19

Class

Optional.

Type / Range

Integer in the range of 0 to 19

Default

0

Roles**Modify**

sysadmin, manage

6.12 cmm nsvcEndps

Control NSVC endpoints. Syntax, description, parameters, and roles for cmm nsvcEndps command.

Syntax

Description

Control all dynamic NSVC endpoints from a certain PAPS

Parameters

Name

papsId - PAPS Identifier

Syntax

--papsId <integer>

Description

It identifies the PAPS Id for which this command should run for

Class

Required on create.

Type / Range

Integer in the range of 0 to 19

Roles

Add

sysadmin, manage

Remove

sysadmin, manage

6.13 cmm ntpAuthenticate

NTP Authenticate. Syntax, description, parameters, and roles for **cmm ntpAuthenticate** command.

Syntax

Description

This command is used to configure NTP authentication

Parameters

Name

ntpServer - NTP Server

Syntax

```
--ntpServer <string>
```

Description

This parameter specifies the NTP Server that given NTP authentication mechanism (symmetric key or NTS) will be used.

Restrictions

Given address should be already configured as NTP Server.

Class

Required key.

Type / Range

Digit string of length 1 to 128 with the allowed pattern of [0-9a-zA-Z\.\-:~@]*

Name

keyFormat - key format

Syntax

```
--keyFormat <list-item>
```

Description

This parameter specifies key's format.

Class

Optional.

List

- ASCII - ASCII format
- HEX - HEX format

Default

HEX

Name

keyId - key ID

Syntax

```
--keyId <integer>
```

Description

This parameter defines the key's ID that will be used to the relevant NTP server. Key ID 0 is used when no key has been defined. If NTS is enabled (Yes), keyId has no effect.

Class

Optional.

Type / Range

Integer in the range of 0 to 65,535

Default

0

Name

keyType - key type

Syntax

--keyType <list-item>

Description

This parameter specifies key's type. The type is a name of a cryptographic hash function or cipher which is used to generate and verify the MAC.

Class

Optional.

List

- AES128 - AES128 function is used for authentication.
- AES256 - AES256 function is used for authentication.
- SHA1 - SHA1 function is used for authentication.
- SHA256 - SHA256 function is used for authentication.
- SHA384 - SHA384 function is used for authentication.
- SHA512 - SHA512 function is used for authentication.

Default

SHA1

Name

keyValue - key value

Syntax

--keyValue <string>

Description

This parameter specifies key's actual value.

Class

Optional.

Type / Range

Digit string of length 0, 20 to 1024

Default

"

Name

nts - NTS

Syntax

--nts <list-item>

Description

This parameter enables Network Time Security (NTS) authentication to the relevant NTP server. If NTS is enabled (Yes), keyId has no effect.

Class

Optional.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

oamTlsProfileName - OAM TLS Profile

Syntax

--oamTlsProfileName <string>

Description

This parameter contains the profile for TLS used if nts is yes. It contains the certificate names needed for establishing secure communication.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

"

6.14 cmm ntpUpdate

NTP Update. Syntax, description, parameters, and roles for cmm ntpUpdate command.

Syntax

Description

This command allows the update of the CMM NTP server(s). This command is only applicable to VNF and appliance. It is not allowed for CNF.

Parameters

Name

updateId - Id

Syntax

--updateId <string>

Description

Just type config here.

Class

Required key.

Type / Range

Digit string of length 6 to 6 with the allowed pattern of [0-9a-zA-Z\._ :]*

Name

ntpPrimaryIp - NTP primary IP

Syntax

--ntpPrimaryIp <string>

Description

NTP primary IP.

Class

Optional.

Type / Range

Digit string of length 0 or 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

ntpSecondaryIp - NTP secondary IP

Syntax

--ntpSecondaryIp <string>

Description

NTP secondary IP.

Class

Optional.

Type / Range

Digit string of length 0 or 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Roles**Modify**

secadmin

Show

secadmin

6.15 cmm nwdafUeMobilityProfile

NWDAF Profile. Syntax, description, parameters, and roles for cmm nwdafUeMobilityProfile command.

Syntax**Description**

Specifies the communication parameters with an NWDAF

Parameters**Name**

name - Name

Syntax

--name <string>

Description

Name of the NWDAF Profile

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

accuracy - Accuracy

Syntax

--accuracy <list-item>

Description

Requested Accuracy for NWDAF Predictions

Class

Optional.

List

- high - High Accuracy requested
- low - Low Accuracy Requested

Default

high

Name

endTs - End Time

Syntax

--endTs <string>

Description

Ending Time of the window for which predictions are requested. . The default is blank (no time specified). Valid range is 1980-01-01 00:00:00 through 2037-12-31 23:59:59 or blank. This value, if non-blank, must be greater than startTs.

Class

Optional.

Type / Range

Digit string of length 0 or 19 to 19 with the allowed pattern of (\d{4}-\d{2}-\d{2} \d{2}:\d{2}:\d{2})*\d{2})*

Default

"

Name

maxReports - Maximum Number of Reports

Syntax

--maxReports <integer>

Description

Specifies the maximum number of reports, after which the subscription ceases to exist. If blank, the subscription does not request maximum reports. See TS 29.523 Section 5.6.2.4.

Class

Optional.

Type / Range

Integer in the range of 1 to 25,000

Default

100

Name

monitoringDuration - Monitoring Duration

Syntax

--monitoringDuration <string>

Description

The time at which a subscription is requested to expire. The default is blank (no time specified). Valid range is 1980-01-01 00:00:00 through 2037-12-31 23:59:59 or blank. If blank, there is no time limit. See TS 29.523 Section 5.6.2.4.

Class

Optional.

Type / Range

Digit string of length 0 or 19 to 19 with the allowed pattern of (\d{4}-\d{2}-\d{2} \d{2}:\d{2}:\d{2})*\d{2})*

Default

"

Name

repetitionPeriod - Repetition Period

Syntax

--repetitionPeriod <integer>

Description

The requested interval between periodic reports received from the NWDAF.

Class

Optional.

Type / Range

Integer in the range of 1 to 60,000 in units of Second

Default

600

Name

serviceApi - Service API

Syntax

--serviceApi <list-item>

Description

Specifies the Service API to be used for requesting UE_MOBILITY predictive analytics.

Class

Optional.

List

- Nnwdaf_AnalyticsInfo - The Nnwdaf_AnalyticsInfo Service API.
- Nnwdaf_EventsSubscription - The Nnwdaf_EventsSubscription Service API.

Default

Nnwdaf_EventsSubscription

Name

startTs - Start Time

Syntax`--startTs <string>`**Description**

Starting Time of the window for which predictions are requested. The default is blank (no time specified). Valid range is 1980-01-01 00:00:00 through 2037-12-31 23:59:59 or blank.

Class

Optional.

Type / Range

Digit string of length 0 or 19 to 19 with the allowed pattern of `(\d{4}-\d{2}-\d{2} \d{2}:\d{2}:\d{2})*\d{2}`

Default

"

6.16 cmm oamDns

OAM DNS Configurations . Syntax, description, parameters, and roles for cmm oamDns command.

Syntax

Description

This command is used to administer OAM DNS configurations and includes parameters for defining the external DNS IP addresses. The IP addresses must be added in order and no holes can be left during deletions.

Parameters

Name

dnsProfileName - OAM DNS ID

Syntax

--dnsProfileName <string>

Description

Name of the OAM DNS configuration.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Name

priDnsIp - DNS primary ID

Syntax

--priDnsIp <string>

Description

The IP address of the primary external DNS.

Class

Required on create.

Type / Range

Digit string of length 3 to 39 with valid IPv4 or IPv6 address

Name

secDnsIp - DNS secondary ID

Syntax

--secDnsIp <string>

Description

The IP address of the secondary external DNS.

Class

Optional.

Type / Range

Digit string of length 0 or 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Default

""

6.17 cmm oamLogins

OAM Logins. Syntax, description, parameters, and roles for `cmm oamLogins` command.

Syntax**Description**

This command is used to configure the maximum logins/sessions per OAM user.

Parameters**Name**

user - User

Syntax

--user <string>

Description

OAM user name.

Class

Required key.

Type / Range

User name in Linux format. Username must start with a letter, a digit, an underscore or a full stop. The last character must be a letter, a digit, an underscore, a hyphen, a dollar sign or a full stop. The other characters must be letters, digits, underscores, hyphens or full stops. The length must be between 1 and 32 characters.

Name

dualFactorAuthentication - Flag to enable or disable Dual-Factor Authentication for user accounts

Syntax

--dualFactorAuthentication <list-item>

Description

This parameter activates the Dual-Factor Authentication for the user accounts, using PASSWORD and CRYPTOGRAPHIC KEYS simultaneously. Activation can be done after the user has ssh public keys installed. This will force the user to enter password once ssh key matches.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

maxLogins - Maximum logins

Syntax

--maxLogins <integer>

Description

Maximum logins/sessions per OAM user.

Class

Optional.

Type / Range

Integer in the range of 1 to 20

Default

20

6.18 cmm oamSession

OAM Session. Syntax, description, parameters, and roles for cmm oamSession command.

Syntax

Description

This command is used to configure the OAM users interactive session time-out period.

Parameters

Name

userGroup - User Group

Syntax

--userGroup <list-item>

Description

User Group

Class

Required key.

List

- security - security user group
- admin - admin user group
- manage - manage (/configurator) user group
- monitor - monitor user group

- ligroup - lawful interception (li) user group

Name

timeout - time out

Syntax

--timeout <integer>

Description

Inactivity OAM session time out

Class

Optional.

Type / Range

Integer in the range of 0 or 30 to 28,800 in units of Second

Default

3600

6.19 cmm oamTlsCAcert

OAM TLSCAcert. Syntax, description, parameters, and roles for cmm oamTlsCAcert command.

Syntax**Description**

This command creates the CA certificate to be loaded into openssl for OAM users. The Certificate is used to validate certificates received from other tls entities.

Parameters**Name**

name - OAM TLS Certificate Name

Syntax

--name <string>

Description

OAM TLS CA Certificate Name. This is the pem file for the CA authority.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

6.25 cmm oamTlsProfile

OAM Tls Profile. Syntax, description, parameters, and roles for cmm oamTlsProfile command.

Syntax

Description

Create, modify and delete a Transport Layer Security profile for OAM services. The CA certificate must be provisioned. Server and Client certificates may be provisioned based on the service need.

Parameters

Name

name - OAM TLS Profile Name

Syntax

--name <string>

Description

OAM TLS Profile Name

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

mutualTlsAuth - Mutual TLS Authentication

Syntax

--mutualTlsAuth <list-item>

Description

This parameter indicates if the Service should ask to Authenticate the Client through mutual Authentication. If the EndPoint associated with this Profile is a Client this parameter is ignored.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

tlsCACertificateName - TLS CA Certificate Name

Syntax

--tlsCACertificateName <string>

Description

Configure TLS CA Root certificate used in establishing secure communication.

Restrictions

This element is only applicable when interfaceName is a SBI interface.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

"

Name

tlsCAIMCertName - TLS CA IM Cert Name

Syntax

--tlsCAIMCertName <string>

Description

Configure TLS CA IM certificate used in establishing secure communication.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

"

Name

tlsClientCertName - TLS Client Certificate Name

Syntax

--tlsClientCertName <string>

Description

Configure TLS Client certificate used in establishing secure communication.

Restrictions

This element is only applicable when interfaceName is a SBI interface.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

"

Name

tlsServerCertName - TLS Server Certificate Name

Syntax

--tlsServerCertName <string>

Description

Configure TLS Server certificate used in establishing secure communication.

Restrictions

This element is only applicable when interfaceName is a SBI interface.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

"

Name

tlsVersion - TLS Version

Syntax

--tlsVersion <list-item>

Description

TLS version used to set up secure TCP connection

Class

Optional.

List

- 1.2 - Version 1.2

- 1.3 - Version 1.3
- negotiation - Negotiation of TLS 1.3 OR 1.2

OAuth 2.0 Access Token Key. Syntax, description, parameters, and roles for cmm oauthAccessTokenKey command.

Syntax

Description

OAuth 2.0 Access Token Key. Syntax, description, parameters, and roles for the cmm oauth2AccessTokenKey command.

Parameters

Name

oauthAccessTokenKeyListName - OAuth Access Token Key Name

Syntax

--oauthAccessTokenKeyListName <string>

Description

OAuth Access Token Key. Not applicable for the list operation.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

keyFile - Key File Name

Syntax

--keyFile <string>

Description

Absolute path of the key file name. Example: /tmp/accesstoken.key

Class

Required on create, not modifiable.

Type / Range

Digit string of length 1 to 100 with the allowed pattern of [0-9a-zA-Z\.\-_:&()/]*

Name

content - Key Content

Syntax

--content <string>

Description

Key content

Class

Optional.

Type / Range

Digit string of length 1 to 100 with the allowed pattern of [0-9a-zA-Z\.\-_:]*

Name

lineNumber - Content Line Number

Syntax

--lineNumber <integer>

Description

Line number of the key content

Class

Read only.

Type / Range

Integer in the range of 1 to 100

6.30 cmm oauthNrfCertificate

OAuth2.0 NRF Certificates. Syntax, description, parameters, and roles for cmm oauthNrfCertificate command.

Syntax

Description

This command manages certificates of the NRFs acting as the Authorization Server for AMF. The certificate that matches the UUID and algorithm indicated in the the OAuth2.0 Token is used for the signature validation.

Parameters

Name

name - Name

Syntax

--name <string>

Description

Name of the certificate

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

signedCertFile - Signed Certificate File Name

Syntax

--signedCertFile <string>

Description

Absolute path of the signed certificate file name. Example: /tmp/certificate/nrf1.crt

Class

Required on create, not modifiable.

Type / Range

Digit string of length 1 to 100 with the allowed pattern of [0-9a-zA-Z\._&(),/]*

Name

content - certificate content

Syntax

--content <string>

Description

certificate content

Class

Optional.

Type / Range

String of length 0 to 120

Name

kid - Key Identifier

Syntax

--kid <string>

Description

The key associated with the certificate. It is used along with the Access Token issuer and the algorithm when selecting the locally provisioned NRF Public Keys to be used for signature validation.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Default

""

Name

lineNumber - content line number

Syntax

--lineNumber <integer>

Description

line number of the certificate content

Class

Optional.

Type / Range

Integer in the range of 0 to 65,535

Roles**Create**

secadmin

Delete

List

secadmin

6.31 cmm oauthProfile

OAuth Profile. Syntax, description, parameters, and roles for cmm oauthProfile command.

Syntax**Description**

Administer oauth Profile.

Parameters

Name

name - OAuth Profile Name

Syntax

--name <string>

Description

OAuth profile name

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Name

asNrfConnectionAuditTimer - AS-NRF Connection Audit Timer

Syntax

--asNrfConnectionAuditTimer <integer>

Description

This parameter controls how often CMM periodically audits the state of the link to the AS-NRFs. If the link does not exist CMM will try to create one so as to acquire the Public Key. The audit is relevant only when CMM is provisioned to support multiple Public Keys for OAuth token validation (i.e. use of public keys of AS-NRFs which CMM is not currently registered to)

Class

Optional.

Type / Range

Integer in the range of 1 to 60 in units of Minute

Default

30

Name

consumerOAuthEnable - Consumer OAuth Enable

Syntax

--consumerOAuthEnable <list-item>

Description

Parameter controls if the AMF as a consumer uses OAuth for the authorization of the API access. When the parameter is set to 'true', the AMF consumer shall support OAuth for authorization of the API access. When the parameter is set to 'false', the AMF consumer does not support OAuth for authorization. By default, this parameter shall be set to 'true'.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

consumerTokenPrefetch - Consumer Access Token Prefetch Period

Syntax

--consumerTokenPrefetch <integer>

Description

This parameter defines the period (in seconds) within which AMF will try to prefetch a new Access Token which is about to expire. If the Token to be used has expiration within the prefetch period AMF will issue a background Request to NRF to get a new one.

Class

Optional.

Type / Range

Integer in the range of 0 to 3,600 in units of Second

Default

0

Recommended

It is recommended to set the prefetch period to 60 seconds or more.

Name

oauthAccessTokenKeyListName - OAuth Access Token Key List Name

Syntax

--oauthAccessTokenKeyListName <string>

Description

OAuth Access Token Key List Name

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

oauthVersion - OAuth Version

Syntax

--oauthVersion <list-item>

Description

Version of OAuth

Class

Optional.

List

- 2.0.0 - V2.0.0 - Version 2.0.0

Default

2.0.0

Name

producerOAuthEnable - Producer OAuth Enable

Syntax

--producerOAuthEnable <list-item>

Description

Parameter controls if the AMF as producer requires an API request to have an OAuth access token in the Authorization HTTP request header. When the parameter is set to 'true', the AMF producer requires an access token to be provided by the consumer. When the parameter is set to 'false', the AMF producer does not perform OAuth authorization upon receiving an API request. By default, this parameter shall be set to 'true'

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

producerTokenExpGracePeriod - Producer Token Expiration Grace Period

Syntax

--producerTokenExpGracePeriod <integer>

Description

This parameter defines the period (in seconds) for which OAuth Access tokens that have recently expired as still considered valid.

Class

Optional.

Type / Range

Integer in the range of 0 to 3,600 in units of Second

Default

0

Recommended

Unless there are security concerns value should be set to 60 sec or longer. This can improve robustness during NRF failures as it allows Consumer use (recently) expired tokens.

Name

requestOAuthAccessTokenOnChallenge - Request OAuth Access Token On Challenge

Syntax

--requestOAuthAccessTokenOnChallenge <list-item>

Description

Parameter shall be used to control whether the AMF service consumer (a) requests an OAuth access token only after receiving challenge from the NF service producer, or (b) requests an OAuth access token prior to accessing an NF service producer. When the parameter is set to 'true', AMF requests an OAuth access token only when it receives a challenge from an NF service producer. When the parameter is set to 'false', AMF requests an OAuth access token prior to accessing an NF service producer. By default this shall be set to 'false'.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

supportModelA - Support Model A

Syntax

--supportModelA <list-item>

Description

When this parameter is enabled AMF will use OAuth tokens in model A and model C when producer is selected from local provisioning.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

supportMultiplePlmnsConsumer - Support Multiple Serving PLMNs as a Consumer

Syntax

--supportMultiplePlmnsConsumer <list-item>

Description

This parameter enhances OAuth functionality by supporting attributes that are required when AMF is the Consumer and the AMF and/or the Peers NFs serve multiple PLMNs.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Recommended

Should be set to true when AMF or Peers serve multiple PLMNs

Name

supportMultiplePlmnsProducer - Support Multiple Serving PLMNs as a Producer

Syntax

--supportMultiplePlmnsProducer <list-item>

Description

This parameter enhances OAuth functionality by supporting attributes that are required when AMF is the Producer and the AMF and/or the Peers NFs serve multiple PLMNs.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Recommended

Should be set to true when AMF or Peers serve multiple PLMNs

Name

supportMultiplePublicKeys - Support Multiple Public Keys

Syntax

--supportMultiplePublicKeys <list-item>

Description

When this parameter is set to true, the validation of the issuer of an OAuth Token can use the Public Key of any locally Provisioned NRF. When this parameter is set to false, the validation of the issuer of an OAuth Token done only with the Public Key of the NRF the AMF is currently registered.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

supportSliceInformation - Support Slice Information

Syntax

--supportSliceInformation <list-item>

Description

Defines if AMF supports Slice Information in Access Token Claim when a access token is requested for an NF type.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

tokenRequestByNFType - Token Request By NF Type

Syntax

--tokenRequestByNfType <list-item>

Description

Parameter controls whether the AMF consumer requests access tokens for an NF type or requests access token for an NF service instance. When the parameter is set to 'true', the AMF consumer will request access token for an NF type. When the parameter is set to 'false', the AMF consumer will request access token for an NR service instance. The only value supported is 'false'.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

useLocalNrfCertificatesForValidation - Use local NRF Certificates for Validation

Syntax

--useLocalNrfCertificatesForValidation <list-item>

Description

When this parameter is enabled, and AMF receives a Request including an OAuth Token, it searches for the local NRF certificate that matches the algorithm, and Instance ID (as extracted from the JWS) and uses the relevant algorithm / public Key to validate the signature. When this parameter is disabled AMF uses the NRF Certificate(s) acquired via the TLS handshake to the NRF(s).

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Recommended

This parameter should be set to true if AMF is provisioned to supports OAuth2.0 as a Producer there is no direct TLS connection to the NRF that issues the OAuth Tokens.

6.32 cmm openCdr

Open CDR. Syntax, description, parameters, and roles for `cmm openCdr` command.

Syntax

Description

Show open CDRs.

Parameters

Name

access - Access

Syntax

--access <list-item>

Description

Radio access type of the S-CDRs to be shown.

Class

Required on create.

List

- ALL - Specify charging access of all subscribers.
- DTIHSPA - Direct tunnel I-HSPA - Specify charging access of direct tunnel I-HSPA subscribers.
- DTIU - Direct tunnel iu interface - Specify charging access of direct tunnel iu interface subscribers.

- GB - Gb interface - Specify charging access of gb interface subscribers.
- I-HSPA - I-HSPA - Specify charging access of I-HSPA subscribers.
- IU - Iu interface - Specify charging access of Iu interface subscribers.

Name

sub - Subscriber

Syntax

--sub <list-item>

Description

Roaming status of the S-CDRs to be shown.

Class

Required on create.

List

- ALL - All.
- HOME - Home.
- ROAM - Roam.

6.33 cmm oprDefQciProfile

Operator Defined QCI Profile. Syntax, description, parameters, and roles for `cmm oprDefQciProfile` command.

Syntax**Description**

This command is used to administer an Operator Defined QCI Profile and includes parameters for defining the operator defined QCI value, the mapped QCI value (from 1 - 9), and the associated paging type.

Parameters**Name**

oprDefQciProfileListName - Operator defined QCI profile name

Syntax

--oprDefQciProfileListName <string>

Description

Operator defined QCI profile name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

oprDefQci - Operator defined QCI

Syntax

--oprDefQci <integer>

Description

Operator defined QCI.

Class

Required key.

Type / Range

Integer in the range of 128 to 254

Name

mappedQci - Mapped QCI

Syntax

--mappedQci <integer>

Description

Mapped QCI value from 1 - 9 specifies QCI value.

Class

Optional.

Type / Range

Integer in the range of 1 to 9

Default

1

Name

pagingType - Paging type

Syntax

--pagingType <list-item>

Description

Paging type for the operator defined QCI value.

Class

Optional.

List

- APN1 - paging type for APN1
- APN10 - paging type for APN10
- APN2 - paging type for APN2
- APN3 - paging type for APN3
- APN4 - paging type for APN4
- APN5 - paging type for APN5
- APN6 - paging type for APN6
- APN7 - paging type for APN7
- APN8 - paging type for APN8
- APN9 - paging type for APN9
- ARP15 - Paging policy ARP15.
- Basic - Default paging policy for UE reactivation.
- Basic_QCI_1 - Optional paging policy for bearers with QCI 1.
- Basic_QCI_2 - Optional paging policy for bearers with QCI 2.
- Basic_QCI_3 - Optional paging policy for bearers with QCI 3.
- Basic_QCI_4 - Optional paging policy for bearers with QCI 4.
- Basic_QCI_5 - Optional paging policy for bearers with QCI 5.
- Basic_QCI_6 - Optional paging policy for bearers with QCI 6.
- Basic_QCI_7 - Optional paging policy for bearers with QCI 7.
- Basic_QCI_8 - Optional paging policy for bearers with QCI 8.
- Basic_QCI_9 - Optional paging policy for bearers with QCI 9.
- CoverageEnhancement - Coverage enhancement information policy.
- LPA - Low priority access UEs.
- NB_EDRX_10 - Paging type for NB-S1 UE with eDRX cycle length of 327.68 seconds.
- NB_EDRX_11 - Paging type for NB-S1 UE with eDRX cycle length of 655.36 seconds.
- NB_EDRX_12 - Paging type for NB-S1 UE with eDRX cycle length of 1310.72 seconds.
- NB_EDRX_13 - Paging type for NB-S1 UE with eDRX cycle length of 2621.44 seconds.

- NB_EDRX_14 - Paging type for NB-S1 UE with eDRX cycle length of 5242.88 seconds.
- NB_EDRX_15 - Paging type for NB-S1 UE with eDRX cycle length of 10485.76 seconds.
- NB_EDRX_2 - Paging type for NB-S1 UE with eDRX cycle length of 20.48 seconds.
- NB_EDRX_3 - Paging type for NB-S1 UE with eDRX cycle length of 40.96 seconds.
- NB_EDRX_5 - Paging type for NB-S1 UE with eDRX cycle length of 81.92 seconds.
- NB_EDRX_9 - Paging type for NB-S1 UE with eDRX cycle length of 163.84 seconds.
- PGWRestart - PGW restart paging policy for the mobile network for a paging attempt.
- PPI0 - Paging policy differentiation using paging policy indication flag.
- PPI1 - Paging policy differentiation using paging policy indication flag.
- PPI10 - Paging policy differentiation using paging policy indication flag.
- PPI11 - Paging policy differentiation using paging policy indication flag.
- PPI12 - Paging policy differentiation using paging policy indication flag.
- PPI13 - Paging policy differentiation using paging policy indication flag.
- PPI14 - Paging policy differentiation using paging policy indication flag.
- PPI15 - Paging policy differentiation using paging policy indication flag.
- PPI16 - Paging policy differentiation using paging policy indication flag.
- PPI17 - Paging policy differentiation using paging policy indication flag.
- PPI18 - Paging policy differentiation using paging policy indication flag.
- PPI19 - Paging policy differentiation using paging policy indication flag.
- PPI2 - Paging policy differentiation using paging policy indication flag.
- PPI20 - Paging policy differentiation using paging policy indication flag.
- PPI21 - Paging policy differentiation using paging policy indication flag.
- PPI22 - Paging policy differentiation using paging policy indication flag.
- PPI23 - Paging policy differentiation using paging policy indication flag.
- PPI24 - Paging policy differentiation using paging policy indication flag.
- PPI25 - Paging policy differentiation using paging policy indication flag.
- PPI26 - Paging policy differentiation using paging policy indication flag.
- PPI27 - Paging policy differentiation using paging policy indication flag.
- PPI28 - Paging policy differentiation using paging policy indication flag.
- PPI29 - Paging policy differentiation using paging policy indication flag.
- PPI3 - Paging policy differentiation using paging policy indication flag.

- PPI30 - Paging policy differentiation using paging policy indication flag.
- PPI31 - Paging policy differentiation using paging policy indication flag.
- PPI32 - Paging policy differentiation using paging policy indication flag.
- PPI33 - Paging policy differentiation using paging policy indication flag.
- PPI34 - Paging policy differentiation using paging policy indication flag.
- PPI35 - Paging policy differentiation using paging policy indication flag.
- PPI36 - Paging policy differentiation using paging policy indication flag.
- PPI37 - Paging policy differentiation using paging policy indication flag.
- PPI38 - Paging policy differentiation using paging policy indication flag.
- PPI39 - Paging policy differentiation using paging policy indication flag.
- PPI4 - Paging policy differentiation using paging policy indication flag.
- PPI40 - Paging policy differentiation using paging policy indication flag.
- PPI41 - Paging policy differentiation using paging policy indication flag.
- PPI42 - Paging policy differentiation using paging policy indication flag.
- PPI43 - Paging policy differentiation using paging policy indication flag.
- PPI44 - Paging policy differentiation using paging policy indication flag.
- PPI45 - Paging policy differentiation using paging policy indication flag.
- PPI46 - Paging policy differentiation using paging policy indication flag.
- PPI47 - Paging policy differentiation using paging policy indication flag.
- PPI48 - Paging policy differentiation using paging policy indication flag.
- PPI49 - Paging policy differentiation using paging policy indication flag.
- PPI5 - Paging policy differentiation using paging policy indication flag.
- PPI50 - Paging policy differentiation using paging policy indication flag.
- PPI51 - Paging policy differentiation using paging policy indication flag.
- PPI52 - Paging policy differentiation using paging policy indication flag.
- PPI53 - Paging policy differentiation using paging policy indication flag.
- PPI54 - Paging policy differentiation using paging policy indication flag.
- PPI55 - Paging policy differentiation using paging policy indication flag.
- PPI56 - Paging policy differentiation using paging policy indication flag.
- PPI57 - Paging policy differentiation using paging policy indication flag.
- PPI58 - Paging policy differentiation using paging policy indication flag.

- PPI59 - Paging policy differentiation using paging policy indication flag.
- PPI6 - Paging policy differentiation using paging policy indication flag.
- PPI60 - Paging policy differentiation using paging policy indication flag.
- PPI61 - Paging policy differentiation using paging policy indication flag.
- PPI62 - Paging policy differentiation using paging policy indication flag.
- PPI63 - Paging policy differentiation using paging policy indication flag.
- PPI7 - Paging policy differentiation using paging policy indication flag.
- PPI8 - Paging policy differentiation using paging policy indication flag.
- PPI9 - Paging policy differentiation using paging policy indication flag.
- Restricted - Restricted paging is triggered when OLC determines the CMM/WMM is in overload. the restricted paging type is used instead of the normal paging types during an overload condition. the restricted paging type normally has only a single page attempt.
- S102 - S102 is the paging type when in the "PS" mode and the request was received over the S102 interface.
- S102_CS - S102 is the paging type when in the "CS" mode and the request was received over the S102 interface.
- SGD_PAGING - SGD - Paging policy for SGd triggered paging requests.
- SGS_CS - Paging policy for SGs paging requests in circuit-switch mode.
- SGS_PS - Paging policy for SGs paging requests in packet-switch mode.
- SxnRestoration - SRS restoration paging.
- UELB_PAGING - Paging type for UE Load Balancing pagings.
- UeMonitLocationPaging - UE monitoring location paging - This is for Ue Monitoring feature with monitor type location. If UE is in idle and location trigger from SCEF via HSS to MME, then Page is requested
- UserDefPaging1 - Operator-defined QCI policy.
- UserDefPaging2 - Operator-defined QCI policy.
- UserDefPaging3 - Operator-defined QCI policy.
- UserDefPaging4 - Operator-defined QCI policy.
- UserDefPaging5 - Operator-defined QCI policy.
- UserDefPaging6 - Operator-defined QCI policy.
- WB_EDRX_0 - Paging type for WB-S1 UE with eDRX cycle length of 5.12 seconds
- WB_EDRX_1 - Paging type for WB-S1 UE with eDRX cycle length of 10.24 seconds.

- WB_EDRX_10 - Paging type for WB-S1 UE with eDRX cycle length of 327.68 seconds.
- WB_EDRX_11 - Paging type for WB-S1 UE with eDRX cycle length of 655.36 seconds.
- WB_EDRX_12 - Paging type for WB-S1 UE with eDRX cycle length of 1310.72 seconds.
- WB_EDRX_13 - Paging type for WB-S1 UE with eDRX cycle length of 2621.44 seconds.
- WB_EDRX_2 - Paging type for WB-S1 UE with eDRX cycle length of 20.48 seconds.
- WB_EDRX_3 - Paging type for WB-S1 UE with eDRX cycle length of 40.96 seconds.
- WB_EDRX_4 - Paging type for WB-S1 UE with eDRX cycle length of 61.44 seconds.
- WB_EDRX_5 - Paging type for WB-S1 UE with eDRX cycle length of 81.92 seconds.
- WB_EDRX_6 - Paging type for WB-S1 UE with eDRX cycle length of 102.40 seconds.
- WB_EDRX_7 - Paging type for WB-S1 UE with eDRX cycle length of 122.88 seconds.
- WB_EDRX_8 - Paging type for WB-S1 UE with eDRX cycle length of 143.36 seconds.
- WB_EDRX_9 - Paging type for WB-S1 UE with eDRX cycle length of 163.84 seconds.

6.34 cmm oprDefQciProfileList

Operator Defined QCI Profile List. Syntax, description, parameters, and roles for cmm oprDefQciProfileList command.

Syntax

Description

This command is used to administer the Operator Defined QCI Profile List.

Parameters

Name

name - Operator defined QCI profile name

Syntax

--name <string>

Description

Operator defined QCI profile name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

6.35 cmm oprDefQciToRel99QosMapping

Operator Defined QCI to Rel99 QoS Mapping. Syntax, description, parameters, and roles for cmm oprDefQciToRel99QosMapping command.

Syntax

Description

Used by the SGSN to defines the Mapping between operator Defined QCIs and Release 99 QoS parameter values. Up to 32 operator Defined QCIs may be defined

Parameters

Name

qci - QCI

Syntax

--qci <integer>

Description

Operator Defined QoS Class Identifier

Class

Required key.

Type / Range

Integer in the range of 128 to 254

Name

deliveryOfErroneousSDUs - Delivery Of Erroneous SDUs

Syntax

--deliveryOfErroneousSDUs <list-item>

Description

Indicates whether SDUs detected as erroneous shall be delivered or discarded. 'accept' implies that error detection is employed and that erroneous SDUs are delivered together with an error indication, 'discard' implies that error detection is employed and that erroneous SDUs are discarded, and 'do-not-detect' implies that SDUs are delivered without considering error detection. Values: accept, discard, do-not-detect Default: discard

Class

Optional.

List

- accept - Specifies detect and accept erroneous data packets.
- discard - Specifies detect and discard erroneous data packets.
- do-not-detect - Do not detect - Specifies do not detect erroneous data packets.

Default

discard

Name

deliveryOrder - Delivery Order

Syntax

--deliveryOrder <list-item>

Description

Definition: indicates whether the UMTS bearer shall provide in-sequence SDU delivery or not.
Default: No

Class

Optional.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

dscp - Differentiated Services Code Point

Syntax

--dscp <integer>

Description

DSCP value (in decimal) to be applied in the user plane traffic for the specific QCI. Values 0..64 Default: 0

Class

Optional.

Type / Range

Integer in the range of 0 to 63

Default

0

Name

maxSduSize - Maximum SDU Size

Syntax

--maxSduSize <integer>

Description

The maximum SDU size for which the network shall satisfy the negotiated QoS

Class

Optional.

Type / Range

Integer in the range of 0 to 1,500

Default

1500

Name

residualBitErrorRatioNonRealTime - Residual Bit Error Ratio Non Real Time

Syntax

--residualBitErrorRatioNonRealTime <list-item>

Description

Error Ratio the undetected bit error ratio in the delivered SDUs for Non Real Time traffic (i.e Interactive, Background). If no error detection is requested, Residual bit error ratio indicates the bit error ratio in the delivered SDUs Default: 1×10^{-5}

Class

Optional.

List

- 1×10^{-5} - 0.00001 - Specify residual bit error ratio 0.00001.
- 4×10^{-3} - 0.004 - Specify residual bit error ratio of 0.004.
- 6×10^{-8} - 0.00000006 - Specify residual bit error ratio of 0.00000006.

Default

1×10^{-5}

Name

residualBitErrorRatioRealTime - Residual Bit Error Real Time

Syntax

--residualBitErrorRatioRealTime <list-item>

Description

Error Ratio the undetected bit error ratio in the delivered SDUs for Real Time traffic (i.e Conversational, Streaming). If no error detection is requested, Residual bit error ratio indicates the bit error ratio in the delivered SDUs Default: 1×10^{-5}

Class

Optional.

List

- 1×10^{-2} - 0.01 - Specify residual bit error ratio of 0.01.
- 1×10^{-3} - 0.001 - Specify residual bit error ratio of 0.001.
- 1×10^{-4} - 0.0001 - Specify residual bit error ratio of 0.0001.
- 1×10^{-5} - 0.00001 - Specify residual bit error ratio of 0.00001.
- 1×10^{-6} - 0.000001 - Specify residual bit error ratio of 0.000001.
- 5×10^{-2} - 0.05 - Specify residual bit error ratio of 0.05.
- 5×10^{-3} - 0.005 - Specify residual bit error ratio of 0.005.

Default

1*10⁻⁵

Name

sduErrorRatioConversational - SDU Error Ratio Conversational

Syntax

--sduErrorRatioConversational <list-item>

Description

Ratio of SDUs lost or detected as erroneous. Relevant only for Conversational traffic.
Default: 1*10⁻³

Class

Optional.

List

- 1*10⁻² - 0.01 - Specify service data unit error ratio of 0.01.
- 1*10⁻³ - 0.001 - Specify service data unit error ratio of 0.001.
- 1*10⁻⁴ - 0.0001 - Specify service data unit error ratio of 0.0001.
- 1*10⁻⁵ - 0.00001 - Specify service data unit error ratio of 0.00001.
- 7*10⁻³ - 0.007 - Specify service data unit error ratio of 0.007.

Default

1*10⁻³

Name

sduErrorRatioNonRealTime - SDU Error Ratio Non Real Time

Syntax

--sduErrorRatioNonRealTime <list-item>

Description

Ratio of SDUs lost or detected as erroneous. SDU error ratio for non Real Time traffic is defined only for conforming traffic (i.e. Background and Interactive) . Default: 1*10⁻⁴

Class

Optional.

List

- 1*10⁻³ - 0.001 - Specify service data unit error ratio of 0.001.
- 1*10⁻⁴ - 0.0001 - Specify service data unit error ratio of 0.0001.
- 1*10⁻⁶ - 0.000001 - Specify service data unit error ratio of 0.000001.

Default

1*10⁻⁴

Name

sduErrorRatioStreaming - SDU Error Ratio Streaming

Syntax

--sduErrorRatioStreaming <list-item>

Description

Ratio of SDUs lost or detected as erroneous. Relevant only for Streaming traffic. Default: 1×10^{-4}

Class

Optional.

List

- 1×10^{-1} - 0.1 - Specify service data unit error ratio of 0.1.
- 1×10^{-2} - 0.01 - Specify service data unit error ratio of 0.01.
- 1×10^{-3} - 0.001 - Specify service data unit error ratio of 0.001.
- 1×10^{-4} - 0.0001 - Specify service data unit error ratio of 0.0001.
- 1×10^{-5} - 0.00001 - Specify service data unit error ratio of 0.00001.
- 7×10^{-3} - 0.007 - Specify service data unit error ratio of 0.007.

Default

1×10^{-4}

Name

signalingIndication - Signaling Indication

Syntax

--signalingIndication <list-item>

Description

Definition: Indicates the signalling nature of the submitted SDUs. This attribute is additional to the other QoS attributes and does not over-ride them. This attribute is only defined for the interactive traffic class. If signalling indication is set to 'Yes', the UE should set the traffic handling priority to '1'. Default: No

Class

Optional.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

sourceStatisticsDescriptorSpeech - Source Statistics Descriptor Speech

Syntax

--sourceStatisticsDescriptorSpeech <list-item>

Description

Source statistics descriptor Definition: specifies characteristics of the source of submitted SDUs. Conversational speech has a well-known statistical behaviour (or the discontinuous transmission (DTX) factor). By being informed that the SDUs for a RAB are generated by a speech source, RAN may, based on experience, calculate a statistical multiplex gain for use in admission control on the radio and RAN Access interfaces. Values: False (Unknown), True (Speech) Default: False

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

trafficClass - Traffic Class

Syntax

--trafficClass <list-item>

Description

Type of application for which the bearer service is optimised Default: Background

Class

Optional.

List

- Background - Traffic class type of background.
- Conversational - Traffic class type of conversational.
- Interactive - Traffic class type of interactive.
- Streaming - Traffic class type of streaming.

Default

Background

Name

trafficHandlingPriority - Traffic Handling Priority

Syntax

--trafficHandlingPriority <integer>

Description

Specifies the relative importance for handling of all SDUs belonging to the bearer compared to the SDUs of other bearers. Possible values are 0 (N/A,) 1,2 or 4. Default: 0 (Not Applicable)

Class

Optional.

Type / Range

Integer in the range of 0 to 3

Default

0

Name

transferDelay - Transfer Delay

Syntax

--transferDelay <integer>

Description

Indicates maximum delay in ms for 95th percentile of the distribution of delay for all delivered SDUs during the lifetime of a bearer service, where delay for an SDU is defined as the time from a request to transfer an SDU at one SAP to its delivery at the other SAP. Values: 10..4000 Default: 10

Class

Optional.

Type / Range

Integer in the range of 10 to 4,000

Default

10

6.36 cmm outputPapsStatus

outputPapsStatus. Syntax, description, parameters, and roles for cmm outputPapsStatus command.

Syntax

Description

Show maintenance status of PAPS.

Parameters

Name

active - Activation state of PAPS

Syntax

--active <list-item>

Description

Activation state of PAPS.

Class

Optional, not filterable on list.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

bfMRespCode - Response codes for blocked for maintenance feature

Syntax

--bfMRespCode <string>

Description

Response codes for PAPS maintenance block feature.

Class

Optional, not filterable on list.

Type / Range

Digit string of length 0 to 10 with the allowed pattern of [0-9a-zA-Z\.\-:]*

Name

bfMRespCodeTimestamp - Timestamp of last response for block PAPS feature

Syntax

--bfMRespCodeTimestamp <string>

Description

Timestamp of last response for block PAPU feature.

Class

Optional, not filterable on list.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

blockForMaint - Blocked for maintenance feature status

Syntax

--blockForMaint <list-item>

Description

Status code for PAPS maintenance block feature.

Class

Optional, not filterable on list.

List

- Blocked - Specify block status of blocked.
- Started - Specify block status of started.
- Unblocked - Specify block status of unblocked.

Default

Unblocked

Name

massDetach - Mass detach status

Syntax

--massDetach <list-item>

Description

Status code for mass detach feature.

Class

Optional, not filterable on list.

List

- Cancelled - Specify mass detach status of cancelled.
- Cancelling - Specify mass detach status of cancelling.
- Idle - Specify mass detach status of idle.

- Started - Specify mass detach status of started.

Default

Idle

Name

mDRespCode - Response codes for mass detach feature

Syntax

--mDRespCode <string>

Description

Response codes for mass detach feature.

Class

Optional, not filterable on list.

Type / Range

Digit string of length 0 to 10 with the allowed pattern of [0-9a-zA-Z\.\-:]*

Name

mDRespCodeTimestamp - Timestamp of last response for mass detach feature

Syntax

--mDRespCodeTimestamp <string>

Description

Timestamp of last response for mass detach feature.

Class

Optional, not filterable on list.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

offload - Status for offload feature

Syntax

--offload <list-item>

Description

Status code for offload feature.

Class

Optional, not filterable on list.

List

- AUTO completed - PAPS offload - AUTO completed.
- Cancelled - PAPS offload - cancelled.
- Cancelling - PAPS offload - cancelling.

- Idle - PAPS offload - idle.
- Phase1 - PAPS offload - phase 1.
- Phase1 completed - PAPS offload - phase 1 completed.
- Phase2 - PAPS offload - phase 2.
- Phase2 completed - PAPS offload - phase 2 completed.
- Phase3 - PAPS offload - phase 3.
- Phase3 completed - PAPS offload - phase 3 completed.
- Started - PAPS offload - started.

Default

Idle

Name

offlRespCode - Response codes for offload feature

Syntax

--offlRespCode <string>

Description

Response codes for offload feature.

Class

Optional, not filterable on list.

Type / Range

Digit string of length 0 to 10 with the allowed pattern of [0-9a-zA-Z\.\-:]*

Name

offlRespCodeTimestamp - Timestamp of last response for offload feature

Syntax

--offlRespCodeTimestamp <string>

Description

Timestamp of last response for offload feature.

Class

Optional, not filterable on list.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-:@]*

Name

id - PAPS unit index

Syntax

<list-item>

Description

This parameter defines the PAPU unit index. the value can range from 0 to 19.

Class

Required value.

List

- paps0 - Specify packet processing service unit id 0.
- paps1 - Specify packet processing service unit id 1.
- paps2 - Specify packet processing service unit id 2.
- paps3 - Specify packet processing service unit id 3.
- paps4 - Specify packet processing service unit id 4.
- paps5 - Specify packet processing service unit id 5.
- paps6 - Specify packet processing service unit id 6.
- paps7 - Specify packet processing service unit id 7.
- paps8 - Specify packet processing service unit id 8.
- paps9 - Specify packet processing service unit id 9.
- paps10 - Specify packet processing service unit id 10.
- paps11 - Specify packet processing service unit id 11.
- paps12 - Specify packet processing service unit id 12.
- paps13 - Specify packet processing service unit id 13.
- paps14 - Specify packet processing service unit id 14.
- paps15 - Specify packet processing service 15.
- paps16 - Specify packet processing service unit id 16.
- paps17 - Specify packet processing service unit id 17.
- paps18 - Specify packet processing service unit id 18.
- paps19 - Specify packet processing service unit id 19.

6.37 cmm pagingPolicy

Paging Policy. Syntax, description, parameters, and roles for cmm pagingPolicy command.

Syntax

Description

This command is used to administer a Paging Policy and includes parameters for defining the number of paging attempts, the maximum number of eNBs paged, paging method, paging type, and paging response timer. Note, for provisioned SGd paging type, if also eDRX is provisioned, the eDRX value takes priority

Parameters

Name

plmnName - Mobile network name

Syntax

--plmnName <string>

Description

Name that identifies mobile network.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

pagingType - Paging type

Syntax

--pagingType <list-item>

Description

Defines the type of paging to be done, basic, SGS_CS, or SGS_PS at least one tuple must exist for each paging type.

Class

Required key.

List

- APN1 - paging type for APN1
- APN10 - paging type for APN10
- APN2 - paging type for APN2
- APN3 - paging type for APN3

- APN4 - paging type for APN4
- APN5 - paging type for APN5
- APN6 - paging type for APN6
- APN7 - paging type for APN7
- APN8 - paging type for APN8
- APN9 - paging type for APN9
- ARP15 - Paging policy ARP15.
- Basic - Default paging policy for UE reactivation.
- Basic_QCI_1 - Optional paging policy for bearers with QCI 1.
- Basic_QCI_2 - Optional paging policy for bearers with QCI 2.
- Basic_QCI_3 - Optional paging policy for bearers with QCI 3.
- Basic_QCI_4 - Optional paging policy for bearers with QCI 4.
- Basic_QCI_5 - Optional paging policy for bearers with QCI 5.
- Basic_QCI_6 - Optional paging policy for bearers with QCI 6.
- Basic_QCI_7 - Optional paging policy for bearers with QCI 7.
- Basic_QCI_8 - Optional paging policy for bearers with QCI 8.
- Basic_QCI_9 - Optional paging policy for bearers with QCI 9.
- CoverageEnhancement - Coverage enhancement information policy.
- LPA - Low priority access UEs.
- NB_EDRX_10 - Paging type for NB-S1 UE with eDRX cycle length of 327.68 seconds.
- NB_EDRX_11 - Paging type for NB-S1 UE with eDRX cycle length of 655.36 seconds.
- NB_EDRX_12 - Paging type for NB-S1 UE with eDRX cycle length of 1310.72 seconds.
- NB_EDRX_13 - Paging type for NB-S1 UE with eDRX cycle length of 2621.44 seconds.
- NB_EDRX_14 - Paging type for NB-S1 UE with eDRX cycle length of 5242.88 seconds.
- NB_EDRX_15 - Paging type for NB-S1 UE with eDRX cycle length of 10485.76 seconds.
- NB_EDRX_2 - Paging type for NB-S1 UE with eDRX cycle length of 20.48 seconds.
- NB_EDRX_3 - Paging type for NB-S1 UE with eDRX cycle length of 40.96 seconds.
- NB_EDRX_5 - Paging type for NB-S1 UE with eDRX cycle length of 81.92 seconds.
- NB_EDRX_9 - Paging type for NB-S1 UE with eDRX cycle length of 163.84 seconds.
- PGWRestart - PGW restart paging policy for the mobile network for a paging attempt.
- PPI0 - Paging policy differentiation using paging policy indication flag.

- PPI1 - Paging policy differentiation using paging policy indication flag.
- PPI10 - Paging policy differentiation using paging policy indication flag.
- PPI11 - Paging policy differentiation using paging policy indication flag.
- PPI12 - Paging policy differentiation using paging policy indication flag.
- PPI13 - Paging policy differentiation using paging policy indication flag.
- PPI14 - Paging policy differentiation using paging policy indication flag.
- PPI15 - Paging policy differentiation using paging policy indication flag.
- PPI16 - Paging policy differentiation using paging policy indication flag.
- PPI17 - Paging policy differentiation using paging policy indication flag.
- PPI18 - Paging policy differentiation using paging policy indication flag.
- PPI19 - Paging policy differentiation using paging policy indication flag.
- PPI2 - Paging policy differentiation using paging policy indication flag.
- PPI20 - Paging policy differentiation using paging policy indication flag.
- PPI21 - Paging policy differentiation using paging policy indication flag.
- PPI22 - Paging policy differentiation using paging policy indication flag.
- PPI23 - Paging policy differentiation using paging policy indication flag.
- PPI24 - Paging policy differentiation using paging policy indication flag.
- PPI25 - Paging policy differentiation using paging policy indication flag.
- PPI26 - Paging policy differentiation using paging policy indication flag.
- PPI27 - Paging policy differentiation using paging policy indication flag.
- PPI28 - Paging policy differentiation using paging policy indication flag.
- PPI29 - Paging policy differentiation using paging policy indication flag.
- PPI3 - Paging policy differentiation using paging policy indication flag.
- PPI30 - Paging policy differentiation using paging policy indication flag.
- PPI31 - Paging policy differentiation using paging policy indication flag.
- PPI32 - Paging policy differentiation using paging policy indication flag.
- PPI33 - Paging policy differentiation using paging policy indication flag.
- PPI34 - Paging policy differentiation using paging policy indication flag.
- PPI35 - Paging policy differentiation using paging policy indication flag.
- PPI36 - Paging policy differentiation using paging policy indication flag.
- PPI37 - Paging policy differentiation using paging policy indication flag.

- PPI38 - Paging policy differentiation using paging policy indication flag.
- PPI39 - Paging policy differentiation using paging policy indication flag.
- PPI4 - Paging policy differentiation using paging policy indication flag.
- PPI40 - Paging policy differentiation using paging policy indication flag.
- PPI41 - Paging policy differentiation using paging policy indication flag.
- PPI42 - Paging policy differentiation using paging policy indication flag.
- PPI43 - Paging policy differentiation using paging policy indication flag.
- PPI44 - Paging policy differentiation using paging policy indication flag.
- PPI45 - Paging policy differentiation using paging policy indication flag.
- PPI46 - Paging policy differentiation using paging policy indication flag.
- PPI47 - Paging policy differentiation using paging policy indication flag.
- PPI48 - Paging policy differentiation using paging policy indication flag.
- PPI49 - Paging policy differentiation using paging policy indication flag.
- PPI5 - Paging policy differentiation using paging policy indication flag.
- PPI50 - Paging policy differentiation using paging policy indication flag.
- PPI51 - Paging policy differentiation using paging policy indication flag.
- PPI52 - Paging policy differentiation using paging policy indication flag.
- PPI53 - Paging policy differentiation using paging policy indication flag.
- PPI54 - Paging policy differentiation using paging policy indication flag.
- PPI55 - Paging policy differentiation using paging policy indication flag.
- PPI56 - Paging policy differentiation using paging policy indication flag.
- PPI57 - Paging policy differentiation using paging policy indication flag.
- PPI58 - Paging policy differentiation using paging policy indication flag.
- PPI59 - Paging policy differentiation using paging policy indication flag.
- PPI6 - Paging policy differentiation using paging policy indication flag.
- PPI60 - Paging policy differentiation using paging policy indication flag.
- PPI61 - Paging policy differentiation using paging policy indication flag.
- PPI62 - Paging policy differentiation using paging policy indication flag.
- PPI63 - Paging policy differentiation using paging policy indication flag.
- PPI7 - Paging policy differentiation using paging policy indication flag.
- PPI8 - Paging policy differentiation using paging policy indication flag.

- PPI9 - Paging policy differentiation using paging policy indication flag.
- Restricted - Restricted paging is triggered when OLC determines the CMM/WMM is in overload. the restricted paging type is used instead of the normal paging types during an overload condition. the restricted paging type normally has only a single page attempt.
- S102 - S102 is the paging type when in the "PS" mode and the request was received over the S102 interface.
- S102_CS - S102 is the paging type when in the "CS" mode and the request was received over the S102 interface.
- SGD_PAGING - SGD - Paging policy for SGd triggered paging requests.
- SGS_CS - Paging policy for SGs paging requests in circuit-switch mode.
- SGS_PS - Paging policy for SGs paging requests in packet-switch mode.
- SxnRestoration - SRS restoration paging.
- UELB_PAGING - Paging type for UE Load Balancing pagings.
- UeMonitLocationPaging - UE monitoring location paging - This is for Ue Monitoring feature with monitor type location. If UE is in idle and location trigger from SCEF via HSS to MME, then Page is requested
- UserDefPaging1 - Operator-defined QCI policy.
- UserDefPaging2 - Operator-defined QCI policy.
- UserDefPaging3 - Operator-defined QCI policy.
- UserDefPaging4 - Operator-defined QCI policy.
- UserDefPaging5 - Operator-defined QCI policy.
- UserDefPaging6 - Operator-defined QCI policy.
- WB_EDRX_0 - Paging type for WB-S1 UE with eDRX cycle length of 5.12 seconds
- WB_EDRX_1 - Paging type for WB-S1 UE with eDRX cycle length of 10.24 seconds.
- WB_EDRX_10 - Paging type for WB-S1 UE with eDRX cycle length of 327.68 seconds.
- WB_EDRX_11 - Paging type for WB-S1 UE with eDRX cycle length of 655.36 seconds.
- WB_EDRX_12 - Paging type for WB-S1 UE with eDRX cycle length of 1310.72 seconds.
- WB_EDRX_13 - Paging type for WB-S1 UE with eDRX cycle length of 2621.44 seconds.
- WB_EDRX_2 - Paging type for WB-S1 UE with eDRX cycle length of 20.48 seconds.
- WB_EDRX_3 - Paging type for WB-S1 UE with eDRX cycle length of 40.96 seconds.
- WB_EDRX_4 - Paging type for WB-S1 UE with eDRX cycle length of 61.44 seconds.
- WB_EDRX_5 - Paging type for WB-S1 UE with eDRX cycle length of 81.92 seconds.

- WB_EDRX_6 - Paging type for WB-S1 UE with eDRX cycle length of 102.40 seconds.
- WB_EDRX_7 - Paging type for WB-S1 UE with eDRX cycle length of 122.88 seconds.
- WB_EDRX_8 - Paging type for WB-S1 UE with eDRX cycle length of 143.36 seconds.
- WB_EDRX_9 - Paging type for WB-S1 UE with eDRX cycle length of 163.84 seconds.

Name

attempt - Attempt

Syntax

--attempt <list-item>

Description

Defines the attempt (1 of 4 possible). attempt numbers must start at 1 and be consecutive (1st attempt, 2nd attempt, and so on).

Class

Required key.

List

- Attempt1 - Attempt 1 - First attempt.
- Attempt2 - Attempt 2 - Second attempt.
- Attempt3 - Attempt 3 - Third attempt.
- Attempt4 - Attempt 4 - 4th attempt.

Name

extRangeFlag - Extended range flag

Syntax

--extRangeFlag <list-item>

Description

Extended range flag for a given paging mode.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

maxEnbsPaged - Maximum Number of eNBs Paged

Syntax

--maxEnbsPaged <integer>

Description

Defines the maximum number of eNBs that may be paged for this page attempt. This parameter is only applicable to the Last Seen eNB List paging method. The default value of 0 is used to indicate that no maximum limit of eNBs paged is specified. If the default value of 0 is used with the Last Seen eNB List paging method, MME paging will assume a default value of 3.

Class

Optional.

Type / Range

Integer in the range of 0 to 16

Default

0

Name

method - Method

Syntax

--method <list-item>

Description

Method that the designated attempt (1 - 4) should use.

Class

Optional.

List

- LastSeenENB - Last seen eNB - Last seen eNB.
- LastSeenENBList - Last seen eNB list - Last seen eNB list.
- LastSeenTAI - Last seen TAI - Last seen TAI.
- LastSeenTAINBTAI - Last seen TAINBTAI - Last seen TAINBTAI.

Default

LastSeenENB

Name

overridePagingGapTimer - Override Paging Gap Timer Value

Syntax

--overridePagingGapTimer <integer>

Description

Parameter would allow the Paging Gap feature to behave differently for different paging types. For example, one could make the Paging Gap timer longer (or shorter) when an eDRX paging type is used. The time unit is in minutes.

Class

Optional.

Type / Range

Integer in the range of 0 to 1,440

Default

0

Name

preemptionLevel - Paging Pre-Emption Level

Syntax

--preemptionLevel <integer>

Description

Defines the pre-emption level for a paging type. The pre-emption level determines whether a new DDN request will pre-empt an ongoing DDN procedure. A lower non-zero numeric value represents a higher (i.e., stronger) pre-emption level. For example, a DDN with a preemptionLevel value of 1 will pre-empt a DDN with a preemptionLevel value of 2. However, a DDN using Multimedia Priority Services (MPS) will be considered to have the highest pre-emption level. The value of '0' (default) indicates that no pre-emption level is associated with that paging type. This parameter is only relevant to pagingPolicy records for Attempt1. In addition, this parameter does not apply to the following paging types, SxnRestoration, SGS_CS, SGS_PS, S102, and S102_CS.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

0

Name

radioCapInfo - UE radio capability for paging

Syntax

--radioCapInfo <list-item>

Description

Enable/disable inclusion of radio capability for paging IE in the S1AP PAGING message.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

suppressPagingGap - Suppress Paging Gap

Syntax

--suppressPagingGap <list-item>

Description

Parameter allows the service provider to suppress the Paging Gap functionality for any MME paging type that they desire.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

t3413Timer - T3413 timer

Syntax

--t3413Timer <integer>

Description

Defines the value for the T3413 timer used for receiving responses to a paging request. when this timer expires, it triggers the MME to proceed with the next paging attempt as provisioned in the MME pagingpolicy table. this timer value should be set according to the maximum time it takes a UE to respond to a paging message under normal operating conditions. indicates the T3413 timer interval in seconds.

Class

Optional.

Type / Range

Integer in the range of 1 to 60 in units of Second

Default

6

Name

t3415Timer - T3415 timer

Syntax

--t3415Timer <integer>

Description

Defines the value for the T3415 timer used for receiving responses to a paging request. when this timer expires, it triggers the MME to proceed with the next paging attempt as provisioned in the MME pagingpolicy table. this timer value should be set according to the maximum time it takes an eDRX UE to respond to a paging message under normal operating conditions. indicates the T3415 timer interval in milliseconds. Default value is 0 for non eDRX paging types and 6000 ms for WB_EDRX_0 per f11603-06.

Class

Optional.

Type / Range

Integer in the range of 0 or 100 to 60,000 in units of Millisecond

Default

0

6.38 cmm pagingPriProfile

Paging Priority Profile. Syntax, description, parameters, and roles for cmm pagingPriProfile command.

Syntax**Description**

This command is used to administer a Paging Priority Profile and includes parameters for defining the ARP and paging priority levels.

Parameters

Name

pagingPriProfileListName - Paging priority profile name

Syntax

--pagingPriProfileListName <string>

Description

Name that identifies paging priority profile table (alternate key).

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

arpLevel - Allocation Retention Priority level

Syntax

--arpLevel <integer>

Description

Allocation Retention Priority (ARP) priority level related to paging priority profile. ARP priority level indicates the priority of allocation and retention and can take values between 1 and 15. Value 15 means 'no priority'. Values between 1 and 14 are ordered in decreasing order of priority, i.e., 1 indicates highest priority and 14 indicates lowest priority.

Class

Required key.

Type / Range

Integer in the range of 1 to 15

Name

pagingPriLevel - Paging priority level

Syntax

--pagingPriLevel <list-item>

Description

Paging priority level.

Class

Optional.

List

- PrioLevel0 - Priority level 0 - Priority level 0. No paging priority is set.
- PrioLevel1 - Priority level 1 - Priority level 1. Highest Paging priority.

- PrioLevel2 - Priority level 2 - Priority level 2.
- PrioLevel3 - Priority level 3 - Priority level 3.
- PrioLevel4 - Priority level 4 - Priority level 4.
- PrioLevel5 - Priority level 5 - Priority level 5.
- PrioLevel6 - Priority level 6 - Priority level 6.
- PrioLevel7 - Priority level 7 - Priority level 7.
- PrioLevel8 - Priority level 8 - Priority level 8. Lowest Paging Priority.

Default

PrioLevel0

6.39 cmm pagingPriProfileList

Paging Priority Profile List. Syntax, description, parameters, and roles for cmm pagingPriProfileList command.

Syntax**Description**

This command is used to administer a Paging Priority Profile List.

Parameters**Name**

name - Paging priority profile name

Syntax

--name <digits>

Description

Defines the paging priority profile name.

Class

Required key.

Type / Range

Digit string of length 1 to 1 with the allowed pattern of [1-8]*

Name

description - Description

Syntax

--description <string>

Description

Profile description.

Class

Optional.

Type / Range

Digit string of length 0 to 160 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

..

6.40 cmm passwdPolicy

Minimum password length. Syntax, description, parameters, and roles for cmm passwdPolicy command.

Syntax

Description

Change minimum password length for CMM user accounts.

Parameters

Name

passwdPolicyId - Id

Syntax

--passwdPolicyId <string>

Description

Just type 'config' here.

Class

Required key.

Type / Range

Digit string of length 6 to 6 with the allowed pattern of [0-9a-zA-Z\.\-_:]*

Name

minLen - Minimum password length

Syntax

--minLen <integer>

Description

Minimum password length for CMM user accounts.

Class

Optional.

Type / Range

Integer in the range of 10 to 127

Default

10

Roles

Show

secadmin

Modify

secadmin

List

6.41 cmm patchParameter

patchparameters. Syntax, description, parameters, and roles for cmm patchParameter command.

Syntax

Description

Configure, list and show patched parameters (former utpfil).

Parameters

Name

appld - Identifier for application process

Syntax

--appId <string>

Description

Identifier for application process.

Class

Required on create, not filterable on list.

Type / Range

Digit string of length 1 to 10 with the allowed pattern of [0-9a-zA-Z\._ :]*

Name

paramId - Identifier for parameter

Syntax

--paramId <string>

Description

Identifier for parameter.

Class

Required on create, not filterable on list.

Type / Range

Digit string of length 1 to 10 with the allowed pattern of [0-9a-zA-Z\._ :]*

Name

value - Value for parameter

Syntax

--value <string>

Description

Value for parameter.

Class

Required on create, not filterable on list.

Type / Range

Digit string of length 1 to 10 with the allowed pattern of [0-9a-zA-Z\.\-_:]*

Name

id - Identifier for instance

Syntax

<integer>

Description

Identifier for instance.

Class

Required value.

Type / Range

Integer in the range of 1 to 200

6.42 cmm pcmdConfig

PCMD Configuration. Syntax, description, parameters, and roles for cmm pcmdConfig command.

Syntax

Description

This command is used to administer the PCMD configuration and includes a parameter to enable/disable inclusion of eNB per-cell measurement reports in PCMD records.

Parameters

Name

enableBothIpv4v6TeidAddresses - Enable Both IPv4 IPv6 Teid Addresses

Syntax

--enableBothIpv4v6TeidAddresses <list-item>

Description

When both IPv4 and IPv6 Teid addresses are available and this parameter is set, then peg both addresses at pcmd record. If not set, then include only the IPv6, if available. If not available then include the IPv4 address instead.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

enableCmReport - Enable CM report

Syntax

--enableCmReport <list-item>

Description

Defines whether or not eNB per-cell measurement reports are included in the PCMD records.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

enableTeidParams - Enable TEID Parameters

Syntax

--enableTeidParams <list-item>

Description

This parameter enables TEID parameters (PdnType, Endpoint Id, TEID IP address) at MME PCMD records. If disabled then these parameters are all removed from the PCMD record to minimize the PCMD record length

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

includeRequestedApn - Include Requested APN

Syntax

--includeRequestedApn <list-item>

Description

When this parameter is enabled, the Requested APN may be pegged at the secondary record, if available. When disabled, the Requested APN is not pegged even if it is available.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

includeS1ulpAddress - Include RAN S1-u IP Address

Syntax

--includeS1uIpAddress <list-item>

Description

When enabled, MME populates RAN IPv4 or IPv6 S1-U IP address in Secondary Record (default bearer) or Tertiary Record (dedicated bearer). Note: RAN S1-U IP address could be that of eNB or gNB for 3X split bearer.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

6.43 cmm pcmdStreaming

PCMD Streaming. Syntax, description, parameters, and roles for cmm pcmdStreaming command.

Syntax**Description**

With this command, the PCMD Streaming function of CMM is configured

Parameters**Name**

streamingType - PCMD Streaming Type

Syntax

--streamingType <list-item>

Description

Configure the respective PCMD Streaming Type

Restrictions

Only one Streaming Type may be created per application. So, in maximum up to 3 records.
One for AMF, one for MME and one for SGSN

Class

Required key.

List

- AMF - Configure PCMD streaming type for AMF
- MME - Configure PCMD streaming type for MME
- SGSN - Configure PCMD streaming type for SGSN

Name

primaryPort - Primary Port

Syntax

--primaryPort <integer>

Description

Primary port address of service.

Class

Required on create.

Type / Range

Integer in the range of 1,024 to 65,535

Name

dscpCode - DSCP Code

Syntax

--dscpCode <list-item>

Description

Parameter to set DSCP code to be used for an IP packet.

Class

Optional.

List

- AF11 - Assured forwarding 11.
- AF12 - Assured forwarding 12.
- AF13 - Assured forwarding 13.
- AF21 - Assured forwarding 21.
- AF22 - Assured forwarding 22.
- AF23 - Assured forwarding 23.
- AF31 - Assured forwarding 31.
- AF32 - Assured forwarding 32.
- AF33 - Assured forwarding 33.

- AF41 - Assured forwarding 41.
- AF42 - Assured forwarding 42.
- AF43 - Assured forwarding 43.
- BE - BE.
- CS1 - Class selector 1.
- CS2 - Class selector 2.
- CS3 - Class selector 3.
- CS4 - Class selector 4.
- CS5 - Class selector 5.
- CS6 - Class selector 6.
- CS7 - Class selector 7.
- EF - Expedited forwarding.
- voiceAdmit - Voice Admit

Default

AF41

Name

oamTlsProfileName - OAM TLS Profile

Syntax

--oamTlsProfileName <string>

Description

This parameter contains the profile for TLS. It contains the certificate names needed for establishing secure communication.

Class

Optional.

Type / Range

Digit string of length 0 or 1 to 31 with the allowed pattern of [0-9a-zA-Z_\.\\-:@]*

Name

operationStateAct - Operation State Active

Syntax

--operationStateAct <list-item>

Description

Operation State of the particular streaming type

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

pcmdFqdn - PCMD FQDN

Syntax

--pcmdFqdn <string>

Description

The parameter defines the PCMD Analytics Server FQDN.

Restrictions

Either the PCMD Analytics FQDN or the Primary IP must be set

Class

Optional.

Type / Range

Digit string of length 0 to 255 with the allowed pattern of [A-Za-z0-9.-]

Default

""

Name

primaryIp - Analytics server Primary IP

Syntax

--primaryIp <string>

Description

Primary IP address of the Analytics server.

Restrictions

Either the PCMD Analytics FQDN or the Primary IP must be set

Class

Optional.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Default

0.0.0.0

Name

runOnNecc - Run On NECC

Syntax

--runOnNecc <list-item>

Description

Run On Active or Standby NECC node. This parameter is not applicable either on CNF or VNF based deployments.

Class

Optional.

List

- active - Refer to NECC active node
- default - Software decides automatically based on predefined rules
- standby - Refer to NECC standby node

Default

default

Name

secondaryIp - Analytics server Secondary IP

Syntax

--secondaryIp <string>

Description

Secondary IP address of the Analytics server.

Class

Optional.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Default

0.0.0.0

Name

secondaryPort - Secondary Port

Syntax

--secondaryPort <integer>

Description

Secondary port address of service

Class

Optional.

Type / Range

Integer in the range of 0 or 1,024 to 65,535

Default

0

Name

tcpProfileName - TCP Profile Name

Syntax`--tcpProfileName <string>`**Description**

Configure TCP profile to the endpoint.

Class

Optional.

Type / RangeDigit string of length 1 to 31 with the allowed pattern of `[0-9a-zA-Z\.\-_\:@]*`**Default**

default

6.44 cmm pcsCluster

pcs command wrapper. Syntax, description, parameters, and roles for **cmm pcsCluster** command.

Syntax**Description**

This command is used to take an action on the PCS cluster. The actions are config - show PCS cluster configuration details, status - show PCS cluster status, standby - place a cluster in standby, unstandby - restore a PCS cluster from standby.

Parameters

Name

operation - pcs operation

Syntax

--operation <list-item>

Description

Operation to perform

Class

Required key.

List

- config - PCS operation of config.
- standby - PCS operation of standby.
- status - PCS operation of status.
- unstandby - PCS operation of unstandby.

Name

data - response field

Syntax

--data <string>

Description

response field

Class

Read only.

Type / Range

Digit string of length

Name

node - Node

Syntax

--node <integer>

Description

Node.

Class

Optional.

Type / Range

Integer in the range of 0 to 2

Roles

Create

sysadmin, manage

List

sysadmin, manage, monitor

6.45 cmm perfParams

perf tool parameters . Syntax, description, parameters, and roles for cmm perfParams command.

Syntax

Description

Parameters needed for configuring perf tool for automatic perf collection and recovery actions. This command should only be used by Nokia support team.

Parameters

Name

poolType - Pool type

Syntax

--poolType <list-item>

Description

Target sgsn pool type.

Class

Required key.

List

- IPPS - IP packet processing service

Name

allowedDuration - Allowed duration

Syntax

--allowedDuration <integer>

Description

Allowed active duration in seconds of the configured overload before restarting the process.
0 should indicate that we will never restart the process.

Class

Optional.

Type / Range

Integer in the range of 0 to 600

Default

0

Name

callGraph - Call graph during perf collection

Syntax

--callGraph <list-item>

Description

If call graph will be enabled during perf log collection

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

enable - State of the mechanism

Syntax

--enable <list-item>

Description

State of the whole mechanism, if its active or not

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

logCollectionAlarmSeverity - Severity of the overload

Syntax

--logCollectionAlarmSeverity <list-item>

Description

Severity of the overload the automatic log collection / recovery actions will start.

Class

Optional.

List

- critical - Critical alarm severity
- major - Major alarm severity
- minor - Minor alarm severity

Default

critical

Name

perfDuration - Duration of perf collection

Syntax

--perfDuration <integer>

Description

Duration of perf collection in seconds

Class

Optional.

Type / Range

Integer in the range of 1 to 10

Default

5

Name

samplesToCollect - Perf samples

Syntax

--samplesToCollect <integer>

Description

Perf samples we want to collect in each occurrence

Class

Optional.

Type / Range

Integer in the range of 1 to 5

Default

1

Roles

Create

sysadmin, manage

Show

sysadmin, manage, monitor

Modify

sysadmin, manage

Delete

sysadmin, manage

List

sysadmin, manage, monitor

6.46 cmm personalize

Personalize. Syntax, description, parameters, and roles for cmm personalize command.

Syntax

Description

Personalize locale, timezone, naming and ntp parameters.

Parameters

Name

personalizeId - Id

Syntax

--personalizeId <string>

Description

Just type 'config' here.

Class

Required key.

Type / Range

Digit string of length 6 to 6 with the allowed pattern of [0-9a-zA-Z\._:\]*

Name

ntpPrimaryIp - NTP primary IP

Syntax

--ntpPrimaryIp <string>

Description

NTP primary IP.

Class

Optional.

Type / Range

Digit string of length 0 or 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

ntpSecondaryIp - NTP secondary IP

Syntax

--ntpSecondaryIp <string>

Description

NTP secondary IP.

Class

Optional.

Type / Range

Digit string of length 0 or 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

timeZoneName - Time zone

Syntax

--timeZoneName <list-item>

Description

Time zone.

Class

Optional.

List

- Africa/Abidjan - Timezone for africa/abidjan UTC offset of +00:00.
- Africa/Accra - Timezone for africa/accra UTC offset of +00:00.
- Africa/Addis_Ababa - Timezone for africa/addis_ababa UTC offset of +03:00.
- Africa/Algiers - Timezone for africa/algiers UTC offset of +01:00.
- Africa/Asmara - Timezone for africa/asmara UTC offset of +03:00.
- Africa/Asmera - Timezone for africa/asmera UTC offset of +03:00.
- Africa/Bamako - Timezone for africa/bamako UTC offset of +00:00.
- Africa/Bangui - Timezone for africa/bangui UTC offset of +01:00.
- Africa/Banjul - Timezone for africa/banjul UTC offset of +00:00.

- Africa/Bissau - Timezone for africa/bissau UTC offset of +00:00.
- Africa/Blantyre - Timezone for africa/blantyre UTC offset of +02:00.
- Africa/Brazzaville - Timezone for africa/brazzaville UTC offset of +01:00.
- Africa/Bujumbura - Timezone for africa/bujumbura UTC offset of +02:00.
- Africa/Cairo - Timezone for africa/cairo UTC offset of +02:00.
- Africa/Casablanca - Timezone for africa/casablanca UTC offset of +00:00.
- Africa/Ceuta - Timezone for africa/ceuta UTC offset of +01:00.
- Africa/Conakry - Timezone for africa/conakry UTC offset of +00:00.
- Africa/Dakar - Timezone for africa/dakar UTC offset of +00:00.
- Africa/Dar_es_Salaam - Timezone for africa/dar_es_salaam UTC offset of +03:00.
- Africa/Djibouti - Timezone for africa/djibouti UTC offset of +03:00.
- Africa/Douala - Timezone for africa/douala UTC offset of +01:00.
- Africa/El_Aaiun - Timezone for africa/el_aaiun UTC offset of +00:00.
- Africa/Freetown - Timezone for africa/freetown UTC offset of +00:00.
- Africa/Gaborone - Timezone for africa/gaborone UTC offset of +02:00.
- Africa/Harare - Timezone for africa/harare UTC offset of +02:00.
- Africa/Johannesburg - Timezone for africa/johannesburg UTC offset of +02:00.
- Africa/Juba - Timezone for africa/juba UTC offset of +03:00.
- Africa/Kampala - Timezone for africa/kampala UTC offset of +03:00.
- Africa/Khartoum - Timezone for africa/khartoum UTC offset of +03:00.
- Africa/Kigali - Timezone for africa/kigali UTC offset of +02:00.
- Africa/Kinshasa - Timezone for africa/kinshasa UTC offset of +01:00.
- Africa/Lagos - Timezone for africa/lagos UTC offset of +01:00.
- Africa/Libreville - Timezone for africa/libreville UTC offset of +01:00.
- Africa/Lome - Timezone for africa/lome UTC offset of +00:00.
- Africa/Luanda - Timezone for africa/luanda UTC offset of +01:00.
- Africa/Lubumbashi - Timezone for africa/lubumbashi UTC offset of +02:00.
- Africa/Lusaka - Timezone for africa/lusaka UTC offset of +02:00.
- Africa/Malabo - Timezone for africa/malabo UTC offset of +01:00.
- Africa/Maputo - Timezone for africa/maputo UTC offset of +02:00.
- Africa/Maseru - Timezone for africa/maseru UTC offset of +02:00.

- Africa/Mbabane - Timezone for africa/mbabane UTC offset of +02:00.
- Africa/Mogadishu - Timezone for africa/mogadishu UTC offset of +03:00.
- Africa/Monrovia - Timezone for africa/monrovia UTC offset of +00:00.
- Africa/Nairobi - Timezone for africa/nairobi UTC offset of +03:00.
- Africa/Ndjamena - Timezone for africa/ndjamena UTC offset of +01:00.
- Africa/Niamey - Timezone for africa/niamey UTC offset of +01:00.
- Africa/Nouakchott - Timezone for africa/nouakchott UTC offset of +00:00.
- Africa/Ouagadougou - Timezone for africa/ouagadougou UTC offset of +00:00.
- Africa/Porto-Novo - Timezone for africa/porto-novo UTC offset of +01:00.
- Africa/Sao_Tome - Timezone for africa/sao_tome UTC offset of +00:00.
- Africa/Timbuktu - Timezone for africa/timbuktu UTC offset of +00:00.
- Africa/Tripoli - Timezone for africa/tripoli UTC offset of +02:00.
- Africa/Tunis - Timezone for africa/tunis UTC offset of +01:00.
- Africa/Windhoek - Timezone for africa/windhoek UTC offset of +02:00.
- America/Adak - Timezone for america/adak UTC offset of -10:00.
- America/Anchorage - Timezone for america/anchorage UTC offset of -09:00.
- America/Anguilla - Timezone for america/anguilla UTC offset of -04:00.
- America/Antigua - Timezone for america/antigua UTC offset of -04:00.
- America/Araguaina - Timezone for america/araguaina UTC offset of -03:00.
- America/Argentina/Buenos_Aires - Timezone for america/argentina/buenos_aires UTC offset of -03:00.
- America/Argentina/Catamarca - Timezone for america/argentina/catamarca UTC offset of -03:00.
- America/Argentina/ComodRivadavia - Timezone for america/argentina/comodrivadavia UTC offset of -03:00.
- America/Argentina/Cordoba - Timezone for america/argentina/cordoba UTC offset of -03:00.
- America/Argentina/Jujuy - Timezone for america/argentina/jujuy UTC offset of -03:00.
- America/Argentina/La_Rioja - Timezone for america/argentina/la_rioja UTC offset of -03:00.
- America/Argentina/Mendoza - Timezone for america/argentina/mendoza UTC offset of -03:00.

- America/Argentina/Rio_Gallegos - Timezone for america/argentina/rio_gallegos UTC offset of -03:00.
- America/Argentina/Salta - Timezone for america/argentina/salta UTC offset of -03:00.
- America/Argentina/San_Juan - Timezone for america/argentina/san_juan UTC offset of -03:00.
- America/Argentina/San_Luis - Timezone for america/argentina/san_luis UTC offset of -03:00.
- America/Argentina/Tucuman - Timezone for america/argentina/tucuman UTC offset of -03:00.
- America/Argentina/Ushuaia - Timezone for america/argentina/ushuaia UTC offset of -03:00.
- America/Aruba - Timezone for america/aruba UTC offset of -04:00.

- Pacific/Truk - Timezone for pacific/truk UTC offset of +10:00.
- Pacific/Wake - Timezone for pacific/wake UTC offset of +12:00.
- Pacific/Wallis - Timezone for pacific/wallis UTC offset of +12:00.
- Pacific/Yap - Timezone for pacific/yap UTC offset of +10:00.
- Poland - Timezone for poland UTC offset of +01:00.
- Portugal - Timezone for portugal UTC offset of +00:00.
- ROC - Timezone for ROC UTC offset of +08:00.
- ROK - Timezone for ROK UTC offset of +09:00.
- Singapore - Timezone for singapore UTC offset of +08:00.
- Turkey - Timezone for turkey UTC offset of +03:00.
- UCT - Timezone for UCT UTC offset of +00:00.
- US/Pacific-New - Timezone for US/Pacific-New UTC offset of -08:00.
- Universal - Timezone for universal UTC offset of +00:00.
- W-SU - Timezone for W-SU UTC offset of +03:00.
- WET - Timezone for WET UTC offset of +00:00.
- Zulu - Timezone for zulu UTC offset of +00:00.
- jdj_tz - Timezone for jdj_tz UTC offset of +00:00.

Name

vnfcCpps - VNFC CPPSO

Syntax

--vnfcCpps <string>

Description

VNFC CPPSO.

Class

Optional.

Type / Range

Digit string of length 1 to 15 with the allowed pattern of [0-9a-zA-Z\-*]

Name

vnfcDbcs - VNFC DBS0

Syntax

--vnfcDbcs <string>

Description

VNFC DBS0.

Class

Optional.

Type / Range

Digit string of length 1 to 15 with the allowed pattern of [0-9a-zA-Z\-*]

Name

vnfcIpds - VNFC IPDS0

Syntax

--vnfcIpds <string>

Description

VNFC IPDS0.

Class

Optional.

Type / Range

Digit string of length 1 to 15 with the allowed pattern of [0-9a-zA-Z\-*]

Name

vnfcIpps - VNFC IPPS0

Syntax

--vnfcIpps <string>

Description

VNFC IPPS0.

Class

Optional.

Type / Range

Digit string of length 1 to 15 with the allowed pattern of [0-9a-zA-Z\-*]

Name

vnfcNecc - VNFC NECC0

Syntax

--vnfcNecc <string>

Description

VNFC NECC0.

Class

Optional.

Type / Range

Digit string of length 1 to 15 with the allowed pattern of [0-9a-zA-Z\-*]

Name

vnfcPaps - VNFC PAPSO

Syntax

--vnfcPaps <string>

Description

VNFC PAPSO.

Class

Optional.

Type / Range

Digit string of length 1 to 15 with the allowed pattern of [0-9a-zA-Z\-*]

Name

vnfName - VNF name

Syntax

--vnfName <string>

Description

VNF name.

Class

Optional.

Type / Range

Digit string of length 1 to 40 with the allowed pattern of [0-9a-zA-Z\-*]

Roles**Show**

sysadmin, manage, monitor

Modify

sysadmin, manage

List

6.47 cmm pgw

PGW. Syntax, description, parameters, and roles for cmm pgw command.

Syntax

Description

PGW.

Parameters

Name

ip - PGW IP address

Syntax

--ip <string>

Description

PGW IP address.

Class

Required key.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

hostName - PGW host name

Syntax

--hostName <string>

Description

PGW host name.

Class

Required on create.

Type / Range

Digit string of length 1 to 255

Name

combinedSmfPgwc - Combined SMF and PGW-c

Syntax

--combinedSmfPgwc <list-item>

Description

Identifies a combined SMF and PGW-c node

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

6.48 cmm pgwFqdnItem

PGW FQDN. Syntax, description, parameters, and roles for cmm pgwFqdnItem command.

Syntax**Description**

Define an FQDN to be added to a PGW FQDN List.

Parameters**Name**

name - PGW FQDN Name

Syntax

--name <string>

Description

PGW FQDN Name

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Name

fqdn - FQDN

Syntax

--fqdn <string>

Description

FQDN

Class

Required on create, not modifiable.

Type / Range

Digit string of length 1 to 96 with the allowed pattern of [0-9a-zA-Z.-]*

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

sysadmin, manage, monitor

6.49 cmm pgwFqdnList

PGW FQDN List. Syntax, description, parameters, and roles for cmm pgwFqdnList command.

Syntax**Description**

List of PGW FQDNs. Up to 1024 lists can be created. Each list can have up to 16 FQDNs.

Parameters**Name**

name - Name

Syntax

--name <string>

Description

PGW FQDN List Name

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

sysadmin, manage, monitor

6.50 cmm pgwFqdnListItem

PGW FQDN List Item. Syntax, description, parameters, and roles for cmm pgwFqdnListItem command.

Syntax**Description**

Link a PGW FQDN to a PGW FQDN List. An FQDN may be added only once in a list.

Parameters**Name**

pgwFqdnListName - PGW FQDN List Name

Syntax

--pgwFqdnListName <string>

Description

PGW FQDN List Name

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

pgwFqdnItemName - PGW FQDN Item Name

Syntax

--pgwFqdnItemName <string>

Description

PGW FQDN Name

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Roles**Create**

sysadmin, manage

Show

6.51 cmm pgwSelectionAllServingPlmns

PGW selection All Serving PLMNs. Syntax, description, parameters, and roles for cmm pgwSelectionAllServingPlmns command.

Syntax**Description**

MME global static PGW selection service for defined full IMSIs on all available serving PLMNs. An entry identified by an entry id includes the match criteria: -IMSI list or IMSI range (minImsi, maxImsi) -APN list - for roamers, the APN list type (LBO/HRT/both), separate list required for different roaming types. The APN list type only applies for roaming. When a UE PDN connectivity request (type 'Initial Request') matches the above criteria, the entry defines the GW pool with the static PGW(s) that shall be used for these IMSI(s)

towards the indicated APN(s) (per roaming type). Either IMSI list or IMSI range can be set for a single entry id: If IMSI list is provided, both min IMSI and max IMSI must not be set. For IMSI range, both min IMSI and max IMSI need to be provided. Min IMSI must have smaller value than max IMSI. If min IMSI and max IMSI are provided, IMSI list must not be set. If neither IMSI list nor IMSI range (min IMSI, max IMSI) is provided, the entry id is valid for all IMSIs. If no APN list is provided, the entry id applies for any APN for the indicated IMSI(s) (or all IMSIs, if neither IMSI list nor IMSI range is provided as above).

Parameters

Name

entryId - Entry identifier

Syntax

--entryId <integer>

Description

Entry identifier.

Class

Required key.

Type / Range

Integer in the range of 1 to 1000

Name

gwPoolName - GW Pool name

Syntax

--gwPoolName <string>

Description

The GW pool name.

Class

Required on create.

Type / Range

Digit string of length 1 to 20 with the allowed pattern of [0-9a-zA-Z\._:-]*

Name

apnListType - APN List Type

Syntax

--apnListType <list-item>

Description

Identifies the roaming usage type of the APN list, applied for rules defined for PGW pools.

Class

Optional.

List

- both - Local Breakout and Home Routed Traffic - APN List is used for roaming with Local Breakout and Home Routed Traffic
- hrt - Home Routed Traffic - APN List is used for roaming with Home Routed Traffic
- lbo - Local Break Out - APN List is used for roaming with Local Break Out

Default

both

Name

apnPgwSelectionListName - APN PGW selection list name

Syntax

--apnPgwSelectionListName <string>

Description

The name of APN PGW selection list indicating the APN(s).

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

"

Name

imsiListName - IMSI List Name

Syntax

--imsiListName <string>

Description

The name of the IMSI list to apply the selection.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

"

Name

maxImsi - Maximum IMSI

Syntax

--maxImsi <digits>

Description

The Maximum full IMSI value of an IMSI range.

Class

Optional.

Type / Range

Digit string of length 0 or 9 to 15

Default

"

Name

minImsi - Minimum IMSI

Syntax

--minImsi <digits>

Description

The Minimum full IMSI value of an IMSI range.

Class

Optional.

Type / Range

Digit string of length 0 or 9 to 15

Default

"

6.52 cmm pgwSelectionApn

PGW Selection Supplementary APN. Syntax, description, parameters, and roles for cmm pgwSelectionApn command.

Syntax

Description

This command is used to administer a PGW Selection Supplementary APN and includes parameters for defining the supplementary APN name, served mobile network name, and PDN type.

Parameters

Name

plmnName - Mobile network name

Syntax

--plmnName <string>

Description

Name that identifies served mobile network.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

pdnType - PDN type

Syntax

--pdnType <list-item>

Description

PDN type.

Class

Required key.

List

- ipv4 - Specify PDN type of IPv4.
- ipv4v6 - Specify PDN type of IPv4 / IPv6.
- ipv6 - Specify PDN type of IPv6.

Name

apnNi - Supplementary access point name

Syntax

--apnNi <string>

Description

Supplementary access point name.

Class

Required on create.

Type / Range

Digit string of length 1 to 62 with the allowed pattern of [0-9a-zA-Z\.\-]*

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Modify

sysadmin, manage

Delete

sysadmin, manage

List

sysadmin, manage, monitor

6.53 cmm pgwSelectionCcApn

PGW selection charging characteristics per APN. Syntax, description, parameters, and roles for cmm pgwSelectionCcApn command.

Syntax**Description**

charging characteristics per APN for selecting P gateway.

Parameters**Name**

listName - List name

Syntax

--listName <string>

Description

Name of the list of APNs and other attributes.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

apnNi - Access point name - network indicator

Syntax

--apnNi <string>

Description

APN NI to match on.

Class

Required key.

Type / Range

Digit string of length 1 to 62 with the allowed pattern of [0-9a-zA-Z\.-]*

Name

ccLength - Charging characteristics length

Syntax

--ccLength <integer>

Description

Length of CC to be used for P-GW selection.

Class

Optional.

Type / Range

Integer in the range of 0 to 16

Default

4

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Modify

sysadmin, manage

Delete

sysadmin, manage

6.54 cmm pgwSelectionRangeServices

Services based on PGW selection range. Syntax, description, parameters, and roles for cmm pgwSelectionRangeServices command.

Syntax

Description

Services based on PGW selection range.

Parameters

Name

uePlmnServicesName - Name of services based on UE network and served network

Syntax

--uePlmnServicesName <string>

Description

Name that identifies roaming agreement.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

entryId - Entry ID

Syntax

--entryId <integer>

Description

Entry ID.

Class

Required key.

Type / Range

Integer in the range of 1 to 10,000

Name

apnPgwSelectionListName - Name of APN PGW selection list

Syntax

--apnPgwSelectionListName <string>

Description

Name of APN PGW selection list.

Class

Required on create.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

gwPoolName - PGW pool name

Syntax

--gwPoolName <string>

Description

Gateway pool name this gateway is assigned to.

Class

Required on create.

Type / Range

Digit string of length 1 to 20 with the allowed pattern of [0-9a-zA-Z\.\-_:]*

Name

maxMsin - Maximum MSIN

Syntax

--maxMsin <digits>

Description

The maximum IMSI MSIN value.

Restrictions

The length 2-15 is only allowed for an MSISDN type. For an IMSI the allowed length is 8-10.

Class

Required on create.

Type / Range

Digit string of length 0 or 2 to 15

Name

minMsin - Minimum MSIN

Syntax

--minMsin <digits>

Description

The minimum IMSI MSIN value.

Restrictions

The length 2-15 is only allowed for an MSISDN type. For an IMSI the allowed length is 8-10.

Class

Required on create.

Type / Range

Digit string of length 0 or 2 to 15

Name

rangeServiceType - Range service type

Syntax

--rangeServiceType <list-item>

Description

Range service type.

Class

Required on create, not modifiable.

List

- imsi - Specify range service type of IMSI.
- msisdn - Specify range service type of MSISDN.

Name

apnListType - APN List Type

Syntax

--apnListType <list-item>

Description

Identifies the roaming usage type of the APN list.

Class

Optional.

List

- both - Local Breakout and Home Routed Traffic - APN List is used for roaming with Local Breakout and Home Routed Traffic
- hrt - Home Routed Traffic - APN List is used for roaming with Home Routed Traffic
- lbo - Local Break Out - APN List is used for roaming with Local Break Out

Default

both

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Modify

sysadmin, manage

Delete

sysadmin, manage

sysadmin, manage, monitor

6.55 cmm pgwSelectionService

Service based on PGW selection. Syntax, description, parameters, and roles for cmm pgwSelectionService command.

Syntax**Description**

Service based on PGW selection.

Parameters**Name**

apnPgwSelectionListName - Name of APN PGW selection list

Syntax

--apnPgwSelectionListName <string>

Description

Name of APN PGW selection list.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

gwPoolName - PGW pool name

Syntax

--gwPoolName <string>

Description

Gateway pool name this gateway is assigned to.

Class

Required key.

Type / Range

Digit string of length 1 to 20 with the allowed pattern of [0-9a-zA-Z\._ :]*

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

sysadmin, manage, monitor

6.56 cmm plmn

Public Land Mobile Networks. Syntax, description, parameters, and roles for cmm plmn command.

Syntax**Description**

This command is used to administer a Public Land Mobile Network and includes parameters for defining the network's MCC and MNC, PLMN type, roaming agreements, ARP level, QCI value, and APN-NI.

Parameters**Name**

name - Mobile network name

Syntax

--name <string>

Description

Name that identifies mobile network (alternate key).

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

mcc - Mobile country code

Syntax

--mcc <digits>

Description

3-digit number used to represent the mobile country code.

Class

Required on create, not modifiable.

Type / Range

Digit string of length 3

Name

mnc - Mobile network code

Syntax

--mnc <digits>

Description

Digits used to represent mobile network code.

Class

Required on create, not modifiable.

Type / Range

Digit string of length 2 to 3

Name

allowUnknEquipEirRsp - Allow Unknown Equipment Eir Rsp

Syntax

--allowUnknEquipEirRsp <list-item>

Description

Allow EIR Check supports a provisioning option per PLMN to allow UEs with a EIR check result of 'Equipment Unknown' to attach successfully.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

apnAdminListName - APN Administration List Name

Syntax

--apnAdminListName <string>

Description

The list for the APN administration actions.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

apnQciPpiMapListName - APN QCI PPI mapping list name

Syntax

--apnQciPpiMapListName <string>

Description

Assign an APN to QCI to PPI map previously created to home network.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

"

Name

arp - Allocation retention priority

Syntax

--arp <integer>

Description

Allocation retention priority, priority-level.

Restrictions

This element is not applicable when plmnType is Other Network.

Class

Optional.

Type / Range

Integer in the range of 1 to 15

Default

1

Name

arpHiPriorityLevel - ARP high priority level

Syntax`--arpHiPriorityLevel <integer>`**Description**

Indicate the largest ARP value that can be assigned to a high priority access user.

Restrictions

This element is not applicable when plmnType is Other Network.

Class

Optional.

Type / Range

Integer in the range of 0 to 15

Default

0

Name

arpPciDisabled - ARP PCI always disabled

Syntax`--arpPciDisabled <list-item>`**Description**

ARP PCI always disabled.

Restrictions

This element is not applicable when plmnType is Other Network.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

camelAllowed - Camel subscriber roaming

Syntax`--camelAllowed <list-item>`

Description

Indicates whether roaming of camel subscribers is allowed or not.

Restrictions

This element is not applicable when plmnType is Other Network.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

checkImsApnSubscription - Check IMS APN subscription

Syntax

--checkImsApnSubscription <list-item>

Description

Check IMS APN subscription in determining network IMS voice over PS support.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

checkStnSrAvpAvailability - Check availability of STN-SR

Syntax

--checkStnSrAvpAvailability <list-item>

Description

Check STN-SR AVP availability in determining network IMS voice over PS support.

Class

Optional.

List

- false - Boolean value of false.

- true - Boolean value of true.

Default

false

Name

decorAllowed - Decor Allowed

Syntax

--decorAllowed <list-item>

Description

Specifies whether Decor is allowed to be used in this serving PLMN.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

defaultDcnId - Default Dedicated Core Network ID

Syntax

--defaultDcnId <integer>

Description

This parameter indicates the DCN ID for the default dedicated core. Operators must choose the same default DCN ID for the MME group designated as default MME group. The MME supporting the will ignore the UE Usage Types assigned to the DCN ID as default DCN supports all UE Usage Types and UE with no UE Usage Type parameter.

Class

Optional.

Type / Range

Integer in the range of 1 to 126 or 128 to 65,535

Default

65535

Name

defaultDcnIdRoamer - Default Dedicated Core Network ID for Roamer

Syntax

--defaultDcnIdRoamer <integer>

Description

This parameter indicates the DCN ID for the default dedicated core for an inbound roamer to the PLMN. Operators must choose the same default DCN ID for the MME group designated as default MME group. The MME supporting the will ignore the UE Usage Types assigned to the DCN ID as default DCN supports all UE Usage Types and UE with no UE Usage Type parameter.

Class

Optional.

Type / Range

Integer in the range of 1 to 126 or 128 to 65,535

Default

65535

Name

defaultMappingPlmnName - Default Mapping PLMN Name

Syntax

--defaultMappingPlmnName <string>

Description

Default PLMN ID for LAI for TAI-to-LAI Mapping

Restrictions

Can be set only in home PLMN

Class

Optional.

Type / Range

Digit string of length 0 or 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

"

Name

defaultRacFor5gSrvccMme - Default RAC for 5G-SRVCC on MME_SRVCC

Syntax

--defaultRacFor5gSrvccMme <integer>

Description

Defines the value for the default RAC used by the MME_SRVCC during 5G-SRVCC for MSC server discovery. The MME_SRVCC ignores the AMF N26 provided RAC to always discover the MSC server with same (internally provisioned) RAC to interwork with any AMF.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

255

Name

description - Mobile PLMN description

Syntax

--description <string>

Description

Mobile PLMN description.

Class

Optional.

Type / Range

Digit string of length 0 to 160 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Name

directTunnelOn - Direct tunnel enabled

Syntax

--directTunnelOn <list-item>

Description

Indicates whether direct tunnel is enabled or not.

Restrictions

This element is not applicable when plmnType is Other Network.

Class

Optional.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

emergencyProfileName - Emergency profile name

Syntax

--emergencyProfileName <string>

Description

Emergency profile name.

Restrictions

This element is not applicable when plmnType is Other Network.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

"

Name

grAvRequested - Gr authentication vectors requested

Syntax

--grAvRequested <integer>

Description

2g3g authentication vectors requested over gr interface.

Class

Optional.

Type / Range

Integer in the range of 1 to 5

Default

3

Name

grImmRspPref - Gr immediate response preferred

Syntax

--grImmRspPref <list-item>

Description

Indicates whether to include "Immediate response preferred" parameter in map send auth info message over gr interface.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

homeApnNi - Home APN NI

Syntax

--homeApnNi <string>

Description

Home access point name (APN) network identifier (NI).

Restrictions

This element is not applicable when plmnType is Other Network.

Class

Optional.

Type / Range

Digit string of length 0 to 62 with the allowed pattern of [0-9a-zA-Z\.\-]*

Default

''

Name

hpGwCcApnListName - msisdn based home GW selection with CC ListName

Syntax

--hpGwCcApnListName <string>

Description

msisdn based home GW selection with CC ListName. This list applies to UEs whose IMSI is served by the Home/Shared PLMN, and also to UEs whose IMSI has a Treat-as-Home-Subscriber Roaming Agreement with this serving PLMN

Restrictions

This element is not applicable when plmnType is Other Network. For Other Network, plmnType hpGwCcApnListName must be left empty

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

hplmnCcLength - ISDN country code length

Syntax

--hplmnCcLength <integer>

Description

Returning to the home province GGSN feature. value specifies MSISDN offset from which digits will be taken and added to APN. length is specified by number of characters added to APN parameter. This attribute applies to UEs whose IMSI is served by the Home/Shared

PLMN, and also to UEs whose IMSI has a Treat-as-Home-Subscriber Roaming Agreement with this serving PLMN.

Restrictions

This element is not applicable when plmnType is Other Network.

Class

Optional.

Type / Range

Integer in the range of 1 to 3

Default

2

Name

immediateCancelLocationAck - Immediate cancel location ack

Syntax

--immediateCancelLocationAck <list-item>

Description

Cancel location acknowledgment is sent immediately.

Restrictions

This element is not applicable when plmnType is Other Network.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

includePlmnAttachRate - Include Plmn Attach Rate

Syntax

--includePlmnAttachRate <list-item>

Description

When enabled, UE attaches with this PLMN are counted towards the Roamer Attach Rate calculation when the Roamer Attach Rate Limit global parameter is enabled.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

initiateLcsEmergency - Initiate LCS emergency

Syntax

--initiateLcsEmergency <list-item>

Description

Indicates whether the MME should initiate a location request for a UE sending an emergency attach request or an emergency PDN connectivity request valid values are do not initiate, send SLR to GMLC with estimated UE location, send SLR without location estimate to GMLC.

Class

Optional.

List

- Do not initiate - Do not initiate.
- Send SLR to GMLC with estimated UE location - Send SLR to GMLC with estimated UE location.
- Send SLR without location estimate to GMLC - Send SLR without location estimate to GMLC.

Default

Do not initiate

Name

interMmeTauEcrPercentage - Inter MME TAU ECR percentage

Syntax

--interMmeTauEcrPercentage <integer>

Description

Inter MME TAU ECR percentage to EIR.

Class

Optional.

Type / Range

Integer in the range of 0 to 100

Default

0

Name

ipV6SupportForNoDab - IPv6 PDN type used when DAB is not supported

Syntax

--ipV6SupportForNoDab <list-item>

Description

Indicates whether IPv6 PDN type is used when PLMN does not support DAB (Dual access bearer) otherwise IPv4 PDN type is used.

Restrictions

This element is not applicable when plmnType is of type Other Network.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

iratTauEcrPercentage - IRAT TAU ECR percentage

Syntax

--iratTauEcrPercentage <integer>

Description

IRAT TAU ECR percentage.

Class

Optional.

Type / Range

Integer in the range of 0 to 100

Default

0

Name

isdnCc - ISDN country code

Syntax

--isdnCc <digits>

Description

Digits use to represent the ISDN country code. used when validating zone codes received from the HSS. zone codes include a country code identifier.

Class

Optional.

Type / Range

Digit string of length 0 to 3

Name

lteTo2G3GQosMappingName - LTE to 2G3G QoS mapping profile name

Syntax

--lteTo2G3GQosMappingName <string>

Description

Name that identifies the LTE-2G3G QoS mapping profile, whose parameters are used during handover between 2G/3G and 4G networks.

Restrictions

This element is not applicable when plmnType is Other Network.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

default

Name

maxBitRateDown - Max UE AMBR downlink rate

Syntax

--maxBitRateDown <integer>

Description

Max UE AMBR downlink rate.

Restrictions

This element is not applicable when plmnType is Other Network.

Class

Optional.

Type / Range

Integer in the range of 0, 1-63, 64- 568, 576-8640, 8700-16000, 17000-128000, 130000-4000000000 in units of kbps

Default

256000

Name

maxBitRateUp - Max UE AMBR uplink rate

Syntax

--maxBitRateUp <integer>

Description

Max UE AMBR uplink rate.

Restrictions

This element is not applicable when plmnType is Other Network.

Class

Optional.

Type / Range

Integer in the range of 0, 1-63, 64- 568, 576-8640, 8700-16000, 17000-128000, 130000-4000000000 in units of kbps

Default

256000

Name

mbmsEnabled - MBMS enabled

Syntax

--mbmsEnabled <list-item>

Description

Indicates whether multimedia broadcast/multicast service is enabled.

Restrictions

This element is not applicable when plmnType is Other Network.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

mncDigits - Number of MNC digits

Syntax

--mncDigits <list-item>

Description

Number of digits used to represent the mobile network code.

Class

Not modifiable.

List

- 2/3Digits - 2 or 3 digits - 2 or 3 digits.
- 2Digits - 2 digits - 2 digits.
- 3Digits - 3 digits - 3 digits.

Default

3Digits

Name

mnSubscriberDbType - Mobile network subscriber database type

Syntax

--mnSubscriberDbType <list-item>

Description

Mobile network subscriber database type.

Restrictions

Home and Shared PLMN must not be None. Other PLMN must be set to None. This element is not applicable when plmnType is Other Network.

Class

Optional.

List

- " - Empty - Empty.
- EPC-Capability - EPC-Capability.
- HLR - HLR.
- HLR-HSS - HLR-HSS.
- HSS - HSS.
- None - None.

Default

"

Name

nonBroadcastLaiLac - Non-Broadcast LAI LAC

Syntax

--nonBroadcastLaiLac <integer>

Description

The non-broadcast LAI is used for two different purposes: in the SMS in MME and combined attach without CS domain functionalities. This parameter defines the LAC part of it. The MME may provide a Location Area Identification (LAI) for the UE on Combined Attach/TAU Accept to indicate the CS registration area. When either the SMS in MME or the combined attach without CS domain feature is used, the CS domain is not involved and thus the MME needs to provide the UE a LAI that is not associated with any VLR. The MME provides this provisioned LAI in order not to mix with any real CS NW used LAI.

Class

Optional.

Type / Range

Integer in the range of 1 to 65,533

Default

65533

Name

nonBroadcastTac - Non Broadcast TAC

Syntax

--nonBroadcastTac <integer>

Description

MME uses this TAC in GUTI allocation request to force UE to send TAU request

Class

Optional.

Type / Range

Integer in the range of 0 to 65,535

Default

65534

Name

nriLength - NRI length

Syntax

--nriLength <integer>

Description

The number of bits within a P-TMSI that are used as the network resource identifier.

Class

Optional.

Type / Range

Integer in the range of 0 to 8

Default

0

Name

numberOfAddedDigits - Number of digits added to APN

Syntax

--numberOfAddedDigits <integer>

Description

Returning to the home province GGSN (0=feature is off). value specifies number of digits taken from MSISDN (starting after ISDN country code length) and added to APN. This attribute applies to UEs whose IMSI is served by the Home/Shared PLMN, and also to UEs whose IMSI has a Treat-as-Home-Subscriber Roaming Agreement with this serving PLMN.

Restrictions

This element is not applicable when plmnType is Other Network.

Class

Optional.

Type / Range

Integer in the range of 0 to 15

Default

0

Name

obtainImeiSv - Obtain IMEISV

Syntax

--obtainImeiSv <list-item>

Description

Obtain International Mobile Equipment Identifier. Defines whether the MME obtains the IMEI from the UE, or not. If this field is set to "None" then Validate IMEI with EIR must be set to false when plmnType is either Home Network or Shared Network

Restrictions

This element is not applicable when plmnType is Other Network.

Class

Optional.

List

- IDR - Use NAS IDENTITY REQUEST.
- None - Do not obtain IMEI.
- SMC - Use NAS security mode control procedure.

Default

SMC

Name

oprDefQciProfileListName - Operator defined QCI profile name

Syntax

--oprDefQciProfileListName <string>

Description

Operator defined QCI profile name.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

"

Name

plmnNetProtocol - Inter-Gateway protocol

Syntax

--plmnNetProtocol <list-item>

Description

PLMN inter-gateway protocol type used by this MME.

Restrictions

This element is not applicable when plmnType is Other Network.

Class

Optional.

List

- GTP - Specify SGW supports S5/S8 based on GTP.
- PMIP - Specify SGW supports S5/S8 based on PMIP.

Default

GTP

Name

plmnType - PLMN type

Syntax

--plmnType <list-item>

Description

Indicates for the PLMN type.

Class

Not modifiable.

List

- Home Network - Specify network type of home network.
- Other Network - Specify network type of other network (not home or shared).
- Shared Network - Specify network type of shared network.

Default

Other Network

Name

qci - QoS class identifier

Syntax

--qci <integer>

Description

Indicates a cap (best possible QoS value allowed) for roamer UEs.

Restrictions

This element is not applicable when plmnType is Other Network.

Class

Optional.

Type / Range

Integer in the range of 6 to 9

Default

6

Name

ratDefaultRoamingHandling - Roaming agreement default handling

Syntax

--ratDefaultRoamingHandling <list-item>

Description

Roaming agreement default handling - allows / restricts access for those PLMNs not explicitly defined in the roaming networks.

Restrictions

This element is not applicable when plmnType is Other Network.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

regionalSubscriptionForRoamers - Regional subscription for roamers

Syntax

--regionalSubscriptionForRoamers <list-item>

Description

When set to true enables regional subscription for roamers in SGSN.

Restrictions

This element is not applicable when plmnType is of type Other Network.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

reservedTmsi - Reserved TMSI

Syntax

--reservedTmsi <integer>

Description

The reserved TMSI is used for two functionalities: the SMS in MME and the combined attach without CS domain. The MME may provide a Temporary Mobile Subscriber Identity (TMSI) for the UE on Combined Attach/TAU Accept for the CS registration. When either the SMS in MME or combined attach without CS domain feature is used, the CS domain is not involved and thus the MME needs to provide the UE a reserved TMSI value that cannot cause any ambiguities with other TMSIs (e.g. when the UE changes to an area where it needs to derive SMS services from a GERAN/UTRAN MSC). The MME provides this provisioned reserved TMSI value in order not to mix with any real CS NW used TMSIs.

Class

Optional.

Type / Range

Integer in the range of 0 to 4,294,967,295

Default

0

Name

sbcEnabled - SBc enabled type

Syntax

--sbcEnabled <list-item>

Description

Indicates whether the CBC feature shall be enabled or not.

Restrictions

This element is not applicable when plmnType is Other Network.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

tauEcrPercentage - TAU ECR percentage

Syntax

--tauEcrPercentage <integer>

Description

TAU ECR percentage to EIR.

Class

Optional.

Type / Range

Integer in the range of 0 to 100

Default

0

Name

timeZoneName - Time zone name

Syntax

--timeZoneName <list-item>

Description

Provides time zone names that correspond to the region selected.

Restrictions

See comments on TIME_ZONE type in CfgDataType.xsd. This element is not applicable when plmnType is Other Network.

Class

Optional.

List

- Africa/Abidjan - Timezone for africa/abidjan UTC offset of +00:00.
- Africa/Accra - Timezone for africa/accra UTC offset of +00:00.
- Africa/Addis_Ababa - Timezone for africa/addis_ababa UTC offset of +03:00.
- Africa/Algiers - Timezone for africa/algiers UTC offset of +01:00.
- Africa/Asmara - Timezone for africa/asmara UTC offset of +03:00.
- Africa/Asmera - Timezone for africa/asmera UTC offset of +03:00.
- Africa/Bamako - Timezone for africa/bamako UTC offset of +00:00.
- Africa/Bangui - Timezone for africa/bangui UTC offset of +01:00.
- Africa/Banjul - Timezone for africa/banjul UTC offset of +00:00.
- Africa/Bissau - Timezone for africa/bissau UTC offset of +00:00.
- Africa/Blantyre - Timezone for africa/blantyre UTC offset of +02:00.
- Africa/Brazzaville - Timezone for africa/brazzaville UTC offset of +01:00.
- Africa/Bujumbura - Timezone for africa/bujumbura UTC offset of +02:00.
- Africa/Cairo - Timezone for africa/cairo UTC offset of +02:00.
- Africa/Casablanca - Timezone for africa/casablanca UTC offset of +00:00.
- Africa/Ceuta - Timezone for africa/ceuta UTC offset of +01:00.
- Africa/Conakry - Timezone for africa/conakry UTC offset of +00:00.
- Africa/Dakar - Timezone for africa/dakar UTC offset of +00:00.
- Africa/Dar_es_Salaam - Timezone for africa/dar_es_salaam UTC offset of +03:00.
- Africa/Djibouti - Timezone for africa/djibouti UTC offset of +03:00.
- Africa/Douala - Timezone for africa/douala UTC offset of +01:00.
- Africa/El_Aaiun - Timezone for africa/el_aaiun UTC offset of +00:00.
- Africa/Freetown - Timezone for africa/freetown UTC offset of +00:00.
- Africa/Gaborone - Timezone for africa/gaborone UTC offset of +02:00.
- Africa/Harare - Timezone for africa/harare UTC offset of +02:00.
- Africa/Johannesburg - Timezone for africa/johannesburg UTC offset of +02:00.
- Africa/Juba - Timezone for africa/juba UTC offset of +03:00.

- Africa/Kampala - Timezone for africa/kampala UTC offset of +03:00.
- Africa/Khartoum - Timezone for africa/khartoum UTC offset of +03:00.
- Africa/Kigali - Timezone for africa/kigali UTC offset of +02:00.
- Africa/Kinshasa - Timezone for africa/kinshasa UTC offset of +01:00.
- Africa/Lagos - Timezone for africa/lagos UTC offset of +01:00.
- Africa/Libreville - Timezone for africa/libreville UTC offset of +01:00.
- Africa/Lome - Timezone for africa/lome UTC offset of +00:00.
- Africa/Luanda - Timezone for africa/luanda UTC offset of +01:00.
- Africa/Lubumbashi - Timezone for africa/lubumbashi UTC offset of +02:00.
- Africa/Lusaka - Timezone for africa/lusaka UTC offset of +02:00.
- Africa/Malabo - Timezone for africa/malabo UTC offset of +01:00.
- Africa/Maputo - Timezone for africa/maputo UTC offset of +02:00.
- Africa/Maseru - Timezone for africa/maseru UTC offset of +02:00.
- Africa/Mbabane - Timezone for africa/mbabane UTC offset of +02:00.
- Africa/Mogadishu - Timezone for africa/mogadishu UTC offset of +03:00.
- Africa/Monrovia - Timezone for africa/monrovia UTC offset of +00:00.
- Africa/Nairobi - Timezone for africa/nairobi UTC offset of +03:00.
- Africa/Ndjamena - Timezone for africa/ndjamena UTC offset of +01:00.
- Africa/Niamey - Timezone for africa/niamey UTC offset of +01:00.
- Africa/Nouakchott - Timezone for africa/nouakchott UTC offset of +00:00.

- Pacific/Tahiti - Timezone for pacific/tahiti UTC offset of -10:00.
- Pacific/Tarawa - Timezone for pacific/tarawa UTC offset of +12:00.
- Pacific/Tongatapu - Timezone for pacific/tongatapu UTC offset of +14:00.
- Pacific/Truk - Timezone for pacific/truk UTC offset of +10:00.
- Pacific/Wake - Timezone for pacific/wake UTC offset of +12:00.
- Pacific/Wallis - Timezone for pacific/wallis UTC offset of +12:00.
- Pacific/Yap - Timezone for pacific/yap UTC offset of +10:00.
- Poland - Timezone for poland UTC offset of +01:00.
- Portugal - Timezone for portugal UTC offset of +00:00.
- ROC - Timezone for ROC UTC offset of +08:00.
- ROK - Timezone for ROK UTC offset of +09:00.
- Singapore - Timezone for singapore UTC offset of +08:00.
- Turkey - Timezone for turkey UTC offset of +03:00.
- UCT - Timezone for UCT UTC offset of +00:00.
- US/Pacific-New - Timezone for US/Pacific-New UTC offset of -08:00.
- Universal - Timezone for universal UTC offset of +00:00.

- W-SU - Timezone for W-SU UTC offset of +03:00.
- WET - Timezone for WET UTC offset of +00:00.
- Zulu - Timezone for zulu UTC offset of +00:00.
- jdj_tz - Timezone for jdj_tz UTC offset of +00:00.

Default

Default

Name

ueRadioCapabilityMatch - UE radio capability match

Syntax

--ueRadioCapabilityMatch <list-item>

Description

When set to true enables UE radio capability match procedure context feature and also to provision whether to use SRVCC capability in determining the support of IMS voice.

Restrictions

This element is not applicable when plmnType is of type Other Network.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

ueSrvccCapability - UE SRVCC capability

Syntax

--ueSrvccCapability <list-item>

Description

When set to true enables the use of UE SRVCC capability and also local SRVCC enable/disable provisioning (Refer to service profile for the SRVCC command) in determining IMS voice over PS indication to a UE. in some cases, operators may like to force a UE to perform CSFB rather than using IMS voice over PS if the UE is not capable of SRVCC to prevent call drops when UE moves from an area where IMS voice is supported to an area IMS voice is not supported. the no form of the command disables the capability. this provisioning is only applicable if the UE radio capability match feature is enabled.

Restrictions

This element is not applicable when plmnType is of type Other Network.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

validateImeiEir - Validate IMEI with EIR

Syntax

```
--validateImeiEir <list-item>
```

Description

Indicates whether the MME performs a validation of the IMEI in the EIR. This field can only be set to "checked" if field Obtain IMEISV is different than "None" when plmnType is either Home Network or Shared Network

Restrictions

This element is not applicable when plmnType is Other Network.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Roles**Create**

sysadmin, manage

sysadmin, manage

List

sysadmin, manage, monitor

6.57 cmm plmnParam

plmnParam. Syntax, description, parameters, and roles for **cmm plmnParam** command.

Syntax**Description**

Configure, list and show PLMN parameter sets.

Parameters**Name**

plmnParamId - PLMN parameter set name

Syntax

--plmnParamId <string>

Description

PLMN parameter set name. Note, authentication repetition parameters are taken into use when authenticationMode (cmm securityParam) is set equal to ACT.

Class

Required key.

Type / Range

Digit string of length 1 to 15 with the allowed pattern of [0-9a-zA-Z\._ :]*

Name

homePlmn - Home plmn

Syntax

--homePlmn <list-item>

Description

Home PLMN or not.

Class

Required on create.

List

- false - Boolean value of false.
- true - Boolean value of true.

Name

accRestrCauCnt - Reject cause code for subscriber count

Syntax

--accRestrCauCnt <list-item>

Description

Reject cause code for subscriber count la - location area not allowed plmn - PLMN not allowed roamLa - roaming not allowed in this LA gprsPlmn - GPRS services not allowed in this PLMN cellLa - no suitable cells in LA notUsed - not set.

Class

Optional.

List

- cellLa - No suitable cells in LA.
- gprsPlmn - GPRS services not allowed in this PLMN.
- la - Location area not allowed.
- notUsed - Not set.
- plmn - PLMN not allowed.
- roamLa - Roaming not allowed in this LA.

Default

notUsed

Name

accRestrCauGtoG - Reject cause code for a GSM subscriber to the GSM network

Syntax

--accRestrCauGtoG <list-item>

Description

Reject cause code for a GSM subscriber to the GSM network la - location area not allowed plmn - PLMN not allowed roamLa - roaming not allowed in this LA gprsPlmn - GPRS services not allowed in this PLMN cellLa - no suitable cells in LA notUsed - not set.

Class

Optional.

List

- cellLa - No suitable cells in LA.
- gprsPlmn - GPRS services not allowed in this PLMN.
- la - Location area not allowed.
- notUsed - Not set.
- plmn - PLMN not allowed.

- roamLa - Roaming not allowed in this LA.

Default

notUsed

Name

accRestrCauGtoU - Reject cause code for a GSM subscriber to the UMTS network

Syntax

--accRestrCauGtoU <list-item>

Description

Reject cause code for a GSM subscriber to the UMTS network la - location area not allowed
plmn - PLMN not allowed roamLa - roaming not allowed in this LA gprsPlmn - GPRS services
not allowed in this PLMN cellLa - no suitable cells in LA notUsed - not set.

Class

Optional.

List

- cellLa - No suitable cells in LA.
- gprsPlmn - GPRS services not allowed in this PLMN.
- la - Location area not allowed.
- notUsed - Not set.
- plmn - PLMN not allowed.
- roamLa - Roaming not allowed in this LA.

Default

notUsed

Name

accRestrCauR97 - Reject cause code for a R97/98 terminal to the GSM network

Syntax

--accRestrCauR97 <list-item>

Description

Reject cause code for a R97/98 terminal to the GSM network la - location area not allowed
plmn - PLMN not allowed roamLa - roaming not allowed in this LA gprsPlmn - GPRS services
not allowed in this PLMN cellLa - no suitable cells in LA notUsed - not set.

Class

Optional.

List

- cellLa - No suitable cells in LA.
- gprsPlmn - GPRS services not allowed in this PLMN.

- la - Location area not allowed.
- notUsed - Not set.
- plmn - PLMN not allowed.
- roamLa - Roaming not allowed in this LA.

Default

notUsed

Name

accRestrCauUtoG - Reject cause code for a UMTS subscriber to the GSM network

Syntax

--accRestrCauUtoG <list-item>

Description

Reject cause code for a UMTS subscriber to the GSM network
la - location/ area not allowed
plmn - PLMN not allowed
roamLa - roaming not allowed in this LA
gprsPlmn - GPRS services not allowed in this PLMN
cellLa - no suitable cells in LA
notUsed - not set.

Class

Optional.

List

- cellLa - No suitable cells in LA.
- gprsPlmn - GPRS services not allowed in this PLMN.
- la - Location area not allowed.
- notUsed - Not set.
- plmn - PLMN not allowed.
- roamLa - Roaming not allowed in this LA.

Default

notUsed

Name

accRestrCauUtoU - Reject cause code for a UMTS subscriber to the UMTS network

Syntax

--accRestrCauUtoU <list-item>

Description

Reject cause code for a UMTS subscriber to the UMTS network
la - location area not allowed
plmn - PLMN not allowed
roamLa - roaming not allowed in this LA
gprsPlmn - GPRS services not allowed in this PLMN
cellLa - no suitable cells in LA
notUsed - not set.

Class

Optional.

List

- cellLa - No suitable cells in LA.
- gprsPlmn - GPRS services not allowed in this PLMN.
- la - Location area not allowed.
- notUsed - Not set.
- plmn - PLMN not allowed.
- roamLa - Roaming not allowed in this LA.

Default

notUsed

Name

accRestrGtoG - Access right for a GSM subscriber to the GSM network

Syntax

--accRestrGtoG <list-item>

Description

Access right for a GSM subscriber to the GSM network notused - the access right parameters are ignored allowed - the access right is granted notallowed - the access right is denied.

Class

Optional.

List

- allowed - Allowed.
- notAllowed - Not allowed - Not allowed.
- notUsed - Not used - Not used.

Default

notUsed

Name

accRestrGtoU - Access right for a GSM subscriber to the UMTS network

Syntax

--accRestrGtoU <list-item>

Description

Access right for a GSM subscriber to the UMTS network notused - the access right parameters are ignored allowed - the access right is granted notallowed - the access right is denied.

Class

Optional.

List

- allowed - Allowed.
- notAllowed - Not allowed - Not allowed.
- notUsed - Not used - Not used.

Default

notUsed

Name

accRestrUtoG - Access right for a UMTS subscriber to the GSM network

Syntax

--accRestrUtoG <list-item>

Description

Access right for a UMTS subscriber to the GSM network notused - the access right parameters are ignored allowed - the access right is granted notallowed - the access right is denied.

Class

Optional.

List

- allowed - Allowed.
- notAllowed - Not allowed - Not allowed.
- notUsed - Not used - Not used.

Default

notUsed

Name

accRestrUtoU - Access right for a UMTS subscriber to the UMTS network

Syntax

--accRestrUtoU <list-item>

Description

Access right for a UMTS subscriber to the UMTS network notused - the access right parameters are ignored allowed - the access right is granted notallowed - the access right is denied.

Class

Optional.

List

- allowed - Allowed.
- notAllowed - Not allowed - Not allowed.

- notUsed - Not used - Not used.

Default

notUsed

Name

allocRetention - Allocation/retention priority for roaming subscribers

Syntax

--allocRetention <integer>

Description

Allocation/retention priority for roaming subscribers. this parameter defines the allocation/retention priority which can be used by roaming subscriber at most.

Class

Optional.

Type / Range

Integer in the range of 1 to 3

Default

3

Name

blackListEffect - Black list effect

Syntax

--blackListEffect <list-item>

Description

The black list effect. With the black list effect you can define how to handle mobile stations on black list allow - the action is allowed block - the action is blocked note, when feature SG02220 S13 IMEI checking is activated BLE is not visible.

Class

Optional.

List

- allow - Allow.
- block - Block.

Default

block

Name

blacklistImeiEffect - Allow blacklisted equipment

Syntax

--blacklistImeiEffect <list-item>

Description

Allow blacklisted equipment allow - is used for allowing blacklisted IMEI block - is used for not allowing blacklisted IMEI.

Class

Optional.

List

- allow - Allow.
- block - Block.

Default

block

Name

cipherMode - Ciphering mode

Syntax

--cipherMode <list-item>

Description

Ciphering mode. with the ciphering mode you can define the usage of ciphering true - the ciphering is in use false - the ciphering is not in use.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

combAttIimeiChk - IMEI status check from EIR for combined IMSI and GPRS attach

Syntax

--combAttIimeiChk <list-item>

Description

IMEI status check from EIR for combined IMSI and GPRS attach.

Class

Optional.

List

- false - Boolean value of false.

- true - Boolean value of true.

Default

false

Name

combRaulmeiChk - IMEI status check from EIR for combined RA and LA update

Syntax

--combRauIimeiChk <list-item>

Description

IMEI status check from EIR for combined RA and LA update.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

csPsCoord - CS/PS coordination

Syntax

--csPsCoord <list-item>

Description

CS/PS coordination.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

ctrlR7R8DnsQuery - control R8-R7 DNS query/PLMN

Syntax

--ctrlR7R8DnsQuery <list-item>

Description

With this parameter, the operator can control on PLMN level whether Rel-8 DNS query for S/P-GW selection or Rel-7 query DNS for GGSN selection will be preferred during PDP context creation. The provided options are: - Default: based on existing selection criteria such as EPC capability, EPS subscription and APN. - S4 preferred: First attempt is with R8 query for S/P-GW selection even if UE is non-EPC capable nor has EPS subscription. If no valid entry is found fallback to R7 for GGSN selection is triggered. - Gn only : In this case only Rel7 DNS query to GGSN is made

Class

Optional.

List

- ExistFunc - Existing R8 GW selection - operator control on PLMN level whether Rel-8 APN DNS query for S/P-GW selection or Rel-7 query DNS for GGSN/GW selection will be preferred during 1st PDP context creation. This item is to select based on existing selection criteria such as EPC, EPS subscription and APN.
- Gn - Gn is preferred - Gn only : In this case only Rel7 DNS query to GGSN is made
- S4 - s4 is preferred - S4 preferred: First attempt is with R8 query for S/P-GW selection even if UE is non-EPC capable nor has EPS subscription. If no valid entry is found fallback to R7 for GGSN selection is triggered.

Default

ExistFunc

Name

defaultApnOi - Define APN operator identifier

Syntax

--defaultApnOi <string>

Description

Define APN operator identifier: maximum of 10 unique default APN operator identifier allowed in database. contains 6...37 characters ('A'...'Z', 'a'...'z', '0'...'9', '.') last part of defapn has to be '.GPRS' remove default APN operator identifier using value 0.

Class

Optional.

Type / Range

Digit string of length 1 to 37 with the allowed pattern of [0-9a-zA-Z\._:-]*

Default

0

Name

defaultApnOi2 - Secondary default APN operator identifier

Syntax

--defaultApnOi2 <string>

Description

Secondary default APN operator identifier.

Class

Optional.

Type / Range

Digit string of length 1 to 37 with the allowed pattern of [0-9a-zA-Z\._ :]*

Default

0

Name

detachImeiChk - IMEI status check from EIR for MO GPRS detach

Syntax

--detachImeiChk <list-item>

Description

IMEI status check from EIR for MO GPRS detach.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

dnsMcc - Define LTE inbound roaming subscribers default DNS domain mobile country code

Syntax

--dnsMcc <string>

Description

Define LTE inbound roaming subscribers default DNS domain mobile country code.

Class

Optional.

Type / Range

Digit string of length 3 to 3 with the allowed pattern of [0-9a-zA-Z\._ :]*

Name

dnsMnc - Define LTE inbound roaming subscribers default DNS domain mobile network code

Syntax

--dnsMnc <string>

Description

Define LTE inbound roaming subscribers default DNS domain mobile network code.

Class

Optional.

Type / Range

Digit string of length 2 to 3 with the allowed pattern of [0-9a-zA-Z\.\-_:]*

Name

earp - Evolved allocation/retention priority

Syntax

--earp <integer>

Description

Evolved allocation/retention priority.

Class

Optional.

Type / Range

Integer in the range of 1 to 15

Default

14

Name

fallbackGr - fall back to Gr interface

Syntax

--fallbackGr <list-item>

Description

This parameter is needed also/PLMN(IMSI NS). For most PLMN (IMSI NS), if S6d is set, then by default, fallback to Gr is also required unless this parameter is set to false->no need to support fall back. fallbackGr=true, fallback to Gr will be supported fallbackGr=false, fallback to Gr will be not supported default is true

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

fullNetwName - Full network name

Syntax

--fullNetwName <string>

Description

This parameter defines the full network name of the network operator (PLMN level). This is for the case MVNO used, different PLMN number is used for different operators.

Class

Optional.

Type / Range

Digit string of length 0 to 64

Default

""

Name

gbCauseCodeRec - Cause code set for gb interface

Syntax

--gbCauseCodeRec <string>

Description

Cause code set for gb interface. with this parameter you can define the name for cause code set, which will be used for actual PLMN on the gb interface. default values can be used if 0 is given as the cause code set name.

Class

Optional.

Type / Range

Digit string of length 1 to 8 with the allowed pattern of [0-9a-zA-Z\._:-]*

Default

0

Name

gbCombAttAuth - Authentication repetition rate for combined IMSI and GPRS attach

Syntax

--gbCombAttAuth <integer>

Description

Authentication repetition rate for combined IMSI and GPRS attach.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

1

Name

gbCombAttImei - IMEI check repetition rate for combined gb IMSI and GPRS attach

Syntax`--gbCombAttImei <integer>`**Description**

IMEI check repetition rate for combined gb IMSI and GPRS attach.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

0

Name

gbComRaLaAuth - Authentication repetition rate for combined gb RA and LA update

Syntax`--gbComRaLaAuth <integer>`**Description**

Authentication repetition rate for combined gb RA and LA update.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

0

Name

gbComRaLaImei - IMEI check repetition rate for combined gb RA and LA update

Syntax`--gbComRaLaImei <integer>`**Description**

IMEI check repetition rate for combined gb RA and LA update.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

0

Name

gbGprsAttAuth - Authentication repetition rate for gb GPRS attach

Syntax

--gbGprsAttAuth <integer>

Description

Authentication repetition rate for gb GPRS attach.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

1

Name

gbGprsAttImei - IMEI check repetition rate for gb GPRS attach

Syntax

--gbGprsAttImei <integer>

Description

IMEI check repetition rate for gb GPRS attach.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

0

Name

gbGprsAttPtmsiSign - PTMSI signature repetition rate for gb GPRS attach

Syntax

--gbGprsAttPtmsiSign <integer>

Description

PTMSI signature repetition rate for gb GPRS attach.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

0

Name

gbImsiAttAuth - Authentication repetition rate for gb IMSI attach

Syntax

--gbImsiAttAuth <integer>

Description

Authentication repetition rate for gb IMSI attach.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

1

Name

gbImsiAttImei - IMEI check repetition rate for gb IMSI attach

Syntax

--gbImsiAttImei <integer>

Description

IMEI check repetition rate for gb IMSI attach.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

0

Name

gbMncl - Gb MNC length

Syntax

--gbMncl <integer>

Description

Gb MNC length.

Class

Optional.

Type / Range

Integer in the range of 2 to 3

Default

2

Name

gbMoGprsDeaAuth - Authentication repetition rate for gb MO GPRS detach

Syntax

--gbMoGprsDeaAuth <integer>

Description

Authentication repetition rate for gb MO GPRS detach.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

0

Name

gbMoGprsDeaImei - IMEI check repetition rate for gb MO GPRS detach

Syntax

--gbMoGprsDeaImei <integer>

Description

IMEI check repetition rate for gb MO GPRS detach.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

0

Name

gbMoPdpActAuth - Authentication repetition rate for gb MO PDP context activation

Syntax

--gbMoPdpActAuth <integer>

Description

Authentication repetition rate for gb MO PDP context activation.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

0

Name

gbMoPdpActImei - IMEI check repetition rate for gb MO PDP context activation

Syntax

--gbMoPdpActImei <integer>

Description

IMEI check repetition rate for gb MO PDP context activation.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

0

Name

gbMoPdpDeaAuth - Authentication repetition rate for MO PDP context deactivation

Syntax

--gbMoPdpDeaAuth <integer>

Description

Authentication repetition rate for MO PDP context deactivation.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

0

Name

gbMoPdpDeaImei - IMEI check repetition rate for MO PDP context deactivation

Syntax

--gbMoPdpDeaImei <integer>

Description

IMEI check repetition rate for MO PDP context deactivation.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

0

Name

gbNormalRaPtmsiSign - PTMSI signature repetition rate for normal gb RA update

Syntax

--gbNormalRaPtmsiSign <integer>

Description

PTMSI signature repetition rate for normal gb RA update.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

0

Name

gbNormalRaPtmsiSignVisitor - PTMSI signature repetition rate for normal gb RA update, new visitor

Syntax

--gbNormalRaPtmsiSignVisitor <integer>

Description

PTMSI signature repetition rate for normal gb RA update, new visitor.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

0

Name

gbNormRaAuth - Authentication repetition rate for normal gb RA update

Syntax

--gbNormRaAuth <integer>

Description

Authentication repetition rate for normal gb RA update.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

0

Name

gbNormRaAuthVisitor - Authentication repetition rate for normal gb RA update, new visitor

Syntax

--gbNormRaAuthVisitor <integer>

Description

Authentication repetition rate for normal gb RA update, new visitor.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

0

Name

gbNormRaImei - IMEI check repetition rate for normal gb RA update

Syntax

--gbNormRaImei <integer>

Description

IMEI check repetition rate for normal gb RA update.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

0

Name

gbNormRaImeiVisitor - IMEI check repetition rate for normal gb RA update, new visitor

Syntax

```
--gbNormRaImeiVisitor <integer>
```

Description

IMEI check repetition rate for normal gb RA update, new visitor.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

0

Name

gbPeriodicRaAuth - Authentication repetition rate for periodic gb RA update

Syntax

```
--gbPeriodicRaAuth <integer>
```

Description

Authentication repetition rate for periodic gb RA update.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

0

Name

gbPeriodicRaImei - IMEI check repetition rate for periodic RA update

Syntax

```
--gbPeriodicRaImei <integer>
```

Description

IMEI check repetition rate for periodic RA update.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

0

Name

gbPeriodicRaPtmsiAlloc - PTMSI allocation repetition rate for periodic gb RA update

Syntax

--gbPeriodicRaPtmsiAlloc <integer>

Description

PTMSI allocation repetition rate for periodic gb RA update.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

1

Name

gbPeriodicRaPtmsiSign - PTMSI signature repetition rate for periodic gb RA update

Syntax

--gbPeriodicRaPtmsiSign <integer>

Description

PTMSI signature repetition rate for periodic gb RA update.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

0

Name

genericTreatmentForUnsubscribedApn - Generic Treatment For Unsubscribed APN

Syntax

--genericTreatmentForUnsubscribedApn <list-item>

Description

Generic Treatment For Unsubscribed APN

Class

Optional.

List

- existSystemBehavior - Existing System Behavior - existing system behavior as a default action
- convertIfLocalSubscribedElseLowestContextId - Convert If Local Subscribed Else Lowest Context Id - convert If Local and Subscribed Else uses Lowest Context Id

- convertIfLocalSubscribedElseReject - Convert If Local Subscribed Else Reject - Convert If it matches Local and Subscribed Else Reject
- noConvertAndReject - No Convert And Reject - No convert and reject PDP

Default

existSystemBehavior

Name

gprsAttImeiChk - IMEI status check from EIR for GPRS attach

Syntax

--gprsAttImeiChk <list-item>

Description

IMEI status check from EIR for GPRS attach.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

gtpTmrprId - GTP timer profile id

Syntax

--gtpTmrprId <integer>

Description

GTP timer profile id.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

255

Name

guaranBitRateDl - Guaranteed bit rate for downlink for roaming subscribers

Syntax

--guaranBitRateDl <integer>

Description

This parameter defines the guaranteed bit rate for downlink for roaming subscribers.

Class

Optional.

Type / Range

Integer in the range of 0 to 28,000

Default

0

Name

guaranBitRateUl - Guaranteed bit rate for uplink for roaming subscribers

Syntax

--guaranBitRateUl <integer>

Description

This parameter defines the guaranteed bit rate for uplink for roaming subscribers.

Class

Optional.

Type / Range

Integer in the range of 0 to 11,500

Default

0

Name

imeiValidityTimer - IMEI check validity timer in hours

Syntax

--imeiValidityTimer <integer>

Description

IMEI check validity timer in hours.

Class

Optional.

Type / Range

Integer in the range of 0 to 743

Default

0

Name

imsApn - IMS APN allowed

Syntax

--imsApn <list-item>

Description

Specifies whether IMS APN is allowed in SGSN or not.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

imsiAttIimeiChk - IMEI status check from EIR for IMSI attach

Syntax

```
--imsiAttIimeiChk <list-item>
```

Description

IMEI status check from EIR for IMSI attach.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

iuCauseCodeRec - Cause code set for iu interface

Syntax

```
--iuCauseCodeRec <string>
```

Description

Cause code set for iu interface. with this parameter you can define the name for cause code set, which will be used for actual PLMN on the iu interface. default values can be used if 0 is given as the cause code set name.

Class

Optional.

Type / Range

Digit string of length 1 to 8 with the allowed pattern of [0-9a-zA-Z\._:-]*

Default

0

Name

iuCombAttImei - IMEI check repetition rate for combined iu IMSI and GPRS attach

Syntax

--iuCombAttImei <integer>

Description

IMEI check repetition rate for combined iu IMSI and GPRS attach.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

0

Name

iuComRaLaAuth - Authentication repetition rate for combined iu RA and LA update

Syntax

--iuComRaLaAuth <integer>

Description

Authentication repetition rate for combined iu RA and LA update.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

0

Name

iuComRaLaImei - IMEI check repetition rate for combined iu RA and LA update

Syntax

--iuComRaLaImei <integer>

Description

IMEI check repetition rate for combined iu RA and LA update.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

0

Name

iuGprsAttImei - IMEI check repetition rate for iu GPRS attach

Syntax`--iuGprsAttImei <integer>`**Description**

IMEI check repetition rate for iu GPRS attach.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

0

Name

iuGprsAttPtmsiSign - PTMSI signature repetition rate for iu GPRS attach

Syntax`--iuGprsAttPtmsiSign <integer>`**Description**

PTMSI signature repetition rate for iu GPRS attach.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

0

Name

iuImsiAttImei - IMEI check repetition rate for iu IMSI attach

Syntax`--iuImsiAttImei <integer>`**Description**

IMEI check repetition rate for iu IMSI attach.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

0

Name

iuMncl - Iu MNC length

Syntax

--iuMncl <integer>

Description

Iu MNC length.

Class

Optional.

Type / Range

Integer in the range of 2 to 3

Default

2

Name

iuMoGprsDeaAuth - Authentication repetition rate for Iu MO GPRS detach

Syntax

--iuMoGprsDeaAuth <integer>

Description

Authentication repetition rate for Iu MO GPRS detach.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

0

Name

iuMoGprsDeaImei - IMEI check repetition rate for Iu MO GPRS detach

Syntax

--iuMoGprsDeaImei <integer>

Description

IMEI check repetition rate for Iu MO GPRS detach.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

0

Name

iuMoPdpActAuth - Authentication repetition rate for iu MO PDP context activation

Syntax

--iuMoPdpActAuth <integer>

Description

Authentication repetition rate for iu MO PDP context activation.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

0

Name

iuMoPdpActImei - IMEI check repetition rate for iu MO PDP context activation

Syntax

--iuMoPdpActImei <integer>

Description

IMEI check repetition rate for iu MO PDP context activation.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

0

Name

iuMoPdpDeaAuth - Authentication repetition rate for iu MO PDP context deactivation

Syntax

--iuMoPdpDeaAuth <integer>

Description

Authentication repetition rate for iu MO PDP context deactivation.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

0

Name

iuMoPdpDeaImei - IMEI check repetition rate for iu MO PDP context deactivation

Syntax

--iuMoPdpDeaImei <integer>

Description

IMEI check repetition rate for iu MO PDP context deactivation.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

0

Name

iuNormalRaPtmsiSign - PTMSI signature repetition rate for normal iu RA update

Syntax

--iuNormalRaPtmsiSign <integer>

Description

PTMSI signature repetition rate for normal iu RA update.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

0

Name

iuNormalRaPtmsiSignVisitor - PTMSI signature repetition rate for normal iu RA update, new visitor

Syntax

--iuNormalRaPtmsiSignVisitor <integer>

Description

PTMSI signature repetition rate for normal iu RA update, new visitor.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

0

Name

iuNormRaAuth - Authentication repetition rate for normal iu RA update

Syntax

--iuNormRaAuth <integer>

Description

Authentication repetition rate for normal iu RA update.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

0

Name

iuNormRaAuthVisitor - Authentication repetition rate for normal iu RA update, new visitor

Syntax

--iuNormRaAuthVisitor <integer>

Description

Authentication repetition rate for normal iu RA update, new visitor.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

0

Name

iuNormRaImei - IMEI check repetition rate for normal iu RA update

Syntax

--iuNormRaImei <integer>

Description

IMEI check repetition rate for normal iu RA update.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

0

Name

iuNormRalmeiVisitor - IMEI check repetition rate for normal iu RA update, new visitor

Syntax

```
--iuNormRaImeiVisitor <integer>
```

Description

IMEI check repetition rate for normal iu RA update, new visitor.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

0

Name

iuPeriodicRaAuth - Authentication repetition rate for periodic iu RA update

Syntax

```
--iuPeriodicRaAuth <integer>
```

Description

Authentication repetition rate for periodic iu RA update.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

0

Name

iuPeriodicRalmei - IMEI check repetition rate for periodic iu RA update

Syntax

```
--iuPeriodicRaImei <integer>
```

Description

IMEI check repetition rate for periodic iu RA update.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

0

Name

iuPeriodicRaPtmsiAlloc - PTMSI allocation repetition rate for periodic iu RA update

Syntax

```
--iuPeriodicRaPtmsiAlloc <integer>
```

Description

PTMSI allocation repetition rate for periodic iu RA update.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

1

Name

iuPeriodicRaPtmsiSign - PTMSI signature repetition rate for periodic iu RA update

Syntax

```
--iuPeriodicRaPtmsiSign <integer>
```

Description

PTMSI signature repetition rate for periodic iu RA update.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

0

Name

iuServReqAuth - Authentication repetition rate for iu service request

Syntax

--iuServReqAuth <integer>

Description

Authentication repetition rate for iu service request.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

0

Name

iuServReqImei - IMEI check repetition rate for iu service request

Syntax

--iuServReqImei <integer>

Description

IMEI check repetition rate for iu service request.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

0

Name

iuServReqPtmsiAlloc - PTMSI allocation repetition rate for iu service request

Syntax

--iuServReqPtmsiAlloc <integer>

Description

PTMSI allocation repetition rate for iu service request.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

0

Name

lb - Enable or disable the local breakout functionality

Syntax

--lb <list-item>

Description

Enable or disable the local breakout functionality.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

lbo - Specifies local break out feature status

Syntax

--lbo <list-item>

Description

Specifies local break out feature status.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

localApnPlmn - Local APN PLMN

Syntax

--localApnPlmn <string>

Description

Local configured APN/PLMN in SGSN for plmn level override function (v4)

Class

Optional.

Type / Range

Digit string of length 0 or 1 to 62

Default

""

Name

localApnPlmnV4V6 - Local APN PLMN for IPv4v6

Syntax

--localApnPlmnV4V6 <string>

Description

Local configured APN/PLMN in SGSN for IPv4v6 for plmn level override function

Class

Optional.

Type / Range

Digit string of length 0 or 1 to 62

Default

""

Name

localApnPlmnV6 - Local APN PLMN for IPv6

Syntax

--localApnPlmnV6 <string>

Description

Local configured APN/PLMN in SGSN for IPv6 type for plmn level override function

Class

Optional.

Type / Range

Digit string of length 0 or 1 to 62

Default

""

Name

locationBasedGwForRoamer - Location Based Gateway Selection For Roamer

Syntax

--locationBasedGwForRoamer <list-item>

Description

With this parameter set to true, SGSN will allow the roamers under this PLMN (national roamer) to do DNS query for gateway selection with current roamer's location info, thus to select closest gateway

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

maxBitRateForDL - Maximum bit rate for downlink for roaming subscribers

Syntax

--maxBitRateForDL <integer>

Description

This parameter defines the maximum bit rate for downlink for roaming subscribers.

Class

Optional.

Type / Range

Integer in the range of 0 to 28,000

Default

50

Name

maxBitRateForUL - Maximum bit rate for uplink for roaming subscribers

Syntax

--maxBitRateForUL <integer>

Description

This parameter defines the maximum bit rate for uplink for roaming subscribers.

Class

Optional.

Type / Range

Integer in the range of 0 to 11,500

Default

50

Name

normalRaulmeiChk - IMEI status check from EIR for normal RA update

Syntax

--normalRauImeiChk <list-item>

Description

IMEI status check from EIR for normal RA update.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

normalRaulmeiChkVisitor - IMEI status check from EIR for normal RA update, new visitor

Syntax

```
--normalRauImeiChkVisitor <list-item>
```

Description

IMEI status check from EIR for normal RA update, new visitor.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

overrideApn - Override APN Allowed

Syntax

```
--overrideApn <list-item>
```

Description

This PLMN parameter will be used to control whether Override APN is allowed for this PLMN. If this parameter sets to true, then override APN feature will apply for the roamer from the PLMN. Otherwise, override APN feature will not work/allow for roamers. By default, this parameter is set to false. This parameter applies to roamers only, for home PLMNs, no impacts. This parameter can be used only when sgsnGParam overridePlmn set to True

Class

Optional.

List

- false - Boolean value of false.

- true - Boolean value of true.

Default

false

Name

overrideRfspIndex - Override RFSP Index

Syntax

--overrideRfspIndex <integer>

Description

When sgsnGParam rfspIndexSelectionOption is enabled and rfspIndexSelectionOption equals overrideRfspIndex then the SGSN sends locally provisioned RFSP value, as defined in current field.

Class

Optional.

Type / Range

Integer in the range of 0 to 256

Default

0

Name

pdpActImeiChk - IMEI status check from EIR for MO PDP context activation

Syntax

--pdpActImeiChk <list-item>

Description

IMEI status check from EIR for MO PDP context activation.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

pdpDeactImeiChk - IMEI status check from EIR for MO PDP context deactivation

Syntax

--pdpDeactImeiChk <list-item>

Description

IMEI status check from EIR for MO PDP context deactivation.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

periodRaulmeiChk - IMEI status check from EIR for periodic RA update

Syntax

--periodRauImeiChk <list-item>

Description

IMEI status check from EIR for periodic RA update.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

plmnEARpHPriority - ARP priority value for high priority

Syntax

--plmnEARpHPriority <integer>

Description

ARP priority value for high priority. plmnearphpriority should be less than plmnearpmpriority.

Class

Optional.

Type / Range

Integer in the range of 1 to 13

Default

5

Name

plmnEARpMPriority - ARP priority value for medium priority

Syntax

--plmnEARpMPriority <integer>

Description

ARP priority value for medium priority.plmnearpmpriority should be less than plmnearphpriority.

Class

Optional.

Type / Range

Integer in the range of 2 to 14

Default

10

Name

plmnEARpPCap - Pre-emption capability

Syntax

--plmnEARpPCap <list-item>

Description

Pre-emption capability true - enable false - disable.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

plmnEARpPVul - Pre-emption vulnerability

Syntax

--plmnEARpPVul <list-item>

Description

Pre-emption vulnerability true - enable false - disable.

Class

Optional.

List

- false - Boolean value of false.

- true - Boolean value of true.

Default

false

Name

plmnSpecQosRParInUse - PLMN specific QoS roaming parameters in use

Syntax

--plmnSpecQosRParInUse <list-item>

Description

PLMN specific QoS roaming parameters in use true - PLMN specific QoS roaming parameters are in use. Roaming check is performed according to PLMN specific parameters, which can be defined with the help of MAXQOS parameter group. false - PLMN specific QoS roaming parameters are not in use. Roaming check is performed according to SGSN specific QoS roaming subscribers parameters. Note: this parameter has effect only if the parameter qosRoamingAllowed is defined as false.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

pon - LTE QoS policy set id

Syntax

--pon <integer>

Description

LTE QoS policy set id.

Class

Optional.

Type / Range

Integer in the range of 0 to 6

Default

0

Name

qosRoamingAllowed - QoS based roaming agreement

Syntax

--qosRoamingAllowed <list-item>

Description

QoS based roaming agreement. with the QoS based roaming agreement you can define to allow QoS roaming. true - QoS roaming is allowed. roaming check is not performed, and QoS parameter downgrade, according to QoS roaming list, is not possible false - QoS roaming is not allowed. roaming check must be performed according to QOSPLMN parameter value.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

rfspIndexSelectionOption - RFSP Selection Option

Syntax

--rfspIndexSelectionOption <list-item>

Description

This field defines the way that RFSP Index is selected for the UE. Options are (1) (feature) disabled (2) apply local value as configured in overrideRfspIndex field

Class

Optional.

List

- disabled - Feature is disabled at the rfspProfile
- overrideRfspIndex - Override RFSP Index - SGSN assigns to the UE the RFSP Index as defined in Override RFSP Index field in rfspProfile

Default

disabled

Name

roamingControl - Roaming control

Syntax

--roamingControl <list-item>

Description

Roaming control parameter LBO - only local breakout is allowed. HRT - only home routed traffic is allowed. BOTH - both home routed traffic and local breakout are allowed. NOT - roaming not allowed. Default value is HRT

Class

Optional.

List

- BOTH - Both home routed traffic and local breakout are allowed.
- HRT - Home routed traffic - Only home routed traffic is allowed.
- LBO - Local breakout - Only local breakout is allowed.
- NOT - Not.

Default

HRT

Name

s4SgsnRoamingControl - Roaming control for S4 SGSN

Syntax

--s4SgsnRoamingControl <list-item>

Description

S4 SGSN Roaming control parameter LBO - only local breakout is allowed. HRT - only home routed traffic is allowed. BOTH - both home routed traffic and local breakout are allowed. NOT - roaming not allowed. Default value is HRT

Class

Optional.

List

- BOTH - Both home routed traffic and local breakout are allowed.
- HRT - Home routed traffic - Only home routed traffic is allowed.
- LBO - Local breakout - Only local breakout is allowed.
- NOT - Not.

Default

HRT

Name

s6dSelection - s6dGr selection per PLMN

Syntax

--s6dSelection <list-item>

Description

Operator can control on PLMN level whether S6d interface to HSS or Gr interface to HLR will be selected to acquire the UE subscription. The options are: - true, SGSN initially attempts to get EPS Subscription from HSS. Fallback to Gr is triggered if subscription is not acquired

from HSS unless Gr fallback parameter is set to not support fallback. -false, SGSN will get GPRS Subscription from HLR. Fallback to HSS is not supported

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

serviceReqImeiChk - IMEI status check from EIR for service request

Syntax

--serviceReqImeiChk <list-item>

Description

IMEI status check from EIR for service request.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

sgsnLboAllowedApnListName - name of sgsn LBO Allowed Apn List

Syntax

--sgsnLboAllowedApnListName <string>

Description

name of sgsn LBO Allowed Apn List

Class

Optional.

Type / Range

Digit string of length 0 or 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

shortNetwName - Short network name

Syntax

--shortNetwName <string>

Description

This parameter defines the short network name of the network operator (PLMN level). This is for the case MVNO used, different PLMN number is used for different operators.

Class

Optional.

Type / Range

Digit string of length 0 to 64

Default

""

Name

specialApnListName - Special Apn List Name

Syntax

--specialApnListName <string>

Description

Special Apn List Name

Class

Optional.

Type / Range

Digit string of length 0 or 1 to 31 with the allowed pattern of [0-9a-zA-Z_\.\\-:@]*

Default

""

Name

tcForQci1 - Traffic class for QCI

Syntax

--tcForQci1 <list-item>

Description

Select any traffic class based on the QCI selected possible values if QCI 1 to 4 traffic class 1 to 4 - 1 - .convesational speech - 2 - .convesational with time delay 150ms - 3 - .convesational with time delay 80ms - 4 - .streaming - 10 - default which maps to standard mapping.

Class

Optional.

List

- 1 - Conversational speech.
- 2 - Conversational with time delay 150ms.

- 3 - Conversational with time delay 80ms.
- 4 - Streaming.
- 10 - Default which maps to standard mapping.

Default

10

Name

tcForQci2 - Traffic class for QCI

Syntax`--tcForQci2 <list-item>`**Description**

Select any traffic class based on the QCI selected possible values if QCI 1 to 4 traffic class 1 to 4 - 1 - .convesational speech - 2 - .convesational with time delay 150ms - 3 - .convesational with time delay 80ms - 4 - .streaming - 10 - default which maps to standard mapping.

Class

Optional.

List

- 1 - Conversational speech.
- 2 - Conversational with time delay 150ms.
- 3 - Conversational with time delay 80ms.
- 4 - Streaming.
- 10 - Default which maps to standard mapping.

Default

10

Name

tcForQci3 - Traffic class for QCI

Syntax`--tcForQci3 <list-item>`**Description**

Select any traffic class based on the QCI selected possible values if QCI 1 to 4 traffic class 1 to 4 - 1 - .convesational speech - 2 - .convesational with time delay 150ms - 3 - .convesational with time delay 80ms - 4 - .streaming - 10 - default which maps to standard mapping.

Class

Optional.

List

- 1 - Conversational speech.
- 2 - Conversational with time delay 150ms.
- 3 - Conversational with time delay 80ms.
- 4 - Streaming.
- 10 - Default which maps to standard mapping.

Default

10

Name

tcForQci4 - Traffic class for QCI

Syntax`--tcForQci4 <list-item>`**Description**

Select any traffic class based on the QCI selected possible values if QCI 1 to 4 traffic class 1 to 4 - 1 - .convesational speech - 2 - .convesational with time delay 150ms - 3 - .convesational with time delay 80ms - 4 - .streaming - 10 - default which maps to standard mapping.

Class

Optional.

List

- 1 - Conversational speech.
- 2 - Conversational with time delay 150ms.
- 3 - Conversational with time delay 80ms.
- 4 - Streaming.
- 10 - Default which maps to standard mapping.

Default

10

Name

tcForQci5 - Traffic class for QCI

Syntax`--tcForQci5 <list-item>`**Description**

Select any traffic class based on the QCI selected possible values if QCI 5 to 9 traffic class 5 to 9 - 5 - interactive priority level 1 with signalling indication enabled - 6 - interactive priority

level 1 - 7 - interactive priority level 2 - 8 - interactive priority level 3 - 9 - background - 10 - default which maps to standard mapping.

Class

Optional.

List

- 5 - Interactive priority level 1 with signalling indication enabled.
- 6 - Interactive priority level 1.
- 7 - Interactive priority level 2.
- 8 - Interactive priority level 3.
- 9 - Background.
- 10 - Default which maps to standard mapping.

Default

10

Name

tcForQci6 - Traffic class for QCI

Syntax

--tcForQci6 <list-item>

Description

Select any traffic class based on the QCI selected possible values if QCI 5 to 9 traffic class 5 to 9 - 5 - interactive priority level 1 with signalling indication enabled - 6 - interactive priority level 1 - 7 - interactive priority level 2 - 8 - interactive priority level 3 - 9 - background - 10 - default which maps to standard mapping.

Class

Optional.

List

- 5 - Interactive priority level 1 with signalling indication enabled.
- 6 - Interactive priority level 1.
- 7 - Interactive priority level 2.
- 8 - Interactive priority level 3.
- 9 - Background.
- 10 - Default which maps to standard mapping.

Default

10

Name

tcForQci7 - Traffic class for QCI

Syntax

--tcForQci7 <list-item>

Description

Select any traffic class based on the QCI selected possible values if QCI 5 to 9 traffic class 5 to 9 - 5 - interactive priority level 1 with signalling indication enabled - 6 - interactive priority level 1 - 7 - interactive priority level 2 - 8 - interactive priority level 3 - 9 - background - 10 - default which maps to standard mapping.

Class

Optional.

List

- 5 - Interactive priority level 1 with signalling indication enabled.
- 6 - Interactive priority level 1.
- 7 - Interactive priority level 2.
- 8 - Interactive priority level 3.
- 9 - Background.
- 10 - Default which maps to standard mapping.

Default

10

Name

tcForQci8 - Traffic class for QCI

Syntax

--tcForQci8 <list-item>

Description

Select any traffic class based on the QCI selected possible values if QCI 5 to 9 traffic class 5 to 9 - 5 - interactive priority level 1 with signalling indication enabled - 6 - interactive priority level 1 - 7 - interactive priority level 2 - 8 - interactive priority level 3 - 9 - background - 10 - default which maps to standard mapping.

Class

Optional.

List

- 5 - Interactive priority level 1 with signalling indication enabled.
- 6 - Interactive priority level 1.
- 7 - Interactive priority level 2.
- 8 - Interactive priority level 3.

- 9 - Background.
- 10 - Default which maps to standard mapping.

Default

10

Name

tcForQci9 - Traffic class for QCI

Syntax

--tcForQci9 <list-item>

Description

Select any traffic class based on the QCI selected possible values if QCI 5 to 9 traffic class 5 to 9 - 5 - interactive priority level 1 with signalling indication enabled - 6 - interactive priority level 1 - 7 - interactive priority level 2 - 8 - interactive priority level 3 - 9 - background - 10 - default which maps to standard mapping.

Class

Optional.

List

- 5 - Interactive priority level 1 with signalling indication enabled.
- 6 - Interactive priority level 1.
- 7 - Interactive priority level 2.
- 8 - Interactive priority level 3.
- 9 - Background.
- 10 - Default which maps to standard mapping.

Default

10

Name

timeZone - TIME ZONE

Syntax

--timeZone <list-item>

Description

Time Zone per PLMN

Class

Optional.

List

- Africa/Abidjan - Timezone for africa/abidjan UTC offset of +00:00.

- Africa/Accra - Timezone for africa/accra UTC offset of +00:00.
- Africa/Addis_Ababa - Timezone for africa/addis_ababa UTC offset of +03:00.
- Africa/Algiers - Timezone for africa/algiers UTC offset of +01:00.
- Africa/Asmara - Timezone for africa/asmara UTC offset of +03:00.
- Africa/Asmera - Timezone for africa/asmera UTC offset of +03:00.
- Africa/Bamako - Timezone for africa/bamako UTC offset of +00:00.
- Africa/Bangui - Timezone for africa/bangui UTC offset of +01:00.
- Africa/Banjul - Timezone for africa/banjul UTC offset of +00:00.
- Africa/Bissau - Timezone for africa/bissau UTC offset of +00:00.
- Africa/Blantyre - Timezone for africa/blantyre UTC offset of +02:00.
- Africa/Brazzaville - Timezone for africa/brazzaville UTC offset of +01:00.
- Africa/Bujumbura - Timezone for africa/bujumbura UTC offset of +02:00.
- Africa/Cairo - Timezone for africa/cairo UTC offset of +02:00.
- Africa/Casablanca - Timezone for africa/casablanca UTC offset of +00:00.
- Africa/Ceuta - Timezone for africa/ceuta UTC offset of +01:00.
- Africa/Conakry - Timezone for africa/conakry UTC offset of +00:00.
- Africa/Dakar - Timezone for africa/dakar UTC offset of +00:00.
- Africa/Dar_es_Salaam - Timezone for africa/dar_es_salaam UTC offset of +03:00.
- Africa/Djibouti - Timezone for africa/djibouti UTC offset of +03:00.
- Africa/Douala - Timezone for africa/douala UTC offset of +01:00.
- Africa/El_Aaiun - Timezone for africa/el_aaiun UTC offset of +00:00.
- Africa/Freetown - Timezone for africa/freetown UTC offset of +00:00.
- Africa/Gaborone - Timezone for africa/gaborone UTC offset of +02:00.
- Africa/Harare - Timezone for africa/harare UTC offset of +02:00.
- Africa/Johannesburg - Timezone for africa/johannesburg UTC offset of +02:00.
- Africa/Juba - Timezone for africa/juba UTC offset of +03:00.
- Africa/Kampala - Timezone for africa/kampala UTC offset of +03:00.
- Africa/Khartoum - Timezone for africa/khartoum UTC offset of +03:00.
- Africa/Kigali - Timezone for africa/kigali UTC offset of +02:00.
- Africa/Kinshasa - Timezone for africa/kinshasa UTC offset of +01:00.
- Africa/Lagos - Timezone for africa/lagos UTC offset of +01:00.

- Africa/Libreville - Timezone for africa/libreville UTC offset of +01:00.
- Africa/Lome - Timezone for africa/lome UTC offset of +00:00.
- Africa/Luanda - Timezone for africa/luanda UTC offset of +01:00.
- Africa/Lubumbashi - Timezone for africa/lubumbashi UTC offset of +02:00.

Default

Default

Name

traffHandlingPrio - Traffic handling priority for roaming subscribers

Syntax

--traffHandlingPrio <integer>

Description

Traffic handling priority for roaming subscribers. this parameter defines the traffic handling priority which can be used by roaming subscriber at most.

Class

Optional.

Type / Range

Integer in the range of 1 to 3

Default

3

Name

trafficClass - Traffic class for roaming subscribers

Syntax

--trafficClass <list-item>

Description

Traffic class for roaming subscribers. this parameter defines the traffic class which can be used by roaming subscriber at most conversational - traffic class type of conversational streaming - traffic class type of streaming interactive - traffic class type of interactive background - traffic class type of background.

Class

Optional.

List

- Background - Traffic class type of background.
- Conversational - Traffic class type of conversational.
- Interactive - Traffic class type of interactive.
- Streaming - Traffic class type of streaming.

Default

Interactive

Name

unknownImeiEffect - Allow unknown equipment

Syntax

--unknownImeiEffect <list-item>

Description

Allow unknown equipment allow - is used for allowing unknown IMEI block - is used for not allowing unknown IMEI.

Class

Optional.

List

- allow - Allow.
- block - Block.

Default

block

6.58 cmm plmnSecurity

PLMN Security. Syntax, description, parameters, and roles for cmm plmnSecurity command.

Syntax

Description

This command is used to administer PLMN Security and includes parameters for defining the authentication interaction and GUTI reallocation percentages for an MME procedure. GUTI reallocation is only applicable to the following procedures: SubAttach TAUUpdate

Parameters

Name

plmnName - Mobile network name

Syntax

--plmnName <string>

Description

Name that identifies mobile network (alternate key).

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

procedureName - Procedure name

Syntax

--procedureName <list-item>

Description

Name of MME procedure.

Class

Required key.

List

- CPSRequest - CPS request - CPS request.
- IPLMNTAUUpdate - Inter PLMN TA update - Inter-PLMN TA update.
- IRATTAUUpdate - IRAT TAU - Authentication and GUTI reallocation frequency for IRAT TAU procedure.
- ServiceReq - Service request - Service request.
- SubAttach - Sub attach - Sub attach.
- TAUUpdate - TAU update - TAU update.
- UEInitDetach - UE init detach - UE init detach.
- UEInitExtSrvReq - UE init extended service request - UE init extended service request.

Name

authInteraction - Authentication interaction

Syntax

--authInteraction <integer>

Description

Indicates the percentage of cases in which an authentication interaction is performed for the specified procedure.

Class

Optional.

Type / Range

Integer in the range of 0 to 100

Default

20

Name

gutiReallocation - GUTI reallocation

Syntax

--gutiReallocation <integer>

Description

Indicates the percentage of cases in which a GUTI (Globally unique temporary identity) reallocation is performed for the specified procedure.

Class

Optional.

Type / Range

Integer in the range of 0 to 100

Default

20

Name

irat5gAuth - Authentication when UE is moving from 5G to 4G

Syntax

--irat5gAuth <list-item>

Description

Enable authentication when UE is moving from 5G to 4G

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Roles**Show**

sysadmin, manage, monitor

Modify

sysadmin, manage

List

sysadmin, manage, monitor

6.59 cmm plmnSecurityProfile

plmn Security Profile. Syntax, description, parameters, and roles for cmm plmnSecurityProfile command.

Syntax

Description

plmnSecurity is being created whenever an MME PLMN is created. So it is tied to the PLMN. This profile intents for a given range of IMSIs that can point to a different plmnSecurity. This new profile is used as an override to plmnSecurity - if it is provisioned and linked.

Parameters

Name

plmnSecurityProfileListName - Name of identifies profile

Syntax

--plmnSecurityProfileListName <string>

Description

Name that identifies a profile

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

procedureName - Procedure name

Syntax

--procedureName <list-item>

Description

Name of MME procedure.

Class

Required key.

List

- CPSRequest - CPS request - CPS request.
- IPLMNTAUUpdate - Inter PLMN TA update - Inter-PLMN TA update.
- IRATTAUUpdate - IRAT TAU - Authentication and GUTI reallocation frequency for IRAT TAU procedure.
- ServiceReq - Service request - Service request.
- SubAttach - Sub attach - Sub attach.
- TAUUpdate - TAU update - TAU update.
- UEInitDetach - UE init detach - UE init detach.
- UEInitExtSrvReq - UE init extended service request - UE init extended service request.

Name

authInteraction - Authentication interaction

Syntax

--authInteraction <integer>

Description

Indicates the percentage of cases in which an authentication interaction is performed for the specified procedure. Note: default value should align with cli plmnSecurity. The default values in plmnSecurity for each procedure set by call processing.

Class

Optional.

Type / Range

Integer in the range of 0 to 100

Default

20

Name

gutiReallocation - GUTI reallocation

Syntax

--gutiReallocation <integer>

Description

Indicates the percentage of cases in which a GUTI (Globally unique temporary identity) reallocation is performed for the specified procedure. Note: default value should align with cli plmnSecurity. The default values in plmnSecurity for each procedure set by call processing.

Class

Optional.

Type / Range

Integer in the range of 0 to 100

Default

20

Name

irat5gAuth - Authentication when UE is moving from 5G to 4G

Syntax

--irat5gAuth <list-item>

Description

Enable authentication when UE is moving from 5G to 4G

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

sysadmin, manage, monitor

6.60 cmm plmnSecurityProfileList

Plmn Security Profile List. Syntax, description, parameters, and roles for cmm plmnSecurityProfileList command.

Syntax**Description**

This command is used to administer a Plmn Security Profile List

Parameters

Name

name - Name of Plmn Security Profile List

Syntax

--name <string>

Description

Name of Plmn Security Profile List

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Roles

Create

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

6.61 cmm plmnStatistic

plmn Statistic. Syntax, description, parameters, and roles for cmm plmnStatistic command.

Syntax

Description

Home/Foreign PLMN statistics file.

Parameters

Name

mcc - MCC

Syntax

--mcc <digits>

Description

Mobile country code.

Class

Required on create, not filterable on list.

Type / Range

Digit string of length 3

Name

mnc - MNC

Syntax

--mnc <digits>

Description

Mobile network code.

Class

Required on create, not filterable on list.

Type / Range

Digit string of length 2 to 3

Name

plmnType - Plmn type

Syntax

--plmnType <list-item>

Description

Plmn type. allowed values, ALL ... all PLMNs. includes all PLMNs (home, roaming and specific PLMNs) HOME ... home PLMNs. includes operator's home PLMNs ROAMING ... roaming PLMNs. includes roaming subscribers PLMNs PLMNID ... specific PLMN id. includes only one specific PLMN id (MCC+MNC) INVALID ... invalidate entry.

Class

Required on create, not filterable on list.

List

- ALL - All PLMNs. includes all PLMNs (home, roaming and specific PLMNs).
- HOME - Home PLMNs. includes operator's home PLMNs.
- INVALID - Invalidate entry.
- PLMNID - Specific PLMN id. includes only one specific PLMN id (MCC+MNC).
- ROAMING - Roaming PLMNs. includes roaming subscribers PLMNs.

Name

id - Id

Syntax

<integer>

Description

PlmnStatistic identifier.

Class

Required value.

Type / Range

Integer in the range of 1 to 24

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

sysadmin, manage, monitor

6.62 cmm pmFluentdConfig

PM FluentD Configuration. Syntax, description, parameters, and roles for cmm pmFluentdConfig command.

Syntax**Description**

This command is used in order to configure the various capabilities for streaming PM information towards fluentD.

Parameters**Name**

name - Name

Syntax

--name <string>

Description

Fluentd configuration name

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

pmJobName - PM Job Name

Syntax

--pmJobName <string>

Description

This parameter defines which PM job name would be used in order to stream its content towards fluentD.

Class

Required on create.

Type / Range

Digit string of length 1 to 50 with the allowed pattern of [0-9a-zA-Z_\.\-:@]*

Name

streamingMethod - Streaming method

Syntax

--streamingMethod <list-item>

Description

This parameter defines the streaming method to be used from CMM towards fluentD.

Class

Optional.

List

- stderr - The PM info would be sent to stderr
- tcp - tcp socket - The PM info would be sent to the tcp socket
- none - To disable the job (no streaming)

Default

stderr

6.63 cmm pmJob

Performance Measurement Job Entry. Syntax, description, parameters, and roles for cmm pmJob command.

Syntax**Description**

This command is used to create a Performance Measurements (PM) job and includes parameters for defining start and end dates, granularity period, and to activate/suspend the job.

Parameters**Name**

jobName - Job name

Syntax

--jobName <string>

Description

Identifies the name of a performance measurement job.

Class

Required key.

Type / Range

Digit string of length 1 to 50 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Name

active - Job status

Syntax

--active <list-item>

Description

Identifies whether a performance measurement job is active or suspended.

Class

Optional.

List

- Active - Specify performance measurements job status of active.
- Suspended - Specify performance measurements job status of suspended.

Default

Suspended

Name

endDate - End date

Syntax

--endDate <string>

Description

Identifies the end date of a performance measurement job.

Class

Optional.

Type / Range

Digit string of length 8 to 11 with the allowed pattern of (\d{2}:\d{2}:\d{2})|(No_End_Date)

Default

No_End_Date

Name

granuPeriod - Granularity period

Syntax

--granuPeriod <list-item>

Description

Identifies the performance measurement job interval.

Class

Optional.

List

- 5 - Specify performance measurements period of 5 minutes.
- 15 - Specify performance measurements period of 15 minutes.

Default

15

Name

longTerm - Long term

Syntax

--longTerm <list-item>

Description

Identifies if a performance measurement job is defined as long term.

Class

Read only.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

startDate - Start date

Syntax

--startDate <string>

Description

Identifies the start date of a performance measurement job.

Class

Optional.

Type / Range

Digit string of length 8 to 13 with the allowed pattern of (\d{2}:\d{2}:\d{2})|(No_Start_Date)

Default

No_Start_Date

Roles**Create**

6.64 cmm pmJobMeas

Performance Measurement Job Measurements. Syntax, description, parameters, and roles for cmm pmJobMeas command.

Syntax

Description

This command is used to add a measurement group or type to a PM job. Groups are either system defined or custom defined. The group named 'allMts' is reserved and contains all measurements available in the system.

Parameters

Name

jobName - Job name

Syntax

--jobName <string>

Description

Identifies the name of a performance measurement job.

Class

Required key.

Type / Range

Digit string of length 1 to 50 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Name

mts - Measurement name

Syntax

--mts <string>

Description

Identifies a performance measurement name.

Class

Required key.

Type / Range

Digit string of length 1 to 70 with the allowed pattern of ([a-zA-Z0-9_\. \-:@]*)

6.65 cmm pmJobSched

Performance Measurement Job Schedules. Syntax, description, parameters, and roles for cmm pmJobSched command.

Syntax

Description

This command is used to define the day of week and time of day values for a PM job. Special day (spd) schedules can be configured for specific dates within the start-date and end-date. A job can have multiple schedules for a given day-of-week or spd; this capability enables the operator to collect information for several time periods in a day. A PM job can have an unlimited number of schedules, and schedules can overlap. Each time a schedule is added, the system assigns an integer value identifier to the schedule. Assignment and reassignment of IDs: Schedule IDs are assigned and reassigned (upon deletion) in a contiguous manner. The system automatically reassigns schedule IDs upon deletion of a schedule. If no schedule is specified, a job runs uninterrupted between the start-date and end-date settings.

Parameters

Name

jobName - Job name

Syntax

--jobName <string>

Description

Identifies the name of a performance measurement job.

Class

Required key.

Type / Range

Digit string of length 1 to 50 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Name

schedId - Schedule ID

Syntax

--schedId <integer>

Description

Identifies the ID of a performance measurement job schedule.

Class

Required key.

Type / Range

Integer in the range of 0 to 4,294,967,295

Name

colDate - Collection date

Syntax

--colDate <string>

Description

Identifies the data collection date for a special performance measurement job.

Class

Optional.

Type / Range

Digit string of length 8 to 11 with the allowed pattern of (\d{2}:\d{2}:\d{2})|(No_Spd_Date)

Default

No_Spd_Date

Name

endTime - End time

Syntax

--endTime <string>

Description

Identifies the end time of a scheduled performance measurement job.

Class

Optional.

Type / Range

Digit string of length 5 to 5 with the allowed pattern of (\d{2}:\d{2})

Default

24:00

Name

schedType - Schedule type

Syntax

--schedType <list-item>

Description

Schedule-type.

Class

Optional.

List

- dly - Daily - Performance measurement job runs every day.
- fri - Friday - Performance measurement job runs every friday.

- mon - Monday - Performance measurement job runs every monday.
- sat - Saturday - Performance measurement job runs every saturday.
- spd - Specific date - Performance measurement job runs on a specific date (e.g. new year's day).
- sun - Sunday - Performance measurement job runs every sunday.
- thu - Thursday - Performance measurement job runs every thursday.
- tue - Tuesday - Performance measurement job runs every tuesday.
- wed - Wednesday - Performance measurement job runs every wednesday.

Default

dly

Name

startTime - Start time

Syntax

--startTime <string>

Description

Identifies the start time of a scheduled performance measurement job.

Class

Optional.

Type / Range

Digit string of length 5 to 5 with the allowed pattern of (\d{2}:\d{2})

Default

00:00

6.66 cmm pmMeasGroupName

Performance Measurement Group Name. Syntax, description, parameters, and roles for cmm pmMeasGroupName command.

Syntax

Description

This command is used to administer a Performance Measurement Group Name and includes a parameter for defining the group level (the relative location of a PM group within a hierarchy of performance measurements).

Parameters

Name

groupName - Measurement group name

Syntax

--groupName <string>

Description

Identifies the name of a performance measurement group.

Class

Required key.

Type / Range

Digit string of length 1 to 50 with the allowed pattern of [0-9a-zA-Z_\.\-:@]*

Name

groupLevel - Measurement group level

Syntax

--groupLevel <list-item>

Description

Identifies the relative location of a performance measurement group within a hierarchy of performance measurements. Group Level can be: 1) System_Leaf - a system-defined group that contains only measurement types, 2) System_Non_Leaf - a system-defined group that can contain measurement groups and measurement types, 3) Custom - a user-defined group.

Class

Not modifiable.

List

- Custom - A user-defined group.

- **System_Leaf** - System leaf - A system-defined group that contains only measurement types.
- **System_Non_Leaf** - System non-leaf - A system-defined group that can contain measurement groups and measurement types.

Default

Custom

Name

measGroupDesc - Measurement group description

Syntax

--measGroupDesc <string>

Description

Identifies the description of a performance measurement group.

Class

Optional.

Type / Range

Digit string of length 0 to 94 with the allowed pattern of [0-9a-zA-Z.\-/_:@]*

Roles**Create**

6.67 cmm pmMeasGroups

Performance Measurement Groups. Syntax, description, parameters, and roles for cmm pmMeasGroups command.

Syntax

Description

This command is used to add/remove a measurement group or measurement type to a custom measurement group.

Parameters

Name

groupName - Measurement group name

Syntax

--groupName <string>

Description

Identifies the name of a performance measurement group.

Class

Required key.

Type / Range

Digit string of length 1 to 50 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Name

measName - Measurement name

Syntax

--measName <string>

Description

Identifies the name of a performance measurement.

Class

Required key.

Type / Range

Digit string of length 1 to 70 with the allowed pattern of ([a-zA-Z0-9_\. \-:@]*)

6.68 cmm pool

Pools. Syntax, description, parameters, and roles for `cmm pool` command.

Syntax

Description

Configure, list and show Pools.

Parameters

Name

ipAddress - ipAddress

Syntax

--ipAddress <string>

Description

IPv4-IPv6 address of the target SGSN over Gn or S16 interface

Class

Required on create, not filterable on list.

Type / Range

Digit string of length 0 or 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

poolnri - Pool nri

Syntax

--poolnri <integer>

Description

Network resource identifier (SGSN).

Class

Required on create, not filterable on list.

Type / Range

Integer in the range of 0 to 127

Name

interface - Interface

Syntax

--interface <list-item>

Description

Interface type.

Class

Optional, not filterable on list.

List

- GN - Specify pool interface type of Gn.
- S16 - Specify pool interface type of S16.

Default

GN

Name

id - Id

Syntax

<integer>

Description

Index of the respective unit record.

Class

Required value.

Type / Range

Integer in the range of 1 to 64

6.69 cmm praAttributes

PRA Attributes. Syntax, description, parameters, and roles for cmm praAttributes command.

Syntax**Description**

Manage the Presence Reporting Area.

Parameters

Name

prald - PRA Identifier

Syntax

--prald <integer>

Description

The identifier of the Presence Reporting Area.

Class

Required key.

Type / Range

Integer in the range of 8,388,608 to 16,777,215

Name

praState - PRA Identifier State

Syntax

--praState <list-item>

Description

Presence Reporting Area identifier state.

Class

Optional.

List

- praActive - PRA Active - Presence Reporting Area identifier is active. MME reports UE presence on the associated CN predefined area normally.
- praDormant - PRA Dormant - Presence Reporting Area identifier is dormant. MME suppresses UE presence reports on the associated CN predefined area.

Default

praActive

6.70 cmm praDclpv4List

PRA Dual Connectivity IPv4 List. Syntax, description, parameters, and roles for cmm praDcIpv4List command.

Syntax

Description

PRA Dual Connectivity IPv4 List. The Dual connectivity Presence Reporting Area functionality updating based on provisioned IPv4 address range utilizes the IPv4 address definitions. The functionality uses CN predefined PRAs. The MME reports via PRA reporting that a UE is inside the area when a 5G gNB having an IPv4 address belonging to the provisioned range is used for this UE with dual connectivity. The UE is outside the area when the corresponding 5G gNB is not used for the UE. A single list (that is mapped to a single PRA identifier) can contain 10 address ranges. MME supports max or altogether 128 segment lists (or PRA identifiers).

Parameters

Name

name - PRA Dual Connectivity IPv4 Mapping List Name

Syntax

--name <string>

Description

The name of the PRA Dual Connectivity IPv4 Mapping List.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

6.71 cmm praDclpv4Range

PRA Dual Connectivity IPv4 Address Range. Syntax, description, parameters, and roles for cmm praDcIpv4Range command.

Syntax

Description

Manage a 5G gNB IPv4 address range list. The IPv4 address ranges belong to 5G gNBs that are used for dual connectivity and dual connectivity based reporting of 5G usage. The MME reports via PRA reporting that a UE is inside the area when a 5G gNB having an IPv4 address belonging to the provisioned range is used for this UE with dual connectivity. The UE is outside the area when the corresponding 5G gNB is not used for the UE. An IPv4 address range list can contain 10 ranges. The list maps to a single PRA identifier. MME supports max 128 PRA identifiers and thus max 128 segment lists.

Parameters

Name

praDclpv4ListName - PRA Dual Connectivity IPv4 List Name

Syntax

--praDcIpv4ListName <string>

Description

The name of the PRA Dual Connectivity IPv4 List.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

ipv4Base - IPv4 Subnet Base

Syntax

--ipv4Base <string>

Description

Defines the IPv4 subnet used to differentiate gNBs (5G) from eNBs (4G) in dual connectivity PRA reporting.

Class

Required key.

Type / Range

Digit string of length 7 to 15 with the allowed pattern of [0-9\.*]

Name

ipv4RangeMask - IPv4 Range Mask

Syntax

--ipv4RangeMask <string>

Description

Defines the IPv4 range mask used to differentiate gNBs (5G) from eNBs (4G) in dual connectivity PRA reporting. This parameter defines the range of bits used for the low/high limits.

Class

Required key.

Type / Range

Digit string of length 7 to 15 with the allowed pattern of [0-9\.*]

Name

ipv4RangeHighLimit - IPv4 Range High Limit

Syntax

--ipv4RangeHighLimit <string>

Description

Defines the high limit of the ipv4 address range to differentiate gNBs (5G) from eNBs (4G) in dual connectivity PRA reporting. The high limit value is included in the range.

Class

Required on create.

Type / Range

Digit string of length 7 to 15 with the allowed pattern of [0-9\.*]

Name

ipv4RangeLowLimit - IPv4 Range Low Limit

Syntax

--ipv4RangeLowLimit <string>

Description

Defines the low limit of the ipv4 address range to differentiate gNBs (5G) from eNBs (4G) in dual connectivity PRA reporting. The low limit is included in the range.

Class

Required on create.

Type / Range

Digit string of length 7 to 15 with the allowed pattern of [0-9\.*]

Name

ipv4SubnetMask - IPv4 Subnet Mask

Syntax

--ipv4SubnetMask <string>

Description

Defines the IPv4 mask used to differentiate gNBs (5G) from eNBs (4G) in dual connectivity PRA reporting. This parameter defines the base and the mask.

Class

Required on create.

Type / Range

Digit string of length 7 to 15 with the allowed pattern of [0-9\.*]

6.72 cmm praDcIpv6Prefix

PRA Dual Connectivity IPv6 Address Prefix. Syntax, description, parameters, and roles for cmm praDcIpv6Prefix command.

Syntax**Description**

Manage a 5G gNB IPv6 address prefix list. The defined IPv6 addresses belong to 5G gNBs that are used for dual connectivity and dual connectivity based reporting of 5G usage. The MME reports via PRA reporting that a UE is inside the area when a 5G gNB having an IPv6 address covered by the provisioned prefix is used for this UE with dual connectivity. The UE is outside the area when a 5G gNB is not used for the UE. An IPv6

address prefix list can contain up to 25 prefixes. MME supports max 128 PRA identifiers and thus max 128 prefix lists.

Parameters

Name

praDcIpv6PrefixListName - PRA DC IPv6 Prefix List Name

Syntax

--praDcIpv6PrefixListName <string>

Description

The name of the IPv6 address prefix list.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

baseIpv6Address - IPv6 Prefix

Syntax

--baseIpv6Address <string>

Description

The base IPv6 address of the IPv6 prefix identifying the 5G gNBs.

Class

Required key.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of '[0-9a-f:]*'

Name

prefixLength - Prefix Length

Syntax

--prefixLength <integer>

Description

The length of the IPv6 prefix.

Class

Required on create, not modifiable.

Type / Range

Integer in the range of 0 to 128

6.73 cmm praDclpv6PrefixList

PRA Dual Connectivity IPv6 Address Prefix List. Syntax, description, parameters, and roles for cmm praDcIpv6PrefixList command.

Syntax

Description

PRA Dual Connectivity IPv6 Address Prefix List. The Dual Connectivity Presence Reporting Area functionality updating based on provisioned IPv6 Address Prefix List defines the gNB addresses with IPv6 prefixes. The functionality uses CN predefined PRAs. The MME reports via PRA reporting that a UE is inside the area when a 5G gNB having an IPv6 address covered by the provisioned prefix is used for this UE with dual connectivity. The UE is outside the area when a 5G gNB is not used for the UE. A single list (that is mapped to a single PRA identifier) can contain 25 IPv6 address prefixes. MME supports max or altogether 128 IPv6 address prefix lists (or PRA identifiers).

Parameters

Name

name - Name

Syntax

--name <string>

Description

The name of the IPv6 address prefix list.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

6.74 cmm praDcSegment

PRA Dual connectivity segment. Syntax, description, parameters, and roles for cmm praDcSegment command.

Syntax

Description

Manage a 5G gNB IPv6 address segments. The IPv6 address segments belong to 5G gNBs that are used for dual connectivity and segment based reporting of 5G usage. The MME reports via PRA reporting that a UE is inside the area when a 5G gNB having a provisioned IPv6 address segment is used for this UE with dual connectivity. The UE is outside the area when the corresponding 5G gNB is not used for the UE. An IPv6 segment list can contain 10 segments. The segment list maps to a single PRA identifier. MME supports max 128 PRA identifiers and thus max 128 segment lists.

Parameters

Name

praDcSegmentListName - PRA Dual Connectivity Segment List Name

Syntax

--praDcSegmentListName <string>

Description

The name of the PRA Dual Connectivity Segment List.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

ipv6SegmentContent - IPv6 address segment content

Syntax

--ipv6SegmentContent <string>

Description

The full content of the special IPv6 address segment.

Class

Required key.

Type / Range

Digit string of length 1 to 4 with the allowed pattern of [0-9a-fA-F]*

Name

ipv6SegmentNumber - IPv6 Address Segment Number

Syntax

--ipv6SegmentNumber <integer>

Description

This field specifies which segment number is specified in the Segment Content field.

Class

Required key.

Type / Range

Integer in the range of 1 to 8

6.75 cmm praDcSegmentList

PRA Dual Connectivity Segment List. Syntax, description, parameters, and roles for cmm praDcSegmentList command.

Syntax

Description

PRA Dual Connectivity Segment List. The Dual connectivity Presence Reporting Area functionality updating based on provisioned IPv6 address segment utilizes the segment lists. The functionality uses CN predefined PRAs. The MME reports via PRA reporting that a UE is inside the area when a 5G gNB having a provisioned IPv6 address segment is used for this UE with dual connectivity. The UE is outside the area when the corresponding 5G gNB is not used for the UE. A single list (that is mapped to a single PRA identifier) can contain 10 segments. MME supports max/altogether 128 segment lists (or PRA identifiers).

Parameters

Name

name - PRA Dual Connectivity Segment Mapping List Name

Syntax

--name <string>

Description

The name of the PRA Dual Connectivity Segment Mapping List.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Roles

Create

6.76 cmm praDcSegmentMapping

PRA Dual connectivity segment mapping. Syntax, description, parameters, and roles for cmm praDcSegmentMapping command.

Syntax

Description

Map a CN predefined PRA id to the specific 5G gNB IP address segment/range or a segment/range list. The Dual connectivity Presence Reporting Area functionality updating based on provisioned IP address segment/range utilizes this mapping. The functionality uses CN predefined PRAs. The MME reports via PRA reporting that a UE is inside the area when a 5G gNB having a provisioned IPv6 address segment or belonging to the provisioned IPv4 address range is used for this UE with dual connectivity. The UE is outside the area when the corresponding 5G gNB is not used for the UE. MME supports max 128 PRA identifiers and max 128 segment/range lists. Each PRA identifier can map to a single segment list and/or a single range list. Each segment/range list may contain max 10 segments.

Parameters

Name

dcSegmentPraId - Dual Connectivity Segment Presence Reporting Area Identifier

Syntax

--dcSegmentPraId <integer>

Description

An integer that identifies the Core Network predefined Presence Reporting Area that is used for the Dual Connectivity segment based reporting.

Restrictions

In the current product release only a single PRA id may be provisioned.

Class

Required key.

Type / Range

Integer in the range of 8,388,608 to 16,777,215

Name

ipv6SegmentContent - IPv6 address segment content

Syntax

--ipv6SegmentContent <string>

Description

The full content of the special IPv6 address segment. Note: if singleSegmentMapping is set to false, ipv6SegmentContent will show default value 0.

Class

Optional.

Type / Range

Digit string of length 1 to 4 with the allowed pattern of [0-9a-fA-F]*

Default

0

Name

ipv6SegmentNumber - IPv6 Address Segment Number

Syntax

--ipv6SegmentNumber <integer>

Description

This field specifies which segment number is specified in the Segment Content field. Note: if singleSegmentMapping is set to false, ipv6SegmentNumber will show default value 6.

Class

Optional.

Type / Range

Integer in the range of 1 to 8

Default

6

Name

praDclpv4ListName - PRA Dual Connectivity IPv4 List Name

Syntax

--praDcIpv4ListName <string>

Description

The name of the PRA Dual Connectivity IPv4 List.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

praDclpv6PrefixListName - PRA DC IPv6 Prefix List Name

Syntax

--praDcIpv6PrefixListName <string>

Description

The name of the presence reporting area dual connectivity IPv6 address prefix list to define the gNBs.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

praDcSegmentListName - PRA Dual Connectivity Segment List Name

Syntax

--praDcSegmentListName <string>

Description

The name of the PRA Dual Connectivity Segment List including the IPv6 segments associated with the Presence Reporting Area identifier.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

""

Name

singleSegmentMapping - Single Segment Mapping

Syntax

--singleSegmentMapping <list-item>

Description

Controls whether the IPv6 segment(s) is(are) defined as a single segment (value true) or as a list of IPv6 segments (value false).

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

6.77 cmm praEcgi

Presence Reporting Area for ECGI. Syntax, description, parameters, and roles for cmm praEcgi command.

Syntax

Description

Administer Presence Reporting Area for E-UTRAN Cell Global Identifier area type. MME supports up to 10500 ECGIs per each CN predefined PRA, with a limit of 50000 of the combined number of TACs, eNBs, and ECGIs.

Parameters

Name

prald - Presence reporting area identifier

Syntax

--praId <integer>

Description

An integer that identifies the core network predefined presence reporting area.

Class

Required key.

Type / Range

Integer in the range of 8,388,608 to 16,777,215

Name

plmnName - Mobile network name

Syntax

--plmnName <string>

Description

A name that identifies mobile network.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

eci - ECI of the ECGI in the PRA

Syntax

--eci <integer>

Description

E-UTRAN cell identifier for the ECGI area type of the presence reporting area.

Class

Required key.

Type / Range

Integer in the range of 0 to 268,435,455

Roles**Create**

6.78 cmm praEnb

Presence Reporting Area for ENB. Syntax, description, parameters, and roles for cmm praEnb command.

Syntax**Description**

Administer Presence Reporting Area for the ENB area type. MME supports up to 3500 home eNBs and 3500 macro eNBs per each CN predefined PRA, with the limit of 50000 of the combined number of TACs, eNBs, and ECGIs.

Parameters**Name**

prald - Presence reporting area identifier

Syntax

--praId <integer>

Description

An integer that identifies the core network predefined presence reporting area.

Class

Required key.

Type / Range

Integer in the range of 8,388,608 to 16,777,215

Name

plmnName - Mobile network name

Syntax

--plmnName <string>

Description

A name that identifies mobile network.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

enbType - Presence reporting area eNB type

Syntax

--enbType <list-item>

Description

Indicates the eNB type for the presence reporting area.

Class

Required key.

List

- homeEnb - Home eNodeB - Specify eNodeB type of home eNodeB.
- macroEnb - Macro eNodeB - Specify eNodeB type of macro eNodeB.

Name

enbId - eNB identifier of the eNB area type

Syntax

--enbId <integer>

Description

eNB identifier of the eNB area type for the presence reporting area .

Class

Required key.

6.79 cmm praSet

Presence Reporting Area Set. Syntax, description, parameters, and roles for cmm praSet command.

Syntax**Description**

Administer Presence Reporting Area set. PRA set can only consist of PRA ids related to either standard based PRA functionality, or related to segment based PRA functionality. Both PRA ids related to segment based functionality and PRA ids related to standard based are not allowed on the same PRA set. A Core Network predefined PRA id must be unique in the system. A single PRA id may be contained in multiple PRA sets. PRA set id cannot be contained in the same or a different PRA set (i.e. nested PRA sets are not allowed). A PRA set can contain max 9 PRA ids. Only a single PRA set can be requested to be reported at a time for a single UE. Another PRA set id reporting request for the same UE and PDN (or the same PRA set id reporting request for a different or same PDN of the same UE) will be ignored in the MME.

Parameters**Name**

praSetId - Presence Reporting Area Set Identifier

Syntax

--praSetId <integer>

Description

An integer that identifies the core network predefined presence reporting area set.

Class

Required key.

Type / Range

Integer in the range of 8,388,608 to 16,777,215

Name

prald - Presence Reporting Area Identifier

Syntax

--praId <integer>

Description

An integer that identifies the core network predefined presence reporting area.

Class

Required key.

Type / Range

Integer in the range of 8,388,608 to 16,777,215

6.80 cmm praTai

Presence Reporting Area for TAI. Syntax, description, parameters, and roles for `cmm praTai` command.

Syntax**Description**

Administer Presence Reporting Area for Tracking Area Identity area type. MME supports up to 1500 TAIs per each CN predefined PRA, with the limit of 50000 of the combined number of TACs, eNBs, and ECGIs.

Parameters

Name

prald - Presence reporting area identifier

Syntax

--praId <integer>

Description

An integer that identifies the core network predefined presence reporting area.

Class

Required key.

Type / Range

Integer in the range of 8,388,608 to 16,777,215

Name

plmnName - Mobile network name

Syntax

--plmnName <string>

Description

A name that identifies mobile network.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Name

tac - TAC in the TAI of the PRA

Syntax

--tac <integer>

Description

Tracking area code in the tracking area identity area type of the presence reporting area.

Class

Required key.

6.81 cmm preferredNfTypeList

Preferred NF Type List. Syntax, description, parameters, and roles for cmm preferredNfTypeList command.

Syntax

Description

List of Preferred NF Types. Each NF Type can be added only once

Parameters

Name

name - Preferred NF Type List Name

Syntax`--name <string>`**Description**

Preferred NF Type List Name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Roles

6.82 cmm preferredNfTypes

Preferred NF Type. Syntax, description, parameters, and roles for cmm preferredNfTypes command.

Syntax

Description

Adds a preferred NFType to a preferred NFType list

Parameters

Name

preferredNfTypeListName - Preferred NF Type List Name

Syntax

--preferredNfTypeListName <string>

Description

Preferred NF Type List Name

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

preferredNfType - Preferred NF Type

Syntax

--preferredNfType <list-item>

Description

Preferred NF Type

Class

Required key.

List

- hAusf - Home Network AUSF
- hPcf - Home Network PCF
- hSmf - Home Network SMF
- hUdm - Home Network UDM

- vPcf - Visiting Network PCF
- vSmf - Visiting Network SMF

6.83 cmm prometheusGW

Prometheus pushGateway. Syntax, description, parameters, and roles for cmm prometheusGW command.

Syntax

Description

Provision the address and characteristics of the Prometheus pushGateway

Parameters

Name

prometheusIndex - Prometheus GW Index

Syntax

--prometheusIndex <integer>

Description

Index for the Prometheus GW

Class

Required key.

Type / Range

Integer in the range of 1 to 1

Name

primaryIp - Prometheus GW Primary IP

Syntax

--primaryIp <string>

Description

Primary IP address of the Prometheus GW

Class

Required on create.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

primaryPort - Primary Port

Syntax

--primaryPort <integer>

Description

Primary port address of Prometheus GW.

Class

Required on create.

Type / Range

Integer in the range of 1,024 to 65,535

Name

prometheusConnName - Connection Name for Prometheus

Syntax

--prometheusConnName <string>

Description

Name used to identify the AMF on Prometheus connection

Class

Required on create.

Type / Range

Digit string of length 0 or 1 to 64 with the allowed pattern of [0-9a-zA-Z\._:-]*

Name

prometheusConnWord - Prometheus Connection word

Syntax

--prometheusConnWord <string>

Description

Connection word for Prometheus

Class

Required on create.

Type / Range

Digit string of length 0 or 1 to 64 with the allowed pattern of [0-9a-zA-Z\._:\]*

6.84 cmm prometheusScrape

Prometheus Server Interface. Syntax, description, parameters, and roles for **cmm prometheusScrape** command.

Syntax**Description**

This command is used to provision the configuration needed so that Prometheus Server can directly scrape the relevant metrics from NECC (prometheusClient).

Parameters**Name**

dscpCode - DSCP Code

Syntax

--dscpCode <list-item>

Description

Parameter to set DSCP code to be used for an IP packet

Class

Optional.

List

- AF11 - Assured forwarding 11.

- AF12 - Assured forwarding 12.
- AF13 - Assured forwarding 13.
- AF21 - Assured forwarding 21.
- AF22 - Assured forwarding 22.
- AF23 - Assured forwarding 23.
- AF31 - Assured forwarding 31.
- AF32 - Assured forwarding 32.
- AF33 - Assured forwarding 33.

- CS3 - Class selector 3.
- CS4 - Class selector 4.
- CS5 - Class selector 5.
- CS6 - Class selector 6.
- CS7 - Class selector 7.
- EF - Expedited forwarding.
- voiceAdmit - Voice Admit

Default

AF41

Name

httpProfileName - HTTP Profile Name

Syntax`--httpProfileName <string>`**Description**

Assign HTTP profile for the end point.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

default

Name

oamTlsProfileName - OAM TLS Profile

Syntax

--oamTlsProfileName <string>

Description

This parameter contains the profile for TLS. It contains the certificate names needed for establishing secure communication.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

"

Name

tcpProfileName - TCP Profile Name

Syntax

--tcpProfileName <string>

Description

Configure TCP profile to the endpoint.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

default

6.85 cmm psmApn

PSM APN. Syntax, description, parameters, and roles for cmm psmApn command.

Syntax

Description

Administer PSM for APN.

Parameters

Name

psmApnListName - PSM APN list name

Syntax

--psmApnListName <string>

Description

PSM APN list name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Name

apnNi - APN NI

Syntax

--apnNi <string>

Description

APN NI.

Class

Required key.

Type / Range

Digit string of length 1 to 62 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Name

nbPsmT3412Timer - NB-S1 mode power savings mode T3412 timer

Syntax

--nbPsmT3412Timer <integer>

Description

Configure T3412 timer to be used for a NB-S1 UE that supports PSM.

Class

Optional.

Type / Range

Integer in the range of 1 to 31

Default

31

Name

nbPsmT3412TimerUnit - NB-S1 mode power savings mode T3412 timer unit

Syntax

--nbPsmT3412TimerUnit <list-item>

Description

Power savings mode T3412 timer unit.

Class

Optional.

List

- 10Hours - Specify unit of T3412 timer of 10 hours.
- 10Minutes - Specify unit of T3412 timer of 10 minutes.
- 2Seconds - Specify unit of T3412 timer of 2 seconds.
- 30Seconds - Specify unit of T3412 timer of 30 seconds.
- Hour - Specify unit of T3412 timer of hours.
- Minute - Specify unit of T3412 timer of minutes.
- 320Hours - Specify unit of T3412 timer of 320 hours.

Default

10Minutes

Name

nbT3324Timer - NB-S1 mode T3324 timer

Syntax

--nbT3324Timer <integer>

Description

Active timer for NB-S1 UE in seconds.

Class

Optional.

Type / Range

Integer in the range of 0 to 11,160

Default

300

Name

psmEnabled - PSM enabled

Syntax

--psmEnabled <list-item>

Description

PSM enabled.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

source - source

Syntax

--source <list-item>

Description

source

Class

Optional.

List

- UE - description: Specifies eDRX/PSM source as UE.
- local - description: local means Specifies eDRX/PSM source as APN .

Default

local

Name

wbPsmT3412Timer - WB-S1 mode power savings mode T3412 timer

Syntax

--wbPsmT3412Timer <integer>

Description

Configure T3412 timer to be used for a WB-S1 UE that supports PSM.

Class

Optional.

Type / Range

Integer in the range of 1 to 31

Default

31

Name

wbPsmT3412TimerUnit - WB-S1 mode power savings mode T3412 timer unit

Syntax

--wbPsmT3412TimerUnit <list-item>

Description

Power savings mode T3412 timer unit.

Class

Optional.

List

- 10Hours - Specify unit of T3412 timer of 10 hours.
- 10Minutes - Specify unit of T3412 timer of 10 minutes.
- 2Seconds - Specify unit of T3412 timer of 2 seconds.
- 30Seconds - Specify unit of T3412 timer of 30 seconds.
- Hour - Specify unit of T3412 timer of hours.
- Minute - Specify unit of T3412 timer of minutes.
- 320Hours - Specify unit of T3412 timer of 320 hours.

Default

10Minutes

Name

wbT3324Timer - WB-S1 mode T3324 timer

Syntax

--wbT3324Timer <integer>

Description

Active timer for WB-S1 UE in seconds.

Class

Optional.

Type / Range

Integer in the range of 0 to 11,160

Default

300

6.86 cmm psmApnList

PSM APN List. Syntax, description, parameters, and roles for cmm psmApnList command.

Syntax**Description**

Administer List of APNs for PSM.

Parameters**Name**

name - PSM APN list name

Syntax

--name <string>

Description

PSM APN list name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Name

description - Description

Syntax

--description <string>

Description

Profile description.

Class

Optional.

Type / Range

Digit string of length 0 to 160 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

"

6.87 cmm qosConf

QoS configuration. Syntax, description, parameters, and roles for cmm qosConf command.

Syntax**Description**

Configure and show QoS parameters.

Parameters**Name**

arpRoam - Allocation/retention priority for roaming

Syntax`--arpRoam <integer>`**Description**

This parameter defines the allocation/retention priority which can be used by a roaming subscriber at most. possible values range from 1 to 3.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 3

Default

3

Name

downMaxRoam - Maximum bit rate for downlink for roaming

Syntax`--downMaxRoam <integer>`**Description**

This parameter defines the maximum bit rate for downlink traffic for a roaming subscriber. the values range from 0 to 63 in steps of 1, from 64 to 568 in steps of 8, and from 576 to 8640 in steps of 64. optionally, there are also the range of values from 8700 to 16000 in steps of 100, from 17000 to 128000 in steps of 1000 and from 130000 to 168000 in steps of 2000.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 0 to 168,000

Default

50

Name

Default

100010

Name

dwGbrRoam - Guaranteed bit rate for downlink for roaming

Syntax

--dwGbrRoam <integer>

Description

This parameter defines the guaranteed bit rate for downlink traffic for a roaming subscriber. the values range from 0 to 63 in steps of 1, from 64 to 568 in steps of 8, and from 576 to

8640 in steps of 64. optionally, there is also the range of values from 8700 to 16000 in steps of 100, from 17000 to 128000 in steps of 1000 and from 130000 to 168000 in steps of 2000.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 0 to 168,000

Default

0

Name

earpRoam - Evolved allocation/retention priority

Syntax

--earpRoam <integer>

Description

This parameter indicates the evolved ARP. the values range from 1 to 15.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 15

Default

14

Name

epsHighPrioRoam - EPS bearer ARP high prior for roaming subscriber

Syntax

--epsHighPrioRoam <integer>

Description

EPS bearer ARP high prior for roaming subscriber. the values range from 1 to 13.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 13

Default

5

Name

epsMedPrioRoam - EPS bearer ARP medium prior for roaming subscriber

Syntax

--epsMedPrioRoam <integer>

Description

EPS bearer ARP medium prior for roaming subscriber. the values range from 2 to 14.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 2 to 14

Default

10

Name

gbWredSwitch - Enhanced random early detection in gb buffer, QGB

Syntax

--gbWredSwitch <list-item>

Description

This parameter defines whether the enhanced random early detection (ERED) algorithm is used in the gb buffer.

Class

Optional, not filterable on list.

List

- inUse - In use - Specify QoS switch type of in use.
- notInUse - Not in use - Specify QoS switch type of not in use.

Default

inUse

Name

gtpWredSwitch - Random early detection in GTP buffer, QGTP

Syntax

--gtpWredSwitch <list-item>

Description

This parameter defines whether the random early detection (RED) algorithm is used in the GPRS tunnelling protocol (GTP) buffer.

Class

Optional, not filterable on list.

List

- inUse - In use - Specify QoS switch type of in use.
- notInUse - Not in use - Specify QoS switch type of not in use.

Default

inUse

Name

hPriority - EPS bearer ARP high priority

Syntax

--hPriority <integer>

Description

EPS bearer ARP high priority. possible weight values range from 1 to 13.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 13

Default

5

Name

igbr - Guaranteed bit rate for UTRAN to GERAN in ISHO

Syntax

--igbr <integer>

Description

This parameter defines the guaranteed bit rate for UTRAN to GERAN in ISHO. the values range from 0 to 63 kbit/s in steps of 1 and from 64 to 472 kbit/s in steps of 8. IGBR has to be smaller or same than IMBR.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 0 to 472

Default

472

Name

imbr - Maximum bit rate for UTRAN to GERAN in ISHO

Syntax

--imbr <integer>

Description

This parameter defines the maximum bit rate for UTRAN to GERAN in ISHO. the values range from 0 to 63 kbit/s in steps of 1 and from 64 to 472 kbit/s in steps of 8. IMBR has to be greater or same than IGBR.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 0 to 472

Default

472

Name

mPriority - EPS bearer ARP medium priority

Syntax

--mPriority <integer>

Description

EPS bearer ARP medium priority. possible weight values range from 2 to 14.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 2 to 14

Default

10

Name

pcap - Pre-emption capability

Syntax

--pcap <list-item>

Description

Pre-emption capability. enable or disable.

Class

Optional, not filterable on list.

List

- disable - Specify preempt value of disable.
- enable - Specify preempt value of enable.

Default

disable

Name

pcapRoam - Pre-emption capability for roaming subscriber

Syntax

--pcapRoam <list-item>

Description

Pre-emption capability for roaming subscriber. enable or disable.

Class

Optional, not filterable on list.

List

- disable - Specify preempt value of disable.
- enable - Specify preempt value of enable.

Default

disable

Name

pvul - Pre-emption vulnerability

Syntax

--pvul <list-item>

Description

Pre-emption vulnerability. enable or disable.

Class

Optional, not filterable on list.

List

- disable - Specify preempt value of disable.
- enable - Specify preempt value of enable.

Default

enable

Name

pvulRoam - Pre-emption vulnerability for roaming subscriber

Syntax

--pvulRoam <list-item>

Description

Pre-emption vulnerability for roaming subscriber. enable or disable.

Class

Optional, not filterable on list.

List

- disable - Specify preempt value of disable.
- enable - Specify preempt value of enable.

Default

disable

Name

scheduleSwitch - Scheduling in gb buffer, QSGB

Syntax

--scheduleSwitch <list-item>

Description

This parameter defines whether the scheduling algorithm is used.

Class

Optional, not filterable on list.

List

- inUse - In use - Specify QoS switch type of in use.
- notInUse - Not in use - Specify QoS switch type of not in use.

Default

inUse

Name

trafClassRoam - Traffic class for roaming

Syntax

--trafClassRoam <list-item>

Description

This parameter defines the traffic class which can be used by a roaming subscriber at most.

Class

Optional, not filterable on list.

List

- Background - Traffic class type of background.
- Conversational - Traffic class type of conversational.
- Interactive - Traffic class type of interactive.
- Streaming - Traffic class type of streaming.

Default

Interactive

Name

trafHandPrioRoam - Traffic handling priority for roaming

Syntax

--trafHandPrioRoam <integer>

Description

This parameter defines the traffic handling priority which can be used by a roaming subscriber at most. possible values range from 1 to 3.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 3

Default

3

Name

upGbrRoam - Guaranteed bit rate for uplink for roaming

Syntax

--upGbrRoam <integer>

Description

This parameter defines the guaranteed bit rate for uplink traffic for a roaming subscriber. the values range from 0 to 63 in steps of 1, from 64 to 568 in steps of 8, and from 576 to 8640 in steps of 64. optionally, there is also the range of values from 8700 to 16000 in steps of 100 and from 17000 to 46000 in steps of 1000.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 0 to 46,000

Default

0

Name

upMaxRoam - Maximum bit rate for uplink for roaming

Syntax

--upMaxRoam <integer>

Description

This parameter defines the maximum bit rate for uplink traffic for a roaming subscriber. the values range from 0 to 63 in steps of 1, from 64 to 568 in steps of 8, and from 576 to 8640 in steps of 64. optionally, there is also the range of values from 8700 to 16000 in steps of 100 and from 17000 to 46000 in steps of 1000.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 0 to 46,000

Default

50

Name

weightPri1 - Weight for scheduling priority one, QP1

Syntax

--weightPri1 <integer>

Description

This parameter defines the relative capacity of delay class 1 compared to the other delay classes. possible weight values range from 25 to 90 in steps of 5. if you enter a value for the weight for scheduling priority one parameter, you must enter values for the other weightpri parameters as well.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 25 to 90

Default

50

Name

weightPri2 - Weight for scheduling priority two, QP2

Syntax

--weightPri2 <integer>

Description

This parameter defines the relative capacity of delay class 2 compared to the other delay classes. possible weight values range from 5 to 45 in steps of 5. if you enter a value for the weight for scheduling priority one parameter, you must enter values for the other weightpri parameters as well.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 5 to 45

Default

30

Name

weightPri3 - Weight for scheduling priority three, QP3

Syntax

--weightPri3 <integer>

Description

This parameter defines the relative capacity of delay class 3 compared to the other delay classes. possible weight values range from 5 to 30 in steps of 5. if you enter a value for the weight for scheduling priority one parameter, you must enter values for the other weightpri parameters as well.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 5 to 30

Default

15

Name

weightPri4 - Weight for scheduling priority four, QP4

Syntax

--weightPri4 <integer>

Description

This parameter defines the relative capacity of delay class 4 compared to the other delay classes. possible weight values range from 0 to 25 in steps of 5. if you enter a value for the weight for scheduling priority one parameter, you must enter values for the other weightpri parameters as well.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 0 to 25

Default

5

Name

weightPri5 - Non-guaranteed streaming traffic queue priority

Syntax

--weightPri5 <integer>

Description

This parameter defines the weight value for non-guaranteed streaming traffic queue. the priority of streaming queue is set to be guaranteed by default. if other queues start to fill up, the streaming queue weight is downgraded to operatordefined non-guaranteed weight value until traffic is balanced, and the streaming queue can start to use higher priority again. possible values range from 0 to 200.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 0 to 200

Default

200

Name

id - Id

Syntax

config

Description

Just type 'config' here.

Class

Required value.

List

- config - Specify LTE QoS policy default of config.

Roles**Show**

Modify

sysadmin, manage

List

sysadmin, manage, monitor

6.88 cmm qosProfile

Enhanced QoS Profile for Roaming Subscribers. Syntax, description, parameters, and roles for cmm qosProfile command.

Syntax**Description**

This command is used to administer an Enhanced QoS Profile for Roaming Subscribers and includes parameters for defining the APN-NI, APN AMBR bitrates, default bearer ARP, QCI, PCI and PVI values, and guaranteed and non-guaranteed dedicated bearer ARP, bitrate, QCI, PCI and PVI values.

Parameters**Name**

name - Roaming QoS profile

Syntax

--name <string>

Description

A name that identifies this roaming QoS profile.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Name

profileType - Enhanced roaming QoS profile type

Syntax

--profileType <list-item>

Description

Profile Type. Uniquely identifies the various types of profiles we support: IMS, Non-IMS, Custom APN 1, 2 or 3

Class

Required on create, not modifiable.

List

- CustomAPN2gPrfl - 2G custom APN profile - 2G S4 QoS profile for custom APNs.
- CustomAPN3gPrfl - 3G custom APN profile - 3G S4 QoS profile for custom APNs.
- CustomAPNPrfl1 - Custom APN profile - 1 - Roaming QoS profile for custom APN 1.
- CustomAPNPrfl2 - Custom APN profile - 2 - Roaming QoS profile for custom APN 2.
- CustomAPNPrfl3 - Custom APN profile - 3 - Roaming QoS profile for custom APN 3.
- IMSAPN2gPrfl - 2G S4 IMS APN profile - 2G S4 QoS profile IMS APNs.
- IMSAPN3gPrfl - 3G S4 IMS APN profile - 3G S4 QoS profile IMS APNs.
- IMSAPNPrfl - IMS APN profile - Roaming QoS profile for IMS APNs.
- NonIMSAPN2gPrfl - 2G non-ims APN profile - 2G S4 QoS profile for non-ims APNs.
- NonIMSAPN3gPrfl - 3G non-ims APN profile - 3G S4 QoS profile for non-ims APNs.
- NonIMSAPNPrfl - Non-IMS APN profile - Roaming QoS profile for non-ims APNs.

Name

apnAmbrDownLink - APN AMBR downlink for default bearer

Syntax

--apnAmbrDownLink <integer>

Description

APN aggregated maximum bitrate downlink for default bearer.

Class

Optional.

Type / Range

Integer in the range of 0, 1-63, 64- 568, 576-8640, 8700-16000, 17000-128000,
130000-4000000000 in units of kbps

Default

128000

Name

apnAmbrUpLink - APN AMBR uplink for default bearer

Syntax

--apnAmbrUpLink <integer>

Description

APN aggregated maximum bitrate uplink for default bearer.

Class

Optional.

Type / Range

Integer in the range of 0, 1-63, 64- 568, 576-8640, 8700-16000, 17000-128000,
130000-4000000000 in units of kbps

Default

128000

Name

apnAmbrUseHssValue - APN AMBR use HSS value

Syntax

--apnAmbrUseHssValue <list-item>

Description

Indicates whether to override both of the local QoS profile uplink APN-AMBR and downlink APN-AMBR values with subscribed uplink APN-AMBR and downlink APN-AMBR values in HSS.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Name

apnNi - Access point name - network indicator

Syntax

--apnNi <string>

Description

APN NI for this roaming QoS profile.

Restrictions

apnNi must be a null string if profileType is one of IMSAPNPrfl or NonIMSAPNPrfl apnNi must NOT be a null string IF (profileType is one of CustomAPNPrfl1 or CustomAPNPrfl2 or CustomAPNPrfl3) AND (given qosProfile is referenced by another table)

Class

Optional.

Type / Range

Digit string of length 0 to 62 with the allowed pattern of [0-9a-zA-Z\.\-]*

Default

"

Name

defaultBrrArp - Default bearer ARP

Syntax

--defaultBrrArp <integer>

Description

Default bearer allocation and retention priority.

Class

Optional.

Type / Range

Integer in the range of 1 to 15

Default

15

Name

defaultBrrQci - Default bearer QCI

Syntax

--defaultBrrQci <integer>

Description

QoS class identifier for default bearer.

Class

Optional.

Type / Range

Integer in the range of 5 to 9

Default

9

Name

defaultBrrUseHssValue - Default bearer use HSS value

Syntax

--defaultBrrUseHssValue <list-item>

Description

Indicates whether to override the default bearer attributes (arp-priority-level, pci, pvi) values in the local QoS profile with subscribed values in HSS.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Name

defBrrPci - Default bearer PCI

Syntax

--defBrrPci <list-item>

Description

Default bearer pre-emption capability indicator.

Class

Optional.

List

- Disabled - PCI disabled - Pre-emption capability disabled.
- Enabled - PCI enabled - Pre-emption capability enabled.

Default

Enabled

Name

defBrrPvi - Default bearer PVI

Syntax

--defBrrPvi <list-item>

Description

Default bearer pre-emption vulnerability indicator.

Class

Optional.

List

- Disabled - PVI disabled - Pre-emption vulnerability disabled.
- Enabled - PVI enabled - Pre-emption vulnerability enabled.

Default

Enabled

Name

description - Description

Syntax

--description <string>

Description

Profile description.

Class

Optional.

Type / Range

Digit string of length 0 to 160 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

"

Name

gbrDedBrrArp - Guaranteed dedicated bearer ARP

Syntax

--gbrDedBrrArp <integer>

Description

Guaranteed dedicated bearer allocation and retention priority.

Class

Optional.

Type / Range

Integer in the range of 0 to 15

Default

15

Name

gbrDedBrrBitrateDownlink - Guaranteed dedicated bearer downlink bitrate

Syntax

--gbrDedBrrBitrateDownlink <integer>

Description

Guaranteed dedicated bearer downlink bitrate.

Class

Optional.

Type / Range

Integer in the range of 0, 1-63, 64-568, 576-8640, 8700-16000, 17000-128000, 130000-256000, 260000-500000, 510000-1500000, 1600000-4000000000 in units of kbps

Default

128000

Name

gbrDedBrrBitrateUplink - Guaranteed dedicated bearer uplink bitrate

Syntax

--gbrDedBrrBitrateUplink <integer>

Description

Guaranteed dedicated bearer uplink bitrate.

Class

Optional.

Type / Range

Integer in the range of 0, 1-63, 64-568, 576-8640, 8700-16000, 17000-128000, 130000-256000, 260000-500000, 510000-1500000, 1600000-4000000000 in units of kbps

Default

128000

Name

gbrDedBrrMaxBitrateDownlink - Guaranteed dedicated bearer maximum downlink bitrate

Syntax

--gbrDedBrrMaxBitrateDownlink <integer>

Description

Guaranteed dedicated bearer maximum downlink bitrate.

Class

Optional.

Type / Range

Integer in the range of 0, 1-63, 64-568, 576-8640, 8700-16000, 17000-128000, 130000-256000, 260000-500000, 510000-1500000, 1600000-4000000000 in units of kbps

Default

128000

Name

gbrDedBrrMaxBitrateUplink - Guaranteed dedicated bearer maximum uplink bitrate

Syntax

--gbrDedBrrMaxBitrateUplink <integer>

Description

Guaranteed dedicated bearer maximum uplink bitrate.

Class

Optional.

Type / Range

Integer in the range of 0, 1-63, 64-568, 576-8640, 8700-16000, 17000-128000, 130000-256000, 260000-500000, 510000-1500000, 1600000-4000000000 in units of kbps

Default

128000

Name

gbrDedBrrPci - Guaranteed dedicated bearer PCI

Syntax

--gbrDedBrrPci <list-item>

Description

Guaranteed dedicated bearer pre-emption capability indicator.

Class

Optional.

List

- Disabled - PCI disabled - Pre-emption capability disabled.
- Enabled - PCI enabled - Pre-emption capability enabled.

Default

Disabled

Name

gbrDedBrrPvi - Guaranteed dedicated bearer PVI

Syntax

--gbrDedBrrPvi <list-item>

Description

Guaranteed dedicated bearer pre-emption vulnerability indicator.

Class

Optional.

List

- Disabled - PVI disabled - Pre-emption vulnerability disabled.
- Enabled - PVI enabled - Pre-emption vulnerability enabled.

Default

Disabled

Name

gbrDedBrrQci - Guaranteed dedicated bearer QCI

Syntax

--gbrDedBrrQci <integer>

Description

Guaranteed dedicated bearer QoS class identifier.

Class

Optional.

Type / Range

Integer in the range of 0 to 4

Default

4

Name

nonGbrDedBrrArp - Non guaranteed dedicated bearer ARP

Syntax

--nonGbrDedBrrArp <integer>

Description

Non guaranteed dedicated bearer allocation and retention priority.

Class

Optional.

Type / Range

Integer in the range of 0 to 15

Default

15

Name

nonGbrDedBrrPci - Non guaranteed dedicated bearer PCI

Syntax

--nonGbrDedBrrPci <list-item>

Description

Non guaranteed dedicated bearer pre-emption capability indicator.

Class

Optional.

List

- Disabled - PCI disabled - Pre-emption capability disabled.
- Enabled - PCI enabled - Pre-emption capability enabled.

Default

Disabled

Name

nonGbrDedBrrPvi - Non guaranteed dedicated bearer PVI

Syntax

--nonGbrDedBrrPvi <list-item>

Description

Non guaranteed dedicated bearer pre-emption vulnerability indicator.

Class

Optional.

List

- Disabled - PVI disabled - Pre-emption vulnerability disabled.
- Enabled - PVI enabled - Pre-emption vulnerability enabled.

Default

Disabled

Name

nonGbrDedBrrQci - Non guaranteed dedicated bearer QCI

Syntax

--nonGbrDedBrrQci <integer>

Description

Non guaranteed dedicated bearer QoS class identifier.

Class

Optional.

Type / Range

Integer in the range of 0 or 6 to 9

Default

9

6.89 cmm qosProfileBackTc

Background Traffic Class QoS Profile. Syntax, description, parameters, and roles for cmm qosProfileBackTc command.

Syntax

Description

This command is used to administer a Background Traffic Class QoS Profile and includes parameters for defining the Allocation Retention Priority (ARP), QoS maximum bitrates, priority level, error ratios, and PCI and PVI values.

Parameters

Name

name - Background traffic class QoS profile name

Syntax

--name <string>

Description

Name that identifies the background traffic class quality of service (QoS) profile.

Restrictions

default QoS profiles cannot be deleted, but can be updated.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

arp - ARP

Syntax

--arp <list-item>

Description

Allocation retention priority (ARP) for background traffic class.

Class

Optional.

List

- high - Specify priority of high.
- low - Specify priority of low.
- normal - Specify priority of normal.

Default

low

Name

deliveryErroneousSdu - Delivery erroneous SDU

Syntax

--deliveryErroneousSdu <list-item>

Description

Indicates whether to detect erroneous service data units (SDUs) for background traffic class, and if so, whether to accept or discard them; the default is do-not-detect.

Class

Optional.

List

- accept - Specifies detect and accept erroneous data packets.
- discard - Specifies detect and discard erroneous data packets.
- do-not-detect - Do not detect - Specifies do not detect erroneous data packets.

Default

do-not-detect

Name

deliveryOrder - Delivery order

Syntax

--deliveryOrder <list-item>

Description

Enable (with-order) or disable (without-order) delivery order for background traffic class.

Class

Optional.

List

- with-order - With order - Specifies delivery with order.
- without-order - Without order - Specifies delivery without order.

Default

without-order

Name

description - Background traffic class QoS profile description

Syntax

--description <string>

Description

Background traffic class quality of service (QoS) profile description.

Class

Optional.

Type / Range

Digit string of length 0 to 80 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

"

Name

maxBitRateDownlink - Max bit rate for downlink

Syntax

--maxBitRateDownlink <integer>

Description

Quality of service (QoS) default maximum bit rate for downlink for background class, in kbps.

Restrictions

if in the range 64..568, must be a multiple of 8 kbps if in the range 576..8640, must be a multiple of 64 kbps if in the range 8700..16000, must be a multiple of 100 kbps if in the range 17000..128000, must be a multiple of 1 Mbps if in the range 130000..256000, must be a multiple of 2 Mbps

Class

Optional.

Type / Range

Integer in the range of 0, 1-63, 64-568, 576-8640, 8700-16000, 17000-128000, 130000-256000, 260000-500000, 510000-1500000, 1600000-4000000000 in units of Kbps

Default

384

Name

maxBitRateUplink - Max bit rate for uplink

Syntax

--maxBitRateUplink <integer>

Description

Quality of service (QoS) default maximum bit rate for uplink for background class, in kbps.

Restrictions

if in the range 64..568, must be a multiple of 8 kbps if in the range 576..8640, must be a multiple of 64 kbps if in the range 8700..16000, must be a multiple of 100 kbps if in the range 17000..128000, must be a multiple of 1 Mbps if in the range 130000..256000, must be a multiple of 2 Mbps

Class

Optional.

Type / Range

Integer in the range of 0, 1-63, 64-568, 576-8640, 8700-16000, 17000-128000, 130000-256000, 260000-500000, 510000-1500000, 1600000-4000000000 in units of Kbps

Default

384

Name

maxSduSize - Max SDU size

Syntax

--maxSduSize <integer>

Description

Maximum service data unit (SDU) size for background traffic class, in bytes.

Restrictions

if in the range 10..1500, must be a multiple of 10 bytes if greater than 1500, can only be 1502

Class

Optional.

Type / Range

Integer in the range of 10 to 1,502 in units of Byte

Default

1502

Name

pci - Pre-emption capability indicator

Syntax`--pci <list-item>`**Description**

Indicates whether a bearer request can preempt resources in a limited resource condition as part of the allocation and retention policy (ARP) aspect of quality of service (QoS) information.

Class

Optional.

List

- disabled - Specify type of disabled.
- enabled - Specify type of enabled.

Default

disabled

Name

prioLevel - Priority level

Syntax`--prioLevel <integer>`**Description**

The priority level value of EARP used to override the value received from the HSS/HLR or to use as a default value if no value is received.

Class

Optional.

Type / Range

Integer in the range of 1 to 15

Default

15

Name

pvi - Pre-emption vulnerability indicator

Syntax`--pvi <list-item>`**Description**

Indicates whether an active bearer can be preempted by a preemption capable high priority bearer in a limited resource condition as part of the allocation and retention policy (ARP) aspect of quality of service (QoS) information.

Class

Optional.

List

- disabled - Specify type of disabled.
- enabled - Specify type of enabled.

Default

enabled

Name

residualBerNrt - Residual BER

Syntax

--residualBerNrt <list-item>

Description

Residual bit error ratio (BER) for background traffic class.

Class

Optional.

List

- $1 \cdot 10^{-5}$ - 0.00001 - Specify residual bit error ratio 0.00001.
- $4 \cdot 10^{-3}$ - 0.004 - Specify residual bit error ratio of 0.004.
- $6 \cdot 10^{-8}$ - 0.00000006 - Specify residual bit error ratio of 0.00000006.

Default

$6 \cdot 10^{-8}$

Name

sduErrorRatioNrt - SDU error ratio

Syntax

--sduErrorRatioNrt <list-item>

Description

Service data unit (SDU) error ratio for background traffic class.

Class

Optional.

List

- $1 \cdot 10^{-3}$ - 0.001 - Specify service data unit error ratio of 0.001.

- 1×10^{-4} - 0.0001 - Specify service data unit error ratio of 0.0001.
- 1×10^{-6} - 0.000001 - Specify service data unit error ratio of 0.000001.

Default

1×10^{-6}

6.90 cmm qosProfileConvTc

Conversational Traffic Class QoS Profile. Syntax, description, parameters, and roles for `cmm qosProfileConvTc` command.

Syntax**Description**

This command is used to administer a Conversational Traffic Class QoS Profile and includes parameters for defining the Allocation Retention Priority (ARP), QoS maximum and guaranteed bitrates, priority level, error ratios, and PCI and PVI values.

Parameters**Name**

name - Conversational traffic class QoS profile name

Syntax

--name <string>

Description

Name that identifies the conversational traffic class quality of service (QoS) profile.

Restrictions

default QoS profiles cannot be deleted, but can be updated.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

arp - ARP

Syntax

--arp <list-item>

Description

Allocation retention priority (ARP) for conversational traffic class.

Class

Optional.

List

- high - Specify priority of high.
- low - Specify priority of low.
- normal - Specify priority of normal.

Default

high

Name

deliveryErroneousSdu - Delivery erroneous SDU

Syntax

--deliveryErroneousSdu <list-item>

Description

Indicates whether to detect erroneous Service Data Units (SDUs) for Conversational traffic class, and if so, whether to accept or discard them; the default is do-not-detect.

Class

Optional.

List

- accept - Specifies detect and accept erroneous data packets.
- discard - Specifies detect and discard erroneous data packets.
- do-not-detect - Do not detect - Specifies do not detect erroneous data packets.

Default

do-not-detect

Name

deliveryOrder - Delivery order

Syntax

--deliveryOrder <list-item>

Description

Enable (with-order) or disable (without-order) delivery order for conversational traffic class.

Class

Optional.

List

- with-order - With order - Specifies delivery with order.
- without-order - Without order - Specifies delivery without order.

Default

without-order

Name

description - Conversational traffic class QoS profile description

Syntax

--description <string>

Description

Conversational traffic class quality of service (QoS) profile description.

Class

Optional.

Type / Range

Digit string of length 0 to 80 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

"

Name

guaranteedBitRateDownlink - Guaranteed bit rate for downlink

Syntax

--guaranteedBitRateDownlink <integer>

Description

Quality of service (QoS) default guaranteed bit rate for downlink for conversational traffic class, in kbps.

Restrictions

if in the range 64..568, must be a multiple of 8 kbps if in the range 576..8640, must be a multiple of 64 kbps if in the range 8700..16000, must be a multiple of 100 kbps if in the

range 17000..128000, must be a multiple of 1 Mbps if in the range 130000..256000, must be a multiple of 2 Mbps

Class

Optional.

Type / Range

Integer in the range of 0, 1-63, 64-568, 576-8640, 8700-16000, 17000-128000, 130000-256000, 260000-500000, 510000-1500000, 1600000-4000000000 in units of Kbps

Default

384

Name

guaranteedBitRateUplink - Guaranteed bit rate for uplink

Syntax

--guaranteedBitRateUplink <integer>

Description

Quality of service (QoS) default guaranteed bit rate for uplink for conversational traffic class, in kbps.

Restrictions

if in the range 64..568, must be a multiple of 8 kbps if in the range 576..8640, must be a multiple of 64 kbps if in the range 8700..16000, must be a multiple of 100 kbps if in the range 17000..128000, must be a multiple of 1 Mbps if in the range 130000..256000, must be a multiple of 2 Mbps

Class

Optional.

Type / Range

Integer in the range of 0, 1-63, 64-568, 576-8640, 8700-16000, 17000-128000, 130000-256000, 260000-500000, 510000-1500000, 1600000-4000000000 in units of Kbps

Default

384

Name

maxBitRateDownlink - Max bit rate for downlink

Syntax

--maxBitRateDownlink <integer>

Description

Quality of service (QoS) default maximum bit rate for downlink for conversational traffic class, in kbps.

Restrictions

if in the range 64..568, must be a multiple of 8 kbps if in the range 576..8640, must be a multiple of 64 kbps if in the range 8700..16000, must be a multiple of 100 kbps if in the range 17000..128000, must be a multiple of 1 Mbps if in the range 130000..256000, must be a multiple of 2 Mbps

Class

Optional.

Type / Range

Integer in the range of 0, 1-63, 64-568, 576-8640, 8700-16000, 17000-128000, 130000-256000, 260000-500000, 510000-1500000, 1600000-4000000000 in units of Kbps

Default

384

Name

maxBitRateUplink - Max bit rate for uplink

Syntax

--maxBitRateUplink <integer>

Description

Quality of service (QoS) default maximum bit rate for uplink for conversational traffic class, in kbps.

Restrictions

if in the range 64..568, must be a multiple of 8 kbps if in the range 576..8640, must be a multiple of 64 kbps if in the range 8700..16000, must be a multiple of 100 kbps if in the range 17000..128000, must be a multiple of 1 Mbps if in the range 130000..256000, must be a multiple of 2 Mbps

Class

Optional.

Type / Range

Integer in the range of 0, 1-63, 64-568, 576-8640, 8700-16000, 17000-128000, 130000-256000, 260000-500000, 510000-1500000, 1600000-4000000000 in units of Kbps

Default

384

Name

maxSduSize - Max SDU size

Syntax

--maxSduSize <integer>

Description

Maximum service data unit (SDU) size for conversational traffic class, in bytes.

Restrictions

if in the range 10..1500, must be a multiple of 10 bytes if greater than 1500, can only be 1502

Class

Optional.

Type / Range

Integer in the range of 10 to 1,502 in units of Byte

Default

1502

Name

pci - Pre-emption capability indicator

Syntax

--pci <list-item>

Description

Indicates whether a bearer request can preempt resources in a limited resource condition as part of the allocation and retention policy (ARP) aspect of quality of service (QoS) information.

Class

Optional.

List

- disabled - Specify type of disabled.
- enabled - Specify type of enabled.

Default

disabled

Name

prioLevel - Priority level

Syntax

--prioLevel <integer>

Description

The priority level value of EARP used to override the value received from the HSS/HLR or to use as a default value if no value is received.

Class

Optional.

Type / Range

Integer in the range of 1 to 15

Default

15

Name

pvi - Pre-emption vulnerability indicator

Syntax

--pvi <list-item>

Description

Indicates whether an active bearer can be preempted by a preemption capable high priority bearer in a limited resource condition as part of the allocation and retention policy (ARP) aspect of quality of service (QoS) information.

Class

Optional.

List

- disabled - Specify type of disabled.
- enabled - Specify type of enabled.

Default

enabled

Name

residualBerRt - Residual BER

Syntax

--residualBerRt <list-item>

Description

Residual bit error ratio (BER) for conversational traffic class.

Class

Optional.

List

- 1×10^{-2} - 0.01 - Specify residual bit error ratio of 0.01.
- 1×10^{-3} - 0.001 - Specify residual bit error ratio of 0.001.
- 1×10^{-4} - 0.0001 - Specify residual bit error ratio of 0.0001.
- 1×10^{-5} - 0.00001 - Specify residual bit error ratio of 0.00001.
- 1×10^{-6} - 0.000001 - Specify residual bit error ratio of 0.000001.
- 5×10^{-2} - 0.05 - Specify residual bit error ratio of 0.05.

- 5×10^{-3} - 0.005 - Specify residual bit error ratio of 0.005.

Default

1×10^{-6}

Name

sduErrorRatioConv - SDU error ratio

Syntax

--sduErrorRatioConv <list-item>

Description

Service data unit (SDU) error ratio for conversational traffic class.

Class

Optional.

List

- 1×10^{-2} - 0.01 - Specify service data unit error ratio of 0.01.
- 1×10^{-3} - 0.001 - Specify service data unit error ratio of 0.001.
- 1×10^{-4} - 0.0001 - Specify service data unit error ratio of 0.0001.
- 1×10^{-5} - 0.00001 - Specify service data unit error ratio of 0.00001.
- 7×10^{-3} - 0.007 - Specify service data unit error ratio of 0.007.

Default

1×10^{-5}

Name

transferDelay - Transfer delay

Syntax

--transferDelay <integer>

Description

Transfer delay for conversational traffic class.

Restrictions

if in the range 10..150, must be a multiple of 10 ms if in the range 200..950, must be a multiple of 50 ms if in the range 1000..4000, must be a multiple of 100 ms

Class

Optional.

Type / Range

Integer in the range of 10 to 4,000 in units of Millisecond

Default

100

6.91 cmm qosProfileInteractTc

Interactive Traffic Class QoS Profile. Syntax, description, parameters, and roles for `cmm qosProfileInteractTc` command.

Syntax

Description

This command is used to administer an Interactive Traffic Class QoS Profile and includes parameters for defining the Allocation Retention Priority (ARP), QoS maximum bitrates, priority level, error ratios, and PCI and PVI values.

Parameters

Name

name - Interactive traffic class QoS profile name

Syntax

--name <string>

Description

Name that identifies the interactive traffic class quality of service (QoS) profile.

Restrictions

default QoS profiles cannot be deleted, but can be updated.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of `[0-9a-zA-Z\.\-_:@]*`

Name

arp - ARP

Syntax

--arp <list-item>

Description

Allocation retention priority (ARP) for interactive traffic class.

Class

Optional.

List

- high - Specify priority of high.
- low - Specify priority of low.
- normal - Specify priority of normal.

Default

normal

Name

deliveryErroneousSdu - Delivery erroneous SDU

Syntax

--deliveryErroneousSdu <list-item>

Description

Indicates whether to detect erroneous service data units (SDUs) for interactive traffic class, and if so, whether to accept or discard them; the default is do-not-detect.

Class

Optional.

List

- accept - Specifies detect and accept erroneous data packets.
- discard - Specifies detect and discard erroneous data packets.
- do-not-detect - Do not detect - Specifies do not detect erroneous data packets.

Default

do-not-detect

Name

deliveryOrder - Delivery order

Syntax

--deliveryOrder <list-item>

Description

Enable (with-order) or disable (without-order) delivery order for interactive traffic class.

Class

Optional.

List

- with-order - With order - Specifies delivery with order.
- without-order - Without order - Specifies delivery without order.

Default

without-order

Name

description - Interactive traffic class QoS profile description

Syntax

--description <string>

Description

Interactive traffic class quality of service (QoS) profile description.

Class

Optional.

Type / Range

Digit string of length 0 to 80 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

"

Name

handlingPriority - Traffic handling priority

Syntax

--handlingPriority <list-item>

Description

Traffic handling priority for interactive traffic class.

Class

Optional.

List

- high - Specify priority of high.
- low - Specify priority of low.
- normal - Specify priority of normal.

Default

high

Name

maxBitRateDownlink - Max bit rate for downlink

Syntax

--maxBitRateDownlink <integer>

Description

Quality of service (QoS) default maximum bit rate for downlink for interactive traffic class, in kbps.

Restrictions

if in the range 64..568, must be a multiple of 8 kbps if in the range 576..8640, must be a multiple of 64 kbps if in the range 8700..16000, must be a multiple of 100 kbps if in the range 17000..128000, must be a multiple of 1 Mbps if in the range 130000..256000, must be a multiple of 2 Mbps

Class

Optional.

Type / Range

Integer in the range of 0, 1-63, 64-568, 576-8640, 8700-16000, 17000-128000, 130000-256000, 260000-500000, 510000-1500000, 1600000-4000000000 in units of Kbps

Default

384

Name

maxBitRateUplink - Max bit rate for uplink

Syntax

--maxBitRateUplink <integer>

Description

Quality of service (QoS) default maximum bit rate for uplink for interactive traffic class, in kbps.

Restrictions

if in the range 64..568, must be a multiple of 8 kbps if in the range 576..8640, must be a multiple of 64 kbps if in the range 8700..16000, must be a multiple of 100 kbps if in the range 17000..128000, must be a multiple of 1 Mbps if in the range 130000..256000, must be a multiple of 2 Mbps

Class

Optional.

Type / Range

Integer in the range of 0, 1-63, 64-568, 576-8640, 8700-16000, 17000-128000, 130000-256000, 260000-500000, 510000-1500000, 1600000-4000000000 in units of Kbps

Default

384

Name

maxSduSize - Max SDU size

Syntax`--maxSduSize <integer>`**Description**

Maximum service data unit (SDU) size for streaming traffic class, in bytes.

Restrictionsif in the range 10..1500, must be a multiple of 10 bytes if greater than 1500, can only be
1502**Class**

Optional.

Type / Range

Integer in the range of 10 to 1,502 in units of Byte

Default

1502

Name

pci - Pre-emption capability indicator

Syntax`--pci <list-item>`**Description**Indicates whether a bearer request can preempt resources in a limited resource condition
as part of the allocation and retention policy (ARP) aspect of quality of service (QoS)
information.**Class**

Optional.

List

- disabled - Specify type of disabled.
- enabled - Specify type of enabled.

Default

disabled

Name

prioLevel - Priority level

Syntax

--prioLevel <integer>

Description

The priority level value of EARP used to override the value received from the HSS/HLR or to use as a default value if no value is received.

Class

Optional.

Type / Range

Integer in the range of 1 to 15

Default

15

Name

pvi - Pre-emption vulnerability indicator

Syntax

--pvi <list-item>

Description

Indicates whether an active bearer can be preempted by a preemption capable high priority bearer in a limited resource condition as part of the allocation and retention policy (ARP) aspect of quality of service (QoS) information.

Class

Optional.

List

- disabled - Specify type of disabled.
- enabled - Specify type of enabled.

Default

enabled

Name

residualBerNrt - Residual BER

Syntax

--residualBerNrt <list-item>

Description

Residual bit error ratio (BER) for interactive traffic class.

Class

Optional.

List

- 1×10^{-5} - 0.00001 - Specify residual bit error ratio 0.00001.

- 4×10^{-3} - 0.004 - Specify residual bit error ratio of 0.004.
- 6×10^{-8} - 0.00000006 - Specify residual bit error ratio of 0.00000006.

Default

6×10^{-8}

Name

sduErrorRatioNrt - SDU error ratio

Syntax

--sduErrorRatioNrt <list-item>

Description

Service data unit (SDU) error ratio for interactive traffic class.

Class

Optional.

List

- 1×10^{-3} - 0.001 - Specify service data unit error ratio of 0.001.
- 1×10^{-4} - 0.0001 - Specify service data unit error ratio of 0.0001.
- 1×10^{-6} - 0.000001 - Specify service data unit error ratio of 0.000001.

Default

1×10^{-6}

Name

signallingIndication3G - Signaling indication for 3G

Syntax

--signallingIndication3G <list-item>

Description

Indicates whether to optimize for signaling traffic for interactive traffic class.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

6.92 cmm qosProfileStreamTc

Streaming Traffic Class QoS Profile. Syntax, description, parameters, and roles for cmm qosProfileStreamTc command.

Syntax

Description

This command is used to administer a Streaming Traffic Class QoS Profile and includes parameters for defining the Allocation Retention Priority (ARP), QoS maximum and guaranteed bitrates, priority level, error ratios, and PCI and PVI values.

Parameters

Name

name - Streaming traffic class QoS profile name

Syntax

--name <string>

Description

Name that identifies the streaming traffic class quality of service (QoS) profile.

Restrictions

default QoS profiles cannot be deleted, but can be updated.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

arp - ARP

Syntax

--arp <list-item>

Description

Allocation retention priority (ARP) for streaming traffic class.

Class

Optional.

List

- high - Specify priority of high.
- low - Specify priority of low.
- normal - Specify priority of normal.

Default

normal

Name

deliveryErroneousSdu - Delivery erroneous SDU

Syntax

--deliveryErroneousSdu <list-item>

Description

Indicates whether to detect erroneous service data units (SDUs) for streaming traffic class, and if so, whether to accept or discard them; the default is do-not-detect.

Class

Optional.

List

- accept - Specifies detect and accept erroneous data packets.
- discard - Specifies detect and discard erroneous data packets.
- do-not-detect - Do not detect - Specifies do not detect erroneous data packets.

Default

do-not-detect

Name

deliveryOrder - Delivery order

Syntax

--deliveryOrder <list-item>

Description

Enable (with-order) or disable (without-order) delivery order for streaming traffic class.

Class

Optional.

List

- with-order - With order - Specifies delivery with order.
- without-order - Without order - Specifies delivery without order.

Default

without-order

Name

description - Streaming traffic class QoS profile description

Syntax

--description <string>

Description

Streaming traffic class quality of service (QoS) profile description.

Class

Optional.

Type / Range

Digit string of length 0 to 80 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

''

Name

guaranteedBitRateDownlink - Guaranteed bit rate for downlink

Syntax

--guaranteedBitRateDownlink <integer>

Description

Quality of service (QoS) default guaranteed bit rate for downlink for streaming traffic class, in kbps.

Restrictions

if in the range 64..568, must be a multiple of 8 kbps if in the range 576..8640, must be a multiple of 64 kbps if in the range 8700..16000, must be a multiple of 100 kbps if in the range 17000..128000, must be a multiple of 1 Mbps if in the range 130000..256000, must be a multiple of 2 Mbps

Class

Optional.

Type / Range

Integer in the range of 0, 1-63, 64-568, 576-8640, 8700-16000, 17000-128000, 130000-256000, 260000-500000, 510000-1500000, 1600000-4000000000 in units of Kbps

Default

384

Name

guaranteedBitRateUplink - Guaranteed bit rate for uplink

Syntax`--guaranteedBitRateUplink <integer>`**Description**

Quality of service (QoS) default guaranteed bit rate for uplink for streaming traffic class, in kbps.

Restrictions

if in the range 64..568, must be a multiple of 8 kbps if in the range 576..8640, must be a multiple of 64 kbps if in the range 8700..16000, must be a multiple of 100 kbps if in the range 17000..128000, must be a multiple of 1 Mbps if in the range 130000..256000, must be a multiple of 2 Mbps

Class

Optional.

Type / Range

Integer in the range of 0, 1-63, 64-568, 576-8640, 8700-16000, 17000-128000, 130000-256000, 260000-500000, 510000-1500000, 1600000-4000000000 in units of Kbps

Default

384

Name

maxBitRateDownlink - Max bit rate for downlink

Syntax`--maxBitRateDownlink <integer>`**Description**

Quality of service (QoS) default maximum bit rate for downlink for streaming traffic class, in kbps.

Restrictions

if in the range 64..568, must be a multiple of 8 kbps if in the range 576..8640, must be a multiple of 64 kbps if in the range 8700..16000, must be a multiple of 100 kbps if in the range 17000..128000, must be a multiple of 1 Mbps if in the range 130000..256000, must be a multiple of 2 Mbps

Class

Optional.

Type / Range

Integer in the range of 0, 1-63, 64-568, 576-8640, 8700-16000, 17000-128000, 130000-256000, 260000-500000, 510000-1500000, 1600000-4000000000 in units of Kbps

Default

384

Name

maxBitRateUplink - Max bit rate for uplink

Syntax

--maxBitRateUplink <integer>

Description

Quality of service (QoS) default maximum bit rate for uplink for streaming traffic class, in kbps.

Restrictions

if in the range 64..568, must be a multiple of 8 kbps if in the range 576..8640, must be a multiple of 64 kbps if in the range 8700..16000, must be a multiple of 100 kbps if in the range 17000..128000, must be a multiple of 1 Mbps if in the range 130000..256000, must be a multiple of 2 Mbps

Class

Optional.

Type / Range

Integer in the range of 0, 1-63, 64-568, 576-8640, 8700-16000, 17000-128000, 130000-256000, 260000-500000, 510000-1500000, 1600000-4000000000 in units of Kbps

Default

384

Name

maxSduSize - Max SDU size

Syntax

--maxSduSize <integer>

Description

Maximum service data unit (SDU) size for streaming traffic class, in bytes.

Restrictions

if in the range 10..1500, must be a multiple of 10 bytes if greater than 1500, can only be 1502

Class

Optional.

Type / Range

Integer in the range of 10 to 1,502 in units of Byte

Default

1502

Name

pci - Pre-emption capability indicator

Syntax

--pci <list-item>

Description

Indicates whether a bearer request can preempt resources in a limited resource condition as part of the allocation and retention policy (ARP) aspect of quality of service (QoS) information.

Class

Optional.

List

- disabled - Specify type of disabled.
- enabled - Specify type of enabled.

Default

disabled

Name

prioLevel - Priority level

Syntax

--prioLevel <integer>

Description

The priority level value of EARP used to override the value received from the HSS/HLR or to use as a default value if no value is received.

Class

Optional.

Type / Range

Integer in the range of 1 to 15

Default

15

Name

pvi - Pre-emption vulnerability indicator

Syntax

--pvi <list-item>

Description

Indicates whether an active bearer can be preempted by a preemption capable high priority bearer in a limited resource condition as part of the allocation and retention policy (ARP) aspect of quality of service (QoS) information.

Class

Optional.

List

- disabled - Specify type of disabled.
- enabled - Specify type of enabled.

Default

enabled

Name

residualBerRt - Residual BER

Syntax

--residualBerRt <list-item>

Description

Residual bit error ratio (BER) for streaming traffic class.

Class

Optional.

List

- 1×10^{-2} - 0.01 - Specify residual bit error ratio of 0.01.
- 1×10^{-3} - 0.001 - Specify residual bit error ratio of 0.001.
- 1×10^{-4} - 0.0001 - Specify residual bit error ratio of 0.0001.
- 1×10^{-5} - 0.00001 - Specify residual bit error ratio of 0.00001.
- 1×10^{-6} - 0.000001 - Specify residual bit error ratio of 0.000001.
- 5×10^{-2} - 0.05 - Specify residual bit error ratio of 0.05.
- 5×10^{-3} - 0.005 - Specify residual bit error ratio of 0.005.

Default

1×10^{-6}

Name

sduErrorRatioStream - SDU error ratio

Syntax

--sduErrorRatioStream <list-item>

Description

Service data unit (SDU) error ratio for streaming traffic class.

Class

Optional.

List

- $1 \cdot 10^{-1}$ - 0.1 - Specify service data unit error ratio of 0.1.
- $1 \cdot 10^{-2}$ - 0.01 - Specify service data unit error ratio of 0.01.
- $1 \cdot 10^{-3}$ - 0.001 - Specify service data unit error ratio of 0.001.
- $1 \cdot 10^{-4}$ - 0.0001 - Specify service data unit error ratio of 0.0001.
- $1 \cdot 10^{-5}$ - 0.00001 - Specify service data unit error ratio of 0.00001.
- $7 \cdot 10^{-3}$ - 0.007 - Specify service data unit error ratio of 0.007.

Default

$1 \cdot 10^{-5}$

Name

transferDelay - Transfer delay

Syntax

--transferDelay <integer>

Description

Transfer delay for streaming traffic class.

Restrictions

if in the range 10..150, must be a multiple of 10 ms if in the range 200..950, must be a multiple of 50 ms if in the range 1000..4000, must be a multiple of 100 ms

Class

Optional.

Type / Range

Integer in the range of 10 to 4,000 in units of Millisecond

Default

300

6.93 cmm racOfNse

racs of nse. Syntax, description, parameters, and roles for cmm racOfNse command.

Syntax

Description

RAC and NSE linking.

Parameters

Name

mcc - MCC

Syntax

--mcc <digits>

Description

Mobile country code.

Class

Required key.

Type / Range

Digit string of length 3

Name

mnc - MNC

Syntax

--mnc <digits>

Description

Mobile network code.

Class

Required key.

Type / Range

Digit string of length 2 to 3

Name

lac - LAC

Syntax

--lac <integer>

Description

Location area code.

Class

Required key.

Type / Range

Integer in the range of 1 to 65,533

Name

rac - RAC id

Syntax

--rac <integer>

Description

RAC identifier.

Class

Required key.

Type / Range

Integer in the range of 0 to 255

Name

nsId - NSE id

Syntax

--nseId <integer>

Description

Network service entity identifier.

Class

Required key.

Type / Range

Integer in the range of 0 to 65,535

Roles**Show**

sysadmin, manage, monitor

List

sysadmin, manage, monitor

6.94 cmm radiusProxy

radiusProxy. Syntax, description, parameters, and roles for cmm radiusProxy command.

Syntax

Description

Radius Proxy configuration

Parameters

Name

proxyId - Proxy ID

Syntax

--proxyId <integer>

Description

Radius Proxy config identification (1)

Class

Required key.

Type / Range

Integer in the range of 1 to 1

Name

nasIp - NAS-IP-address

Syntax

--nasIp <string>

Description

CMM External address (NAS-IP-Address)

Class

Required on create.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

6.95 cmm rait

Routing Area Identification. Syntax, description, parameters, and roles for cmm rait command.

Syntax

Description

Configure, list and show Routing Area Identification.

Parameters

Name

raitId - Rai id

Syntax`--raitId <integer>`**Description**

RAI identifier.

Class

Required key.

Type / Range

Integer in the range of 1 to 3,000

Name

lac - LAC

Syntax`--lac <integer>`**Description**

Location area code.

Class

Required on create.

Type / Range

Integer in the range of 1 to 65,533

Name

mcc - MCC

Syntax

--mcc <digits>

Description

Mobile country code digits of broadcasted PLMN.

Class

Required on create.

Type / Range

Digit string of length 3 to 3 with the allowed pattern of [0-9]*

Name

mnc - MNC

Syntax

--mnc <digits>

Description

Mobile network code digits of broadcasted PLMN.

Class

Required on create.

Type / Range

Digit string of length 2 to 3 with the allowed pattern of [0-9]*

Name

rac - RAC

Syntax

--rac <integer>

Description

Routing area code.

Class

Required on create.

Type / Range

Integer in the range of 0 to 255

Name

epind - Epind

Syntax

--epind <integer>

Description

Identify equivalent PLMN list index: decimal number 0 ... 5 or 255 0 ... all equivalent PLMN are used 255 ... no equivalent PLMN are used.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

0

6.96 cmm raitOfRnc

rait Of Rnc. Syntax, description, parameters, and roles for cmm raitOfRnc command.

Syntax**Description**

Configure, list and show RAI of RNC.

Parameters**Name**

raitId - Rai id

Syntax

--raitId <integer>

Description

RAI identifier. this parameter should match parameter raitid of table rait.

Class

Required key.

Type / Range

Integer in the range of 1 to 3,000

Name

rncName - RNC name

Syntax

--rncName <string>

Description

RNC name. this parameter should match parameter rncname of table rnc.

Class

Required key.

Type / Range

Digit string of length 1 to 10 with the allowed pattern of [0-9a-zA-Z\._:-]*

6.97 cmm regionLac

Region LA Lists. Syntax, description, parameters, and roles for cmm regionLac command.

Syntax**Description**

This command is used to administer a Region LA List and includes parameters for defining the mobile network name and Location Area Codes (LACs). The maximum number of LACs per region is 1024.

Parameters

Name

regionListName - Region list name

Syntax

--regionListName <string>

Description

Name that identifies region.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

plmnName - Mobile network name

Syntax

--plmnName <string>

Description

Name that identifies mobile network containing the given region.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

lac - Location area code

Syntax

--lac <integer>

Description

This element represents a LAC (Location area code) to be added to the LA list of a given region.

Class

Required key.

Type / Range

Integer in the range of 1 to 65,535

6.98 cmm regionList

LA TA Region. Syntax, description, parameters, and roles for cmm regionList command.

Syntax

Description

This command is used to administer an LA TA Region and includes parameters for defining the region and mobile network names and whether the region will be used by the Regional UE Detach application. The maximum number of regions is 3000.

Parameters

Name

name - Region name

Syntax

--name <string>

Description

Name that identifies region.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

plmnName - Mobile network name

Syntax

--plmnName <string>

Description

Name that identifies mobile network containing the given region.

Restrictions

plmnType of plmnName must not be Other Network

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

description - Region description

Syntax

--description <string>

Description

Region description.

Class

Optional.

Type / Range

Digit string of length 0 to 160 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

"

Name

regionalUeDetach - Regional UE detach

Syntax

--regionalUeDetach <list-item>

Description

If set to true, the regional UE detach application will use this region when determining if UE has transitioned from one region to another.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

6.99 cmm regionTac

Region TA Lists. Syntax, description, parameters, and roles for cmm regionTac command.

Syntax

Description

This command is used to administer a Region TA List and includes parameters for defining the mobile network name and Tracking Area Codes (TACs). The maximum number of TACs per region is 1024.

Parameters

Name

regionListName - Region label

Syntax

--regionListName <string>

Description

Name that identifies region.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

plmnName - Mobile network name

Syntax

--plmnName <string>

Description

Name that identifies mobile network containing the given region.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Name

tac - Tracking area code

Syntax

--tac <integer>

Description

This element represents a TAC (Tracking area code) to be added to the TA list of a given region.

Class

Required key.

Type / Range

Integer in the range of 1 to 65,535

Roles**Create**

6.100 cmm registeredUePerTa

Registered UE per TA. Syntax, description, parameters, and roles for cmm registeredUePerTa command.

Syntax**Description**

This command creates a list of TA which can be used to assign maximum number of UEs allowed per TA in the list.

Parameters

Name

registeredUePerTaListName - Name of the list

Syntax

--registeredUePerTaListName <string>

Description

Name of the list.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

servingPlmnName - Serving PLMN Name

Syntax

--servingPlmnName <string>

Description

The serving PLMN is either MME home network or shared network.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

tac - Tracking Area Code

Syntax

--tac <integer>

Description

Tracking Area Code

Class

Required key.

Type / Range

Integer in the range of 1 to 65,535

Name

maxUeAllowedPerTac - Maximum UE Allowed PER Tracking Area Code

Syntax

--maxUeAllowedPerTac <integer>

Description

Provision maximum number of UE allowed in the TAC of the serving PLMN.

Class

Optional.

Type / Range

Integer in the range of 0 to 4,294,967,294

Default

0

Roles**Create**

sysadmin, manage

Show

6.101 cmm registeredUePerTaList

Registered UE per TA List. Syntax, description, parameters, and roles for cmm registeredUePerTaList command.

Syntax**Description**

Add or delete a TAC to the TAI list used for restricting max number of roamer UE.

Parameters**Name**

name - Registered UE per TA List Name

Syntax

--name <string>

Description

Name of the registered UE per TA List.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

sysadmin, manage, monitor

6.102 cmm registeredUePerTaRange

Registered UE per TA List. Syntax, description, parameters, and roles for cmm registeredUePerTaRange command.

Syntax**Description**

This command creates a list of TA which can be used to assign maximum number of UEs allowed per TA in the list.

Parameters**Name**

registeredUePerTaListName - Name of the list

Syntax

--registeredUePerTaListName <string>

Description

Name of the list.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

servingPlmnName - Serving PLMN Name

Syntax

--servingPlmnName <string>

Description

The serving PLMN is either MME home network or shared network.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

allTac - All Tracking Area Codes

Syntax

--allTac <list-item>

Description

This parameter can be used to configure Max Allowed UE per TAC for all the TACs in the PLMN. If the parameter is set to False then the 'minTac' and 'maxTac' parameters are used.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

maxTac - Max Tracking Area Code

Syntax

--maxTac <integer>

Description

Ending TAC of a TA range.

Class

Optional.

Type / Range

Integer in the range of 0 to 65,535

Default

0

Name

maxUeAllowedPerTac - Maximum UE Allowed PER Tracking Area Code

Syntax`--maxUeAllowedPerTac <integer>`**Description**

Provision maximum number of UE allowed in the TAC of the serving PLMN.

Class

Optional.

Type / Range

Integer in the range of 0 to 4,294,967,294

Default

0

Name

minTac - Min Tracking Area Code

Syntax`--minTac <integer>`**Description**

The starting Tracking Area Code of a TA range.

Class

Optional.

Type / Range

Integer in the range of 0 to 65,535

Default

0

Roles**Modify**

sysadmin, manage

6.103 cmm remoteCopySetup

remote-copy parameters. Syntax, description, parameters, and roles for `cmm remoteCopySetup` command.

Syntax

Description

Create, list, modify, delete and show remote-copy parameters.

Parameters

Name

remoteId - Remote Copy Name

Syntax

--remoteId <list-item>

Description

Remote-copy name.

Class

Required key.

List

- remote-config - Specify remote copy of remote-config.

Name

remoteDir - Remote directory

Syntax

--remoteDir <string>

Description

Remote-copy directory.

Class

Required on create.

Type / Range

Digit string of length 1 to 512 with the allowed pattern of `^/(/?[\w\-\~\.\,]+)/?$`

Name

remoteLogin - Remote login name

Syntax

--remoteLogin <string>

Description

Remote login name.

Class

Required on create.

Type / Range

User name in Linux format. Username must start with a letter, a digit, an underscore or a full stop. The last character must be a letter, a digit, an underscore, a hyphen, a dollar sign or a

full stop. The other characters must be letters, digits, underscores, hyphens or full stops.
The length must be between 1 and 32 characters.

Name

remoteCopyFqdn - Remote Copy FQDN

Syntax

--remoteCopyFqdn <string>

Description

The parameter defines the Remote Copy FQDN.

Restrictions

Either the Remote Copy FQDN or the remote IP must be set

Class

Optional.

Type / Range

Digit string of length 0 to 255 with the allowed pattern of [A-Za-z0-9.-]

Default

""

Name

remotelp - Remote IP Address

Syntax

--remoteIp <string>

Description

Remote IP-address.

Restrictions

Either the PCMD Analytics FQDN or the Primary IP must be set

Class

Optional.

Type / Range

Digit string of length 0 or 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Default

""

Name

secondaryRemotelp - Secondary Remote IP Address

Syntax

--secondaryRemoteIp <string>

Description

Secondary Remote IP Address. If backup to the first remoteIP fails, this IP will be attempted. If not populated there will be no secondary attempt.

Class

Optional.

Type / Range

Digit string of length 0 or 2 to 39 with the allowed pattern of [0-9a-f\.:]*

6.104 cmm restNasMappingProfile

Access Restriction To NAS Cause Mapping Profile. Syntax, description, parameters, and roles for cmm restNasMappingProfile command.

Syntax**Description**

This command is used to administer the Access Restriction To NAS Cause Mapping Profile. This profile is used to select the right cause code to send to the UE when a UE mobility management request is rejected due to an access restriction. The maximum number of profiles supported is 1024. A default profile, named is provided.

Parameters**Name**

name - Name of access restriction to NAS cause code profile name

Syntax

--name <string>

Description

Profile name for access restriction to NAS cause code mapping.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Name

attachRequestWithoutSmsGrpId - Attach request without SMS group ID

Syntax

--attachRequestWithoutSmsGrpId <integer>

Description

Selection EMM CC to be used when MME rejects attach request without SMS indication when bit 0 of local-group-id AVP is set to indicate that UE must indicate SMS request.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

14

Name

csgRestricted - CSG restricted

Syntax

--csgRestricted <integer>

Description

NAS cause code to be sent if UE MME is rejected because of CSG restrictions.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

25

Name

description - Description of profile

Syntax

--description <string>

Description

Description of profile.

Class

Optional.

Type / Range

Digit string of length 0 to 160 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

""

Name

emmCcForEsmCc29 - EMM CC for ESM CC29

Syntax

--emmCcForEsmCc29 <integer>

Description

Configure NAS MM CC for attach reject when PDN connectivity request is rejected with cause code #29.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

15

Name

emmCcForEsmCc72 - EMM CC for ESM CC72

Syntax

--emmCcForEsmCc72 <integer>

Description

Configure NAS MM CC for attach reject when MME receives Create Session Response with cause code #72 for homers or treat roamer as homer.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

19

Name

emmCcForEsmCc92 - EMM CC for ESM CC92

Syntax

--emmCcForEsmCc92 <integer>

Description

Configure NAS MM CC for attach reject when MME receives Create Session Response with cause code #92 for homers or treat roamer as homer. If gParms enableProvCc is enabled, this field is not used unless generalGParms overrideEnhEmmCcCreateSessRespUserAuthFail is enabled.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

19

Name

emmRegisteredWithoutPdnNotAllowed - EMM-REGISTERED without PDN not allowed

Syntax

--emmRegisteredWithoutPdnNotAllowed <integer>

Description

NAS cause code to be sent if attach or TAU request is rejected if EMM-REGISTERED without PDN connection feature support is not enabled.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

15

Name

eutranNotAllowedHplmn - EUTRAN restricted in the UE's HPLMN

Syntax

--eutranNotAllowedHplmn <integer>

Description

NAS cause code to be sent if UE MME is rejected because a roaming UE is not allowed to access LTE.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

7

Name

imsApnRoamingFailure - IMS APN roaming failure

Syntax`--imsApnRoamingFailure <integer>`**Description**

NAS cause code to be sent if attach is rejected because of IMS APN roaming failure.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

19

Name

interPlmnTauRejDuelmsRoamControl - Inter plmn TAU reject due to IMS roaming control

Syntax`--interPlmnTauRejDueImsRoamControl <integer>`**Description**

NAS cause code to be sent if inter PLMN TAU is rejected because of IMS APN roaming control.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

40

Name

interPlmnTauReject - Inter PLMN TAU reject

Syntax`--interPlmnTauReject <integer>`**Description**

NAS cause code to be used by MME when inter-plmn TAU request is rejected.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

9

Name

lteBarAllPacketOdb - ODB - all packet oriented services barred

Syntax

--lteBarAllPacketOdb <integer>

Description

NAS cause code to be sent if UE MME is rejected because LTE all packet oriented services barred.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

8

Name

ItemNotAllowedHplmn - LTE-M Not Allowed in HPLMN

Syntax

--ItemNotAllowedHplmn <integer>

Description

NAS cause code to be sent to UE if it is not allowed LTE-M access

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

15

Name

ltePlmnNotAllowed - PLMN of IMSI is not allowed

Syntax

--ltePlmnNotAllowed <integer>

Description

NAS cause code to be sent if UE MME request is rejected because PLMN access is not allowed.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

11

Name

nbiotAttachSgsFail - NB-IOT Attach Sgs Fail

Syntax

--nbiotAttachSgsFail <integer>

Description

NAS cause code to be sent in attach reject if fails to set up SGs association.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

15

Name

nbiotBarAllPacketOdb - NB-IOT Bar All Packet ODB

Syntax

--nbiotBarAllPacketOdb <integer>

Description

Specifies the cause code to send to a NB-IoT UE that has ODB.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

8

Name

nbiotNotAllowed - NB-IOT Not Allowed

Syntax

--nbiotNotAllowed <integer>

Description

NAS cause code to be sent if CIOT is not allowed.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

15

Name

nbiotTauSgsFail - NB-IOT TAU Sgs Fail

Syntax

--nbiotTauSgsFail <integer>

Description

NAS cause code to be sent in TAU reject if fails to set up SGs association.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

15

Name

notAllowedTaiHplmn - UE is not allowed in a TAI in HPLMN

Syntax

--notAllowedTaiHplmn <integer>

Description

NAS cause code to be sent if UE MME is rejected because UE is in a restricted TA where UE is not allowed to access services.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

12

Name

pdnTypeIpv6RestrictionTauRejectionCause - PDN Type IPv6 Restriction TAU Rejection Cause

Syntax

--pdnTypeIpv6RestrictionTauRejectionCause <integer>

Description

Defines the EMM cause value when MME rejects the inter MME or inter RAT TAU due to PDN Type IPv6 being restricted, and the UE not having any PDN that can be maintained at the new MME.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

15

Name

rejectionS1u - Rejection S1U

Syntax

--rejectionS1u <integer>

Description

Rejection cause code when UE requests to establish S1-U by sending TAU with active flag, SR or CPSR when a UE has all PDN connections data transport over CP.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

35

Name

rfspAccessRestrictionCc - RFSP Access Restriction Cause Code

Syntax

--rfspAccessRestrictionCc <integer>

Description

The Cause Code to be sent to a UE if it is restricted access based on RFSP

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

15

Name

roamingEmmCcForEsmCc72 - Roaming EMM CC for ESM CC72

Syntax

```
--roamingEmmCcForEsmCc72 <integer>
```

Description

Configure NAS MM CC for attach reject when MME receives Create Session Response with cause code #72 for roamers.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

19

Name

roamingEmmCcForEsmCc92 - Roaming EMM CC for ESM CC92

Syntax

```
--roamingEmmCcForEsmCc92 <integer>
```

Description

Configure NAS MM CC for attach reject when MME receives Create Session Response with cause code #92 for roamers. If gParms enableProvCc is enabled, this field is not used unless generalGParms overrideEnhEmmCcCreateSessRespUserAuthFail is enabled.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

19

Name

roamingLtemNotAllowed - Roaming LTE-M Not Allowed

Syntax

```
--roamingLtemNotAllowed <integer>
```

Description

NAS cause code to be sent if inbound roaming UE is not allowed access to LTE-M

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

15

Name

roamingNbiotNotAllowed - Roaming NB-IoT Not Allowed

Syntax`--roamingNbiotNotAllowed <integer>`**Description**

NAS cause code to be sent to UE if it is not allowed NB-IoT access.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

15

Name

roamingUeEutranNotAllowedVplmn - Roaming UE EUTRAN restricted in a VPLMN

Syntax`--roamingUeEutranNotAllowedVplmn <integer>`**Description**

NAS cause code to be sent if UE MME is rejected because a roaming UE is not allowed to roam in the VPLMN.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

14

Name

roamingUeNotAllowedTai - Roaming UE is not allowed in the TAI

Syntax`--roamingUeNotAllowedTai <integer>`**Description**

NAS cause code to be sent if UE MME is rejected because UE is in a restricted TA where UE is not allowed to roam.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

12

Name

roamingWbEutranExceptLtemNotAllowed - Roaming WB-UTRAN Except LTE-M Not Allowed

Syntax

--roamingWbEutranExceptLtemNotAllowed <integer>

Description

NAS cause code to be sent to UE if it is not allowed WB EUTRAN except LTE-M access.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

15

Name

targetNodeLte - LTE target access restricted by node

Syntax

--targetNodeLte <integer>

Description

NAS cause code to send to the UE when we receive GTPv2 context response with cause code "Target access restricted for the subscriber".

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

15

Name

tauRequestWithoutSmsGrpId - TAU request without SMS group ID

Syntax

--tauRequestWithoutSmsGrpId <integer>

Description

Selection EMM CC to be used when MME rejects TAU request without SMS indication when bit 0 of local-group-id AVP is set to indicate that UE must indicate SMS request.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

14

Name

unsupportedFeatureRestriction - Roaming restricted due to unsupported features

Syntax

--unsupportedFeatureRestriction <integer>

Description

NAS cause code to be sent if UE MME is rejected because of unsupported feature restrictions.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

14

Name

wbEutranExceptLtemNotAllowedHplmn - WB-EUTRAN Except LTE-M Not Allowed in HPLMN

Syntax

--wbEutranExceptLtemNotAllowedHplmn <integer>

Description

NAS cause code to be sent to inbound roaming UE if it is not allowed WB EUTRAN except LTE-M access.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

15

6.105 cmm restorationAcc

Restoration Access. Syntax, description, parameters, and roles for `cmm restorationAcc` command.

Syntax

Description

This command is used to administer restoration access control and includes parameters for defining the remote node IP address and whether it is a primary access record. The 'shutdown' parameter is used to enable/shutdown the interface.

Parameters

Name

rmtNodeName - Remote node name

Syntax

--rmtNodeName <string>

Description

Remote node name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

rmtNodeIp - Remote node IP address

Syntax

--rmtNodeIp <string>

Description

Remote Node IP address

Class

Optional.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

shutdown - Shutdown

Syntax

--shutdown <list-item>

Description

When it is true, indicates that interface is shut down.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Name

srsPrimaryAcc - SRS primary access

Syntax

--srsPrimaryAcc <list-item>

Description

Indicates whether it is a primary access record or not.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

6.106 cmm restorationApn

Restoration APN. Syntax, description, parameters, and roles for `cmm restorationApn` command.

Syntax

Description

This command is used to administer a Restoration APN Network Identifier.

Parameters

Name

srsApn - APN network identifier

Syntax

--srsApn <string>

Description

APN network identifier.

Class

Required key.

Type / Range

Digit string of length 1 to 62 with the allowed pattern of [0-9a-zA-Z\.\-]*

Roles

Create

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

sysadmin, manage, monitor

6.107 cmm restorationApnList

Restoration APN List. Syntax, description, parameters, and roles for cmm restorationApnList command.

Syntax

Description

This command is used to administer a Restoration APN List. The APN list consists of APNs whose bearer context needs to be stored on the Session Restoration Server (SRS) for restoration in case of MME failure/restart. MME does not save any bearer context if there is no APN list or if the APN list has no APN-NI. Only one APN list can be created. Each APN list can have up to three APN-NI.

Parameters

Name

name - Restoration APN list name

Syntax

--name <string>

Description

Restoration APN list name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Roles

Create

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

sysadmin, manage, monitor

6.108 cmm restorationConfig

Session Restoration Configuration. Syntax, description, parameters, and roles for cmm restorationConfig command.

Syntax

Description

This command configures the inter-AMF session restoration architecture. A default config named Default is auto created and it cannot be deleted.

Parameters

Name

name - Name

Syntax

--name <string>

Description

Name

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

"default"

Name

realmId - Realm ID

Syntax

--realmId <string>

Description

The realm Id under which the records are stored in UDSF. Applicable only when restoration mode is UDSF.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

""

Name

restorationMode - Restoration Mode

Syntax

--restorationMode <list-item>

Description

UE Context Restoration Mode. SRS: UE Context is stored in backup CMM UDSF: UE Context is stored in UDSF. when mode is UDSF StorageId and realmId must not be Null.

Class

Optional.

List

- SRS - Inter-CMM based UE context backup storage
- UDSF - UDSF based UE context backup storage

Default

SRS

Name

storageId - Storage ID

Syntax

--storageId <string>

Description

The Storage Id under which the records are stored in UDSF. Applicable only when restoration mode is UDSF.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

sysadmin, manage

List

sysadmin, manage, monitor

6.109 cmm restorationEndPt

Restoration End Point. Syntax, description, parameters, and roles for cmm restorationEndPt command.

Syntax

Description

This command is used to configure the CMMs in a pool that are Restoration Endpoints. A Restoration Endpoint is a CMM that is available to be used as 1st session restoration server (i.e., this endpoint is used by the CMM to store session restoration contexts), or as a source of restoration contexts (i.e., the CMM uses it to retrieve a session restoration context). A CMM is typically configured with restoration endpoints to all other CMMs in the pool, however, only one endpoint is configured as session restoration server (--srsServer is true).

Parameters

Name

srsName - SRS Name

Syntax

--srsName <string>

Description

It is a local string that identifies another CMM as a restoration endpoint

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

interfaceName - Interface Name

Syntax

--interfaceName <list-item>

Description

Interface Name

Class

Required on create, not modifiable.

List

- SBI_NR10 - Specify SBI_NR10 interface.
- SBI_NR10_2 - SBI_NR_10_2 - Specify SBI_NR10_2 interface.
- SBI_NR10_3 - Specify the SBI_NR10_3 interface.
- SBI_NR10_4 - Specify the SBI_NR10_4 interface.
- SBI_NR10_5 - Specify the SBI_NR10_5 interface.
- SBI_NR10_6 - Specify the SBI_NR10_6 interface.
- SBI_NR10_7 - Specify the SBI_NR10_7 interface.
- SBI_NR10_8 - Specify the SBI_NR10_8 interface.
- SBI_NR10_9 - Specify the SBI_NR10_9 interface.
- SBI_NR10_10 - Specify the SBI_NR10_10 interface.
- SBI_NR10_11 - Specify the SBI_NR10_11 interface.
- SBI_NR10_12 - Specify the SBI_NR10_12 interface.
- SBI_NR10_13 - Specify the SBI_NR10_13 interface.
- SBI_NR10_14 - Specify the SBI_NR10_14 interface.
- SBI_NR10_15 - Specify the SBI_NR10_15 interface.
- SBI_NR10_16 - Specify the SBI_NR10_16 interface.

Name

rmtNodeIp - Remote Node Ip

Syntax

--rmtNodeIp <string>

Description

IP address of a CMM that is uses in the pool restoration feature

Class

Required on create.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

sysType - System Type

Syntax

--sysType <list-item>

Description

System type (List of MME, AMF)

Class

Required on create, not modifiable.

List

- MME - MME
- AMF - AMF

Name

state - Administrative state

Syntax

--state <list-item>

Description

Administrative state.

Class

Read only.

List

- locked - Locked.
- unlocked - Unlocked.

Default

locked

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Modify

sysadmin, manage

Delete

sysadmin, manage

List

sysadmin, manage, monitor

6.110 cmm restorationEndPtList

Restoration End Point List. Syntax, description, parameters, and roles for cmm restorationEndPtList command.

Syntax

Description

List of restoration End Points - Contains more than one entry when using multiple IPDSs

Parameters

Name

name - List Name

Syntax

--name <string>

Description

Restoration End Point List Name

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

sysType - System Type

Syntax

--sysType <list-item>

Description

System Type (List of MME, AMF)

Class

Required on create, not modifiable.

List

- MME - MME
- AMF - AMF

Name

srsServer - SRS Server

Syntax

--srsServer <list-item>

Description

If this parameter is set to true it indicates that the MME identified by the corresponding restoration end point list item(s) are used to store this MME restoration contexts.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

sysadmin, manage, monitor

6.111 cmm restorationEndPtListItem

Restoration End Point List Item. Syntax, description, parameters, and roles for cmm restorationEndPtListItem command.

Syntax**Description**

Add or delete a restoration End Point to the named list.

Parameters**Name**

restorationEndPtListName - Reatoration End Point List Name

Syntax

--restorationEndPtListName <string>

Description

List of Restoration End Points

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

restorationEndPtName - Restoration End Point Name

Syntax

--restorationEndPtName <string>

Description

Name of the Restoration End Point

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Roles

Create

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

sysadmin, manage, monitor

6.112 cmm restorationSync

Restoration Synchronization. Syntax, description, parameters, and roles for cmm restorationSync command.

Syntax

Description

This command synchronizes the SRS restoration server contexts after an SU.

Parameters

Name

primaryReSync - Primary Resynchronization

Syntax

--primaryReSync <list-item>

Description

This parameter indicates the CMM SRS server should resync the UE contexts with the Primary Server

Class

Optional.

List

- 4g - 4G contexts - This indicates to rsync 4G contexts
- 4g5g - 5G and 4G contexts - This indicates to rsync both 5G and contexts
- 5g - 5G contexts - This indicates to rsync 5G contexts
- none - Not Applicable

Default

none

Name

srsReSync - SRS Resynchronization

Syntax

--srsReSync <list-item>

Description

This parameter indicates the CMM Primary server should resync the UE contexts with the SRS Server

Class

Optional.

List

- 4g - 4G contexts - This indicates to rsync 4G contexts
- 4g5g - 5G and 4G contexts - This indicates to rsync both 5G and contexts
- 5g - 5G contexts - This indicates to rsync 5G contexts
- none - Not Applicable

Default

none

Roles

Create

sysadmin, manage

6.113 cmm restorationSyncStatus

Restoration Synchronization Status. Syntax, description, parameters, and roles for cmm restorationSyncStatus command.

Syntax

Description

Restoration Synchronization Status Status of the last or running restoration command

Parameters

Name

primaryReSync - Primary Resynchronization

Syntax

--primaryReSync <list-item>

Description

This parameter indicates the CMM SRS server should resync the UE contexts with the Primary Server

Class

Optional.

List

- 4g - 4G contexts - This indicates to rsync 4G contexts
- 4g5g - 5G and 4G contexts - This indicates to rsync both 5G and contexts
- 5g - 5G contexts - This indicates to rsync 5G contexts
- none - Not Applicable

Default

none

Name

primaryReSyncStatus - Primary Resynchronization Status

Syntax

--primaryReSyncStatus <list-item>

Description

Status of the last or running Primary Recsync command

Class

Optional.

List

- Aborted - Aborted - This state is entered when nr10 links are down or administratively locked. It can also be entered when 10 nr10 heartbeats are missed.
- Completed - Completed
- Inprogress - In Progress
- None - None
- Pending - Pending - This state is a transient state when the paired CMM has not replied to the resync start.

Name

srsReSync - SRS Resynchronization

Syntax

--srsReSync <list-item>

Description

This parameter indicates the CMM Primary server should resync the UE contexts with the SRS Server

Class

Optional.

List

- 4g - 4G contexts - This indicates to rsync 4G contexts
- 4g5g - 5G and 4G contexts - This indicates to rsync both 5G and contexts
- 5g - 5G contexts - This indicates to rsync 5G contexts
- none - Not Applicable

Default

none

Name

srsReSyncStatus - SRS Resynchronization Status

Syntax

--srsReSyncStatus <list-item>

Description

Status of the last or running SRS resync command

Class

Optional.

List

- Aborted - Aborted - This state is entered when nr10 links are down or administratively locked. It can also be entered when 10 nr10 heartbeats are missed.
- Completed - Completed
- Inprogress - In Progress
- None - None
- Pending - Pending - This state is a transient state when the paired CMM has not replied to the resync start.

Roles

List

sysadmin, manage, monitor

6.114 cmm rfspAccessRestrictionList

RFSP Access Restriction List. Syntax, description, parameters, and roles for cmm rfspAccessRestrictionList command.

Syntax

Description

Creates list names to be used for an RFSP Access Restriction List

Parameters

Name

name - Name

Syntax

--name <string>

Description

The name of the RFSP Access Restriction List

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Roles

Create

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

sysadmin, manage, monitor

6.115 cmm rfspAccessRestrictionListItem

RFSP Access Restriction List Item. Syntax, description, parameters, and roles for cmm rfspAccessRestrictionListItem command.

Syntax

Description

The RFSP value to assign to a RFSP Access Restriction List.

Parameters

Name

rfspAccessRestrictionListName - RFSP Access Restriction List Item

Syntax

--rfspAccessRestrictionListName <string>

Description

RFSP value to be added to a list.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

rfspValue - RFSP Value

Syntax

--rfspValue <integer>

Description

Value of the RFSP to be assigned to a list

Class

Required key.

Type / Range

Integer in the range of 1 to 256

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

sysadmin, manage, monitor

6.116 cmm rmtAmfInstance

Remote AMF Instance. Syntax, description, parameters, and roles for `cmm rmtAmfInstance` command.

Syntax**Description**

This command is used to create a new AMF instance and modify and delete an existing AMF instance. An AMF instance is identified by its Instance ID.

Parameters**Name**

plmnName - PLMN Name

Syntax

--plmnName <string>

Description

Name of the PLMN of the AMF. Must be set to own AMF's Home PLMN. Currently not allowed to set to Shared PLMN (restriction is not enforced by CLI but impact is undefined). Also not allowed to set to Roaming PLMN as local provisioning is not relevant for NF in different PLMNs

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Name

amfRegionId - AMF Region ID

Syntax

--amfRegionId <integer>

Description

AMF Region Identifier is used to identify an AMF group serving a region. 5G AMF are organized into an AMF region, AMF set and AMF pointer. An AMF is uniquely identified by PLMN ID, AMF Region ID, AMF Set and AMF pointer. The PLMN/Region/AMF Set combination may point to a same or different AMF Set than the one CMM belongs. Region Id is given in decimal format.

Class

Required key.

Type / Range

Integer in the range of 0 to 255

Name

amfSetId - AMF Set Identifier

Syntax

--amfSetId <integer>

Description

AMF Set Identifier is used to identify a set of AMF within an AMF region. An AMF is uniquely identified by PLMN ID, AMF Region ID, AMF Set and AMF pointer.

Class

Required key.

Type / Range

5G AMF Set ID

Name

amfPointer - AMF Pointer

Syntax

--amfPointer <integer>

Description

The AMF Pointer identifies an AMF in an AMF set. An AMF is uniquely identified by PLMN ID, AMF Region ID, AMF Set and AMF pointer.

Class

Required key.

Type / Range

5G AMF Pointer

Name

instanceId - Instance Identifier

Syntax

--instanceId <string>

Description

AMF Instance Identifier is a UUID. The operator must obtain the UUID from the AMF configuration data. The UUID must have the following string format: 8 hex digits-4 hex digts-4hex digits-4 hex digits-12hex digits. Example: 4947a69a-f61b-4bc1-b9da-47c9c5d14b64. Used for AMF selection when AMF discovery is based on target-nf-instance-id

Class

Required on create, not modifiable.

Type / Range

Digit string of length 36 to 36 with the allowed pattern of [0-9a-fA-F]{8}\-[0-9a-fA-F]{4}\-[0-9a-fA-F]{4}\-[0-9a-fA-F]{4}\-[0-9a-fA-F]{12}

Name

capacity - AMF Relative Capacity

Syntax

--capacity <integer>

Description

Relative capacity of the AMF as defined in NFProfile level in 29.510. It is used for load balancing among NFs with equal Priority. As per 29.510 this parameter is used to deduce the NF Service instance Capacity when -and only when- the relevant information is not available on Service Instance level. However since locally provisioned Service instances always have a default capacity value this parameter has no effect for load balancing Service Request (only relevant for Default Notifications)

Class

Optional.

Type / Range

Integer in the range of 0 to 65,535

Default

65535

Name

enable - Enable AMF

Syntax

--enable <list-item>

Description

The parameter is used to enable use of the provisioned instance of the AMF. If not enabled the NF will not be considered as candidate for selection,

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

fqdn - AMF FQDN

Syntax

--fqdn <string>

Description

AMF FQDN. This parameter is currently not used by CMM

Restrictions

FQDN is an optional parameter in CMM19.0 and it is not used even it is provisioned. The AMF instance must be provisioned either with IPv4 or IPv6 address.

Class

Optional.

Type / Range

Digit string of length 0 or 1 to 128

Name

ipAddress - IP V4 Address

Syntax

--ipAddress <string>

Description

An IPv4 or IPv6 address needs to be provisioned if an IP address and the FQDN for an AMF service Instance is not provisioned.

Class

Optional.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Default

0.0.0.0

Name

locality - Location of the AMF

Syntax

--locality <string>

Description

This parameter is used to configure AMF location like geographical location or data center name. Locality of the NF as defined per NF Profile in 29.510. When set, if the locality of the NF matches the locality of the own AMF (amfInstance --locality) the NF is selected with highest priority (if all other criterions are also met). If own AMF has not be provisioned with locality this parameter has no effect.

Class

Optional.

Type / Range

Digit string of length 0 to 64

Default

""

Name

nfServicesListName - NF Service List Name

Syntax

--nfServicesListName <string>

Description

Name of the AMF services list. This list consists of services instances supported by the remote AMF. References a list which links to the NFs service instances. A NF may be provisioned to have multiple service instances for the same service type. For more details on the Services refer to nfServiceInstance command

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Name

priority - AMF Priority

Syntax

--priority <integer>

Description

Indicates priority value relative to the other AMFs in the same AMF set. Relative Priority of the NF as defined in NFProfile level in 29.510. It is used for shortlisting NFs As per 29.510 this parameter is used to deduce the NF Service instance priority when -and only when- the relevant information is not available on Service Instance level. However since locally provisioned Service instances always have a default priority value this parameter has no effect for shortlisting load balancing Service Requests (only relevant for Default Notifications)

Class

Optional.

Type / Range

Integer in the range of 0 to 65,535

Default

1

6.117 cmm rmtEndPtCfg

Remote End Point Configuration. Syntax, description, parameters, and roles for cmm rmtEndPtCfg command.

Syntax

Description

This command is used to administer a Remote End Point Configuration and includes parameters for defining the interface type, DPR disconnect cause, destination host and realm AVP values, IP addresses, end point ID, and port number. The 'shutdown' parameter is used to enable/shutdown the remote endpoint.

Parameters

Name

name - Name

Syntax

--name <string>

Description

Label.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

interfaceName - Interface name

Syntax

--interfaceName <list-item>

Description

Type of interfaces.

Class

Required on create, not modifiable.

List

- S13 - Specify S13 interface to an EIR.
- S6A - Specify S6a interface to an HSS.
- SBC - Specify the SBc interface to a CBC.
- SGD - Specify SGd interface to an SMSC/SMS router.
- SGS - Specify the SGs interface to a GSM/UMTS MSC.
- SGS_LITE - Specify SGs lite interface to an IWF.
- SLG - Specify the Slg interface to a GMLC.
- SLS - Specify the Sls interface to an E-SMLC.
- SV - Specify the Sv interface to a GSM/UMTS MSC.
- T6A - Specify T6a interface to a SCEF.

Name

dprDisconnectCause - DPR disconnect cause

Syntax

--dprDisconnectCause <list-item>

Description

DPR disconnect cause.

Restrictions

dprDisconnectCause parameter is only applicable when interfaceName is S6A, S13, SLG or SGD.

Class

Optional.

List

- Busy - The peer's internal resources are constrained, and it has determined that the transport connection needs to be closed. a receiver of a DPR with above result code SHOULD NOT attempt reconnection.
- DoNotWantToTalkToYou - Do not want to talk to you - The peer has determined that it does not see a need for the transport connection to exist, since it does not expect any messages to be exchanged in the near future. a receiver of a DPR with above result code SHOULD NOT attempt reconnection.
- Reboot - A scheduled reboot is imminent. a receiver of a DPR with above result code MAY attempt reconnection.

Default

DoNotWantToTalkToYou

Name

draDestHostFqdnName - DRA destination host name

Syntax

--draDestHostFqdnName <string>

Description

If MME does not have destination host in VLR (UE shows up for the first time), and the destination is a DRA, MME uses the value of this new field to populate destination host AVP in AIR and ULR.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

''

Name

draDestRealmFqdnName - DRA destination realm name

Syntax

--draDestRealmFqdnName <string>

Description

If MME does not have destination realm in VLR (UE shows up for the first time), and the destination is a DRA, MME uses the value of this new field to populate destination realm AVP in AIR and ULR.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

draSupported - DRA supported

Syntax

--draSupported <list-item>

Description

When the drasupported parameter is true, if MME does not have destination-host/destination-realm in VLR (UE shows up for the first time), MME uses the value of the field draDestRealmFqdnName to populate destination-realm AVP in AIR and ULR.

Restrictions

draSupported parameter is only applicable when interfaceName is S6A, S13, SLG or SGD.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

endPtId - End point ID

Syntax

--endPtId <integer>

Description

Unique numeric ID for this remote end point IP address(es). If the maximum number of HSS and EIRs are provisioned, it is recommended to place the MSC IP id in the higher range of

100-200 to leave enough entries available for HSS and EIR reconfiguration procedures. in particular, when converting HSS / EIR from IPv4 to IPv6, twice the number of S6ad and S13 remote endpoints may be defined during the conversion, and the remote endpoint IP ID (1-100 range) will be filled by the SGa/S13 interfaces, requiring the SGs interfaces to utilize the higher range of 100-200.

Class

Optional.

Type / Range

Integer in the range of 1 to 1,024

Name

ip1 - IP address 1

Syntax

--ip1 <string>

Description

First IP address.

Class

Optional.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Default

0.0.0.0

Name

ip2 - IP address 2

Syntax

--ip2 <string>

Description

Secondary IP address.

Restrictions

ip2 parameter is only applicable when interfaceName is S6A, S13, SLG, SBC, SGS, SLS or SGD.

Class

Optional.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Default

0.0.0.0

Name

port - Port

Syntax

--port <integer>

Description

Port number.

Restrictions

0 forces the default port to be used. The default port values are as follows: S6A:3868, S13:3868, SBC:29168, SLG:3868, SGS:29118, SLS:9082, SV:2123, SGD 3868

Class

Optional.

Type / Range

Integer in the range of 0 or 1,024 to 65,535

Default

0

Name

scefProfileName - SCEF Profile Name

Syntax

--scefProfileName <string>

Description

SCEF Profile

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

"

Name

shutdown - Shutdown

Syntax

--shutdown <list-item>

Description

Indicates if the remote endpoint is shutdown.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

shutdownReconnectTimer - Shutdown reconnect timer

Syntax

--shutdownReconnectTimer <integer>

Description

Shutdown reconnect timer.

Restrictions

shutdownReconnectTimer is only applicable when interfaceName is S6A, S13, SLG or SGD. It must be 0 for other interface types. shutdownReconnectTimer is entered in units of milliseconds and must be a multiple of 100.

Class

Optional.

Type / Range

Integer in the range of 0 to 10,000 in units of Millisecond

Default

0

6.118 cmm rnc

radio network controller. Syntax, description, parameters, and roles for cmm rnc command.

Syntax

Description

Configure, list and show Radio Network controllers.

Parameters

Name

rncName - RNC name

Syntax

--rncName <string>

Description

RNC name.

Class

Required key.

Type / Range

Digit string of length 1 to 10 with the allowed pattern of [0-9a-zA-Z\.\-_:]*

Name

mcc - MCC

Syntax

--mcc <digits>

Description

Mobile country code digits of global RNC identifier.

Class

Required on create.

Type / Range

Digit string of length 3

Name

mnc - MNC

Syntax

--mnc <digits>

Description

Mobile network code digits of global RNC identifier.

Class

Required on create.

Type / Range

Digit string of length 2 to 3

Name

rnclId - RnclId

Syntax

--rncId <integer>

Description

RNC identifier part of global RNC identifier.

Class

Required on create.

Type / Range

Integer in the range of 1 to 65,534

Name

dig - Digits

Syntax

--dig <digits>

Description

Global title address.

Class

Optional.

Type / Range

Digit string of length 0 to 18

Default

""

Name

gipm - Gipm

Syntax

--gipm <integer>

Description

Gateway IP address netmask length (GGSN/S-GW).

Class

Optional.

Type / Range

Integer in the range of 0 to 127

Default

0

Name

ni - Network indicator

Syntax

--ni <list-item>

Description

Network indicator. this parameter defines the value that represents the type of network where the RNC is located. allowed values, IN0 ... international network IN1 ... reserved for international use NAO ... national network NA1 ... reserved for national use.

Class

Optional.

List

- " - No signalling network - No signalling network.
- IN0 - Signalling network IN0 - Signalling network IN0.
- IN1 - Signalling network IN1 - Signalling network IN1.
- NAO - Signalling network NAO - Signalling network NAO.
- NA1 - Signalling network NA1 - Signalling network NA1.

Default

""

Name

operState - operational state

Syntax

--operState <string>

Description

Radio network controller operational state. allowed values, unlocked ... unlocked (RESET can be started by RNC or SGSN, after reset operState is changed to available) locked ... locked (RNC is locked) blocked ... blocked (RNC blocked, no new IU connections, existing remains) available ... available (SGSN is connected to RNC) resetbysgsn ... reset by sgsn (note this state is visible in database only when sgsninitresetprocedure is ongoing). after resetprocedure, iucontrol process change state to available. resetbyrnc ... reset by RNC (note this state is visible in database only when rncinitresetprocedure is ongoing). after resetprocedure, iucontrol process change state to available outofservice ... out of service.

Class

Read only.

Type / Range

Digit string of length 1 to 12 with the allowed pattern of [0-9a-zA-Z\._:]*

Name

pSetId - P set id

Syntax

--pSetId <integer>

Description

Radio network controller parameter set index. this parameter should match parameter rncparamsetid of table rncparamset. when pSetId is 0, rncdefaultparamset is used.

Class

Optional.

Type / Range

Integer in the range of 0 to 10

Default

0

Name

pSetName - P set name

Syntax

--pSetName <string>

Description

Radio network controller parameter set name.

Class

Read only.

Type / Range

Digit string of length 0 to 15 with the allowed pattern of [0-9a-zA-Z\.\-:]*

Name

spc - Spc

Syntax

--spc <integer>

Description

Signalling point code.

Class

Optional.

Type / Range

Integer in the range of 0 to 16,777,215

Default

0

Name

state - RNC state

Syntax

--state <list-item>

Description

Radio network controller administrative state. allowed values, unlocked ... unlocked (RESET can be started by RNC or SGSN, after reset state is changed to available) locked ... locked (RNC is locked) blocked ... blocked (RNC blocked, no new IU connections, existing remains) resetbysgsn ... reset by sgsn (note this state is visible in database only when sgsninitresetprocedure is ongoing). after resetprocedure, iucontrol process change state to available in operState parameter

Class

Optional.

List

- blocked - Blocked (RNC blocked, no new IU connections, existing remains).
- locked - Locked (RNC is locked).
- resetbysgsn - Reset by SGSN - Reset by SGSN (note this state is visible in redis only when sgsninitresetprocedure is ongoing). after resetprocedure, iucontrol process change state to available in redis.
- unlocked - Unlocked (RESET can be started by RNC or SGSN, after reset state is changed to available).

Default

locked

Name

toA - Type of RNC address

Syntax

--toA <list-item>

Description

Identify type of RNC address. allowed values. GT ... global title address. SPC ... destination point code (ni + spc) if GT is given, the dig parameter should be given. if SPC is given, the ni and the spc parameters should be given.

Class

Optional.

List

- GT - Global title address.
- SPC - Destination point code (ni + spc).

Default

GT

Name

type - RNC type

Syntax

--type <list-item>

Description

Type of RNC. this parameter defines the radio network controller type. allowed values, RNC ... radio network controller (in traditional UTRAN architecture) IHSPA ... I-HSPA nodeb (in flat UTRAN architecture).

Class

Optional.

List

- IHSPA - I-HSPA nodeb (in flat UTRAN architecture).
- RNC - Radio network controller (in traditional UTRAN architecture).

Default

RNC

6.119 cmm rncGwlp

RNC Gateway IPs. Syntax, description, parameters, and roles for `cmm rncGwIp` command.

Syntax

Description

RNC Gateway IPs.

Parameters

Name

rncName - RNC name

Syntax

--rncName <string>

Description

RNC name. this parameter should match parameter rncname of table rnc.

Class

Required key.

Type / Range

Digit string of length 1 to 10 with the allowed pattern of [0-9a-zA-Z\.\-_:]*

Name

ipAddress - RNC gateway IP address

Syntax

--ipAddress <string>

Description

RNC gateway IP address.

Class

Required key.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

sysadmin, manage, monitor

6.120 cmm rncParamSet

RNC parameter set. Syntax, description, parameters, and roles for cmm rncParamSet command.

Syntax

Description

Configure, list and show Radio Network controllers parameter set.

Parameters

Name

rncParamSetId - RNC parameter set id

Syntax

--rncParamSetId <integer>

Description

Radio network controller parameter set index, this is pSetId parameter in rncs.yaml.

Class

Required key.

Type / Range

Integer in the range of 0 to 10

Name

cspsCoordinationSupported - SGSN requests CS/PS coordination from the RNC

Syntax

--cspsCoordinationSupported <list-item>

Description

SGSN requests CS/PS coordination from the RNC.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

epsBearerPresSupported - EPS bearer preservation is supported

Syntax

--epsBearerPresSupported <list-item>

Description

EPS bearer preservation is supported.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

guardPeriodAfteSubsProhib - Timer defines the guard period (in seconds) after the subsystem prohibited

Syntax

--guardPeriodAfteSubsProhib <integer>

Description

Timer defines the guard period (in seconds) after the subsystem prohibited.

Class

Optional.

Type / Range

Integer in the range of 1 to 150

Default

29

Name

guardPeriodBeforeResetAck - This timer defines a guard period (in seconds) in the CN before sending a reset acknowledge message

Syntax

--guardPeriodBeforeResetAck <integer>

Description

This timer defines a guard period (in seconds) in the CN before sending a reset acknowledge message.

Class

Optional.

Type / Range

Integer in the range of 3 to 15

Default

5

Name

ipv6AddressSupported - RNC supports IPv6 addresses

Syntax

--ipv6AddressSupported <list-item>

Description

RNC supports IPv6 addresses.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

maxDlBitrateForRab - Maximum downlink value (kbps) for the RAB maximum bit rate (MBR) supported in the RNC

Syntax

--maxDlBitrateForRab <list-item>

Description

Maximum downlink value (kbps) for the RAB maximum bit rate (MBR) supported in the RNC.

Class

Optional.

List

- 0 - Specify maximum bit rate of 0 kbps.
- 16 - Specify maximum bit rate of 16 kbps.
- 32 - Specify maximum bit rate of 32 kbps.
- 64 - Specify maximum bit rate of 64 kbps.
- 128 - Specify maximum bit rate of 128 kbps.
- 256 - Specify maximum bit rate of 256 kbps.
- 512 - Specify maximum bit rate of 512 kbps.
- 1024 - Specify maximum bit rate of 1024 kbps.

- 2048 - Specify maximum bit rate of 2048 kbps.
- 4096 - Specify maximum bit rate of 4096 kbps.
- 8192 - Specify maximum bit rate of 8192 kbps.
- 11500 - 1150 - Specify maximum bit rate of 11500 kbps.
- 16000 - Specify maximum bit rate of 16000 kbps.
- 21000 - Specify maximum bit rate of 21000 kbps.
- 28000 - Specify maximum bit rate of 28000 kbps.
- 42000 - Specify maximum bit rate of 42000 kbps.
- 84000 - Specify maximum bit rate of 84000 kbps.
- 168000 - Specify maximum bit rate of 168000 kbps.

Default

0

Name

maxGuaranteedUlBitrateForRab - Maximum uplink value (kbps) for the RAB guaranteed bit rate (GBR) supported in the RNC

Syntax

- maxGuaranteedUlBitrateForRab <list-item>

Description

Maximum uplink value (kbps) for the RAB guaranteed bit rate (GBR) supported in the RNC.

Class

Optional.

List

- 0 - Specify maximum bit rate of 0 kbps.
- 16 - Specify maximum bit rate of 16 kbps.
- 32 - Specify maximum bit rate of 32 kbps.
- 64 - Specify maximum bit rate of 64 kbps.
- 128 - Specify maximum bit rate of 128 kbps.
- 256 - Specify maximum bit rate of 256 kbps.
- 512 - Specify maximum bit rate of 512 kbps.
- 1024 - Specify maximum bit rate of 1024 kbps.
- 2048 - Specify maximum bit rate of 2048 kbps.
- 4096 - Specify maximum bit rate of 4096 kbps.

- 6144 - Specify maximum bit rate of 6144 kbps.
- 8192 - Specify maximum bit rate of 8192 kbps.
- 11500 - Specify maximum bit rate of 11500 kbps.
- 23000 - Specify maximum bit rate of 23000 kbps.
- 46000 - Specify maximum bit rate of 46000 kbps.

Default

0

Name

maxQuaranteedDLBitRateForRab - Maximum downlink value (kbps) for the RAB guaranteed bit rate (GBR) supported in the RNC

Syntax

--maxQuaranteedDLBitRateForRab <list-item>

Description

Maximum downlink value (kbps) for the RAB guaranteed bit rate (GBR) supported in the RNC.

Class

Optional.

List

- 0 - Specify maximum bit rate of 0 kbps.
- 16 - Specify maximum bit rate of 16 kbps.
- 32 - Specify maximum bit rate of 32 kbps.
- 64 - Specify maximum bit rate of 64 kbps.
- 128 - Specify maximum bit rate of 128 kbps.
- 256 - Specify maximum bit rate of 256 kbps.
- 512 - Specify maximum bit rate of 512 kbps.
- 1024 - Specify maximum bit rate of 1024 kbps.
- 2048 - Specify maximum bit rate of 2048 kbps.
- 4096 - Specify maximum bit rate of 4096 kbps.
- 8192 - Specify maximum bit rate of 8192 kbps.
- 11500 - 1150 - Specify maximum bit rate of 11500 kbps.
- 16000 - Specify maximum bit rate of 16000 kbps.
- 21000 - Specify maximum bit rate of 21000 kbps.
- 28000 - Specify maximum bit rate of 28000 kbps.

- 42000 - Specify maximum bit rate of 42000 kbps.
- 84000 - Specify maximum bit rate of 84000 kbps.
- 168000 - Specify maximum bit rate of 168000 kbps.

Default

0

Name

maxRepeatCntOfRncGlobRst - Maximum repeat count of the RNC global reset message

Syntax`--maxRepeatCntOfRncGlobRst <integer>`**Description**

Maximum repeat count of the RNC global reset message.

Class

Optional.

Type / Range

Integer in the range of 0 to 256

Default

5

Name

maxRepeatForResourceReset - Maximum repeat count of the RNC global reset message

Syntax`--maxRepeatForResourceReset <integer>`**Description**

Maximum repeat count of the resource reset.

Class

Optional.

Type / Range

Integer in the range of 0 to 16

Default

1

Name

maxTimeForIuRelease - Maximum time in seconds to wait for activity in the iu connection

Syntax`--maxTimeForIuRelease <integer>`**Description**

Maximum time in seconds to wait for activity in the iu connection.

Class

Optional.

Type / Range

Integer in the range of 0 to 60

Default

10

Name

maxTimeForIuReleaseCompl - Maximum time in seconds to wait for iu release complete after the iu release command has been sent

Syntax

--maxTimeForIuReleaseCompl <integer>

Description

Maximum time in seconds to wait for iu release complete after the iu release command has been sent.

Class

Optional.

Type / Range

Integer in the range of 1 to 15

Default

5

Name

maxTimeForRabAssignment - Maximum time in seconds for the whole radio access bearers (RABs) assignment procedure

Syntax

--maxTimeForRabAssignment <integer>

Description

Maximum time in seconds for the whole radio access bearers (RABs) assignment procedure.

Class

Optional.

Type / Range

Integer in the range of 10 to 30

Default

20

Name

maxTimeForRelocResAlloc - Maximum time in seconds for the relocation resource allocation procedure

Syntax

--maxTimeForRelocResAlloc <integer>

Description

Maximum time in seconds for the relocation resource allocation procedure.

Class

Optional.

Type / Range

Integer in the range of 2 to 20

Default

10

Name

maxTimeForRelocResCompl - Maximum time in seconds for relocation resource completion

Syntax

--maxTimeForRelocResCompl <integer>

Description

Maximum time in seconds for relocation resource completion.

Class

Optional.

Type / Range

Integer in the range of 2 to 30

Default

15

Name

maxTimeForResetProcedure - Maximum time in seconds for the reset procedure

Syntax

--maxTimeForResetProcedure <integer>

Description

Maximum time in seconds for the reset procedure.

Class

Optional.

Type / Range

Integer in the range of 30 to 120

Default

60

Name

maxTimeForSecModeAck - Maximum time in seconds for security mode complete/reject after the security mode command has been sent

Syntax

--maxTimeForSecModeAck <integer>

Description

Maximum time in seconds for security mode complete/reject after the security mode command has been sent.

Class

Optional.

Type / Range

Integer in the range of 1 to 16

Default

5

Name

maxTimeForSrnsContextResp - Maximum time in seconds to wait for SRNS context response after the SRNS context request has been sent

Syntax

--maxTimeForSrnsContextResp <integer>

Description

Maximum time in seconds to wait for SRNS context response after the SRNS context request has been sent.

Class

Optional.

Type / Range

Integer in the range of 1 to 16

Default

8

Name

maxTimeUntilLocationReport - Maximum time (in seconds) the SGSN is allowed to wait for the radio access network application part RANAP LOCATION_REPORT after the reloc, handover command is sent to the source access

Syntax

--maxTimeUntilLocationReport <integer>

Description

Maximum time (in seconds) the SGSN is allowed to wait for the radio access network application part RANAP LOCATION_REPORT after the reloc, handover command is sent to the source access.

Class

Optional.

Type / Range

Integer in the range of 1 to 30

Default

10

Name

maxUlBitrateForRab - Maximum uplink value (kbps) for the RAB maximum bit rate (MBR) supported in the RNC

Syntax

-maxUlBitrateForRab <list-item>

Description

Maximum uplink value (kbps) for the RAB maximum bit rate (MBR) supported in the RNC.

Class

Optional.

List

- 0 - Specify maximum bit rate of 0 kbps.
- 16 - Specify maximum bit rate of 16 kbps.
- 32 - Specify maximum bit rate of 32 kbps.
- 64 - Specify maximum bit rate of 64 kbps.
- 128 - Specify maximum bit rate of 128 kbps.
- 256 - Specify maximum bit rate of 256 kbps.
- 512 - Specify maximum bit rate of 512 kbps.
- 1024 - Specify maximum bit rate of 1024 kbps.
- 2048 - Specify maximum bit rate of 2048 kbps.
- 4096 - Specify maximum bit rate of 4096 kbps.
- 6144 - Specify maximum bit rate of 6144 kbps.
- 8192 - Specify maximum bit rate of 8192 kbps.
- 11500 - Specify maximum bit rate of 11500 kbps.
- 23000 - Specify maximum bit rate of 23000 kbps.
- 46000 - Specify maximum bit rate of 46000 kbps.

Default

0

Name

overloadLongTimerInSgsn - While this timer is running (in seconds), the CN is not allowed to increase traffic

Syntax

--overloadLongTimerInSgsn <integer>

Description

While this timer is running (in seconds), the CN is not allowed to increase traffic.

Class

Optional.

Type / Range

Integer in the range of 2 to 120

Default

30

Name

overloadShortTimerInSgsn - While this timer is running (in seconds), overload messages and information on congested signalling points in the CN are ignored

Syntax

--overloadShortTimerInSgsn <integer>

Description

While this timer is running (in seconds), overload messages and information on congested signalling points in the CN are ignored.

Class

Optional.

Type / Range

Integer in the range of 1 to 120

Default

10

Name

pSetName - Radio network controller parameter set name

Syntax

--pSetName <string>

Description

Radio network controller parameter set name.

Class

Optional.

Type / Range

Digit string of length 0 to 15 with the allowed pattern of [0-9a-zA-Z\.\-:]*

Default

""

Name

rabModifySupported - RAB modification is supported

Syntax

--rabModifySupported <list-item>

Description

RAB modification is supported.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

rel8RncSupported - RNC supports REL 8

Syntax

--rel8RncSupported <list-item>

Description

RNC supports REL 8.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

resetResourceRepeatInterval - Timer defines the period (in seconds) between reset resource messages if reset acknowledgement is not received

Syntax

--resetResourceRepeatInterval <integer>

Description

Timer defines the period (in seconds) between reset resource messages if reset acknowledgement is not received.

Class

Optional.

Type / Range

Integer in the range of 1 to 30

Default

10

Name

rncSupportForDirectTunnel - RNC supports the direct tunnel

Syntax

--rncSupportForDirectTunnel <list-item>

Description

RNC supports the direct tunnel.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

specialCollisionHandlingDuringHo - Special collision handling during handover

Syntax

--specialCollisionHandlingDuringHo <list-item>

Description

Special handling of GGSN-initiated PDP deactivation collision with SRNS relocation.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

ueAmbrSupported - UE AMBR support in RNC parameter set

Syntax

--ueAmbrSupported <list-item>

Description

UE AMBR support in RNC parameter set.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

6.121 cmm rohcProfile

ROHC Profile. Syntax, description, parameters, and roles for cmm rohcProfile command.

Syntax

Description

Administer ROHC Profile.

Parameters

Name

name - ROHC profile name

Syntax

--name <string>

Description

ROHC profile name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

maxCidNum - Max CID

Syntax

--maxCidNum <integer>

Description

Max CID.

Class

Optional.

Type / Range

Integer in the range of 1 to 16,383

Default

15

Name

prfl0002 - Profile 0x0002

Syntax

--prfl0002 <list-item>

Description

UDP/IP (Profile 0x0002) (RFC 3095).

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

prfl0003 - Profile 0x0003

Syntax

--prfl0003 <list-item>

Description

ESP/IP (Encapsulating security payload) (Profile 0x0003) (RFC 3095).

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

prfl0004 - Profile 0x0004

Syntax

--prfl0004 <list-item>

Description

IP (Profile 0x0004) (RFC 3843 and RFC 4815).

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

prfl0006 - Profile 0x0006

Syntax

--prfl0006 <list-item>

Description

TCP/IP (Profile 0x0006) (RFC 4996).

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

6.122 cmm routeParamSet

M3UA route parameter set. Syntax, description, parameters, and roles for `cmm routeParamSet` command.

Syntax**Description**

Configure, list and show M3UA route parameter set.

Parameters**Name**

name - M3UA route parameter set name

Syntax

--name <string>

Description

M3UA route parameter set name.

Class

Required key.

Type / Range

Digit string of length 1 to 12 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Name

circRouPrevInUse - Circ rou prev in use

Syntax

--circRouPrevInUse <list-item>

Description

D1. control of sending additional transfer prohibited messages concerning this destination in order to limit occurrence of circular routing.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

confusionMsgDenied - Confusion msg denied

Syntax

--confusionMsgDenied <list-item>

Description

D4. denial of sending of MTP confusion messages.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

congLevelSupport - Cong level support

Syntax

--congLevelSupport <list-item>

Description

D3. control of coding congestion level to signalling traffic flow control messages.

Class

Optional.

List

- NONE - No congestion level control.
- TFC - TFC congestion control.
- TFCANDRCT - TFC and RCT congestion control.

Default

TFC

Name

indirectRoutesDefault - Indirect routes default

Syntax

--indirectRoutesDefault <list-item>

Description

C3. action in signalling link set recovery when adjacent signalling point restart procedure is not started.

Class

Optional.

List

- AVAILABLE - Specify route default available.
- RESTRICTED - Specify route default restricted.
- TFMBASED - TFM based - Specify route default TFM based.
- UNAVAILABLE - Specify route default unavailable.

Default

AVAILABLE

Name

jtQ707T10 - JtQ707T10

Syntax

--jtQ707T10 <integer>

Description

A7. supervision timer for signalling routing test ack relevant only in japanese network, in 0.1 seconds.

Class

Optional.

Type / Range

Integer in the range of 20 to 150

Default

100

Name

pstnImplication - Pstn implication

Syntax

--pstnImplication <list-item>

Description

C7. alignment of PSTN link sets when designated M3UA link sets are unavailable.

Class

Optional.

List

- ALIGN - Specify PSTN implication of align.
- FAIL - Specify PSTN implication of fail.

Default

ALIGN

Name

q704T10 - q704T10

Syntax

--q704T10 <integer>

Description

A2. waiting to repeat signalling route set test message, in 1 second.

Class

Optional.

Type / Range

Integer in the range of 10 to 120

Default

31

Name

q704T11 - q704T11

Syntax

--q704T11 <integer>

Description

A3. transfer restricted timer, in 1 second.

Class

Optional.

Type / Range

Integer in the range of 30 to 90

Default

60

Name

q704T15 - q704T15

Syntax

--q704T15 <integer>

Description

A4. waiting to start signalling route set congestion test, in 0.1 seconds.

Class

Optional.

Type / Range

Integer in the range of 20 to 30

Default

25

Name

q704T16JtQ704Tc - q704T16JtQ704Tc

Syntax

--q704T16JtQ704Tc <integer>

Description

A5. waiting for signalling route set congestion status allowed values for Q704_T16 are 14...25 in japan the allowed values for JT_Q704_TC are 26...250, in 0.1 seconds.

Class

Optional.

Type / Range

Integer in the range of 14 to 250

Default

15

Name

q704T19WhiteT111T29 - q704T19WhiteT111T29

Syntax

--q704T19WhiteT111T29 <integer>

Description

B2. waiting to avoid TFP, TFR and TRA messages being bounced back and forth, in 1 second.

Class

Optional.

Type / Range

Integer in the range of 60 to 80

Default

68

Name

q704T21T111T25 - q704T21T111T25

Syntax

--q704T21T111T25 <integer>

Description

B0. waiting to restart traffic through adjacent SP, in 1 second.

Class

Optional.

Type / Range

Integer in the range of 20 to 70

Default

64

Name

q704T6 - q704T6

Syntax

--q704T6 <integer>

Description

A0. delay to avoid MIS-sequencing on controlled rerouting, in 0.1 seconds.

Class

Optional.

Type / Range

Integer in the range of 5 to 20

Default

8

Name

q704T8 - q704T8

Syntax

--q704T8 <integer>

Description

A1. transfer prohibited inhibition timer, in 0.1 seconds.

Class

Optional.

Type / Range

Integer in the range of 5 to 20

Default

10

Name

respTfmControl - Resp tfm control

Syntax

--respTfmControl <list-item>

Description

C5. control of sending transfer prohibited and transfer restricted messages based on response method.

Class

Optional.

List

- TFMDENIED - Transfer denied - Specify traffic management control of transfer denied.
- TFPALLOWED - Transfer prohibited allowed - Specify traffic management control of transfer prohibited allowed.
- TFPFORKNOWN - Transfer prohibited for unknown - Specify traffic management control of transfer prohibited for unknown.
- TFRALLOWED - Transfer restricted allowed - Specify traffic management control of transfer restricted allowed.

Default

TFPALLOWED

Name

rstOnTfpAllowed - Rst on tfp allowed

Syntax

--rstOnTfpAllowed <list-item>

Description

D6. indicates whether sending route set test message is allowed on reception of transfer prohibited message.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

sorRefWithNodeInfo - Sor re fWith node info

Syntax

--sorRefWithNodeInfo <list-item>

Description

C8. indicates whether local reference identifiers of co SCCP messages include also SP info.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

spRestartType - Sp restart type

Syntax

--spRestartType <list-item>

Description

C2. type of signalling point restart procedure.

Class

Optional.

List

- ANSI - ANSI for restart type from american national standards institute.
- BLUE - BLUE for restart type defined by international telecommunications union (ITU) in Q.700 - Q.716 blue book.
- NONE - NONE for restart type of none.
- WHITE - WHITE for restart type defined by international telecommunications union (ITU) in Q.700 - Q.716 3/93 white book.

Default

BLUE

Name

srtDenied - Srt denied

Syntax

--srtDenied <list-item>

Description

D9. control of signal routing test.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

supportOfM3uaSnm - Support of M3UA snm

Syntax

--supportOfM3uaSnm <list-item>

Description

D8. control of sending M3UA signalling network management messages.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

t111T18 - t111T18

Syntax

--t111T18 <integer>

Description

A6. transfer restricted inhibition timer, in 1 second.

Class

Optional.

Type / Range

Integer in the range of 2 to 20

Default

3

Name

t111T28 - t111T28

Syntax

--t111T28 <integer>

Description

B1. waiting for traffic restart waiting message, in 1 second.

Class

Optional.

Type / Range

Integer in the range of 3 to 35

Default

30

Name

t111T30 - t111T30

Syntax

--t111T30 <integer>

Description

B3. waiting to limit sending of TFP and TFR messages in response to unexpected TRA or TRW messages, in 1 second.

Class

Optional.

Type / Range

Integer in the range of 20 to 40

Default

30

Name

tfcDenied - Tfc denied

Syntax

--tfcDenied <list-item>

Description

D2. denial of sending of transfer controlled messages.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

tfmControl - Tfm control

Syntax

--tfmControl <list-item>

Description

C4. control of sending transfer prohibited, transfer restricted and transfer allowed messages.

Class

Optional.

List

- ALLALLOWED - All allowed - Specify TFM control of all allowed.
- ALLDENIED - All denied - Specify TFM control of all denied.
- BROADCASTDENIED - Broadcast denied - Specify TFM control broadcast denied.

Default

ALLALLOWED

Name

tfrDenied - Tfr denied

Syntax

--tfrDenied <list-item>

Description

C6. denial of transfer restricted procedure.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

tfrSendingBasis - Tfr sending basis

Syntax

--tfrSendingBasis <list-item>

Description

D0. method for calculating right time to broadcast transfer restricted messages concerning this destination.

Class

Optional.

List

- ANSI - Specify TFR sending basis of american national standards institute.
- ITU - Specify TFR sending basis of international telecommunication union.
- NONE - Specify TFR sending basis of none.

Default

NONE

Name

trmDenied - Trm denied

Syntax

--trmDenied <list-item>

Description

C0. denial of sending of traffic restart messages.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

trmExpected - Trm expected

Syntax

--trmExpected <list-item>

Description

C1. indicates whether reception of traffic restart messages is expected.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

upuAllowed - Upu allowed

Syntax

--upuAllowed <list-item>

Description

D5. indicates whether the sending of user part unavailable message is allowed.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

useOfM3uaNwApp - Use of M3UA nw app

Syntax

--useOfM3uaNwApp <list-item>

Description

D7. control of using network appearance parameter in the M3UA signalling network management messages.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

usnDenied - Usn denied

Syntax

--usnDenied <list-item>

Description

D10. control of unallocated signalling point number message.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

6.123 cmm routingIndicatorList

Routing Indicator List. Syntax, description, parameters, and roles for cmm routingIndicatorList command.

Syntax**Description**

List of Routing Indicators

Parameters**Name**

name - Name

Syntax

--name <string>

Description

Routing Indicator List Name

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

sysadmin, manage, monitor

6.124 cmm routingIndicators

Routing Indicator. Syntax, description, parameters, and roles for **cmm routingIndicators** command.

Syntax**Description**

Links a Routing Indicator to a Routing Indicator List.

Parameters**Name**

routingIndicatorListName - Routing Indicator List Name

Syntax

--routingIndicatorListName <string>

Description

The name of the Routing Indicator

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

routingIndicator - Routing Indicator

Syntax

--routingIndicator <digits>

Description

Routing Indicator, consisting of 1 to 4 decimal digits assigned by the home network operator and provisioned in the USIM, that allow together with the Home Network Identifier to route network signalling with SUCI to AUSF and UDM instances capable to serve the subscriber. Each decimal digit present in the Routing Indicator shall be regarded as meaningful (e.g. value 012 is not the same as value 12).

Class

Required key.

Type / Range

Used for Routing Indicator which consists of 1 to 4 digits.

6.125 cmm s102CallPriPagingProfile

S102 Call Priority Paging Profile. Syntax, description, parameters, and roles for cmm s102CallPriPagingProfile command.

Syntax

Description

This command is used to administer a S102 Call Priority Paging Profile and includes parameters for defining the S102 call priority and S1AP paging priority level.

Parameters

Name

s102PagingPriProfileName - S102 paging priority profile name

Syntax

--s102PagingPriProfileName <string>

Description

Identifies the S102 paging priority profile label (alternate key).

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

s102CallPriority - S102 call priority

Syntax

--s102CallPriority <integer>

Description

Identifies the S102 call priority.

Class

Required key.

Type / Range

Integer in the range of 0 to 15

Name

s1ApPagingPriLevel - S1AP paging priority level

Syntax

--s1ApPagingPriLevel <list-item>

Description

Identifies the S1AP paging priority level.

Class

Optional.

List

- PrioLevel0 - Priority level 0 - Priority level 0. No paging priority is set.

- PrioLevel1 - Priority level 1 - Priority level 1. Highest Paging priority.
- PrioLevel2 - Priority level 2 - Priority level 2.
- PrioLevel3 - Priority level 3 - Priority level 3.
- PrioLevel4 - Priority level 4 - Priority level 4.
- PrioLevel5 - Priority level 5 - Priority level 5.
- PrioLevel6 - Priority level 6 - Priority level 6.
- PrioLevel7 - Priority level 7 - Priority level 7.
- PrioLevel8 - Priority level 8 - Priority level 8. Lowest Paging Priority.

Default

PrioLevel0

6.126 cmm s102PagingPriProfile

S102 Paging Priority Profile. Syntax, description, parameters, and roles for cmm s102PagingPriProfile command.

Syntax**Description**

This command is used to administer a S102 Paging Priority Profile and includes parameters for defining the S102 paging priority profile name, no call priority paging priority level, and GEC emergency paging priority level.

Parameters

Name

name - S102 paging priority profile name

Syntax

--name <digits>

Description

Defines the S102 paging priority profile name.

Class

Required key.

Type / Range

Digit string of length 1 to 1 with the allowed pattern of [1-8]*

Name

description - Description

Syntax

--description <string>

Description

Profile description.

Class

Optional.

Type / Range

Digit string of length 0 to 160 with the allowed pattern of [0-9a-zA-Z\.\- _:@]*

Default

"

Name

gecEmerPagingPriLevel - GEC emergency paging priority level

Syntax

--gecEmerPagingPriLevel <list-item>

Description

Identifies the GEC emergency paging priority level.

Class

Optional.

List

- PrioLevel0 - Priority level 0 - Priority level 0. No paging priority is set.
- PrioLevel1 - Priority level 1 - Priority level 1. Highest Paging priority.

- PrioLevel2 - Priority level 2 - Priority level 2.
- PrioLevel3 - Priority level 3 - Priority level 3.
- PrioLevel4 - Priority level 4 - Priority level 4.
- PrioLevel5 - Priority level 5 - Priority level 5.
- PrioLevel6 - Priority level 6 - Priority level 6.
- PrioLevel7 - Priority level 7 - Priority level 7.
- PrioLevel8 - Priority level 8 - Priority level 8. Lowest Paging Priority.

Default

PrioLevel0

Name

noCallPriPagingPriLevel - No call priority paging priority level

Syntax

--noCallPriPagingPriLevel <list-item>

Description

Identifies the no call priority paging priority level.

Class

Optional.

List

- PrioLevel0 - Priority level 0 - Priority level 0. No paging priority is set.
- PrioLevel1 - Priority level 1 - Priority level 1. Highest Paging priority.
- PrioLevel2 - Priority level 2 - Priority level 2.
- PrioLevel3 - Priority level 3 - Priority level 3.
- PrioLevel4 - Priority level 4 - Priority level 4.
- PrioLevel5 - Priority level 5 - Priority level 5.
- PrioLevel6 - Priority level 6 - Priority level 6.
- PrioLevel7 - Priority level 7 - Priority level 7.
- PrioLevel8 - Priority level 8 - Priority level 8. Lowest Paging Priority.

6.127 cmm s1apCauseCodeMappingProfile

S1AP Cause Code Mapping Profile. Syntax, description, parameters, and roles for cmm s1apCauseCodeMappingProfile command.

Syntax

Description

Define S1AP cause code mappings.

Parameters

Name

name - S1AP Cause Code Mapping Profile Name

Syntax

--name <string>

Description

The name of the S1AP cause code mapping profile.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

eRabRelApnAdministration - E-RAB Release Command APN Administration

Syntax

--eRabRelApnAdministration <list-item>

Description

The S1AP cause the MME includes on E-RAB release command related to an E-RAB as part of the E-RAB to be released list, when the MME releases the E-RAB due to APN Administration.

Class

Optional.

List

- Disabled - The feature is disabled in the corresponding scenario. The MME does not override the S1AP cause code.
- RadioNetworkLayer_Unspecified - Radio Network Layer Unspecified - S1AP Radio Network Layer cause Unspecified.
- RadioNetworkLayer_TX2RelocOverallExpiry - Radio Network Layer TX2 Reloc Overall Expiry - S1AP Radio Network Layer cause TX2 Reloc Overall Expiry.
- RadioNetworkLayer_SuccessfulHandover - Radio Network Layer Successful Handover - S1AP Radio Network Layer cause Successful Handover.
- RadioNetworkLayer_ReleaseDueToEutranGeneratedReason - Radio Network Layer Release Due to E-UTRAN Generated Reason - S1AP Radio Network Layer cause Release Due to E-UTRAN Generated Reason.
- RadioNetworkLayer_HandoverCancelled - Radio Network Layer Handover Cancelled - S1AP Radio Network Layer cause Handover Cancelled.
- RadioNetworkLayer_PartialHandover - Radio Network Layer Partial Handover - S1AP Radio Network Layer cause Partial Handover.
- RadioNetworkLayer_HandoverFailureInTargetEpcEnbOrTargetSystem - Radio Network Layer Handover Failure in Target EPC/eNB or Target System - S1AP Radio Network Layer cause Handover Failure In Target EPC/eNB or Target System.
- RadioNetworkLayer_HandoverTargetNotAllowed - Radio Network Layer Handover Target Not Allowed - S1AP Radio Network Layer cause Handover Target not allowed.
- RadioNetworkLayer_TS1RelocOverallExpiry - Radio Network Layer TS1 Reloc Overall Expiry - S1AP Radio Network Layer cause TS1Relocoverall Expiry.
- RadioNetworkLayer_TS1RelocPrepExpiry - Radio Network Layer TS1 Reloc Prep Expiry - S1AP Radio Network Layer cause TS1RelocPrep Expiry.
- RadioNetworkLayer_CellNotAvailable - Radio Network Layer Cell Not Available - S1AP Radio Network Layer cause Cell Not Available.
- RadioNetworkLayer_UnknownTargetId - Radio Network Layer Unknown Target Id - S1AP Radio Network Layer cause Unknown Target Id.
- RadioNetworkLayer_NoRadioResourcesAvailableInTargetCell - Radio Network Layer No Resources Available in Target Cell - S1AP Radio Network Layer cause No Resources Available in Target Cell.
- RadioNetworkLayer_UnknownOrAlreadyAllocatedMmeUeS1apId - Radio Network Layer Unknown or Already Allocated MME UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated MME UE S1AP ID.

- `RadioNetworkLayer_UnknownOrAlreadyAllocatedEnbUeS1apId` - Radio Network Layer Unknown or Already Allocated eNB UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated eNB UE S1AP ID.
- `RadioNetworkLayer_UnknownOrInconsistentPairOfUeS1apId` - Radio Network Layer Unknown or Inconsistent Pair of S1AP UE ID - S1AP Radio Network Layer cause Unknown or inconsistent pair of S1AP UE ID.
- `RadioNetworkLayer_HandoverDesirableForRadioReasons` - Radio Network Layer Handover Desirable for Radio Reasons - S1AP Radio Network Layer cause Handover desirable for radio reasons.
- `RadioNetworkLayer_TimeCriticalHandover` - Radio Network Layer Time Critical Handover - S1AP Radio Network Layer cause Time critical handover.
- `RadioNetworkLayer_ResourceOptimisationHandover` - Radio Network Layer Resource Optimisation Handover - S1AP Radio Network Layer cause Resource optimisation handover.
- `RadioNetworkLayer_ReduceLoadInServingCell` - Radio Network Layer Reduce Load in Serving Cell - S1AP Radio Network Layer cause Reduce load in serving cell.
- `RadioNetworkLayer_UserInactivity` - Radio Network Layer User Inactivity - S1AP Radio Network Layer cause User Inactivity.
- `RadioNetworkLayer_RadioConnectionWithUeLost` - Radio Network Layer Radio Connection with UE Lost - S1AP Radio Network Layer cause Radio Connection With UE Lost.
- `RadioNetworkLayer_LoadBalancingTauRequired` - Radio Network Layer Load Balancing TAU Required - S1AP Radio Network Layer cause Load Balancing TAU Required.
- `RadioNetworkLayer_CsFallbackTriggered` - Radio Network Layer CS Fallback Triggered - S1AP Radio Network Layer cause CS Fallback Triggered.
- `RadioNetworkLayer_UeNotAvailableForPsService` - Radio Network Layer UE Not Available for PS Service - S1AP Radio Network Layer cause UE Not Available For PS Service.
- `RadioNetworkLayer_RadioResourcesNotAvailable` - Radio Network Layer Radio Resources Not Available - S1AP Radio Network Layer cause Radio resources not available.
- `RadioNetworkLayer_FailureInTheRadioInterfaceProcedure` - Radio Network Layer Failure in the Radio Interface Procedure - S1AP Radio Network Layer cause Failure in the Radio Interface Procedure.
- `RadioNetworkLayer_InvalidQosCombination` - Radio Network Layer Invalid QoS Combination - S1AP Radio Network Layer cause Invalid QoS combination.
- `RadioNetworkLayer_InterRatRedirection` - Radio Network Layer Inter-RAT Redirection - S1AP Radio Network Layer cause Inter-RAT redirection.

- RadioNetworkLayer_InteractionWithOtherProcedure - Radio Network Layer Interaction with Other Procedure - S1AP Radio Network Layer cause Interaction with other procedure.
- RadioNetworkLayer_UnknownErabId - Radio Network Layer Unknown E-RAB ID - S1AP Radio Network Layer cause Unknown E-RAB ID.
- RadioNetworkLayer_MultipleErabIdInstances - Radio Network Layer Multiple E-RAB ID Instances - S1AP Radio Network Layer cause Multiple E-RAB ID instances.
- RadioNetworkLayer_EncryptionAndOrIntegrityProtectionAlgorithmsNotSupported - Radio Network Layer Encryption and/or Integrity Protection Algorithms Not Supported - S1AP Radio Network Layer cause Encryption and/or Integrity protection algorithms not supported.
- RadioNetworkLayer_S1IntraSystemHandoverTriggered - Radio Network Layer S1 Intra System Handover Triggered - S1AP Radio Network Layer cause S1 intra system Handover triggered.
- RadioNetworkLayer_S1InterSystemHandoverTriggered - Radio Network Layer S1 Inter System Handover Triggered - S1AP Radio Network Layer cause S1 inter system Handover triggered.
- RadioNetworkLayer_x2HandoverTriggered - Radio Network Layer X2 Handover Triggered - S1AP Radio Network Layer cause X2 Handover triggered.
- RadioNetworkLayer_redirectionTowards1xRtt - Radio Network Layer Redirection Towards 1xRTT - S1AP Radio Network Layer cause Redirection towards 1xRTT.
- RadioNetworkLayer_NotSupportedQciValue - Radio Network Layer Not Supported QCI Value - S1AP Radio Network Layer cause Not Supported QCI Value.
- RadioNetworkLayer_InvalidCsgId - Radio Network Layer Invalid CSG Id - S1AP Radio Network Layer cause Invalid CSG Id.
- RadioNetworkLayer_ReleaseDueToPreEmption - Radio Network Layer Release Due to Pre-Emption - S1AP Radio Network Layer cause Release due to Pre-Emption.
- RadioNetworkLayer_N26InterfaceNotAvailable - Radio Network Layer N26 Interface Not Available - S1AP Radio Network Layer cause N26 interface not available.
- TransportLayer_TransportResourceUnavailable - Transport Layer Transport Resource Unavailable - S1AP Transport Layer cause Transport Resource Unavailable.
- TransportLayer_Unspecified - Transport Layer Unspecified - S1AP Transport Layer cause Unspecified.
- Nas_NormalRelease - NAS Normal Release - S1AP NAS cause Normal Release.
- Nas_AuthenticationFailure - NAS Authentication Failure - S1AP NAS cause Authentication failure.
- Nas_Detach - NAS Detach - S1AP NAS cause Detach.

- Nas_Unspecified - NAS Unspecified - S1AP NAS cause Unspecified.
- Nas_CsgSubscriptionExpiry - NAS CSG Subscription Expiry - S1AP NAS cause CSG Subscription Expiry.
- Protocol_TransferSyntaxError - Protocol Transfer Syntax Error - S1AP Protocol cause Transfer Syntax Error.
- Protocol_AbstractSyntaxErrorReject - Protocol Abstract Syntax Error (Reject) - S1AP Protocol cause Abstract Syntax Error (Reject).
- Protocol_AbstractSyntaxErrorIgnoreAndNotify - Protocol Abstract Syntax Error (Ignore and Notify) - S1AP Protocol cause Abstract Syntax Error (Ignore and Notify).
- Protocol_MessageNotCompatibleWithReceiverState - Protocol Message Not Compatible with Receiver State - S1AP Protocol cause Message not Compatible with Receiver State.
- Protocol_SemanticError - Protocol Semantic Error - S1AP Protocol cause Semantic Error.
- Protocol_AbstractSyntaxErrorFalselyConstructedMessage - Protocol Abstract Syntax Error (Falsely Constructed Message) - S1AP Protocol cause Abstract Syntax Error (Falsely Constructed Message).
- Protocol_Unspecified - Protocol Unspecified - S1AP Protocol cause Unspecified.
- Miscellaneous_ControlProcessingOverload - Miscellaneous Control Processing Overload - S1AP Miscellaneous cause Control Processing Overload.
- Miscellaneous_NotEnoughUserPlaneProcessingResources - Miscellaneous Not Enough User Plane Processing Resources - S1AP Miscellaneous cause Not enough User Plane Processing Resources.
- Miscellaneous_HardwareFailure - Miscellaneous Hardware Failure - S1AP Miscellaneous cause Hardware Failure.
- Miscellaneous_OmIntervention - Miscellaneous O&M Intervention - S1AP Miscellaneous cause O&M Intervention.
- Miscellaneous_Unspecified - Miscellaneous Unspecified - S1AP Miscellaneous cause Unspecified.
- Miscellaneous_UnknownPlmn - Miscellaneous Unknown PLMN - S1AP Miscellaneous cause Unknown PLMN.

Default

Nas_NormalRelease

Name

eRabRelMmeDeactFailureHo - E-RAB Release Command MME Deactivation Handover

Syntax

--eRabRelMmeDeactFailureHo <list-item>

Description

The S1AP cause the MME includes on E-RAB release command related to an E-RAB as part of the E-RAB to be released list, when the MME releases the E-RAB due to MME initiated PDN connection deactivation when PDN(s) have failed during TAU/handover.

Class

Optional.

List

- Disabled - The feature is disabled in the corresponding scenario. The MME does not override the S1AP cause code.
- RadioNetworkLayer_Unspecified - Radio Network Layer Unspecified - S1AP Radio Network Layer cause Unspecified.
- RadioNetworkLayer_TX2RelocOverallExpiry - Radio Network Layer TX2 Reloc Overall Expiry - S1AP Radio Network Layer cause TX2 Reloc Overall Expiry.
- RadioNetworkLayer_SuccessfulHandover - Radio Network Layer Successful Handover - S1AP Radio Network Layer cause Successful Handover.
- RadioNetworkLayer_ReleaseDueToEutranGeneratedReason - Radio Network Layer Release Due to E-UTRAN Generated Reason - S1AP Radio Network Layer cause Release Due to E-UTRAN Generated Reason.
- RadioNetworkLayer_HandoverCancelled - Radio Network Layer Handover Cancelled - S1AP Radio Network Layer cause Handover Cancelled.
- RadioNetworkLayer_PartialHandover - Radio Network Layer Partial Handover - S1AP Radio Network Layer cause Partial Handover.
- RadioNetworkLayer_HandoverFailureInTargetEpcEnbOrTargetSystem - Radio Network Layer Handover Failure in Target EPC/eNB or Target System - S1AP Radio Network Layer cause Handover Failure In Target EPC/eNB or Target System.
- RadioNetworkLayer_HandoverTargetNotAllowed - Radio Network Layer Handover Target Not Allowed - S1AP Radio Network Layer cause Handover Target not allowed.
- RadioNetworkLayer_TS1RelocOverallExpiry - Radio Network Layer TS1 Reloc Overall Expiry - S1AP Radio Network Layer cause TS1Relocoverall Expiry.
- RadioNetworkLayer_TS1RelocPrepExpiry - Radio Network Layer TS1 Reloc Prep Expiry - S1AP Radio Network Layer cause TS1RelocPrep Expiry.
- RadioNetworkLayer_CellNotAvailable - Radio Network Layer Cell Not Available - S1AP Radio Network Layer cause Cell Not Available.
- RadioNetworkLayer_UnknownTargetId - Radio Network Layer Unknown Target Id - S1AP Radio Network Layer cause Unknown Target Id.
- RadioNetworkLayer_NoRadioResourcesAvailableInTargetCell - Radio Network Layer No Resources Available in Target Cell - S1AP Radio Network Layer cause No Resources Available in Target Cell.

- `RadioNetworkLayer_UnknownOrAlreadyAllocatedMmeUeS1apId` - Radio Network Layer Unknown or Already Allocated MME UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated MME UE S1AP ID.
- `RadioNetworkLayer_UnknownOrAlreadyAllocatedEnbUeS1apId` - Radio Network Layer Unknown or Already Allocated eNB UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated eNB UE S1AP ID.
- `RadioNetworkLayer_UnknownOrInconsistentPairOfUeS1apId` - Radio Network Layer Unknown or Inconsistent Pair of S1AP UE ID - S1AP Radio Network Layer cause Unknown or inconsistent pair of S1AP UE ID.
- `RadioNetworkLayer_HandoverDesirableForRadioReasons` - Radio Network Layer Handover Desirable for Radio Reasons - S1AP Radio Network Layer cause Handover desirable for radio reasons.
- `RadioNetworkLayer_TimeCriticalHandover` - Radio Network Layer Time Critical Handover - S1AP Radio Network Layer cause Time critical handover.
- `RadioNetworkLayer_ResourceOptimisationHandover` - Radio Network Layer Resource Optimisation Handover - S1AP Radio Network Layer cause Resource optimisation handover.
- `RadioNetworkLayer_ReduceLoadInServingCell` - Radio Network Layer Reduce Load in Serving Cell - S1AP Radio Network Layer cause Reduce load in serving cell.
- `RadioNetworkLayer_UserInactivity` - Radio Network Layer User Inactivity - S1AP Radio Network Layer cause User Inactivity.
- `RadioNetworkLayer_RadioConnectionWithUeLost` - Radio Network Layer Radio Connection with UE Lost - S1AP Radio Network Layer cause Radio Connection With UE Lost.
- `RadioNetworkLayer_LoadBalancingTauRequired` - Radio Network Layer Load Balancing TAU Required - S1AP Radio Network Layer cause Load Balancing TAU Required.
- `RadioNetworkLayer_CsFallbackTriggered` - Radio Network Layer CS Fallback Triggered - S1AP Radio Network Layer cause CS Fallback Triggered.
- `RadioNetworkLayer_UeNotAvailableForPsService` - Radio Network Layer UE Not Available for PS Service - S1AP Radio Network Layer cause UE Not Available For PS Service.
- `RadioNetworkLayer_RadioResourcesNotAvailable` - Radio Network Layer Radio Resources Not Available - S1AP Radio Network Layer cause Radio resources not available.
- `RadioNetworkLayer_FailureInTheRadioInterfaceProcedure` - Radio Network Layer Failure in the Radio Interface Procedure - S1AP Radio Network Layer cause Failure in the Radio Interface Procedure.
- `RadioNetworkLayer_InvalidQosCombination` - Radio Network Layer Invalid QoS Combination - S1AP Radio Network Layer cause Invalid QoS combination.

- **RadioNetworkLayer_InterRatRedirection** - Radio Network Layer Inter-RAT Redirection - S1AP Radio Network Layer cause Inter-RAT redirection.
- **RadioNetworkLayer_InteractionWithOtherProcedure** - Radio Network Layer Interaction with Other Procedure - S1AP Radio Network Layer cause Interaction with other procedure.
- **RadioNetworkLayer_UnknownErabId** - Radio Network Layer Unknown E-RAB ID - S1AP Radio Network Layer cause Unknown E-RAB ID.
- **RadioNetworkLayer_MultipleErabIdInstances** - Radio Network Layer Multiple E-RAB ID Instances - S1AP Radio Network Layer cause Multiple E-RAB ID instances.
- **RadioNetworkLayer_EncryptionAndOrIntegrityProtectionAlgorithmsNotSupported** - Radio Network Layer Encryption and/or Integrity Protection Algorithms Not Supported - S1AP Radio Network Layer cause Encryption and/or Integrity protection algorithms not supported.
- **RadioNetworkLayer_S1IntraSystemHandoverTriggered** - Radio Network Layer S1 Intra System Handover Triggered - S1AP Radio Network Layer cause S1 intra system Handover triggered.
- **RadioNetworkLayer_S1InterSystemHandoverTriggered** - Radio Network Layer S1 Inter System Handover Triggered - S1AP Radio Network Layer cause S1 inter system Handover triggered.
- **RadioNetworkLayer_x2HandoverTriggered** - Radio Network Layer X2 Handover Triggered - S1AP Radio Network Layer cause X2 Handover triggered.
- **RadioNetworkLayer_redirectionTowards1xRtt** - Radio Network Layer Redirection Towards 1xRTT - S1AP Radio Network Layer cause Redirection towards 1xRTT.
- **RadioNetworkLayer_NotSupportedQciValue** - Radio Network Layer Not Supported QCI Value - S1AP Radio Network Layer cause Not Supported QCI Value.
- **RadioNetworkLayer_InvalidCsgId** - Radio Network Layer Invalid CSG Id - S1AP Radio Network Layer cause Invalid CSG Id.
- **RadioNetworkLayer_ReleaseDueToPreEmption** - Radio Network Layer Release Due to Pre-Emption - S1AP Radio Network Layer cause Release due to Pre-Emption.
- **RadioNetworkLayer_N26InterfaceNotAvailable** - Radio Network Layer N26 Interface Not Available - S1AP Radio Network Layer cause N26 interface not available.
- **TransportLayer_TransportResourceUnavailable** - Transport Layer Transport Resource Unavailable - S1AP Transport Layer cause Transport Resource Unavailable.
- **TransportLayer_Unspecified** - Transport Layer Unspecified - S1AP Transport Layer cause Unspecified.
- **Nas_NormalRelease** - NAS Normal Release - S1AP NAS cause Normal Release.
- **Nas_AuthenticationFailure** - NAS Authentication Failure - S1AP NAS cause Authentication failure.

- Nas_Detach - NAS Detach - S1AP NAS cause Detach.
- Nas_Unspecified - NAS Unspecified - S1AP NAS cause Unspecified.
- Nas_CsgSubscriptionExpiry - NAS CSG Subscription Expiry - S1AP NAS cause CSG Subscription Expiry.
- Protocol_TransferSyntaxError - Protocol Transfer Syntax Error - S1AP Protocol cause Transfer Syntax Error.
- Protocol_AbstractSyntaxErrorReject - Protocol Abstract Syntax Error (Reject) - S1AP Protocol cause Abstract Syntax Error (Reject).
- Protocol_AbstractSyntaxErrorIgnoreAndNotify - Protocol Abstract Syntax Error (Ignore and Notify) - S1AP Protocol cause Abstract Syntax Error (Ignore and Notify).
- Protocol_MessageNotCompatibleWithReceiverState - Protocol Message Not Compatible with Receiver State - S1AP Protocol cause Message not Compatible with Receiver State.
- Protocol_SemanticError - Protocol Semantic Error - S1AP Protocol cause Semantic Error.
- Protocol_AbstractSyntaxErrorFalselyConstructedMessage - Protocol Abstract Syntax Error (Falsely Constructed Message) - S1AP Protocol cause Abstract Syntax Error (Falsely Constructed Message).
- Protocol_Unspecified - Protocol Unspecified - S1AP Protocol cause Unspecified.
- Miscellaneous_ControlProcessingOverload - Miscellaneous Control Processing Overload - S1AP Miscellaneous cause Control Processing Overload.
- Miscellaneous_NotEnoughUserPlaneProcessingResources - Miscellaneous Not Enough User Plane Processing Resources - S1AP Miscellaneous cause Not enough User Plane Processing Resources.
- Miscellaneous_HardwareFailure - Miscellaneous Hardware Failure - S1AP Miscellaneous cause Hardware Failure.
- Miscellaneous_OmIntervention - Miscellaneous O&M Intervention - S1AP Miscellaneous cause O&M Intervention.
- Miscellaneous_Unspecified - Miscellaneous Unspecified - S1AP Miscellaneous cause Unspecified.
- Miscellaneous_UnknownPlmn - Miscellaneous Unknown PLMN - S1AP Miscellaneous cause Unknown PLMN.

Default

Disabled

Name

eRabRelPdnDisconnect - E-RAB Release Command PDN Disconnect

Syntax

--eRabRelPdnDisconnect <list-item>

Description

The S1AP cause the MME includes on E-RAB release command related to an E-RAB as part of the E-RAB to be released list, when the MME releases the E-RAB due to PDN Disconnect Request from the UE.

Class

Optional.

List

- Disabled - The feature is disabled in the corresponding scenario. The MME does not override the S1AP cause code.
- RadioNetworkLayer_Unspecified - Radio Network Layer Unspecified - S1AP Radio Network Layer cause Unspecified.
- RadioNetworkLayer_TX2RelocOverallExpiry - Radio Network Layer TX2 Reloc Overall Expiry - S1AP Radio Network Layer cause TX2 Reloc Overall Expiry.
- RadioNetworkLayer_SuccessfulHandover - Radio Network Layer Successful Handover - S1AP Radio Network Layer cause Successful Handover.
- RadioNetworkLayer_ReleaseDueToEutranGeneratedReason - Radio Network Layer Release Due to E-UTRAN Generated Reason - S1AP Radio Network Layer cause Release Due to E-UTRAN Generated Reason.
- RadioNetworkLayer_HandoverCancelled - Radio Network Layer Handover Cancelled - S1AP Radio Network Layer cause Handover Cancelled.
- RadioNetworkLayer_PartialHandover - Radio Network Layer Partial Handover - S1AP Radio Network Layer cause Partial Handover.
- RadioNetworkLayer_HandoverFailureInTargetEpcEnbOrTargetSystem - Radio Network Layer Handover Failure in Target EPC/eNB or Target System - S1AP Radio Network Layer cause Handover Failure In Target EPC/eNB or Target System.
- RadioNetworkLayer_HandoverTargetNotAllowed - Radio Network Layer Handover Target Not Allowed - S1AP Radio Network Layer cause Handover Target not allowed.
- RadioNetworkLayer_TS1RelocOverallExpiry - Radio Network Layer TS1 Reloc Overall Expiry - S1AP Radio Network Layer cause TS1Relocoverall Expiry.
- RadioNetworkLayer_TS1RelocPrepExpiry - Radio Network Layer TS1 Reloc Prep Expiry - S1AP Radio Network Layer cause TS1RelocPrep Expiry.
- RadioNetworkLayer_CellNotAvailable - Radio Network Layer Cell Not Available - S1AP Radio Network Layer cause Cell Not Available.
- RadioNetworkLayer_UnknownTargetId - Radio Network Layer Unknown Target Id - S1AP Radio Network Layer cause Unknown Target Id.

- **RadioNetworkLayer_NoRadioResourcesAvailableInTargetCell** - Radio Network Layer No Resources Available in Target Cell - S1AP Radio Network Layer cause No Resources Available in Target Cell.
- **RadioNetworkLayer_UnknownOrAlreadyAllocatedMmeUeS1apId** - Radio Network Layer Unknown or Already Allocated MME UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated MME UE S1AP ID.
- **RadioNetworkLayer_UnknownOrAlreadyAllocatedEnbUeS1apId** - Radio Network Layer Unknown or Already Allocated eNB UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated eNB UE S1AP ID.
- **RadioNetworkLayer_UnknownOrInconsistentPairOfUeS1apId** - Radio Network Layer Unknown or Inconsistent Pair of S1AP UE ID - S1AP Radio Network Layer cause Unknown or inconsistent pair of S1AP UE ID.
- **RadioNetworkLayer_HandoverDesirableForRadioReasons** - Radio Network Layer Handover Desirable for Radio Reasons - S1AP Radio Network Layer cause Handover desirable for radio reasons.
- **RadioNetworkLayer_TimeCriticalHandover** - Radio Network Layer Time Critical Handover - S1AP Radio Network Layer cause Time critical handover.
- **RadioNetworkLayer_ResourceOptimisationHandover** - Radio Network Layer Resource Optimisation Handover - S1AP Radio Network Layer cause Resource optimisation handover.
- **RadioNetworkLayer_ReduceLoadInServingCell** - Radio Network Layer Reduce Load in Serving Cell - S1AP Radio Network Layer cause Reduce load in serving cell.
- **RadioNetworkLayer_UserInactivity** - Radio Network Layer User Inactivity - S1AP Radio Network Layer cause User Inactivity.
- **RadioNetworkLayer_RadioConnectionWithUeLost** - Radio Network Layer Radio Connection with UE Lost - S1AP Radio Network Layer cause Radio Connection With UE Lost.
- **RadioNetworkLayer_LoadBalancingTauRequired** - Radio Network Layer Load Balancing TAU Required - S1AP Radio Network Layer cause Load Balancing TAU Required.
- **RadioNetworkLayer_CsFallbackTriggered** - Radio Network Layer CS Fallback Triggered - S1AP Radio Network Layer cause CS Fallback Triggered.
- **RadioNetworkLayer_UeNotAvailableForPsService** - Radio Network Layer UE Not Available for PS Service - S1AP Radio Network Layer cause UE Not Available For PS Service.
- **RadioNetworkLayer_RadioResourcesNotAvailable** - Radio Network Layer Radio Resources Not Available - S1AP Radio Network Layer cause Radio resources not available.
- **RadioNetworkLayer_FailureInTheRadioInterfaceProcedure** - Radio Network Layer Failure in the Radio Interface Procedure - S1AP Radio Network Layer cause Failure in the Radio Interface Procedure.

- RadioNetworkLayer_InvalidQosCombination - Radio Network Layer Invalid QoS Combination - S1AP Radio Network Layer cause Invalid QoS combination.
- RadioNetworkLayer_InterRatRedirection - Radio Network Layer Inter-RAT Redirection - S1AP Radio Network Layer cause Inter-RAT redirection.
- RadioNetworkLayer_InteractionWithOtherProcedure - Radio Network Layer Interaction with Other Procedure - S1AP Radio Network Layer cause Interaction with other procedure.
- RadioNetworkLayer_UnknownErabId - Radio Network Layer Unknown E-RAB ID - S1AP Radio Network Layer cause Unknown E-RAB ID.
- RadioNetworkLayer_MultipleErabIdInstances - Radio Network Layer Multiple E-RAB ID Instances - S1AP Radio Network Layer cause Multiple E-RAB ID instances.
- RadioNetworkLayer_EncryptionAndOrIntegrityProtectionAlgorithmsNotSupported - Radio Network Layer Encryption and/or Integrity Protection Algorithms Not Supported - S1AP Radio Network Layer cause Encryption and/or Integrity protection algorithms not supported.
- RadioNetworkLayer_S1IntraSystemhandoverTriggered - Radio Network Layer S1 Intra System Handover Triggered - S1AP Radio Network Layer cause S1 intra system Handover triggered.
- RadioNetworkLayer_S1InterSystemHandoverTriggered - Radio Network Layer S1 Inter System Handover Triggered - S1AP Radio Network Layer cause S1 inter system Handover triggered.
- RadioNetworkLayer_x2HandoverTriggered - Radio Network Layer X2 Handover Triggered - S1AP Radio Network Layer cause X2 Handover triggered.
- RadioNetworkLayer_redirectionTowards1xRtt - Radio Network Layer Redirection Towards 1xRTT - S1AP Radio Network Layer cause Redirection towards 1xRTT.
- RadioNetworkLayer_NotSupportedQciValue - Radio Network Layer Not Supported QCI Value - S1AP Radio Network Layer cause Not Supported QCI Value.
- RadioNetworkLayer_InvalidCsgId - Radio Network Layer Invalid CSG Id - S1AP Radio Network Layer cause Invalid CSG Id.
- RadioNetworkLayer_ReleaseDueToPreEmption - Radio Network Layer Release Due to Pre-Emption - S1AP Radio Network Layer cause Release due to Pre-Emption.
- RadioNetworkLayer_N26InterfaceNotAvailable - Radio Network Layer N26 Interface Not Available - S1AP Radio Network Layer cause N26 interface not available.
- TransportLayer_TransportResourceUnavailable - Transport Layer Transport Resource Unavailable - S1AP Transport Layer cause Transport Resource Unavailable.
- TransportLayer_Unspecified - Transport Layer Unspecified - S1AP Transport Layer cause Unspecified.
- Nas_NormalRelease - NAS Normal Release - S1AP NAS cause Normal Release.

- Nas_AuthenticationFailure - NAS Authentication Failure - S1AP NAS cause Authentication failure.
- Nas_Detach - NAS Detach - S1AP NAS cause Detach.
- Nas_Unspecified - NAS Unspecified - S1AP NAS cause Unspecified.
- Nas_CsgSubscriptionExpiry - NAS CSG Subscription Expiry - S1AP NAS cause CSG Subscription Expiry.
- Protocol_TransferSyntaxError - Protocol Transfer Syntax Error - S1AP Protocol cause Transfer Syntax Error.
- Protocol_AbstractSyntaxErrorReject - Protocol Abstract Syntax Error (Reject) - S1AP Protocol cause Abstract Syntax Error (Reject).
- Protocol_AbstractSyntaxErrorIgnoreAndNotify - Protocol Abstract Syntax Error (Ignore and Notify) - S1AP Protocol cause Abstract Syntax Error (Ignore and Notify).
- Protocol_MessageNotCompatibleWithReceiverState - Protocol Message Not Compatible with Receiver State - S1AP Protocol cause Message not Compatible with Receiver State.
- Protocol_SemanticError - Protocol Semantic Error - S1AP Protocol cause Semantic Error.
- Protocol_AbstractSyntaxErrorFalselyConstructedMessage - Protocol Abstract Syntax Error (Falsely Constructed Message) - S1AP Protocol cause Abstract Syntax Error (Falsely Constructed Message).
- Protocol_Unspecified - Protocol Unspecified - S1AP Protocol cause Unspecified.
- Miscellaneous_ControlProcessingOverload - Miscellaneous Control Processing Overload - S1AP Miscellaneous cause Control Processing Overload.
- Miscellaneous_NotEnoughUserPlaneProcessingResources - Miscellaneous Not Enough User Plane Processing Resources - S1AP Miscellaneous cause Not enough User Plane Processing Resources.
- Miscellaneous_HardwareFailure - Miscellaneous Hardware Failure - S1AP Miscellaneous cause Hardware Failure.
- Miscellaneous_OmIntervention - Miscellaneous O&M Intervention - S1AP Miscellaneous cause O&M Intervention.
- Miscellaneous_Unspecified - Miscellaneous Unspecified - S1AP Miscellaneous cause Unspecified.
- Miscellaneous_UnknownPlmn - Miscellaneous Unknown PLMN - S1AP Miscellaneous cause Unknown PLMN.

Default

Disabled

Name

eRabRelPdnSetupFailure - E-RAB Release Command PDN Setup Failure

Syntax

--eRabRelPdnSetupFailure <list-item>

Description

The S1AP cause the MME includes on E-RAB release command related to an E-RAB as part of the E-RAB to be released list, when PDN Connectivity Request fails due to either collision with handover, or no response or rejection from UE.

Class

Optional.

List

- Disabled - The feature is disabled in the corresponding scenario. The MME does not override the S1AP cause code.
- RadioNetworkLayer_Unspecified - Radio Network Layer Unspecified - S1AP Radio Network Layer cause Unspecified.
- RadioNetworkLayer_TX2RelocOverallExpiry - Radio Network Layer TX2 Reloc Overall Expiry - S1AP Radio Network Layer cause TX2 Reloc Overall Expiry.
- RadioNetworkLayer_SuccessfulHandover - Radio Network Layer Successful Handover - S1AP Radio Network Layer cause Successful Handover.
- RadioNetworkLayer_ReleaseDueToEutranGeneratedReason - Radio Network Layer Release Due to E-UTRAN Generated Reason - S1AP Radio Network Layer cause Release Due to E-UTRAN Generated Reason.
- RadioNetworkLayer_HandoverCancelled - Radio Network Layer Handover Cancelled - S1AP Radio Network Layer cause Handover Cancelled.
- RadioNetworkLayer_PartialHandover - Radio Network Layer Partial Handover - S1AP Radio Network Layer cause Partial Handover.
- RadioNetworkLayer_HandoverFailureInTargetEpcEnbOrTargetSystem - Radio Network Layer Handover Failure in Target EPC/eNB or Target System - S1AP Radio Network Layer cause Handover Failure In Target EPC/eNB or Target System.
- RadioNetworkLayer_HandoverTargetNotAllowed - Radio Network Layer Handover Target Not Allowed - S1AP Radio Network Layer cause Handover Target not allowed.
- RadioNetworkLayer_TS1RelocOverallExpiry - Radio Network Layer TS1 Reloc Overall Expiry - S1AP Radio Network Layer cause TS1Relocoverall Expiry.
- RadioNetworkLayer_TS1RelocPrepExpiry - Radio Network Layer TS1 Reloc Prep Expiry - S1AP Radio Network Layer cause TS1RelocPrep Expiry.
- RadioNetworkLayer_CellNotAvailable - Radio Network Layer Cell Not Available - S1AP Radio Network Layer cause Cell Not Available.
- RadioNetworkLayer_UnknownTargetId - Radio Network Layer Unknown Target Id - S1AP Radio Network Layer cause Unknown Target Id.

- **RadioNetworkLayer_NoRadioResourcesAvailableInTargetCell** - Radio Network Layer No Resources Available in Target Cell - S1AP Radio Network Layer cause No Resources Available in Target Cell.
- **RadioNetworkLayer_UnknownOrAlreadyAllocatedMmeUeS1apId** - Radio Network Layer Unknown or Already Allocated MME UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated MME UE S1AP ID.
- **RadioNetworkLayer_UnknownOrAlreadyAllocatedEnbUeS1apId** - Radio Network Layer Unknown or Already Allocated eNB UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated eNB UE S1AP ID.
- **RadioNetworkLayer_UnknownOrInconsistentPairOfUeS1apId** - Radio Network Layer Unknown or Inconsistent Pair of S1AP UE ID - S1AP Radio Network Layer cause Unknown or inconsistent pair of S1AP UE ID.
- **RadioNetworkLayer_HandoverDesirableForRadioReasons** - Radio Network Layer Handover Desirable for Radio Reasons - S1AP Radio Network Layer cause Handover desirable for radio reasons.
- **RadioNetworkLayer_TimeCriticalHandover** - Radio Network Layer Time Critical Handover - S1AP Radio Network Layer cause Time critical handover.
- **RadioNetworkLayer_ResourceOptimisationHandover** - Radio Network Layer Resource Optimisation Handover - S1AP Radio Network Layer cause Resource optimisation handover.
- **RadioNetworkLayer_ReduceLoadInServingCell** - Radio Network Layer Reduce Load in Serving Cell - S1AP Radio Network Layer cause Reduce load in serving cell.
- **RadioNetworkLayer_UserInactivity** - Radio Network Layer User Inactivity - S1AP Radio Network Layer cause User Inactivity.
- **RadioNetworkLayer_RadioConnectionWithUeLost** - Radio Network Layer Radio Connection with UE Lost - S1AP Radio Network Layer cause Radio Connection With UE Lost.
- **RadioNetworkLayer_LoadBalancingTauRequired** - Radio Network Layer Load Balancing TAU Required - S1AP Radio Network Layer cause Load Balancing TAU Required.
- **RadioNetworkLayer_CsFallbackTriggered** - Radio Network Layer CS Fallback Triggered - S1AP Radio Network Layer cause CS Fallback Triggered.
- **RadioNetworkLayer_UeNotAvailableForPsService** - Radio Network Layer UE Not Available for PS Service - S1AP Radio Network Layer cause UE Not Available For PS Service.
- **RadioNetworkLayer_RadioResourcesNotAvailable** - Radio Network Layer Radio Resources Not Available - S1AP Radio Network Layer cause Radio resources not available.
- **RadioNetworkLayer_FailureInTheRadioInterfaceProcedure** - Radio Network Layer Failure in the Radio Interface Procedure - S1AP Radio Network Layer cause Failure in the Radio Interface Procedure.

- **RadioNetworkLayer_InvalidQosCombination** - Radio Network Layer Invalid QoS Combination - S1AP Radio Network Layer cause Invalid QoS combination.
- **RadioNetworkLayer_InterRatRedirection** - Radio Network Layer Inter-RAT Redirection - S1AP Radio Network Layer cause Inter-RAT redirection.
- **RadioNetworkLayer_InteractionWithOtherProcedure** - Radio Network Layer Interaction with Other Procedure - S1AP Radio Network Layer cause Interaction with other procedure.
- **RadioNetworkLayer_UnknownErabId** - Radio Network Layer Unknown E-RAB ID - S1AP Radio Network Layer cause Unknown E-RAB ID.
- **RadioNetworkLayer_MultipleErabIdInstances** - Radio Network Layer Multiple E-RAB ID Instances - S1AP Radio Network Layer cause Multiple E-RAB ID instances.
- **RadioNetworkLayer_EncryptionAndOrIntegrityProtectionAlgorithmsNotSupported** - Radio Network Layer Encryption and/or Integrity Protection Algorithms Not Supported - S1AP Radio Network Layer cause Encryption and/or Integrity protection algorithms not supported.
- **RadioNetworkLayer_S1IntraSystemhandoverTriggered** - Radio Network Layer S1 Intra System Handover Triggered - S1AP Radio Network Layer cause S1 intra system Handover triggered.
- **RadioNetworkLayer_S1InterSystemHandoverTriggered** - Radio Network Layer S1 Inter System Handover Triggered - S1AP Radio Network Layer cause S1 inter system Handover triggered.
- **RadioNetworkLayer_x2HandoverTriggered** - Radio Network Layer X2 Handover Triggered - S1AP Radio Network Layer cause X2 Handover triggered.
- **RadioNetworkLayer_redirectionTowards1xRtt** - Radio Network Layer Redirection Towards 1xRTT - S1AP Radio Network Layer cause Redirection towards 1xRTT.
- **RadioNetworkLayer_NotSupportedQciValue** - Radio Network Layer Not Supported QCI Value - S1AP Radio Network Layer cause Not Supported QCI Value.
- **RadioNetworkLayer_InvalidCsgId** - Radio Network Layer Invalid CSG Id - S1AP Radio Network Layer cause Invalid CSG Id.
- **RadioNetworkLayer_ReleaseDueToPreEmption** - Radio Network Layer Release Due to Pre-Emption - S1AP Radio Network Layer cause Release due to Pre-Emption.
- **RadioNetworkLayer_N26InterfaceNotAvailable** - Radio Network Layer N26 Interface Not Available - S1AP Radio Network Layer cause N26 interface not available.
- **TransportLayer_TransportResourceUnavailable** - Transport Layer Transport Resource Unavailable - S1AP Transport Layer cause Transport Resource Unavailable.
- **TransportLayer_Unspecified** - Transport Layer Unspecified - S1AP Transport Layer cause Unspecified.
- **Nas_NormalRelease** - NAS Normal Release - S1AP NAS cause Normal Release.

- Nas_AuthenticationFailure - NAS Authentication Failure - S1AP NAS cause Authentication failure.
- Nas_Detach - NAS Detach - S1AP NAS cause Detach.
- Nas_Unspecified - NAS Unspecified - S1AP NAS cause Unspecified.
- Nas_CsgSubscriptionExpiry - NAS CSG Subscription Expiry - S1AP NAS cause CSG Subscription Expiry.
- Protocol_TransferSyntaxError - Protocol Transfer Syntax Error - S1AP Protocol cause Transfer Syntax Error.
- Protocol_AbstractSyntaxErrorReject - Protocol Abstract Syntax Error (Reject) - S1AP Protocol cause Abstract Syntax Error (Reject).
- Protocol_AbstractSyntaxErrorIgnoreAndNotify - Protocol Abstract Syntax Error (Ignore and Notify) - S1AP Protocol cause Abstract Syntax Error (Ignore and Notify).
- Protocol_MessageNotCompatibleWithReceiverState - Protocol Message Not Compatible with Receiver State - S1AP Protocol cause Message not Compatible with Receiver State.
- Protocol_SemanticError - Protocol Semantic Error - S1AP Protocol cause Semantic Error.
- Protocol_AbstractSyntaxErrorFalselyConstructedMessage - Protocol Abstract Syntax Error (Falsely Constructed Message) - S1AP Protocol cause Abstract Syntax Error (Falsely Constructed Message).
- Protocol_Unspecified - Protocol Unspecified - S1AP Protocol cause Unspecified.
- Miscellaneous_ControlProcessingOverload - Miscellaneous Control Processing Overload - S1AP Miscellaneous cause Control Processing Overload.
- Miscellaneous_NotEnoughUserPlaneProcessingResources - Miscellaneous Not Enough User Plane Processing Resources - S1AP Miscellaneous cause Not enough User Plane Processing Resources.
- Miscellaneous_HardwareFailure - Miscellaneous Hardware Failure - S1AP Miscellaneous cause Hardware Failure.
- Miscellaneous_OmIntervention - Miscellaneous O&M Intervention - S1AP Miscellaneous cause O&M Intervention.
- Miscellaneous_Unspecified - Miscellaneous Unspecified - S1AP Miscellaneous cause Unspecified.
- Miscellaneous_UnknownPlmn - Miscellaneous Unknown PLMN - S1AP Miscellaneous cause Unknown PLMN.

Default

Disabled

Name

eRabRelPgwActivationCollisionUe - E-RAB Release Command PGW Activation Collision UE

Syntax

--eRabRelPgwActivationCollisionUe <list-item>

Description

The S1AP cause the MME includes on E-RAB release command related to an E-RAB as part of the E-RAB to be released list, when the MME terminates PGW initiated dedicated bearer activation due to collision after E-RAB setup has been sent, or the UE does not respond or rejects the request.

Class

Optional.

List

- Disabled - The feature is disabled in the corresponding scenario. The MME does not override the S1AP cause code.
- RadioNetworkLayer_Unspecified - Radio Network Layer Unspecified - S1AP Radio Network Layer cause Unspecified.
- RadioNetworkLayer_TX2RelocOverallExpiry - Radio Network Layer TX2 Reloc Overall Expiry - S1AP Radio Network Layer cause TX2 Reloc Overall Expiry.
- RadioNetworkLayer_SuccessfulHandover - Radio Network Layer Successful Handover - S1AP Radio Network Layer cause Successful Handover.
- RadioNetworkLayer_ReleaseDueToEutranGeneratedReason - Radio Network Layer Release Due to E-UTRAN Generated Reason - S1AP Radio Network Layer cause Release Due to E-UTRAN Generated Reason.
- RadioNetworkLayer_HandoverCancelled - Radio Network Layer Handover Cancelled - S1AP Radio Network Layer cause Handover Cancelled.
- RadioNetworkLayer_PartialHandover - Radio Network Layer Partial Handover - S1AP Radio Network Layer cause Partial Handover.
- RadioNetworkLayer_HandoverFailureInTargetEpcEnbOrTargetSystem - Radio Network Layer Handover Failure in Target EPC/eNB or Target System - S1AP Radio Network Layer cause Handover Failure In Target EPC/eNB or Target System.
- RadioNetworkLayer_HandoverTargetNotAllowed - Radio Network Layer Handover Target Not Allowed - S1AP Radio Network Layer cause Handover Target not allowed.
- RadioNetworkLayer_TS1RelocOverallExpiry - Radio Network Layer TS1 Reloc Overall Expiry - S1AP Radio Network Layer cause TS1Relocoverall Expiry.
- RadioNetworkLayer_TS1RelocPrepExpiry - Radio Network Layer TS1 Reloc Prep Expiry - S1AP Radio Network Layer cause TS1RelocPrep Expiry.
- RadioNetworkLayer_CellNotAvailable - Radio Network Layer Cell Not Available - S1AP Radio Network Layer cause Cell Not Available.

- **RadioNetworkLayer_UnknownTargetId** - Radio Network Layer Unknown Target Id - S1AP Radio Network Layer cause Unknown Target Id.
- **RadioNetworkLayer_NoRadioResourcesAvailableInTargetCell** - Radio Network Layer No Resources Available in Target Cell - S1AP Radio Network Layer cause No Resources Available in Target Cell.
- **RadioNetworkLayer_UnknownOrAlreadyAllocatedMmeUeS1apId** - Radio Network Layer Unknown or Already Allocated MME UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated MME UE S1AP ID.
- **RadioNetworkLayer_UnknownOrAlreadyAllocatedEnbUeS1apId** - Radio Network Layer Unknown or Already Allocated eNB UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated eNB UE S1AP ID.
- **RadioNetworkLayer_UnknownOrInconsistentPairOfUeS1apId** - Radio Network Layer Unknown or Inconsistent Pair of S1AP UE ID - S1AP Radio Network Layer cause Unknown or inconsistent pair of S1AP UE ID.
- **RadioNetworkLayer_HandoverDesirableForRadioReasons** - Radio Network Layer Handover Desirable for Radio Reasons - S1AP Radio Network Layer cause Handover desirable for radio reasons.
- **RadioNetworkLayer_TimeCriticalHandover** - Radio Network Layer Time Critical Handover - S1AP Radio Network Layer cause Time critical handover.
- **RadioNetworkLayer_ResourceOptimisationHandover** - Radio Network Layer Resource Optimisation Handover - S1AP Radio Network Layer cause Resource optimisation handover.
- **RadioNetworkLayer_ReduceLoadInServingCell** - Radio Network Layer Reduce Load in Serving Cell - S1AP Radio Network Layer cause Reduce load in serving cell.
- **RadioNetworkLayer_UserInactivity** - Radio Network Layer User Inactivity - S1AP Radio Network Layer cause User Inactivity.
- **RadioNetworkLayer_RadioConnectionWithUeLost** - Radio Network Layer Radio Connection with UE Lost - S1AP Radio Network Layer cause Radio Connection With UE Lost.
- **RadioNetworkLayer_LoadBalancingTauRequired** - Radio Network Layer Load Balancing TAU Required - S1AP Radio Network Layer cause Load Balancing TAU Required.
- **RadioNetworkLayer_CsFallbackTriggered** - Radio Network Layer CS Fallback Triggered - S1AP Radio Network Layer cause CS Fallback Triggered.
- **RadioNetworkLayer_UeNotAvailableForPsService** - Radio Network Layer UE Not Available for PS Service - S1AP Radio Network Layer cause UE Not Available For PS Service.
- **RadioNetworkLayer_RadioResourcesNotAvailable** - Radio Network Layer Radio Resources Not Available - S1AP Radio Network Layer cause Radio resources not available.

- **RadioNetworkLayer_FailureInTheRadioInterfaceProcedure** - Radio Network Layer Failure in the Radio Interface Procedure - S1AP Radio Network Layer cause Failure in the Radio Interface Procedure.
- **RadioNetworkLayer_InvalidQosCombination** - Radio Network Layer Invalid QoS Combination - S1AP Radio Network Layer cause Invalid QoS combination.
- **RadioNetworkLayer_InterRatRedirection** - Radio Network Layer Inter-RAT Redirection - S1AP Radio Network Layer cause Inter-RAT redirection.
- **RadioNetworkLayer_InteractionWithOtherProcedure** - Radio Network Layer Interaction with Other Procedure - S1AP Radio Network Layer cause Interaction with other procedure.
- **RadioNetworkLayer_UnknownEranId** - Radio Network Layer Unknown E-RAB ID - S1AP Radio Network Layer cause Unknown E-RAB ID.
- **RadioNetworkLayer_MultipleEranIdInstances** - Radio Network Layer Multiple E-RAB ID Instances - S1AP Radio Network Layer cause Multiple E-RAB ID instances.
- **RadioNetworkLayer_EncryptionAndOrIntegrityProtectionAlgorithmsNotSupported** - Radio Network Layer Encryption and/or Integrity Protection Algorithms Not Supported - S1AP Radio Network Layer cause Encryption and/or Integrity protection algorithms not supported.
- **RadioNetworkLayer_S1IntraSystemHandoverTriggered** - Radio Network Layer S1 Intra System Handover Triggered - S1AP Radio Network Layer cause S1 intra system Handover triggered.
- **RadioNetworkLayer_S1InterSystemHandoverTriggered** - Radio Network Layer S1 Inter System Handover Triggered - S1AP Radio Network Layer cause S1 inter system Handover triggered.
- **RadioNetworkLayer_x2HandoverTriggered** - Radio Network Layer X2 Handover Triggered - S1AP Radio Network Layer cause X2 Handover triggered.
- **RadioNetworkLayer_redirectionTowards1xRtt** - Radio Network Layer Redirection Towards 1xRTT - S1AP Radio Network Layer cause Redirection towards 1xRTT.
- **RadioNetworkLayer_NotSupportedQciValue** - Radio Network Layer Not Supported QCI Value - S1AP Radio Network Layer cause Not Supported QCI Value.
- **RadioNetworkLayer_InvalidCsgId** - Radio Network Layer Invalid CSG Id - S1AP Radio Network Layer cause Invalid CSG Id.
- **RadioNetworkLayer_ReleaseDueToPreEmption** - Radio Network Layer Release Due to Pre-Emption - S1AP Radio Network Layer cause Release due to Pre-Emption.
- **RadioNetworkLayer_N26InterfaceNotAvailable** - Radio Network Layer N26 Interface Not Available - S1AP Radio Network Layer cause N26 interface not available.
- **TransportLayer_TransportResourceUnavailable** - Transport Layer Transport Resource Unavailable - S1AP Transport Layer cause Transport Resource Unavailable.

- TransportLayer_Unspecified - Transport Layer Unspecified - S1AP Transport Layer cause Unspecified.
- Nas_NormalRelease - NAS Normal Release - S1AP NAS cause Normal Release.
- Nas_AuthenticationFailure - NAS Authentication Failure - S1AP NAS cause Authentication failure.
- Nas_Detach - NAS Detach - S1AP NAS cause Detach.
- Nas_Unspecified - NAS Unspecified - S1AP NAS cause Unspecified.
- Nas_CsgSubscriptionExpiry - NAS CSG Subscription Expiry - S1AP NAS cause CSG Subscription Expiry.
- Protocol_TransferSyntaxError - Protocol Transfer Syntax Error - S1AP Protocol cause Transfer Syntax Error.
- Protocol_AbstractSyntaxErrorReject - Protocol Abstract Syntax Error (Reject) - S1AP Protocol cause Abstract Syntax Error (Reject).
- Protocol_AbstractSyntaxErrorIgnoreAndNotify - Protocol Abstract Syntax Error (Ignore and Notify) - S1AP Protocol cause Abstract Syntax Error (Ignore and Notify).
- Protocol_MessageNotCompatibleWithReceiverState - Protocol Message Not Compatible with Receiver State - S1AP Protocol cause Message not Compatible with Receiver State.
- Protocol_SemanticError - Protocol Semantic Error - S1AP Protocol cause Semantic Error.
- Protocol_AbstractSyntaxErrorFalselyConstructedMessage - Protocol Abstract Syntax Error (Falsely Constructed Message) - S1AP Protocol cause Abstract Syntax Error (Falsely Constructed Message).
- Protocol_Unspecified - Protocol Unspecified - S1AP Protocol cause Unspecified.
- Miscellaneous_ControlProcessingOverload - Miscellaneous Control Processing Overload - S1AP Miscellaneous cause Control Processing Overload.
- Miscellaneous_NotEnoughUserPlaneProcessingResources - Miscellaneous Not Enough User Plane Processing Resources - S1AP Miscellaneous cause Not enough User Plane Processing Resources.
- Miscellaneous_HardwareFailure - Miscellaneous Hardware Failure - S1AP Miscellaneous cause Hardware Failure.
- Miscellaneous_OmIntervention - Miscellaneous O&M Intervention - S1AP Miscellaneous cause O&M Intervention.
- Miscellaneous_Unspecified - Miscellaneous Unspecified - S1AP Miscellaneous cause Unspecified.
- Miscellaneous_UnknownPlmn - Miscellaneous Unknown PLMN - S1AP Miscellaneous cause Unknown PLMN.

Default

Disabled

Name

eRabRelPgwDeactivation - E-RAB Release Command PGW Deactivation

Syntax

--eRabRelPgwDeactivation <list-item>

Description

The S1AP cause the MME includes on E-RAB release command related to an E-RAB as part of the E-RAB to be released list, when the PGW has triggered dedicated bearer deactivation.

Class

Optional.

List

- Disabled - The feature is disabled in the corresponding scenario. The MME does not override the S1AP cause code.
- RadioNetworkLayer_Unspecified - Radio Network Layer Unspecified - S1AP Radio Network Layer cause Unspecified.
- RadioNetworkLayer_TX2RelocOverallExpiry - Radio Network Layer TX2 Reloc Overall Expiry - S1AP Radio Network Layer cause TX2 Reloc Overall Expiry.
- RadioNetworkLayer_SuccessfulHandover - Radio Network Layer Successful Handover - S1AP Radio Network Layer cause Successful Handover.
- RadioNetworkLayer_ReleaseDueToEutranGeneratedReason - Radio Network Layer Release Due to E-UTRAN Generated Reason - S1AP Radio Network Layer cause Release Due to E-UTRAN Generated Reason.
- RadioNetworkLayer_HandoverCancelled - Radio Network Layer Handover Cancelled - S1AP Radio Network Layer cause Handover Cancelled.
- RadioNetworkLayer_PartialHandover - Radio Network Layer Partial Handover - S1AP Radio Network Layer cause Partial Handover.
- RadioNetworkLayer_HandoverFailureInTargetEpcEnbOrTargetSystem - Radio Network Layer Handover Failure in Target EPC/eNB or Target System - S1AP Radio Network Layer cause Handover Failure In Target EPC/eNB or Target System.
- RadioNetworkLayer_HandoverTargetNotAllowed - Radio Network Layer Handover Target Not Allowed - S1AP Radio Network Layer cause Handover Target not allowed.
- RadioNetworkLayer_TS1RelocOverallExpiry - Radio Network Layer TS1 Reloc Overall Expiry - S1AP Radio Network Layer cause TS1Relocoverall Expiry.
- RadioNetworkLayer_TS1RelocPrepExpiry - Radio Network Layer TS1 Reloc Prep Expiry - S1AP Radio Network Layer cause TS1RelocPrep Expiry.
- RadioNetworkLayer_CellNotAvailable - Radio Network Layer Cell Not Available - S1AP Radio Network Layer cause Cell Not Available.

- **RadioNetworkLayer_UnknownTargetId** - Radio Network Layer Unknown Target Id - S1AP Radio Network Layer cause Unknown Target Id.
- **RadioNetworkLayer_NoRadioResourcesAvailableInTargetCell** - Radio Network Layer No Resources Available in Target Cell - S1AP Radio Network Layer cause No Resources Available in Target Cell.
- **RadioNetworkLayer_UnknownOrAlreadyAllocatedMmeUeS1apId** - Radio Network Layer Unknown or Already Allocated MME UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated MME UE S1AP ID.
- **RadioNetworkLayer_UnknownOrAlreadyAllocatedEnbUeS1apId** - Radio Network Layer Unknown or Already Allocated eNB UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated eNB UE S1AP ID.
- **RadioNetworkLayer_UnknownOrInconsistentPairOfUeS1apId** - Radio Network Layer Unknown or Inconsistent Pair of S1AP UE ID - S1AP Radio Network Layer cause Unknown or inconsistent pair of S1AP UE ID.
- **RadioNetworkLayer_HandoverDesirableForRadioReasons** - Radio Network Layer Handover Desirable for Radio Reasons - S1AP Radio Network Layer cause Handover desirable for radio reasons.
- **RadioNetworkLayer_TimeCriticalHandover** - Radio Network Layer Time Critical Handover - S1AP Radio Network Layer cause Time critical handover.
- **RadioNetworkLayer_ResourceOptimisationHandover** - Radio Network Layer Resource Optimisation Handover - S1AP Radio Network Layer cause Resource optimisation handover.
- **RadioNetworkLayer_ReduceLoadInServingCell** - Radio Network Layer Reduce Load in Serving Cell - S1AP Radio Network Layer cause Reduce load in serving cell.
- **RadioNetworkLayer_UserInactivity** - Radio Network Layer User Inactivity - S1AP Radio Network Layer cause User Inactivity.
- **RadioNetworkLayer_RadioConnectionWithUeLost** - Radio Network Layer Radio Connection with UE Lost - S1AP Radio Network Layer cause Radio Connection With UE Lost.
- **RadioNetworkLayer_LoadBalancingTauRequired** - Radio Network Layer Load Balancing TAU Required - S1AP Radio Network Layer cause Load Balancing TAU Required.
- **RadioNetworkLayer_CsFallbackTriggered** - Radio Network Layer CS Fallback Triggered - S1AP Radio Network Layer cause CS Fallback Triggered.
- **RadioNetworkLayer_UeNotAvailableForPsService** - Radio Network Layer UE Not Available for PS Service - S1AP Radio Network Layer cause UE Not Available For PS Service.
- **RadioNetworkLayer_RadioResourcesNotAvailable** - Radio Network Layer Radio Resources Not Available - S1AP Radio Network Layer cause Radio resources not available.

- **RadioNetworkLayer_FailureInTheRadioInterfaceProcedure** - Radio Network Layer Failure in the Radio Interface Procedure - S1AP Radio Network Layer cause Failure in the Radio Interface Procedure.
- **RadioNetworkLayer_InvalidQosCombination** - Radio Network Layer Invalid QoS Combination - S1AP Radio Network Layer cause Invalid QoS combination.
- **RadioNetworkLayer_InterRatRedirection** - Radio Network Layer Inter-RAT Redirection - S1AP Radio Network Layer cause Inter-RAT redirection.
- **RadioNetworkLayer_InteractionWithOtherProcedure** - Radio Network Layer Interaction with Other Procedure - S1AP Radio Network Layer cause Interaction with other procedure.
- **RadioNetworkLayer_UnknownErbId** - Radio Network Layer Unknown E-RAB ID - S1AP Radio Network Layer cause Unknown E-RAB ID.
- **RadioNetworkLayer_MultipleErbIdInstances** - Radio Network Layer Multiple E-RAB ID Instances - S1AP Radio Network Layer cause Multiple E-RAB ID instances.
- **RadioNetworkLayer_EncryptionAndOrIntegrityProtectionAlgorithmsNotSupported** - Radio Network Layer Encryption and/or Integrity Protection Algorithms Not Supported - S1AP Radio Network Layer cause Encryption and/or Integrity protection algorithms not supported.
- **RadioNetworkLayer_S1IntraSystemHandoverTriggered** - Radio Network Layer S1 Intra System Handover Triggered - S1AP Radio Network Layer cause S1 intra system Handover triggered.
- **RadioNetworkLayer_S1InterSystemHandoverTriggered** - Radio Network Layer S1 Inter System Handover Triggered - S1AP Radio Network Layer cause S1 inter system Handover triggered.
- **RadioNetworkLayer_x2HandoverTriggered** - Radio Network Layer X2 Handover Triggered - S1AP Radio Network Layer cause X2 Handover triggered.
- **RadioNetworkLayer_redirectionTowards1xRtt** - Radio Network Layer Redirection Towards 1xRTT - S1AP Radio Network Layer cause Redirection towards 1xRTT.
- **RadioNetworkLayer_NotSupportedQciValue** - Radio Network Layer Not Supported QCI Value - S1AP Radio Network Layer cause Not Supported QCI Value.
- **RadioNetworkLayer_InvalidCsgId** - Radio Network Layer Invalid CSG Id - S1AP Radio Network Layer cause Invalid CSG Id.
- **RadioNetworkLayer_ReleaseDueToPreEmption** - Radio Network Layer Release Due to Pre-Emption - S1AP Radio Network Layer cause Release due to Pre-Emption.
- **RadioNetworkLayer_N26InterfaceNotAvailable** - Radio Network Layer N26 Interface Not Available - S1AP Radio Network Layer cause N26 interface not available.
- **TransportLayer_TransportResourceUnavailable** - Transport Layer Transport Resource Unavailable - S1AP Transport Layer cause Transport Resource Unavailable.

- TransportLayer_Unspecified - Transport Layer Unspecified - S1AP Transport Layer cause Unspecified.
- Nas_NormalRelease - NAS Normal Release - S1AP NAS cause Normal Release.
- Nas_AuthenticationFailure - NAS Authentication Failure - S1AP NAS cause Authentication failure.
- Nas_Detach - NAS Detach - S1AP NAS cause Detach.
- Nas_Unspecified - NAS Unspecified - S1AP NAS cause Unspecified.
- Nas_CsgSubscriptionExpiry - NAS CSG Subscription Expiry - S1AP NAS cause CSG Subscription Expiry.
- Protocol_TransferSyntaxError - Protocol Transfer Syntax Error - S1AP Protocol cause Transfer Syntax Error.
- Protocol_AbstractSyntaxErrorReject - Protocol Abstract Syntax Error (Reject) - S1AP Protocol cause Abstract Syntax Error (Reject).
- Protocol_AbstractSyntaxErrorIgnoreAndNotify - Protocol Abstract Syntax Error (Ignore and Notify) - S1AP Protocol cause Abstract Syntax Error (Ignore and Notify).
- Protocol_MessageNotCompatibleWithReceiverState - Protocol Message Not Compatible with Receiver State - S1AP Protocol cause Message not Compatible with Receiver State.
- Protocol_SemanticError - Protocol Semantic Error - S1AP Protocol cause Semantic Error.
- Protocol_AbstractSyntaxErrorFalselyConstructedMessage - Protocol Abstract Syntax Error (Falsely Constructed Message) - S1AP Protocol cause Abstract Syntax Error (Falsely Constructed Message).
- Protocol_Unspecified - Protocol Unspecified - S1AP Protocol cause Unspecified.
- Miscellaneous_ControlProcessingOverload - Miscellaneous Control Processing Overload - S1AP Miscellaneous cause Control Processing Overload.
- Miscellaneous_NotEnoughUserPlaneProcessingResources - Miscellaneous Not Enough User Plane Processing Resources - S1AP Miscellaneous cause Not enough User Plane Processing Resources.
- Miscellaneous_HardwareFailure - Miscellaneous Hardware Failure - S1AP Miscellaneous cause Hardware Failure.
- Miscellaneous_OmIntervention - Miscellaneous O&M Intervention - S1AP Miscellaneous cause O&M Intervention.
- Miscellaneous_Unspecified - Miscellaneous Unspecified - S1AP Miscellaneous cause Unspecified.
- Miscellaneous_UnknownPlmn - Miscellaneous Unknown PLMN - S1AP Miscellaneous cause Unknown PLMN.

Default

Disabled

Name

eRabRelReEstablishment - E-RAB Release Command Re-establishment

Syntax

--eRabRelReEstablishment <list-item>

Description

The S1AP cause the MME includes on E-RAB release command related to an E-RAB as part of the E-RAB to be released list, when the MME releases the E-RAB (and the PDN) due to PDN connection re-establishment after SGW relocation functionality.

Class

Optional.

List

- Disabled - The feature is disabled in the corresponding scenario. The MME does not override the S1AP cause code.
- RadioNetworkLayer_Unspecified - Radio Network Layer Unspecified - S1AP Radio Network Layer cause Unspecified.
- RadioNetworkLayer_TX2RelocOverallExpiry - Radio Network Layer TX2 Reloc Overall Expiry - S1AP Radio Network Layer cause TX2 Reloc Overall Expiry.
- RadioNetworkLayer_SuccessfulHandover - Radio Network Layer Successful Handover - S1AP Radio Network Layer cause Successful Handover.
- RadioNetworkLayer_ReleaseDueToEutranGeneratedReason - Radio Network Layer Release Due to E-UTRAN Generated Reason - S1AP Radio Network Layer cause Release Due to E-UTRAN Generated Reason.
- RadioNetworkLayer_HandoverCancelled - Radio Network Layer Handover Cancelled - S1AP Radio Network Layer cause Handover Cancelled.
- RadioNetworkLayer_PartialHandover - Radio Network Layer Partial Handover - S1AP Radio Network Layer cause Partial Handover.
- RadioNetworkLayer_HandoverFailureInTargetEpcEnbOrTargetSystem - Radio Network Layer Handover Failure in Target EPC/eNB or Target System - S1AP Radio Network Layer cause Handover Failure In Target EPC/eNB or Target System.
- RadioNetworkLayer_HandoverTargetNotAllowed - Radio Network Layer Handover Target Not Allowed - S1AP Radio Network Layer cause Handover Target not allowed.
- RadioNetworkLayer_TS1RelocOverallExpiry - Radio Network Layer TS1 Reloc Overall Expiry - S1AP Radio Network Layer cause TS1Relocoverall Expiry.
- RadioNetworkLayer_TS1RelocPrepExpiry - Radio Network Layer TS1 Reloc Prep Expiry - S1AP Radio Network Layer cause TS1RelocPrep Expiry.

- **RadioNetworkLayer_CellNotAvailable** - Radio Network Layer Cell Not Available - S1AP Radio Network Layer cause Cell Not Available.
- **RadioNetworkLayer_UnknownTargetId** - Radio Network Layer Unknown Target Id - S1AP Radio Network Layer cause Unknown Target Id.
- **RadioNetworkLayer_NoRadioResourcesAvailableInTargetCell** - Radio Network Layer No Resources Available in Target Cell - S1AP Radio Network Layer cause No Resources Available in Target Cell.
- **RadioNetworkLayer_UnknownOrAlreadyAllocatedMmeUeS1apId** - Radio Network Layer Unknown or Already Allocated MME UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated MME UE S1AP ID.
- **RadioNetworkLayer_UnknownOrAlreadyAllocatedEnbUeS1apId** - Radio Network Layer Unknown or Already Allocated eNB UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated eNB UE S1AP ID.
- **RadioNetworkLayer_UnknownOrInconsistentPairOfUeS1apId** - Radio Network Layer Unknown or Inconsistent Pair of S1AP UE ID - S1AP Radio Network Layer cause Unknown or inconsistent pair of S1AP UE ID.
- **RadioNetworkLayer_HandoverDesirableForRadioReasons** - Radio Network Layer Handover Desirable for Radio Reasons - S1AP Radio Network Layer cause Handover desirable for radio reasons.
- **RadioNetworkLayer_TimeCriticalHandover** - Radio Network Layer Time Critical Handover - S1AP Radio Network Layer cause Time critical handover.
- **RadioNetworkLayer_ResourceOptimisationHandover** - Radio Network Layer Resource Optimisation Handover - S1AP Radio Network Layer cause Resource optimisation handover.
- **RadioNetworkLayer_ReduceLoadInServingCell** - Radio Network Layer Reduce Load in Serving Cell - S1AP Radio Network Layer cause Reduce load in serving cell.
- **RadioNetworkLayer_UserInactivity** - Radio Network Layer User Inactivity - S1AP Radio Network Layer cause User Inactivity.
- **RadioNetworkLayer_RadioConnectionWithUeLost** - Radio Network Layer Radio Connection with UE Lost - S1AP Radio Network Layer cause Radio Connection With UE Lost.
- **RadioNetworkLayer_LoadBalancingTauRequired** - Radio Network Layer Load Balancing TAU Required - S1AP Radio Network Layer cause Load Balancing TAU Required.
- **RadioNetworkLayer_CsFallbackTriggered** - Radio Network Layer CS Fallback Triggered - S1AP Radio Network Layer cause CS Fallback Triggered.
- **RadioNetworkLayer_UeNotAvailableForPsService** - Radio Network Layer UE Not Available for PS Service - S1AP Radio Network Layer cause UE Not Available For PS Service.

- **RadioNetworkLayer_RadioResourcesNotAvailable** - Radio Network Layer Radio Resources Not Available - S1AP Radio Network Layer cause Radio resources not available.
- **RadioNetworkLayer_FailureInTheRadioInterfaceProcedure** - Radio Network Layer Failure in the Radio Interface Procedure - S1AP Radio Network Layer cause Failure in the Radio Interface Procedure.
- **RadioNetworkLayer_InvalidQoSCombination** - Radio Network Layer Invalid QoS Combination - S1AP Radio Network Layer cause Invalid QoS combination.
- **RadioNetworkLayer_InterRatRedirection** - Radio Network Layer Inter-RAT Redirection - S1AP Radio Network Layer cause Inter-RAT redirection.
- **RadioNetworkLayer_InteractionWithOtherProcedure** - Radio Network Layer Interaction with Other Procedure - S1AP Radio Network Layer cause Interaction with other procedure.
- **RadioNetworkLayer_UnknownErabId** - Radio Network Layer Unknown E-RAB ID - S1AP Radio Network Layer cause Unknown E-RAB ID.
- **RadioNetworkLayer_MultipleErabIdInstances** - Radio Network Layer Multiple E-RAB ID Instances - S1AP Radio Network Layer cause Multiple E-RAB ID instances.
- **RadioNetworkLayer_EncryptionAndOrIntegrityProtectionAlgorithmsNotSupported** - Radio Network Layer Encryption and/or Integrity Protection Algorithms Not Supported - S1AP Radio Network Layer cause Encryption and/or Integrity protection algorithms not supported.
- **RadioNetworkLayer_S1IntraSystemHandoverTriggered** - Radio Network Layer S1 Intra System Handover Triggered - S1AP Radio Network Layer cause S1 intra system Handover triggered.
- **RadioNetworkLayer_S1InterSystemHandoverTriggered** - Radio Network Layer S1 Inter System Handover Triggered - S1AP Radio Network Layer cause S1 inter system Handover triggered.
- **RadioNetworkLayer_x2HandoverTriggered** - Radio Network Layer X2 Handover Triggered - S1AP Radio Network Layer cause X2 Handover triggered.
- **RadioNetworkLayer_redirectionTowards1xRtt** - Radio Network Layer Redirection Towards 1xRTT - S1AP Radio Network Layer cause Redirection towards 1xRTT.
- **RadioNetworkLayer_NotSupportedQciValue** - Radio Network Layer Not Supported QCI Value - S1AP Radio Network Layer cause Not Supported QCI Value.
- **RadioNetworkLayer_InvalidCsgId** - Radio Network Layer Invalid CSG Id - S1AP Radio Network Layer cause Invalid CSG Id.
- **RadioNetworkLayer_ReleaseDueToPreEmption** - Radio Network Layer Release Due to Pre-Emption - S1AP Radio Network Layer cause Release due to Pre-Emption.

- RadioNetworkLayer_N26InterfaceNotAvailable - Radio Network Layer N26 Interface Not Available - S1AP Radio Network Layer cause N26 interface not available.
- TransportLayer_TransportResourceUnavailable - Transport Layer Transport Resource Unavailable - S1AP Transport Layer cause Transport Resource Unavailable.
- TransportLayer_Unspecified - Transport Layer Unspecified - S1AP Transport Layer cause Unspecified.
- Nas_NormalRelease - NAS Normal Release - S1AP NAS cause Normal Release.
- Nas_AuthenticationFailure - NAS Authentication Failure - S1AP NAS cause Authentication failure.
- Nas_Detach - NAS Detach - S1AP NAS cause Detach.
- Nas_Unspecified - NAS Unspecified - S1AP NAS cause Unspecified.
- Nas_CsgSubscriptionExpiry - NAS CSG Subscription Expiry - S1AP NAS cause CSG Subscription Expiry.
- Protocol_TransferSyntaxError - Protocol Transfer Syntax Error - S1AP Protocol cause Transfer Syntax Error.
- Protocol_AbstractSyntaxErrorReject - Protocol Abstract Syntax Error (Reject) - S1AP Protocol cause Abstract Syntax Error (Reject).
- Protocol_AbstractSyntaxErrorIgnoreAndNotify - Protocol Abstract Syntax Error (Ignore and Notify) - S1AP Protocol cause Abstract Syntax Error (Ignore and Notify).
- Protocol_MessageNotCompatibleWithReceiverState - Protocol Message Not Compatible with Receiver State - S1AP Protocol cause Message not Compatible with Receiver State.
- Protocol_SemanticError - Protocol Semantic Error - S1AP Protocol cause Semantic Error.
- Protocol_AbstractSyntaxErrorFalselyConstructedMessage - Protocol Abstract Syntax Error (Falsely Constructed Message) - S1AP Protocol cause Abstract Syntax Error (Falsely Constructed Message).
- Protocol_Unspecified - Protocol Unspecified - S1AP Protocol cause Unspecified.
- Miscellaneous_ControlProcessingOverload - Miscellaneous Control Processing Overload - S1AP Miscellaneous cause Control Processing Overload.
- Miscellaneous_NotEnoughUserPlaneProcessingResources - Miscellaneous Not Enough User Plane Processing Resources - S1AP Miscellaneous cause Not enough User Plane Processing Resources.
- Miscellaneous_HardwareFailure - Miscellaneous Hardware Failure - S1AP Miscellaneous cause Hardware Failure.
- Miscellaneous_OmIntervention - Miscellaneous O&M Intervention - S1AP Miscellaneous cause O&M Intervention.

- Miscellaneous_Unspecified - Miscellaneous Unspecified - S1AP Miscellaneous cause Unspecified.
- Miscellaneous_UnknownPlmn - Miscellaneous Unknown PLMN - S1AP Miscellaneous cause Unknown PLMN.

Default

Disabled

Name

eRabRelUeNoBearer - E-RAB Release Command UE No Bearer

Syntax

--eRabRelUeNoBearer <list-item>

Description

The S1AP cause the MME includes on E-RAB release command related to an E-RAB as part of the E-RAB to be released list, when the MME releases the E-RAB when the bearer was successfully setup on E-UTRAN but the UE indicates a corresponding bearer inactive during TAU.

Class

Optional.

List

- Disabled - The feature is disabled in the corresponding scenario. The MME does not override the S1AP cause code.
- RadioNetworkLayer_Unspecified - Radio Network Layer Unspecified - S1AP Radio Network Layer cause Unspecified.
- RadioNetworkLayer_TX2RelocOverallExpiry - Radio Network Layer TX2 Reloc Overall Expiry - S1AP Radio Network Layer cause TX2 Reloc Overall Expiry.
- RadioNetworkLayer_SuccessfulHandover - Radio Network Layer Successful Handover - S1AP Radio Network Layer cause Successful Handover.
- RadioNetworkLayer_ReleaseDueToEutranGeneratedReason - Radio Network Layer Release Due to E-UTRAN Generated Reason - S1AP Radio Network Layer cause Release Due to E-UTRAN Generated Reason.
- RadioNetworkLayer_HandoverCancelled - Radio Network Layer Handover Cancelled - S1AP Radio Network Layer cause Handover Cancelled.
- RadioNetworkLayer_PartialHandover - Radio Network Layer Partial Handover - S1AP Radio Network Layer cause Partial Handover.
- RadioNetworkLayer_HandoverFailureInTargetEpcEnbOrTargetSystem - Radio Network Layer Handover Failure in Target EPC/eNB or Target System - S1AP Radio Network Layer cause Handover Failure In Target EPC/eNB or Target System.

- RadioNetworkLayer_HandoverTargetNotAllowed - Radio Network Layer Handover Target Not Allowed - S1AP Radio Network Layer cause Handover Target not allowed.
- RadioNetworkLayer_TS1RelocOverallExpiry - Radio Network Layer TS1 Reloc Overall Expiry - S1AP Radio Network Layer cause TS1Relocoverall Expiry.
- RadioNetworkLayer_TS1RelocPrepExpiry - Radio Network Layer TS1 Reloc Prep Expiry - S1AP Radio Network Layer cause TS1RelocPrep Expiry.
- RadioNetworkLayer_CellNotAvailable - Radio Network Layer Cell Not Available - S1AP Radio Network Layer cause Cell Not Available.
- RadioNetworkLayer_UnknownTargetId - Radio Network Layer Unknown Target Id - S1AP Radio Network Layer cause Unknown Target Id.
- RadioNetworkLayer_NoRadioResourcesAvailableInTargetCell - Radio Network Layer No Resources Available in Target Cell - S1AP Radio Network Layer cause No Resources Available in Target Cell.
- RadioNetworkLayer_UnknownOrAlreadyAllocatedMmeUeS1apId - Radio Network Layer Unknown or Already Allocated MME UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated MME UE S1AP ID.
- RadioNetworkLayer_UnknownOrAlreadyAllocatedEnbUeS1apId - Radio Network Layer Unknown or Already Allocated eNB UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated eNB UE S1AP ID.
- RadioNetworkLayer_UnknownOrInconsistentPairOfUeS1apId - Radio Network Layer Unknown or Inconsistent Pair of S1AP UE ID - S1AP Radio Network Layer cause Unknown or inconsistent pair of S1AP UE ID.
- RadioNetworkLayer_HandoverDesirableForRadioReasons - Radio Network Layer Handover Desirable for Radio Reasons - S1AP Radio Network Layer cause Handover desirable for radio reasons.
- RadioNetworkLayer_TimeCriticalHandover - Radio Network Layer Time Critical Handover - S1AP Radio Network Layer cause Time critical handover.
- RadioNetworkLayer_ResourceOptimisationHandover - Radio Network Layer Resource Optimisation Handover - S1AP Radio Network Layer cause Resource optimisation handover.
- RadioNetworkLayer_ReduceLoadInServingCell - Radio Network Layer Reduce Load in Serving Cell - S1AP Radio Network Layer cause Reduce load in serving cell.
- RadioNetworkLayer_UserInactivity - Radio Network Layer User Inactivity - S1AP Radio Network Layer cause User Inactivity.
- RadioNetworkLayer_RadioConnectionWithUeLost - Radio Network Layer Radio Connection with UE Lost - S1AP Radio Network Layer cause Radio Connection With UE Lost.

- **RadioNetworkLayer_LoadBalancingTauRequired** - Radio Network Layer Load Balancing TAU Required - S1AP Radio Network Layer cause Load Balancing TAU Required.
- **RadioNetworkLayer_CsFallbackTriggered** - Radio Network Layer CS Fallback Triggered - S1AP Radio Network Layer cause CS Fallback Triggered.
- **RadioNetworkLayer_UeNotAvailableForPsService** - Radio Network Layer UE Not Available for PS Service - S1AP Radio Network Layer cause UE Not Available For PS Service.
- **RadioNetworkLayer_RadioResourcesNotAvailable** - Radio Network Layer Radio Resources Not Available - S1AP Radio Network Layer cause Radio resources not available.
- **RadioNetworkLayer_FailureInTheRadioInterfaceProcedure** - Radio Network Layer Failure in the Radio Interface Procedure - S1AP Radio Network Layer cause Failure in the Radio Interface Procedure.
- **RadioNetworkLayer_InvalidQosCombination** - Radio Network Layer Invalid QoS Combination - S1AP Radio Network Layer cause Invalid QoS combination.
- **RadioNetworkLayer_InterRatRedirection** - Radio Network Layer Inter-RAT Redirection - S1AP Radio Network Layer cause Inter-RAT redirection.
- **RadioNetworkLayer_InteractionWithOtherProcedure** - Radio Network Layer Interaction with Other Procedure - S1AP Radio Network Layer cause Interaction with other procedure.
- **RadioNetworkLayer_UnknownErabId** - Radio Network Layer Unknown E-RAB ID - S1AP Radio Network Layer cause Unknown E-RAB ID.
- **RadioNetworkLayer_MultipleErabIdInstances** - Radio Network Layer Multiple E-RAB ID Instances - S1AP Radio Network Layer cause Multiple E-RAB ID instances.
- **RadioNetworkLayer_EncryptionAndOrIntegrityProtectionAlgorithmsNotSupported** - Radio Network Layer Encryption and/or Integrity Protection Algorithms Not Supported - S1AP Radio Network Layer cause Encryption and/or Integrity protection algorithms not supported.
- **RadioNetworkLayer_S1IntraSystemHandoverTriggered** - Radio Network Layer S1 Intra System Handover Triggered - S1AP Radio Network Layer cause S1 intra system Handover triggered.
- **RadioNetworkLayer_S1InterSystemHandoverTriggered** - Radio Network Layer S1 Inter System Handover Triggered - S1AP Radio Network Layer cause S1 inter system Handover triggered.
- **RadioNetworkLayer_x2HandoverTriggered** - Radio Network Layer X2 Handover Triggered - S1AP Radio Network Layer cause X2 Handover triggered.
- **RadioNetworkLayer_redirectionTowards1xRtt** - Radio Network Layer Redirection Towards 1xRTT - S1AP Radio Network Layer cause Redirection towards 1xRTT.

- RadioNetworkLayer_NotSupportedQciValue - Radio Network Layer Not Supported QCI Value - S1AP Radio Network Layer cause Not Supported QCI Value.
- RadioNetworkLayer_InvalidCsgId - Radio Network Layer Invalid CSG Id - S1AP Radio Network Layer cause Invalid CSG Id.
- RadioNetworkLayer_ReleaseDueToPreEmption - Radio Network Layer Release Due to Pre-Emption - S1AP Radio Network Layer cause Release due to Pre-Emption.
- RadioNetworkLayer_N26InterfaceNotAvailable - Radio Network Layer N26 Interface Not Available - S1AP Radio Network Layer cause N26 interface not available.
- TransportLayer_TransportResourceUnavailable - Transport Layer Transport Resource Unavailable - S1AP Transport Layer cause Transport Resource Unavailable.
- TransportLayer_Unspecified - Transport Layer Unspecified - S1AP Transport Layer cause Unspecified.
- Nas_NormalRelease - NAS Normal Release - S1AP NAS cause Normal Release.
- Nas_AuthenticationFailure - NAS Authentication Failure - S1AP NAS cause Authentication failure.
- Nas_Detach - NAS Detach - S1AP NAS cause Detach.
- Nas_Unspecified - NAS Unspecified - S1AP NAS cause Unspecified.
- Nas_CsgSubscriptionExpiry - NAS CSG Subscription Expiry - S1AP NAS cause CSG Subscription Expiry.
- Protocol_TransferSyntaxError - Protocol Transfer Syntax Error - S1AP Protocol cause Transfer Syntax Error.
- Protocol_AbstractSyntaxErrorReject - Protocol Abstract Syntax Error (Reject) - S1AP Protocol cause Abstract Syntax Error (Reject).
- Protocol_AbstractSyntaxErrorIgnoreAndNotify - Protocol Abstract Syntax Error (Ignore and Notify) - S1AP Protocol cause Abstract Syntax Error (Ignore and Notify).
- Protocol_MessageNotCompatibleWithReceiverState - Protocol Message Not Compatible with Receiver State - S1AP Protocol cause Message not Compatible with Receiver State.
- Protocol_SemanticError - Protocol Semantic Error - S1AP Protocol cause Semantic Error.
- Protocol_AbstractSyntaxErrorFalselyConstructedMessage - Protocol Abstract Syntax Error (Falsely Constructed Message) - S1AP Protocol cause Abstract Syntax Error (Falsely Constructed Message).
- Protocol_Unspecified - Protocol Unspecified - S1AP Protocol cause Unspecified.
- Miscellaneous_ControlProcessingOverload - Miscellaneous Control Processing Overload - S1AP Miscellaneous cause Control Processing Overload.

- **Miscellaneous_NotEnoughUserPlaneProcessingResources** - Miscellaneous Not Enough User Plane Processing Resources - S1AP Miscellaneous cause Not enough User Plane Processing Resources.
- **Miscellaneous_HardwareFailure** - Miscellaneous Hardware Failure - S1AP Miscellaneous cause Hardware Failure.
- **Miscellaneous_OmIntervention** - Miscellaneous O&M Intervention - S1AP Miscellaneous cause O&M Intervention.
- **Miscellaneous_Unspecified** - Miscellaneous Unspecified - S1AP Miscellaneous cause Unspecified.
- **Miscellaneous_UnknownPlmn** - Miscellaneous Unknown PLMN - S1AP Miscellaneous cause Unknown PLMN.

Default

Disabled

Name

pathSwReqAckCtxtNotFoundERab - Path Switch Request Acknowledge Context Not Found E-RAB

Syntax

--pathSwReqAckCtxtNotFoundERab <list-item>

Description

The S1AP cause the MME includes on Path Switch Request Acknowledge related to an E-RAB as part of the E-RAB to be released list, when the MME releases the E-RAB due to receiving Modify Bearer Response from the SGW indicating 'Context not found' GTP cause.

Class

Optional.

List

- **Disabled** - The feature is disabled in the corresponding scenario. The MME does not override the S1AP cause code.
- **RadioNetworkLayer_Unspecified** - Radio Network Layer Unspecified - S1AP Radio Network Layer cause Unspecified.
- **RadioNetworkLayer_TX2RelocOverallExpiry** - Radio Network Layer TX2 Reloc Overall Expiry - S1AP Radio Network Layer cause TX2 Reloc Overall Expiry.
- **RadioNetworkLayer_SuccessfulHandover** - Radio Network Layer Successful Handover - S1AP Radio Network Layer cause Successful Handover.
- **RadioNetworkLayer_ReleaseDueToEutranGeneratedReason** - Radio Network Layer Release Due to E-UTRAN Generated Reason - S1AP Radio Network Layer cause Release Due to E-UTRAN Generated Reason.

- RadioNetworkLayer_HandoverCancelled - Radio Network Layer Handover Cancelled - S1AP Radio Network Layer cause Handover Cancelled.
- RadioNetworkLayer_PartialHandover - Radio Network Layer Partial Handover - S1AP Radio Network Layer cause Partial Handover.
- RadioNetworkLayer_HandoverFailureInTargetEpcEnbOrTargetSystem - Radio Network Layer Handover Failure in Target EPC/eNB or Target System - S1AP Radio Network Layer cause Handover Failure In Target EPC/eNB or Target System.
- RadioNetworkLayer_HandoverTargetNotAllowed - Radio Network Layer Handover Target Not Allowed - S1AP Radio Network Layer cause Handover Target not allowed.
- RadioNetworkLayer_TS1RelocOverallExpiry - Radio Network Layer TS1 Reloc Overall Expiry - S1AP Radio Network Layer cause TS1Relocoverall Expiry.
- RadioNetworkLayer_TS1RelocPrepExpiry - Radio Network Layer TS1 Reloc Prep Expiry - S1AP Radio Network Layer cause TS1RelocPrep Expiry.
- RadioNetworkLayer_CellNotAvailable - Radio Network Layer Cell Not Available - S1AP Radio Network Layer cause Cell Not Available.
- RadioNetworkLayer_UnknownTargetId - Radio Network Layer Unknown Target Id - S1AP Radio Network Layer cause Unknown Target Id.
- RadioNetworkLayer_NoRadioResourcesAvailableInTargetCell - Radio Network Layer No Resources Available in Target Cell - S1AP Radio Network Layer cause No Resources Available in Target Cell.
- RadioNetworkLayer_UnknownOrAlreadyAllocatedMmeUeS1apId - Radio Network Layer Unknown or Already Allocated MME UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated MME UE S1AP ID.
- RadioNetworkLayer_UnknownOrAlreadyAllocatedEnbUeS1apId - Radio Network Layer Unknown or Already Allocated eNB UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated eNB UE S1AP ID.
- RadioNetworkLayer_UnknownOrInconsistentPairOfUeS1apId - Radio Network Layer Unknown or Inconsistent Pair of S1AP UE ID - S1AP Radio Network Layer cause Unknown or inconsistent pair of S1AP UE ID.
- RadioNetworkLayer_HandoverDesirableForRadioReasons - Radio Network Layer Handover Desirable for Radio Reasons - S1AP Radio Network Layer cause Handover desirable for radio reasons.
- RadioNetworkLayer_TimeCriticalHandover - Radio Network Layer Time Critical Handover - S1AP Radio Network Layer cause Time critical handover.
- RadioNetworkLayer_ResourceOptimisationHandover - Radio Network Layer Resource Optimisation Handover - S1AP Radio Network Layer cause Resource optimisation handover.

- **RadioNetworkLayer_ReduceLoadInServingCell** - Radio Network Layer Reduce Load in Serving Cell - S1AP Radio Network Layer cause Reduce load in serving cell.
- **RadioNetworkLayer_UserInactivity** - Radio Network Layer User Inactivity - S1AP Radio Network Layer cause User Inactivity.
- **RadioNetworkLayer_RadioConnectionWithUeLost** - Radio Network Layer Radio Connection with UE Lost - S1AP Radio Network Layer cause Radio Connection With UE Lost.
- **RadioNetworkLayer_LoadBalancingTauRequired** - Radio Network Layer Load Balancing TAU Required - S1AP Radio Network Layer cause Load Balancing TAU Required.
- **RadioNetworkLayer_CsFallbackTriggered** - Radio Network Layer CS Fallback Triggered - S1AP Radio Network Layer cause CS Fallback Triggered.
- **RadioNetworkLayer_UeNotAvailableForPsService** - Radio Network Layer UE Not Available for PS Service - S1AP Radio Network Layer cause UE Not Available For PS Service.
- **RadioNetworkLayer_RadioResourcesNotAvailable** - Radio Network Layer Radio Resources Not Available - S1AP Radio Network Layer cause Radio resources not available.
- **RadioNetworkLayer_FailureInTheRadioInterfaceProcedure** - Radio Network Layer Failure in the Radio Interface Procedure - S1AP Radio Network Layer cause Failure in the Radio Interface Procedure.
- **RadioNetworkLayer_InvalidQosCombination** - Radio Network Layer Invalid QoS Combination - S1AP Radio Network Layer cause Invalid QoS combination.
- **RadioNetworkLayer_InterRatRedirection** - Radio Network Layer Inter-RAT Redirection - S1AP Radio Network Layer cause Inter-RAT redirection.
- **RadioNetworkLayer_InteractionWithOtherProcedure** - Radio Network Layer Interaction with Other Procedure - S1AP Radio Network Layer cause Interaction with other procedure.
- **RadioNetworkLayer_UnknownErabId** - Radio Network Layer Unknown E-RAB ID - S1AP Radio Network Layer cause Unknown E-RAB ID.
- **RadioNetworkLayer_MultipleErabIdInstances** - Radio Network Layer Multiple E-RAB ID Instances - S1AP Radio Network Layer cause Multiple E-RAB ID instances.
- **RadioNetworkLayer_EncryptionAndOrIntegrityProtectionAlgorithmsNotSupported** - Radio Network Layer Encryption and/or Integrity Protection Algorithms Not Supported - S1AP Radio Network Layer cause Encryption and/or Integrity protection algorithms not supported.
- **RadioNetworkLayer_S1IntraSystemhandoverTriggered** - Radio Network Layer S1 Intra System Handover Triggered - S1AP Radio Network Layer cause S1 intra system Handover triggered.

- RadioNetworkLayer_S1InterSystemHandoverTriggered - Radio Network Layer S1 Inter System Handover Triggered - S1AP Radio Network Layer cause S1 inter system Handover triggered.
- RadioNetworkLayer_x2HandoverTriggered - Radio Network Layer X2 Handover Triggered - S1AP Radio Network Layer cause X2 Handover triggered.
- RadioNetworkLayer_redirectionTowards1xRtt - Radio Network Layer Redirection Towards 1xRTT - S1AP Radio Network Layer cause Redirection towards 1xRTT.
- RadioNetworkLayer_NotSupportedQciValue - Radio Network Layer Not Supported QCI Value - S1AP Radio Network Layer cause Not Supported QCI Value.
- RadioNetworkLayer_InvalidCsgId - Radio Network Layer Invalid CSG Id - S1AP Radio Network Layer cause Invalid CSG Id.
- RadioNetworkLayer_ReleaseDueToPreEmption - Radio Network Layer Release Due to Pre-Emption - S1AP Radio Network Layer cause Release due to Pre-Emption.
- RadioNetworkLayer_N26InterfaceNotAvailable - Radio Network Layer N26 Interface Not Available - S1AP Radio Network Layer cause N26 interface not available.
- TransportLayer_TransportResourceUnavailable - Transport Layer Transport Resource Unavailable - S1AP Transport Layer cause Transport Resource Unavailable.
- TransportLayer_Unspecified - Transport Layer Unspecified - S1AP Transport Layer cause Unspecified.
- Nas_NormalRelease - NAS Normal Release - S1AP NAS cause Normal Release.
- Nas_AuthenticationFailure - NAS Authentication Failure - S1AP NAS cause Authentication failure.
- Nas_Detach - NAS Detach - S1AP NAS cause Detach.
- Nas_Unspecified - NAS Unspecified - S1AP NAS cause Unspecified.
- Nas_CsgSubscriptionExpiry - NAS CSG Subscription Expiry - S1AP NAS cause CSG Subscription Expiry.
- Protocol_TransferSyntaxError - Protocol Transfer Syntax Error - S1AP Protocol cause Transfer Syntax Error.
- Protocol_AbstractSyntaxErrorReject - Protocol Abstract Syntax Error (Reject) - S1AP Protocol cause Abstract Syntax Error (Reject).
- Protocol_AbstractSyntaxErrorIgnoreAndNotify - Protocol Abstract Syntax Error (Ignore and Notify) - S1AP Protocol cause Abstract Syntax Error (Ignore and Notify).
- Protocol_MessageNotCompatibleWithReceiverState - Protocol Message Not Compatible with Receiver State - S1AP Protocol cause Message not Compatible with Receiver State.
- Protocol_SemanticError - Protocol Semantic Error - S1AP Protocol cause Semantic Error.

- Protocol_AbstractSyntaxErrorFalselyConstructedMessage - Protocol Abstract Syntax Error (Falsely Constructed Message) - S1AP Protocol cause Abstract Syntax Error (Falsely Constructed Message).
- Protocol_Unspecified - Protocol Unspecified - S1AP Protocol cause Unspecified.
- Miscellaneous_ControlProcessingOverload - Miscellaneous Control Processing Overload - S1AP Miscellaneous cause Control Processing Overload.
- Miscellaneous_NotEnoughUserPlaneProcessingResources - Miscellaneous Not Enough User Plane Processing Resources - S1AP Miscellaneous cause Not enough User Plane Processing Resources.
- Miscellaneous_HardwareFailure - Miscellaneous Hardware Failure - S1AP Miscellaneous cause Hardware Failure.
- Miscellaneous_OmIntervention - Miscellaneous O&M Intervention - S1AP Miscellaneous cause O&M Intervention.
- Miscellaneous_Unspecified - Miscellaneous Unspecified - S1AP Miscellaneous cause Unspecified.
- Miscellaneous_UnknownPlmn - Miscellaneous Unknown PLMN - S1AP Miscellaneous cause Unknown PLMN.

Default

Disabled

Name

pathSwReqAckFailToSwitchBearer - Path Switch Request Acknowledge Fail to Switch Bearer

Syntax

--pathSwReqAckFailToSwitchBearer <list-item>

Description

The S1AP cause the MME includes on Path Switch Request Acknowledge related to an E-RAB as part of the E-RAB to be released list, when the MME releases the E-RAB due to failing to switch the requested bearer during the procedure.

Class

Optional.

List

- Disabled - The feature is disabled in the corresponding scenario. The MME does not override the S1AP cause code.
- RadioNetworkLayer_Unspecified - Radio Network Layer Unspecified - S1AP Radio Network Layer cause Unspecified.
- RadioNetworkLayer_TX2RelocOverallExpiry - Radio Network Layer TX2 Reloc Overall Expiry - S1AP Radio Network Layer cause TX2 Reloc Overall Expiry.

- RadioNetworkLayer_SuccessfulHandover - Radio Network Layer Successful Handover - S1AP Radio Network Layer cause Successful Handover.
- RadioNetworkLayer_ReleaseDueToEutranGeneratedReason - Radio Network Layer Release Due to E-UTRAN Generated Reason - S1AP Radio Network Layer cause Release Due to E-UTRAN Generated Reason.
- RadioNetworkLayer_HandoverCancelled - Radio Network Layer Handover Cancelled - S1AP Radio Network Layer cause Handover Cancelled.
- RadioNetworkLayer_PartialHandover - Radio Network Layer Partial Handover - S1AP Radio Network Layer cause Partial Handover.
- RadioNetworkLayer_HandoverFailureInTargetEpcEnbOrTargetSystem - Radio Network Layer Handover Failure in Target EPC/eNB or Target System - S1AP Radio Network Layer cause Handover Failure In Target EPC/eNB or Target System.
- RadioNetworkLayer_HandoverTargetNotAllowed - Radio Network Layer Handover Target Not Allowed - S1AP Radio Network Layer cause Handover Target not allowed.
- RadioNetworkLayer_TS1RelocOverallExpiry - Radio Network Layer TS1 Reloc Overall Expiry - S1AP Radio Network Layer cause TS1Relocoverall Expiry.
- RadioNetworkLayer_TS1RelocPrepExpiry - Radio Network Layer TS1 Reloc Prep Expiry - S1AP Radio Network Layer cause TS1RelocPrep Expiry.
- RadioNetworkLayer_CellNotAvailable - Radio Network Layer Cell Not Available - S1AP Radio Network Layer cause Cell Not Available.
- RadioNetworkLayer_UnknownTargetId - Radio Network Layer Unknown Target Id - S1AP Radio Network Layer cause Unknown Target Id.
- RadioNetworkLayer_NoRadioResourcesAvailableInTargetCell - Radio Network Layer No Resources Available in Target Cell - S1AP Radio Network Layer cause No Resources Available in Target Cell.
- RadioNetworkLayer_UnknownOrAlreadyAllocatedMmeUeS1apId - Radio Network Layer Unknown or Already Allocated MME UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated MME UE S1AP ID.
- RadioNetworkLayer_UnknownOrAlreadyAllocatedEnbUeS1apId - Radio Network Layer Unknown or Already Allocated eNB UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated eNB UE S1AP ID.
- RadioNetworkLayer_UnknownOrInconsistentPairOfUeS1apId - Radio Network Layer Unknown or Inconsistent Pair of S1AP UE ID - S1AP Radio Network Layer cause Unknown or inconsistent pair of S1AP UE ID.
- RadioNetworkLayer_HandoverDesirableForRadioReasons - Radio Network Layer Handover Desirable for Radio Reasons - S1AP Radio Network Layer cause Handover desirable for radio reasons.

- RadioNetworkLayer_TimeCriticalHandover - Radio Network Layer Time Critical Handover - S1AP Radio Network Layer cause Time critical handover.
- RadioNetworkLayer_ResourceOptimisationHandover - Radio Network Layer Resource Optimisation Handover - S1AP Radio Network Layer cause Resource optimisation handover.
- RadioNetworkLayer_ReduceLoadInServingCell - Radio Network Layer Reduce Load in Serving Cell - S1AP Radio Network Layer cause Reduce load in serving cell.
- RadioNetworkLayer_UserInactivity - Radio Network Layer User Inactivity - S1AP Radio Network Layer cause User Inactivity.
- RadioNetworkLayer_RadioConnectionWithUeLost - Radio Network Layer Radio Connection with UE Lost - S1AP Radio Network Layer cause Radio Connection With UE Lost.
- RadioNetworkLayer_LoadBalancingTauRequired - Radio Network Layer Load Balancing TAU Required - S1AP Radio Network Layer cause Load Balancing TAU Required.
- RadioNetworkLayer_CsFallbackTriggered - Radio Network Layer CS Fallback Triggered - S1AP Radio Network Layer cause CS Fallback Triggered.
- RadioNetworkLayer_UeNotAvailableForPsService - Radio Network Layer UE Not Available for PS Service - S1AP Radio Network Layer cause UE Not Available For PS Service.
- RadioNetworkLayer_RadioResourcesNotAvailable - Radio Network Layer Radio Resources Not Available - S1AP Radio Network Layer cause Radio resources not available.
- RadioNetworkLayer_FailureInTheRadioInterfaceProcedure - Radio Network Layer Failure in the Radio Interface Procedure - S1AP Radio Network Layer cause Failure in the Radio Interface Procedure.
- RadioNetworkLayer_InvalidQosCombination - Radio Network Layer Invalid QoS Combination - S1AP Radio Network Layer cause Invalid QoS combination.
- RadioNetworkLayer_InterRatRedirection - Radio Network Layer Inter-RAT Redirection - S1AP Radio Network Layer cause Inter-RAT redirection.
- RadioNetworkLayer_InteractionWithOtherProcedure - Radio Network Layer Interaction with Other Procedure - S1AP Radio Network Layer cause Interaction with other procedure.
- RadioNetworkLayer_UnknownErabId - Radio Network Layer Unknown E-RAB ID - S1AP Radio Network Layer cause Unknown E-RAB ID.
- RadioNetworkLayer_MultipleErabIdInstances - Radio Network Layer Multiple E-RAB ID Instances - S1AP Radio Network Layer cause Multiple E-RAB ID instances.
- RadioNetworkLayer_EncryptionAndOrIntegrityProtectionAlgorithmsNotSupported - Radio Network Layer Encryption and/or Integrity Protection Algorithms Not Supported -

S1AP Radio Network Layer cause Encryption and/or Integrity protection algorithms not supported.

- RadioNetworkLayer_S1IntraSystemHandoverTriggered - Radio Network Layer S1 Intra System Handover Triggered - S1AP Radio Network Layer cause S1 intra system Handover triggered.
- RadioNetworkLayer_S1InterSystemHandoverTriggered - Radio Network Layer S1 Inter System Handover Triggered - S1AP Radio Network Layer cause S1 inter system Handover triggered.
- RadioNetworkLayer_x2HandoverTriggered - Radio Network Layer X2 Handover Triggered - S1AP Radio Network Layer cause X2 Handover triggered.
- RadioNetworkLayer_redirectionTowards1xRtt - Radio Network Layer Redirection Towards 1xRTT - S1AP Radio Network Layer cause Redirection towards 1xRTT.
- RadioNetworkLayer_NotSupportedQciValue - Radio Network Layer Not Supported QCI Value - S1AP Radio Network Layer cause Not Supported QCI Value.
- RadioNetworkLayer_InvalidCsgId - Radio Network Layer Invalid CSG Id - S1AP Radio Network Layer cause Invalid CSG Id.
- RadioNetworkLayer_ReleaseDueToPreEmption - Radio Network Layer Release Due to Pre-Emption - S1AP Radio Network Layer cause Release due to Pre-Emption.
- RadioNetworkLayer_N26InterfaceNotAvailable - Radio Network Layer N26 Interface Not Available - S1AP Radio Network Layer cause N26 interface not available.
- TransportLayer_TransportResourceUnavailable - Transport Layer Transport Resource Unavailable - S1AP Transport Layer cause Transport Resource Unavailable.
- TransportLayer_Unspecified - Transport Layer Unspecified - S1AP Transport Layer cause Unspecified.
- Nas_NormalRelease - NAS Normal Release - S1AP NAS cause Normal Release.
- Nas_AuthenticationFailure - NAS Authentication Failure - S1AP NAS cause Authentication failure.
- Nas_Detach - NAS Detach - S1AP NAS cause Detach.
- Nas_Unspecified - NAS Unspecified - S1AP NAS cause Unspecified.
- Nas_CsgSubscriptionExpiry - NAS CSG Subscription Expiry - S1AP NAS cause CSG Subscription Expiry.
- Protocol_TransferSyntaxError - Protocol Transfer Syntax Error - S1AP Protocol cause Transfer Syntax Error.
- Protocol_AbstractSyntaxErrorReject - Protocol Abstract Syntax Error (Reject) - S1AP Protocol cause Abstract Syntax Error (Reject).
- Protocol_AbstractSyntaxErrorIgnoreAndNotify - Protocol Abstract Syntax Error (Ignore and Notify) - S1AP Protocol cause Abstract Syntax Error (Ignore and Notify).

- Protocol_MessageNotCompatibleWithReceiverState - Protocol Message Not Compatible with Receiver State - S1AP Protocol cause Message not Compatible with Receiver State.
- Protocol_SemanticError - Protocol Semantic Error - S1AP Protocol cause Semantic Error.
- Protocol_AbstractSyntaxErrorFalselyConstructedMessage - Protocol Abstract Syntax Error (Falsely Constructed Message) - S1AP Protocol cause Abstract Syntax Error (Falsely Constructed Message).
- Protocol_Unspecified - Protocol Unspecified - S1AP Protocol cause Unspecified.
- Miscellaneous_ControlProcessingOverload - Miscellaneous Control Processing Overload - S1AP Miscellaneous cause Control Processing Overload.
- Miscellaneous_NotEnoughUserPlaneProcessingResources - Miscellaneous Not Enough User Plane Processing Resources - S1AP Miscellaneous cause Not enough User Plane Processing Resources.
- Miscellaneous_HardwareFailure - Miscellaneous Hardware Failure - S1AP Miscellaneous cause Hardware Failure.
- Miscellaneous_OmIntervention - Miscellaneous O&M Intervention - S1AP Miscellaneous cause O&M Intervention.
- Miscellaneous_Unspecified - Miscellaneous Unspecified - S1AP Miscellaneous cause Unspecified.
- Miscellaneous_UnknownPlmn - Miscellaneous Unknown PLMN - S1AP Miscellaneous cause Unknown PLMN.

Default

Disabled

Name

pathSwReqAckUnknownERab - Path Switch Request Acknowledge Unknown E-RAB

Syntax

--pathSwReqAckUnknownERab <list-item>

Description

The S1AP cause the MME includes on Path Switch Request Acknowledge related to an E-RAB as part of the E-RAB to be released list, when the MME releases the E-RAB due to receiving an unknown E-RAB on the Path Switch Request.

Class

Optional.

List

- Disabled - The feature is disabled in the corresponding scenario. The MME does not override the S1AP cause code.
- RadioNetworkLayer_Unspecified - Radio Network Layer Unspecified - S1AP Radio Network Layer cause Unspecified.

- **RadioNetworkLayer_TX2RelocOverallExpiry** - Radio Network Layer TX2 Reloc Overall Expiry - S1AP Radio Network Layer cause TX2 Reloc Overall Expiry.
- **RadioNetworkLayer_SuccessfulHandover** - Radio Network Layer Successful Handover - S1AP Radio Network Layer cause Successful Handover.
- **RadioNetworkLayer_ReleaseDueToEutranGeneratedReason** - Radio Network Layer Release Due to E-UTRAN Generated Reason - S1AP Radio Network Layer cause Release Due to E-UTRAN Generated Reason.
- **RadioNetworkLayer_HandoverCancelled** - Radio Network Layer Handover Cancelled - S1AP Radio Network Layer cause Handover Cancelled.
- **RadioNetworkLayer_PartialHandover** - Radio Network Layer Partial Handover - S1AP Radio Network Layer cause Partial Handover.
- **RadioNetworkLayer_HandoverFailureInTargetEpcEnbOrTargetSystem** - Radio Network Layer Handover Failure in Target EPC/eNB or Target System - S1AP Radio Network Layer cause Handover Failure In Target EPC/eNB or Target System.
- **RadioNetworkLayer_HandoverTargetNotAllowed** - Radio Network Layer Handover Target Not Allowed - S1AP Radio Network Layer cause Handover Target not allowed.
- **RadioNetworkLayer_TS1RelocOverallExpiry** - Radio Network Layer TS1 Reloc Overall Expiry - S1AP Radio Network Layer cause TS1Relocoverall Expiry.
- **RadioNetworkLayer_TS1RelocPrepExpiry** - Radio Network Layer TS1 Reloc Prep Expiry - S1AP Radio Network Layer cause TS1RelocPrep Expiry.
- **RadioNetworkLayer_CellNotAvailable** - Radio Network Layer Cell Not Available - S1AP Radio Network Layer cause Cell Not Available.
- **RadioNetworkLayer_UnknownTargetId** - Radio Network Layer Unknown Target Id - S1AP Radio Network Layer cause Unknown Target Id.
- **RadioNetworkLayer_NoRadioResourcesAvailableInTargetCell** - Radio Network Layer No Resources Available in Target Cell - S1AP Radio Network Layer cause No Resources Available in Target Cell.
- **RadioNetworkLayer_UnknownOrAlreadyAllocatedMmeUeS1apId** - Radio Network Layer Unknown or Already Allocated MME UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated MME UE S1AP ID.
- **RadioNetworkLayer_UnknownOrAlreadyAllocatedEnbUeS1apId** - Radio Network Layer Unknown or Already Allocated eNB UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated eNB UE S1AP ID.
- **RadioNetworkLayer_UnknownOrInconsistentPairOfUeS1apId** - Radio Network Layer Unknown or Inconsistent Pair of S1AP UE ID - S1AP Radio Network Layer cause Unknown or inconsistent pair of S1AP UE ID.

- **RadioNetworkLayer_HandoverDesirableForRadioReasons** - Radio Network Layer Handover Desirable for Radio Reasons - S1AP Radio Network Layer cause Handover desirable for radio reasons.
- **RadioNetworkLayer_TimeCriticalHandover** - Radio Network Layer Time Critical Handover - S1AP Radio Network Layer cause Time critical handover.
- **RadioNetworkLayer_ResourceOptimisationHandover** - Radio Network Layer Resource Optimisation Handover - S1AP Radio Network Layer cause Resource optimisation handover.
- **RadioNetworkLayer_ReduceLoadInServingCell** - Radio Network Layer Reduce Load in Serving Cell - S1AP Radio Network Layer cause Reduce load in serving cell.
- **RadioNetworkLayer_UserInactivity** - Radio Network Layer User Inactivity - S1AP Radio Network Layer cause User Inactivity.
- **RadioNetworkLayer_RadioConnectionWithUeLost** - Radio Network Layer Radio Connection with UE Lost - S1AP Radio Network Layer cause Radio Connection With UE Lost.
- **RadioNetworkLayer_LoadBalancingTauRequired** - Radio Network Layer Load Balancing TAU Required - S1AP Radio Network Layer cause Load Balancing TAU Required.
- **RadioNetworkLayer_CsFallbackTriggered** - Radio Network Layer CS Fallback Triggered - S1AP Radio Network Layer cause CS Fallback Triggered.
- **RadioNetworkLayer_UeNotAvailableForPsService** - Radio Network Layer UE Not Available for PS Service - S1AP Radio Network Layer cause UE Not Available For PS Service.
- **RadioNetworkLayer_RadioResourcesNotAvailable** - Radio Network Layer Radio Resources Not Available - S1AP Radio Network Layer cause Radio resources not available.
- **RadioNetworkLayer_FailureInTheRadioInterfaceProcedure** - Radio Network Layer Failure in the Radio Interface Procedure - S1AP Radio Network Layer cause Failure in the Radio Interface Procedure.
- **RadioNetworkLayer_InvalidQosCombination** - Radio Network Layer Invalid QoS Combination - S1AP Radio Network Layer cause Invalid QoS combination.
- **RadioNetworkLayer_InterRatRedirection** - Radio Network Layer Inter-RAT Redirection - S1AP Radio Network Layer cause Inter-RAT redirection.
- **RadioNetworkLayer_InteractionWithOtherProcedure** - Radio Network Layer Interaction with Other Procedure - S1AP Radio Network Layer cause Interaction with other procedure.
- **RadioNetworkLayer_UnknownErabId** - Radio Network Layer Unknown E-RAB ID - S1AP Radio Network Layer cause Unknown E-RAB ID.
- **RadioNetworkLayer_MultipleErabIdInstances** - Radio Network Layer Multiple E-RAB ID Instances - S1AP Radio Network Layer cause Multiple E-RAB ID instances.

- **RadioNetworkLayer_EncryptionAndOrIntegrityProtectionAlgorithmsNotSupported** - Radio Network Layer Encryption and/or Integrity Protection Algorithms Not Supported - S1AP Radio Network Layer cause Encryption and/or Integrity protection algorithms not supported.
- **RadioNetworkLayer_S1IntraSystemHandoverTriggered** - Radio Network Layer S1 Intra System Handover Triggered - S1AP Radio Network Layer cause S1 intra system Handover triggered.
- **RadioNetworkLayer_S1InterSystemHandoverTriggered** - Radio Network Layer S1 Inter System Handover Triggered - S1AP Radio Network Layer cause S1 inter system Handover triggered.
- **RadioNetworkLayer_x2HandoverTriggered** - Radio Network Layer X2 Handover Triggered - S1AP Radio Network Layer cause X2 Handover triggered.
- **RadioNetworkLayer_redirectionTowards1xRtt** - Radio Network Layer Redirection Towards 1xRTT - S1AP Radio Network Layer cause Redirection towards 1xRTT.
- **RadioNetworkLayer_NotSupportedQciValue** - Radio Network Layer Not Supported QCI Value - S1AP Radio Network Layer cause Not Supported QCI Value.
- **RadioNetworkLayer_InvalidCsgId** - Radio Network Layer Invalid CSG Id - S1AP Radio Network Layer cause Invalid CSG Id.
- **RadioNetworkLayer_ReleaseDueToPreEmption** - Radio Network Layer Release Due to Pre-Emption - S1AP Radio Network Layer cause Release due to Pre-Emption.
- **RadioNetworkLayer_N26InterfaceNotAvailable** - Radio Network Layer N26 Interface Not Available - S1AP Radio Network Layer cause N26 interface not available.
- **TransportLayer_TransportResourceUnavailable** - Transport Layer Transport Resource Unavailable - S1AP Transport Layer cause Transport Resource Unavailable.
- **TransportLayer_Unspecified** - Transport Layer Unspecified - S1AP Transport Layer cause Unspecified.
- **Nas_NormalRelease** - NAS Normal Release - S1AP NAS cause Normal Release.
- **Nas_AuthenticationFailure** - NAS Authentication Failure - S1AP NAS cause Authentication failure.
- **Nas_Detach** - NAS Detach - S1AP NAS cause Detach.
- **Nas_Unspecified** - NAS Unspecified - S1AP NAS cause Unspecified.
- **Nas_CsgSubscriptionExpiry** - NAS CSG Subscription Expiry - S1AP NAS cause CSG Subscription Expiry.
- **Protocol_TransferSyntaxError** - Protocol Transfer Syntax Error - S1AP Protocol cause Transfer Syntax Error.
- **Protocol_AbstractSyntaxErrorReject** - Protocol Abstract Syntax Error (Reject) - S1AP Protocol cause Abstract Syntax Error (Reject).

- Protocol_AbstractSyntaxErrorIgnoreAndNotify - Protocol Abstract Syntax Error (Ignore and Notify) - S1AP Protocol cause Abstract Syntax Error (Ignore and Notify).
- Protocol_MessageNotCompatibleWithReceiverState - Protocol Message Not Compatible with Receiver State - S1AP Protocol cause Message not Compatible with Receiver State.
- Protocol_SemanticError - Protocol Semantic Error - S1AP Protocol cause Semantic Error.
- Protocol_AbstractSyntaxErrorFalselyConstructedMessage - Protocol Abstract Syntax Error (Falsely Constructed Message) - S1AP Protocol cause Abstract Syntax Error (Falsely Constructed Message).
- Protocol_Unspecified - Protocol Unspecified - S1AP Protocol cause Unspecified.
- Miscellaneous_ControlProcessingOverload - Miscellaneous Control Processing Overload - S1AP Miscellaneous cause Control Processing Overload.
- Miscellaneous_NotEnoughUserPlaneProcessingResources - Miscellaneous Not Enough User Plane Processing Resources - S1AP Miscellaneous cause Not enough User Plane Processing Resources.
- Miscellaneous_HardwareFailure - Miscellaneous Hardware Failure - S1AP Miscellaneous cause Hardware Failure.
- Miscellaneous_OmIntervention - Miscellaneous O&M Intervention - S1AP Miscellaneous cause O&M Intervention.
- Miscellaneous_Unspecified - Miscellaneous Unspecified - S1AP Miscellaneous cause Unspecified.
- Miscellaneous_UnknownPlmn - Miscellaneous Unknown PLMN - S1AP Miscellaneous cause Unknown PLMN.

Default

Disabled

Name

ueCtxtRelAdminDelete - UE Context Release Command Admin Delete

Syntax

--ueCtxtRelAdminDelete <list-item>

Description

S1AP cause code to include on UE context release command when UE context is deleted by network administrator.

Class

Optional.

List

- Disabled - The feature is disabled in the corresponding scenario. The MME does not override the S1AP cause code.

- RadioNetworkLayer_Unspecified - Radio Network Layer Unspecified - S1AP Radio Network Layer cause Unspecified.
- RadioNetworkLayer_TX2RelocOverallExpiry - Radio Network Layer TX2 Reloc Overall Expiry - S1AP Radio Network Layer cause TX2 Reloc Overall Expiry.
- RadioNetworkLayer_SuccessfulHandover - Radio Network Layer Successful Handover - S1AP Radio Network Layer cause Successful Handover.
- RadioNetworkLayer_ReleaseDueToEutranGeneratedReason - Radio Network Layer Release Due to E-UTRAN Generated Reason - S1AP Radio Network Layer cause Release Due to E-UTRAN Generated Reason.
- RadioNetworkLayer_HandoverCancelled - Radio Network Layer Handover Cancelled - S1AP Radio Network Layer cause Handover Cancelled.
- RadioNetworkLayer_PartialHandover - Radio Network Layer Partial Handover - S1AP Radio Network Layer cause Partial Handover.
- RadioNetworkLayer_HandoverFailureInTargetEpcEnbOrTargetSystem - Radio Network Layer Handover Failure in Target EPC/eNB or Target System - S1AP Radio Network Layer cause Handover Failure In Target EPC/eNB or Target System.
- RadioNetworkLayer_HandoverTargetNotAllowed - Radio Network Layer Handover Target Not Allowed - S1AP Radio Network Layer cause Handover Target not allowed.
- RadioNetworkLayer_TS1RelocOverallExpiry - Radio Network Layer TS1 Reloc Overall Expiry - S1AP Radio Network Layer cause TS1Relocoverall Expiry.
- RadioNetworkLayer_TS1RelocPrepExpiry - Radio Network Layer TS1 Reloc Prep Expiry - S1AP Radio Network Layer cause TS1RelocPrep Expiry.
- RadioNetworkLayer_CellNotAvailable - Radio Network Layer Cell Not Available - S1AP Radio Network Layer cause Cell Not Available.
- RadioNetworkLayer_UnknownTargetId - Radio Network Layer Unknown Target Id - S1AP Radio Network Layer cause Unknown Target Id.
- RadioNetworkLayer_NoRadioResourcesAvailableInTargetCell - Radio Network Layer No Resources Available in Target Cell - S1AP Radio Network Layer cause No Resources Available in Target Cell.
- RadioNetworkLayer_UnknownOrAlreadyAllocatedMmeUeS1apId - Radio Network Layer Unknown or Already Allocated MME UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated MME UE S1AP ID.
- RadioNetworkLayer_UnknownOrAlreadyAllocatedEnbUeS1apId - Radio Network Layer Unknown or Already Allocated eNB UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated eNB UE S1AP ID.
- RadioNetworkLayer_UnknownOrInconsistentPairOfUeS1apId - Radio Network Layer Unknown or Inconsistent Pair of S1AP UE ID - S1AP Radio Network Layer cause Unknown or inconsistent pair of S1AP UE ID.

- **RadioNetworkLayer_HandoverDesirableForRadioReasons** - Radio Network Layer Handover Desirable for Radio Reasons - S1AP Radio Network Layer cause Handover desirable for radio reasons.
- **RadioNetworkLayer_TimeCriticalHandover** - Radio Network Layer Time Critical Handover - S1AP Radio Network Layer cause Time critical handover.
- **RadioNetworkLayer_ResourceOptimisationHandover** - Radio Network Layer Resource Optimisation Handover - S1AP Radio Network Layer cause Resource optimisation handover.
- **RadioNetworkLayer_ReduceLoadInServingCell** - Radio Network Layer Reduce Load in Serving Cell - S1AP Radio Network Layer cause Reduce load in serving cell.
- **RadioNetworkLayer_UserInactivity** - Radio Network Layer User Inactivity - S1AP Radio Network Layer cause User Inactivity.
- **RadioNetworkLayer_RadioConnectionWithUeLost** - Radio Network Layer Radio Connection with UE Lost - S1AP Radio Network Layer cause Radio Connection With UE Lost.
- **RadioNetworkLayer_LoadBalancingTauRequired** - Radio Network Layer Load Balancing TAU Required - S1AP Radio Network Layer cause Load Balancing TAU Required.
- **RadioNetworkLayer_CsFallbackTriggered** - Radio Network Layer CS Fallback Triggered - S1AP Radio Network Layer cause CS Fallback Triggered.
- **RadioNetworkLayer_UeNotAvailableForPsService** - Radio Network Layer UE Not Available for PS Service - S1AP Radio Network Layer cause UE Not Available For PS Service.
- **RadioNetworkLayer_RadioResourcesNotAvailable** - Radio Network Layer Radio Resources Not Available - S1AP Radio Network Layer cause Radio resources not available.
- **RadioNetworkLayer_FailureInTheRadioInterfaceProcedure** - Radio Network Layer Failure in the Radio Interface Procedure - S1AP Radio Network Layer cause Failure in the Radio Interface Procedure.
- **RadioNetworkLayer_InvalidQosCombination** - Radio Network Layer Invalid QoS Combination - S1AP Radio Network Layer cause Invalid QoS combination.
- **RadioNetworkLayer_InterRatRedirection** - Radio Network Layer Inter-RAT Redirection - S1AP Radio Network Layer cause Inter-RAT redirection.
- **RadioNetworkLayer_InteractionWithOtherProcedure** - Radio Network Layer Interaction with Other Procedure - S1AP Radio Network Layer cause Interaction with other procedure.
- **RadioNetworkLayer_UnknownErabId** - Radio Network Layer Unknown E-RAB ID - S1AP Radio Network Layer cause Unknown E-RAB ID.
- **RadioNetworkLayer_MultipleErabIdInstances** - Radio Network Layer Multiple E-RAB ID Instances - S1AP Radio Network Layer cause Multiple E-RAB ID instances.

- **RadioNetworkLayer_EncryptionAndOrIntegrityProtectionAlgorithmsNotSupported** - Radio Network Layer Encryption and/or Integrity Protection Algorithms Not Supported - S1AP Radio Network Layer cause Encryption and/or Integrity protection algorithms not supported.
- **RadioNetworkLayer_S1IntraSystemHandoverTriggered** - Radio Network Layer S1 Intra System Handover Triggered - S1AP Radio Network Layer cause S1 intra system Handover triggered.
- **RadioNetworkLayer_S1InterSystemHandoverTriggered** - Radio Network Layer S1 Inter System Handover Triggered - S1AP Radio Network Layer cause S1 inter system Handover triggered.
- **RadioNetworkLayer_x2HandoverTriggered** - Radio Network Layer X2 Handover Triggered - S1AP Radio Network Layer cause X2 Handover triggered.
- **RadioNetworkLayer_redirectionTowards1xRtt** - Radio Network Layer Redirection Towards 1xRTT - S1AP Radio Network Layer cause Redirection towards 1xRTT.
- **RadioNetworkLayer_NotSupportedQciValue** - Radio Network Layer Not Supported QCI Value - S1AP Radio Network Layer cause Not Supported QCI Value.
- **RadioNetworkLayer_InvalidCsgId** - Radio Network Layer Invalid CSG Id - S1AP Radio Network Layer cause Invalid CSG Id.
- **RadioNetworkLayer_ReleaseDueToPreEmption** - Radio Network Layer Release Due to Pre-Emption - S1AP Radio Network Layer cause Release due to Pre-Emption.
- **RadioNetworkLayer_N26InterfaceNotAvailable** - Radio Network Layer N26 Interface Not Available - S1AP Radio Network Layer cause N26 interface not available.
- **TransportLayer_TransportResourceUnavailable** - Transport Layer Transport Resource Unavailable - S1AP Transport Layer cause Transport Resource Unavailable.
- **TransportLayer_Unspecified** - Transport Layer Unspecified - S1AP Transport Layer cause Unspecified.
- **Nas_NormalRelease** - NAS Normal Release - S1AP NAS cause Normal Release.
- **Nas_AuthenticationFailure** - NAS Authentication Failure - S1AP NAS cause Authentication failure.
- **Nas_Detach** - NAS Detach - S1AP NAS cause Detach.
- **Nas_Unspecified** - NAS Unspecified - S1AP NAS cause Unspecified.
- **Nas_CsgSubscriptionExpiry** - NAS CSG Subscription Expiry - S1AP NAS cause CSG Subscription Expiry.
- **Protocol_TransferSyntaxError** - Protocol Transfer Syntax Error - S1AP Protocol cause Transfer Syntax Error.
- **Protocol_AbstractSyntaxErrorReject** - Protocol Abstract Syntax Error (Reject) - S1AP Protocol cause Abstract Syntax Error (Reject).

- Protocol_AbstractSyntaxErrorIgnoreAndNotify - Protocol Abstract Syntax Error (Ignore and Notify) - S1AP Protocol cause Abstract Syntax Error (Ignore and Notify).
- Protocol_MessageNotCompatibleWithReceiverState - Protocol Message Not Compatible with Receiver State - S1AP Protocol cause Message not Compatible with Receiver State.
- Protocol_SemanticError - Protocol Semantic Error - S1AP Protocol cause Semantic Error.
- Protocol_AbstractSyntaxErrorFalselyConstructedMessage - Protocol Abstract Syntax Error (Falsely Constructed Message) - S1AP Protocol cause Abstract Syntax Error (Falsely Constructed Message).
- Protocol_Unspecified - Protocol Unspecified - S1AP Protocol cause Unspecified.
- Miscellaneous_ControlProcessingOverload - Miscellaneous Control Processing Overload - S1AP Miscellaneous cause Control Processing Overload.
- Miscellaneous_NotEnoughUserPlaneProcessingResources - Miscellaneous Not Enough User Plane Processing Resources - S1AP Miscellaneous cause Not enough User Plane Processing Resources.
- Miscellaneous_HardwareFailure - Miscellaneous Hardware Failure - S1AP Miscellaneous cause Hardware Failure.
- Miscellaneous_OmIntervention - Miscellaneous O&M Intervention - S1AP Miscellaneous cause O&M Intervention.
- Miscellaneous_Unspecified - Miscellaneous Unspecified - S1AP Miscellaneous cause Unspecified.
- Miscellaneous_UnknownPlmn - Miscellaneous Unknown PLMN - S1AP Miscellaneous cause Unknown PLMN.

Default

Disabled

Name

ueCtxtRelApnAdministration - UE Context Release APN Administration

Syntax

--ueCtxtRelApnAdministration <list-item>

Description

The S1AP cause the MME includes on UE context release command on message level, when the MME detaches the UE due to APN administration.

Class

Optional.

List

- Disabled - The feature is disabled in the corresponding scenario. The MME does not override the S1AP cause code.

- RadioNetworkLayer_Unspecified - Radio Network Layer Unspecified - S1AP Radio Network Layer cause Unspecified.
- RadioNetworkLayer_TX2RelocOverallExpiry - Radio Network Layer TX2 Reloc Overall Expiry - S1AP Radio Network Layer cause TX2 Reloc Overall Expiry.
- RadioNetworkLayer_SuccessfulHandover - Radio Network Layer Successful Handover - S1AP Radio Network Layer cause Successful Handover.
- RadioNetworkLayer_ReleaseDueToEutranGeneratedReason - Radio Network Layer Release Due to E-UTRAN Generated Reason - S1AP Radio Network Layer cause Release Due to E-UTRAN Generated Reason.
- RadioNetworkLayer_HandoverCancelled - Radio Network Layer Handover Cancelled - S1AP Radio Network Layer cause Handover Cancelled.
- RadioNetworkLayer_PartialHandover - Radio Network Layer Partial Handover - S1AP Radio Network Layer cause Partial Handover.
- RadioNetworkLayer_HandoverFailureInTargetEpcEnbOrTargetSystem - Radio Network Layer Handover Failure in Target EPC/eNB or Target System - S1AP Radio Network Layer cause Handover Failure In Target EPC/eNB or Target System.
- RadioNetworkLayer_HandoverTargetNotAllowed - Radio Network Layer Handover Target Not Allowed - S1AP Radio Network Layer cause Handover Target not allowed.
- RadioNetworkLayer_TS1RelocOverallExpiry - Radio Network Layer TS1 Reloc Overall Expiry - S1AP Radio Network Layer cause TS1Relocoverall Expiry.
- RadioNetworkLayer_TS1RelocPrepExpiry - Radio Network Layer TS1 Reloc Prep Expiry - S1AP Radio Network Layer cause TS1RelocPrep Expiry.
- RadioNetworkLayer_CellNotAvailable - Radio Network Layer Cell Not Available - S1AP Radio Network Layer cause Cell Not Available.
- RadioNetworkLayer_UnknownTargetId - Radio Network Layer Unknown Target Id - S1AP Radio Network Layer cause Unknown Target Id.
- RadioNetworkLayer_NoRadioResourcesAvailableInTargetCell - Radio Network Layer No Resources Available in Target Cell - S1AP Radio Network Layer cause No Resources Available in Target Cell.
- RadioNetworkLayer_UnknownOrAlreadyAllocatedMmeUeS1apId - Radio Network Layer Unknown or Already Allocated MME UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated MME UE S1AP ID.
- RadioNetworkLayer_UnknownOrAlreadyAllocatedEnbUeS1apId - Radio Network Layer Unknown or Already Allocated eNB UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated eNB UE S1AP ID.
- RadioNetworkLayer_UnknownOrInconsistentPairOfUeS1apId - Radio Network Layer Unknown or Inconsistent Pair of S1AP UE ID - S1AP Radio Network Layer cause Unknown or inconsistent pair of S1AP UE ID.

- **RadioNetworkLayer_HandoverDesirableForRadioReasons** - Radio Network Layer Handover Desirable for Radio Reasons - S1AP Radio Network Layer cause Handover desirable for radio reasons.
- **RadioNetworkLayer_TimeCriticalHandover** - Radio Network Layer Time Critical Handover - S1AP Radio Network Layer cause Time critical handover.
- **RadioNetworkLayer_ResourceOptimisationHandover** - Radio Network Layer Resource Optimisation Handover - S1AP Radio Network Layer cause Resource optimisation handover.
- **RadioNetworkLayer_ReduceLoadInServingCell** - Radio Network Layer Reduce Load in Serving Cell - S1AP Radio Network Layer cause Reduce load in serving cell.
- **RadioNetworkLayer_UserInactivity** - Radio Network Layer User Inactivity - S1AP Radio Network Layer cause User Inactivity.
- **RadioNetworkLayer_RadioConnectionWithUeLost** - Radio Network Layer Radio Connection with UE Lost - S1AP Radio Network Layer cause Radio Connection With UE Lost.
- **RadioNetworkLayer_LoadBalancingTauRequired** - Radio Network Layer Load Balancing TAU Required - S1AP Radio Network Layer cause Load Balancing TAU Required.
- **RadioNetworkLayer_CsFallbackTriggered** - Radio Network Layer CS Fallback Triggered - S1AP Radio Network Layer cause CS Fallback Triggered.
- **RadioNetworkLayer_UeNotAvailableForPsService** - Radio Network Layer UE Not Available for PS Service - S1AP Radio Network Layer cause UE Not Available For PS Service.
- **RadioNetworkLayer_RadioResourcesNotAvailable** - Radio Network Layer Radio Resources Not Available - S1AP Radio Network Layer cause Radio resources not available.
- **RadioNetworkLayer_FailureInTheRadioInterfaceProcedure** - Radio Network Layer Failure in the Radio Interface Procedure - S1AP Radio Network Layer cause Failure in the Radio Interface Procedure.
- **RadioNetworkLayer_InvalidQosCombination** - Radio Network Layer Invalid QoS Combination - S1AP Radio Network Layer cause Invalid QoS combination.
- **RadioNetworkLayer_InterRatRedirection** - Radio Network Layer Inter-RAT Redirection - S1AP Radio Network Layer cause Inter-RAT redirection.
- **RadioNetworkLayer_InteractionWithOtherProcedure** - Radio Network Layer Interaction with Other Procedure - S1AP Radio Network Layer cause Interaction with other procedure.
- **RadioNetworkLayer_UnknownEranId** - Radio Network Layer Unknown E-RAB ID - S1AP Radio Network Layer cause Unknown E-RAB ID.
- **RadioNetworkLayer_MultipleEranIdInstances** - Radio Network Layer Multiple E-RAB ID Instances - S1AP Radio Network Layer cause Multiple E-RAB ID instances.

- **RadioNetworkLayer_EncryptionAndOrIntegrityProtectionAlgorithmsNotSupported** - Radio Network Layer Encryption and/or Integrity Protection Algorithms Not Supported - S1AP Radio Network Layer cause Encryption and/or Integrity protection algorithms not supported.
- **RadioNetworkLayer_S1IntraSystemHandoverTriggered** - Radio Network Layer S1 Intra System Handover Triggered - S1AP Radio Network Layer cause S1 intra system Handover triggered.
- **RadioNetworkLayer_S1InterSystemHandoverTriggered** - Radio Network Layer S1 Inter System Handover Triggered - S1AP Radio Network Layer cause S1 inter system Handover triggered.
- **RadioNetworkLayer_x2HandoverTriggered** - Radio Network Layer X2 Handover Triggered - S1AP Radio Network Layer cause X2 Handover triggered.
- **RadioNetworkLayer_redirectionTowards1xRtt** - Radio Network Layer Redirection Towards 1xRTT - S1AP Radio Network Layer cause Redirection towards 1xRTT.
- **RadioNetworkLayer_NotSupportedQciValue** - Radio Network Layer Not Supported QCI Value - S1AP Radio Network Layer cause Not Supported QCI Value.
- **RadioNetworkLayer_InvalidCsgId** - Radio Network Layer Invalid CSG Id - S1AP Radio Network Layer cause Invalid CSG Id.
- **RadioNetworkLayer_ReleaseDueToPreEmption** - Radio Network Layer Release Due to Pre-Emption - S1AP Radio Network Layer cause Release due to Pre-Emption.
- **RadioNetworkLayer_N26InterfaceNotAvailable** - Radio Network Layer N26 Interface Not Available - S1AP Radio Network Layer cause N26 interface not available.
- **TransportLayer_TransportResourceUnavailable** - Transport Layer Transport Resource Unavailable - S1AP Transport Layer cause Transport Resource Unavailable.
- **TransportLayer_Unspecified** - Transport Layer Unspecified - S1AP Transport Layer cause Unspecified.
- **Nas_NormalRelease** - NAS Normal Release - S1AP NAS cause Normal Release.
- **Nas_AuthenticationFailure** - NAS Authentication Failure - S1AP NAS cause Authentication failure.
- **Nas_Detach** - NAS Detach - S1AP NAS cause Detach.
- **Nas_Unspecified** - NAS Unspecified - S1AP NAS cause Unspecified.
- **Nas_CsgSubscriptionExpiry** - NAS CSG Subscription Expiry - S1AP NAS cause CSG Subscription Expiry.
- **Protocol_TransferSyntaxError** - Protocol Transfer Syntax Error - S1AP Protocol cause Transfer Syntax Error.
- **Protocol_AbstractSyntaxErrorReject** - Protocol Abstract Syntax Error (Reject) - S1AP Protocol cause Abstract Syntax Error (Reject).

- Protocol_AbstractSyntaxErrorIgnoreAndNotify - Protocol Abstract Syntax Error (Ignore and Notify) - S1AP Protocol cause Abstract Syntax Error (Ignore and Notify).
- Protocol_MessageNotCompatibleWithReceiverState - Protocol Message Not Compatible with Receiver State - S1AP Protocol cause Message not Compatible with Receiver State.
- Protocol_SemanticError - Protocol Semantic Error - S1AP Protocol cause Semantic Error.
- Protocol_AbstractSyntaxErrorFalselyConstructedMessage - Protocol Abstract Syntax Error (Falsely Constructed Message) - S1AP Protocol cause Abstract Syntax Error (Falsely Constructed Message).
- Protocol_Unspecified - Protocol Unspecified - S1AP Protocol cause Unspecified.
- Miscellaneous_ControlProcessingOverload - Miscellaneous Control Processing Overload - S1AP Miscellaneous cause Control Processing Overload.
- Miscellaneous_NotEnoughUserPlaneProcessingResources - Miscellaneous Not Enough User Plane Processing Resources - S1AP Miscellaneous cause Not enough User Plane Processing Resources.
- Miscellaneous_HardwareFailure - Miscellaneous Hardware Failure - S1AP Miscellaneous cause Hardware Failure.
- Miscellaneous_OmIntervention - Miscellaneous O&M Intervention - S1AP Miscellaneous cause O&M Intervention.
- Miscellaneous_Unspecified - Miscellaneous Unspecified - S1AP Miscellaneous cause Unspecified.
- Miscellaneous_UnknownPlmn - Miscellaneous Unknown PLMN - S1AP Miscellaneous cause Unknown PLMN.

- RadioNetworkLayer_UnknownOrInconsistentPairOfUeS1apId - Radio Network Layer Unknown or Inconsistent Pair of S1AP UE ID - S1AP Radio Network Layer cause Unknown or inconsistent pair of S1AP UE ID.

- **RadioNetworkLayer_HandoverDesirableForRadioReasons** - Radio Network Layer Handover Desirable for Radio Reasons - S1AP Radio Network Layer cause Handover desirable for radio reasons.
- **RadioNetworkLayer_TimeCriticalHandover** - Radio Network Layer Time Critical Handover - S1AP Radio Network Layer cause Time critical handover.
- **RadioNetworkLayer_ResourceOptimisationHandover** - Radio Network Layer Resource Optimisation Handover - S1AP Radio Network Layer cause Resource optimisation handover.
- **RadioNetworkLayer_ReduceLoadInServingCell** - Radio Network Layer Reduce Load in Serving Cell - S1AP Radio Network Layer cause Reduce load in serving cell.
- **RadioNetworkLayer_UserInactivity** - Radio Network Layer User Inactivity - S1AP Radio Network Layer cause User Inactivity.
- **RadioNetworkLayer_RadioConnectionWithUeLost** - Radio Network Layer Radio Connection with UE Lost - S1AP Radio Network Layer cause Radio Connection With UE Lost.
- **RadioNetworkLayer_LoadBalancingTauRequired** - Radio Network Layer Load Balancing TAU Required - S1AP Radio Network Layer cause Load Balancing TAU Required.
- **RadioNetworkLayer_CsFallbackTriggered** - Radio Network Layer CS Fallback Triggered - S1AP Radio Network Layer cause CS Fallback Triggered.
- **RadioNetworkLayer_UeNotAvailableForPsService** - Radio Network Layer UE Not Available for PS Service - S1AP Radio Network Layer cause UE Not Available For PS Service.
- **RadioNetworkLayer_RadioResourcesNotAvailable** - Radio Network Layer Radio Resources Not Available - S1AP Radio Network Layer cause Radio resources not available.
- **RadioNetworkLayer_FailureInTheRadioInterfaceProcedure** - Radio Network Layer Failure in the Radio Interface Procedure - S1AP Radio Network Layer cause Failure in the Radio Interface Procedure.
- **RadioNetworkLayer_InvalidQosCombination** - Radio Network Layer Invalid QoS Combination - S1AP Radio Network Layer cause Invalid QoS combination.
- **RadioNetworkLayer_InterRatRedirection** - Radio Network Layer Inter-RAT Redirection - S1AP Radio Network Layer cause Inter-RAT redirection.
- **RadioNetworkLayer_InteractionWithOtherProcedure** - Radio Network Layer Interaction with Other Procedure - S1AP Radio Network Layer cause Interaction with other procedure.
- **RadioNetworkLayer_UnknownErabId** - Radio Network Layer Unknown E-RAB ID - S1AP Radio Network Layer cause Unknown E-RAB ID.
- **RadioNetworkLayer_MultipleErabIdInstances** - Radio Network Layer Multiple E-RAB ID Instances - S1AP Radio Network Layer cause Multiple E-RAB ID instances.

- **RadioNetworkLayer_EncryptionAndOrIntegrityProtectionAlgorithmsNotSupported** - Radio Network Layer Encryption and/or Integrity Protection Algorithms Not Supported - S1AP Radio Network Layer cause Encryption and/or Integrity protection algorithms not supported.
- **RadioNetworkLayer_S1IntraSystemHandoverTriggered** - Radio Network Layer S1 Intra System Handover Triggered - S1AP Radio Network Layer cause S1 intra system Handover triggered.
- **RadioNetworkLayer_S1InterSystemHandoverTriggered** - Radio Network Layer S1 Inter System Handover Triggered - S1AP Radio Network Layer cause S1 inter system Handover triggered.
- **RadioNetworkLayer_x2HandoverTriggered** - Radio Network Layer X2 Handover Triggered - S1AP Radio Network Layer cause X2 Handover triggered.
- **RadioNetworkLayer_redirectionTowards1xRtt** - Radio Network Layer Redirection Towards 1xRTT - S1AP Radio Network Layer cause Redirection towards 1xRTT.
- **RadioNetworkLayer_NotSupportedQciValue** - Radio Network Layer Not Supported QCI Value - S1AP Radio Network Layer cause Not Supported QCI Value.
- **RadioNetworkLayer_InvalidCsgId** - Radio Network Layer Invalid CSG Id - S1AP Radio Network Layer cause Invalid CSG Id.
- **RadioNetworkLayer_ReleaseDueToPreEmption** - Radio Network Layer Release Due to Pre-Emption - S1AP Radio Network Layer cause Release due to Pre-Emption.
- **RadioNetworkLayer_N26InterfaceNotAvailable** - Radio Network Layer N26 Interface Not Available - S1AP Radio Network Layer cause N26 interface not available.
- **TransportLayer_TransportResourceUnavailable** - Transport Layer Transport Resource Unavailable - S1AP Transport Layer cause Transport Resource Unavailable.
- **TransportLayer_Unspecified** - Transport Layer Unspecified - S1AP Transport Layer cause Unspecified.
- **Nas_NormalRelease** - NAS Normal Release - S1AP NAS cause Normal Release.
- **Nas_AuthenticationFailure** - NAS Authentication Failure - S1AP NAS cause Authentication failure.
- **Nas_Detach** - NAS Detach - S1AP NAS cause Detach.
- **Nas_Unspecified** - NAS Unspecified - S1AP NAS cause Unspecified.
- **Nas_CsgSubscriptionExpiry** - NAS CSG Subscription Expiry - S1AP NAS cause CSG Subscription Expiry.
- **Protocol_TransferSyntaxError** - Protocol Transfer Syntax Error - S1AP Protocol cause Transfer Syntax Error.
- **Protocol_AbstractSyntaxErrorReject** - Protocol Abstract Syntax Error (Reject) - S1AP Protocol cause Abstract Syntax Error (Reject).

- Protocol_AbstractSyntaxErrorIgnoreAndNotify - Protocol Abstract Syntax Error (Ignore and Notify) - S1AP Protocol cause Abstract Syntax Error (Ignore and Notify).
- Protocol_MessageNotCompatibleWithReceiverState - Protocol Message Not Compatible with Receiver State - S1AP Protocol cause Message not Compatible with Receiver State.
- Protocol_SemanticError - Protocol Semantic Error - S1AP Protocol cause Semantic Error.
- Protocol_AbstractSyntaxErrorFalselyConstructedMessage - Protocol Abstract Syntax Error (Falsely Constructed Message) - S1AP Protocol cause Abstract Syntax Error (Falsely Constructed Message).
- Protocol_Unspecified - Protocol Unspecified - S1AP Protocol cause Unspecified.
- Miscellaneous_ControlProcessingOverload - Miscellaneous Control Processing Overload - S1AP Miscellaneous cause Control Processing Overload.
- Miscellaneous_NotEnoughUserPlaneProcessingResources - Miscellaneous Not Enough User Plane Processing Resources - S1AP Miscellaneous cause Not enough User Plane Processing Resources.
- Miscellaneous_HardwareFailure - Miscellaneous Hardware Failure - S1AP Miscellaneous cause Hardware Failure.
- Miscellaneous_OmIntervention - Miscellaneous O&M Intervention - S1AP Miscellaneous cause O&M Intervention.
- Miscellaneous_Unspecified - Miscellaneous Unspecified - S1AP Miscellaneous cause Unspecified.
- Miscellaneous_UnknownPlmn - Miscellaneous Unknown PLMN - S1AP Miscellaneous cause Unknown PLMN.

- RadioNetworkLayer_TS1RelocOverallExpiry - Radio Network Layer TS1 Reloc Overall Expiry - S1AP Radio Network Layer cause TS1Relocoverall Expiry.
- RadioNetworkLayer_TS1RelocPrepExpiry - Radio Network Layer TS1 Reloc Prep Expiry - S1AP Radio Network Layer cause TS1RelocPrep Expiry.
- RadioNetworkLayer_CellNotAvailable - Radio Network Layer Cell Not Available - S1AP Radio Network Layer cause Cell Not Available.
- RadioNetworkLayer_UnknownTargetId - Radio Network Layer Unknown Target Id - S1AP Radio Network Layer cause Unknown Target Id.
- RadioNetworkLayer_NoRadioResourcesAvailableInTargetCell - Radio Network Layer No Resources Available in Target Cell - S1AP Radio Network Layer cause No Resources Available in Target Cell.
- RadioNetworkLayer_UnknownOrAlreadyAllocatedMmeUeS1apId - Radio Network Layer Unknown or Already Allocated MME UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated MME UE S1AP ID.
- RadioNetworkLayer_UnknownOrAlreadyAllocatedEnbUeS1apId - Radio Network Layer Unknown or Already Allocated eNB UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated eNB UE S1AP ID.
- RadioNetworkLayer_UnknownOrInconsistentPairOfUeS1apId - Radio Network Layer Unknown or Inconsistent Pair of S1AP UE ID - S1AP Radio Network Layer cause Unknown or inconsistent pair of S1AP UE ID.

- RadioNetworkLayer_HandoverDesirableForRadioReasons - Radio Network Layer Handover Desirable for Radio Reasons - S1AP Radio Network Layer cause Handover desirable for radio reasons.
- RadioNetworkLayer_TimeCriticalHandover - Radio Network Layer Time Critical Handover - S1AP Radio Network Layer cause Time critical handover.
- RadioNetworkLayer_ResourceOptimisationHandover - Radio Network Layer Resource Optimisation Handover - S1AP Radio Network Layer cause Resource optimisation handover.
- RadioNetworkLayer_ReduceLoadInServingCell - Radio Network Layer Reduce Load in Serving Cell - S1AP Radio Network Layer cause Reduce load in serving cell.
- RadioNetworkLayer_UserInactivity - Radio Network Layer User Inactivity - S1AP Radio Network Layer cause User Inactivity.
- RadioNetworkLayer_RadioConnectionWithUeLost - Radio Network Layer Radio Connection with UE Lost - S1AP Radio Network Layer cause Radio Connection With UE Lost.
- RadioNetworkLayer_LoadBalancingTauRequired - Radio Network Layer Load Balancing TAU Required - S1AP Radio Network Layer cause Load Balancing TAU Required.
- RadioNetworkLayer_CsFallbackTriggered - Radio Network Layer CS Fallback Triggered - S1AP Radio Network Layer cause CS Fallback Triggered.
- RadioNetworkLayer_UeNotAvailableForPsService - Radio Network Layer UE Not Available for PS Service - S1AP Radio Network Layer cause UE Not Available For PS Service.
- RadioNetworkLayer_RadioResourcesNotAvailable - Radio Network Layer Radio Resources Not Available - S1AP Radio Network Layer cause Radio resources not available.
- RadioNetworkLayer_FailureInTheRadioInterfaceProcedure - Radio Network Layer Failure in the Radio Interface Procedure - S1AP Radio Network Layer cause Failure in the Radio Interface Procedure.
- RadioNetworkLayer_InvalidQosCombination - Radio Network Layer Invalid QoS Combination - S1AP Radio Network Layer cause Invalid QoS combination.
- RadioNetworkLayer_InterRatRedirection - Radio Network Layer Inter-RAT Redirection - S1AP Radio Network Layer cause Inter-RAT redirection.
- RadioNetworkLayer_InteractionWithOtherProcedure - Radio Network Layer Interaction with Other Procedure - S1AP Radio Network Layer cause Interaction with other procedure.
- RadioNetworkLayer_UnknownErabId - Radio Network Layer Unknown E-RAB ID - S1AP Radio Network Layer cause Unknown E-RAB ID.
- RadioNetworkLayer_MultipleErabIdInstances - Radio Network Layer Multiple E-RAB ID Instances - S1AP Radio Network Layer cause Multiple E-RAB ID instances.

- **RadioNetworkLayer_EncryptionAndOrIntegrityProtectionAlgorithmsNotSupported** - Radio Network Layer Encryption and/or Integrity Protection Algorithms Not Supported - S1AP Radio Network Layer cause Encryption and/or Integrity protection algorithms not supported.
- **RadioNetworkLayer_S1IntraSystemHandoverTriggered** - Radio Network Layer S1 Intra System Handover Triggered - S1AP Radio Network Layer cause S1 intra system Handover triggered.
- **RadioNetworkLayer_S1InterSystemHandoverTriggered** - Radio Network Layer S1 Inter System Handover Triggered - S1AP Radio Network Layer cause S1 inter system Handover triggered.
- **RadioNetworkLayer_x2HandoverTriggered** - Radio Network Layer X2 Handover Triggered - S1AP Radio Network Layer cause X2 Handover triggered.
- **RadioNetworkLayer_redirectionTowards1xRtt** - Radio Network Layer Redirection Towards 1xRTT - S1AP Radio Network Layer cause Redirection towards 1xRTT.
- **RadioNetworkLayer_NotSupportedQciValue** - Radio Network Layer Not Supported QCI Value - S1AP Radio Network Layer cause Not Supported QCI Value.
- **RadioNetworkLayer_InvalidCsgId** - Radio Network Layer Invalid CSG Id - S1AP Radio Network Layer cause Invalid CSG Id.
- **RadioNetworkLayer_ReleaseDueToPreEmption** - Radio Network Layer Release Due to Pre-Emption - S1AP Radio Network Layer cause Release due to Pre-Emption.
- **RadioNetworkLayer_N26InterfaceNotAvailable** - Radio Network Layer N26 Interface Not Available - S1AP Radio Network Layer cause N26 interface not available.
- **TransportLayer_TransportResourceUnavailable** - Transport Layer Transport Resource Unavailable - S1AP Transport Layer cause Transport Resource Unavailable.
- **TransportLayer_Unspecified** - Transport Layer Unspecified - S1AP Transport Layer cause Unspecified.
- **Nas_NormalRelease** - NAS Normal Release - S1AP NAS cause Normal Release.
- **Nas_AuthenticationFailure** - NAS Authentication Failure - S1AP NAS cause Authentication failure.
- **Nas_Detach** - NAS Detach - S1AP NAS cause Detach.
- **Nas_Unspecified** - NAS Unspecified - S1AP NAS cause Unspecified.
- **Nas_CsgSubscriptionExpiry** - NAS CSG Subscription Expiry - S1AP NAS cause CSG Subscription Expiry.
- **Protocol_TransferSyntaxError** - Protocol Transfer Syntax Error - S1AP Protocol cause Transfer Syntax Error.
- **Protocol_AbstractSyntaxErrorReject** - Protocol Abstract Syntax Error (Reject) - S1AP Protocol cause Abstract Syntax Error (Reject).

- Protocol_AbstractSyntaxErrorIgnoreAndNotify - Protocol Abstract Syntax Error (Ignore and Notify) - S1AP Protocol cause Abstract Syntax Error (Ignore and Notify).
- Protocol_MessageNotCompatibleWithReceiverState - Protocol Message Not Compatible with Receiver State - S1AP Protocol cause Message not Compatible with Receiver State.
- Protocol_SemanticError - Protocol Semantic Error - S1AP Protocol cause Semantic Error.
- Protocol_AbstractSyntaxErrorFalselyConstructedMessage - Protocol Abstract Syntax Error (Falsely Constructed Message) - S1AP Protocol cause Abstract Syntax Error (Falsely Constructed Message).
- Protocol_Unspecified - Protocol Unspecified - S1AP Protocol cause Unspecified.
- Miscellaneous_ControlProcessingOverload - Miscellaneous Control Processing Overload - S1AP Miscellaneous cause Control Processing Overload.
- Miscellaneous_NotEnoughUserPlaneProcessingResources - Miscellaneous Not Enough User Plane Processing Resources - S1AP Miscellaneous cause Not enough User Plane Processing Resources.
- Miscellaneous_HardwareFailure - Miscellaneous Hardware Failure - S1AP Miscellaneous cause Hardware Failure.
- Miscellaneous_OmIntervention - Miscellaneous O&M Intervention - S1AP Miscellaneous cause O&M Intervention.
- Miscellaneous_Unspecified - Miscellaneous Unspecified - S1AP Miscellaneous cause Unspecified.
- Miscellaneous_UnknownPlmn - Miscellaneous Unknown PLMN - S1AP Miscellaneous cause Unknown PLMN.

Default

Disabled

Name

ueCtxtRelCongestion - UE Context Release Command Congestion

Syntax

--ueCtxtRelCongestion <list-item>

Description

The S1AP cause the MME includes on UE context release command on message level, when the UE context release is following Attach/TAU/Service Reject with NAS EMM cause code 22 'congestion' when MME is overloaded and T3346 sending is enabled.

Class

Optional.

List

- Disabled - The feature is disabled in the corresponding scenario. The MME does not override the S1AP cause code.

- RadioNetworkLayer_Unspecified - Radio Network Layer Unspecified - S1AP Radio Network Layer cause Unspecified.
- RadioNetworkLayer_TX2RelocOverallExpiry - Radio Network Layer TX2 Reloc Overall Expiry - S1AP Radio Network Layer cause TX2 Reloc Overall Expiry.
- RadioNetworkLayer_SuccessfulHandover - Radio Network Layer Successful Handover - S1AP Radio Network Layer cause Successful Handover.
- RadioNetworkLayer_ReleaseDueToEutranGeneratedReason - Radio Network Layer Release Due to E-UTRAN Generated Reason - S1AP Radio Network Layer cause Release Due to E-UTRAN Generated Reason.
- RadioNetworkLayer_HandoverCancelled - Radio Network Layer Handover Cancelled - S1AP Radio Network Layer cause Handover Cancelled.
- RadioNetworkLayer_PartialHandover - Radio Network Layer Partial Handover - S1AP Radio Network Layer cause Partial Handover.
- RadioNetworkLayer_HandoverFailureInTargetEpcEnbOrTargetSystem - Radio Network Layer Handover Failure in Target EPC/eNB or Target System - S1AP Radio Network Layer cause Handover Failure In Target EPC/eNB or Target System.
- RadioNetworkLayer_HandoverTargetNotAllowed - Radio Network Layer Handover Target Not Allowed - S1AP Radio Network Layer cause Handover Target not allowed.
- RadioNetworkLayer_TS1RelocOverallExpiry - Radio Network Layer TS1 Reloc Overall Expiry - S1AP Radio Network Layer cause TS1Relocoverall Expiry.
- RadioNetworkLayer_TS1RelocPrepExpiry - Radio Network Layer TS1 Reloc Prep Expiry - S1AP Radio Network Layer cause TS1RelocPrep Expiry.
- RadioNetworkLayer_CellNotAvailable - Radio Network Layer Cell Not Available - S1AP Radio Network Layer cause Cell Not Available.
- RadioNetworkLayer_UnknownTargetId - Radio Network Layer Unknown Target Id - S1AP Radio Network Layer cause Unknown Target Id.
- RadioNetworkLayer_NoRadioResourcesAvailableInTargetCell - Radio Network Layer No Resources Available in Target Cell - S1AP Radio Network Layer cause No Resources Available in Target Cell.
- RadioNetworkLayer_UnknownOrAlreadyAllocatedMmeUeS1apId - Radio Network Layer Unknown or Already Allocated MME UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated MME UE S1AP ID.
- RadioNetworkLayer_UnknownOrAlreadyAllocatedEnbUeS1apId - Radio Network Layer Unknown or Already Allocated eNB UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated eNB UE S1AP ID.
- RadioNetworkLayer_UnknownOrInconsistentPairOfUeS1apId - Radio Network Layer Unknown or Inconsistent Pair of S1AP UE ID - S1AP Radio Network Layer cause Unknown or inconsistent pair of S1AP UE ID.

- **RadioNetworkLayer_HandoverDesirableForRadioReasons** - Radio Network Layer Handover Desirable for Radio Reasons - S1AP Radio Network Layer cause Handover desirable for radio reasons.
- **RadioNetworkLayer_TimeCriticalHandover** - Radio Network Layer Time Critical Handover - S1AP Radio Network Layer cause Time critical handover.
- **RadioNetworkLayer_ResourceOptimisationHandover** - Radio Network Layer Resource Optimisation Handover - S1AP Radio Network Layer cause Resource optimisation handover.
- **RadioNetworkLayer_ReduceLoadInServingCell** - Radio Network Layer Reduce Load in Serving Cell - S1AP Radio Network Layer cause Reduce load in serving cell.
- **RadioNetworkLayer_UserInactivity** - Radio Network Layer User Inactivity - S1AP Radio Network Layer cause User Inactivity.
- **RadioNetworkLayer_RadioConnectionWithUeLost** - Radio Network Layer Radio Connection with UE Lost - S1AP Radio Network Layer cause Radio Connection With UE Lost.
- **RadioNetworkLayer_LoadBalancingTauRequired** - Radio Network Layer Load Balancing TAU Required - S1AP Radio Network Layer cause Load Balancing TAU Required.
- **RadioNetworkLayer_CsFallbackTriggered** - Radio Network Layer CS Fallback Triggered - S1AP Radio Network Layer cause CS Fallback Triggered.
- **RadioNetworkLayer_UeNotAvailableForPsService** - Radio Network Layer UE Not Available for PS Service - S1AP Radio Network Layer cause UE Not Available For PS Service.
- **RadioNetworkLayer_RadioResourcesNotAvailable** - Radio Network Layer Radio Resources Not Available - S1AP Radio Network Layer cause Radio resources not available.
- **RadioNetworkLayer_FailureInTheRadioInterfaceProcedure** - Radio Network Layer Failure in the Radio Interface Procedure - S1AP Radio Network Layer cause Failure in the Radio Interface Procedure.
- **RadioNetworkLayer_InvalidQosCombination** - Radio Network Layer Invalid QoS Combination - S1AP Radio Network Layer cause Invalid QoS combination.
- **RadioNetworkLayer_InterRatRedirection** - Radio Network Layer Inter-RAT Redirection - S1AP Radio Network Layer cause Inter-RAT redirection.
- **RadioNetworkLayer_InteractionWithOtherProcedure** - Radio Network Layer Interaction with Other Procedure - S1AP Radio Network Layer cause Interaction with other procedure.
- **RadioNetworkLayer_UnknownErabId** - Radio Network Layer Unknown E-RAB ID - S1AP Radio Network Layer cause Unknown E-RAB ID.
- **RadioNetworkLayer_MultipleErabIdInstances** - Radio Network Layer Multiple E-RAB ID Instances - S1AP Radio Network Layer cause Multiple E-RAB ID instances.

- **RadioNetworkLayer_EncryptionAndOrIntegrityProtectionAlgorithmsNotSupported** - Radio Network Layer Encryption and/or Integrity Protection Algorithms Not Supported - S1AP Radio Network Layer cause Encryption and/or Integrity protection algorithms not supported.
- **RadioNetworkLayer_S1IntraSystemHandoverTriggered** - Radio Network Layer S1 Intra System Handover Triggered - S1AP Radio Network Layer cause S1 intra system Handover triggered.
- **RadioNetworkLayer_S1InterSystemHandoverTriggered** - Radio Network Layer S1 Inter System Handover Triggered - S1AP Radio Network Layer cause S1 inter system Handover triggered.
- **RadioNetworkLayer_x2HandoverTriggered** - Radio Network Layer X2 Handover Triggered - S1AP Radio Network Layer cause X2 Handover triggered.
- **RadioNetworkLayer_redirectionTowards1xRtt** - Radio Network Layer Redirection Towards 1xRTT - S1AP Radio Network Layer cause Redirection towards 1xRTT.
- **RadioNetworkLayer_NotSupportedQciValue** - Radio Network Layer Not Supported QCI Value - S1AP Radio Network Layer cause Not Supported QCI Value.
- **RadioNetworkLayer_InvalidCsgId** - Radio Network Layer Invalid CSG Id - S1AP Radio Network Layer cause Invalid CSG Id.
- **RadioNetworkLayer_ReleaseDueToPreEmption** - Radio Network Layer Release Due to Pre-Emption - S1AP Radio Network Layer cause Release due to Pre-Emption.
- **RadioNetworkLayer_N26InterfaceNotAvailable** - Radio Network Layer N26 Interface Not Available - S1AP Radio Network Layer cause N26 interface not available.
- **TransportLayer_TransportResourceUnavailable** - Transport Layer Transport Resource Unavailable - S1AP Transport Layer cause Transport Resource Unavailable.
- **TransportLayer_Unspecified** - Transport Layer Unspecified - S1AP Transport Layer cause Unspecified.
- **Nas_NormalRelease** - NAS Normal Release - S1AP NAS cause Normal Release.
- **Nas_AuthenticationFailure** - NAS Authentication Failure - S1AP NAS cause Authentication failure.
- **Nas_Detach** - NAS Detach - S1AP NAS cause Detach.
- **Nas_Unspecified** - NAS Unspecified - S1AP NAS cause Unspecified.
- **Nas_CsgSubscriptionExpiry** - NAS CSG Subscription Expiry - S1AP NAS cause CSG Subscription Expiry.
- **Protocol_TransferSyntaxError** - Protocol Transfer Syntax Error - S1AP Protocol cause Transfer Syntax Error.
- **Protocol_AbstractSyntaxErrorReject** - Protocol Abstract Syntax Error (Reject) - S1AP Protocol cause Abstract Syntax Error (Reject).

- Protocol_AbstractSyntaxErrorIgnoreAndNotify - Protocol Abstract Syntax Error (Ignore and Notify) - S1AP Protocol cause Abstract Syntax Error (Ignore and Notify).
- Protocol_MessageNotCompatibleWithReceiverState - Protocol Message Not Compatible with Receiver State - S1AP Protocol cause Message not Compatible with Receiver State.
- Protocol_SemanticError - Protocol Semantic Error - S1AP Protocol cause Semantic Error.
- Protocol_AbstractSyntaxErrorFalselyConstructedMessage - Protocol Abstract Syntax Error (Falsely Constructed Message) - S1AP Protocol cause Abstract Syntax Error (Falsely Constructed Message).
- Protocol_Unspecified - Protocol Unspecified - S1AP Protocol cause Unspecified.
- Miscellaneous_ControlProcessingOverload - Miscellaneous Control Processing Overload - S1AP Miscellaneous cause Control Processing Overload.
- Miscellaneous_NotEnoughUserPlaneProcessingResources - Miscellaneous Not Enough User Plane Processing Resources - S1AP Miscellaneous cause Not enough User Plane Processing Resources.
- Miscellaneous_HardwareFailure - Miscellaneous Hardware Failure - S1AP Miscellaneous cause Hardware Failure.
- Miscellaneous_OmIntervention - Miscellaneous O&M Intervention - S1AP Miscellaneous cause O&M Intervention.
- Miscellaneous_Unspecified - Miscellaneous Unspecified - S1AP Miscellaneous cause Unspecified.
- Miscellaneous_UnknownPlmn - Miscellaneous Unknown PLMN - S1AP Miscellaneous cause Unknown PLMN.

Default

Disabled

Name

ueCtxtRelCreateSessRespUserAuthFail - UE Context Release Command Create Session Response User Authentication Fail

Syntax

- ueCtxtRelCreateSessRespUserAuthFail <list-item>

Description

S1AP release cause code to include on UE context release command upon receiving create session reject from SGW for attach request.

Class

Optional.

List

- Disabled - The feature is disabled in the corresponding scenario. The MME does not override the S1AP cause code.

- RadioNetworkLayer_Unspecified - Radio Network Layer Unspecified - S1AP Radio Network Layer cause Unspecified.
- RadioNetworkLayer_TX2RelocOverallExpiry - Radio Network Layer TX2 Reloc Overall Expiry - S1AP Radio Network Layer cause TX2 Reloc Overall Expiry.
- RadioNetworkLayer_SuccessfulHandover - Radio Network Layer Successful Handover - S1AP Radio Network Layer cause Successful Handover.
- RadioNetworkLayer_ReleaseDueToEutranGeneratedReason - Radio Network Layer Release Due to E-UTRAN Generated Reason - S1AP Radio Network Layer cause Release Due to E-UTRAN Generated Reason.
- RadioNetworkLayer_HandoverCancelled - Radio Network Layer Handover Cancelled - S1AP Radio Network Layer cause Handover Cancelled.
- RadioNetworkLayer_PartialHandover - Radio Network Layer Partial Handover - S1AP Radio Network Layer cause Partial Handover.
- RadioNetworkLayer_HandoverFailureInTargetEpcEnbOrTargetSystem - Radio Network Layer Handover Failure in Target EPC/eNB or Target System - S1AP Radio Network Layer cause Handover Failure In Target EPC/eNB or Target System.
- RadioNetworkLayer_HandoverTargetNotAllowed - Radio Network Layer Handover Target Not Allowed - S1AP Radio Network Layer cause Handover Target not allowed.
- RadioNetworkLayer_TS1RelocOverallExpiry - Radio Network Layer TS1 Reloc Overall Expiry - S1AP Radio Network Layer cause TS1Relocoverall Expiry.
- RadioNetworkLayer_TS1RelocPrepExpiry - Radio Network Layer TS1 Reloc Prep Expiry - S1AP Radio Network Layer cause TS1RelocPrep Expiry.
- RadioNetworkLayer_CellNotAvailable - Radio Network Layer Cell Not Available - S1AP Radio Network Layer cause Cell Not Available.
- RadioNetworkLayer_UnknownTargetId - Radio Network Layer Unknown Target Id - S1AP Radio Network Layer cause Unknown Target Id.
- RadioNetworkLayer_NoRadioResourcesAvailableInTargetCell - Radio Network Layer No Resources Available in Target Cell - S1AP Radio Network Layer cause No Resources Available in Target Cell.
- RadioNetworkLayer_UnknownOrAlreadyAllocatedMmeUeS1apId - Radio Network Layer Unknown or Already Allocated MME UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated MME UE S1AP ID.
- RadioNetworkLayer_UnknownOrAlreadyAllocatedEnbUeS1apId - Radio Network Layer Unknown or Already Allocated eNB UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated eNB UE S1AP ID.
- RadioNetworkLayer_UnknownOrInconsistentPairOfUeS1apId - Radio Network Layer Unknown or Inconsistent Pair of S1AP UE ID - S1AP Radio Network Layer cause Unknown or inconsistent pair of S1AP UE ID.

- RadioNetworkLayer_HandoverDesirableForRadioReasons - Radio Network Layer Handover Desirable for Radio Reasons - S1AP Radio Network Layer cause Handover desirable for radio reasons.
- RadioNetworkLayer_TimeCriticalHandover - Radio Network Layer Time Critical Handover - S1AP Radio Network Layer cause Time critical handover.
- RadioNetworkLayer_ResourceOptimisationHandover - Radio Network Layer Resource Optimisation Handover - S1AP Radio Network Layer cause Resource optimisation handover.
- RadioNetworkLayer_ReduceLoadInServingCell - Radio Network Layer Reduce Load in Serving Cell - S1AP Radio Network Layer cause Reduce load in serving cell.
- RadioNetworkLayer_UserInactivity - Radio Network Layer User Inactivity - S1AP Radio Network Layer cause User Inactivity.
- RadioNetworkLayer_RadioConnectionWithUeLost - Radio Network Layer Radio Connection with UE Lost - S1AP Radio Network Layer cause Radio Connection With UE Lost.
- RadioNetworkLayer_LoadBalancingTauRequired - Radio Network Layer Load Balancing TAU Required - S1AP Radio Network Layer cause Load Balancing TAU Required.
- RadioNetworkLayer_CsFallbackTriggered - Radio Network Layer CS Fallback Triggered - S1AP Radio Network Layer cause CS Fallback Triggered.
- RadioNetworkLayer_UeNotAvailableForPsService - Radio Network Layer UE Not Available for PS Service - S1AP Radio Network Layer cause UE Not Available For PS Service.
- RadioNetworkLayer_RadioResourcesNotAvailable - Radio Network Layer Radio Resources Not Available - S1AP Radio Network Layer cause Radio resources not available.
- RadioNetworkLayer_FailureInTheRadioInterfaceProcedure - Radio Network Layer Failure in the Radio Interface Procedure - S1AP Radio Network Layer cause Failure in the Radio Interface Procedure.
- RadioNetworkLayer_InvalidQosCombination - Radio Network Layer Invalid QoS Combination - S1AP Radio Network Layer cause Invalid QoS combination.
- RadioNetworkLayer_InterRatRedirection - Radio Network Layer Inter-RAT Redirection - S1AP Radio Network Layer cause Inter-RAT redirection.
- RadioNetworkLayer_InteractionWithOtherProcedure - Radio Network Layer Interaction with Other Procedure - S1AP Radio Network Layer cause Interaction with other procedure.
- RadioNetworkLayer_UnknownEranId - Radio Network Layer Unknown E-RAB ID - S1AP Radio Network Layer cause Unknown E-RAB ID.
- RadioNetworkLayer_MultipleEranIdInstances - Radio Network Layer Multiple E-RAB ID Instances - S1AP Radio Network Layer cause Multiple E-RAB ID instances.

- **RadioNetworkLayer_EncryptionAndOrIntegrityProtectionAlgorithmsNotSupported** - Radio Network Layer Encryption and/or Integrity Protection Algorithms Not Supported - S1AP Radio Network Layer cause Encryption and/or Integrity protection algorithms not supported.
- **RadioNetworkLayer_S1IntraSystemHandoverTriggered** - Radio Network Layer S1 Intra System Handover Triggered - S1AP Radio Network Layer cause S1 intra system Handover triggered.
- **RadioNetworkLayer_S1InterSystemHandoverTriggered** - Radio Network Layer S1 Inter System Handover Triggered - S1AP Radio Network Layer cause S1 inter system Handover triggered.
- **RadioNetworkLayer_x2HandoverTriggered** - Radio Network Layer X2 Handover Triggered - S1AP Radio Network Layer cause X2 Handover triggered.
- **RadioNetworkLayer_redirectionTowards1xRtt** - Radio Network Layer Redirection Towards 1xRTT - S1AP Radio Network Layer cause Redirection towards 1xRTT.
- **RadioNetworkLayer_NotSupportedQciValue** - Radio Network Layer Not Supported QCI Value - S1AP Radio Network Layer cause Not Supported QCI Value.
- **RadioNetworkLayer_InvalidCsgId** - Radio Network Layer Invalid CSG Id - S1AP Radio Network Layer cause Invalid CSG Id.
- **RadioNetworkLayer_ReleaseDueToPreEmption** - Radio Network Layer Release Due to Pre-Emption - S1AP Radio Network Layer cause Release due to Pre-Emption.
- **RadioNetworkLayer_N26InterfaceNotAvailable** - Radio Network Layer N26 Interface Not Available - S1AP Radio Network Layer cause N26 interface not available.
- **TransportLayer_TransportResourceUnavailable** - Transport Layer Transport Resource Unavailable - S1AP Transport Layer cause Transport Resource Unavailable.
- **TransportLayer_Unspecified** - Transport Layer Unspecified - S1AP Transport Layer cause Unspecified.
- **Nas_NormalRelease** - NAS Normal Release - S1AP NAS cause Normal Release.
- **Nas_AuthenticationFailure** - NAS Authentication Failure - S1AP NAS cause Authentication failure.
- **Nas_Detach** - NAS Detach - S1AP NAS cause Detach.
- **Nas_Unspecified** - NAS Unspecified - S1AP NAS cause Unspecified.
- **Nas_CsgSubscriptionExpiry** - NAS CSG Subscription Expiry - S1AP NAS cause CSG Subscription Expiry.
- **Protocol_TransferSyntaxError** - Protocol Transfer Syntax Error - S1AP Protocol cause Transfer Syntax Error.
- **Protocol_AbstractSyntaxErrorReject** - Protocol Abstract Syntax Error (Reject) - S1AP Protocol cause Abstract Syntax Error (Reject).

- Protocol_AbstractSyntaxErrorIgnoreAndNotify - Protocol Abstract Syntax Error (Ignore and Notify) - S1AP Protocol cause Abstract Syntax Error (Ignore and Notify).
- Protocol_MessageNotCompatibleWithReceiverState - Protocol Message Not Compatible with Receiver State - S1AP Protocol cause Message not Compatible with Receiver State.
- Protocol_SemanticError - Protocol Semantic Error - S1AP Protocol cause Semantic Error.
- Protocol_AbstractSyntaxErrorFalselyConstructedMessage - Protocol Abstract Syntax Error (Falsely Constructed Message) - S1AP Protocol cause Abstract Syntax Error (Falsely Constructed Message).
- Protocol_Unspecified - Protocol Unspecified - S1AP Protocol cause Unspecified.
- Miscellaneous_ControlProcessingOverload - Miscellaneous Control Processing Overload - S1AP Miscellaneous cause Control Processing Overload.
- Miscellaneous_NotEnoughUserPlaneProcessingResources - Miscellaneous Not Enough User Plane Processing Resources - S1AP Miscellaneous cause Not enough User Plane Processing Resources.
- Miscellaneous_HardwareFailure - Miscellaneous Hardware Failure - S1AP Miscellaneous cause Hardware Failure.
- Miscellaneous_OmIntervention - Miscellaneous O&M Intervention - S1AP Miscellaneous cause O&M Intervention.
- Miscellaneous_Unspecified - Miscellaneous Unspecified - S1AP Miscellaneous cause Unspecified.
- Miscellaneous_UnknownPlmn - Miscellaneous Unknown PLMN - S1AP Miscellaneous cause Unknown PLMN.

Default

Disabled

Name

ueCtxtRelCsfBMo - UE Context Release Command CSFB MO

Syntax

--ueCtxtRelCsfBMo <list-item>

Description

S1AP cause code to include on UE context release command due to Mobile Originated CSFB.

Class

Optional.

List

- Disabled - The feature is disabled in the corresponding scenario. The MME does not override the S1AP cause code.

- RadioNetworkLayer_Unspecified - Radio Network Layer Unspecified - S1AP Radio Network Layer cause Unspecified.
- RadioNetworkLayer_TX2RelocOverallExpiry - Radio Network Layer TX2 Reloc Overall Expiry - S1AP Radio Network Layer cause TX2 Reloc Overall Expiry.
- RadioNetworkLayer_SuccessfulHandover - Radio Network Layer Successful Handover - S1AP Radio Network Layer cause Successful Handover.
- RadioNetworkLayer_ReleaseDueToEutranGeneratedReason - Radio Network Layer Release Due to E-UTRAN Generated Reason - S1AP Radio Network Layer cause Release Due to E-UTRAN Generated Reason.
- RadioNetworkLayer_HandoverCancelled - Radio Network Layer Handover Cancelled - S1AP Radio Network Layer cause Handover Cancelled.
- RadioNetworkLayer_PartialHandover - Radio Network Layer Partial Handover - S1AP Radio Network Layer cause Partial Handover.
- RadioNetworkLayer_HandoverFailureInTargetEpcEnbOrTargetSystem - Radio Network Layer Handover Failure in Target EPC/eNB or Target System - S1AP Radio Network Layer cause Handover Failure In Target EPC/eNB or Target System.
- RadioNetworkLayer_HandoverTargetNotAllowed - Radio Network Layer Handover Target Not Allowed - S1AP Radio Network Layer cause Handover Target not allowed.
- RadioNetworkLayer_TS1RelocOverallExpiry - Radio Network Layer TS1 Reloc Overall Expiry - S1AP Radio Network Layer cause TS1Relocoverall Expiry.
- RadioNetworkLayer_TS1RelocPrepExpiry - Radio Network Layer TS1 Reloc Prep Expiry - S1AP Radio Network Layer cause TS1RelocPrep Expiry.
- RadioNetworkLayer_CellNotAvailable - Radio Network Layer Cell Not Available - S1AP Radio Network Layer cause Cell Not Available.
- RadioNetworkLayer_UnknownTargetId - Radio Network Layer Unknown Target Id - S1AP Radio Network Layer cause Unknown Target Id.
- RadioNetworkLayer_NoRadioResourcesAvailableInTargetCell - Radio Network Layer No Resources Available in Target Cell - S1AP Radio Network Layer cause No Resources Available in Target Cell.
- RadioNetworkLayer_UnknownOrAlreadyAllocatedMmeUeS1apId - Radio Network Layer Unknown or Already Allocated MME UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated MME UE S1AP ID.
- RadioNetworkLayer_UnknownOrAlreadyAllocatedEnbUeS1apId - Radio Network Layer Unknown or Already Allocated eNB UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated eNB UE S1AP ID.
- RadioNetworkLayer_UnknownOrInconsistentPairOfUeS1apId - Radio Network Layer Unknown or Inconsistent Pair of S1AP UE ID - S1AP Radio Network Layer cause Unknown or inconsistent pair of S1AP UE ID.

- **RadioNetworkLayer_HandoverDesirableForRadioReasons** - Radio Network Layer Handover Desirable for Radio Reasons - S1AP Radio Network Layer cause Handover desirable for radio reasons.
- **RadioNetworkLayer_TimeCriticalHandover** - Radio Network Layer Time Critical Handover - S1AP Radio Network Layer cause Time critical handover.
- **RadioNetworkLayer_ResourceOptimisationHandover** - Radio Network Layer Resource Optimisation Handover - S1AP Radio Network Layer cause Resource optimisation handover.
- **RadioNetworkLayer_ReduceLoadInServingCell** - Radio Network Layer Reduce Load in Serving Cell - S1AP Radio Network Layer cause Reduce load in serving cell.
- **RadioNetworkLayer_UserInactivity** - Radio Network Layer User Inactivity - S1AP Radio Network Layer cause User Inactivity.
- **RadioNetworkLayer_RadioConnectionWithUeLost** - Radio Network Layer Radio Connection with UE Lost - S1AP Radio Network Layer cause Radio Connection With UE Lost.
- **RadioNetworkLayer_LoadBalancingTauRequired** - Radio Network Layer Load Balancing TAU Required - S1AP Radio Network Layer cause Load Balancing TAU Required.
- **RadioNetworkLayer_CsFallbackTriggered** - Radio Network Layer CS Fallback Triggered - S1AP Radio Network Layer cause CS Fallback Triggered.
- **RadioNetworkLayer_UeNotAvailableForPsService** - Radio Network Layer UE Not Available for PS Service - S1AP Radio Network Layer cause UE Not Available For PS Service.
- **RadioNetworkLayer_RadioResourcesNotAvailable** - Radio Network Layer Radio Resources Not Available - S1AP Radio Network Layer cause Radio resources not available.
- **RadioNetworkLayer_FailureInTheRadioInterfaceProcedure** - Radio Network Layer Failure in the Radio Interface Procedure - S1AP Radio Network Layer cause Failure in the Radio Interface Procedure.
- **RadioNetworkLayer_InvalidQosCombination** - Radio Network Layer Invalid QoS Combination - S1AP Radio Network Layer cause Invalid QoS combination.
- **RadioNetworkLayer_InterRatRedirection** - Radio Network Layer Inter-RAT Redirection - S1AP Radio Network Layer cause Inter-RAT redirection.
- **RadioNetworkLayer_InteractionWithOtherProcedure** - Radio Network Layer Interaction with Other Procedure - S1AP Radio Network Layer cause Interaction with other procedure.
- **RadioNetworkLayer_UnknownErabId** - Radio Network Layer Unknown E-RAB ID - S1AP Radio Network Layer cause Unknown E-RAB ID.
- **RadioNetworkLayer_MultipleErabIdInstances** - Radio Network Layer Multiple E-RAB ID Instances - S1AP Radio Network Layer cause Multiple E-RAB ID instances.

- **RadioNetworkLayer_EncryptionAndOrIntegrityProtectionAlgorithmsNotSupported** - Radio Network Layer Encryption and/or Integrity Protection Algorithms Not Supported - S1AP Radio Network Layer cause Encryption and/or Integrity protection algorithms not supported.
- **RadioNetworkLayer_S1IntraSystemHandoverTriggered** - Radio Network Layer S1 Intra System Handover Triggered - S1AP Radio Network Layer cause S1 intra system Handover triggered.
- **RadioNetworkLayer_S1InterSystemHandoverTriggered** - Radio Network Layer S1 Inter System Handover Triggered - S1AP Radio Network Layer cause S1 inter system Handover triggered.
- **RadioNetworkLayer_x2HandoverTriggered** - Radio Network Layer X2 Handover Triggered - S1AP Radio Network Layer cause X2 Handover triggered.
- **RadioNetworkLayer_redirectionTowards1xRtt** - Radio Network Layer Redirection Towards 1xRTT - S1AP Radio Network Layer cause Redirection towards 1xRTT.
- **RadioNetworkLayer_NotSupportedQciValue** - Radio Network Layer Not Supported QCI Value - S1AP Radio Network Layer cause Not Supported QCI Value.
- **RadioNetworkLayer_InvalidCsgId** - Radio Network Layer Invalid CSG Id - S1AP Radio Network Layer cause Invalid CSG Id.
- **RadioNetworkLayer_ReleaseDueToPreEmption** - Radio Network Layer Release Due to Pre-Emption - S1AP Radio Network Layer cause Release due to Pre-Emption.
- **RadioNetworkLayer_N26InterfaceNotAvailable** - Radio Network Layer N26 Interface Not Available - S1AP Radio Network Layer cause N26 interface not available.
- **TransportLayer_TransportResourceUnavailable** - Transport Layer Transport Resource Unavailable - S1AP Transport Layer cause Transport Resource Unavailable.
- **TransportLayer_Unspecified** - Transport Layer Unspecified - S1AP Transport Layer cause Unspecified.
- **Nas_NormalRelease** - NAS Normal Release - S1AP NAS cause Normal Release.
- **Nas_AuthenticationFailure** - NAS Authentication Failure - S1AP NAS cause Authentication failure.
- **Nas_Detach** - NAS Detach - S1AP NAS cause Detach.
- **Nas_Unspecified** - NAS Unspecified - S1AP NAS cause Unspecified.
- **Nas_CsgSubscriptionExpiry** - NAS CSG Subscription Expiry - S1AP NAS cause CSG Subscription Expiry.
- **Protocol_TransferSyntaxError** - Protocol Transfer Syntax Error - S1AP Protocol cause Transfer Syntax Error.
- **Protocol_AbstractSyntaxErrorReject** - Protocol Abstract Syntax Error (Reject) - S1AP Protocol cause Abstract Syntax Error (Reject).

- Protocol_AbstractSyntaxErrorIgnoreAndNotify - Protocol Abstract Syntax Error (Ignore and Notify) - S1AP Protocol cause Abstract Syntax Error (Ignore and Notify).
- Protocol_MessageNotCompatibleWithReceiverState - Protocol Message Not Compatible with Receiver State - S1AP Protocol cause Message not Compatible with Receiver State.
- Protocol_SemanticError - Protocol Semantic Error - S1AP Protocol cause Semantic Error.
- Protocol_AbstractSyntaxErrorFalselyConstructedMessage - Protocol Abstract Syntax Error (Falsely Constructed Message) - S1AP Protocol cause Abstract Syntax Error (Falsely Constructed Message).
- Protocol_Unspecified - Protocol Unspecified - S1AP Protocol cause Unspecified.
- Miscellaneous_ControlProcessingOverload - Miscellaneous Control Processing Overload - S1AP Miscellaneous cause Control Processing Overload.
- Miscellaneous_NotEnoughUserPlaneProcessingResources - Miscellaneous Not Enough User Plane Processing Resources - S1AP Miscellaneous cause Not enough User Plane Processing Resources.
- Miscellaneous_HardwareFailure - Miscellaneous Hardware Failure - S1AP Miscellaneous cause Hardware Failure.
- Miscellaneous_OmIntervention - Miscellaneous O&M Intervention - S1AP Miscellaneous cause O&M Intervention.
- Miscellaneous_Unspecified - Miscellaneous Unspecified - S1AP Miscellaneous cause Unspecified.
- Miscellaneous_UnknownPlmn - Miscellaneous Unknown PLMN - S1AP Miscellaneous cause Unknown PLMN.

Default

Disabled

Name

ueCtxtRelCsfBmt - UE Context Release Command CSFB MT

Syntax

--ueCtxtRelCsfBmt <list-item>

Description

S1AP cause code to include on UE context release command due to Mobile Terminated CSFB.

Class

Optional.

List

- Disabled - The feature is disabled in the corresponding scenario. The MME does not override the S1AP cause code.

- RadioNetworkLayer_Unspecified - Radio Network Layer Unspecified - S1AP Radio Network Layer cause Unspecified.
- RadioNetworkLayer_TX2RelocOverallExpiry - Radio Network Layer TX2 Reloc Overall Expiry - S1AP Radio Network Layer cause TX2 Reloc Overall Expiry.
- RadioNetworkLayer_SuccessfulHandover - Radio Network Layer Successful Handover - S1AP Radio Network Layer cause Successful Handover.
- RadioNetworkLayer_ReleaseDueToEutranGeneratedReason - Radio Network Layer Release Due to E-UTRAN Generated Reason - S1AP Radio Network Layer cause Release Due to E-UTRAN Generated Reason.
- RadioNetworkLayer_HandoverCancelled - Radio Network Layer Handover Cancelled - S1AP Radio Network Layer cause Handover Cancelled.
- RadioNetworkLayer_PartialHandover - Radio Network Layer Partial Handover - S1AP Radio Network Layer cause Partial Handover.
- RadioNetworkLayer_HandoverFailureInTargetEpcEnbOrTargetSystem - Radio Network Layer Handover Failure in Target EPC/eNB or Target System - S1AP Radio Network Layer cause Handover Failure In Target EPC/eNB or Target System.
- RadioNetworkLayer_HandoverTargetNotAllowed - Radio Network Layer Handover Target Not Allowed - S1AP Radio Network Layer cause Handover Target not allowed.
- RadioNetworkLayer_TS1RelocOverallExpiry - Radio Network Layer TS1 Reloc Overall Expiry - S1AP Radio Network Layer cause TS1Relocoverall Expiry.
- RadioNetworkLayer_TS1RelocPrepExpiry - Radio Network Layer TS1 Reloc Prep Expiry - S1AP Radio Network Layer cause TS1RelocPrep Expiry.
- RadioNetworkLayer_CellNotAvailable - Radio Network Layer Cell Not Available - S1AP Radio Network Layer cause Cell Not Available.
- RadioNetworkLayer_UnknownTargetId - Radio Network Layer Unknown Target Id - S1AP Radio Network Layer cause Unknown Target Id.
- RadioNetworkLayer_NoRadioResourcesAvailableInTargetCell - Radio Network Layer No Resources Available in Target Cell - S1AP Radio Network Layer cause No Resources Available in Target Cell.
- RadioNetworkLayer_UnknownOrAlreadyAllocatedMmeUeS1apId - Radio Network Layer Unknown or Already Allocated MME UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated MME UE S1AP ID.
- RadioNetworkLayer_UnknownOrAlreadyAllocatedEnbUeS1apId - Radio Network Layer Unknown or Already Allocated eNB UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated eNB UE S1AP ID.
- RadioNetworkLayer_UnknownOrInconsistentPairOfUeS1apId - Radio Network Layer Unknown or Inconsistent Pair of S1AP UE ID - S1AP Radio Network Layer cause Unknown or inconsistent pair of S1AP UE ID.

- RadioNetworkLayer_HandoverDesirableForRadioReasons - Radio Network Layer Handover Desirable for Radio Reasons - S1AP Radio Network Layer cause Handover desirable for radio reasons.
- RadioNetworkLayer_TimeCriticalHandover - Radio Network Layer Time Critical Handover - S1AP Radio Network Layer cause Time critical handover.
- RadioNetworkLayer_ResourceOptimisationHandover - Radio Network Layer Resource Optimisation Handover - S1AP Radio Network Layer cause Resource optimisation handover.
- RadioNetworkLayer_ReduceLoadInServingCell - Radio Network Layer Reduce Load in Serving Cell - S1AP Radio Network Layer cause Reduce load in serving cell.
- RadioNetworkLayer_UserInactivity - Radio Network Layer User Inactivity - S1AP Radio Network Layer cause User Inactivity.
- RadioNetworkLayer_RadioConnectionWithUeLost - Radio Network Layer Radio Connection with UE Lost - S1AP Radio Network Layer cause Radio Connection With UE Lost.
- RadioNetworkLayer_LoadBalancingTauRequired - Radio Network Layer Load Balancing TAU Required - S1AP Radio Network Layer cause Load Balancing TAU Required.
- RadioNetworkLayer_CsFallbackTriggered - Radio Network Layer CS Fallback Triggered - S1AP Radio Network Layer cause CS Fallback Triggered.
- RadioNetworkLayer_UeNotAvailableForPsService - Radio Network Layer UE Not Available for PS Service - S1AP Radio Network Layer cause UE Not Available For PS Service.
- RadioNetworkLayer_RadioResourcesNotAvailable - Radio Network Layer Radio Resources Not Available - S1AP Radio Network Layer cause Radio resources not available.
- RadioNetworkLayer_FailureInTheRadioInterfaceProcedure - Radio Network Layer Failure in the Radio Interface Procedure - S1AP Radio Network Layer cause Failure in the Radio Interface Procedure.
- RadioNetworkLayer_InvalidQosCombination - Radio Network Layer Invalid QoS Combination - S1AP Radio Network Layer cause Invalid QoS combination.
- RadioNetworkLayer_InterRatRedirection - Radio Network Layer Inter-RAT Redirection - S1AP Radio Network Layer cause Inter-RAT redirection.
- RadioNetworkLayer_InteractionWithOtherProcedure - Radio Network Layer Interaction with Other Procedure - S1AP Radio Network Layer cause Interaction with other procedure.
- RadioNetworkLayer_UnknownErabId - Radio Network Layer Unknown E-RAB ID - S1AP Radio Network Layer cause Unknown E-RAB ID.
- RadioNetworkLayer_MultipleErabIdInstances - Radio Network Layer Multiple E-RAB ID Instances - S1AP Radio Network Layer cause Multiple E-RAB ID instances.

- **RadioNetworkLayer_EncryptionAndOrIntegrityProtectionAlgorithmsNotSupported** - Radio Network Layer Encryption and/or Integrity Protection Algorithms Not Supported - S1AP Radio Network Layer cause Encryption and/or Integrity protection algorithms not supported.
- **RadioNetworkLayer_S1IntraSystemHandoverTriggered** - Radio Network Layer S1 Intra System Handover Triggered - S1AP Radio Network Layer cause S1 intra system Handover triggered.
- **RadioNetworkLayer_S1InterSystemHandoverTriggered** - Radio Network Layer S1 Inter System Handover Triggered - S1AP Radio Network Layer cause S1 inter system Handover triggered.
- **RadioNetworkLayer_x2HandoverTriggered** - Radio Network Layer X2 Handover Triggered - S1AP Radio Network Layer cause X2 Handover triggered.
- **RadioNetworkLayer_redirectionTowards1xRtt** - Radio Network Layer Redirection Towards 1xRTT - S1AP Radio Network Layer cause Redirection towards 1xRTT.
- **RadioNetworkLayer_NotSupportedQciValue** - Radio Network Layer Not Supported QCI Value - S1AP Radio Network Layer cause Not Supported QCI Value.
- **RadioNetworkLayer_InvalidCsgId** - Radio Network Layer Invalid CSG Id - S1AP Radio Network Layer cause Invalid CSG Id.
- **RadioNetworkLayer_ReleaseDueToPreEmption** - Radio Network Layer Release Due to Pre-Emption - S1AP Radio Network Layer cause Release due to Pre-Emption.
- **RadioNetworkLayer_N26InterfaceNotAvailable** - Radio Network Layer N26 Interface Not Available - S1AP Radio Network Layer cause N26 interface not available.
- **TransportLayer_TransportResourceUnavailable** - Transport Layer Transport Resource Unavailable - S1AP Transport Layer cause Transport Resource Unavailable.
- **TransportLayer_Unspecified** - Transport Layer Unspecified - S1AP Transport Layer cause Unspecified.
- **Nas_NormalRelease** - NAS Normal Release - S1AP NAS cause Normal Release.
- **Nas_AuthenticationFailure** - NAS Authentication Failure - S1AP NAS cause Authentication failure.
- **Nas_Detach** - NAS Detach - S1AP NAS cause Detach.
- **Nas_Unspecified** - NAS Unspecified - S1AP NAS cause Unspecified.
- **Nas_CsgSubscriptionExpiry** - NAS CSG Subscription Expiry - S1AP NAS cause CSG Subscription Expiry.
- **Protocol_TransferSyntaxError** - Protocol Transfer Syntax Error - S1AP Protocol cause Transfer Syntax Error.
- **Protocol_AbstractSyntaxErrorReject** - Protocol Abstract Syntax Error (Reject) - S1AP Protocol cause Abstract Syntax Error (Reject).

- Protocol_AbstractSyntaxErrorIgnoreAndNotify - Protocol Abstract Syntax Error (Ignore and Notify) - S1AP Protocol cause Abstract Syntax Error (Ignore and Notify).
- Protocol_MessageNotCompatibleWithReceiverState - Protocol Message Not Compatible with Receiver State - S1AP Protocol cause Message not Compatible with Receiver State.
- Protocol_SemanticError - Protocol Semantic Error - S1AP Protocol cause Semantic Error.
- Protocol_AbstractSyntaxErrorFalselyConstructedMessage - Protocol Abstract Syntax Error (Falsely Constructed Message) - S1AP Protocol cause Abstract Syntax Error (Falsely Constructed Message).
- Protocol_Unspecified - Protocol Unspecified - S1AP Protocol cause Unspecified.
- Miscellaneous_ControlProcessingOverload - Miscellaneous Control Processing Overload - S1AP Miscellaneous cause Control Processing Overload.
- Miscellaneous_NotEnoughUserPlaneProcessingResources - Miscellaneous Not Enough User Plane Processing Resources - S1AP Miscellaneous cause Not enough User Plane Processing Resources.
- Miscellaneous_HardwareFailure - Miscellaneous Hardware Failure - S1AP Miscellaneous cause Hardware Failure.
- Miscellaneous_OmIntervention - Miscellaneous O&M Intervention - S1AP Miscellaneous cause O&M Intervention.
- Miscellaneous_Unspecified - Miscellaneous Unspecified - S1AP Miscellaneous cause Unspecified.
- Miscellaneous_UnknownPlmn - Miscellaneous Unknown PLMN - S1AP Miscellaneous cause Unknown PLMN.

Default

Disabled

Name

ueCtxtRelCsgRestricted - UE Context Release Command CSG Restricted

Syntax

--ueCtxtRelCsgRestricted <list-item>

Description

S1AP cause code to include on UE context release command when the procedure is rejected because of CSG restrictions.

Class

Optional.

List

- Disabled - The feature is disabled in the corresponding scenario. The MME does not override the S1AP cause code.

- RadioNetworkLayer_Unspecified - Radio Network Layer Unspecified - S1AP Radio Network Layer cause Unspecified.
- RadioNetworkLayer_TX2RelocOverallExpiry - Radio Network Layer TX2 Reloc Overall Expiry - S1AP Radio Network Layer cause TX2 Reloc Overall Expiry.
- RadioNetworkLayer_SuccessfulHandover - Radio Network Layer Successful Handover - S1AP Radio Network Layer cause Successful Handover.
- RadioNetworkLayer_ReleaseDueToEutranGeneratedReason - Radio Network Layer Release Due to E-UTRAN Generated Reason - S1AP Radio Network Layer cause Release Due to E-UTRAN Generated Reason.
- RadioNetworkLayer_HandoverCancelled - Radio Network Layer Handover Cancelled - S1AP Radio Network Layer cause Handover Cancelled.
- RadioNetworkLayer_PartialHandover - Radio Network Layer Partial Handover - S1AP Radio Network Layer cause Partial Handover.
- RadioNetworkLayer_HandoverFailureInTargetEpcEnbOrTargetSystem - Radio Network Layer Handover Failure in Target EPC/eNB or Target System - S1AP Radio Network Layer cause Handover Failure In Target EPC/eNB or Target System.
- RadioNetworkLayer_HandoverTargetNotAllowed - Radio Network Layer Handover Target Not Allowed - S1AP Radio Network Layer cause Handover Target not allowed.
- RadioNetworkLayer_TS1RelocOverallExpiry - Radio Network Layer TS1 Reloc Overall Expiry - S1AP Radio Network Layer cause TS1Relocoverall Expiry.
- RadioNetworkLayer_TS1RelocPrepExpiry - Radio Network Layer TS1 Reloc Prep Expiry - S1AP Radio Network Layer cause TS1RelocPrep Expiry.
- RadioNetworkLayer_CellNotAvailable - Radio Network Layer Cell Not Available - S1AP Radio Network Layer cause Cell Not Available.
- RadioNetworkLayer_UnknownTargetId - Radio Network Layer Unknown Target Id - S1AP Radio Network Layer cause Unknown Target Id.
- RadioNetworkLayer_NoRadioResourcesAvailableInTargetCell - Radio Network Layer No Resources Available in Target Cell - S1AP Radio Network Layer cause No Resources Available in Target Cell.
- RadioNetworkLayer_UnknownOrAlreadyAllocatedMmeUeS1apId - Radio Network Layer Unknown or Already Allocated MME UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated MME UE S1AP ID.
- RadioNetworkLayer_UnknownOrAlreadyAllocatedEnbUeS1apId - Radio Network Layer Unknown or Already Allocated eNB UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated eNB UE S1AP ID.
- RadioNetworkLayer_UnknownOrInconsistentPairOfUeS1apId - Radio Network Layer Unknown or Inconsistent Pair of S1AP UE ID - S1AP Radio Network Layer cause Unknown or inconsistent pair of S1AP UE ID.

- **RadioNetworkLayer_HandoverDesirableForRadioReasons** - Radio Network Layer Handover Desirable for Radio Reasons - S1AP Radio Network Layer cause Handover desirable for radio reasons.
- **RadioNetworkLayer_TimeCriticalHandover** - Radio Network Layer Time Critical Handover - S1AP Radio Network Layer cause Time critical handover.
- **RadioNetworkLayer_ResourceOptimisationHandover** - Radio Network Layer Resource Optimisation Handover - S1AP Radio Network Layer cause Resource optimisation handover.
- **RadioNetworkLayer_ReduceLoadInServingCell** - Radio Network Layer Reduce Load in Serving Cell - S1AP Radio Network Layer cause Reduce load in serving cell.
- **RadioNetworkLayer_UserInactivity** - Radio Network Layer User Inactivity - S1AP Radio Network Layer cause User Inactivity.
- **RadioNetworkLayer_RadioConnectionWithUeLost** - Radio Network Layer Radio Connection with UE Lost - S1AP Radio Network Layer cause Radio Connection With UE Lost.
- **RadioNetworkLayer_LoadBalancingTauRequired** - Radio Network Layer Load Balancing TAU Required - S1AP Radio Network Layer cause Load Balancing TAU Required.
- **RadioNetworkLayer_CsFallbackTriggered** - Radio Network Layer CS Fallback Triggered - S1AP Radio Network Layer cause CS Fallback Triggered.
- **RadioNetworkLayer_UeNotAvailableForPsService** - Radio Network Layer UE Not Available for PS Service - S1AP Radio Network Layer cause UE Not Available For PS Service.
- **RadioNetworkLayer_RadioResourcesNotAvailable** - Radio Network Layer Radio Resources Not Available - S1AP Radio Network Layer cause Radio resources not available.
- **RadioNetworkLayer_FailureInTheRadioInterfaceProcedure** - Radio Network Layer Failure in the Radio Interface Procedure - S1AP Radio Network Layer cause Failure in the Radio Interface Procedure.
- **RadioNetworkLayer_InvalidQosCombination** - Radio Network Layer Invalid QoS Combination - S1AP Radio Network Layer cause Invalid QoS combination.
- **RadioNetworkLayer_InterRatRedirection** - Radio Network Layer Inter-RAT Redirection - S1AP Radio Network Layer cause Inter-RAT redirection.
- **RadioNetworkLayer_InteractionWithOtherProcedure** - Radio Network Layer Interaction with Other Procedure - S1AP Radio Network Layer cause Interaction with other procedure.
- **RadioNetworkLayer_UnknownEranId** - Radio Network Layer Unknown E-RAB ID - S1AP Radio Network Layer cause Unknown E-RAB ID.
- **RadioNetworkLayer_MultipleEranIdInstances** - Radio Network Layer Multiple E-RAB ID Instances - S1AP Radio Network Layer cause Multiple E-RAB ID instances.

- **RadioNetworkLayer_EncryptionAndOrIntegrityProtectionAlgorithmsNotSupported** - Radio Network Layer Encryption and/or Integrity Protection Algorithms Not Supported - S1AP Radio Network Layer cause Encryption and/or Integrity protection algorithms not supported.
- **RadioNetworkLayer_S1IntraSystemHandoverTriggered** - Radio Network Layer S1 Intra System Handover Triggered - S1AP Radio Network Layer cause S1 intra system Handover triggered.
- **RadioNetworkLayer_S1InterSystemHandoverTriggered** - Radio Network Layer S1 Inter System Handover Triggered - S1AP Radio Network Layer cause S1 inter system Handover triggered.
- **RadioNetworkLayer_x2HandoverTriggered** - Radio Network Layer X2 Handover Triggered - S1AP Radio Network Layer cause X2 Handover triggered.
- **RadioNetworkLayer_redirectionTowards1xRtt** - Radio Network Layer Redirection Towards 1xRTT - S1AP Radio Network Layer cause Redirection towards 1xRTT.
- **RadioNetworkLayer_NotSupportedQciValue** - Radio Network Layer Not Supported QCI Value - S1AP Radio Network Layer cause Not Supported QCI Value.
- **RadioNetworkLayer_InvalidCsgId** - Radio Network Layer Invalid CSG Id - S1AP Radio Network Layer cause Invalid CSG Id.
- **RadioNetworkLayer_ReleaseDueToPreEmption** - Radio Network Layer Release Due to Pre-Emption - S1AP Radio Network Layer cause Release due to Pre-Emption.
- **RadioNetworkLayer_N26InterfaceNotAvailable** - Radio Network Layer N26 Interface Not Available - S1AP Radio Network Layer cause N26 interface not available.
- **TransportLayer_TransportResourceUnavailable** - Transport Layer Transport Resource Unavailable - S1AP Transport Layer cause Transport Resource Unavailable.
- **TransportLayer_Unspecified** - Transport Layer Unspecified - S1AP Transport Layer cause Unspecified.
- **Nas_NormalRelease** - NAS Normal Release - S1AP NAS cause Normal Release.
- **Nas_AuthenticationFailure** - NAS Authentication Failure - S1AP NAS cause Authentication failure.
- **Nas_Detach** - NAS Detach - S1AP NAS cause Detach.
- **Nas_Unspecified** - NAS Unspecified - S1AP NAS cause Unspecified.
- **Nas_CsgSubscriptionExpiry** - NAS CSG Subscription Expiry - S1AP NAS cause CSG Subscription Expiry.
- **Protocol_TransferSyntaxError** - Protocol Transfer Syntax Error - S1AP Protocol cause Transfer Syntax Error.
- **Protocol_AbstractSyntaxErrorReject** - Protocol Abstract Syntax Error (Reject) - S1AP Protocol cause Abstract Syntax Error (Reject).

- Protocol_AbstractSyntaxErrorIgnoreAndNotify - Protocol Abstract Syntax Error (Ignore and Notify) - S1AP Protocol cause Abstract Syntax Error (Ignore and Notify).
- Protocol_MessageNotCompatibleWithReceiverState - Protocol Message Not Compatible with Receiver State - S1AP Protocol cause Message not Compatible with Receiver State.
- Protocol_SemanticError - Protocol Semantic Error - S1AP Protocol cause Semantic Error.
- Protocol_AbstractSyntaxErrorFalselyConstructedMessage - Protocol Abstract Syntax Error (Falsely Constructed Message) - S1AP Protocol cause Abstract Syntax Error (Falsely Constructed Message).
- Protocol_Unspecified - Protocol Unspecified - S1AP Protocol cause Unspecified.
- Miscellaneous_ControlProcessingOverload - Miscellaneous Control Processing Overload - S1AP Miscellaneous cause Control Processing Overload.
- Miscellaneous_NotEnoughUserPlaneProcessingResources - Miscellaneous Not Enough User Plane Processing Resources - S1AP Miscellaneous cause Not enough User Plane Processing Resources.
- Miscellaneous_HardwareFailure - Miscellaneous Hardware Failure - S1AP Miscellaneous cause Hardware Failure.
- Miscellaneous_OmIntervention - Miscellaneous O&M Intervention - S1AP Miscellaneous cause O&M Intervention.
- Miscellaneous_Unspecified - Miscellaneous Unspecified - S1AP Miscellaneous cause Unspecified.
- Miscellaneous_UnknownPlmn - Miscellaneous Unknown PLMN - S1AP Miscellaneous cause Unknown PLMN.

Default

Disabled

Name

ueCtxtRelDelBearerReq - UE Context Release Command Delete Bearer Request

Syntax

--ueCtxtRelDelBearerReq <list-item>

Description

S1AP cause code to include on UE context release command when detach reason is delete bearer request.

Class

Optional.

List

- Disabled - The feature is disabled in the corresponding scenario. The MME does not override the S1AP cause code.

- RadioNetworkLayer_Unspecified - Radio Network Layer Unspecified - S1AP Radio Network Layer cause Unspecified.
- RadioNetworkLayer_TX2RelocOverallExpiry - Radio Network Layer TX2 Reloc Overall Expiry - S1AP Radio Network Layer cause TX2 Reloc Overall Expiry.
- RadioNetworkLayer_SuccessfulHandover - Radio Network Layer Successful Handover - S1AP Radio Network Layer cause Successful Handover.
- RadioNetworkLayer_ReleaseDueToEutranGeneratedReason - Radio Network Layer Release Due to E-UTRAN Generated Reason - S1AP Radio Network Layer cause Release Due to E-UTRAN Generated Reason.
- RadioNetworkLayer_HandoverCancelled - Radio Network Layer Handover Cancelled - S1AP Radio Network Layer cause Handover Cancelled.
- RadioNetworkLayer_PartialHandover - Radio Network Layer Partial Handover - S1AP Radio Network Layer cause Partial Handover.
- RadioNetworkLayer_HandoverFailureInTargetEpcEnbOrTargetSystem - Radio Network Layer Handover Failure in Target EPC/eNB or Target System - S1AP Radio Network Layer cause Handover Failure In Target EPC/eNB or Target System.
- RadioNetworkLayer_HandoverTargetNotAllowed - Radio Network Layer Handover Target Not Allowed - S1AP Radio Network Layer cause Handover Target not allowed.
- RadioNetworkLayer_TS1RelocOverallExpiry - Radio Network Layer TS1 Reloc Overall Expiry - S1AP Radio Network Layer cause TS1Relocoverall Expiry.
- RadioNetworkLayer_TS1RelocPrepExpiry - Radio Network Layer TS1 Reloc Prep Expiry - S1AP Radio Network Layer cause TS1RelocPrep Expiry.
- RadioNetworkLayer_CellNotAvailable - Radio Network Layer Cell Not Available - S1AP Radio Network Layer cause Cell Not Available.
- RadioNetworkLayer_UnknownTargetId - Radio Network Layer Unknown Target Id - S1AP Radio Network Layer cause Unknown Target Id.
- RadioNetworkLayer_NoRadioResourcesAvailableInTargetCell - Radio Network Layer No Resources Available in Target Cell - S1AP Radio Network Layer cause No Resources Available in Target Cell.
- RadioNetworkLayer_UnknownOrAlreadyAllocatedMmeUeS1apId - Radio Network Layer Unknown or Already Allocated MME UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated MME UE S1AP ID.
- RadioNetworkLayer_UnknownOrAlreadyAllocatedEnbUeS1apId - Radio Network Layer Unknown or Already Allocated eNB UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated eNB UE S1AP ID.
- RadioNetworkLayer_UnknownOrInconsistentPairOfUeS1apId - Radio Network Layer Unknown or Inconsistent Pair of S1AP UE ID - S1AP Radio Network Layer cause Unknown or inconsistent pair of S1AP UE ID.

- **RadioNetworkLayer_HandoverDesirableForRadioReasons** - Radio Network Layer Handover Desirable for Radio Reasons - S1AP Radio Network Layer cause Handover desirable for radio reasons.
- **RadioNetworkLayer_TimeCriticalHandover** - Radio Network Layer Time Critical Handover - S1AP Radio Network Layer cause Time critical handover.
- **RadioNetworkLayer_ResourceOptimisationHandover** - Radio Network Layer Resource Optimisation Handover - S1AP Radio Network Layer cause Resource optimisation handover.
- **RadioNetworkLayer_ReduceLoadInServingCell** - Radio Network Layer Reduce Load in Serving Cell - S1AP Radio Network Layer cause Reduce load in serving cell.
- **RadioNetworkLayer_UserInactivity** - Radio Network Layer User Inactivity - S1AP Radio Network Layer cause User Inactivity.
- **RadioNetworkLayer_RadioConnectionWithUeLost** - Radio Network Layer Radio Connection with UE Lost - S1AP Radio Network Layer cause Radio Connection With UE Lost.
- **RadioNetworkLayer_LoadBalancingTauRequired** - Radio Network Layer Load Balancing TAU Required - S1AP Radio Network Layer cause Load Balancing TAU Required.
- **RadioNetworkLayer_CsFallbackTriggered** - Radio Network Layer CS Fallback Triggered - S1AP Radio Network Layer cause CS Fallback Triggered.
- **RadioNetworkLayer_UeNotAvailableForPsService** - Radio Network Layer UE Not Available for PS Service - S1AP Radio Network Layer cause UE Not Available For PS Service.
- **RadioNetworkLayer_RadioResourcesNotAvailable** - Radio Network Layer Radio Resources Not Available - S1AP Radio Network Layer cause Radio resources not available.
- **RadioNetworkLayer_FailureInTheRadioInterfaceProcedure** - Radio Network Layer Failure in the Radio Interface Procedure - S1AP Radio Network Layer cause Failure in the Radio Interface Procedure.
- **RadioNetworkLayer_InvalidQosCombination** - Radio Network Layer Invalid QoS Combination - S1AP Radio Network Layer cause Invalid QoS combination.
- **RadioNetworkLayer_InterRatRedirection** - Radio Network Layer Inter-RAT Redirection - S1AP Radio Network Layer cause Inter-RAT redirection.
- **RadioNetworkLayer_InteractionWithOtherProcedure** - Radio Network Layer Interaction with Other Procedure - S1AP Radio Network Layer cause Interaction with other procedure.
- **RadioNetworkLayer_UnknownEranId** - Radio Network Layer Unknown E-RAB ID - S1AP Radio Network Layer cause Unknown E-RAB ID.
- **RadioNetworkLayer_MultipleEranIdInstances** - Radio Network Layer Multiple E-RAB ID Instances - S1AP Radio Network Layer cause Multiple E-RAB ID instances.

- **RadioNetworkLayer_EncryptionAndOrIntegrityProtectionAlgorithmsNotSupported** - Radio Network Layer Encryption and/or Integrity Protection Algorithms Not Supported - S1AP Radio Network Layer cause Encryption and/or Integrity protection algorithms not supported.
- **RadioNetworkLayer_S1IntraSystemHandoverTriggered** - Radio Network Layer S1 Intra System Handover Triggered - S1AP Radio Network Layer cause S1 intra system Handover triggered.
- **RadioNetworkLayer_S1InterSystemHandoverTriggered** - Radio Network Layer S1 Inter System Handover Triggered - S1AP Radio Network Layer cause S1 inter system Handover triggered.
- **RadioNetworkLayer_x2HandoverTriggered** - Radio Network Layer X2 Handover Triggered - S1AP Radio Network Layer cause X2 Handover triggered.
- **RadioNetworkLayer_redirectionTowards1xRtt** - Radio Network Layer Redirection Towards 1xRTT - S1AP Radio Network Layer cause Redirection towards 1xRTT.
- **RadioNetworkLayer_NotSupportedQciValue** - Radio Network Layer Not Supported QCI Value - S1AP Radio Network Layer cause Not Supported QCI Value.
- **RadioNetworkLayer_InvalidCsgId** - Radio Network Layer Invalid CSG Id - S1AP Radio Network Layer cause Invalid CSG Id.
- **RadioNetworkLayer_ReleaseDueToPreEmption** - Radio Network Layer Release Due to Pre-Emption - S1AP Radio Network Layer cause Release due to Pre-Emption.
- **RadioNetworkLayer_N26InterfaceNotAvailable** - Radio Network Layer N26 Interface Not Available - S1AP Radio Network Layer cause N26 interface not available.
- **TransportLayer_TransportResourceUnavailable** - Transport Layer Transport Resource Unavailable - S1AP Transport Layer cause Transport Resource Unavailable.
- **TransportLayer_Unspecified** - Transport Layer Unspecified - S1AP Transport Layer cause Unspecified.
- **Nas_NormalRelease** - NAS Normal Release - S1AP NAS cause Normal Release.
- **Nas_AuthenticationFailure** - NAS Authentication Failure - S1AP NAS cause Authentication failure.
- **Nas_Detach** - NAS Detach - S1AP NAS cause Detach.
- **Nas_Unspecified** - NAS Unspecified - S1AP NAS cause Unspecified.
- **Nas_CsgSubscriptionExpiry** - NAS CSG Subscription Expiry - S1AP NAS cause CSG Subscription Expiry.
- **Protocol_TransferSyntaxError** - Protocol Transfer Syntax Error - S1AP Protocol cause Transfer Syntax Error.
- **Protocol_AbstractSyntaxErrorReject** - Protocol Abstract Syntax Error (Reject) - S1AP Protocol cause Abstract Syntax Error (Reject).

- Protocol_AbstractSyntaxErrorIgnoreAndNotify - Protocol Abstract Syntax Error (Ignore and Notify) - S1AP Protocol cause Abstract Syntax Error (Ignore and Notify).
- Protocol_MessageNotCompatibleWithReceiverState - Protocol Message Not Compatible with Receiver State - S1AP Protocol cause Message not Compatible with Receiver State.
- Protocol_SemanticError - Protocol Semantic Error - S1AP Protocol cause Semantic Error.
- Protocol_AbstractSyntaxErrorFalselyConstructedMessage - Protocol Abstract Syntax Error (Falsely Constructed Message) - S1AP Protocol cause Abstract Syntax Error (Falsely Constructed Message).
- Protocol_Unspecified - Protocol Unspecified - S1AP Protocol cause Unspecified.
- Miscellaneous_ControlProcessingOverload - Miscellaneous Control Processing Overload - S1AP Miscellaneous cause Control Processing Overload.
- Miscellaneous_NotEnoughUserPlaneProcessingResources - Miscellaneous Not Enough User Plane Processing Resources - S1AP Miscellaneous cause Not enough User Plane Processing Resources.
- Miscellaneous_HardwareFailure - Miscellaneous Hardware Failure - S1AP Miscellaneous cause Hardware Failure.
- Miscellaneous_OmIntervention - Miscellaneous O&M Intervention - S1AP Miscellaneous cause O&M Intervention.
- Miscellaneous_Unspecified - Miscellaneous Unspecified - S1AP Miscellaneous cause Unspecified.
- Miscellaneous_UnknownPlmn - Miscellaneous Unknown PLMN - S1AP Miscellaneous cause Unknown PLMN.

Default

Disabled

Name

ueCtxtRelDiamError - UE Context Release Command Diameter Error

Syntax

--ueCtxtRelDiamError <list-item>

Description

Mapping for incoming Diameter error to S1 release cause code.

Class

Optional.

List

- Disabled - The feature is disabled in the corresponding scenario. The MME does not override the S1AP cause code.

- RadioNetworkLayer_Unspecified - Radio Network Layer Unspecified - S1AP Radio Network Layer cause Unspecified.

- Miscellaneous_NotEnoughUserPlaneProcessingResources - Miscellaneous Not Enough User Plane Processing Resources - S1AP Miscellaneous cause Not enough User Plane Processing Resources.
- Miscellaneous_HardwareFailure - Miscellaneous Hardware Failure - S1AP Miscellaneous cause Hardware Failure.
- Miscellaneous_OmIntervention - Miscellaneous O&M Intervention - S1AP Miscellaneous cause O&M Intervention.
- Miscellaneous_Unspecified - Miscellaneous Unspecified - S1AP Miscellaneous cause Unspecified.
- Miscellaneous_UnknownPlmn - Miscellaneous Unknown PLMN - S1AP Miscellaneous cause Unknown PLMN.

Default

Disabled

Name

ueCtxtRelDoubleS1 - UE Context Release Command Double S1

Syntax

--ueCtxtRelDoubleS1 <list-item>

Description

The S1AP cause the MME includes on UE context release command on message level, when the MME releases the old S1 connection due to receiving an S1AP Initial UE Message for an ECM-CONNECTED UE.

Class

Optional.

List

- Disabled - The feature is disabled in the corresponding scenario. The MME does not override the S1AP cause code.

- RadioNetworkLayer_Unspecified - Radio Network Layer Unspecified - S1AP Radio Network Layer cause Unspecified.
- RadioNetworkLayer_TX2RelocOverallExpiry - Radio Network Layer TX2 Reloc Overall Expiry - S1AP Radio Network Layer cause TX2 Reloc Overall Expiry.
- RadioNetworkLayer_SuccessfulHandover - Radio Network Layer Successful Handover - S1AP Radio Network Layer cause Successful Handover.
- RadioNetworkLayer_ReleaseDueToEutranGeneratedReason - Radio Network Layer Release Due to E-UTRAN Generated Reason - S1AP Radio Network Layer cause Release Due to E-UTRAN Generated Reason.
- RadioNetworkLayer_HandoverCancelled - Radio Network Layer Handover Cancelled - S1AP Radio Network Layer cause Handover Cancelled.
- RadioNetworkLayer_PartialHandover - Radio Network Layer Partial Handover - S1AP Radio Network Layer cause Partial Handover.
- RadioNetworkLayer_HandoverFailureInTargetEpcEnbOrTargetSystem - Radio Network Layer Handover Failure in Target EPC/eNB or Target System - S1AP Radio Network Layer cause Handover Failure In Target EPC/eNB or Target System.
- RadioNetworkLayer_HandoverTargetNotAllowed - Radio Network Layer Handover Target Not Allowed - S1AP Radio Network Layer cause Handover Target not allowed.
- RadioNetworkLayer_TS1RelocOverallExpiry - Radio Network Layer TS1 Reloc Overall Expiry - S1AP Radio Network Layer cause TS1Relocoverall Expiry.
- RadioNetworkLayer_TS1RelocPrepExpiry - Radio Network Layer TS1 Reloc Prep Expiry - S1AP Radio Network Layer cause TS1RelocPrep Expiry.
- RadioNetworkLayer_CellNotAvailable - Radio Network Layer Cell Not Available - S1AP Radio Network Layer cause Cell Not Available.
- RadioNetworkLayer_UnknownTargetId - Radio Network Layer Unknown Target Id - S1AP Radio Network Layer cause Unknown Target Id.
- RadioNetworkLayer_NoRadioResourcesAvailableInTargetCell - Radio Network Layer No Resources Available in Target Cell - S1AP Radio Network Layer cause No Resources Available in Target Cell.
- RadioNetworkLayer_UnknownOrAlreadyAllocatedMmeUeS1apId - Radio Network Layer Unknown or Already Allocated MME UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated MME UE S1AP ID.
- RadioNetworkLayer_UnknownOrAlreadyAllocatedEnbUeS1apId - Radio Network Layer Unknown or Already Allocated eNB UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated eNB UE S1AP ID.
- RadioNetworkLayer_UnknownOrInconsistentPairOfUeS1apId - Radio Network Layer Unknown or Inconsistent Pair of S1AP UE ID - S1AP Radio Network Layer cause Unknown or inconsistent pair of S1AP UE ID.

- **RadioNetworkLayer_HandoverDesirableForRadioReasons** - Radio Network Layer Handover Desirable for Radio Reasons - S1AP Radio Network Layer cause Handover desirable for radio reasons.
- **RadioNetworkLayer_TimeCriticalHandover** - Radio Network Layer Time Critical Handover - S1AP Radio Network Layer cause Time critical handover.
- **RadioNetworkLayer_ResourceOptimisationHandover** - Radio Network Layer Resource Optimisation Handover - S1AP Radio Network Layer cause Resource optimisation handover.
- **RadioNetworkLayer_ReduceLoadInServingCell** - Radio Network Layer Reduce Load in Serving Cell - S1AP Radio Network Layer cause Reduce load in serving cell.
- **RadioNetworkLayer_UserInactivity** - Radio Network Layer User Inactivity - S1AP Radio Network Layer cause User Inactivity.
- **RadioNetworkLayer_RadioConnectionWithUeLost** - Radio Network Layer Radio Connection with UE Lost - S1AP Radio Network Layer cause Radio Connection With UE Lost.
- **RadioNetworkLayer_LoadBalancingTauRequired** - Radio Network Layer Load Balancing TAU Required - S1AP Radio Network Layer cause Load Balancing TAU Required.
- **RadioNetworkLayer_CsFallbackTriggered** - Radio Network Layer CS Fallback Triggered - S1AP Radio Network Layer cause CS Fallback Triggered.
- **RadioNetworkLayer_UeNotAvailableForPsService** - Radio Network Layer UE Not Available for PS Service - S1AP Radio Network Layer cause UE Not Available For PS Service.
- **RadioNetworkLayer_RadioResourcesNotAvailable** - Radio Network Layer Radio Resources Not Available - S1AP Radio Network Layer cause Radio resources not available.
- **RadioNetworkLayer_FailureInTheRadioInterfaceProcedure** - Radio Network Layer Failure in the Radio Interface Procedure - S1AP Radio Network Layer cause Failure in the Radio Interface Procedure.
- **RadioNetworkLayer_InvalidQosCombination** - Radio Network Layer Invalid QoS Combination - S1AP Radio Network Layer cause Invalid QoS combination.
- **RadioNetworkLayer_InterRatRedirection** - Radio Network Layer Inter-RAT Redirection - S1AP Radio Network Layer cause Inter-RAT redirection.
- **RadioNetworkLayer_InteractionWithOtherProcedure** - Radio Network Layer Interaction with Other Procedure - S1AP Radio Network Layer cause Interaction with other procedure.
- **RadioNetworkLayer_UnknownErabId** - Radio Network Layer Unknown E-RAB ID - S1AP Radio Network Layer cause Unknown E-RAB ID.
- **RadioNetworkLayer_MultipleErabIdInstances** - Radio Network Layer Multiple E-RAB ID Instances - S1AP Radio Network Layer cause Multiple E-RAB ID instances.

- **RadioNetworkLayer_EncryptionAndOrIntegrityProtectionAlgorithmsNotSupported** - Radio Network Layer Encryption and/or Integrity Protection Algorithms Not Supported - S1AP Radio Network Layer cause Encryption and/or Integrity protection algorithms not supported.
- **RadioNetworkLayer_S1IntraSystemHandoverTriggered** - Radio Network Layer S1 Intra System Handover Triggered - S1AP Radio Network Layer cause S1 intra system Handover triggered.
- **RadioNetworkLayer_S1InterSystemHandoverTriggered** - Radio Network Layer S1 Inter System Handover Triggered - S1AP Radio Network Layer cause S1 inter system Handover triggered.
- **RadioNetworkLayer_x2HandoverTriggered** - Radio Network Layer X2 Handover Triggered - S1AP Radio Network Layer cause X2 Handover triggered.
- **RadioNetworkLayer_redirectionTowards1xRtt** - Radio Network Layer Redirection Towards 1xRTT - S1AP Radio Network Layer cause Redirection towards 1xRTT.
- **RadioNetworkLayer_NotSupportedQciValue** - Radio Network Layer Not Supported QCI Value - S1AP Radio Network Layer cause Not Supported QCI Value.
- **RadioNetworkLayer_InvalidCsgId** - Radio Network Layer Invalid CSG Id - S1AP Radio Network Layer cause Invalid CSG Id.
- **RadioNetworkLayer_ReleaseDueToPreEmption** - Radio Network Layer Release Due to Pre-Emption - S1AP Radio Network Layer cause Release due to Pre-Emption.
- **RadioNetworkLayer_N26InterfaceNotAvailable** - Radio Network Layer N26 Interface Not Available - S1AP Radio Network Layer cause N26 interface not available.
- **TransportLayer_TransportResourceUnavailable** - Transport Layer Transport Resource Unavailable - S1AP Transport Layer cause Transport Resource Unavailable.
- **TransportLayer_Unspecified** - Transport Layer Unspecified - S1AP Transport Layer cause Unspecified.
- **Nas_NormalRelease** - NAS Normal Release - S1AP NAS cause Normal Release.
- **Nas_AuthenticationFailure** - NAS Authentication Failure - S1AP NAS cause Authentication failure.
- **Nas_Detach** - NAS Detach - S1AP NAS cause Detach.
- **Nas_Unspecified** - NAS Unspecified - S1AP NAS cause Unspecified.
- **Nas_CsgSubscriptionExpiry** - NAS CSG Subscription Expiry - S1AP NAS cause CSG Subscription Expiry.
- **Protocol_TransferSyntaxError** - Protocol Transfer Syntax Error - S1AP Protocol cause Transfer Syntax Error.
- **Protocol_AbstractSyntaxErrorReject** - Protocol Abstract Syntax Error (Reject) - S1AP Protocol cause Abstract Syntax Error (Reject).

- Protocol_AbstractSyntaxErrorIgnoreAndNotify - Protocol Abstract Syntax Error (Ignore and Notify) - S1AP Protocol cause Abstract Syntax Error (Ignore and Notify).
- Protocol_MessageNotCompatibleWithReceiverState - Protocol Message Not Compatible with Receiver State - S1AP Protocol cause Message not Compatible with Receiver State.
- Protocol_SemanticError - Protocol Semantic Error - S1AP Protocol cause Semantic Error.
- Protocol_AbstractSyntaxErrorFalselyConstructedMessage - Protocol Abstract Syntax Error (Falsely Constructed Message) - S1AP Protocol cause Abstract Syntax Error (Falsely Constructed Message).
- Protocol_Unspecified - Protocol Unspecified - S1AP Protocol cause Unspecified.
- Miscellaneous_ControlProcessingOverload - Miscellaneous Control Processing Overload - S1AP Miscellaneous cause Control Processing Overload.
- Miscellaneous_NotEnoughUserPlaneProcessingResources - Miscellaneous Not Enough User Plane Processing Resources - S1AP Miscellaneous cause Not enough User Plane Processing Resources.
- Miscellaneous_HardwareFailure - Miscellaneous Hardware Failure - S1AP Miscellaneous cause Hardware Failure.
- Miscellaneous_OmIntervention - Miscellaneous O&M Intervention - S1AP Miscellaneous cause O&M Intervention.
- Miscellaneous_Unspecified - Miscellaneous Unspecified - S1AP Miscellaneous cause Unspecified.
- Miscellaneous_UnknownPlmn - Miscellaneous Unknown PLMN - S1AP Miscellaneous cause Unknown PLMN.

- RadioNetworkLayer_HandoverCancelled - Radio Network Layer Handover Cancelled - S1AP Radio Network Layer cause Handover Cancelled.
- RadioNetworkLayer_PartialHandover - Radio Network Layer Partial Handover - S1AP Radio Network Layer cause Partial Handover.
- RadioNetworkLayer_HandoverFailureInTargetEpcEnbOrTargetSystem - Radio Network Layer Handover Failure in Target EPC/eNB or Target System - S1AP Radio Network Layer cause Handover Failure In Target EPC/eNB or Target System.
- RadioNetworkLayer_HandoverTargetNotAllowed - Radio Network Layer Handover Target Not Allowed - S1AP Radio Network Layer cause Handover Target not allowed.
- RadioNetworkLayer_TS1RelocOverallExpiry - Radio Network Layer TS1 Reloc Overall Expiry - S1AP Radio Network Layer cause TS1Relocoverall Expiry.
- RadioNetworkLayer_TS1RelocPrepExpiry - Radio Network Layer TS1 Reloc Prep Expiry - S1AP Radio Network Layer cause TS1RelocPrep Expiry.
- RadioNetworkLayer_CellNotAvailable - Radio Network Layer Cell Not Available - S1AP Radio Network Layer cause Cell Not Available.
- RadioNetworkLayer_UnknownTargetId - Radio Network Layer Unknown Target Id - S1AP Radio Network Layer cause Unknown Target Id.
- RadioNetworkLayer_NoRadioResourcesAvailableInTargetCell - Radio Network Layer No Resources Available in Target Cell - S1AP Radio Network Layer cause No Resources Available in Target Cell.
- RadioNetworkLayer_UnknownOrAlreadyAllocatedMmeUeS1apId - Radio Network Layer Unknown or Already Allocated MME UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated MME UE S1AP ID.
- RadioNetworkLayer_UnknownOrAlreadyAllocatedEnbUeS1apId - Radio Network Layer Unknown or Already Allocated eNB UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated eNB UE S1AP ID.
- RadioNetworkLayer_UnknownOrInconsistentPairOfUeS1apId - Radio Network Layer Unknown or Inconsistent Pair of S1AP UE ID - S1AP Radio Network Layer cause Unknown or inconsistent pair of S1AP UE ID.

- **RadioNetworkLayer_HandoverDesirableForRadioReasons** - Radio Network Layer Handover Desirable for Radio Reasons - S1AP Radio Network Layer cause Handover desirable for radio reasons.
- **RadioNetworkLayer_TimeCriticalHandover** - Radio Network Layer Time Critical Handover - S1AP Radio Network Layer cause Time critical handover.
- **RadioNetworkLayer_ResourceOptimisationHandover** - Radio Network Layer Resource Optimisation Handover - S1AP Radio Network Layer cause Resource optimisation handover.
- **RadioNetworkLayer_ReduceLoadInServingCell** - Radio Network Layer Reduce Load in Serving Cell - S1AP Radio Network Layer cause Reduce load in serving cell.
- **RadioNetworkLayer_UserInactivity** - Radio Network Layer User Inactivity - S1AP Radio Network Layer cause User Inactivity.
- **RadioNetworkLayer_RadioConnectionWithUeLost** - Radio Network Layer Radio Connection with UE Lost - S1AP Radio Network Layer cause Radio Connection With UE Lost.
- **RadioNetworkLayer_LoadBalancingTauRequired** - Radio Network Layer Load Balancing TAU Required - S1AP Radio Network Layer cause Load Balancing TAU Required.
- **RadioNetworkLayer_CsFallbackTriggered** - Radio Network Layer CS Fallback Triggered - S1AP Radio Network Layer cause CS Fallback Triggered.
- **RadioNetworkLayer_UeNotAvailableForPsService** - Radio Network Layer UE Not Available for PS Service - S1AP Radio Network Layer cause UE Not Available For PS Service.
- **RadioNetworkLayer_RadioResourcesNotAvailable** - Radio Network Layer Radio Resources Not Available - S1AP Radio Network Layer cause Radio resources not available.
- **RadioNetworkLayer_FailureInTheRadioInterfaceProcedure** - Radio Network Layer Failure in the Radio Interface Procedure - S1AP Radio Network Layer cause Failure in the Radio Interface Procedure.
- **RadioNetworkLayer_InvalidQosCombination** - Radio Network Layer Invalid QoS Combination - S1AP Radio Network Layer cause Invalid QoS combination.
- **RadioNetworkLayer_InterRatRedirection** - Radio Network Layer Inter-RAT Redirection - S1AP Radio Network Layer cause Inter-RAT redirection.
- **RadioNetworkLayer_InteractionWithOtherProcedure** - Radio Network Layer Interaction with Other Procedure - S1AP Radio Network Layer cause Interaction with other procedure.
- **RadioNetworkLayer_UnknownErabId** - Radio Network Layer Unknown E-RAB ID - S1AP Radio Network Layer cause Unknown E-RAB ID.
- **RadioNetworkLayer_MultipleErabIdInstances** - Radio Network Layer Multiple E-RAB ID Instances - S1AP Radio Network Layer cause Multiple E-RAB ID instances.

- **RadioNetworkLayer_EncryptionAndOrIntegrityProtectionAlgorithmsNotSupported** - Radio Network Layer Encryption and/or Integrity Protection Algorithms Not Supported - S1AP Radio Network Layer cause Encryption and/or Integrity protection algorithms not supported.
- **RadioNetworkLayer_S1IntraSystemHandoverTriggered** - Radio Network Layer S1 Intra System Handover Triggered - S1AP Radio Network Layer cause S1 intra system Handover triggered.
- **RadioNetworkLayer_S1InterSystemHandoverTriggered** - Radio Network Layer S1 Inter System Handover Triggered - S1AP Radio Network Layer cause S1 inter system Handover triggered.
- **RadioNetworkLayer_x2HandoverTriggered** - Radio Network Layer X2 Handover Triggered - S1AP Radio Network Layer cause X2 Handover triggered.
- **RadioNetworkLayer_redirectionTowards1xRtt** - Radio Network Layer Redirection Towards 1xRTT - S1AP Radio Network Layer cause Redirection towards 1xRTT.
- **RadioNetworkLayer_NotSupportedQciValue** - Radio Network Layer Not Supported QCI Value - S1AP Radio Network Layer cause Not Supported QCI Value.
- **RadioNetworkLayer_InvalidCsgId** - Radio Network Layer Invalid CSG Id - S1AP Radio Network Layer cause Invalid CSG Id.
- **RadioNetworkLayer_ReleaseDueToPreEmption** - Radio Network Layer Release Due to Pre-Emption - S1AP Radio Network Layer cause Release due to Pre-Emption.
- **RadioNetworkLayer_N26InterfaceNotAvailable** - Radio Network Layer N26 Interface Not Available - S1AP Radio Network Layer cause N26 interface not available.
- **TransportLayer_TransportResourceUnavailable** - Transport Layer Transport Resource Unavailable - S1AP Transport Layer cause Transport Resource Unavailable.
- **TransportLayer_Unspecified** - Transport Layer Unspecified - S1AP Transport Layer cause Unspecified.
- **Nas_NormalRelease** - NAS Normal Release - S1AP NAS cause Normal Release.
- **Nas_AuthenticationFailure** - NAS Authentication Failure - S1AP NAS cause Authentication failure.
- **Nas_Detach** - NAS Detach - S1AP NAS cause Detach.
- **Nas_Unspecified** - NAS Unspecified - S1AP NAS cause Unspecified.
- **Nas_CsgSubscriptionExpiry** - NAS CSG Subscription Expiry - S1AP NAS cause CSG Subscription Expiry.
- **Protocol_TransferSyntaxError** - Protocol Transfer Syntax Error - S1AP Protocol cause Transfer Syntax Error.
- **Protocol_AbstractSyntaxErrorReject** - Protocol Abstract Syntax Error (Reject) - S1AP Protocol cause Abstract Syntax Error (Reject).

- Protocol_AbstractSyntaxErrorIgnoreAndNotify - Protocol Abstract Syntax Error (Ignore and Notify) - S1AP Protocol cause Abstract Syntax Error (Ignore and Notify).
- Protocol_MessageNotCompatibleWithReceiverState - Protocol Message Not Compatible with Receiver State - S1AP Protocol cause Message not Compatible with Receiver State.
- Protocol_SemanticError - Protocol Semantic Error - S1AP Protocol cause Semantic Error.
- Protocol_AbstractSyntaxErrorFalselyConstructedMessage - Protocol Abstract Syntax Error (Falsely Constructed Message) - S1AP Protocol cause Abstract Syntax Error (Falsely Constructed Message).
- Protocol_Unspecified - Protocol Unspecified - S1AP Protocol cause Unspecified.
- Miscellaneous_ControlProcessingOverload - Miscellaneous Control Processing Overload - S1AP Miscellaneous cause Control Processing Overload.
- Miscellaneous_NotEnoughUserPlaneProcessingResources - Miscellaneous Not Enough User Plane Processing Resources - S1AP Miscellaneous cause Not enough User Plane Processing Resources.
- Miscellaneous_HardwareFailure - Miscellaneous Hardware Failure - S1AP Miscellaneous cause Hardware Failure.
- Miscellaneous_OmIntervention - Miscellaneous O&M Intervention - S1AP Miscellaneous cause O&M Intervention.
- Miscellaneous_Unspecified - Miscellaneous Unspecified - S1AP Miscellaneous cause Unspecified.
- Miscellaneous_UnknownPlmn - Miscellaneous Unknown PLMN - S1AP Miscellaneous cause Unknown PLMN.

Default

Disabled

Name

ueCtxtRelEmmRegisteredWithoutPdnNotAllowed - UE Context Release Command EMM
Registered Without PDN Not Allowed

Syntax

- ueCtxtRelEmmRegisteredWithoutPdnNotAllowed <list-item>

Description

S1AP cause code to include on UE context release command when attach or TAU is rejected due to EMM-REGISTERED without PDN connection feature support is not enabled.

Class

Optional.

List

- Disabled - The feature is disabled in the corresponding scenario. The MME does not override the S1AP cause code.

- RadioNetworkLayer_Unspecified - Radio Network Layer Unspecified - S1AP Radio Network Layer cause Unspecified.
- RadioNetworkLayer_TX2RelocOverallExpiry - Radio Network Layer TX2 Reloc Overall Expiry - S1AP Radio Network Layer cause TX2 Reloc Overall Expiry.
- RadioNetworkLayer_SuccessfulHandover - Radio Network Layer Successful Handover - S1AP Radio Network Layer cause Successful Handover.
- RadioNetworkLayer_ReleaseDueToEutranGeneratedReason - Radio Network Layer Release Due to E-UTRAN Generated Reason - S1AP Radio Network Layer cause Release Due to E-UTRAN Generated Reason.
- RadioNetworkLayer_HandoverCancelled - Radio Network Layer Handover Cancelled - S1AP Radio Network Layer cause Handover Cancelled.
- RadioNetworkLayer_PartialHandover - Radio Network Layer Partial Handover - S1AP Radio Network Layer cause Partial Handover.
- RadioNetworkLayer_HandoverFailureInTargetEpcEnbOrTargetSystem - Radio Network Layer Handover Failure in Target EPC/eNB or Target System - S1AP Radio Network Layer cause Handover Failure In Target EPC/eNB or Target System.
- RadioNetworkLayer_HandoverTargetNotAllowed - Radio Network Layer Handover Target Not Allowed - S1AP Radio Network Layer cause Handover Target not allowed.
- RadioNetworkLayer_TS1RelocOverallExpiry - Radio Network Layer TS1 Reloc Overall Expiry - S1AP Radio Network Layer cause TS1Relocoverall Expiry.
- RadioNetworkLayer_TS1RelocPrepExpiry - Radio Network Layer TS1 Reloc Prep Expiry - S1AP Radio Network Layer cause TS1RelocPrep Expiry.
- RadioNetworkLayer_CellNotAvailable - Radio Network Layer Cell Not Available - S1AP Radio Network Layer cause Cell Not Available.
- RadioNetworkLayer_UnknownTargetId - Radio Network Layer Unknown Target Id - S1AP Radio Network Layer cause Unknown Target Id.
- RadioNetworkLayer_NoRadioResourcesAvailableInTargetCell - Radio Network Layer No Resources Available in Target Cell - S1AP Radio Network Layer cause No Resources Available in Target Cell.
- RadioNetworkLayer_UnknownOrAlreadyAllocatedMmeUeS1apId - Radio Network Layer Unknown or Already Allocated MME UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated MME UE S1AP ID.
- RadioNetworkLayer_UnknownOrAlreadyAllocatedEnbUeS1apId - Radio Network Layer Unknown or Already Allocated eNB UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated eNB UE S1AP ID.
- RadioNetworkLayer_UnknownOrInconsistentPairOfUeS1apId - Radio Network Layer Unknown or Inconsistent Pair of S1AP UE ID - S1AP Radio Network Layer cause Unknown or inconsistent pair of S1AP UE ID.

- **RadioNetworkLayer_HandoverDesirableForRadioReasons** - Radio Network Layer Handover Desirable for Radio Reasons - S1AP Radio Network Layer cause Handover desirable for radio reasons.
- **RadioNetworkLayer_TimeCriticalHandover** - Radio Network Layer Time Critical Handover - S1AP Radio Network Layer cause Time critical handover.
- **RadioNetworkLayer_ResourceOptimisationHandover** - Radio Network Layer Resource Optimisation Handover - S1AP Radio Network Layer cause Resource optimisation handover.
- **RadioNetworkLayer_ReduceLoadInServingCell** - Radio Network Layer Reduce Load in Serving Cell - S1AP Radio Network Layer cause Reduce load in serving cell.
- **RadioNetworkLayer_UserInactivity** - Radio Network Layer User Inactivity - S1AP Radio Network Layer cause User Inactivity.
- **RadioNetworkLayer_RadioConnectionWithUeLost** - Radio Network Layer Radio Connection with UE Lost - S1AP Radio Network Layer cause Radio Connection With UE Lost.
- **RadioNetworkLayer_LoadBalancingTauRequired** - Radio Network Layer Load Balancing TAU Required - S1AP Radio Network Layer cause Load Balancing TAU Required.
- **RadioNetworkLayer_CsFallbackTriggered** - Radio Network Layer CS Fallback Triggered - S1AP Radio Network Layer cause CS Fallback Triggered.
- **RadioNetworkLayer_UeNotAvailableForPsService** - Radio Network Layer UE Not Available for PS Service - S1AP Radio Network Layer cause UE Not Available For PS Service.
- **RadioNetworkLayer_RadioResourcesNotAvailable** - Radio Network Layer Radio Resources Not Available - S1AP Radio Network Layer cause Radio resources not available.
- **RadioNetworkLayer_FailureInTheRadioInterfaceProcedure** - Radio Network Layer Failure in the Radio Interface Procedure - S1AP Radio Network Layer cause Failure in the Radio Interface Procedure.
- **RadioNetworkLayer_InvalidQosCombination** - Radio Network Layer Invalid QoS Combination - S1AP Radio Network Layer cause Invalid QoS combination.
- **RadioNetworkLayer_InterRatRedirection** - Radio Network Layer Inter-RAT Redirection - S1AP Radio Network Layer cause Inter-RAT redirection.
- **RadioNetworkLayer_InteractionWithOtherProcedure** - Radio Network Layer Interaction with Other Procedure - S1AP Radio Network Layer cause Interaction with other procedure.
- **RadioNetworkLayer_UnknownEranId** - Radio Network Layer Unknown E-RAB ID - S1AP Radio Network Layer cause Unknown E-RAB ID.
- **RadioNetworkLayer_MultipleEranIdInstances** - Radio Network Layer Multiple E-RAB ID Instances - S1AP Radio Network Layer cause Multiple E-RAB ID instances.

- **RadioNetworkLayer_EncryptionAndOrIntegrityProtectionAlgorithmsNotSupported** - Radio Network Layer Encryption and/or Integrity Protection Algorithms Not Supported - S1AP Radio Network Layer cause Encryption and/or Integrity protection algorithms not supported.
- **RadioNetworkLayer_S1IntraSystemHandoverTriggered** - Radio Network Layer S1 Intra System Handover Triggered - S1AP Radio Network Layer cause S1 intra system Handover triggered.
- **RadioNetworkLayer_S1InterSystemHandoverTriggered** - Radio Network Layer S1 Inter System Handover Triggered - S1AP Radio Network Layer cause S1 inter system Handover triggered.
- **RadioNetworkLayer_x2HandoverTriggered** - Radio Network Layer X2 Handover Triggered - S1AP Radio Network Layer cause X2 Handover triggered.
- **RadioNetworkLayer_redirectionTowards1xRtt** - Radio Network Layer Redirection Towards 1xRTT - S1AP Radio Network Layer cause Redirection towards 1xRTT.
- **RadioNetworkLayer_NotSupportedQciValue** - Radio Network Layer Not Supported QCI Value - S1AP Radio Network Layer cause Not Supported QCI Value.
- **RadioNetworkLayer_InvalidCsgId** - Radio Network Layer Invalid CSG Id - S1AP Radio Network Layer cause Invalid CSG Id.
- **RadioNetworkLayer_ReleaseDueToPreEmption** - Radio Network Layer Release Due to Pre-Emption - S1AP Radio Network Layer cause Release due to Pre-Emption.
- **RadioNetworkLayer_N26InterfaceNotAvailable** - Radio Network Layer N26 Interface Not Available - S1AP Radio Network Layer cause N26 interface not available.
- **TransportLayer_TransportResourceUnavailable** - Transport Layer Transport Resource Unavailable - S1AP Transport Layer cause Transport Resource Unavailable.
- **TransportLayer_Unspecified** - Transport Layer Unspecified - S1AP Transport Layer cause Unspecified.
- **Nas_NormalRelease** - NAS Normal Release - S1AP NAS cause Normal Release.
- **Nas_AuthenticationFailure** - NAS Authentication Failure - S1AP NAS cause Authentication failure.
- **Nas_Detach** - NAS Detach - S1AP NAS cause Detach.
- **Nas_Unspecified** - NAS Unspecified - S1AP NAS cause Unspecified.
- **Nas_CsgSubscriptionExpiry** - NAS CSG Subscription Expiry - S1AP NAS cause CSG Subscription Expiry.
- **Protocol_TransferSyntaxError** - Protocol Transfer Syntax Error - S1AP Protocol cause Transfer Syntax Error.
- **Protocol_AbstractSyntaxErrorReject** - Protocol Abstract Syntax Error (Reject) - S1AP Protocol cause Abstract Syntax Error (Reject).

- Protocol_AbstractSyntaxErrorIgnoreAndNotify - Protocol Abstract Syntax Error (Ignore and Notify) - S1AP Protocol cause Abstract Syntax Error (Ignore and Notify).
- Protocol_MessageNotCompatibleWithReceiverState - Protocol Message Not Compatible with Receiver State - S1AP Protocol cause Message not Compatible with Receiver State.
- Protocol_SemanticError - Protocol Semantic Error - S1AP Protocol cause Semantic Error.
- Protocol_AbstractSyntaxErrorFalselyConstructedMessage - Protocol Abstract Syntax Error (Falsely Constructed Message) - S1AP Protocol cause Abstract Syntax Error (Falsely Constructed Message).
- Protocol_Unspecified - Protocol Unspecified - S1AP Protocol cause Unspecified.
- Miscellaneous_ControlProcessingOverload - Miscellaneous Control Processing Overload - S1AP Miscellaneous cause Control Processing Overload.
- Miscellaneous_NotEnoughUserPlaneProcessingResources - Miscellaneous Not Enough User Plane Processing Resources - S1AP Miscellaneous cause Not enough User Plane Processing Resources.
- Miscellaneous_HardwareFailure - Miscellaneous Hardware Failure - S1AP Miscellaneous cause Hardware Failure.
- Miscellaneous_OmIntervention - Miscellaneous O&M Intervention - S1AP Miscellaneous cause O&M Intervention.
- Miscellaneous_Unspecified - Miscellaneous Unspecified - S1AP Miscellaneous cause Unspecified.
- Miscellaneous_UnknownPlmn - Miscellaneous Unknown PLMN - S1AP Miscellaneous cause Unknown PLMN.

Default

Disabled

Name

ueCtxtRelEsmCc29 - UE Context Release Command ESM CC 29

Syntax

--ueCtxtRelEsmCc29 <list-item>

Description

S1AP cause code to include on UE context release command when attach is rejected due to PDN connectivity request is rejected with cause code 29.

Class

Optional.

List

- Disabled - The feature is disabled in the corresponding scenario. The MME does not override the S1AP cause code.

Disabled

Name

ueCtxtRelEutranNotAllowed - UE Context Release Command E-UTRAN Not Allowed

Syntax

--ueCtxtRelEutranNotAllowed <list-item>

Description

S1AP cause code to include on UE context release command when the procedure is rejected because UE is not allowed to access LTE.

Class

Optional.

List

- Disabled - The feature is disabled in the corresponding scenario. The MME does not override the S1AP cause code.

- RadioNetworkLayer_Unspecified - Radio Network Layer Unspecified - S1AP Radio Network Layer cause Unspecified.
- RadioNetworkLayer_TX2RelocOverallExpiry - Radio Network Layer TX2 Reloc Overall Expiry - S1AP Radio Network Layer cause TX2 Reloc Overall Expiry.
- RadioNetworkLayer_SuccessfulHandover - Radio Network Layer Successful Handover - S1AP Radio Network Layer cause Successful Handover.
- RadioNetworkLayer_ReleaseDueToEutranGeneratedReason - Radio Network Layer Release Due to E-UTRAN Generated Reason - S1AP Radio Network Layer cause Release Due to E-UTRAN Generated Reason.
- RadioNetworkLayer_HandoverCancelled - Radio Network Layer Handover Cancelled - S1AP Radio Network Layer cause Handover Cancelled.
- RadioNetworkLayer_PartialHandover - Radio Network Layer Partial Handover - S1AP Radio Network Layer cause Partial Handover.
- RadioNetworkLayer_HandoverFailureInTargetEpcEnbOrTargetSystem - Radio Network Layer Handover Failure in Target EPC/eNB or Target System - S1AP Radio Network Layer cause Handover Failure In Target EPC/eNB or Target System.
- RadioNetworkLayer_HandoverTargetNotAllowed - Radio Network Layer Handover Target Not Allowed - S1AP Radio Network Layer cause Handover Target not allowed.
- RadioNetworkLayer_TS1RelocOverallExpiry - Radio Network Layer TS1 Reloc Overall Expiry - S1AP Radio Network Layer cause TS1Relocoverall Expiry.
- RadioNetworkLayer_TS1RelocPrepExpiry - Radio Network Layer TS1 Reloc Prep Expiry - S1AP Radio Network Layer cause TS1RelocPrep Expiry.
- RadioNetworkLayer_CellNotAvailable - Radio Network Layer Cell Not Available - S1AP Radio Network Layer cause Cell Not Available.
- RadioNetworkLayer_UnknownTargetId - Radio Network Layer Unknown Target Id - S1AP Radio Network Layer cause Unknown Target Id.
- RadioNetworkLayer_NoRadioResourcesAvailableInTargetCell - Radio Network Layer No Resources Available in Target Cell - S1AP Radio Network Layer cause No Resources Available in Target Cell.
- RadioNetworkLayer_UnknownOrAlreadyAllocatedMmeUeS1apId - Radio Network Layer Unknown or Already Allocated MME UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated MME UE S1AP ID.
- RadioNetworkLayer_UnknownOrAlreadyAllocatedEnbUeS1apId - Radio Network Layer Unknown or Already Allocated eNB UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated eNB UE S1AP ID.
- RadioNetworkLayer_UnknownOrInconsistentPairOfUeS1apId - Radio Network Layer Unknown or Inconsistent Pair of S1AP UE ID - S1AP Radio Network Layer cause Unknown or inconsistent pair of S1AP UE ID.

- RadioNetworkLayer_HandoverDesirableForRadioReasons - Radio Network Layer Handover Desirable for Radio Reasons - S1AP Radio Network Layer cause Handover desirable for radio reasons.
- RadioNetworkLayer_TimeCriticalHandover - Radio Network Layer Time Critical Handover - S1AP Radio Network Layer cause Time critical handover.
- RadioNetworkLayer_ResourceOptimisationHandover - Radio Network Layer Resource Optimisation Handover - S1AP Radio Network Layer cause Resource optimisation handover.
- RadioNetworkLayer_ReduceLoadInServingCell - Radio Network Layer Reduce Load in Serving Cell - S1AP Radio Network Layer cause Reduce load in serving cell.
- RadioNetworkLayer_UserInactivity - Radio Network Layer User Inactivity - S1AP Radio Network Layer cause User Inactivity.
- RadioNetworkLayer_RadioConnectionWithUeLost - Radio Network Layer Radio Connection with UE Lost - S1AP Radio Network Layer cause Radio Connection With UE Lost.
- RadioNetworkLayer_LoadBalancingTauRequired - Radio Network Layer Load Balancing TAU Required - S1AP Radio Network Layer cause Load Balancing TAU Required.
- RadioNetworkLayer_CsFallbackTriggered - Radio Network Layer CS Fallback Triggered - S1AP Radio Network Layer cause CS Fallback Triggered.
- RadioNetworkLayer_UeNotAvailableForPsService - Radio Network Layer UE Not Available for PS Service - S1AP Radio Network Layer cause UE Not Available For PS Service.
- RadioNetworkLayer_RadioResourcesNotAvailable - Radio Network Layer Radio Resources Not Available - S1AP Radio Network Layer cause Radio resources not available.
- RadioNetworkLayer_FailureInTheRadioInterfaceProcedure - Radio Network Layer Failure in the Radio Interface Procedure - S1AP Radio Network Layer cause Failure in the Radio Interface Procedure.
- RadioNetworkLayer_InvalidQosCombination - Radio Network Layer Invalid QoS Combination - S1AP Radio Network Layer cause Invalid QoS combination.
- RadioNetworkLayer_InterRatRedirection - Radio Network Layer Inter-RAT Redirection - S1AP Radio Network Layer cause Inter-RAT redirection.
- RadioNetworkLayer_InteractionWithOtherProcedure - Radio Network Layer Interaction with Other Procedure - S1AP Radio Network Layer cause Interaction with other procedure.
- RadioNetworkLayer_UnknownErabId - Radio Network Layer Unknown E-RAB ID - S1AP Radio Network Layer cause Unknown E-RAB ID.
- RadioNetworkLayer_MultipleErabIdInstances - Radio Network Layer Multiple E-RAB ID Instances - S1AP Radio Network Layer cause Multiple E-RAB ID instances.

- **RadioNetworkLayer_EncryptionAndOrIntegrityProtectionAlgorithmsNotSupported** - Radio Network Layer Encryption and/or Integrity Protection Algorithms Not Supported - S1AP Radio Network Layer cause Encryption and/or Integrity protection algorithms not supported.
- **RadioNetworkLayer_S1IntraSystemHandoverTriggered** - Radio Network Layer S1 Intra System Handover Triggered - S1AP Radio Network Layer cause S1 intra system Handover triggered.
- **RadioNetworkLayer_S1InterSystemHandoverTriggered** - Radio Network Layer S1 Inter System Handover Triggered - S1AP Radio Network Layer cause S1 inter system Handover triggered.
- **RadioNetworkLayer_x2HandoverTriggered** - Radio Network Layer X2 Handover Triggered - S1AP Radio Network Layer cause X2 Handover triggered.
- **RadioNetworkLayer_redirectionTowards1xRtt** - Radio Network Layer Redirection Towards 1xRTT - S1AP Radio Network Layer cause Redirection towards 1xRTT.
- **RadioNetworkLayer_NotSupportedQciValue** - Radio Network Layer Not Supported QCI Value - S1AP Radio Network Layer cause Not Supported QCI Value.
- **RadioNetworkLayer_InvalidCsgId** - Radio Network Layer Invalid CSG Id - S1AP Radio Network Layer cause Invalid CSG Id.
- **RadioNetworkLayer_ReleaseDueToPreEmption** - Radio Network Layer Release Due to Pre-Emption - S1AP Radio Network Layer cause Release due to Pre-Emption.
- **RadioNetworkLayer_N26InterfaceNotAvailable** - Radio Network Layer N26 Interface Not Available - S1AP Radio Network Layer cause N26 interface not available.
- **TransportLayer_TransportResourceUnavailable** - Transport Layer Transport Resource Unavailable - S1AP Transport Layer cause Transport Resource Unavailable.
- **TransportLayer_Unspecified** - Transport Layer Unspecified - S1AP Transport Layer cause Unspecified.
- **Nas_NormalRelease** - NAS Normal Release - S1AP NAS cause Normal Release.
- **Nas_AuthenticationFailure** - NAS Authentication Failure - S1AP NAS cause Authentication failure.
- **Nas_Detach** - NAS Detach - S1AP NAS cause Detach.
- **Nas_Unspecified** - NAS Unspecified - S1AP NAS cause Unspecified.
- **Nas_CsgSubscriptionExpiry** - NAS CSG Subscription Expiry - S1AP NAS cause CSG Subscription Expiry.
- **Protocol_TransferSyntaxError** - Protocol Transfer Syntax Error - S1AP Protocol cause Transfer Syntax Error.
- **Protocol_AbstractSyntaxErrorReject** - Protocol Abstract Syntax Error (Reject) - S1AP Protocol cause Abstract Syntax Error (Reject).

- Protocol_AbstractSyntaxErrorIgnoreAndNotify - Protocol Abstract Syntax Error (Ignore and Notify) - S1AP Protocol cause Abstract Syntax Error (Ignore and Notify).
- Protocol_MessageNotCompatibleWithReceiverState - Protocol Message Not Compatible with Receiver State - S1AP Protocol cause Message not Compatible with Receiver State.
- Protocol_SemanticError - Protocol Semantic Error - S1AP Protocol cause Semantic Error.
- Protocol_AbstractSyntaxErrorFalselyConstructedMessage - Protocol Abstract Syntax Error (Falsely Constructed Message) - S1AP Protocol cause Abstract Syntax Error (Falsely Constructed Message).
- Protocol_Unspecified - Protocol Unspecified - S1AP Protocol cause Unspecified.
- Miscellaneous_ControlProcessingOverload - Miscellaneous Control Processing Overload - S1AP Miscellaneous cause Control Processing Overload.
- Miscellaneous_NotEnoughUserPlaneProcessingResources - Miscellaneous Not Enough User Plane Processing Resources - S1AP Miscellaneous cause Not enough User Plane Processing Resources.
- Miscellaneous_HardwareFailure - Miscellaneous Hardware Failure - S1AP Miscellaneous cause Hardware Failure.
- Miscellaneous_OmIntervention - Miscellaneous O&M Intervention - S1AP Miscellaneous cause O&M Intervention.
- Miscellaneous_Unspecified - Miscellaneous Unspecified - S1AP Miscellaneous cause Unspecified.
- Miscellaneous_UnknownPlmn - Miscellaneous Unknown PLMN - S1AP Miscellaneous cause Unknown PLMN.

Default

Disabled

Name

ueCtxtRelFailopenRestoration - UE Context Release Command Failopen Restoration

Syntax

--ueCtxtRelFailopenRestoration <list-item>

Description

Define the S1AP cause code to include on UE context release command, when the MME detaches a UE that has been attached with the help of the failopen profile due to HSS unavailability manual restoration.

Class

Optional.

List

- Disabled - The feature is disabled in the corresponding scenario. The MME does not override the S1AP cause code.

- RadioNetworkLayer_Unspecified - Radio Network Layer Unspecified - S1AP Radio Network Layer cause Unspecified.
- RadioNetworkLayer_TX2RelocOverallExpiry - Radio Network Layer TX2 Reloc Overall Expiry - S1AP Radio Network Layer cause TX2 Reloc Overall Expiry.
- RadioNetworkLayer_SuccessfulHandover - Radio Network Layer Successful Handover - S1AP Radio Network Layer cause Successful Handover.
- RadioNetworkLayer_ReleaseDueToEutranGeneratedReason - Radio Network Layer Release Due to E-UTRAN Generated Reason - S1AP Radio Network Layer cause Release Due to E-UTRAN Generated Reason.
- RadioNetworkLayer_HandoverCancelled - Radio Network Layer Handover Cancelled - S1AP Radio Network Layer cause Handover Cancelled.
- RadioNetworkLayer_PartialHandover - Radio Network Layer Partial Handover - S1AP Radio Network Layer cause Partial Handover.
- RadioNetworkLayer_HandoverFailureInTargetEpcEnbOrTargetSystem - Radio Network Layer Handover Failure in Target EPC/eNB or Target System - S1AP Radio Network Layer cause Handover Failure In Target EPC/eNB or Target System.
- RadioNetworkLayer_HandoverTargetNotAllowed - Radio Network Layer Handover Target Not Allowed - S1AP Radio Network Layer cause Handover Target not allowed.
- RadioNetworkLayer_TS1RelocOverallExpiry - Radio Network Layer TS1 Reloc Overall Expiry - S1AP Radio Network Layer cause TS1Relocoverall Expiry.
- RadioNetworkLayer_TS1RelocPrepExpiry - Radio Network Layer TS1 Reloc Prep Expiry - S1AP Radio Network Layer cause TS1RelocPrep Expiry.
- RadioNetworkLayer_CellNotAvailable - Radio Network Layer Cell Not Available - S1AP Radio Network Layer cause Cell Not Available.
- RadioNetworkLayer_UnknownTargetId - Radio Network Layer Unknown Target Id - S1AP Radio Network Layer cause Unknown Target Id.
- RadioNetworkLayer_NoRadioResourcesAvailableInTargetCell - Radio Network Layer No Resources Available in Target Cell - S1AP Radio Network Layer cause No Resources Available in Target Cell.
- RadioNetworkLayer_UnknownOrAlreadyAllocatedMmeUeS1apId - Radio Network Layer Unknown or Already Allocated MME UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated MME UE S1AP ID.
- RadioNetworkLayer_UnknownOrAlreadyAllocatedEnbUeS1apId - Radio Network Layer Unknown or Already Allocated eNB UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated eNB UE S1AP ID.
- RadioNetworkLayer_UnknownOrInconsistentPairOfUeS1apId - Radio Network Layer Unknown or Inconsistent Pair of S1AP UE ID - S1AP Radio Network Layer cause Unknown or inconsistent pair of S1AP UE ID.

- `RadioNetworkLayer_HandoverDesirableForRadioReasons` - Radio Network Layer Handover Desirable for Radio Reasons - S1AP Radio Network Layer cause Handover desirable for radio reasons.
- `RadioNetworkLayer_TimeCriticalHandover` - Radio Network Layer Time Critical Handover - S1AP Radio Network Layer cause Time critical handover.
- `RadioNetworkLayer_ResourceOptimisationHandover` - Radio Network Layer Resource Optimisation Handover - S1AP Radio Network Layer cause Resource optimisation handover.
- `RadioNetworkLayer_ReduceLoadInServingCell` - Radio Network Layer Reduce Load in Serving Cell - S1AP Radio Network Layer cause Reduce load in serving cell.
- `RadioNetworkLayer_UserInactivity` - Radio Network Layer User Inactivity - S1AP Radio Network Layer cause User Inactivity.
- `RadioNetworkLayer_RadioConnectionWithUeLost` - Radio Network Layer Radio Connection with UE Lost - S1AP Radio Network Layer cause Radio Connection With UE Lost.
- `RadioNetworkLayer_LoadBalancingTauRequired` - Radio Network Layer Load Balancing TAU Required - S1AP Radio Network Layer cause Load Balancing TAU Required.
- `RadioNetworkLayer_CsFallbackTriggered` - Radio Network Layer CS Fallback Triggered - S1AP Radio Network Layer cause CS Fallback Triggered.
- `RadioNetworkLayer_UeNotAvailableForPsService` - Radio Network Layer UE Not Available for PS Service - S1AP Radio Network Layer cause UE Not Available For PS Service.
- `RadioNetworkLayer_RadioResourcesNotAvailable` - Radio Network Layer Radio Resources Not Available - S1AP Radio Network Layer cause Radio resources not available.
- `RadioNetworkLayer_FailureInTheRadioInterfaceProcedure` - Radio Network Layer Failure in the Radio Interface Procedure - S1AP Radio Network Layer cause Failure in the Radio Interface Procedure.
- `RadioNetworkLayer_InvalidQosCombination` - Radio Network Layer Invalid QoS Combination - S1AP Radio Network Layer cause Invalid QoS combination.
- `RadioNetworkLayer_InterRatRedirection` - Radio Network Layer Inter-RAT Redirection - S1AP Radio Network Layer cause Inter-RAT redirection.
- `RadioNetworkLayer_InteractionWithOtherProcedure` - Radio Network Layer Interaction with Other Procedure - S1AP Radio Network Layer cause Interaction with other procedure.
- `RadioNetworkLayer_UnknownEranId` - Radio Network Layer Unknown E-RAB ID - S1AP Radio Network Layer cause Unknown E-RAB ID.
- `RadioNetworkLayer_MultipleEranIdInstances` - Radio Network Layer Multiple E-RAB ID Instances - S1AP Radio Network Layer cause Multiple E-RAB ID instances.

- **RadioNetworkLayer_EncryptionAndOrIntegrityProtectionAlgorithmsNotSupported** - Radio Network Layer Encryption and/or Integrity Protection Algorithms Not Supported - S1AP Radio Network Layer cause Encryption and/or Integrity protection algorithms not supported.
- **RadioNetworkLayer_S1IntraSystemHandoverTriggered** - Radio Network Layer S1 Intra System Handover Triggered - S1AP Radio Network Layer cause S1 intra system Handover triggered.
- **RadioNetworkLayer_S1InterSystemHandoverTriggered** - Radio Network Layer S1 Inter System Handover Triggered - S1AP Radio Network Layer cause S1 inter system Handover triggered.
- **RadioNetworkLayer_x2HandoverTriggered** - Radio Network Layer X2 Handover Triggered - S1AP Radio Network Layer cause X2 Handover triggered.
- **RadioNetworkLayer_redirectionTowards1xRtt** - Radio Network Layer Redirection Towards 1xRTT - S1AP Radio Network Layer cause Redirection towards 1xRTT.
- **RadioNetworkLayer_NotSupportedQciValue** - Radio Network Layer Not Supported QCI Value - S1AP Radio Network Layer cause Not Supported QCI Value.
- **RadioNetworkLayer_InvalidCsgId** - Radio Network Layer Invalid CSG Id - S1AP Radio Network Layer cause Invalid CSG Id.
- **RadioNetworkLayer_ReleaseDueToPreEmption** - Radio Network Layer Release Due to Pre-Emption - S1AP Radio Network Layer cause Release due to Pre-Emption.
- **RadioNetworkLayer_N26InterfaceNotAvailable** - Radio Network Layer N26 Interface Not Available - S1AP Radio Network Layer cause N26 interface not available.
- **TransportLayer_TransportResourceUnavailable** - Transport Layer Transport Resource Unavailable - S1AP Transport Layer cause Transport Resource Unavailable.
- **TransportLayer_Unspecified** - Transport Layer Unspecified - S1AP Transport Layer cause Unspecified.
- **Nas_NormalRelease** - NAS Normal Release - S1AP NAS cause Normal Release.
- **Nas_AuthenticationFailure** - NAS Authentication Failure - S1AP NAS cause Authentication failure.
- **Nas_Detach** - NAS Detach - S1AP NAS cause Detach.
- **Nas_Unspecified** - NAS Unspecified - S1AP NAS cause Unspecified.
- **Nas_CsgSubscriptionExpiry** - NAS CSG Subscription Expiry - S1AP NAS cause CSG Subscription Expiry.
- **Protocol_TransferSyntaxError** - Protocol Transfer Syntax Error - S1AP Protocol cause Transfer Syntax Error.
- **Protocol_AbstractSyntaxErrorReject** - Protocol Abstract Syntax Error (Reject) - S1AP Protocol cause Abstract Syntax Error (Reject).

- Protocol_AbstractSyntaxErrorIgnoreAndNotify - Protocol Abstract Syntax Error (Ignore and Notify) - S1AP Protocol cause Abstract Syntax Error (Ignore and Notify).
- Protocol_MessageNotCompatibleWithReceiverState - Protocol Message Not Compatible with Receiver State - S1AP Protocol cause Message not Compatible with Receiver State.
- Protocol_SemanticError - Protocol Semantic Error - S1AP Protocol cause Semantic Error.
- Protocol_AbstractSyntaxErrorFalselyConstructedMessage - Protocol Abstract Syntax Error (Falsely Constructed Message) - S1AP Protocol cause Abstract Syntax Error (Falsely Constructed Message).
- Protocol_Unspecified - Protocol Unspecified - S1AP Protocol cause Unspecified.
- Miscellaneous_ControlProcessingOverload - Miscellaneous Control Processing Overload - S1AP Miscellaneous cause Control Processing Overload.
- Miscellaneous_NotEnoughUserPlaneProcessingResources - Miscellaneous Not Enough User Plane Processing Resources - S1AP Miscellaneous cause Not enough User Plane Processing Resources.
- Miscellaneous_HardwareFailure - Miscellaneous Hardware Failure - S1AP Miscellaneous cause Hardware Failure.
- Miscellaneous_OmIntervention - Miscellaneous O&M Intervention - S1AP Miscellaneous cause O&M Intervention.
- Miscellaneous_Unspecified - Miscellaneous Unspecified - S1AP Miscellaneous cause Unspecified.
- Miscellaneous_UnknownPlmn - Miscellaneous Unknown PLMN - S1AP Miscellaneous cause Unknown PLMN.

Default

Disabled

Name

ueCtxtRelHssOrEirDown - UE Context Release Command HSS or EIR Down

Syntax

--ueCtxtRelHssOrEirDown <list-item>

Description

Mapping for HSS or EIR down to S1 release cause code.

Class

Optional.

List

- Disabled - The feature is disabled in the corresponding scenario. The MME does not override the S1AP cause code.

- RadioNetworkLayer_Unspecified - Radio Network Layer Unspecified - S1AP Radio Network Layer cause Unspecified.
- RadioNetworkLayer_TX2RelocOverallExpiry - Radio Network Layer TX2 Reloc Overall Expiry - S1AP Radio Network Layer cause TX2 Reloc Overall Expiry.
- RadioNetworkLayer_SuccessfulHandover - Radio Network Layer Successful Handover - S1AP Radio Network Layer cause Successful Handover.
- RadioNetworkLayer_ReleaseDueToEutranGeneratedReason - Radio Network Layer Release Due to E-UTRAN Generated Reason - S1AP Radio Network Layer cause Release Due to E-UTRAN Generated Reason.
- RadioNetworkLayer_HandoverCancelled - Radio Network Layer Handover Cancelled - S1AP Radio Network Layer cause Handover Cancelled.
- RadioNetworkLayer_PartialHandover - Radio Network Layer Partial Handover - S1AP Radio Network Layer cause Partial Handover.
- RadioNetworkLayer_HandoverFailureInTargetEpcEnbOrTargetSystem - Radio Network Layer Handover Failure in Target EPC/eNB or Target System - S1AP Radio Network Layer cause Handover Failure In Target EPC/eNB or Target System.
- RadioNetworkLayer_HandoverTargetNotAllowed - Radio Network Layer Handover Target Not Allowed - S1AP Radio Network Layer cause Handover Target not allowed.
- RadioNetworkLayer_TS1RelocOverallExpiry - Radio Network Layer TS1 Reloc Overall Expiry - S1AP Radio Network Layer cause TS1Relocoverall Expiry.
- RadioNetworkLayer_TS1RelocPrepExpiry - Radio Network Layer TS1 Reloc Prep Expiry - S1AP Radio Network Layer cause TS1RelocPrep Expiry.
- RadioNetworkLayer_CellNotAvailable - Radio Network Layer Cell Not Available - S1AP Radio Network Layer cause Cell Not Available.
- RadioNetworkLayer_UnknownTargetId - Radio Network Layer Unknown Target Id - S1AP Radio Network Layer cause Unknown Target Id.
- RadioNetworkLayer_NoRadioResourcesAvailableInTargetCell - Radio Network Layer No Resources Available in Target Cell - S1AP Radio Network Layer cause No Resources Available in Target Cell.
- RadioNetworkLayer_UnknownOrAlreadyAllocatedMmeUeS1apId - Radio Network Layer Unknown or Already Allocated MME UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated MME UE S1AP ID.
- RadioNetworkLayer_UnknownOrAlreadyAllocatedEnbUeS1apId - Radio Network Layer Unknown or Already Allocated eNB UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated eNB UE S1AP ID.
- RadioNetworkLayer_UnknownOrInconsistentPairOfUeS1apId - Radio Network Layer Unknown or Inconsistent Pair of S1AP UE ID - S1AP Radio Network Layer cause Unknown or inconsistent pair of S1AP UE ID.

- **RadioNetworkLayer_HandoverDesirableForRadioReasons** - Radio Network Layer Handover Desirable for Radio Reasons - S1AP Radio Network Layer cause Handover desirable for radio reasons.
- **RadioNetworkLayer_TimeCriticalHandover** - Radio Network Layer Time Critical Handover - S1AP Radio Network Layer cause Time critical handover.
- **RadioNetworkLayer_ResourceOptimisationHandover** - Radio Network Layer Resource Optimisation Handover - S1AP Radio Network Layer cause Resource optimisation handover.
- **RadioNetworkLayer_ReduceLoadInServingCell** - Radio Network Layer Reduce Load in Serving Cell - S1AP Radio Network Layer cause Reduce load in serving cell.
- **RadioNetworkLayer_UserInactivity** - Radio Network Layer User Inactivity - S1AP Radio Network Layer cause User Inactivity.
- **RadioNetworkLayer_RadioConnectionWithUeLost** - Radio Network Layer Radio Connection with UE Lost - S1AP Radio Network Layer cause Radio Connection With UE Lost.
- **RadioNetworkLayer_LoadBalancingTauRequired** - Radio Network Layer Load Balancing TAU Required - S1AP Radio Network Layer cause Load Balancing TAU Required.
- **RadioNetworkLayer_CsFallbackTriggered** - Radio Network Layer CS Fallback Triggered - S1AP Radio Network Layer cause CS Fallback Triggered.
- **RadioNetworkLayer_UeNotAvailableForPsService** - Radio Network Layer UE Not Available for PS Service - S1AP Radio Network Layer cause UE Not Available For PS Service.
- **RadioNetworkLayer_RadioResourcesNotAvailable** - Radio Network Layer Radio Resources Not Available - S1AP Radio Network Layer cause Radio resources not available.
- **RadioNetworkLayer_FailureInTheRadioInterfaceProcedure** - Radio Network Layer Failure in the Radio Interface Procedure - S1AP Radio Network Layer cause Failure in the Radio Interface Procedure.
- **RadioNetworkLayer_InvalidQosCombination** - Radio Network Layer Invalid QoS Combination - S1AP Radio Network Layer cause Invalid QoS combination.
- **RadioNetworkLayer_InterRatRedirection** - Radio Network Layer Inter-RAT Redirection - S1AP Radio Network Layer cause Inter-RAT redirection.
- **RadioNetworkLayer_InteractionWithOtherProcedure** - Radio Network Layer Interaction with Other Procedure - S1AP Radio Network Layer cause Interaction with other procedure.
- **RadioNetworkLayer_UnknownEranId** - Radio Network Layer Unknown E-RAB ID - S1AP Radio Network Layer cause Unknown E-RAB ID.
- **RadioNetworkLayer_MultipleEranIdInstances** - Radio Network Layer Multiple E-RAB ID Instances - S1AP Radio Network Layer cause Multiple E-RAB ID instances.

- **RadioNetworkLayer_EncryptionAndOrIntegrityProtectionAlgorithmsNotSupported** - Radio Network Layer Encryption and/or Integrity Protection Algorithms Not Supported - S1AP Radio Network Layer cause Encryption and/or Integrity protection algorithms not supported.
- **RadioNetworkLayer_S1IntraSystemHandoverTriggered** - Radio Network Layer S1 Intra System Handover Triggered - S1AP Radio Network Layer cause S1 intra system Handover triggered.
- **RadioNetworkLayer_S1InterSystemHandoverTriggered** - Radio Network Layer S1 Inter System Handover Triggered - S1AP Radio Network Layer cause S1 inter system Handover triggered.
- **RadioNetworkLayer_x2HandoverTriggered** - Radio Network Layer X2 Handover Triggered - S1AP Radio Network Layer cause X2 Handover triggered.
- **RadioNetworkLayer_redirectionTowards1xRtt** - Radio Network Layer Redirection Towards 1xRTT - S1AP Radio Network Layer cause Redirection towards 1xRTT.
- **RadioNetworkLayer_NotSupportedQciValue** - Radio Network Layer Not Supported QCI Value - S1AP Radio Network Layer cause Not Supported QCI Value.
- **RadioNetworkLayer_InvalidCsgId** - Radio Network Layer Invalid CSG Id - S1AP Radio Network Layer cause Invalid CSG Id.
- **RadioNetworkLayer_ReleaseDueToPreEmption** - Radio Network Layer Release Due to Pre-Emption - S1AP Radio Network Layer cause Release due to Pre-Emption.
- **RadioNetworkLayer_N26InterfaceNotAvailable** - Radio Network Layer N26 Interface Not Available - S1AP Radio Network Layer cause N26 interface not available.
- **TransportLayer_TransportResourceUnavailable** - Transport Layer Transport Resource Unavailable - S1AP Transport Layer cause Transport Resource Unavailable.
- **TransportLayer_Unspecified** - Transport Layer Unspecified - S1AP Transport Layer cause Unspecified.
- **Nas_NormalRelease** - NAS Normal Release - S1AP NAS cause Normal Release.
- **Nas_AuthenticationFailure** - NAS Authentication Failure - S1AP NAS cause Authentication failure.
- **Nas_Detach** - NAS Detach - S1AP NAS cause Detach.
- **Nas_Unspecified** - NAS Unspecified - S1AP NAS cause Unspecified.
- **Nas_CsgSubscriptionExpiry** - NAS CSG Subscription Expiry - S1AP NAS cause CSG Subscription Expiry.
- **Protocol_TransferSyntaxError** - Protocol Transfer Syntax Error - S1AP Protocol cause Transfer Syntax Error.
- **Protocol_AbstractSyntaxErrorReject** - Protocol Abstract Syntax Error (Reject) - S1AP Protocol cause Abstract Syntax Error (Reject).

- Protocol_AbstractSyntaxErrorIgnoreAndNotify - Protocol Abstract Syntax Error (Ignore and Notify) - S1AP Protocol cause Abstract Syntax Error (Ignore and Notify).
- Protocol_MessageNotCompatibleWithReceiverState - Protocol Message Not Compatible with Receiver State - S1AP Protocol cause Message not Compatible with Receiver State.
- Protocol_SemanticError - Protocol Semantic Error - S1AP Protocol cause Semantic Error.
- Protocol_AbstractSyntaxErrorFalselyConstructedMessage - Protocol Abstract Syntax Error (Falsely Constructed Message) - S1AP Protocol cause Abstract Syntax Error (Falsely Constructed Message).
- Protocol_Unspecified - Protocol Unspecified - S1AP Protocol cause Unspecified.
- Miscellaneous_ControlProcessingOverload - Miscellaneous Control Processing Overload - S1AP Miscellaneous cause Control Processing Overload.
- Miscellaneous_NotEnoughUserPlaneProcessingResources - Miscellaneous Not Enough User Plane Processing Resources - S1AP Miscellaneous cause Not enough User Plane Processing Resources.
- Miscellaneous_HardwareFailure - Miscellaneous Hardware Failure - S1AP Miscellaneous cause Hardware Failure.
- Miscellaneous_OmIntervention - Miscellaneous O&M Intervention - S1AP Miscellaneous cause O&M Intervention.
- Miscellaneous_Unspecified - Miscellaneous Unspecified - S1AP Miscellaneous cause Unspecified.
- Miscellaneous_UnknownPlmn - Miscellaneous Unknown PLMN - S1AP Miscellaneous cause Unknown PLMN.

Default

Disabled

Name

ueCtxtRelImsApnRoamingFailure - UE Context Release Command IMS APN Roaming Failure

Syntax

--ueCtxtRelImsApnRoamingFailure <list-item>

Description

S1AP cause code to include on UE context release command when attach is rejected because of IMS APN roaming failure.

Class

Optional.

List

- Disabled - The feature is disabled in the corresponding scenario. The MME does not override the S1AP cause code.

- RadioNetworkLayer_Unspecified - Radio Network Layer Unspecified - S1AP Radio Network Layer cause Unspecified.
- RadioNetworkLayer_TX2RelocOverallExpiry - Radio Network Layer TX2 Reloc Overall Expiry - S1AP Radio Network Layer cause TX2 Reloc Overall Expiry.
- RadioNetworkLayer_SuccessfulHandover - Radio Network Layer Successful Handover - S1AP Radio Network Layer cause Successful Handover.
- RadioNetworkLayer_ReleaseDueToEutranGeneratedReason - Radio Network Layer Release Due to E-UTRAN Generated Reason - S1AP Radio Network Layer cause Release Due to E-UTRAN Generated Reason.
- RadioNetworkLayer_HandoverCancelled - Radio Network Layer Handover Cancelled - S1AP Radio Network Layer cause Handover Cancelled.
- RadioNetworkLayer_PartialHandover - Radio Network Layer Partial Handover - S1AP Radio Network Layer cause Partial Handover.
- RadioNetworkLayer_HandoverFailureInTargetEpcEnbOrTargetSystem - Radio Network Layer Handover Failure in Target EPC/eNB or Target System - S1AP Radio Network Layer cause Handover Failure In Target EPC/eNB or Target System.
- RadioNetworkLayer_HandoverTargetNotAllowed - Radio Network Layer Handover Target Not Allowed - S1AP Radio Network Layer cause Handover Target not allowed.
- RadioNetworkLayer_TS1RelocOverallExpiry - Radio Network Layer TS1 Reloc Overall Expiry - S1AP Radio Network Layer cause TS1Relocoverall Expiry.
- RadioNetworkLayer_TS1RelocPrepExpiry - Radio Network Layer TS1 Reloc Prep Expiry - S1AP Radio Network Layer cause TS1RelocPrep Expiry.
- RadioNetworkLayer_CellNotAvailable - Radio Network Layer Cell Not Available - S1AP Radio Network Layer cause Cell Not Available.
- RadioNetworkLayer_UnknownTargetId - Radio Network Layer Unknown Target Id - S1AP Radio Network Layer cause Unknown Target Id.
- RadioNetworkLayer_NoRadioResourcesAvailableInTargetCell - Radio Network Layer No Resources Available in Target Cell - S1AP Radio Network Layer cause No Resources Available in Target Cell.
- RadioNetworkLayer_UnknownOrAlreadyAllocatedMmeUeS1apId - Radio Network Layer Unknown or Already Allocated MME UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated MME UE S1AP ID.
- RadioNetworkLayer_UnknownOrAlreadyAllocatedEnbUeS1apId - Radio Network Layer Unknown or Already Allocated eNB UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated eNB UE S1AP ID.
- RadioNetworkLayer_UnknownOrInconsistentPairOfUeS1apId - Radio Network Layer Unknown or Inconsistent Pair of S1AP UE ID - S1AP Radio Network Layer cause Unknown or inconsistent pair of S1AP UE ID.

- **RadioNetworkLayer_HandoverDesirableForRadioReasons** - Radio Network Layer Handover Desirable for Radio Reasons - S1AP Radio Network Layer cause Handover desirable for radio reasons.
- **RadioNetworkLayer_TimeCriticalHandover** - Radio Network Layer Time Critical Handover - S1AP Radio Network Layer cause Time critical handover.
- **RadioNetworkLayer_ResourceOptimisationHandover** - Radio Network Layer Resource Optimisation Handover - S1AP Radio Network Layer cause Resource optimisation handover.
- **RadioNetworkLayer_ReduceLoadInServingCell** - Radio Network Layer Reduce Load in Serving Cell - S1AP Radio Network Layer cause Reduce load in serving cell.
- **RadioNetworkLayer_UserInactivity** - Radio Network Layer User Inactivity - S1AP Radio Network Layer cause User Inactivity.
- **RadioNetworkLayer_RadioConnectionWithUeLost** - Radio Network Layer Radio Connection with UE Lost - S1AP Radio Network Layer cause Radio Connection With UE Lost.
- **RadioNetworkLayer_LoadBalancingTauRequired** - Radio Network Layer Load Balancing TAU Required - S1AP Radio Network Layer cause Load Balancing TAU Required.
- **RadioNetworkLayer_CsFallbackTriggered** - Radio Network Layer CS Fallback Triggered - S1AP Radio Network Layer cause CS Fallback Triggered.
- **RadioNetworkLayer_UeNotAvailableForPsService** - Radio Network Layer UE Not Available for PS Service - S1AP Radio Network Layer cause UE Not Available For PS Service.
- **RadioNetworkLayer_RadioResourcesNotAvailable** - Radio Network Layer Radio Resources Not Available - S1AP Radio Network Layer cause Radio resources not available.
- **RadioNetworkLayer_FailureInTheRadioInterfaceProcedure** - Radio Network Layer Failure in the Radio Interface Procedure - S1AP Radio Network Layer cause Failure in the Radio Interface Procedure.
- **RadioNetworkLayer_InvalidQosCombination** - Radio Network Layer Invalid QoS Combination - S1AP Radio Network Layer cause Invalid QoS combination.
- **RadioNetworkLayer_InterRatRedirection** - Radio Network Layer Inter-RAT Redirection - S1AP Radio Network Layer cause Inter-RAT redirection.
- **RadioNetworkLayer_InteractionWithOtherProcedure** - Radio Network Layer Interaction with Other Procedure - S1AP Radio Network Layer cause Interaction with other procedure.
- **RadioNetworkLayer_UnknownEranId** - Radio Network Layer Unknown E-RAB ID - S1AP Radio Network Layer cause Unknown E-RAB ID.
- **RadioNetworkLayer_MultipleEranIdInstances** - Radio Network Layer Multiple E-RAB ID Instances - S1AP Radio Network Layer cause Multiple E-RAB ID instances.

- **RadioNetworkLayer_EncryptionAndOrIntegrityProtectionAlgorithmsNotSupported** - Radio Network Layer Encryption and/or Integrity Protection Algorithms Not Supported - S1AP Radio Network Layer cause Encryption and/or Integrity protection algorithms not supported.
- **RadioNetworkLayer_S1IntraSystemHandoverTriggered** - Radio Network Layer S1 Intra System Handover Triggered - S1AP Radio Network Layer cause S1 intra system Handover triggered.
- **RadioNetworkLayer_S1InterSystemHandoverTriggered** - Radio Network Layer S1 Inter System Handover Triggered - S1AP Radio Network Layer cause S1 inter system Handover triggered.
- **RadioNetworkLayer_x2HandoverTriggered** - Radio Network Layer X2 Handover Triggered - S1AP Radio Network Layer cause X2 Handover triggered.
- **RadioNetworkLayer_redirectionTowards1xRtt** - Radio Network Layer Redirection Towards 1xRTT - S1AP Radio Network Layer cause Redirection towards 1xRTT.
- **RadioNetworkLayer_NotSupportedQciValue** - Radio Network Layer Not Supported QCI Value - S1AP Radio Network Layer cause Not Supported QCI Value.
- **RadioNetworkLayer_InvalidCsgId** - Radio Network Layer Invalid CSG Id - S1AP Radio Network Layer cause Invalid CSG Id.
- **RadioNetworkLayer_ReleaseDueToPreEmption** - Radio Network Layer Release Due to Pre-Emption - S1AP Radio Network Layer cause Release due to Pre-Emption.
- **RadioNetworkLayer_N26InterfaceNotAvailable** - Radio Network Layer N26 Interface Not Available - S1AP Radio Network Layer cause N26 interface not available.
- **TransportLayer_TransportResourceUnavailable** - Transport Layer Transport Resource Unavailable - S1AP Transport Layer cause Transport Resource Unavailable.
- **TransportLayer_Unspecified** - Transport Layer Unspecified - S1AP Transport Layer cause Unspecified.
- **Nas_NormalRelease** - NAS Normal Release - S1AP NAS cause Normal Release.
- **Nas_AuthenticationFailure** - NAS Authentication Failure - S1AP NAS cause Authentication failure.
- **Nas_Detach** - NAS Detach - S1AP NAS cause Detach.
- **Nas_Unspecified** - NAS Unspecified - S1AP NAS cause Unspecified.
- **Nas_CsgSubscriptionExpiry** - NAS CSG Subscription Expiry - S1AP NAS cause CSG Subscription Expiry.
- **Protocol_TransferSyntaxError** - Protocol Transfer Syntax Error - S1AP Protocol cause Transfer Syntax Error.
- **Protocol_AbstractSyntaxErrorReject** - Protocol Abstract Syntax Error (Reject) - S1AP Protocol cause Abstract Syntax Error (Reject).

- Protocol_AbstractSyntaxErrorIgnoreAndNotify - Protocol Abstract Syntax Error (Ignore and Notify) - S1AP Protocol cause Abstract Syntax Error (Ignore and Notify).
- Protocol_MessageNotCompatibleWithReceiverState - Protocol Message Not Compatible with Receiver State - S1AP Protocol cause Message not Compatible with Receiver State.
- Protocol_SemanticError - Protocol Semantic Error - S1AP Protocol cause Semantic Error.
- Protocol_AbstractSyntaxErrorFalselyConstructedMessage - Protocol Abstract Syntax Error (Falsely Constructed Message) - S1AP Protocol cause Abstract Syntax Error (Falsely Constructed Message).
- Protocol_Unspecified - Protocol Unspecified - S1AP Protocol cause Unspecified.
- Miscellaneous_ControlProcessingOverload - Miscellaneous Control Processing Overload - S1AP Miscellaneous cause Control Processing Overload.
- Miscellaneous_NotEnoughUserPlaneProcessingResources - Miscellaneous Not Enough User Plane Processing Resources - S1AP Miscellaneous cause Not enough User Plane Processing Resources.
- Miscellaneous_HardwareFailure - Miscellaneous Hardware Failure - S1AP Miscellaneous cause Hardware Failure.
- Miscellaneous_OmIntervention - Miscellaneous O&M Intervention - S1AP Miscellaneous cause O&M Intervention.
- Miscellaneous_Unspecified - Miscellaneous Unspecified - S1AP Miscellaneous cause Unspecified.
- Miscellaneous_UnknownPlmn - Miscellaneous Unknown PLMN - S1AP Miscellaneous cause Unknown PLMN.

Default

Disabled

Name

ueCtxtRelImsPdnActivationTimerExpired - UE Context Release Command IMS PDN Activation Timer Expired

Syntax

- ueCtxtRelImsPdnActivationTimerExpired <list-item>

Description

The S1AP Cause code to include on UE context release command when the MME detaches the UE as part of the IMS supervision functionality. MME performs detach for a UE when the IMS PDN Activation Timer expires and IMS PDN is not activated.

Class

Optional.

List

- Disabled - The feature is disabled in the corresponding scenario. The MME does not override the S1AP cause code.
- RadioNetworkLayer_Unspecified - Radio Network Layer Unspecified - S1AP Radio Network Layer cause Unspecified.
- RadioNetworkLayer_TX2RelocOverallExpiry - Radio Network Layer TX2 Reloc Overall Expiry - S1AP Radio Network Layer cause TX2 Reloc Overall Expiry.
- RadioNetworkLayer_SuccessfulHandover - Radio Network Layer Successful Handover - S1AP Radio Network Layer cause Successful Handover.
- RadioNetworkLayer_ReleaseDueToEutranGeneratedReason - Radio Network Layer Release Due to E-UTRAN Generated Reason - S1AP Radio Network Layer cause Release Due to E-UTRAN Generated Reason.
- RadioNetworkLayer_HandoverCancelled - Radio Network Layer Handover Cancelled - S1AP Radio Network Layer cause Handover Cancelled.
- RadioNetworkLayer_PartialHandover - Radio Network Layer Partial Handover - S1AP Radio Network Layer cause Partial Handover.
- RadioNetworkLayer_HandoverFailureInTargetEpcEnbOrTargetSystem - Radio Network Layer Handover Failure in Target EPC/eNB or Target System - S1AP Radio Network Layer cause Handover Failure In Target EPC/eNB or Target System.
- RadioNetworkLayer_HandoverTargetNotAllowed - Radio Network Layer Handover Target Not Allowed - S1AP Radio Network Layer cause Handover Target not allowed.
- RadioNetworkLayer_TS1RelocOverallExpiry - Radio Network Layer TS1 Reloc Overall Expiry - S1AP Radio Network Layer cause TS1Relocoverall Expiry.
- RadioNetworkLayer_TS1RelocPrepExpiry - Radio Network Layer TS1 Reloc Prep Expiry - S1AP Radio Network Layer cause TS1RelocPrep Expiry.
- RadioNetworkLayer_CellNotAvailable - Radio Network Layer Cell Not Available - S1AP Radio Network Layer cause Cell Not Available.
- RadioNetworkLayer_UnknownTargetId - Radio Network Layer Unknown Target Id - S1AP Radio Network Layer cause Unknown Target Id.
- RadioNetworkLayer_NoRadioResourcesAvailableInTargetCell - Radio Network Layer No Resources Available in Target Cell - S1AP Radio Network Layer cause No Resources Available in Target Cell.
- RadioNetworkLayer_UnknownOrAlreadyAllocatedMmeUeS1apId - Radio Network Layer Unknown or Already Allocated MME UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated MME UE S1AP ID.
- RadioNetworkLayer_UnknownOrAlreadyAllocatedEnbUeS1apId - Radio Network Layer Unknown or Already Allocated eNB UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated eNB UE S1AP ID.

- RadioNetworkLayer_UnknownOrInconsistentPairOfUeS1apId - Radio Network Layer Unknown or Inconsistent Pair of S1AP UE ID - S1AP Radio Network Layer cause Unknown or inconsistent pair of S1AP UE ID.
- RadioNetworkLayer_HandoverDesirableForRadioReasons - Radio Network Layer Handover Desirable for Radio Reasons - S1AP Radio Network Layer cause Handover desirable for radio reasons.
- RadioNetworkLayer_TimeCriticalHandover - Radio Network Layer Time Critical Handover - S1AP Radio Network Layer cause Time critical handover.
- RadioNetworkLayer_ResourceOptimisationHandover - Radio Network Layer Resource Optimisation Handover - S1AP Radio Network Layer cause Resource optimisation handover.
- RadioNetworkLayer_ReduceLoadInServingCell - Radio Network Layer Reduce Load in Serving Cell - S1AP Radio Network Layer cause Reduce load in serving cell.
- RadioNetworkLayer_UserInactivity - Radio Network Layer User Inactivity - S1AP Radio Network Layer cause User Inactivity.
- RadioNetworkLayer_RadioConnectionWithUeLost - Radio Network Layer Radio Connection with UE Lost - S1AP Radio Network Layer cause Radio Connection With UE Lost.
- RadioNetworkLayer_LoadBalancingTauRequired - Radio Network Layer Load Balancing TAU Required - S1AP Radio Network Layer cause Load Balancing TAU Required.
- RadioNetworkLayer_CsFallbackTriggered - Radio Network Layer CS Fallback Triggered - S1AP Radio Network Layer cause CS Fallback Triggered.
- RadioNetworkLayer_UeNotAvailableForPsService - Radio Network Layer UE Not Available for PS Service - S1AP Radio Network Layer cause UE Not Available For PS Service.
- RadioNetworkLayer_RadioResourcesNotAvailable - Radio Network Layer Radio Resources Not Available - S1AP Radio Network Layer cause Radio resources not available.
- RadioNetworkLayer_FailureInTheRadioInterfaceProcedure - Radio Network Layer Failure in the Radio Interface Procedure - S1AP Radio Network Layer cause Failure in the Radio Interface Procedure.
- RadioNetworkLayer_InvalidQosCombination - Radio Network Layer Invalid QoS Combination - S1AP Radio Network Layer cause Invalid QoS combination.
- RadioNetworkLayer_InterRatRedirection - Radio Network Layer Inter-RAT Redirection - S1AP Radio Network Layer cause Inter-RAT redirection.
- RadioNetworkLayer_InteractionWithOtherProcedure - Radio Network Layer Interaction with Other Procedure - S1AP Radio Network Layer cause Interaction with other procedure.

- **RadioNetworkLayer_UnknownErabId** - Radio Network Layer Unknown E-RAB ID - S1AP Radio Network Layer cause Unknown E-RAB ID.
- **RadioNetworkLayer_MultipleErabIdInstances** - Radio Network Layer Multiple E-RAB ID Instances - S1AP Radio Network Layer cause Multiple E-RAB ID instances.
- **RadioNetworkLayer_EncryptionAndOrIntegrityProtectionAlgorithmsNotSupported** - Radio Network Layer Encryption and/or Integrity Protection Algorithms Not Supported - S1AP Radio Network Layer cause Encryption and/or Integrity protection algorithms not supported.
- **RadioNetworkLayer_S1IntraSystemHandoverTriggered** - Radio Network Layer S1 Intra System Handover Triggered - S1AP Radio Network Layer cause S1 intra system Handover triggered.
- **RadioNetworkLayer_S1InterSystemHandoverTriggered** - Radio Network Layer S1 Inter System Handover Triggered - S1AP Radio Network Layer cause S1 inter system Handover triggered.
- **RadioNetworkLayer_x2HandoverTriggered** - Radio Network Layer X2 Handover Triggered - S1AP Radio Network Layer cause X2 Handover triggered.
- **RadioNetworkLayer_redirectionTowards1xRtt** - Radio Network Layer Redirection Towards 1xRTT - S1AP Radio Network Layer cause Redirection towards 1xRTT.
- **RadioNetworkLayer_NotSupportedQciValue** - Radio Network Layer Not Supported QCI Value - S1AP Radio Network Layer cause Not Supported QCI Value.
- **RadioNetworkLayer_InvalidCsgId** - Radio Network Layer Invalid CSG Id - S1AP Radio Network Layer cause Invalid CSG Id.
- **RadioNetworkLayer_ReleaseDueToPreEmption** - Radio Network Layer Release Due to Pre-Emption - S1AP Radio Network Layer cause Release due to Pre-Emption.
- **RadioNetworkLayer_N26InterfaceNotAvailable** - Radio Network Layer N26 Interface Not Available - S1AP Radio Network Layer cause N26 interface not available.
- **TransportLayer_TransportResourceUnavailable** - Transport Layer Transport Resource Unavailable - S1AP Transport Layer cause Transport Resource Unavailable.
- **TransportLayer_Unspecified** - Transport Layer Unspecified - S1AP Transport Layer cause Unspecified.
- **Nas_NormalRelease** - NAS Normal Release - S1AP NAS cause Normal Release.
- **Nas_AuthenticationFailure** - NAS Authentication Failure - S1AP NAS cause Authentication failure.
- **Nas_Detach** - NAS Detach - S1AP NAS cause Detach.
- **Nas_Unspecified** - NAS Unspecified - S1AP NAS cause Unspecified.
- **Nas_CsgSubscriptionExpiry** - NAS CSG Subscription Expiry - S1AP NAS cause CSG Subscription Expiry.

- Protocol_TransferSyntaxError - Protocol Transfer Syntax Error - S1AP Protocol cause Transfer Syntax Error.
- Protocol_AbstractSyntaxErrorReject - Protocol Abstract Syntax Error (Reject) - S1AP Protocol cause Abstract Syntax Error (Reject).
- Protocol_AbstractSyntaxErrorIgnoreAndNotify - Protocol Abstract Syntax Error (Ignore and Notify) - S1AP Protocol cause Abstract Syntax Error (Ignore and Notify).
- Protocol_MessageNotCompatibleWithReceiverState - Protocol Message Not Compatible with Receiver State - S1AP Protocol cause Message not Compatible with Receiver State.
- Protocol_SemanticError - Protocol Semantic Error - S1AP Protocol cause Semantic Error.
- Protocol_AbstractSyntaxErrorFalselyConstructedMessage - Protocol Abstract Syntax Error (Falsely Constructed Message) - S1AP Protocol cause Abstract Syntax Error (Falsely Constructed Message).
- Protocol_Unspecified - Protocol Unspecified - S1AP Protocol cause Unspecified.
- Miscellaneous_ControlProcessingOverload - Miscellaneous Control Processing Overload - S1AP Miscellaneous cause Control Processing Overload.
- Miscellaneous_NotEnoughUserPlaneProcessingResources - Miscellaneous Not Enough User Plane Processing Resources - S1AP Miscellaneous cause Not enough User Plane Processing Resources.
- Miscellaneous_HardwareFailure - Miscellaneous Hardware Failure - S1AP Miscellaneous cause Hardware Failure.
- Miscellaneous_OmIntervention - Miscellaneous O&M Intervention - S1AP Miscellaneous cause O&M Intervention.
- Miscellaneous_Unspecified - Miscellaneous Unspecified - S1AP Miscellaneous cause Unspecified.
- Miscellaneous_UnknownPlmn - Miscellaneous Unknown PLMN - S1AP Miscellaneous cause Unknown PLMN.

Default

Disabled

Name

ueCtxtRelImsRegistrationFailed - UE Context Release Command IMS Registration Failed

Syntax

--ueCtxtRelImsRegistrationFailed <list-item>

Description

The S1AP cause code to include on UE context release command when the IMS Registration Timer expires and the UE has not performed successful IMS registration.

Class

Optional.

List

- Disabled - The feature is disabled in the corresponding scenario. The MME does not override the S1AP cause code.
- RadioNetworkLayer_Unspecified - Radio Network Layer Unspecified - S1AP Radio Network Layer cause Unspecified.
- RadioNetworkLayer_TX2RelocOverallExpiry - Radio Network Layer TX2 Reloc Overall Expiry - S1AP Radio Network Layer cause TX2 Reloc Overall Expiry.
- RadioNetworkLayer_SuccessfulHandover - Radio Network Layer Successful Handover - S1AP Radio Network Layer cause Successful Handover.
- RadioNetworkLayer_ReleaseDueToEutranGeneratedReason - Radio Network Layer Release Due to E-UTRAN Generated Reason - S1AP Radio Network Layer cause Release Due to E-UTRAN Generated Reason.
- RadioNetworkLayer_HandoverCancelled - Radio Network Layer Handover Cancelled - S1AP Radio Network Layer cause Handover Cancelled.
- RadioNetworkLayer_PartialHandover - Radio Network Layer Partial Handover - S1AP Radio Network Layer cause Partial Handover.
- RadioNetworkLayer_HandoverFailureInTargetEpcEnbOrTargetSystem - Radio Network Layer Handover Failure in Target EPC/eNB or Target System - S1AP Radio Network Layer cause Handover Failure In Target EPC/eNB or Target System.
- RadioNetworkLayer_HandoverTargetNotAllowed - Radio Network Layer Handover Target Not Allowed - S1AP Radio Network Layer cause Handover Target not allowed.
- RadioNetworkLayer_TS1RelocOverallExpiry - Radio Network Layer TS1 Reloc Overall Expiry - S1AP Radio Network Layer cause TS1Relocoverall Expiry.
- RadioNetworkLayer_TS1RelocPrepExpiry - Radio Network Layer TS1 Reloc Prep Expiry - S1AP Radio Network Layer cause TS1RelocPrep Expiry.
- RadioNetworkLayer_CellNotAvailable - Radio Network Layer Cell Not Available - S1AP Radio Network Layer cause Cell Not Available.
- RadioNetworkLayer_UnknownTargetId - Radio Network Layer Unknown Target Id - S1AP Radio Network Layer cause Unknown Target Id.
- RadioNetworkLayer_NoRadioResourcesAvailableInTargetCell - Radio Network Layer No Resources Available in Target Cell - S1AP Radio Network Layer cause No Resources Available in Target Cell.
- RadioNetworkLayer_UnknownOrAlreadyAllocatedMmeUeS1apId - Radio Network Layer Unknown or Already Allocated MME UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated MME UE S1AP ID.
- RadioNetworkLayer_UnknownOrAlreadyAllocatedEnbUeS1apId - Radio Network Layer Unknown or Already Allocated eNB UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated eNB UE S1AP ID.

- RadioNetworkLayer_UnknownOrInconsistentPairOfUeS1apId - Radio Network Layer Unknown or Inconsistent Pair of S1AP UE ID - S1AP Radio Network Layer cause Unknown or inconsistent pair of S1AP UE ID.
- RadioNetworkLayer_HandoverDesirableForRadioReasons - Radio Network Layer Handover Desirable for Radio Reasons - S1AP Radio Network Layer cause Handover desirable for radio reasons.
- RadioNetworkLayer_TimeCriticalHandover - Radio Network Layer Time Critical Handover - S1AP Radio Network Layer cause Time critical handover.
- RadioNetworkLayer_ResourceOptimisationHandover - Radio Network Layer Resource Optimisation Handover - S1AP Radio Network Layer cause Resource optimisation handover.
- RadioNetworkLayer_ReduceLoadInServingCell - Radio Network Layer Reduce Load in Serving Cell - S1AP Radio Network Layer cause Reduce load in serving cell.
- RadioNetworkLayer_UserInactivity - Radio Network Layer User Inactivity - S1AP Radio Network Layer cause User Inactivity.
- RadioNetworkLayer_RadioConnectionWithUeLost - Radio Network Layer Radio Connection with UE Lost - S1AP Radio Network Layer cause Radio Connection With UE Lost.
- RadioNetworkLayer_LoadBalancingTauRequired - Radio Network Layer Load Balancing TAU Required - S1AP Radio Network Layer cause Load Balancing TAU Required.
- RadioNetworkLayer_CsFallbackTriggered - Radio Network Layer CS Fallback Triggered - S1AP Radio Network Layer cause CS Fallback Triggered.
- RadioNetworkLayer_UeNotAvailableForPsService - Radio Network Layer UE Not Available for PS Service - S1AP Radio Network Layer cause UE Not Available For PS Service.
- RadioNetworkLayer_RadioResourcesNotAvailable - Radio Network Layer Radio Resources Not Available - S1AP Radio Network Layer cause Radio resources not available.
- RadioNetworkLayer_FailureInTheRadioInterfaceProcedure - Radio Network Layer Failure in the Radio Interface Procedure - S1AP Radio Network Layer cause Failure in the Radio Interface Procedure.
- RadioNetworkLayer_InvalidQosCombination - Radio Network Layer Invalid QoS Combination - S1AP Radio Network Layer cause Invalid QoS combination.
- RadioNetworkLayer_InterRatRedirection - Radio Network Layer Inter-RAT Redirection - S1AP Radio Network Layer cause Inter-RAT redirection.
- RadioNetworkLayer_InteractionWithOtherProcedure - Radio Network Layer Interaction with Other Procedure - S1AP Radio Network Layer cause Interaction with other procedure.

- **RadioNetworkLayer_UnknownErabId** - Radio Network Layer Unknown E-RAB ID - S1AP Radio Network Layer cause Unknown E-RAB ID.
- **RadioNetworkLayer_MultipleErabIdInstances** - Radio Network Layer Multiple E-RAB ID Instances - S1AP Radio Network Layer cause Multiple E-RAB ID instances.
- **RadioNetworkLayer_EncryptionAndOrIntegrityProtectionAlgorithmsNotSupported** - Radio Network Layer Encryption and/or Integrity Protection Algorithms Not Supported - S1AP Radio Network Layer cause Encryption and/or Integrity protection algorithms not supported.
- **RadioNetworkLayer_S1IntraSystemHandoverTriggered** - Radio Network Layer S1 Intra System Handover Triggered - S1AP Radio Network Layer cause S1 intra system Handover triggered.
- **RadioNetworkLayer_S1InterSystemHandoverTriggered** - Radio Network Layer S1 Inter System Handover Triggered - S1AP Radio Network Layer cause S1 inter system Handover triggered.
- **RadioNetworkLayer_x2HandoverTriggered** - Radio Network Layer X2 Handover Triggered - S1AP Radio Network Layer cause X2 Handover triggered.
- **RadioNetworkLayer_redirectionTowards1xRtt** - Radio Network Layer Redirection Towards 1xRTT - S1AP Radio Network Layer cause Redirection towards 1xRTT.
- **RadioNetworkLayer_NotSupportedQciValue** - Radio Network Layer Not Supported QCI Value - S1AP Radio Network Layer cause Not Supported QCI Value.
- **RadioNetworkLayer_InvalidCsgId** - Radio Network Layer Invalid CSG Id - S1AP Radio Network Layer cause Invalid CSG Id.
- **RadioNetworkLayer_ReleaseDueToPreEmption** - Radio Network Layer Release Due to Pre-Emption - S1AP Radio Network Layer cause Release due to Pre-Emption.
- **RadioNetworkLayer_N26InterfaceNotAvailable** - Radio Network Layer N26 Interface Not Available - S1AP Radio Network Layer cause N26 interface not available.
- **TransportLayer_TransportResourceUnavailable** - Transport Layer Transport Resource Unavailable - S1AP Transport Layer cause Transport Resource Unavailable.
- **TransportLayer_Unspecified** - Transport Layer Unspecified - S1AP Transport Layer cause Unspecified.
- **Nas_NormalRelease** - NAS Normal Release - S1AP NAS cause Normal Release.
- **Nas_AuthenticationFailure** - NAS Authentication Failure - S1AP NAS cause Authentication failure.
- **Nas_Detach** - NAS Detach - S1AP NAS cause Detach.
- **Nas_Unspecified** - NAS Unspecified - S1AP NAS cause Unspecified.
- **Nas_CsgSubscriptionExpiry** - NAS CSG Subscription Expiry - S1AP NAS cause CSG Subscription Expiry.

- Protocol_TransferSyntaxError - Protocol Transfer Syntax Error - S1AP Protocol cause Transfer Syntax Error.
- Protocol_AbstractSyntaxErrorReject - Protocol Abstract Syntax Error (Reject) - S1AP Protocol cause Abstract Syntax Error (Reject).
- Protocol_AbstractSyntaxErrorIgnoreAndNotify - Protocol Abstract Syntax Error (Ignore and Notify) - S1AP Protocol cause Abstract Syntax Error (Ignore and Notify).
- Protocol_MessageNotCompatibleWithReceiverState - Protocol Message Not Compatible with Receiver State - S1AP Protocol cause Message not Compatible with Receiver State.
- Protocol_SemanticError - Protocol Semantic Error - S1AP Protocol cause Semantic Error.
- Protocol_AbstractSyntaxErrorFalselyConstructedMessage - Protocol Abstract Syntax Error (Falsely Constructed Message) - S1AP Protocol cause Abstract Syntax Error (Falsely Constructed Message).
- Protocol_Unspecified - Protocol Unspecified - S1AP Protocol cause Unspecified.
- Miscellaneous_ControlProcessingOverload - Miscellaneous Control Processing Overload - S1AP Miscellaneous cause Control Processing Overload.
- Miscellaneous_NotEnoughUserPlaneProcessingResources - Miscellaneous Not Enough User Plane Processing Resources - S1AP Miscellaneous cause Not enough User Plane Processing Resources.
- Miscellaneous_HardwareFailure - Miscellaneous Hardware Failure - S1AP Miscellaneous cause Hardware Failure.
- Miscellaneous_OmIntervention - Miscellaneous O&M Intervention - S1AP Miscellaneous cause O&M Intervention.
- Miscellaneous_Unspecified - Miscellaneous Unspecified - S1AP Miscellaneous cause Unspecified.
- Miscellaneous_UnknownPlmn - Miscellaneous Unknown PLMN - S1AP Miscellaneous cause Unknown PLMN.

Default

Disabled

Name

ueCtxtRelInterPlmnTauReject - UE Context Release Command Inter PLMN TAU Reject

Syntax

--ueCtxtRelInterPlmnTauReject <list-item>

Description

S1AP cause code to include on UE context release command when inter PLMN TAU request is rejected.

Class

Optional.

List

- Disabled - The feature is disabled in the corresponding scenario. The MME does not override the S1AP cause code.
- RadioNetworkLayer_Unspecified - Radio Network Layer Unspecified - S1AP Radio Network Layer cause Unspecified.
- RadioNetworkLayer_TX2RelocOverallExpiry - Radio Network Layer TX2 Reloc Overall Expiry - S1AP Radio Network Layer cause TX2 Reloc Overall Expiry.
- RadioNetworkLayer_SuccessfulHandover - Radio Network Layer Successful Handover - S1AP Radio Network Layer cause Successful Handover.
- RadioNetworkLayer_ReleaseDueToEutranGeneratedReason - Radio Network Layer Release Due to E-UTRAN Generated Reason - S1AP Radio Network Layer cause Release Due to E-UTRAN Generated Reason.
- RadioNetworkLayer_HandoverCancelled - Radio Network Layer Handover Cancelled - S1AP Radio Network Layer cause Handover Cancelled.
- RadioNetworkLayer_PartialHandover - Radio Network Layer Partial Handover - S1AP Radio Network Layer cause Partial Handover.
- RadioNetworkLayer_HandoverFailureInTargetEpcEnbOrTargetSystem - Radio Network Layer Handover Failure in Target EPC/eNB or Target System - S1AP Radio Network Layer cause Handover Failure In Target EPC/eNB or Target System.
- RadioNetworkLayer_HandoverTargetNotAllowed - Radio Network Layer Handover Target Not Allowed - S1AP Radio Network Layer cause Handover Target not allowed.
- RadioNetworkLayer_TS1RelocOverallExpiry - Radio Network Layer TS1 Reloc Overall Expiry - S1AP Radio Network Layer cause TS1Relocoverall Expiry.
- RadioNetworkLayer_TS1RelocPrepExpiry - Radio Network Layer TS1 Reloc Prep Expiry - S1AP Radio Network Layer cause TS1RelocPrep Expiry.
- RadioNetworkLayer_CellNotAvailable - Radio Network Layer Cell Not Available - S1AP Radio Network Layer cause Cell Not Available.
- RadioNetworkLayer_UnknownTargetId - Radio Network Layer Unknown Target Id - S1AP Radio Network Layer cause Unknown Target Id.
- RadioNetworkLayer_NoRadioResourcesAvailableInTargetCell - Radio Network Layer No Resources Available in Target Cell - S1AP Radio Network Layer cause No Resources Available in Target Cell.
- RadioNetworkLayer_UnknownOrAlreadyAllocatedMmeUeS1apId - Radio Network Layer Unknown or Already Allocated MME UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated MME UE S1AP ID.
- RadioNetworkLayer_UnknownOrAlreadyAllocatedEnbUeS1apId - Radio Network Layer Unknown or Already Allocated eNB UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated eNB UE S1AP ID.

- **RadioNetworkLayer_UnknownOrInconsistentPairOfUeS1apId** - Radio Network Layer Unknown or Inconsistent Pair of S1AP UE ID - S1AP Radio Network Layer cause Unknown or inconsistent pair of S1AP UE ID.
- **RadioNetworkLayer_HandoverDesirableForRadioReasons** - Radio Network Layer Handover Desirable for Radio Reasons - S1AP Radio Network Layer cause Handover desirable for radio reasons.
- **RadioNetworkLayer_TimeCriticalHandover** - Radio Network Layer Time Critical Handover - S1AP Radio Network Layer cause Time critical handover.
- **RadioNetworkLayer_ResourceOptimisationHandover** - Radio Network Layer Resource Optimisation Handover - S1AP Radio Network Layer cause Resource optimisation handover.
- **RadioNetworkLayer_ReduceLoadInServingCell** - Radio Network Layer Reduce Load in Serving Cell - S1AP Radio Network Layer cause Reduce load in serving cell.
- **RadioNetworkLayer_UserInactivity** - Radio Network Layer User Inactivity - S1AP Radio Network Layer cause User Inactivity.
- **RadioNetworkLayer_RadioConnectionWithUeLost** - Radio Network Layer Radio Connection with UE Lost - S1AP Radio Network Layer cause Radio Connection With UE Lost.
- **RadioNetworkLayer_LoadBalancingTauRequired** - Radio Network Layer Load Balancing TAU Required - S1AP Radio Network Layer cause Load Balancing TAU Required.
- **RadioNetworkLayer_CsFallbackTriggered** - Radio Network Layer CS Fallback Triggered - S1AP Radio Network Layer cause CS Fallback Triggered.
- **RadioNetworkLayer_UeNotAvailableForPsService** - Radio Network Layer UE Not Available for PS Service - S1AP Radio Network Layer cause UE Not Available For PS Service.
- **RadioNetworkLayer_RadioResourcesNotAvailable** - Radio Network Layer Radio Resources Not Available - S1AP Radio Network Layer cause Radio resources not available.
- **RadioNetworkLayer_FailureInTheRadioInterfaceProcedure** - Radio Network Layer Failure in the Radio Interface Procedure - S1AP Radio Network Layer cause Failure in the Radio Interface Procedure.
- **RadioNetworkLayer_InvalidQosCombination** - Radio Network Layer Invalid QoS Combination - S1AP Radio Network Layer cause Invalid QoS combination.
- **RadioNetworkLayer_InterRatRedirection** - Radio Network Layer Inter-RAT Redirection - S1AP Radio Network Layer cause Inter-RAT redirection.
- **RadioNetworkLayer_InteractionWithOtherProcedure** - Radio Network Layer Interaction with Other Procedure - S1AP Radio Network Layer cause Interaction with other procedure.

- **RadioNetworkLayer_UnknownErabId** - Radio Network Layer Unknown E-RAB ID - S1AP Radio Network Layer cause Unknown E-RAB ID.
- **RadioNetworkLayer_MultipleErabIdInstances** - Radio Network Layer Multiple E-RAB ID Instances - S1AP Radio Network Layer cause Multiple E-RAB ID instances.
- **RadioNetworkLayer_EncryptionAndOrIntegrityProtectionAlgorithmsNotSupported** - Radio Network Layer Encryption and/or Integrity Protection Algorithms Not Supported - S1AP Radio Network Layer cause Encryption and/or Integrity protection algorithms not supported.
- **RadioNetworkLayer_S1IntraSystemHandoverTriggered** - Radio Network Layer S1 Intra System Handover Triggered - S1AP Radio Network Layer cause S1 intra system Handover triggered.
- **RadioNetworkLayer_S1InterSystemHandoverTriggered** - Radio Network Layer S1 Inter System Handover Triggered - S1AP Radio Network Layer cause S1 inter system Handover triggered.
- **RadioNetworkLayer_x2HandoverTriggered** - Radio Network Layer X2 Handover Triggered - S1AP Radio Network Layer cause X2 Handover triggered.
- **RadioNetworkLayer_redirectionTowards1xRtt** - Radio Network Layer Redirection Towards 1xRTT - S1AP Radio Network Layer cause Redirection towards 1xRTT.
- **RadioNetworkLayer_NotSupportedQciValue** - Radio Network Layer Not Supported QCI Value - S1AP Radio Network Layer cause Not Supported QCI Value.
- **RadioNetworkLayer_InvalidCsgId** - Radio Network Layer Invalid CSG Id - S1AP Radio Network Layer cause Invalid CSG Id.
- **RadioNetworkLayer_ReleaseDueToPreEmption** - Radio Network Layer Release Due to Pre-Emption - S1AP Radio Network Layer cause Release due to Pre-Emption.
- **RadioNetworkLayer_N26InterfaceNotAvailable** - Radio Network Layer N26 Interface Not Available - S1AP Radio Network Layer cause N26 interface not available.
- **TransportLayer_TransportResourceUnavailable** - Transport Layer Transport Resource Unavailable - S1AP Transport Layer cause Transport Resource Unavailable.
- **TransportLayer_Unspecified** - Transport Layer Unspecified - S1AP Transport Layer cause Unspecified.
- **Nas_NormalRelease** - NAS Normal Release - S1AP NAS cause Normal Release.
- **Nas_AuthenticationFailure** - NAS Authentication Failure - S1AP NAS cause Authentication failure.
- **Nas_Detach** - NAS Detach - S1AP NAS cause Detach.
- **Nas_Unspecified** - NAS Unspecified - S1AP NAS cause Unspecified.
- **Nas_CsgSubscriptionExpiry** - NAS CSG Subscription Expiry - S1AP NAS cause CSG Subscription Expiry.

- Miscellaneous_OmIntervention - Miscellaneous O&M Intervention - S1AP Miscellaneous cause O&M Intervention.
- Miscellaneous_Unspecified - Miscellaneous Unspecified - S1AP Miscellaneous cause Unspecified.
- Miscellaneous_UnknownPlmn - Miscellaneous Unknown PLMN - S1AP Miscellaneous cause Unknown PLMN.

Default

Disabled

Name

ueCtxtRelIntraMmeHoFailure - UE Context Release Command Intra MME Handover Failure

Syntax

--ueCtxtRelIntraMmeHoFailure <list-item>

Description

The S1AP cause the MME includes on UE context release command on message level, when the S1 is released due to a failure during intra MME handover.

Class

Optional.

List

- Disabled - The feature is disabled in the corresponding scenario. The MME does not override the S1AP cause code.
- RadioNetworkLayer_Unspecified - Radio Network Layer Unspecified - S1AP Radio Network Layer cause Unspecified.
- RadioNetworkLayer_TX2RelocOverallExpiry - Radio Network Layer TX2 Reloc Overall Expiry - S1AP Radio Network Layer cause TX2 Reloc Overall Expiry.
- RadioNetworkLayer_SuccessfulHandover - Radio Network Layer Successful Handover - S1AP Radio Network Layer cause Successful Handover.
- RadioNetworkLayer_ReleaseDueToEutranGeneratedReason - Radio Network Layer Release Due to E-UTRAN Generated Reason - S1AP Radio Network Layer cause Release Due to E-UTRAN Generated Reason.
- RadioNetworkLayer_HandoverCancelled - Radio Network Layer Handover Cancelled - S1AP Radio Network Layer cause Handover Cancelled.
- RadioNetworkLayer_PartialHandover - Radio Network Layer Partial Handover - S1AP Radio Network Layer cause Partial Handover.
- RadioNetworkLayer_HandoverFailureInTargetEpcEnbOrTargetSystem - Radio Network Layer Handover Failure in Target EPC/eNB or Target System - S1AP Radio Network Layer cause Handover Failure In Target EPC/eNB or Target System.
- RadioNetworkLayer_HandoverTargetNotAllowed - Radio Network Layer Handover Target Not Allowed - S1AP Radio Network Layer cause Handover Target not allowed.
- RadioNetworkLayer_TS1RelocOverallExpiry - Radio Network Layer TS1 Reloc Overall Expiry - S1AP Radio Network Layer cause TS1Relocoverall Expiry.
- RadioNetworkLayer_TS1RelocPrepExpiry - Radio Network Layer TS1 Reloc Prep Expiry - S1AP Radio Network Layer cause TS1RelocPrep Expiry.
- RadioNetworkLayer_CellNotAvailable - Radio Network Layer Cell Not Available - S1AP Radio Network Layer cause Cell Not Available.
- RadioNetworkLayer_UnknownTargetId - Radio Network Layer Unknown Target Id - S1AP Radio Network Layer cause Unknown Target Id.
- RadioNetworkLayer_NoRadioResourcesAvailableInTargetCell - Radio Network Layer No Resources Available in Target Cell - S1AP Radio Network Layer cause No Resources Available in Target Cell.
- RadioNetworkLayer_UnknownOrAlreadyAllocatedMmeUeS1apId - Radio Network Layer Unknown or Already Allocated MME UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated MME UE S1AP ID.
- RadioNetworkLayer_UnknownOrAlreadyAllocatedEnbUeS1apId - Radio Network Layer Unknown or Already Allocated eNB UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated eNB UE S1AP ID.

- RadioNetworkLayer_UnknownOrInconsistentPairOfUeS1apId - Radio Network Layer Unknown or Inconsistent Pair of S1AP UE ID - S1AP Radio Network Layer cause Unknown or inconsistent pair of S1AP UE ID.
- RadioNetworkLayer_HandoverDesirableForRadioReasons - Radio Network Layer Handover Desirable for Radio Reasons - S1AP Radio Network Layer cause Handover desirable for radio reasons.
- RadioNetworkLayer_TimeCriticalHandover - Radio Network Layer Time Critical Handover - S1AP Radio Network Layer cause Time critical handover.
- RadioNetworkLayer_ResourceOptimisationHandover - Radio Network Layer Resource Optimisation Handover - S1AP Radio Network Layer cause Resource optimisation handover.
- RadioNetworkLayer_ReduceLoadInServingCell - Radio Network Layer Reduce Load in Serving Cell - S1AP Radio Network Layer cause Reduce load in serving cell.
- RadioNetworkLayer_UserInactivity - Radio Network Layer User Inactivity - S1AP Radio Network Layer cause User Inactivity.
- RadioNetworkLayer_RadioConnectionWithUeLost - Radio Network Layer Radio Connection with UE Lost - S1AP Radio Network Layer cause Radio Connection With UE Lost.
- RadioNetworkLayer_LoadBalancingTauRequired - Radio Network Layer Load Balancing TAU Required - S1AP Radio Network Layer cause Load Balancing TAU Required.
- RadioNetworkLayer_CsFallbackTriggered - Radio Network Layer CS Fallback Triggered - S1AP Radio Network Layer cause CS Fallback Triggered.
- RadioNetworkLayer_UeNotAvailableForPsService - Radio Network Layer UE Not Available for PS Service - S1AP Radio Network Layer cause UE Not Available For PS Service.
- RadioNetworkLayer_RadioResourcesNotAvailable - Radio Network Layer Radio Resources Not Available - S1AP Radio Network Layer cause Radio resources not available.
- RadioNetworkLayer_FailureInTheRadioInterfaceProcedure - Radio Network Layer Failure in the Radio Interface Procedure - S1AP Radio Network Layer cause Failure in the Radio Interface Procedure.
- RadioNetworkLayer_InvalidQosCombination - Radio Network Layer Invalid QoS Combination - S1AP Radio Network Layer cause Invalid QoS combination.
- RadioNetworkLayer_InterRatRedirection - Radio Network Layer Inter-RAT Redirection - S1AP Radio Network Layer cause Inter-RAT redirection.
- RadioNetworkLayer_InteractionWithOtherProcedure - Radio Network Layer Interaction with Other Procedure - S1AP Radio Network Layer cause Interaction with other procedure.

- **RadioNetworkLayer_UnknownErabId** - Radio Network Layer Unknown E-RAB ID - S1AP Radio Network Layer cause Unknown E-RAB ID.
- **RadioNetworkLayer_MultipleErabIdInstances** - Radio Network Layer Multiple E-RAB ID Instances - S1AP Radio Network Layer cause Multiple E-RAB ID instances.
- **RadioNetworkLayer_EncryptionAndOrIntegrityProtectionAlgorithmsNotSupported** - Radio Network Layer Encryption and/or Integrity Protection Algorithms Not Supported - S1AP Radio Network Layer cause Encryption and/or Integrity protection algorithms not supported.
- **RadioNetworkLayer_S1IntraSystemHandoverTriggered** - Radio Network Layer S1 Intra System Handover Triggered - S1AP Radio Network Layer cause S1 intra system Handover triggered.
- **RadioNetworkLayer_S1InterSystemHandoverTriggered** - Radio Network Layer S1 Inter System Handover Triggered - S1AP Radio Network Layer cause S1 inter system Handover triggered.
- **RadioNetworkLayer_x2HandoverTriggered** - Radio Network Layer X2 Handover Triggered - S1AP Radio Network Layer cause X2 Handover triggered.
- **RadioNetworkLayer_redirectionTowards1xRtt** - Radio Network Layer Redirection Towards 1xRTT - S1AP Radio Network Layer cause Redirection towards 1xRTT.
- **RadioNetworkLayer_NotSupportedQciValue** - Radio Network Layer Not Supported QCI Value - S1AP Radio Network Layer cause Not Supported QCI Value.
- **RadioNetworkLayer_InvalidCsgId** - Radio Network Layer Invalid CSG Id - S1AP Radio Network Layer cause Invalid CSG Id.
- **RadioNetworkLayer_ReleaseDueToPreEmption** - Radio Network Layer Release Due to Pre-Emption - S1AP Radio Network Layer cause Release due to Pre-Emption.
- **RadioNetworkLayer_N26InterfaceNotAvailable** - Radio Network Layer N26 Interface Not Available - S1AP Radio Network Layer cause N26 interface not available.
- **TransportLayer_TransportResourceUnavailable** - Transport Layer Transport Resource Unavailable - S1AP Transport Layer cause Transport Resource Unavailable.
- **TransportLayer_Unspecified** - Transport Layer Unspecified - S1AP Transport Layer cause Unspecified.
- **Nas_NormalRelease** - NAS Normal Release - S1AP NAS cause Normal Release.
- **Nas_AuthenticationFailure** - NAS Authentication Failure - S1AP NAS cause Authentication failure.
- **Nas_Detach** - NAS Detach - S1AP NAS cause Detach.
- **Nas_Unspecified** - NAS Unspecified - S1AP NAS cause Unspecified.
- **Nas_CsgSubscriptionExpiry** - NAS CSG Subscription Expiry - S1AP NAS cause CSG Subscription Expiry.

- Protocol_TransferSyntaxError - Protocol Transfer Syntax Error - S1AP Protocol cause Transfer Syntax Error.
- Protocol_AbstractSyntaxErrorReject - Protocol Abstract Syntax Error (Reject) - S1AP Protocol cause Abstract Syntax Error (Reject).
- Protocol_AbstractSyntaxErrorIgnoreAndNotify - Protocol Abstract Syntax Error (Ignore and Notify) - S1AP Protocol cause Abstract Syntax Error (Ignore and Notify).
- Protocol_MessageNotCompatibleWithReceiverState - Protocol Message Not Compatible with Receiver State - S1AP Protocol cause Message not Compatible with Receiver State.
- Protocol_SemanticError - Protocol Semantic Error - S1AP Protocol cause Semantic Error.
- Protocol_AbstractSyntaxErrorFalselyConstructedMessage - Protocol Abstract Syntax Error (Falsely Constructed Message) - S1AP Protocol cause Abstract Syntax Error (Falsely Constructed Message).
- Protocol_Unspecified - Protocol Unspecified - S1AP Protocol cause Unspecified.
- Miscellaneous_ControlProcessingOverload - Miscellaneous Control Processing Overload - S1AP Miscellaneous cause Control Processing Overload.
- Miscellaneous_NotEnoughUserPlaneProcessingResources - Miscellaneous Not Enough User Plane Processing Resources - S1AP Miscellaneous cause Not enough User Plane Processing Resources.
- Miscellaneous_HardwareFailure - Miscellaneous Hardware Failure - S1AP Miscellaneous cause Hardware Failure.
- Miscellaneous_OmIntervention - Miscellaneous O&M Intervention - S1AP Miscellaneous cause O&M Intervention.
- Miscellaneous_Unspecified - Miscellaneous Unspecified - S1AP Miscellaneous cause Unspecified.
- Miscellaneous_UnknownPlmn - Miscellaneous Unknown PLMN - S1AP Miscellaneous cause Unknown PLMN.

Default

Disabled

Name

ueCtxtRelIpVerMismatch - UE Context Release Command IP Version Mismatch

Syntax

--ueCtxtRelIpVerMismatch <list-item>

Description

S1AP cause code to include on UE context release command when IPv4 only allowed, IPv6 only allowed or IP version mismatch during Attach, Service request or TAU.

Class

Optional.

List

- Disabled - The feature is disabled in the corresponding scenario. The MME does not override the S1AP cause code.
- RadioNetworkLayer_Unspecified - Radio Network Layer Unspecified - S1AP Radio Network Layer cause Unspecified.

- RadioNetworkLayer_SuccessfulHandover - Radio Network Layer Successful Handover - S1AP Radio Network Layer cause Successful Handover.
- RadioNetworkLayer_ReleaseDueToEutranGeneratedReason - Radio Network Layer Release Due to E-UTRAN Generated Reason - S1AP Radio Network Layer cause Release Due to E-UTRAN Generated Reason.
- RadioNetworkLayer_HandoverCancelled - Radio Network Layer Handover Cancelled - S1AP Radio Network Layer cause Handover Cancelled.
- RadioNetworkLayer_PartialHandover - Radio Network Layer Partial Handover - S1AP Radio Network Layer cause Partial Handover.
- RadioNetworkLayer_HandoverFailureInTargetEpcEnbOrTargetSystem - Radio Network Layer Handover Failure in Target EPC/eNB or Target System - S1AP Radio Network Layer cause Handover Failure In Target EPC/eNB or Target System.
- RadioNetworkLayer_HandoverTargetNotAllowed - Radio Network Layer Handover Target Not Allowed - S1AP Radio Network Layer cause Handover Target not allowed.
- RadioNetworkLayer_TS1RelocOverallExpiry - Radio Network Layer TS1 Reloc Overall Expiry - S1AP Radio Network Layer cause TS1Relocoverall Expiry.
- RadioNetworkLayer_TS1RelocPrepExpiry - Radio Network Layer TS1 Reloc Prep Expiry - S1AP Radio Network Layer cause TS1RelocPrep Expiry.
- RadioNetworkLayer_CellNotAvailable - Radio Network Layer Cell Not Available - S1AP Radio Network Layer cause Cell Not Available.
- RadioNetworkLayer_UnknownTargetId - Radio Network Layer Unknown Target Id - S1AP Radio Network Layer cause Unknown Target Id.
- RadioNetworkLayer_NoRadioResourcesAvailableInTargetCell - Radio Network Layer No Resources Available in Target Cell - S1AP Radio Network Layer cause No Resources Available in Target Cell.
- RadioNetworkLayer_UnknownOrAlreadyAllocatedMmeUeS1apId - Radio Network Layer Unknown or Already Allocated MME UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated MME UE S1AP ID.
- RadioNetworkLayer_UnknownOrAlreadyAllocatedEnbUeS1apId - Radio Network Layer Unknown or Already Allocated eNB UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated eNB UE S1AP ID.

- RadioNetworkLayer_UnknownOrInconsistentPairOfUeS1apId - Radio Network Layer Unknown or Inconsistent Pair of S1AP UE ID - S1AP Radio Network Layer cause Unknown or inconsistent pair of S1AP UE ID.
- RadioNetworkLayer_HandoverDesirableForRadioReasons - Radio Network Layer Handover Desirable for Radio Reasons - S1AP Radio Network Layer cause Handover desirable for radio reasons.
- RadioNetworkLayer_TimeCriticalHandover - Radio Network Layer Time Critical Handover - S1AP Radio Network Layer cause Time critical handover.
- RadioNetworkLayer_ResourceOptimisationHandover - Radio Network Layer Resource Optimisation Handover - S1AP Radio Network Layer cause Resource optimisation handover.
- RadioNetworkLayer_ReduceLoadInServingCell - Radio Network Layer Reduce Load in Serving Cell - S1AP Radio Network Layer cause Reduce load in serving cell.
- RadioNetworkLayer_UserInactivity - Radio Network Layer User Inactivity - S1AP Radio Network Layer cause User Inactivity.
- RadioNetworkLayer_RadioConnectionWithUeLost - Radio Network Layer Radio Connection with UE Lost - S1AP Radio Network Layer cause Radio Connection With UE Lost.
- RadioNetworkLayer_LoadBalancingTauRequired - Radio Network Layer Load Balancing TAU Required - S1AP Radio Network Layer cause Load Balancing TAU Required.
- RadioNetworkLayer_CsFallbackTriggered - Radio Network Layer CS Fallback Triggered - S1AP Radio Network Layer cause CS Fallback Triggered.
- RadioNetworkLayer_UeNotAvailableForPsService - Radio Network Layer UE Not Available for PS Service - S1AP Radio Network Layer cause UE Not Available For PS Service.
- RadioNetworkLayer_RadioResourcesNotAvailable - Radio Network Layer Radio Resources Not Available - S1AP Radio Network Layer cause Radio resources not available.
- RadioNetworkLayer_FailureInTheRadioInterfaceProcedure - Radio Network Layer Failure in the Radio Interface Procedure - S1AP Radio Network Layer cause Failure in the Radio Interface Procedure.
- RadioNetworkLayer_InvalidQosCombination - Radio Network Layer Invalid QoS Combination - S1AP Radio Network Layer cause Invalid QoS combination.
- RadioNetworkLayer_InterRatRedirection - Radio Network Layer Inter-RAT Redirection - S1AP Radio Network Layer cause Inter-RAT redirection.
- RadioNetworkLayer_InteractionWithOtherProcedure - Radio Network Layer Interaction with Other Procedure - S1AP Radio Network Layer cause Interaction with other procedure.

- **RadioNetworkLayer_UnknownErabId** - Radio Network Layer Unknown E-RAB ID - S1AP Radio Network Layer cause Unknown E-RAB ID.
- **RadioNetworkLayer_MultipleErabIdInstances** - Radio Network Layer Multiple E-RAB ID Instances - S1AP Radio Network Layer cause Multiple E-RAB ID instances.
- **RadioNetworkLayer_EncryptionAndOrIntegrityProtectionAlgorithmsNotSupported** - Radio Network Layer Encryption and/or Integrity Protection Algorithms Not Supported - S1AP Radio Network Layer cause Encryption and/or Integrity protection algorithms not supported.
- **RadioNetworkLayer_S1IntraSystemHandoverTriggered** - Radio Network Layer S1 Intra System Handover Triggered - S1AP Radio Network Layer cause S1 intra system Handover triggered.
- **RadioNetworkLayer_S1InterSystemHandoverTriggered** - Radio Network Layer S1 Inter System Handover Triggered - S1AP Radio Network Layer cause S1 inter system Handover triggered.
- **RadioNetworkLayer_x2HandoverTriggered** - Radio Network Layer X2 Handover Triggered - S1AP Radio Network Layer cause X2 Handover triggered.
- **RadioNetworkLayer_redirectionTowards1xRtt** - Radio Network Layer Redirection Towards 1xRTT - S1AP Radio Network Layer cause Redirection towards 1xRTT.
- **RadioNetworkLayer_NotSupportedQciValue** - Radio Network Layer Not Supported QCI Value - S1AP Radio Network Layer cause Not Supported QCI Value.
- **RadioNetworkLayer_InvalidCsgId** - Radio Network Layer Invalid CSG Id - S1AP Radio Network Layer cause Invalid CSG Id.
- **RadioNetworkLayer_ReleaseDueToPreEmption** - Radio Network Layer Release Due to Pre-Emption - S1AP Radio Network Layer cause Release due to Pre-Emption.
- **RadioNetworkLayer_N26InterfaceNotAvailable** - Radio Network Layer N26 Interface Not Available - S1AP Radio Network Layer cause N26 interface not available.
- **TransportLayer_TransportResourceUnavailable** - Transport Layer Transport Resource Unavailable - S1AP Transport Layer cause Transport Resource Unavailable.
- **TransportLayer_Unspecified** - Transport Layer Unspecified - S1AP Transport Layer cause Unspecified.
- **Nas_NormalRelease** - NAS Normal Release - S1AP NAS cause Normal Release.
- **Nas_AuthenticationFailure** - NAS Authentication Failure - S1AP NAS cause Authentication failure.
- **Nas_Detach** - NAS Detach - S1AP NAS cause Detach.
- **Nas_Unspecified** - NAS Unspecified - S1AP NAS cause Unspecified.
- **Nas_CsgSubscriptionExpiry** - NAS CSG Subscription Expiry - S1AP NAS cause CSG Subscription Expiry.

- Protocol_TransferSyntaxError - Protocol Transfer Syntax Error - S1AP Protocol cause Transfer Syntax Error.
- Protocol_AbstractSyntaxErrorReject - Protocol Abstract Syntax Error (Reject) - S1AP Protocol cause Abstract Syntax Error (Reject).
- Protocol_AbstractSyntaxErrorIgnoreAndNotify - Protocol Abstract Syntax Error (Ignore and Notify) - S1AP Protocol cause Abstract Syntax Error (Ignore and Notify).
- Protocol_MessageNotCompatibleWithReceiverState - Protocol Message Not Compatible with Receiver State - S1AP Protocol cause Message not Compatible with Receiver State.
- Protocol_SemanticError - Protocol Semantic Error - S1AP Protocol cause Semantic Error.
- Protocol_AbstractSyntaxErrorFalselyConstructedMessage - Protocol Abstract Syntax Error (Falsely Constructed Message) - S1AP Protocol cause Abstract Syntax Error (Falsely Constructed Message).
- Protocol_Unspecified - Protocol Unspecified - S1AP Protocol cause Unspecified.
- Miscellaneous_ControlProcessingOverload - Miscellaneous Control Processing Overload - S1AP Miscellaneous cause Control Processing Overload.
- Miscellaneous_NotEnoughUserPlaneProcessingResources - Miscellaneous Not Enough User Plane Processing Resources - S1AP Miscellaneous cause Not enough User Plane Processing Resources.
- Miscellaneous_HardwareFailure - Miscellaneous Hardware Failure - S1AP Miscellaneous cause Hardware Failure.
- Miscellaneous_OmIntervention - Miscellaneous O&M Intervention - S1AP Miscellaneous cause O&M Intervention.
- Miscellaneous_Unspecified - Miscellaneous Unspecified - S1AP Miscellaneous cause Unspecified.
- Miscellaneous_UnknownPlmn - Miscellaneous Unknown PLMN - S1AP Miscellaneous cause Unknown PLMN.

Default

Disabled

Name

ueCtxtRelLteBarAllPacketOdb - UE Context Release Command ODB All Packet Oriented Services Barred

Syntax

--ueCtxtRelLteBarAllPacketOdb <list-item>

Description

S1AP cause code to include on UE context release command when in LTE all packet oriented services are barred.

Class

Optional.

List

- Disabled - The feature is disabled in the corresponding scenario. The MME does not override the S1AP cause code.
- RadioNetworkLayer_Unspecified - Radio Network Layer Unspecified - S1AP Radio Network Layer cause Unspecified.
- RadioNetworkLayer_TX2RelocOverallExpiry - Radio Network Layer TX2 Reloc Overall Expiry - S1AP Radio Network Layer cause TX2 Reloc Overall Expiry.
- RadioNetworkLayer_SuccessfulHandover - Radio Network Layer Successful Handover - S1AP Radio Network Layer cause Successful Handover.
- RadioNetworkLayer_ReleaseDueToEutranGeneratedReason - Radio Network Layer Release Due to E-UTRAN Generated Reason - S1AP Radio Network Layer cause Release Due to E-UTRAN Generated Reason.
- RadioNetworkLayer_HandoverCancelled - Radio Network Layer Handover Cancelled - S1AP Radio Network Layer cause Handover Cancelled.
- RadioNetworkLayer_PartialHandover - Radio Network Layer Partial Handover - S1AP Radio Network Layer cause Partial Handover.
- RadioNetworkLayer_HandoverFailureInTargetEpcEnbOrTargetSystem - Radio Network Layer Handover Failure in Target EPC/eNB or Target System - S1AP Radio Network Layer cause Handover Failure In Target EPC/eNB or Target System.
- RadioNetworkLayer_HandoverTargetNotAllowed - Radio Network Layer Handover Target Not Allowed - S1AP Radio Network Layer cause Handover Target not allowed.
- RadioNetworkLayer_TS1RelocOverallExpiry - Radio Network Layer TS1 Reloc Overall Expiry - S1AP Radio Network Layer cause TS1Relocoverall Expiry.
- RadioNetworkLayer_TS1RelocPrepExpiry - Radio Network Layer TS1 Reloc Prep Expiry - S1AP Radio Network Layer cause TS1RelocPrep Expiry.
- RadioNetworkLayer_CellNotAvailable - Radio Network Layer Cell Not Available - S1AP Radio Network Layer cause Cell Not Available.
- RadioNetworkLayer_UnknownTargetId - Radio Network Layer Unknown Target Id - S1AP Radio Network Layer cause Unknown Target Id.
- RadioNetworkLayer_NoRadioResourcesAvailableInTargetCell - Radio Network Layer No Resources Available in Target Cell - S1AP Radio Network Layer cause No Resources Available in Target Cell.
- RadioNetworkLayer_UnknownOrAlreadyAllocatedMmeUeS1apId - Radio Network Layer Unknown or Already Allocated MME UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated MME UE S1AP ID.

- **RadioNetworkLayer_UnknownOrAlreadyAllocatedEnbUeS1apId** - Radio Network Layer Unknown or Already Allocated eNB UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated eNB UE S1AP ID.
- **RadioNetworkLayer_UnknownOrInconsistentPairOfUeS1apId** - Radio Network Layer Unknown or Inconsistent Pair of S1AP UE ID - S1AP Radio Network Layer cause Unknown or inconsistent pair of S1AP UE ID.
- **RadioNetworkLayer_HandoverDesirableForRadioReasons** - Radio Network Layer Handover Desirable for Radio Reasons - S1AP Radio Network Layer cause Handover desirable for radio reasons.
- **RadioNetworkLayer_TimeCriticalHandover** - Radio Network Layer Time Critical Handover - S1AP Radio Network Layer cause Time critical handover.
- **RadioNetworkLayer_ResourceOptimisationHandover** - Radio Network Layer Resource Optimisation Handover - S1AP Radio Network Layer cause Resource optimisation handover.
- **RadioNetworkLayer_ReduceLoadInServingCell** - Radio Network Layer Reduce Load in Serving Cell - S1AP Radio Network Layer cause Reduce load in serving cell.
- **RadioNetworkLayer_UserInactivity** - Radio Network Layer User Inactivity - S1AP Radio Network Layer cause User Inactivity.
- **RadioNetworkLayer_RadioConnectionWithUeLost** - Radio Network Layer Radio Connection with UE Lost - S1AP Radio Network Layer cause Radio Connection With UE Lost.
- **RadioNetworkLayer_LoadBalancingTauRequired** - Radio Network Layer Load Balancing TAU Required - S1AP Radio Network Layer cause Load Balancing TAU Required.
- **RadioNetworkLayer_CsFallbackTriggered** - Radio Network Layer CS Fallback Triggered - S1AP Radio Network Layer cause CS Fallback Triggered.
- **RadioNetworkLayer_UeNotAvailableForPsService** - Radio Network Layer UE Not Available for PS Service - S1AP Radio Network Layer cause UE Not Available For PS Service.
- **RadioNetworkLayer_RadioResourcesNotAvailable** - Radio Network Layer Radio Resources Not Available - S1AP Radio Network Layer cause Radio resources not available.
- **RadioNetworkLayer_FailureInTheRadioInterfaceProcedure** - Radio Network Layer Failure in the Radio Interface Procedure - S1AP Radio Network Layer cause Failure in the Radio Interface Procedure.
- **RadioNetworkLayer_InvalidQosCombination** - Radio Network Layer Invalid QoS Combination - S1AP Radio Network Layer cause Invalid QoS combination.
- **RadioNetworkLayer_InterRatRedirection** - Radio Network Layer Inter-RAT Redirection - S1AP Radio Network Layer cause Inter-RAT redirection.

- RadioNetworkLayer_InteractionWithOtherProcedure - Radio Network Layer Interaction with Other Procedure - S1AP Radio Network Layer cause Interaction with other procedure.
- RadioNetworkLayer_UnknownErbId - Radio Network Layer Unknown E-RAB ID - S1AP Radio Network Layer cause Unknown E-RAB ID.
- RadioNetworkLayer_MultipleErbIdInstances - Radio Network Layer Multiple E-RAB ID Instances - S1AP Radio Network Layer cause Multiple E-RAB ID instances.
- RadioNetworkLayer_EncryptionAndOrIntegrityProtectionAlgorithmsNotSupported - Radio Network Layer Encryption and/or Integrity Protection Algorithms Not Supported - S1AP Radio Network Layer cause Encryption and/or Integrity protection algorithms not supported.
- RadioNetworkLayer_S1IntraSystemHandoverTriggered - Radio Network Layer S1 Intra System Handover Triggered - S1AP Radio Network Layer cause S1 intra system Handover triggered.
- RadioNetworkLayer_S1InterSystemHandoverTriggered - Radio Network Layer S1 Inter System Handover Triggered - S1AP Radio Network Layer cause S1 inter system Handover triggered.
- RadioNetworkLayer_x2HandoverTriggered - Radio Network Layer X2 Handover Triggered - S1AP Radio Network Layer cause X2 Handover triggered.
- RadioNetworkLayer_redirectionTowards1xRtt - Radio Network Layer Redirection Towards 1xRTT - S1AP Radio Network Layer cause Redirection towards 1xRTT.
- RadioNetworkLayer_NotSupportedQciValue - Radio Network Layer Not Supported QCI Value - S1AP Radio Network Layer cause Not Supported QCI Value.
- RadioNetworkLayer_InvalidCsgId - Radio Network Layer Invalid CSG Id - S1AP Radio Network Layer cause Invalid CSG Id.
- RadioNetworkLayer_ReleaseDueToPreEmption - Radio Network Layer Release Due to Pre-Emption - S1AP Radio Network Layer cause Release due to Pre-Emption.
- RadioNetworkLayer_N26InterfaceNotAvailable - Radio Network Layer N26 Interface Not Available - S1AP Radio Network Layer cause N26 interface not available.
- TransportLayer_TransportResourceUnavailable - Transport Layer Transport Resource Unavailable - S1AP Transport Layer cause Transport Resource Unavailable.
- TransportLayer_Unspecified - Transport Layer Unspecified - S1AP Transport Layer cause Unspecified.
- Nas_NormalRelease - NAS Normal Release - S1AP NAS cause Normal Release.
- Nas_AuthenticationFailure - NAS Authentication Failure - S1AP NAS cause Authentication failure.
- Nas_Detach - NAS Detach - S1AP NAS cause Detach.

- Nas_Unspecified - NAS Unspecified - S1AP NAS cause Unspecified.
- Nas_CsgSubscriptionExpiry - NAS CSG Subscription Expiry - S1AP NAS cause CSG Subscription Expiry.
- Protocol_TransferSyntaxError - Protocol Transfer Syntax Error - S1AP Protocol cause Transfer Syntax Error.
- Protocol_AbstractSyntaxErrorReject - Protocol Abstract Syntax Error (Reject) - S1AP Protocol cause Abstract Syntax Error (Reject).
- Protocol_AbstractSyntaxErrorIgnoreAndNotify - Protocol Abstract Syntax Error (Ignore and Notify) - S1AP Protocol cause Abstract Syntax Error (Ignore and Notify).
- Protocol_MessageNotCompatibleWithReceiverState - Protocol Message Not Compatible with Receiver State - S1AP Protocol cause Message not Compatible with Receiver State.
- Protocol_SemanticError - Protocol Semantic Error - S1AP Protocol cause Semantic Error.
- Protocol_AbstractSyntaxErrorFalselyConstructedMessage - Protocol Abstract Syntax Error (Falsely Constructed Message) - S1AP Protocol cause Abstract Syntax Error (Falsely Constructed Message).
- Protocol_Unspecified - Protocol Unspecified - S1AP Protocol cause Unspecified.
- Miscellaneous_ControlProcessingOverload - Miscellaneous Control Processing Overload - S1AP Miscellaneous cause Control Processing Overload.
- Miscellaneous_NotEnoughUserPlaneProcessingResources - Miscellaneous Not Enough User Plane Processing Resources - S1AP Miscellaneous cause Not enough User Plane Processing Resources.
- Miscellaneous_HardwareFailure - Miscellaneous Hardware Failure - S1AP Miscellaneous cause Hardware Failure.
- Miscellaneous_OmIntervention - Miscellaneous O&M Intervention - S1AP Miscellaneous cause O&M Intervention.
- Miscellaneous_Unspecified - Miscellaneous Unspecified - S1AP Miscellaneous cause Unspecified.
- Miscellaneous_UnknownPlmn - Miscellaneous Unknown PLMN - S1AP Miscellaneous cause Unknown PLMN.

Default

Disabled

Name

ueCtxtRelLtemNotAllowed - UE Context Release Command LTE-M Not Allowed

Syntax

--ueCtxtRelLtemNotAllowed <list-item>

Description

S1AP cause code to include on UE context release command when the UE is not allowed in LTE-M access.

Class

Optional.

List

- Disabled - The feature is disabled in the corresponding scenario. The MME does not override the S1AP cause code.
- RadioNetworkLayer_Unspecified - Radio Network Layer Unspecified - S1AP Radio Network Layer cause Unspecified.
- RadioNetworkLayer_TX2RelocOverallExpiry - Radio Network Layer TX2 Reloc Overall Expiry - S1AP Radio Network Layer cause TX2 Reloc Overall Expiry.
- RadioNetworkLayer_SuccessfulHandover - Radio Network Layer Successful Handover - S1AP Radio Network Layer cause Successful Handover.
- RadioNetworkLayer_ReleaseDueToEutranGeneratedReason - Radio Network Layer Release Due to E-UTRAN Generated Reason - S1AP Radio Network Layer cause Release Due to E-UTRAN Generated Reason.
- RadioNetworkLayer_HandoverCancelled - Radio Network Layer Handover Cancelled - S1AP Radio Network Layer cause Handover Cancelled.
- RadioNetworkLayer_PartialHandover - Radio Network Layer Partial Handover - S1AP Radio Network Layer cause Partial Handover.
- RadioNetworkLayer_HandoverFailureInTargetEpcEnbOrTargetSystem - Radio Network Layer Handover Failure in Target EPC/eNB or Target System - S1AP Radio Network Layer cause Handover Failure In Target EPC/eNB or Target System.
- RadioNetworkLayer_HandoverTargetNotAllowed - Radio Network Layer Handover Target Not Allowed - S1AP Radio Network Layer cause Handover Target not allowed.
- RadioNetworkLayer_TS1RelocOverallExpiry - Radio Network Layer TS1 Reloc Overall Expiry - S1AP Radio Network Layer cause TS1Relocoverall Expiry.
- RadioNetworkLayer_TS1RelocPrepExpiry - Radio Network Layer TS1 Reloc Prep Expiry - S1AP Radio Network Layer cause TS1RelocPrep Expiry.
- RadioNetworkLayer_CellNotAvailable - Radio Network Layer Cell Not Available - S1AP Radio Network Layer cause Cell Not Available.
- RadioNetworkLayer_UnknownTargetId - Radio Network Layer Unknown Target Id - S1AP Radio Network Layer cause Unknown Target Id.
- RadioNetworkLayer_NoRadioResourcesAvailableInTargetCell - Radio Network Layer No Resources Available in Target Cell - S1AP Radio Network Layer cause No Resources Available in Target Cell.

- `RadioNetworkLayer_UnknownOrAlreadyAllocatedMmeUeS1apId` - Radio Network Layer Unknown or Already Allocated MME UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated MME UE S1AP ID.
- `RadioNetworkLayer_UnknownOrAlreadyAllocatedEnbUeS1apId` - Radio Network Layer Unknown or Already Allocated eNB UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated eNB UE S1AP ID.
- `RadioNetworkLayer_UnknownOrInconsistentPairOfUeS1apId` - Radio Network Layer Unknown or Inconsistent Pair of S1AP UE ID - S1AP Radio Network Layer cause Unknown or inconsistent pair of S1AP UE ID.
- `RadioNetworkLayer_HandoverDesirableForRadioReasons` - Radio Network Layer Handover Desirable for Radio Reasons - S1AP Radio Network Layer cause Handover desirable for radio reasons.
- `RadioNetworkLayer_TimeCriticalHandover` - Radio Network Layer Time Critical Handover - S1AP Radio Network Layer cause Time critical handover.
- `RadioNetworkLayer_ResourceOptimisationHandover` - Radio Network Layer Resource Optimisation Handover - S1AP Radio Network Layer cause Resource optimisation handover.
- `RadioNetworkLayer_ReduceLoadInServingCell` - Radio Network Layer Reduce Load in Serving Cell - S1AP Radio Network Layer cause Reduce load in serving cell.
- `RadioNetworkLayer_UserInactivity` - Radio Network Layer User Inactivity - S1AP Radio Network Layer cause User Inactivity.
- `RadioNetworkLayer_RadioConnectionWithUeLost` - Radio Network Layer Radio Connection with UE Lost - S1AP Radio Network Layer cause Radio Connection With UE Lost.
- `RadioNetworkLayer_LoadBalancingTauRequired` - Radio Network Layer Load Balancing TAU Required - S1AP Radio Network Layer cause Load Balancing TAU Required.
- `RadioNetworkLayer_CsFallbackTriggered` - Radio Network Layer CS Fallback Triggered - S1AP Radio Network Layer cause CS Fallback Triggered.
- `RadioNetworkLayer_UeNotAvailableForPsService` - Radio Network Layer UE Not Available for PS Service - S1AP Radio Network Layer cause UE Not Available For PS Service.
- `RadioNetworkLayer_RadioResourcesNotAvailable` - Radio Network Layer Radio Resources Not Available - S1AP Radio Network Layer cause Radio resources not available.
- `RadioNetworkLayer_FailureInTheRadioInterfaceProcedure` - Radio Network Layer Failure in the Radio Interface Procedure - S1AP Radio Network Layer cause Failure in the Radio Interface Procedure.
- `RadioNetworkLayer_InvalidQosCombination` - Radio Network Layer Invalid QoS Combination - S1AP Radio Network Layer cause Invalid QoS combination.

- **RadioNetworkLayer_InterRatRedirection** - Radio Network Layer Inter-RAT Redirection - S1AP Radio Network Layer cause Inter-RAT redirection.
- **RadioNetworkLayer_InteractionWithOtherProcedure** - Radio Network Layer Interaction with Other Procedure - S1AP Radio Network Layer cause Interaction with other procedure.
- **RadioNetworkLayer_UnknownErabId** - Radio Network Layer Unknown E-RAB ID - S1AP Radio Network Layer cause Unknown E-RAB ID.
- **RadioNetworkLayer_MultipleErabIdInstances** - Radio Network Layer Multiple E-RAB ID Instances - S1AP Radio Network Layer cause Multiple E-RAB ID instances.
- **RadioNetworkLayer_EncryptionAndOrIntegrityProtectionAlgorithmsNotSupported** - Radio Network Layer Encryption and/or Integrity Protection Algorithms Not Supported - S1AP Radio Network Layer cause Encryption and/or Integrity protection algorithms not supported.
- **RadioNetworkLayer_S1IntraSystemHandoverTriggered** - Radio Network Layer S1 Intra System Handover Triggered - S1AP Radio Network Layer cause S1 intra system Handover triggered.
- **RadioNetworkLayer_S1InterSystemHandoverTriggered** - Radio Network Layer S1 Inter System Handover Triggered - S1AP Radio Network Layer cause S1 inter system Handover triggered.
- **RadioNetworkLayer_x2HandoverTriggered** - Radio Network Layer X2 Handover Triggered - S1AP Radio Network Layer cause X2 Handover triggered.
- **RadioNetworkLayer_redirectionTowards1xRtt** - Radio Network Layer Redirection Towards 1xRTT - S1AP Radio Network Layer cause Redirection towards 1xRTT.
- **RadioNetworkLayer_NotSupportedQciValue** - Radio Network Layer Not Supported QCI Value - S1AP Radio Network Layer cause Not Supported QCI Value.
- **RadioNetworkLayer_InvalidCsgId** - Radio Network Layer Invalid CSG Id - S1AP Radio Network Layer cause Invalid CSG Id.
- **RadioNetworkLayer_ReleaseDueToPreEmption** - Radio Network Layer Release Due to Pre-Emption - S1AP Radio Network Layer cause Release due to Pre-Emption.
- **RadioNetworkLayer_N26InterfaceNotAvailable** - Radio Network Layer N26 Interface Not Available - S1AP Radio Network Layer cause N26 interface not available.
- **TransportLayer_TransportResourceUnavailable** - Transport Layer Transport Resource Unavailable - S1AP Transport Layer cause Transport Resource Unavailable.
- **TransportLayer_Unspecified** - Transport Layer Unspecified - S1AP Transport Layer cause Unspecified.
- **Nas_NormalRelease** - NAS Normal Release - S1AP NAS cause Normal Release.
- **Nas_AuthenticationFailure** - NAS Authentication Failure - S1AP NAS cause Authentication failure.

- Nas_Detach - NAS Detach - S1AP NAS cause Detach.
- Nas_Unspecified - NAS Unspecified - S1AP NAS cause Unspecified.
- Nas_CsgSubscriptionExpiry - NAS CSG Subscription Expiry - S1AP NAS cause CSG Subscription Expiry.
- Protocol_TransferSyntaxError - Protocol Transfer Syntax Error - S1AP Protocol cause Transfer Syntax Error.
- Protocol_AbstractSyntaxErrorReject - Protocol Abstract Syntax Error (Reject) - S1AP Protocol cause Abstract Syntax Error (Reject).
- Protocol_AbstractSyntaxErrorIgnoreAndNotify - Protocol Abstract Syntax Error (Ignore and Notify) - S1AP Protocol cause Abstract Syntax Error (Ignore and Notify).
- Protocol_MessageNotCompatibleWithReceiverState - Protocol Message Not Compatible with Receiver State - S1AP Protocol cause Message not Compatible with Receiver State.
- Protocol_SemanticError - Protocol Semantic Error - S1AP Protocol cause Semantic Error.
- Protocol_AbstractSyntaxErrorFalselyConstructedMessage - Protocol Abstract Syntax Error (Falsely Constructed Message) - S1AP Protocol cause Abstract Syntax Error (Falsely Constructed Message).
- Protocol_Unspecified - Protocol Unspecified - S1AP Protocol cause Unspecified.
- Miscellaneous_ControlProcessingOverload - Miscellaneous Control Processing Overload - S1AP Miscellaneous cause Control Processing Overload.
- Miscellaneous_NotEnoughUserPlaneProcessingResources - Miscellaneous Not Enough User Plane Processing Resources - S1AP Miscellaneous cause Not enough User Plane Processing Resources.
- Miscellaneous_HardwareFailure - Miscellaneous Hardware Failure - S1AP Miscellaneous cause Hardware Failure.
- Miscellaneous_OmIntervention - Miscellaneous O&M Intervention - S1AP Miscellaneous cause O&M Intervention.
- Miscellaneous_Unspecified - Miscellaneous Unspecified - S1AP Miscellaneous cause Unspecified.
- Miscellaneous_UnknownPlmn - Miscellaneous Unknown PLMN - S1AP Miscellaneous cause Unknown PLMN.

Default

Disabled

Name

ueCtxtRelLtePlmnNotAllowed - UE Context Release Command PLMN of IMSI Is Not Allowed

Syntax

--ueCtxtRelLtePlmnNotAllowed <list-item>

Description

S1AP cause code to include on UE context release command when PLMN access is not allowed.

Class

Optional.

List

- Disabled - The feature is disabled in the corresponding scenario. The MME does not override the S1AP cause code.
- RadioNetworkLayer_Unspecified - Radio Network Layer Unspecified - S1AP Radio Network Layer cause Unspecified.
- RadioNetworkLayer_TX2RelocOverallExpiry - Radio Network Layer TX2 Reloc Overall Expiry - S1AP Radio Network Layer cause TX2 Reloc Overall Expiry.
- RadioNetworkLayer_SuccessfulHandover - Radio Network Layer Successful Handover - S1AP Radio Network Layer cause Successful Handover.
- RadioNetworkLayer_ReleaseDueToEutranGeneratedReason - Radio Network Layer Release Due to E-UTRAN Generated Reason - S1AP Radio Network Layer cause Release Due to E-UTRAN Generated Reason.
- RadioNetworkLayer_HandoverCancelled - Radio Network Layer Handover Cancelled - S1AP Radio Network Layer cause Handover Cancelled.
- RadioNetworkLayer_PartialHandover - Radio Network Layer Partial Handover - S1AP Radio Network Layer cause Partial Handover.
- RadioNetworkLayer_HandoverFailureInTargetEpcEnbOrTargetSystem - Radio Network Layer Handover Failure in Target EPC/eNB or Target System - S1AP Radio Network Layer cause Handover Failure In Target EPC/eNB or Target System.
- RadioNetworkLayer_HandoverTargetNotAllowed - Radio Network Layer Handover Target Not Allowed - S1AP Radio Network Layer cause Handover Target not allowed.
- RadioNetworkLayer_TS1RelocOverallExpiry - Radio Network Layer TS1 Reloc Overall Expiry - S1AP Radio Network Layer cause TS1Relocoverall Expiry.
- RadioNetworkLayer_TS1RelocPrepExpiry - Radio Network Layer TS1 Reloc Prep Expiry - S1AP Radio Network Layer cause TS1RelocPrep Expiry.
- RadioNetworkLayer_CellNotAvailable - Radio Network Layer Cell Not Available - S1AP Radio Network Layer cause Cell Not Available.
- RadioNetworkLayer_UnknownTargetId - Radio Network Layer Unknown Target Id - S1AP Radio Network Layer cause Unknown Target Id.
- RadioNetworkLayer_NoRadioResourcesAvailableInTargetCell - Radio Network Layer No Resources Available in Target Cell - S1AP Radio Network Layer cause No Resources Available in Target Cell.

- RadioNetworkLayer_UnknownOrAlreadyAllocatedMmeUeS1apId - Radio Network Layer Unknown or Already Allocated MME UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated MME UE S1AP ID.
- RadioNetworkLayer_UnknownOrAlreadyAllocatedEnbUeS1apId - Radio Network Layer Unknown or Already Allocated eNB UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated eNB UE S1AP ID.
- RadioNetworkLayer_UnknownOrInconsistentPairOfUeS1apId - Radio Network Layer Unknown or Inconsistent Pair of S1AP UE ID - S1AP Radio Network Layer cause Unknown or inconsistent pair of S1AP UE ID.
- RadioNetworkLayer_HandoverDesirableForRadioReasons - Radio Network Layer Handover Desirable for Radio Reasons - S1AP Radio Network Layer cause Handover desirable for radio reasons.
- RadioNetworkLayer_TimeCriticalHandover - Radio Network Layer Time Critical Handover - S1AP Radio Network Layer cause Time critical handover.
- RadioNetworkLayer_ResourceOptimisationHandover - Radio Network Layer Resource Optimisation Handover - S1AP Radio Network Layer cause Resource optimisation handover.
- RadioNetworkLayer_ReduceLoadInServingCell - Radio Network Layer Reduce Load in Serving Cell - S1AP Radio Network Layer cause Reduce load in serving cell.
- RadioNetworkLayer_UserInactivity - Radio Network Layer User Inactivity - S1AP Radio Network Layer cause User Inactivity.
- RadioNetworkLayer_RadioConnectionWithUeLost - Radio Network Layer Radio Connection with UE Lost - S1AP Radio Network Layer cause Radio Connection With UE Lost.
- RadioNetworkLayer_LoadBalancingTauRequired - Radio Network Layer Load Balancing TAU Required - S1AP Radio Network Layer cause Load Balancing TAU Required.
- RadioNetworkLayer_CsFallbackTriggered - Radio Network Layer CS Fallback Triggered - S1AP Radio Network Layer cause CS Fallback Triggered.
- RadioNetworkLayer_UeNotAvailableForPsService - Radio Network Layer UE Not Available for PS Service - S1AP Radio Network Layer cause UE Not Available For PS Service.
- RadioNetworkLayer_RadioResourcesNotAvailable - Radio Network Layer Radio Resources Not Available - S1AP Radio Network Layer cause Radio resources not available.
- RadioNetworkLayer_FailureInTheRadioInterfaceProcedure - Radio Network Layer Failure in the Radio Interface Procedure - S1AP Radio Network Layer cause Failure in the Radio Interface Procedure.
- RadioNetworkLayer_InvalidQosCombination - Radio Network Layer Invalid QoS Combination - S1AP Radio Network Layer cause Invalid QoS combination.

- **RadioNetworkLayer_InterRatRedirection** - Radio Network Layer Inter-RAT Redirection - S1AP Radio Network Layer cause Inter-RAT redirection.
- **RadioNetworkLayer_InteractionWithOtherProcedure** - Radio Network Layer Interaction with Other Procedure - S1AP Radio Network Layer cause Interaction with other procedure.
- **RadioNetworkLayer_UnknownEranId** - Radio Network Layer Unknown E-RAB ID - S1AP Radio Network Layer cause Unknown E-RAB ID.
- **RadioNetworkLayer_MultipleEranIdInstances** - Radio Network Layer Multiple E-RAB ID Instances - S1AP Radio Network Layer cause Multiple E-RAB ID instances.
- **RadioNetworkLayer_EncryptionAndOrIntegrityProtectionAlgorithmsNotSupported** - Radio Network Layer Encryption and/or Integrity Protection Algorithms Not Supported - S1AP Radio Network Layer cause Encryption and/or Integrity protection algorithms not supported.
- **RadioNetworkLayer_S1IntraSystemHandoverTriggered** - Radio Network Layer S1 Intra System Handover Triggered - S1AP Radio Network Layer cause S1 intra system Handover triggered.
- **RadioNetworkLayer_S1InterSystemHandoverTriggered** - Radio Network Layer S1 Inter System Handover Triggered - S1AP Radio Network Layer cause S1 inter system Handover triggered.
- **RadioNetworkLayer_x2HandoverTriggered** - Radio Network Layer X2 Handover Triggered - S1AP Radio Network Layer cause X2 Handover triggered.
- **RadioNetworkLayer_redirectionTowards1xRtt** - Radio Network Layer Redirection Towards 1xRTT - S1AP Radio Network Layer cause Redirection towards 1xRTT.
- **RadioNetworkLayer_NotSupportedQciValue** - Radio Network Layer Not Supported QCI Value - S1AP Radio Network Layer cause Not Supported QCI Value.
- **RadioNetworkLayer_InvalidCsgId** - Radio Network Layer Invalid CSG Id - S1AP Radio Network Layer cause Invalid CSG Id.
- **RadioNetworkLayer_ReleaseDueToPreEmption** - Radio Network Layer Release Due to Pre-Emption - S1AP Radio Network Layer cause Release due to Pre-Emption.
- **RadioNetworkLayer_N26InterfaceNotAvailable** - Radio Network Layer N26 Interface Not Available - S1AP Radio Network Layer cause N26 interface not available.
- **TransportLayer_TransportResourceUnavailable** - Transport Layer Transport Resource Unavailable - S1AP Transport Layer cause Transport Resource Unavailable.
- **TransportLayer_Unspecified** - Transport Layer Unspecified - S1AP Transport Layer cause Unspecified.
- **Nas_NormalRelease** - NAS Normal Release - S1AP NAS cause Normal Release.
- **Nas_AuthenticationFailure** - NAS Authentication Failure - S1AP NAS cause Authentication failure.

- Nas_Detach - NAS Detach - S1AP NAS cause Detach.
- Nas_Unspecified - NAS Unspecified - S1AP NAS cause Unspecified.
- Nas_CsgSubscriptionExpiry - NAS CSG Subscription Expiry - S1AP NAS cause CSG Subscription Expiry.
- Protocol_TransferSyntaxError - Protocol Transfer Syntax Error - S1AP Protocol cause Transfer Syntax Error.
- Protocol_AbstractSyntaxErrorReject - Protocol Abstract Syntax Error (Reject) - S1AP Protocol cause Abstract Syntax Error (Reject).
- Protocol_AbstractSyntaxErrorIgnoreAndNotify - Protocol Abstract Syntax Error (Ignore and Notify) - S1AP Protocol cause Abstract Syntax Error (Ignore and Notify).
- Protocol_MessageNotCompatibleWithReceiverState - Protocol Message Not Compatible with Receiver State - S1AP Protocol cause Message not Compatible with Receiver State.
- Protocol_SemanticError - Protocol Semantic Error - S1AP Protocol cause Semantic Error.
- Protocol_AbstractSyntaxErrorFalselyConstructedMessage - Protocol Abstract Syntax Error (Falsely Constructed Message) - S1AP Protocol cause Abstract Syntax Error (Falsely Constructed Message).
- Protocol_Unspecified - Protocol Unspecified - S1AP Protocol cause Unspecified.
- Miscellaneous_ControlProcessingOverload - Miscellaneous Control Processing Overload - S1AP Miscellaneous cause Control Processing Overload.
- Miscellaneous_NotEnoughUserPlaneProcessingResources - Miscellaneous Not Enough User Plane Processing Resources - S1AP Miscellaneous cause Not enough User Plane Processing Resources.
- Miscellaneous_HardwareFailure - Miscellaneous Hardware Failure - S1AP Miscellaneous cause Hardware Failure.
- Miscellaneous_OmIntervention - Miscellaneous O&M Intervention - S1AP Miscellaneous cause O&M Intervention.
- Miscellaneous_Unspecified - Miscellaneous Unspecified - S1AP Miscellaneous cause Unspecified.
- Miscellaneous_UnknownPlmn - Miscellaneous Unknown PLMN - S1AP Miscellaneous cause Unknown PLMN.

Default

Disabled

Name

ueCtxtRelNasProtocolError - UE Context Release Command NAS Protocol Error

Syntax

--ueCtxtRelNasProtocolError <list-item>

Description

S1AP cause code to include on UE context release command when NAS protocol error is met:
-mandatory IE incorrect -optional IE incorrect

Class

Optional.

List

- Disabled - The feature is disabled in the corresponding scenario. The MME does not override the S1AP cause code.
- RadioNetworkLayer_Unspecified - Radio Network Layer Unspecified - S1AP Radio Network Layer cause Unspecified.
- RadioNetworkLayer_TX2RelocOverallExpiry - Radio Network Layer TX2 Reloc Overall Expiry - S1AP Radio Network Layer cause TX2 Reloc Overall Expiry.
- RadioNetworkLayer_SuccessfulHandover - Radio Network Layer Successful Handover - S1AP Radio Network Layer cause Successful Handover.
- RadioNetworkLayer_ReleaseDueToEutranGeneratedReason - Radio Network Layer Release Due to E-UTRAN Generated Reason - S1AP Radio Network Layer cause Release Due to E-UTRAN Generated Reason.
- RadioNetworkLayer_HandoverCancelled - Radio Network Layer Handover Cancelled - S1AP Radio Network Layer cause Handover Cancelled.
- RadioNetworkLayer_PartialHandover - Radio Network Layer Partial Handover - S1AP Radio Network Layer cause Partial Handover.
- RadioNetworkLayer_HandoverFailureInTargetEpcEnbOrTargetSystem - Radio Network Layer Handover Failure in Target EPC/eNB or Target System - S1AP Radio Network Layer cause Handover Failure In Target EPC/eNB or Target System.
- RadioNetworkLayer_HandoverTargetNotAllowed - Radio Network Layer Handover Target Not Allowed - S1AP Radio Network Layer cause Handover Target not allowed.
- RadioNetworkLayer_TS1RelocOverallExpiry - Radio Network Layer TS1 Reloc Overall Expiry - S1AP Radio Network Layer cause TS1Relocoverall Expiry.
- RadioNetworkLayer_TS1RelocPrepExpiry - Radio Network Layer TS1 Reloc Prep Expiry - S1AP Radio Network Layer cause TS1RelocPrep Expiry.
- RadioNetworkLayer_CellNotAvailable - Radio Network Layer Cell Not Available - S1AP Radio Network Layer cause Cell Not Available.
- RadioNetworkLayer_UnknownTargetId - Radio Network Layer Unknown Target Id - S1AP Radio Network Layer cause Unknown Target Id.
- RadioNetworkLayer_NoRadioResourcesAvailableInTargetCell - Radio Network Layer No Resources Available in Target Cell - S1AP Radio Network Layer cause No Resources Available in Target Cell.

- RadioNetworkLayer_UnknownOrAlreadyAllocatedMmeUeS1apId - Radio Network Layer Unknown or Already Allocated MME UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated MME UE S1AP ID.
- RadioNetworkLayer_UnknownOrAlreadyAllocatedEnbUeS1apId - Radio Network Layer Unknown or Already Allocated eNB UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated eNB UE S1AP ID.
- RadioNetworkLayer_UnknownOrInconsistentPairOfUeS1apId - Radio Network Layer Unknown or Inconsistent Pair of S1AP UE ID - S1AP Radio Network Layer cause Unknown or inconsistent pair of S1AP UE ID.
- RadioNetworkLayer_HandoverDesirableForRadioReasons - Radio Network Layer Handover Desirable for Radio Reasons - S1AP Radio Network Layer cause Handover desirable for radio reasons.
- RadioNetworkLayer_TimeCriticalHandover - Radio Network Layer Time Critical Handover - S1AP Radio Network Layer cause Time critical handover.
- RadioNetworkLayer_ResourceOptimisationHandover - Radio Network Layer Resource Optimisation Handover - S1AP Radio Network Layer cause Resource optimisation handover.
- RadioNetworkLayer_ReduceLoadInServingCell - Radio Network Layer Reduce Load in Serving Cell - S1AP Radio Network Layer cause Reduce load in serving cell.
- RadioNetworkLayer_UserInactivity - Radio Network Layer User Inactivity - S1AP Radio Network Layer cause User Inactivity.
- RadioNetworkLayer_RadioConnectionWithUeLost - Radio Network Layer Radio Connection with UE Lost - S1AP Radio Network Layer cause Radio Connection With UE Lost.
- RadioNetworkLayer_LoadBalancingTauRequired - Radio Network Layer Load Balancing TAU Required - S1AP Radio Network Layer cause Load Balancing TAU Required.
- RadioNetworkLayer_CsFallbackTriggered - Radio Network Layer CS Fallback Triggered - S1AP Radio Network Layer cause CS Fallback Triggered.
- RadioNetworkLayer_UeNotAvailableForPsService - Radio Network Layer UE Not Available for PS Service - S1AP Radio Network Layer cause UE Not Available For PS Service.
- RadioNetworkLayer_RadioResourcesNotAvailable - Radio Network Layer Radio Resources Not Available - S1AP Radio Network Layer cause Radio resources not available.
- RadioNetworkLayer_FailureInTheRadioInterfaceProcedure - Radio Network Layer Failure in the Radio Interface Procedure - S1AP Radio Network Layer cause Failure in the Radio Interface Procedure.
- RadioNetworkLayer_InvalidQosCombination - Radio Network Layer Invalid QoS Combination - S1AP Radio Network Layer cause Invalid QoS combination.

- **RadioNetworkLayer_InterRatRedirection** - Radio Network Layer Inter-RAT Redirection - S1AP Radio Network Layer cause Inter-RAT redirection.
- **RadioNetworkLayer_InteractionWithOtherProcedure** - Radio Network Layer Interaction with Other Procedure - S1AP Radio Network Layer cause Interaction with other procedure.
- **RadioNetworkLayer_UnknownErabId** - Radio Network Layer Unknown E-RAB ID - S1AP Radio Network Layer cause Unknown E-RAB ID.
- **RadioNetworkLayer_MultipleErabIdInstances** - Radio Network Layer Multiple E-RAB ID Instances - S1AP Radio Network Layer cause Multiple E-RAB ID instances.
- **RadioNetworkLayer_EncryptionAndOrIntegrityProtectionAlgorithmsNotSupported** - Radio Network Layer Encryption and/or Integrity Protection Algorithms Not Supported - S1AP Radio Network Layer cause Encryption and/or Integrity protection algorithms not supported.
- **RadioNetworkLayer_S1IntraSystemHandoverTriggered** - Radio Network Layer S1 Intra System Handover Triggered - S1AP Radio Network Layer cause S1 intra system Handover triggered.
- **RadioNetworkLayer_S1InterSystemHandoverTriggered** - Radio Network Layer S1 Inter System Handover Triggered - S1AP Radio Network Layer cause S1 inter system Handover triggered.
- **RadioNetworkLayer_x2HandoverTriggered** - Radio Network Layer X2 Handover Triggered - S1AP Radio Network Layer cause X2 Handover triggered.
- **RadioNetworkLayer_redirectionTowards1xRtt** - Radio Network Layer Redirection Towards 1xRTT - S1AP Radio Network Layer cause Redirection towards 1xRTT.
- **RadioNetworkLayer_NotSupportedQciValue** - Radio Network Layer Not Supported QCI Value - S1AP Radio Network Layer cause Not Supported QCI Value.
- **RadioNetworkLayer_InvalidCsgId** - Radio Network Layer Invalid CSG Id - S1AP Radio Network Layer cause Invalid CSG Id.
- **RadioNetworkLayer_ReleaseDueToPreEmption** - Radio Network Layer Release Due to Pre-Emption - S1AP Radio Network Layer cause Release due to Pre-Emption.
- **RadioNetworkLayer_N26InterfaceNotAvailable** - Radio Network Layer N26 Interface Not Available - S1AP Radio Network Layer cause N26 interface not available.
- **TransportLayer_TransportResourceUnavailable** - Transport Layer Transport Resource Unavailable - S1AP Transport Layer cause Transport Resource Unavailable.
- **TransportLayer_Unspecified** - Transport Layer Unspecified - S1AP Transport Layer cause Unspecified.
- **Nas_NormalRelease** - NAS Normal Release - S1AP NAS cause Normal Release.
- **Nas_AuthenticationFailure** - NAS Authentication Failure - S1AP NAS cause Authentication failure.

- Nas_Detach - NAS Detach - S1AP NAS cause Detach.
- Nas_Unspecified - NAS Unspecified - S1AP NAS cause Unspecified.
- Nas_CsgSubscriptionExpiry - NAS CSG Subscription Expiry - S1AP NAS cause CSG Subscription Expiry.
- Protocol_TransferSyntaxError - Protocol Transfer Syntax Error - S1AP Protocol cause Transfer Syntax Error.
- Protocol_AbstractSyntaxErrorReject - Protocol Abstract Syntax Error (Reject) - S1AP Protocol cause Abstract Syntax Error (Reject).
- Protocol_AbstractSyntaxErrorIgnoreAndNotify - Protocol Abstract Syntax Error (Ignore and Notify) - S1AP Protocol cause Abstract Syntax Error (Ignore and Notify).
- Protocol_MessageNotCompatibleWithReceiverState - Protocol Message Not Compatible with Receiver State - S1AP Protocol cause Message not Compatible with Receiver State.
- Protocol_SemanticError - Protocol Semantic Error - S1AP Protocol cause Semantic Error.
- Protocol_AbstractSyntaxErrorFalselyConstructedMessage - Protocol Abstract Syntax Error (Falsely Constructed Message) - S1AP Protocol cause Abstract Syntax Error (Falsely Constructed Message).
- Protocol_Unspecified - Protocol Unspecified - S1AP Protocol cause Unspecified.
- Miscellaneous_ControlProcessingOverload - Miscellaneous Control Processing Overload - S1AP Miscellaneous cause Control Processing Overload.
- Miscellaneous_NotEnoughUserPlaneProcessingResources - Miscellaneous Not Enough User Plane Processing Resources - S1AP Miscellaneous cause Not enough User Plane Processing Resources.
- Miscellaneous_HardwareFailure - Miscellaneous Hardware Failure - S1AP Miscellaneous cause Hardware Failure.
- Miscellaneous_OmIntervention - Miscellaneous O&M Intervention - S1AP Miscellaneous cause O&M Intervention.
- Miscellaneous_Unspecified - Miscellaneous Unspecified - S1AP Miscellaneous cause Unspecified.
- Miscellaneous_UnknownPlmn - Miscellaneous Unknown PLMN - S1AP Miscellaneous cause Unknown PLMN.

Default

Disabled

Name

ueCtxtRelNasRejectApnAdministration - UE Context Release NAS Reject APN Administration

Syntax

--ueCtxtRelNasRejectApnAdministration <list-item>

Description

The S1AP cause the MME includes on UE context release command on message level, when the MME rejects the Attach due to APN administration.

Class

Optional.

List

- Disabled - The feature is disabled in the corresponding scenario. The MME does not override the S1AP cause code.
- RadioNetworkLayer_Unspecified - Radio Network Layer Unspecified - S1AP Radio Network Layer cause Unspecified.
- RadioNetworkLayer_TX2RelocOverallExpiry - Radio Network Layer TX2 Reloc Overall Expiry - S1AP Radio Network Layer cause TX2 Reloc Overall Expiry.
- RadioNetworkLayer_SuccessfulHandover - Radio Network Layer Successful Handover - S1AP Radio Network Layer cause Successful Handover.
- RadioNetworkLayer_ReleaseDueToEutranGeneratedReason - Radio Network Layer Release Due to E-UTRAN Generated Reason - S1AP Radio Network Layer cause Release Due to E-UTRAN Generated Reason.
- RadioNetworkLayer_HandoverCancelled - Radio Network Layer Handover Cancelled - S1AP Radio Network Layer cause Handover Cancelled.
- RadioNetworkLayer_PartialHandover - Radio Network Layer Partial Handover - S1AP Radio Network Layer cause Partial Handover.
- RadioNetworkLayer_HandoverFailureInTargetEpcEnbOrTargetSystem - Radio Network Layer Handover Failure in Target EPC/eNB or Target System - S1AP Radio Network Layer cause Handover Failure In Target EPC/eNB or Target System.
- RadioNetworkLayer_HandoverTargetNotAllowed - Radio Network Layer Handover Target Not Allowed - S1AP Radio Network Layer cause Handover Target not allowed.
- RadioNetworkLayer_TS1RelocOverallExpiry - Radio Network Layer TS1 Reloc Overall Expiry - S1AP Radio Network Layer cause TS1Relocoverall Expiry.
- RadioNetworkLayer_TS1RelocPrepExpiry - Radio Network Layer TS1 Reloc Prep Expiry - S1AP Radio Network Layer cause TS1RelocPrep Expiry.
- RadioNetworkLayer_CellNotAvailable - Radio Network Layer Cell Not Available - S1AP Radio Network Layer cause Cell Not Available.
- RadioNetworkLayer_UnknownTargetId - Radio Network Layer Unknown Target Id - S1AP Radio Network Layer cause Unknown Target Id.
- RadioNetworkLayer_NoRadioResourcesAvailableInTargetCell - Radio Network Layer No Resources Available in Target Cell - S1AP Radio Network Layer cause No Resources Available in Target Cell.

- RadioNetworkLayer_UnknownOrAlreadyAllocatedMmeUeS1apId - Radio Network Layer Unknown or Already Allocated MME UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated MME UE S1AP ID.
- RadioNetworkLayer_UnknownOrAlreadyAllocatedEnbUeS1apId - Radio Network Layer Unknown or Already Allocated eNB UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated eNB UE S1AP ID.
- RadioNetworkLayer_UnknownOrInconsistentPairOfUeS1apId - Radio Network Layer Unknown or Inconsistent Pair of S1AP UE ID - S1AP Radio Network Layer cause Unknown or inconsistent pair of S1AP UE ID.
- RadioNetworkLayer_HandoverDesirableForRadioReasons - Radio Network Layer Handover Desirable for Radio Reasons - S1AP Radio Network Layer cause Handover desirable for radio reasons.
- RadioNetworkLayer_TimeCriticalHandover - Radio Network Layer Time Critical Handover - S1AP Radio Network Layer cause Time critical handover.
- RadioNetworkLayer_ResourceOptimisationHandover - Radio Network Layer Resource Optimisation Handover - S1AP Radio Network Layer cause Resource optimisation handover.
- RadioNetworkLayer_ReduceLoadInServingCell - Radio Network Layer Reduce Load in Serving Cell - S1AP Radio Network Layer cause Reduce load in serving cell.
- RadioNetworkLayer_UserInactivity - Radio Network Layer User Inactivity - S1AP Radio Network Layer cause User Inactivity.
- RadioNetworkLayer_RadioConnectionWithUeLost - Radio Network Layer Radio Connection with UE Lost - S1AP Radio Network Layer cause Radio Connection With UE Lost.
- RadioNetworkLayer_LoadBalancingTauRequired - Radio Network Layer Load Balancing TAU Required - S1AP Radio Network Layer cause Load Balancing TAU Required.
- RadioNetworkLayer_CsFallbackTriggered - Radio Network Layer CS Fallback Triggered - S1AP Radio Network Layer cause CS Fallback Triggered.
- RadioNetworkLayer_UeNotAvailableForPsService - Radio Network Layer UE Not Available for PS Service - S1AP Radio Network Layer cause UE Not Available For PS Service.
- RadioNetworkLayer_RadioResourcesNotAvailable - Radio Network Layer Radio Resources Not Available - S1AP Radio Network Layer cause Radio resources not available.
- RadioNetworkLayer_FailureInTheRadioInterfaceProcedure - Radio Network Layer Failure in the Radio Interface Procedure - S1AP Radio Network Layer cause Failure in the Radio Interface Procedure.
- RadioNetworkLayer_InvalidQosCombination - Radio Network Layer Invalid QoS Combination - S1AP Radio Network Layer cause Invalid QoS combination.

- **RadioNetworkLayer_InterRatRedirection** - Radio Network Layer Inter-RAT Redirection - S1AP Radio Network Layer cause Inter-RAT redirection.
- **RadioNetworkLayer_InteractionWithOtherProcedure** - Radio Network Layer Interaction with Other Procedure - S1AP Radio Network Layer cause Interaction with other procedure.
- **RadioNetworkLayer_UnknownErabId** - Radio Network Layer Unknown E-RAB ID - S1AP Radio Network Layer cause Unknown E-RAB ID.
- **RadioNetworkLayer_MultipleErabIdInstances** - Radio Network Layer Multiple E-RAB ID Instances - S1AP Radio Network Layer cause Multiple E-RAB ID instances.
- **RadioNetworkLayer_EncryptionAndOrIntegrityProtectionAlgorithmsNotSupported** - Radio Network Layer Encryption and/or Integrity Protection Algorithms Not Supported - S1AP Radio Network Layer cause Encryption and/or Integrity protection algorithms not supported.
- **RadioNetworkLayer_S1IntraSystemhandoverTriggered** - Radio Network Layer S1 Intra System Handover Triggered - S1AP Radio Network Layer cause S1 intra system Handover triggered.
- **RadioNetworkLayer_S1InterSystemHandoverTriggered** - Radio Network Layer S1 Inter System Handover Triggered - S1AP Radio Network Layer cause S1 inter system Handover triggered.
- **RadioNetworkLayer_x2HandoverTriggered** - Radio Network Layer X2 Handover Triggered - S1AP Radio Network Layer cause X2 Handover triggered.
- **RadioNetworkLayer_redirectionTowards1xRtt** - Radio Network Layer Redirection Towards 1xRTT - S1AP Radio Network Layer cause Redirection towards 1xRTT.
- **RadioNetworkLayer_NotSupportedQciValue** - Radio Network Layer Not Supported QCI Value - S1AP Radio Network Layer cause Not Supported QCI Value.
- **RadioNetworkLayer_InvalidCsgId** - Radio Network Layer Invalid CSG Id - S1AP Radio Network Layer cause Invalid CSG Id.
- **RadioNetworkLayer_ReleaseDueToPreEmption** - Radio Network Layer Release Due to Pre-Emption - S1AP Radio Network Layer cause Release due to Pre-Emption.
- **RadioNetworkLayer_N26InterfaceNotAvailable** - Radio Network Layer N26 Interface Not Available - S1AP Radio Network Layer cause N26 interface not available.
- **TransportLayer_TransportResourceUnavailable** - Transport Layer Transport Resource Unavailable - S1AP Transport Layer cause Transport Resource Unavailable.
- **TransportLayer_Unspecified** - Transport Layer Unspecified - S1AP Transport Layer cause Unspecified.
- **Nas_NormalRelease** - NAS Normal Release - S1AP NAS cause Normal Release.
- **Nas_AuthenticationFailure** - NAS Authentication Failure - S1AP NAS cause Authentication failure.

- Nas_Detach - NAS Detach - S1AP NAS cause Detach.
- Nas_Unspecified - NAS Unspecified - S1AP NAS cause Unspecified.
- Nas_CsgSubscriptionExpiry - NAS CSG Subscription Expiry - S1AP NAS cause CSG Subscription Expiry.
- Protocol_TransferSyntaxError - Protocol Transfer Syntax Error - S1AP Protocol cause Transfer Syntax Error.
- Protocol_AbstractSyntaxErrorReject - Protocol Abstract Syntax Error (Reject) - S1AP Protocol cause Abstract Syntax Error (Reject).
- Protocol_AbstractSyntaxErrorIgnoreAndNotify - Protocol Abstract Syntax Error (Ignore and Notify) - S1AP Protocol cause Abstract Syntax Error (Ignore and Notify).
- Protocol_MessageNotCompatibleWithReceiverState - Protocol Message Not Compatible with Receiver State - S1AP Protocol cause Message not Compatible with Receiver State.
- Protocol_SemanticError - Protocol Semantic Error - S1AP Protocol cause Semantic Error.
- Protocol_AbstractSyntaxErrorFalselyConstructedMessage - Protocol Abstract Syntax Error (Falsely Constructed Message) - S1AP Protocol cause Abstract Syntax Error (Falsely Constructed Message).
- Protocol_Unspecified - Protocol Unspecified - S1AP Protocol cause Unspecified.
- Miscellaneous_ControlProcessingOverload - Miscellaneous Control Processing Overload - S1AP Miscellaneous cause Control Processing Overload.
- Miscellaneous_NotEnoughUserPlaneProcessingResources - Miscellaneous Not Enough User Plane Processing Resources - S1AP Miscellaneous cause Not enough User Plane Processing Resources.
- Miscellaneous_HardwareFailure - Miscellaneous Hardware Failure - S1AP Miscellaneous cause Hardware Failure.
- Miscellaneous_OmIntervention - Miscellaneous O&M Intervention - S1AP Miscellaneous cause O&M Intervention.
- Miscellaneous_Unspecified - Miscellaneous Unspecified - S1AP Miscellaneous cause Unspecified.
- Miscellaneous_UnknownPlmn - Miscellaneous Unknown PLMN - S1AP Miscellaneous cause Unknown PLMN.

Default

Nas_NormalRelease

Name

ueCtxtRelNbiotBarAllPacketOdb - UE Context Release Command NB-IOT Bar All Packet ODB

Syntax

--ueCtxtRelNbiotBarAllPacketOdb <list-item>

Description

S1AP cause code to include on UE context release command when NB-IoT UE that has ODB.

Class

Optional.

List

- Disabled - The feature is disabled in the corresponding scenario. The MME does not override the S1AP cause code.
- RadioNetworkLayer_Unspecified - Radio Network Layer Unspecified - S1AP Radio Network Layer cause Unspecified.
- RadioNetworkLayer_TX2RelocOverallExpiry - Radio Network Layer TX2 Reloc Overall Expiry - S1AP Radio Network Layer cause TX2 Reloc Overall Expiry.
- RadioNetworkLayer_SuccessfulHandover - Radio Network Layer Successful Handover - S1AP Radio Network Layer cause Successful Handover.
- RadioNetworkLayer_ReleaseDueToEutranGeneratedReason - Radio Network Layer Release Due to E-UTRAN Generated Reason - S1AP Radio Network Layer cause Release Due to E-UTRAN Generated Reason.
- RadioNetworkLayer_HandoverCancelled - Radio Network Layer Handover Cancelled - S1AP Radio Network Layer cause Handover Cancelled.
- RadioNetworkLayer_PartialHandover - Radio Network Layer Partial Handover - S1AP Radio Network Layer cause Partial Handover.
- RadioNetworkLayer_HandoverFailureInTargetEpcEnbOrTargetSystem - Radio Network Layer Handover Failure in Target EPC/eNB or Target System - S1AP Radio Network Layer cause Handover Failure In Target EPC/eNB or Target System.
- RadioNetworkLayer_HandoverTargetNotAllowed - Radio Network Layer Handover Target Not Allowed - S1AP Radio Network Layer cause Handover Target not allowed.
- RadioNetworkLayer_TS1RelocOverallExpiry - Radio Network Layer TS1 Reloc Overall Expiry - S1AP Radio Network Layer cause TS1Relocoverall Expiry.
- RadioNetworkLayer_TS1RelocPrepExpiry - Radio Network Layer TS1 Reloc Prep Expiry - S1AP Radio Network Layer cause TS1RelocPrep Expiry.
- RadioNetworkLayer_CellNotAvailable - Radio Network Layer Cell Not Available - S1AP Radio Network Layer cause Cell Not Available.
- RadioNetworkLayer_UnknownTargetId - Radio Network Layer Unknown Target Id - S1AP Radio Network Layer cause Unknown Target Id.
- RadioNetworkLayer_NoRadioResourcesAvailableInTargetCell - Radio Network Layer No Resources Available in Target Cell - S1AP Radio Network Layer cause No Resources Available in Target Cell.

- RadioNetworkLayer_UnknownOrAlreadyAllocatedMmeUeS1apId - Radio Network Layer Unknown or Already Allocated MME UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated MME UE S1AP ID.
- RadioNetworkLayer_UnknownOrAlreadyAllocatedEnbUeS1apId - Radio Network Layer Unknown or Already Allocated eNB UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated eNB UE S1AP ID.
- RadioNetworkLayer_UnknownOrInconsistentPairOfUeS1apId - Radio Network Layer Unknown or Inconsistent Pair of S1AP UE ID - S1AP Radio Network Layer cause Unknown or inconsistent pair of S1AP UE ID.
- RadioNetworkLayer_HandoverDesirableForRadioReasons - Radio Network Layer Handover Desirable for Radio Reasons - S1AP Radio Network Layer cause Handover desirable for radio reasons.
- RadioNetworkLayer_TimeCriticalHandover - Radio Network Layer Time Critical Handover - S1AP Radio Network Layer cause Time critical handover.
- RadioNetworkLayer_ResourceOptimisationHandover - Radio Network Layer Resource Optimisation Handover - S1AP Radio Network Layer cause Resource optimisation handover.
- RadioNetworkLayer_ReduceLoadInServingCell - Radio Network Layer Reduce Load in Serving Cell - S1AP Radio Network Layer cause Reduce load in serving cell.
- RadioNetworkLayer_UserInactivity - Radio Network Layer User Inactivity - S1AP Radio Network Layer cause User Inactivity.
- RadioNetworkLayer_RadioConnectionWithUeLost - Radio Network Layer Radio Connection with UE Lost - S1AP Radio Network Layer cause Radio Connection With UE Lost.
- RadioNetworkLayer_LoadBalancingTauRequired - Radio Network Layer Load Balancing TAU Required - S1AP Radio Network Layer cause Load Balancing TAU Required.
- RadioNetworkLayer_CsFallbackTriggered - Radio Network Layer CS Fallback Triggered - S1AP Radio Network Layer cause CS Fallback Triggered.
- RadioNetworkLayer_UeNotAvailableForPsService - Radio Network Layer UE Not Available for PS Service - S1AP Radio Network Layer cause UE Not Available For PS Service.
- RadioNetworkLayer_RadioResourcesNotAvailable - Radio Network Layer Radio Resources Not Available - S1AP Radio Network Layer cause Radio resources not available.
- RadioNetworkLayer_FailureInTheRadioInterfaceProcedure - Radio Network Layer Failure in the Radio Interface Procedure - S1AP Radio Network Layer cause Failure in the Radio Interface Procedure.
- RadioNetworkLayer_InvalidQosCombination - Radio Network Layer Invalid QoS Combination - S1AP Radio Network Layer cause Invalid QoS combination.

- **RadioNetworkLayer_InterRatRedirection** - Radio Network Layer Inter-RAT Redirection - S1AP Radio Network Layer cause Inter-RAT redirection.
- **RadioNetworkLayer_InteractionWithOtherProcedure** - Radio Network Layer Interaction with Other Procedure - S1AP Radio Network Layer cause Interaction with other procedure.
- **RadioNetworkLayer_UnknownErabId** - Radio Network Layer Unknown E-RAB ID - S1AP Radio Network Layer cause Unknown E-RAB ID.
- **RadioNetworkLayer_MultipleErabIdInstances** - Radio Network Layer Multiple E-RAB ID Instances - S1AP Radio Network Layer cause Multiple E-RAB ID instances.
- **RadioNetworkLayer_EncryptionAndOrIntegrityProtectionAlgorithmsNotSupported** - Radio Network Layer Encryption and/or Integrity Protection Algorithms Not Supported - S1AP Radio Network Layer cause Encryption and/or Integrity protection algorithms not supported.
- **RadioNetworkLayer_S1IntraSystemHandoverTriggered** - Radio Network Layer S1 Intra System Handover Triggered - S1AP Radio Network Layer cause S1 intra system Handover triggered.
- **RadioNetworkLayer_S1InterSystemHandoverTriggered** - Radio Network Layer S1 Inter System Handover Triggered - S1AP Radio Network Layer cause S1 inter system Handover triggered.
- **RadioNetworkLayer_x2HandoverTriggered** - Radio Network Layer X2 Handover Triggered - S1AP Radio Network Layer cause X2 Handover triggered.
- **RadioNetworkLayer_redirectionTowards1xRtt** - Radio Network Layer Redirection Towards 1xRTT - S1AP Radio Network Layer cause Redirection towards 1xRTT.
- **RadioNetworkLayer_NotSupportedQciValue** - Radio Network Layer Not Supported QCI Value - S1AP Radio Network Layer cause Not Supported QCI Value.
- **RadioNetworkLayer_InvalidCsgId** - Radio Network Layer Invalid CSG Id - S1AP Radio Network Layer cause Invalid CSG Id.
- **RadioNetworkLayer_ReleaseDueToPreEmption** - Radio Network Layer Release Due to Pre-Emption - S1AP Radio Network Layer cause Release due to Pre-Emption.
- **RadioNetworkLayer_N26InterfaceNotAvailable** - Radio Network Layer N26 Interface Not Available - S1AP Radio Network Layer cause N26 interface not available.
- **TransportLayer_TransportResourceUnavailable** - Transport Layer Transport Resource Unavailable - S1AP Transport Layer cause Transport Resource Unavailable.
- **TransportLayer_Unspecified** - Transport Layer Unspecified - S1AP Transport Layer cause Unspecified.
- **Nas_NormalRelease** - NAS Normal Release - S1AP NAS cause Normal Release.
- **Nas_AuthenticationFailure** - NAS Authentication Failure - S1AP NAS cause Authentication failure.

- Nas_Detach - NAS Detach - S1AP NAS cause Detach.
- Nas_Unspecified - NAS Unspecified - S1AP NAS cause Unspecified.
- Nas_CsgSubscriptionExpiry - NAS CSG Subscription Expiry - S1AP NAS cause CSG Subscription Expiry.
- Protocol_TransferSyntaxError - Protocol Transfer Syntax Error - S1AP Protocol cause Transfer Syntax Error.
- Protocol_AbstractSyntaxErrorReject - Protocol Abstract Syntax Error (Reject) - S1AP Protocol cause Abstract Syntax Error (Reject).
- Protocol_AbstractSyntaxErrorIgnoreAndNotify - Protocol Abstract Syntax Error (Ignore and Notify) - S1AP Protocol cause Abstract Syntax Error (Ignore and Notify).
- Protocol_MessageNotCompatibleWithReceiverState - Protocol Message Not Compatible with Receiver State - S1AP Protocol cause Message not Compatible with Receiver State.
- Protocol_SemanticError - Protocol Semantic Error - S1AP Protocol cause Semantic Error.
- Protocol_AbstractSyntaxErrorFalselyConstructedMessage - Protocol Abstract Syntax Error (Falsely Constructed Message) - S1AP Protocol cause Abstract Syntax Error (Falsely Constructed Message).
- Protocol_Unspecified - Protocol Unspecified - S1AP Protocol cause Unspecified.
- Miscellaneous_ControlProcessingOverload - Miscellaneous Control Processing Overload - S1AP Miscellaneous cause Control Processing Overload.
- Miscellaneous_NotEnoughUserPlaneProcessingResources - Miscellaneous Not Enough User Plane Processing Resources - S1AP Miscellaneous cause Not enough User Plane Processing Resources.
- Miscellaneous_HardwareFailure - Miscellaneous Hardware Failure - S1AP Miscellaneous cause Hardware Failure.
- Miscellaneous_OmIntervention - Miscellaneous O&M Intervention - S1AP Miscellaneous cause O&M Intervention.
- Miscellaneous_Unspecified - Miscellaneous Unspecified - S1AP Miscellaneous cause Unspecified.
- Miscellaneous_UnknownPlmn - Miscellaneous Unknown PLMN - S1AP Miscellaneous cause Unknown PLMN.

Default

Disabled

Name

ueCtxtRelNbIotNotAllowed - UE Context Release Command NB-IOT Not Allowed

Syntax

--ueCtxtRelNbIotNotAllowed <list-item>

Description

S1AP cause code to include on UE context release command when NB-IoT is not allowed.

Class

Optional.

List

- Disabled - The feature is disabled in the corresponding scenario. The MME does not override the S1AP cause code.
- RadioNetworkLayer_Unspecified - Radio Network Layer Unspecified - S1AP Radio Network Layer cause Unspecified.
- RadioNetworkLayer_TX2RelocOverallExpiry - Radio Network Layer TX2 Reloc Overall Expiry - S1AP Radio Network Layer cause TX2 Reloc Overall Expiry.
- RadioNetworkLayer_SuccessfulHandover - Radio Network Layer Successful Handover - S1AP Radio Network Layer cause Successful Handover.
- RadioNetworkLayer_ReleaseDueToEutranGeneratedReason - Radio Network Layer Release Due to E-UTRAN Generated Reason - S1AP Radio Network Layer cause Release Due to E-UTRAN Generated Reason.
- RadioNetworkLayer_HandoverCancelled - Radio Network Layer Handover Cancelled - S1AP Radio Network Layer cause Handover Cancelled.
- RadioNetworkLayer_PartialHandover - Radio Network Layer Partial Handover - S1AP Radio Network Layer cause Partial Handover.
- RadioNetworkLayer_HandoverFailureInTargetEpcEnbOrTargetSystem - Radio Network Layer Handover Failure in Target EPC/eNB or Target System - S1AP Radio Network Layer cause Handover Failure In Target EPC/eNB or Target System.
- RadioNetworkLayer_HandoverTargetNotAllowed - Radio Network Layer Handover Target Not Allowed - S1AP Radio Network Layer cause Handover Target not allowed.
- RadioNetworkLayer_TS1RelocOverallExpiry - Radio Network Layer TS1 Reloc Overall Expiry - S1AP Radio Network Layer cause TS1Relocoverall Expiry.
- RadioNetworkLayer_TS1RelocPrepExpiry - Radio Network Layer TS1 Reloc Prep Expiry - S1AP Radio Network Layer cause TS1RelocPrep Expiry.
- RadioNetworkLayer_CellNotAvailable - Radio Network Layer Cell Not Available - S1AP Radio Network Layer cause Cell Not Available.
- RadioNetworkLayer_UnknownTargetId - Radio Network Layer Unknown Target Id - S1AP Radio Network Layer cause Unknown Target Id.
- RadioNetworkLayer_NoRadioResourcesAvailableInTargetCell - Radio Network Layer No Resources Available in Target Cell - S1AP Radio Network Layer cause No Resources Available in Target Cell.

- RadioNetworkLayer_UnknownOrAlreadyAllocatedMmeUeS1apId - Radio Network Layer Unknown or Already Allocated MME UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated MME UE S1AP ID.
- RadioNetworkLayer_UnknownOrAlreadyAllocatedEnbUeS1apId - Radio Network Layer Unknown or Already Allocated eNB UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated eNB UE S1AP ID.
- RadioNetworkLayer_UnknownOrInconsistentPairOfUeS1apId - Radio Network Layer Unknown or Inconsistent Pair of S1AP UE ID - S1AP Radio Network Layer cause Unknown or inconsistent pair of S1AP UE ID.
- RadioNetworkLayer_HandoverDesirableForRadioReasons - Radio Network Layer Handover Desirable for Radio Reasons - S1AP Radio Network Layer cause Handover desirable for radio reasons.
- RadioNetworkLayer_TimeCriticalHandover - Radio Network Layer Time Critical Handover - S1AP Radio Network Layer cause Time critical handover.
- RadioNetworkLayer_ResourceOptimisationHandover - Radio Network Layer Resource Optimisation Handover - S1AP Radio Network Layer cause Resource optimisation handover.
- RadioNetworkLayer_ReduceLoadInServingCell - Radio Network Layer Reduce Load in Serving Cell - S1AP Radio Network Layer cause Reduce load in serving cell.
- RadioNetworkLayer_UserInactivity - Radio Network Layer User Inactivity - S1AP Radio Network Layer cause User Inactivity.
- RadioNetworkLayer_RadioConnectionWithUeLost - Radio Network Layer Radio Connection with UE Lost - S1AP Radio Network Layer cause Radio Connection With UE Lost.
- RadioNetworkLayer_LoadBalancingTauRequired - Radio Network Layer Load Balancing TAU Required - S1AP Radio Network Layer cause Load Balancing TAU Required.
- RadioNetworkLayer_CsFallbackTriggered - Radio Network Layer CS Fallback Triggered - S1AP Radio Network Layer cause CS Fallback Triggered.
- RadioNetworkLayer_UeNotAvailableForPsService - Radio Network Layer UE Not Available for PS Service - S1AP Radio Network Layer cause UE Not Available For PS Service.
- RadioNetworkLayer_RadioResourcesNotAvailable - Radio Network Layer Radio Resources Not Available - S1AP Radio Network Layer cause Radio resources not available.
- RadioNetworkLayer_FailureInTheRadioInterfaceProcedure - Radio Network Layer Failure in the Radio Interface Procedure - S1AP Radio Network Layer cause Failure in the Radio Interface Procedure.
- RadioNetworkLayer_InvalidQosCombination - Radio Network Layer Invalid QoS Combination - S1AP Radio Network Layer cause Invalid QoS combination.

- **RadioNetworkLayer_InterRatRedirection** - Radio Network Layer Inter-RAT Redirection - S1AP Radio Network Layer cause Inter-RAT redirection.
- **RadioNetworkLayer_InteractionWithOtherProcedure** - Radio Network Layer Interaction with Other Procedure - S1AP Radio Network Layer cause Interaction with other procedure.
- **RadioNetworkLayer_UnknownErabId** - Radio Network Layer Unknown E-RAB ID - S1AP Radio Network Layer cause Unknown E-RAB ID.
- **RadioNetworkLayer_MultipleErabIdInstances** - Radio Network Layer Multiple E-RAB ID Instances - S1AP Radio Network Layer cause Multiple E-RAB ID instances.
- **RadioNetworkLayer_EncryptionAndOrIntegrityProtectionAlgorithmsNotSupported** - Radio Network Layer Encryption and/or Integrity Protection Algorithms Not Supported - S1AP Radio Network Layer cause Encryption and/or Integrity protection algorithms not supported.
- **RadioNetworkLayer_S1IntraSystemhandoverTriggered** - Radio Network Layer S1 Intra System Handover Triggered - S1AP Radio Network Layer cause S1 intra system Handover triggered.
- **RadioNetworkLayer_S1InterSystemHandoverTriggered** - Radio Network Layer S1 Inter System Handover Triggered - S1AP Radio Network Layer cause S1 inter system Handover triggered.
- **RadioNetworkLayer_x2HandoverTriggered** - Radio Network Layer X2 Handover Triggered - S1AP Radio Network Layer cause X2 Handover triggered.
- **RadioNetworkLayer_redirectionTowards1xRtt** - Radio Network Layer Redirection Towards 1xRTT - S1AP Radio Network Layer cause Redirection towards 1xRTT.
- **RadioNetworkLayer_NotSupportedQciValue** - Radio Network Layer Not Supported QCI Value - S1AP Radio Network Layer cause Not Supported QCI Value.
- **RadioNetworkLayer_InvalidCsgId** - Radio Network Layer Invalid CSG Id - S1AP Radio Network Layer cause Invalid CSG Id.
- **RadioNetworkLayer_ReleaseDueToPreEmption** - Radio Network Layer Release Due to Pre-Emption - S1AP Radio Network Layer cause Release due to Pre-Emption.
- **RadioNetworkLayer_N26InterfaceNotAvailable** - Radio Network Layer N26 Interface Not Available - S1AP Radio Network Layer cause N26 interface not available.
- **TransportLayer_TransportResourceUnavailable** - Transport Layer Transport Resource Unavailable - S1AP Transport Layer cause Transport Resource Unavailable.
- **TransportLayer_Unspecified** - Transport Layer Unspecified - S1AP Transport Layer cause Unspecified.
- **Nas_NormalRelease** - NAS Normal Release - S1AP NAS cause Normal Release.
- **Nas_AuthenticationFailure** - NAS Authentication Failure - S1AP NAS cause Authentication failure.

- Nas_Detach - NAS Detach - S1AP NAS cause Detach.
- Nas_Unspecified - NAS Unspecified - S1AP NAS cause Unspecified.
- Nas_CsgSubscriptionExpiry - NAS CSG Subscription Expiry - S1AP NAS cause CSG Subscription Expiry.
- Protocol_TransferSyntaxError - Protocol Transfer Syntax Error - S1AP Protocol cause Transfer Syntax Error.
- Protocol_AbstractSyntaxErrorReject - Protocol Abstract Syntax Error (Reject) - S1AP Protocol cause Abstract Syntax Error (Reject).
- Protocol_AbstractSyntaxErrorIgnoreAndNotify - Protocol Abstract Syntax Error (Ignore and Notify) - S1AP Protocol cause Abstract Syntax Error (Ignore and Notify).
- Protocol_MessageNotCompatibleWithReceiverState - Protocol Message Not Compatible with Receiver State - S1AP Protocol cause Message not Compatible with Receiver State.
- Protocol_SemanticError - Protocol Semantic Error - S1AP Protocol cause Semantic Error.
- Protocol_AbstractSyntaxErrorFalselyConstructedMessage - Protocol Abstract Syntax Error (Falsely Constructed Message) - S1AP Protocol cause Abstract Syntax Error (Falsely Constructed Message).
- Protocol_Unspecified - Protocol Unspecified - S1AP Protocol cause Unspecified.
- Miscellaneous_ControlProcessingOverload - Miscellaneous Control Processing Overload - S1AP Miscellaneous cause Control Processing Overload.
- Miscellaneous_NotEnoughUserPlaneProcessingResources - Miscellaneous Not Enough User Plane Processing Resources - S1AP Miscellaneous cause Not enough User Plane Processing Resources.
- Miscellaneous_HardwareFailure - Miscellaneous Hardware Failure - S1AP Miscellaneous cause Hardware Failure.
- Miscellaneous_OmIntervention - Miscellaneous O&M Intervention - S1AP Miscellaneous cause O&M Intervention.
- Miscellaneous_Unspecified - Miscellaneous Unspecified - S1AP Miscellaneous cause Unspecified.
- Miscellaneous_UnknownPlmn - Miscellaneous Unknown PLMN - S1AP Miscellaneous cause Unknown PLMN.

Default

Disabled

Name

ueCtxtRelNbiotSgsFail - UE Context Release Command NB-IOT SGs Fail

Syntax

--ueCtxtRelNbiotSgsFail <list-item>

Description

S1AP cause code to include on UE context release command when attach or TAU rejected if MME fails to set up SGs association.

Class

Optional.

List

- Disabled - The feature is disabled in the corresponding scenario. The MME does not override the S1AP cause code.
- RadioNetworkLayer_Unspecified - Radio Network Layer Unspecified - S1AP Radio Network Layer cause Unspecified.
- RadioNetworkLayer_TX2RelocOverallExpiry - Radio Network Layer TX2 Reloc Overall Expiry - S1AP Radio Network Layer cause TX2 Reloc Overall Expiry.
- RadioNetworkLayer_SuccessfulHandover - Radio Network Layer Successful Handover - S1AP Radio Network Layer cause Successful Handover.
- RadioNetworkLayer_ReleaseDueToEutranGeneratedReason - Radio Network Layer Release Due to E-UTRAN Generated Reason - S1AP Radio Network Layer cause Release Due to E-UTRAN Generated Reason.
- RadioNetworkLayer_HandoverCancelled - Radio Network Layer Handover Cancelled - S1AP Radio Network Layer cause Handover Cancelled.
- RadioNetworkLayer_PartialHandover - Radio Network Layer Partial Handover - S1AP Radio Network Layer cause Partial Handover.
- RadioNetworkLayer_HandoverFailureInTargetEpcEnbOrTargetSystem - Radio Network Layer Handover Failure in Target EPC/eNB or Target System - S1AP Radio Network Layer cause Handover Failure In Target EPC/eNB or Target System.
- RadioNetworkLayer_HandoverTargetNotAllowed - Radio Network Layer Handover Target Not Allowed - S1AP Radio Network Layer cause Handover Target not allowed.
- RadioNetworkLayer_TS1RelocOverallExpiry - Radio Network Layer TS1 Reloc Overall Expiry - S1AP Radio Network Layer cause TS1Relocoverall Expiry.
- RadioNetworkLayer_TS1RelocPrepExpiry - Radio Network Layer TS1 Reloc Prep Expiry - S1AP Radio Network Layer cause TS1RelocPrep Expiry.
- RadioNetworkLayer_CellNotAvailable - Radio Network Layer Cell Not Available - S1AP Radio Network Layer cause Cell Not Available.
- RadioNetworkLayer_UnknownTargetId - Radio Network Layer Unknown Target Id - S1AP Radio Network Layer cause Unknown Target Id.
- RadioNetworkLayer_NoRadioResourcesAvailableInTargetCell - Radio Network Layer No Resources Available in Target Cell - S1AP Radio Network Layer cause No Resources Available in Target Cell.

- `RadioNetworkLayer_UnknownOrAlreadyAllocatedMmeUeS1apId` - Radio Network Layer Unknown or Already Allocated MME UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated MME UE S1AP ID.
- `RadioNetworkLayer_UnknownOrAlreadyAllocatedEnbUeS1apId` - Radio Network Layer Unknown or Already Allocated eNB UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated eNB UE S1AP ID.
- `RadioNetworkLayer_UnknownOrInconsistentPairOfUeS1apId` - Radio Network Layer Unknown or Inconsistent Pair of S1AP UE ID - S1AP Radio Network Layer cause Unknown or inconsistent pair of S1AP UE ID.
- `RadioNetworkLayer_HandoverDesirableForRadioReasons` - Radio Network Layer Handover Desirable for Radio Reasons - S1AP Radio Network Layer cause Handover desirable for radio reasons.
- `RadioNetworkLayer_TimeCriticalHandover` - Radio Network Layer Time Critical Handover - S1AP Radio Network Layer cause Time critical handover.
- `RadioNetworkLayer_ResourceOptimisationHandover` - Radio Network Layer Resource Optimisation Handover - S1AP Radio Network Layer cause Resource optimisation handover.
- `RadioNetworkLayer_ReduceLoadInServingCell` - Radio Network Layer Reduce Load in Serving Cell - S1AP Radio Network Layer cause Reduce load in serving cell.
- `RadioNetworkLayer_UserInactivity` - Radio Network Layer User Inactivity - S1AP Radio Network Layer cause User Inactivity.
- `RadioNetworkLayer_RadioConnectionWithUeLost` - Radio Network Layer Radio Connection with UE Lost - S1AP Radio Network Layer cause Radio Connection With UE Lost.
- `RadioNetworkLayer_LoadBalancingTauRequired` - Radio Network Layer Load Balancing TAU Required - S1AP Radio Network Layer cause Load Balancing TAU Required.
- `RadioNetworkLayer_CsFallbackTriggered` - Radio Network Layer CS Fallback Triggered - S1AP Radio Network Layer cause CS Fallback Triggered.
- `RadioNetworkLayer_UeNotAvailableForPsService` - Radio Network Layer UE Not Available for PS Service - S1AP Radio Network Layer cause UE Not Available For PS Service.
- `RadioNetworkLayer_RadioResourcesNotAvailable` - Radio Network Layer Radio Resources Not Available - S1AP Radio Network Layer cause Radio resources not available.
- `RadioNetworkLayer_FailureInTheRadioInterfaceProcedure` - Radio Network Layer Failure in the Radio Interface Procedure - S1AP Radio Network Layer cause Failure in the Radio Interface Procedure.
- `RadioNetworkLayer_InvalidQosCombination` - Radio Network Layer Invalid QoS Combination - S1AP Radio Network Layer cause Invalid QoS combination.

- **RadioNetworkLayer_InterRatRedirection** - Radio Network Layer Inter-RAT Redirection - S1AP Radio Network Layer cause Inter-RAT redirection.
- **RadioNetworkLayer_InteractionWithOtherProcedure** - Radio Network Layer Interaction with Other Procedure - S1AP Radio Network Layer cause Interaction with other procedure.
- **RadioNetworkLayer_UnknownErabId** - Radio Network Layer Unknown E-RAB ID - S1AP Radio Network Layer cause Unknown E-RAB ID.
- **RadioNetworkLayer_MultipleErabIdInstances** - Radio Network Layer Multiple E-RAB ID Instances - S1AP Radio Network Layer cause Multiple E-RAB ID instances.
- **RadioNetworkLayer_EncryptionAndOrIntegrityProtectionAlgorithmsNotSupported** - Radio Network Layer Encryption and/or Integrity Protection Algorithms Not Supported - S1AP Radio Network Layer cause Encryption and/or Integrity protection algorithms not supported.
- **RadioNetworkLayer_S1IntraSystemHandoverTriggered** - Radio Network Layer S1 Intra System Handover Triggered - S1AP Radio Network Layer cause S1 intra system Handover triggered.
- **RadioNetworkLayer_S1InterSystemHandoverTriggered** - Radio Network Layer S1 Inter System Handover Triggered - S1AP Radio Network Layer cause S1 inter system Handover triggered.
- **RadioNetworkLayer_x2HandoverTriggered** - Radio Network Layer X2 Handover Triggered - S1AP Radio Network Layer cause X2 Handover triggered.
- **RadioNetworkLayer_redirectionTowards1xRtt** - Radio Network Layer Redirection Towards 1xRTT - S1AP Radio Network Layer cause Redirection towards 1xRTT.
- **RadioNetworkLayer_NotSupportedQciValue** - Radio Network Layer Not Supported QCI Value - S1AP Radio Network Layer cause Not Supported QCI Value.
- **RadioNetworkLayer_InvalidCsgId** - Radio Network Layer Invalid CSG Id - S1AP Radio Network Layer cause Invalid CSG Id.
- **RadioNetworkLayer_ReleaseDueToPreEmption** - Radio Network Layer Release Due to Pre-Emption - S1AP Radio Network Layer cause Release due to Pre-Emption.
- **RadioNetworkLayer_N26InterfaceNotAvailable** - Radio Network Layer N26 Interface Not Available - S1AP Radio Network Layer cause N26 interface not available.
- **TransportLayer_TransportResourceUnavailable** - Transport Layer Transport Resource Unavailable - S1AP Transport Layer cause Transport Resource Unavailable.
- **TransportLayer_Unspecified** - Transport Layer Unspecified - S1AP Transport Layer cause Unspecified.
- **Nas_NormalRelease** - NAS Normal Release - S1AP NAS cause Normal Release.
- **Nas_AuthenticationFailure** - NAS Authentication Failure - S1AP NAS cause Authentication failure.

- Nas_Detach - NAS Detach - S1AP NAS cause Detach.
- Nas_Unspecified - NAS Unspecified - S1AP NAS cause Unspecified.
- Nas_CsgSubscriptionExpiry - NAS CSG Subscription Expiry - S1AP NAS cause CSG Subscription Expiry.
- Protocol_TransferSyntaxError - Protocol Transfer Syntax Error - S1AP Protocol cause Transfer Syntax Error.
- Protocol_AbstractSyntaxErrorReject - Protocol Abstract Syntax Error (Reject) - S1AP Protocol cause Abstract Syntax Error (Reject).
- Protocol_AbstractSyntaxErrorIgnoreAndNotify - Protocol Abstract Syntax Error (Ignore and Notify) - S1AP Protocol cause Abstract Syntax Error (Ignore and Notify).
- Protocol_MessageNotCompatibleWithReceiverState - Protocol Message Not Compatible with Receiver State - S1AP Protocol cause Message not Compatible with Receiver State.
- Protocol_SemanticError - Protocol Semantic Error - S1AP Protocol cause Semantic Error.
- Protocol_AbstractSyntaxErrorFalselyConstructedMessage - Protocol Abstract Syntax Error (Falsely Constructed Message) - S1AP Protocol cause Abstract Syntax Error (Falsely Constructed Message).
- Protocol_Unspecified - Protocol Unspecified - S1AP Protocol cause Unspecified.
- Miscellaneous_ControlProcessingOverload - Miscellaneous Control Processing Overload - S1AP Miscellaneous cause Control Processing Overload.
- Miscellaneous_NotEnoughUserPlaneProcessingResources - Miscellaneous Not Enough User Plane Processing Resources - S1AP Miscellaneous cause Not enough User Plane Processing Resources.
- Miscellaneous_HardwareFailure - Miscellaneous Hardware Failure - S1AP Miscellaneous cause Hardware Failure.
- Miscellaneous_OmIntervention - Miscellaneous O&M Intervention - S1AP Miscellaneous cause O&M Intervention.
- Miscellaneous_Unspecified - Miscellaneous Unspecified - S1AP Miscellaneous cause Unspecified.
- Miscellaneous_UnknownPlmn - Miscellaneous Unknown PLMN - S1AP Miscellaneous cause Unknown PLMN.

Default

Disabled

Name

ueCtxtRelNoApnAllowedByHss - UE Context Release Command No APN Allowed by HSS

Syntax`--ueCtxtRelNoApnAllowedByHss <list-item>`

Description

S1AP cause code to include on UE context release command when no APN is allowed by HSS:

Class

Optional.

List

- Disabled - The feature is disabled in the corresponding scenario. The MME does not override the S1AP cause code.
- RadioNetworkLayer_Unspecified - Radio Network Layer Unspecified - S1AP Radio Network Layer cause Unspecified.
- RadioNetworkLayer_TX2RelocOverallExpiry - Radio Network Layer TX2 Reloc Overall Expiry - S1AP Radio Network Layer cause TX2 Reloc Overall Expiry.
- RadioNetworkLayer_SuccessfulHandover - Radio Network Layer Successful Handover - S1AP Radio Network Layer cause Successful Handover.
- RadioNetworkLayer_ReleaseDueToEutranGeneratedReason - Radio Network Layer Release Due to E-UTRAN Generated Reason - S1AP Radio Network Layer cause Release Due to E-UTRAN Generated Reason.
- RadioNetworkLayer_HandoverCancelled - Radio Network Layer Handover Cancelled - S1AP Radio Network Layer cause Handover Cancelled.
- RadioNetworkLayer_PartialHandover - Radio Network Layer Partial Handover - S1AP Radio Network Layer cause Partial Handover.
- RadioNetworkLayer_HandoverFailureInTargetEpcEnbOrTargetSystem - Radio Network Layer Handover Failure in Target EPC/eNB or Target System - S1AP Radio Network Layer cause Handover Failure In Target EPC/eNB or Target System.
- RadioNetworkLayer_HandoverTargetNotAllowed - Radio Network Layer Handover Target Not Allowed - S1AP Radio Network Layer cause Handover Target not allowed.
- RadioNetworkLayer_TS1RelocOverallExpiry - Radio Network Layer TS1 Reloc Overall Expiry - S1AP Radio Network Layer cause TS1Relocoverall Expiry.
- RadioNetworkLayer_TS1RelocPrepExpiry - Radio Network Layer TS1 Reloc Prep Expiry - S1AP Radio Network Layer cause TS1RelocPrep Expiry.
- RadioNetworkLayer_CellNotAvailable - Radio Network Layer Cell Not Available - S1AP Radio Network Layer cause Cell Not Available.
- RadioNetworkLayer_UnknownTargetId - Radio Network Layer Unknown Target Id - S1AP Radio Network Layer cause Unknown Target Id.
- RadioNetworkLayer_NoRadioResourcesAvailableInTargetCell - Radio Network Layer No Resources Available in Target Cell - S1AP Radio Network Layer cause No Resources Available in Target Cell.

- `RadioNetworkLayer_UnknownOrAlreadyAllocatedMmeUeS1apId` - Radio Network Layer Unknown or Already Allocated MME UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated MME UE S1AP ID.
- `RadioNetworkLayer_UnknownOrAlreadyAllocatedEnbUeS1apId` - Radio Network Layer Unknown or Already Allocated eNB UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated eNB UE S1AP ID.
- `RadioNetworkLayer_UnknownOrInconsistentPairOfUeS1apId` - Radio Network Layer Unknown or Inconsistent Pair of S1AP UE ID - S1AP Radio Network Layer cause Unknown or inconsistent pair of S1AP UE ID.
- `RadioNetworkLayer_HandoverDesirableForRadioReasons` - Radio Network Layer Handover Desirable for Radio Reasons - S1AP Radio Network Layer cause Handover desirable for radio reasons.
- `RadioNetworkLayer_TimeCriticalHandover` - Radio Network Layer Time Critical Handover - S1AP Radio Network Layer cause Time critical handover.
- `RadioNetworkLayer_ResourceOptimisationHandover` - Radio Network Layer Resource Optimisation Handover - S1AP Radio Network Layer cause Resource optimisation handover.
- `RadioNetworkLayer_ReduceLoadInServingCell` - Radio Network Layer Reduce Load in Serving Cell - S1AP Radio Network Layer cause Reduce load in serving cell.
- `RadioNetworkLayer_UserInactivity` - Radio Network Layer User Inactivity - S1AP Radio Network Layer cause User Inactivity.
- `RadioNetworkLayer_RadioConnectionWithUeLost` - Radio Network Layer Radio Connection with UE Lost - S1AP Radio Network Layer cause Radio Connection With UE Lost.
- `RadioNetworkLayer_LoadBalancingTauRequired` - Radio Network Layer Load Balancing TAU Required - S1AP Radio Network Layer cause Load Balancing TAU Required.
- `RadioNetworkLayer_CsFallbackTriggered` - Radio Network Layer CS Fallback Triggered - S1AP Radio Network Layer cause CS Fallback Triggered.
- `RadioNetworkLayer_UeNotAvailableForPsService` - Radio Network Layer UE Not Available for PS Service - S1AP Radio Network Layer cause UE Not Available For PS Service.
- `RadioNetworkLayer_RadioResourcesNotAvailable` - Radio Network Layer Radio Resources Not Available - S1AP Radio Network Layer cause Radio resources not available.
- `RadioNetworkLayer_FailureInTheRadioInterfaceProcedure` - Radio Network Layer Failure in the Radio Interface Procedure - S1AP Radio Network Layer cause Failure in the Radio Interface Procedure.
- `RadioNetworkLayer_InvalidQosCombination` - Radio Network Layer Invalid QoS Combination - S1AP Radio Network Layer cause Invalid QoS combination.

- **RadioNetworkLayer_InterRatRedirection** - Radio Network Layer Inter-RAT Redirection - S1AP Radio Network Layer cause Inter-RAT redirection.
- **RadioNetworkLayer_InteractionWithOtherProcedure** - Radio Network Layer Interaction with Other Procedure - S1AP Radio Network Layer cause Interaction with other procedure.
- **RadioNetworkLayer_UnknownErabId** - Radio Network Layer Unknown E-RAB ID - S1AP Radio Network Layer cause Unknown E-RAB ID.
- **RadioNetworkLayer_MultipleErabIdInstances** - Radio Network Layer Multiple E-RAB ID Instances - S1AP Radio Network Layer cause Multiple E-RAB ID instances.
- **RadioNetworkLayer_EncryptionAndOrIntegrityProtectionAlgorithmsNotSupported** - Radio Network Layer Encryption and/or Integrity Protection Algorithms Not Supported - S1AP Radio Network Layer cause Encryption and/or Integrity protection algorithms not supported.
- **RadioNetworkLayer_S1IntraSystemHandoverTriggered** - Radio Network Layer S1 Intra System Handover Triggered - S1AP Radio Network Layer cause S1 intra system Handover triggered.
- **RadioNetworkLayer_S1InterSystemHandoverTriggered** - Radio Network Layer S1 Inter System Handover Triggered - S1AP Radio Network Layer cause S1 inter system Handover triggered.
- **RadioNetworkLayer_x2HandoverTriggered** - Radio Network Layer X2 Handover Triggered - S1AP Radio Network Layer cause X2 Handover triggered.
- **RadioNetworkLayer_redirectionTowards1xRtt** - Radio Network Layer Redirection Towards 1xRTT - S1AP Radio Network Layer cause Redirection towards 1xRTT.
- **RadioNetworkLayer_NotSupportedQciValue** - Radio Network Layer Not Supported QCI Value - S1AP Radio Network Layer cause Not Supported QCI Value.
- **RadioNetworkLayer_InvalidCsgId** - Radio Network Layer Invalid CSG Id - S1AP Radio Network Layer cause Invalid CSG Id.
- **RadioNetworkLayer_ReleaseDueToPreEmption** - Radio Network Layer Release Due to Pre-Emption - S1AP Radio Network Layer cause Release due to Pre-Emption.
- **RadioNetworkLayer_N26InterfaceNotAvailable** - Radio Network Layer N26 Interface Not Available - S1AP Radio Network Layer cause N26 interface not available.
- **TransportLayer_TransportResourceUnavailable** - Transport Layer Transport Resource Unavailable - S1AP Transport Layer cause Transport Resource Unavailable.
- **TransportLayer_Unspecified** - Transport Layer Unspecified - S1AP Transport Layer cause Unspecified.
- **Nas_NormalRelease** - NAS Normal Release - S1AP NAS cause Normal Release.
- **Nas_AuthenticationFailure** - NAS Authentication Failure - S1AP NAS cause Authentication failure.

- Nas_Detach - NAS Detach - S1AP NAS cause Detach.
- Nas_Unspecified - NAS Unspecified - S1AP NAS cause Unspecified.
- Nas_CsgSubscriptionExpiry - NAS CSG Subscription Expiry - S1AP NAS cause CSG Subscription Expiry.
- Protocol_TransferSyntaxError - Protocol Transfer Syntax Error - S1AP Protocol cause Transfer Syntax Error.
- Protocol_AbstractSyntaxErrorReject - Protocol Abstract Syntax Error (Reject) - S1AP Protocol cause Abstract Syntax Error (Reject).
- Protocol_AbstractSyntaxErrorIgnoreAndNotify - Protocol Abstract Syntax Error (Ignore and Notify) - S1AP Protocol cause Abstract Syntax Error (Ignore and Notify).
- Protocol_MessageNotCompatibleWithReceiverState - Protocol Message Not Compatible with Receiver State - S1AP Protocol cause Message not Compatible with Receiver State.
- Protocol_SemanticError - Protocol Semantic Error - S1AP Protocol cause Semantic Error.
- Protocol_AbstractSyntaxErrorFalselyConstructedMessage - Protocol Abstract Syntax Error (Falsely Constructed Message) - S1AP Protocol cause Abstract Syntax Error (Falsely Constructed Message).
- Protocol_Unspecified - Protocol Unspecified - S1AP Protocol cause Unspecified.
- Miscellaneous_ControlProcessingOverload - Miscellaneous Control Processing Overload - S1AP Miscellaneous cause Control Processing Overload.
- Miscellaneous_NotEnoughUserPlaneProcessingResources - Miscellaneous Not Enough User Plane Processing Resources - S1AP Miscellaneous cause Not enough User Plane Processing Resources.
- Miscellaneous_HardwareFailure - Miscellaneous Hardware Failure - S1AP Miscellaneous cause Hardware Failure.
- Miscellaneous_OmIntervention - Miscellaneous O&M Intervention - S1AP Miscellaneous cause O&M Intervention.
- Miscellaneous_Unspecified - Miscellaneous Unspecified - S1AP Miscellaneous cause Unspecified.
- Miscellaneous_UnknownPlmn - Miscellaneous Unknown PLMN - S1AP Miscellaneous cause Unknown PLMN.

Default

Disabled

Name

ueCtxtRelNoaUe - UE Context Release Command NOA User Unknown

Syntax`--ueCtxtRelNoaUe <list-item>`

Description

The S1AP cause code to include on UE context release command when detach reason is user unknown received in Notify Answer from HSS.

Class

Optional.

List

- Disabled - The feature is disabled in the corresponding scenario. The MME does not override the S1AP cause code.
- RadioNetworkLayer_Unspecified - Radio Network Layer Unspecified - S1AP Radio Network Layer cause Unspecified.
- RadioNetworkLayer_TX2RelocOverallExpiry - Radio Network Layer TX2 Reloc Overall Expiry - S1AP Radio Network Layer cause TX2 Reloc Overall Expiry.
- RadioNetworkLayer_SuccessfulHandover - Radio Network Layer Successful Handover - S1AP Radio Network Layer cause Successful Handover.
- RadioNetworkLayer_ReleaseDueToEutranGeneratedReason - Radio Network Layer Release Due to E-UTRAN Generated Reason - S1AP Radio Network Layer cause Release Due to E-UTRAN Generated Reason.
- RadioNetworkLayer_HandoverCancelled - Radio Network Layer Handover Cancelled - S1AP Radio Network Layer cause Handover Cancelled.
- RadioNetworkLayer_PartialHandover - Radio Network Layer Partial Handover - S1AP Radio Network Layer cause Partial Handover.
- RadioNetworkLayer_HandoverFailureInTargetEpcEnbOrTargetSystem - Radio Network Layer Handover Failure in Target EPC/eNB or Target System - S1AP Radio Network Layer cause Handover Failure In Target EPC/eNB or Target System.
- RadioNetworkLayer_HandoverTargetNotAllowed - Radio Network Layer Handover Target Not Allowed - S1AP Radio Network Layer cause Handover Target not allowed.
- RadioNetworkLayer_TS1RelocOverallExpiry - Radio Network Layer TS1 Reloc Overall Expiry - S1AP Radio Network Layer cause TS1Relocoverall Expiry.
- RadioNetworkLayer_TS1RelocPrepExpiry - Radio Network Layer TS1 Reloc Prep Expiry - S1AP Radio Network Layer cause TS1RelocPrep Expiry.
- RadioNetworkLayer_CellNotAvailable - Radio Network Layer Cell Not Available - S1AP Radio Network Layer cause Cell Not Available.
- RadioNetworkLayer_UnknownTargetId - Radio Network Layer Unknown Target Id - S1AP Radio Network Layer cause Unknown Target Id.
- RadioNetworkLayer_NoRadioResourcesAvailableInTargetCell - Radio Network Layer No Resources Available in Target Cell - S1AP Radio Network Layer cause No Resources Available in Target Cell.

- RadioNetworkLayer_UnknownOrAlreadyAllocatedMmeUeS1apId - Radio Network Layer Unknown or Already Allocated MME UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated MME UE S1AP ID.
- RadioNetworkLayer_UnknownOrAlreadyAllocatedEnbUeS1apId - Radio Network Layer Unknown or Already Allocated eNB UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated eNB UE S1AP ID.
- RadioNetworkLayer_UnknownOrInconsistentPairOfUeS1apId - Radio Network Layer Unknown or Inconsistent Pair of S1AP UE ID - S1AP Radio Network Layer cause Unknown or inconsistent pair of S1AP UE ID.
- RadioNetworkLayer_HandoverDesirableForRadioReasons - Radio Network Layer Handover Desirable for Radio Reasons - S1AP Radio Network Layer cause Handover desirable for radio reasons.
- RadioNetworkLayer_TimeCriticalHandover - Radio Network Layer Time Critical Handover - S1AP Radio Network Layer cause Time critical handover.
- RadioNetworkLayer_ResourceOptimisationHandover - Radio Network Layer Resource Optimisation Handover - S1AP Radio Network Layer cause Resource optimisation handover.
- RadioNetworkLayer_ReduceLoadInServingCell - Radio Network Layer Reduce Load in Serving Cell - S1AP Radio Network Layer cause Reduce load in serving cell.
- RadioNetworkLayer_UserInactivity - Radio Network Layer User Inactivity - S1AP Radio Network Layer cause User Inactivity.
- RadioNetworkLayer_RadioConnectionWithUeLost - Radio Network Layer Radio Connection with UE Lost - S1AP Radio Network Layer cause Radio Connection With UE Lost.
- RadioNetworkLayer_LoadBalancingTauRequired - Radio Network Layer Load Balancing TAU Required - S1AP Radio Network Layer cause Load Balancing TAU Required.
- RadioNetworkLayer_CsFallbackTriggered - Radio Network Layer CS Fallback Triggered - S1AP Radio Network Layer cause CS Fallback Triggered.
- RadioNetworkLayer_UeNotAvailableForPsService - Radio Network Layer UE Not Available for PS Service - S1AP Radio Network Layer cause UE Not Available For PS Service.
- RadioNetworkLayer_RadioResourcesNotAvailable - Radio Network Layer Radio Resources Not Available - S1AP Radio Network Layer cause Radio resources not available.
- RadioNetworkLayer_FailureInTheRadioInterfaceProcedure - Radio Network Layer Failure in the Radio Interface Procedure - S1AP Radio Network Layer cause Failure in the Radio Interface Procedure.
- RadioNetworkLayer_InvalidQosCombination - Radio Network Layer Invalid QoS Combination - S1AP Radio Network Layer cause Invalid QoS combination.

- **RadioNetworkLayer_InterRatRedirection** - Radio Network Layer Inter-RAT Redirection - S1AP Radio Network Layer cause Inter-RAT redirection.
- **RadioNetworkLayer_InteractionWithOtherProcedure** - Radio Network Layer Interaction with Other Procedure - S1AP Radio Network Layer cause Interaction with other procedure.
- **RadioNetworkLayer_UnknownErabId** - Radio Network Layer Unknown E-RAB ID - S1AP Radio Network Layer cause Unknown E-RAB ID.
- **RadioNetworkLayer_MultipleErabIdInstances** - Radio Network Layer Multiple E-RAB ID Instances - S1AP Radio Network Layer cause Multiple E-RAB ID instances.
- **RadioNetworkLayer_EncryptionAndOrIntegrityProtectionAlgorithmsNotSupported** - Radio Network Layer Encryption and/or Integrity Protection Algorithms Not Supported - S1AP Radio Network Layer cause Encryption and/or Integrity protection algorithms not supported.
- **RadioNetworkLayer_S1IntraSystemHandoverTriggered** - Radio Network Layer S1 Intra System Handover Triggered - S1AP Radio Network Layer cause S1 intra system Handover triggered.
- **RadioNetworkLayer_S1InterSystemHandoverTriggered** - Radio Network Layer S1 Inter System Handover Triggered - S1AP Radio Network Layer cause S1 inter system Handover triggered.
- **RadioNetworkLayer_x2HandoverTriggered** - Radio Network Layer X2 Handover Triggered - S1AP Radio Network Layer cause X2 Handover triggered.
- **RadioNetworkLayer_redirectionTowards1xRtt** - Radio Network Layer Redirection Towards 1xRTT - S1AP Radio Network Layer cause Redirection towards 1xRTT.
- **RadioNetworkLayer_NotSupportedQciValue** - Radio Network Layer Not Supported QCI Value - S1AP Radio Network Layer cause Not Supported QCI Value.
- **RadioNetworkLayer_InvalidCsgId** - Radio Network Layer Invalid CSG Id - S1AP Radio Network Layer cause Invalid CSG Id.
- **RadioNetworkLayer_ReleaseDueToPreEmption** - Radio Network Layer Release Due to Pre-Emption - S1AP Radio Network Layer cause Release due to Pre-Emption.
- **RadioNetworkLayer_N26InterfaceNotAvailable** - Radio Network Layer N26 Interface Not Available - S1AP Radio Network Layer cause N26 interface not available.
- **TransportLayer_TransportResourceUnavailable** - Transport Layer Transport Resource Unavailable - S1AP Transport Layer cause Transport Resource Unavailable.
- **TransportLayer_Unspecified** - Transport Layer Unspecified - S1AP Transport Layer cause Unspecified.
- **Nas_NormalRelease** - NAS Normal Release - S1AP NAS cause Normal Release.
- **Nas_AuthenticationFailure** - NAS Authentication Failure - S1AP NAS cause Authentication failure.

- Nas_Detach - NAS Detach - S1AP NAS cause Detach.
- Nas_Unspecified - NAS Unspecified - S1AP NAS cause Unspecified.
- Nas_CsgSubscriptionExpiry - NAS CSG Subscription Expiry - S1AP NAS cause CSG Subscription Expiry.
- Protocol_TransferSyntaxError - Protocol Transfer Syntax Error - S1AP Protocol cause Transfer Syntax Error.
- Protocol_AbstractSyntaxErrorReject - Protocol Abstract Syntax Error (Reject) - S1AP Protocol cause Abstract Syntax Error (Reject).
- Protocol_AbstractSyntaxErrorIgnoreAndNotify - Protocol Abstract Syntax Error (Ignore and Notify) - S1AP Protocol cause Abstract Syntax Error (Ignore and Notify).
- Protocol_MessageNotCompatibleWithReceiverState - Protocol Message Not Compatible with Receiver State - S1AP Protocol cause Message not Compatible with Receiver State.
- Protocol_SemanticError - Protocol Semantic Error - S1AP Protocol cause Semantic Error.
- Protocol_AbstractSyntaxErrorFalselyConstructedMessage - Protocol Abstract Syntax Error (Falsely Constructed Message) - S1AP Protocol cause Abstract Syntax Error (Falsely Constructed Message).
- Protocol_Unspecified - Protocol Unspecified - S1AP Protocol cause Unspecified.
- Miscellaneous_ControlProcessingOverload - Miscellaneous Control Processing Overload - S1AP Miscellaneous cause Control Processing Overload.
- Miscellaneous_NotEnoughUserPlaneProcessingResources - Miscellaneous Not Enough User Plane Processing Resources - S1AP Miscellaneous cause Not enough User Plane Processing Resources.
- Miscellaneous_HardwareFailure - Miscellaneous Hardware Failure - S1AP Miscellaneous cause Hardware Failure.
- Miscellaneous_OmIntervention - Miscellaneous O&M Intervention - S1AP Miscellaneous cause O&M Intervention.
- Miscellaneous_Unspecified - Miscellaneous Unspecified - S1AP Miscellaneous cause Unspecified.
- Miscellaneous_UnknownPlmn - Miscellaneous Unknown PLMN - S1AP Miscellaneous cause Unknown PLMN.

Default

Disabled

Name

ueCtxtRelNoProvisionedHss - UE Context Release Command No Provisioned HSS

Syntax

--ueCtxtRelNoProvisionedHss <list-item>

Description

Mapping for no provisioned HSS to S1 release cause code.

Class

Optional.

List

- Disabled - The feature is disabled in the corresponding scenario. The MME does not override the S1AP cause code.
- RadioNetworkLayer_Unspecified - Radio Network Layer Unspecified - S1AP Radio Network Layer cause Unspecified.
- RadioNetworkLayer_TX2RelocOverallExpiry - Radio Network Layer TX2 Reloc Overall Expiry - S1AP Radio Network Layer cause TX2 Reloc Overall Expiry.
- RadioNetworkLayer_SuccessfulHandover - Radio Network Layer Successful Handover - S1AP Radio Network Layer cause Successful Handover.
- RadioNetworkLayer_ReleaseDueToEutranGeneratedReason - Radio Network Layer Release Due to E-UTRAN Generated Reason - S1AP Radio Network Layer cause Release Due to E-UTRAN Generated Reason.
- RadioNetworkLayer_HandoverCancelled - Radio Network Layer Handover Cancelled - S1AP Radio Network Layer cause Handover Cancelled.
- RadioNetworkLayer_PartialHandover - Radio Network Layer Partial Handover - S1AP Radio Network Layer cause Partial Handover.
- RadioNetworkLayer_HandoverFailureInTargetEpcEnbOrTargetSystem - Radio Network Layer Handover Failure in Target EPC/eNB or Target System - S1AP Radio Network Layer cause Handover Failure In Target EPC/eNB or Target System.
- RadioNetworkLayer_HandoverTargetNotAllowed - Radio Network Layer Handover Target Not Allowed - S1AP Radio Network Layer cause Handover Target not allowed.
- RadioNetworkLayer_TS1RelocOverallExpiry - Radio Network Layer TS1 Reloc Overall Expiry - S1AP Radio Network Layer cause TS1Relocoverall Expiry.
- RadioNetworkLayer_TS1RelocPrepExpiry - Radio Network Layer TS1 Reloc Prep Expiry - S1AP Radio Network Layer cause TS1RelocPrep Expiry.
- RadioNetworkLayer_CellNotAvailable - Radio Network Layer Cell Not Available - S1AP Radio Network Layer cause Cell Not Available.
- RadioNetworkLayer_UnknownTargetId - Radio Network Layer Unknown Target Id - S1AP Radio Network Layer cause Unknown Target Id.
- RadioNetworkLayer_NoRadioResourcesAvailableInTargetCell - Radio Network Layer No Resources Available in Target Cell - S1AP Radio Network Layer cause No Resources Available in Target Cell.

- `RadioNetworkLayer_UnknownOrAlreadyAllocatedMmeUeS1apId` - Radio Network Layer Unknown or Already Allocated MME UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated MME UE S1AP ID.
- `RadioNetworkLayer_UnknownOrAlreadyAllocatedEnbUeS1apId` - Radio Network Layer Unknown or Already Allocated eNB UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated eNB UE S1AP ID.
- `RadioNetworkLayer_UnknownOrInconsistentPairOfUeS1apId` - Radio Network Layer Unknown or Inconsistent Pair of S1AP UE ID - S1AP Radio Network Layer cause Unknown or inconsistent pair of S1AP UE ID.
- `RadioNetworkLayer_HandoverDesirableForRadioReasons` - Radio Network Layer Handover Desirable for Radio Reasons - S1AP Radio Network Layer cause Handover desirable for radio reasons.
- `RadioNetworkLayer_TimeCriticalHandover` - Radio Network Layer Time Critical Handover - S1AP Radio Network Layer cause Time critical handover.
- `RadioNetworkLayer_ResourceOptimisationHandover` - Radio Network Layer Resource Optimisation Handover - S1AP Radio Network Layer cause Resource optimisation handover.
- `RadioNetworkLayer_ReduceLoadInServingCell` - Radio Network Layer Reduce Load in Serving Cell - S1AP Radio Network Layer cause Reduce load in serving cell.
- `RadioNetworkLayer_UserInactivity` - Radio Network Layer User Inactivity - S1AP Radio Network Layer cause User Inactivity.
- `RadioNetworkLayer_RadioConnectionWithUeLost` - Radio Network Layer Radio Connection with UE Lost - S1AP Radio Network Layer cause Radio Connection With UE Lost.
- `RadioNetworkLayer_LoadBalancingTauRequired` - Radio Network Layer Load Balancing TAU Required - S1AP Radio Network Layer cause Load Balancing TAU Required.
- `RadioNetworkLayer_CsFallbackTriggered` - Radio Network Layer CS Fallback Triggered - S1AP Radio Network Layer cause CS Fallback Triggered.
- `RadioNetworkLayer_UeNotAvailableForPsService` - Radio Network Layer UE Not Available for PS Service - S1AP Radio Network Layer cause UE Not Available For PS Service.
- `RadioNetworkLayer_RadioResourcesNotAvailable` - Radio Network Layer Radio Resources Not Available - S1AP Radio Network Layer cause Radio resources not available.
- `RadioNetworkLayer_FailureInTheRadioInterfaceProcedure` - Radio Network Layer Failure in the Radio Interface Procedure - S1AP Radio Network Layer cause Failure in the Radio Interface Procedure.
- `RadioNetworkLayer_InvalidQosCombination` - Radio Network Layer Invalid QoS Combination - S1AP Radio Network Layer cause Invalid QoS combination.

- **RadioNetworkLayer_InterRatRedirection** - Radio Network Layer Inter-RAT Redirection - S1AP Radio Network Layer cause Inter-RAT redirection.
- **RadioNetworkLayer_InteractionWithOtherProcedure** - Radio Network Layer Interaction with Other Procedure - S1AP Radio Network Layer cause Interaction with other procedure.
- **RadioNetworkLayer_UnknownErabId** - Radio Network Layer Unknown E-RAB ID - S1AP Radio Network Layer cause Unknown E-RAB ID.
- **RadioNetworkLayer_MultipleErabIdInstances** - Radio Network Layer Multiple E-RAB ID Instances - S1AP Radio Network Layer cause Multiple E-RAB ID instances.
- **RadioNetworkLayer_EncryptionAndOrIntegrityProtectionAlgorithmsNotSupported** - Radio Network Layer Encryption and/or Integrity Protection Algorithms Not Supported - S1AP Radio Network Layer cause Encryption and/or Integrity protection algorithms not supported.
- **RadioNetworkLayer_S1IntraSystemHandoverTriggered** - Radio Network Layer S1 Intra System Handover Triggered - S1AP Radio Network Layer cause S1 intra system Handover triggered.
- **RadioNetworkLayer_S1InterSystemHandoverTriggered** - Radio Network Layer S1 Inter System Handover Triggered - S1AP Radio Network Layer cause S1 inter system Handover triggered.
- **RadioNetworkLayer_x2HandoverTriggered** - Radio Network Layer X2 Handover Triggered - S1AP Radio Network Layer cause X2 Handover triggered.
- **RadioNetworkLayer_redirectionTowards1xRtt** - Radio Network Layer Redirection Towards 1xRTT - S1AP Radio Network Layer cause Redirection towards 1xRTT.
- **RadioNetworkLayer_NotSupportedQciValue** - Radio Network Layer Not Supported QCI Value - S1AP Radio Network Layer cause Not Supported QCI Value.
- **RadioNetworkLayer_InvalidCsgId** - Radio Network Layer Invalid CSG Id - S1AP Radio Network Layer cause Invalid CSG Id.
- **RadioNetworkLayer_ReleaseDueToPreEmption** - Radio Network Layer Release Due to Pre-Emption - S1AP Radio Network Layer cause Release due to Pre-Emption.
- **RadioNetworkLayer_N26InterfaceNotAvailable** - Radio Network Layer N26 Interface Not Available - S1AP Radio Network Layer cause N26 interface not available.
- **TransportLayer_TransportResourceUnavailable** - Transport Layer Transport Resource Unavailable - S1AP Transport Layer cause Transport Resource Unavailable.
- **TransportLayer_Unspecified** - Transport Layer Unspecified - S1AP Transport Layer cause Unspecified.
- **Nas_NormalRelease** - NAS Normal Release - S1AP NAS cause Normal Release.
- **Nas_AuthenticationFailure** - NAS Authentication Failure - S1AP NAS cause Authentication failure.

- Nas_Detach - NAS Detach - S1AP NAS cause Detach.
- Nas_Unspecified - NAS Unspecified - S1AP NAS cause Unspecified.
- Nas_CsgSubscriptionExpiry - NAS CSG Subscription Expiry - S1AP NAS cause CSG Subscription Expiry.
- Protocol_TransferSyntaxError - Protocol Transfer Syntax Error - S1AP Protocol cause Transfer Syntax Error.
- Protocol_AbstractSyntaxErrorReject - Protocol Abstract Syntax Error (Reject) - S1AP Protocol cause Abstract Syntax Error (Reject).
- Protocol_AbstractSyntaxErrorIgnoreAndNotify - Protocol Abstract Syntax Error (Ignore and Notify) - S1AP Protocol cause Abstract Syntax Error (Ignore and Notify).
- Protocol_MessageNotCompatibleWithReceiverState - Protocol Message Not Compatible with Receiver State - S1AP Protocol cause Message not Compatible with Receiver State.
- Protocol_SemanticError - Protocol Semantic Error - S1AP Protocol cause Semantic Error.
- Protocol_AbstractSyntaxErrorFalselyConstructedMessage - Protocol Abstract Syntax Error (Falsely Constructed Message) - S1AP Protocol cause Abstract Syntax Error (Falsely Constructed Message).
- Protocol_Unspecified - Protocol Unspecified - S1AP Protocol cause Unspecified.
- Miscellaneous_ControlProcessingOverload - Miscellaneous Control Processing Overload - S1AP Miscellaneous cause Control Processing Overload.
- Miscellaneous_NotEnoughUserPlaneProcessingResources - Miscellaneous Not Enough User Plane Processing Resources - S1AP Miscellaneous cause Not enough User Plane Processing Resources.
- Miscellaneous_HardwareFailure - Miscellaneous Hardware Failure - S1AP Miscellaneous cause Hardware Failure.
- Miscellaneous_OmIntervention - Miscellaneous O&M Intervention - S1AP Miscellaneous cause O&M Intervention.
- Miscellaneous_Unspecified - Miscellaneous Unspecified - S1AP Miscellaneous cause Unspecified.
- Miscellaneous_UnknownPlmn - Miscellaneous Unknown PLMN - S1AP Miscellaneous cause Unknown PLMN.

Default

Disabled

Name

ueCtxtRelNoResponseFromHss - UE Context Release Command No Response from HSS

Syntax

--ueCtxtRelNoResponseFromHss <list-item>

Description

Mapping for no response from HSS to S1 release cause code.

Class

Optional.

List

- Disabled - The feature is disabled in the corresponding scenario. The MME does not override the S1AP cause code.
- RadioNetworkLayer_Unspecified - Radio Network Layer Unspecified - S1AP Radio Network Layer cause Unspecified.
- RadioNetworkLayer_TX2RelocOverallExpiry - Radio Network Layer TX2 Reloc Overall Expiry - S1AP Radio Network Layer cause TX2 Reloc Overall Expiry.
- RadioNetworkLayer_SuccessfulHandover - Radio Network Layer Successful Handover - S1AP Radio Network Layer cause Successful Handover.
- RadioNetworkLayer_ReleaseDueToEutranGeneratedReason - Radio Network Layer Release Due to E-UTRAN Generated Reason - S1AP Radio Network Layer cause Release Due to E-UTRAN Generated Reason.
- RadioNetworkLayer_HandoverCancelled - Radio Network Layer Handover Cancelled - S1AP Radio Network Layer cause Handover Cancelled.
- RadioNetworkLayer_PartialHandover - Radio Network Layer Partial Handover - S1AP Radio Network Layer cause Partial Handover.
- RadioNetworkLayer_HandoverFailureInTargetEpcEnbOrTargetSystem - Radio Network Layer Handover Failure in Target EPC/eNB or Target System - S1AP Radio Network Layer cause Handover Failure In Target EPC/eNB or Target System.
- RadioNetworkLayer_HandoverTargetNotAllowed - Radio Network Layer Handover Target Not Allowed - S1AP Radio Network Layer cause Handover Target not allowed.
- RadioNetworkLayer_TS1RelocOverallExpiry - Radio Network Layer TS1 Reloc Overall Expiry - S1AP Radio Network Layer cause TS1Relocoverall Expiry.
- RadioNetworkLayer_TS1RelocPrepExpiry - Radio Network Layer TS1 Reloc Prep Expiry - S1AP Radio Network Layer cause TS1RelocPrep Expiry.
- RadioNetworkLayer_CellNotAvailable - Radio Network Layer Cell Not Available - S1AP Radio Network Layer cause Cell Not Available.
- RadioNetworkLayer_UnknownTargetId - Radio Network Layer Unknown Target Id - S1AP Radio Network Layer cause Unknown Target Id.
- RadioNetworkLayer_NoRadioResourcesAvailableInTargetCell - Radio Network Layer No Resources Available in Target Cell - S1AP Radio Network Layer cause No Resources Available in Target Cell.

- `RadioNetworkLayer_UnknownOrAlreadyAllocatedMmeUeS1apId` - Radio Network Layer Unknown or Already Allocated MME UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated MME UE S1AP ID.
- `RadioNetworkLayer_UnknownOrAlreadyAllocatedEnbUeS1apId` - Radio Network Layer Unknown or Already Allocated eNB UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated eNB UE S1AP ID.
- `RadioNetworkLayer_UnknownOrInconsistentPairOfUeS1apId` - Radio Network Layer Unknown or Inconsistent Pair of S1AP UE ID - S1AP Radio Network Layer cause Unknown or inconsistent pair of S1AP UE ID.
- `RadioNetworkLayer_HandoverDesirableForRadioReasons` - Radio Network Layer Handover Desirable for Radio Reasons - S1AP Radio Network Layer cause Handover desirable for radio reasons.
- `RadioNetworkLayer_TimeCriticalHandover` - Radio Network Layer Time Critical Handover - S1AP Radio Network Layer cause Time critical handover.
- `RadioNetworkLayer_ResourceOptimisationHandover` - Radio Network Layer Resource Optimisation Handover - S1AP Radio Network Layer cause Resource optimisation handover.
- `RadioNetworkLayer_ReduceLoadInServingCell` - Radio Network Layer Reduce Load in Serving Cell - S1AP Radio Network Layer cause Reduce load in serving cell.
- `RadioNetworkLayer_UserInactivity` - Radio Network Layer User Inactivity - S1AP Radio Network Layer cause User Inactivity.
- `RadioNetworkLayer_RadioConnectionWithUeLost` - Radio Network Layer Radio Connection with UE Lost - S1AP Radio Network Layer cause Radio Connection With UE Lost.
- `RadioNetworkLayer_LoadBalancingTauRequired` - Radio Network Layer Load Balancing TAU Required - S1AP Radio Network Layer cause Load Balancing TAU Required.
- `RadioNetworkLayer_CsFallbackTriggered` - Radio Network Layer CS Fallback Triggered - S1AP Radio Network Layer cause CS Fallback Triggered.
- `RadioNetworkLayer_UeNotAvailableForPsService` - Radio Network Layer UE Not Available for PS Service - S1AP Radio Network Layer cause UE Not Available For PS Service.
- `RadioNetworkLayer_RadioResourcesNotAvailable` - Radio Network Layer Radio Resources Not Available - S1AP Radio Network Layer cause Radio resources not available.
- `RadioNetworkLayer_FailureInTheRadioInterfaceProcedure` - Radio Network Layer Failure in the Radio Interface Procedure - S1AP Radio Network Layer cause Failure in the Radio Interface Procedure.
- `RadioNetworkLayer_InvalidQosCombination` - Radio Network Layer Invalid QoS Combination - S1AP Radio Network Layer cause Invalid QoS combination.

- **RadioNetworkLayer_InterRatRedirection** - Radio Network Layer Inter-RAT Redirection - S1AP Radio Network Layer cause Inter-RAT redirection.
- **RadioNetworkLayer_InteractionWithOtherProcedure** - Radio Network Layer Interaction with Other Procedure - S1AP Radio Network Layer cause Interaction with other procedure.
- **RadioNetworkLayer_UnknownEranId** - Radio Network Layer Unknown E-RAB ID - S1AP Radio Network Layer cause Unknown E-RAB ID.
- **RadioNetworkLayer_MultipleEranIdInstances** - Radio Network Layer Multiple E-RAB ID Instances - S1AP Radio Network Layer cause Multiple E-RAB ID instances.
- **RadioNetworkLayer_EncryptionAndOrIntegrityProtectionAlgorithmsNotSupported** - Radio Network Layer Encryption and/or Integrity Protection Algorithms Not Supported - S1AP Radio Network Layer cause Encryption and/or Integrity protection algorithms not supported.
- **RadioNetworkLayer_S1IntraSystemHandoverTriggered** - Radio Network Layer S1 Intra System Handover Triggered - S1AP Radio Network Layer cause S1 intra system Handover triggered.
- **RadioNetworkLayer_S1InterSystemHandoverTriggered** - Radio Network Layer S1 Inter System Handover Triggered - S1AP Radio Network Layer cause S1 inter system Handover triggered.
- **RadioNetworkLayer_x2HandoverTriggered** - Radio Network Layer X2 Handover Triggered - S1AP Radio Network Layer cause X2 Handover triggered.
- **RadioNetworkLayer_redirectionTowards1xRtt** - Radio Network Layer Redirection Towards 1xRTT - S1AP Radio Network Layer cause Redirection towards 1xRTT.
- **RadioNetworkLayer_NotSupportedQciValue** - Radio Network Layer Not Supported QCI Value - S1AP Radio Network Layer cause Not Supported QCI Value.
- **RadioNetworkLayer_InvalidCsgId** - Radio Network Layer Invalid CSG Id - S1AP Radio Network Layer cause Invalid CSG Id.
- **RadioNetworkLayer_ReleaseDueToPreEmption** - Radio Network Layer Release Due to Pre-Emption - S1AP Radio Network Layer cause Release due to Pre-Emption.
- **RadioNetworkLayer_N26InterfaceNotAvailable** - Radio Network Layer N26 Interface Not Available - S1AP Radio Network Layer cause N26 interface not available.
- **TransportLayer_TransportResourceUnavailable** - Transport Layer Transport Resource Unavailable - S1AP Transport Layer cause Transport Resource Unavailable.
- **TransportLayer_Unspecified** - Transport Layer Unspecified - S1AP Transport Layer cause Unspecified.
- **Nas_NormalRelease** - NAS Normal Release - S1AP NAS cause Normal Release.
- **Nas_AuthenticationFailure** - NAS Authentication Failure - S1AP NAS cause Authentication failure.

- Nas_Detach - NAS Detach - S1AP NAS cause Detach.
- Nas_Unspecified - NAS Unspecified - S1AP NAS cause Unspecified.
- Nas_CsgSubscriptionExpiry - NAS CSG Subscription Expiry - S1AP NAS cause CSG Subscription Expiry.
- Protocol_TransferSyntaxError - Protocol Transfer Syntax Error - S1AP Protocol cause Transfer Syntax Error.
- Protocol_AbstractSyntaxErrorReject - Protocol Abstract Syntax Error (Reject) - S1AP Protocol cause Abstract Syntax Error (Reject).
- Protocol_AbstractSyntaxErrorIgnoreAndNotify - Protocol Abstract Syntax Error (Ignore and Notify) - S1AP Protocol cause Abstract Syntax Error (Ignore and Notify).
- Protocol_MessageNotCompatibleWithReceiverState - Protocol Message Not Compatible with Receiver State - S1AP Protocol cause Message not Compatible with Receiver State.
- Protocol_SemanticError - Protocol Semantic Error - S1AP Protocol cause Semantic Error.
- Protocol_AbstractSyntaxErrorFalselyConstructedMessage - Protocol Abstract Syntax Error (Falsely Constructed Message) - S1AP Protocol cause Abstract Syntax Error (Falsely Constructed Message).
- Protocol_Unspecified - Protocol Unspecified - S1AP Protocol cause Unspecified.
- Miscellaneous_ControlProcessingOverload - Miscellaneous Control Processing Overload - S1AP Miscellaneous cause Control Processing Overload.
- Miscellaneous_NotEnoughUserPlaneProcessingResources - Miscellaneous Not Enough User Plane Processing Resources - S1AP Miscellaneous cause Not enough User Plane Processing Resources.
- Miscellaneous_HardwareFailure - Miscellaneous Hardware Failure - S1AP Miscellaneous cause Hardware Failure.
- Miscellaneous_OmIntervention - Miscellaneous O&M Intervention - S1AP Miscellaneous cause O&M Intervention.
- Miscellaneous_Unspecified - Miscellaneous Unspecified - S1AP Miscellaneous cause Unspecified.
- Miscellaneous_UnknownPlmn - Miscellaneous Unknown PLMN - S1AP Miscellaneous cause Unknown PLMN.

Default

Disabled

Name

ueCtxtRelNoResponseFromSgw - UE Context Release Command No Response from SGW

Syntax

--ueCtxtRelNoResponseFromSgw <list-item>

Description

S1AP cause code to include on UE context release command when there is no response from SGW.

Class

Optional.

List

- Disabled - The feature is disabled in the corresponding scenario. The MME does not override the S1AP cause code.
- RadioNetworkLayer_Unspecified - Radio Network Layer Unspecified - S1AP Radio Network Layer cause Unspecified.
- RadioNetworkLayer_TX2RelocOverallExpiry - Radio Network Layer TX2 Reloc Overall Expiry - S1AP Radio Network Layer cause TX2 Reloc Overall Expiry.
- RadioNetworkLayer_SuccessfulHandover - Radio Network Layer Successful Handover - S1AP Radio Network Layer cause Successful Handover.
- RadioNetworkLayer_ReleaseDueToEutranGeneratedReason - Radio Network Layer Release Due to E-UTRAN Generated Reason - S1AP Radio Network Layer cause Release Due to E-UTRAN Generated Reason.
- RadioNetworkLayer_HandoverCancelled - Radio Network Layer Handover Cancelled - S1AP Radio Network Layer cause Handover Cancelled.
- RadioNetworkLayer_PartialHandover - Radio Network Layer Partial Handover - S1AP Radio Network Layer cause Partial Handover.
- RadioNetworkLayer_HandoverFailureInTargetEpcEnbOrTargetSystem - Radio Network Layer Handover Failure in Target EPC/eNB or Target System - S1AP Radio Network Layer cause Handover Failure In Target EPC/eNB or Target System.

- RadioNetworkLayer_TS1RelocOverallExpiry - Radio Network Layer TS1 Reloc Overall Expiry - S1AP Radio Network Layer cause TS1Relocoverall Expiry.
- RadioNetworkLayer_TS1RelocPrepExpiry - Radio Network Layer TS1 Reloc Prep Expiry - S1AP Radio Network Layer cause TS1RelocPrep Expiry.
- RadioNetworkLayer_CellNotAvailable - Radio Network Layer Cell Not Available - S1AP Radio Network Layer cause Cell Not Available.
- RadioNetworkLayer_UnknownTargetId - Radio Network Layer Unknown Target Id - S1AP Radio Network Layer cause Unknown Target Id.
- RadioNetworkLayer_NoRadioResourcesAvailableInTargetCell - Radio Network Layer No Resources Available in Target Cell - S1AP Radio Network Layer cause No Resources Available in Target Cell.

- RadioNetworkLayer_UnknownOrAlreadyAllocatedMmeUeS1apId - Radio Network Layer Unknown or Already Allocated MME UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated MME UE S1AP ID.
- RadioNetworkLayer_UnknownOrAlreadyAllocatedEnbUeS1apId - Radio Network Layer Unknown or Already Allocated eNB UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated eNB UE S1AP ID.
- RadioNetworkLayer_UnknownOrInconsistentPairOfUeS1apId - Radio Network Layer Unknown or Inconsistent Pair of S1AP UE ID - S1AP Radio Network Layer cause Unknown or inconsistent pair of S1AP UE ID.
- RadioNetworkLayer_HandoverDesirableForRadioReasons - Radio Network Layer Handover Desirable for Radio Reasons - S1AP Radio Network Layer cause Handover desirable for radio reasons.
- RadioNetworkLayer_TimeCriticalHandover - Radio Network Layer Time Critical Handover - S1AP Radio Network Layer cause Time critical handover.
- RadioNetworkLayer_ResourceOptimisationHandover - Radio Network Layer Resource Optimisation Handover - S1AP Radio Network Layer cause Resource optimisation handover.
- RadioNetworkLayer_ReduceLoadInServingCell - Radio Network Layer Reduce Load in Serving Cell - S1AP Radio Network Layer cause Reduce load in serving cell.
- RadioNetworkLayer_UserInactivity - Radio Network Layer User Inactivity - S1AP Radio Network Layer cause User Inactivity.
- RadioNetworkLayer_RadioConnectionWithUeLost - Radio Network Layer Radio Connection with UE Lost - S1AP Radio Network Layer cause Radio Connection With UE Lost.
- RadioNetworkLayer_LoadBalancingTauRequired - Radio Network Layer Load Balancing TAU Required - S1AP Radio Network Layer cause Load Balancing TAU Required.
- RadioNetworkLayer_CsFallbackTriggered - Radio Network Layer CS Fallback Triggered - S1AP Radio Network Layer cause CS Fallback Triggered.
- RadioNetworkLayer_UeNotAvailableForPsService - Radio Network Layer UE Not Available for PS Service - S1AP Radio Network Layer cause UE Not Available For PS Service.
- RadioNetworkLayer_RadioResourcesNotAvailable - Radio Network Layer Radio Resources Not Available - S1AP Radio Network Layer cause Radio resources not available.
- RadioNetworkLayer_FailureInTheRadioInterfaceProcedure - Radio Network Layer Failure in the Radio Interface Procedure - S1AP Radio Network Layer cause Failure in the Radio Interface Procedure.
- RadioNetworkLayer_InvalidQosCombination - Radio Network Layer Invalid QoS Combination - S1AP Radio Network Layer cause Invalid QoS combination.

- **RadioNetworkLayer_InterRatRedirection** - Radio Network Layer Inter-RAT Redirection - S1AP Radio Network Layer cause Inter-RAT redirection.
- **RadioNetworkLayer_InteractionWithOtherProcedure** - Radio Network Layer Interaction with Other Procedure - S1AP Radio Network Layer cause Interaction with other procedure.
- **RadioNetworkLayer_UnknownErabId** - Radio Network Layer Unknown E-RAB ID - S1AP Radio Network Layer cause Unknown E-RAB ID.
- **RadioNetworkLayer_MultipleErabIdInstances** - Radio Network Layer Multiple E-RAB ID Instances - S1AP Radio Network Layer cause Multiple E-RAB ID instances.
- **RadioNetworkLayer_EncryptionAndOrIntegrityProtectionAlgorithmsNotSupported** - Radio Network Layer Encryption and/or Integrity Protection Algorithms Not Supported - S1AP Radio Network Layer cause Encryption and/or Integrity protection algorithms not supported.
- **RadioNetworkLayer_S1IntraSystemHandoverTriggered** - Radio Network Layer S1 Intra System Handover Triggered - S1AP Radio Network Layer cause S1 intra system Handover triggered.
- **RadioNetworkLayer_S1InterSystemHandoverTriggered** - Radio Network Layer S1 Inter System Handover Triggered - S1AP Radio Network Layer cause S1 inter system Handover triggered.
- **RadioNetworkLayer_x2HandoverTriggered** - Radio Network Layer X2 Handover Triggered - S1AP Radio Network Layer cause X2 Handover triggered.
- **RadioNetworkLayer_redirectionTowards1xRtt** - Radio Network Layer Redirection Towards 1xRTT - S1AP Radio Network Layer cause Redirection towards 1xRTT.
- **RadioNetworkLayer_NotSupportedQciValue** - Radio Network Layer Not Supported QCI Value - S1AP Radio Network Layer cause Not Supported QCI Value.
- **RadioNetworkLayer_InvalidCsgId** - Radio Network Layer Invalid CSG Id - S1AP Radio Network Layer cause Invalid CSG Id.
- **RadioNetworkLayer_ReleaseDueToPreEmption** - Radio Network Layer Release Due to Pre-Emption - S1AP Radio Network Layer cause Release due to Pre-Emption.
- **RadioNetworkLayer_N26InterfaceNotAvailable** - Radio Network Layer N26 Interface Not Available - S1AP Radio Network Layer cause N26 interface not available.
- **TransportLayer_TransportResourceUnavailable** - Transport Layer Transport Resource Unavailable - S1AP Transport Layer cause Transport Resource Unavailable.
- **TransportLayer_Unspecified** - Transport Layer Unspecified - S1AP Transport Layer cause Unspecified.
- **Nas_NormalRelease** - NAS Normal Release - S1AP NAS cause Normal Release.
- **Nas_AuthenticationFailure** - NAS Authentication Failure - S1AP NAS cause Authentication failure.

- Nas_Detach - NAS Detach - S1AP NAS cause Detach.
- Nas_Unspecified - NAS Unspecified - S1AP NAS cause Unspecified.
- Nas_CsgSubscriptionExpiry - NAS CSG Subscription Expiry - S1AP NAS cause CSG Subscription Expiry.
- Protocol_TransferSyntaxError - Protocol Transfer Syntax Error - S1AP Protocol cause Transfer Syntax Error.
- Protocol_AbstractSyntaxErrorReject - Protocol Abstract Syntax Error (Reject) - S1AP Protocol cause Abstract Syntax Error (Reject).
- Protocol_AbstractSyntaxErrorIgnoreAndNotify - Protocol Abstract Syntax Error (Ignore and Notify) - S1AP Protocol cause Abstract Syntax Error (Ignore and Notify).
- Protocol_MessageNotCompatibleWithReceiverState - Protocol Message Not Compatible with Receiver State - S1AP Protocol cause Message not Compatible with Receiver State.
- Protocol_SemanticError - Protocol Semantic Error - S1AP Protocol cause Semantic Error.
- Protocol_AbstractSyntaxErrorFalselyConstructedMessage - Protocol Abstract Syntax Error (Falsely Constructed Message) - S1AP Protocol cause Abstract Syntax Error (Falsely Constructed Message).
- Protocol_Unspecified - Protocol Unspecified - S1AP Protocol cause Unspecified.
- Miscellaneous_ControlProcessingOverload - Miscellaneous Control Processing Overload - S1AP Miscellaneous cause Control Processing Overload.
- Miscellaneous_NotEnoughUserPlaneProcessingResources - Miscellaneous Not Enough User Plane Processing Resources - S1AP Miscellaneous cause Not enough User Plane Processing Resources.
- Miscellaneous_HardwareFailure - Miscellaneous Hardware Failure - S1AP Miscellaneous cause Hardware Failure.
- Miscellaneous_OmIntervention - Miscellaneous O&M Intervention - S1AP Miscellaneous cause O&M Intervention.
- Miscellaneous_Unspecified - Miscellaneous Unspecified - S1AP Miscellaneous cause Unspecified.
- Miscellaneous_UnknownPlmn - Miscellaneous Unknown PLMN - S1AP Miscellaneous cause Unknown PLMN.

Default

Disabled

Name

ueCtxtRelNotAllowedTai - UE Context Release Command Not Allowed in a TAI

Syntax`--ueCtxtRelNotAllowedTai <list-item>`

Description

S1AP cause code to include on UE context release command when UE is in a restricted TA where UE is not allowed to access services.

Class

Optional.

List

- Disabled - The feature is disabled in the corresponding scenario. The MME does not override the S1AP cause code.
- RadioNetworkLayer_Unspecified - Radio Network Layer Unspecified - S1AP Radio Network Layer cause Unspecified.
- RadioNetworkLayer_TX2RelocOverallExpiry - Radio Network Layer TX2 Reloc Overall Expiry - S1AP Radio Network Layer cause TX2 Reloc Overall Expiry.
- RadioNetworkLayer_SuccessfulHandover - Radio Network Layer Successful Handover - S1AP Radio Network Layer cause Successful Handover.
- RadioNetworkLayer_ReleaseDueToEutranGeneratedReason - Radio Network Layer Release Due to E-UTRAN Generated Reason - S1AP Radio Network Layer cause Release Due to E-UTRAN Generated Reason.
- RadioNetworkLayer_HandoverCancelled - Radio Network Layer Handover Cancelled - S1AP Radio Network Layer cause Handover Cancelled.
- RadioNetworkLayer_PartialHandover - Radio Network Layer Partial Handover - S1AP Radio Network Layer cause Partial Handover.
- RadioNetworkLayer_HandoverFailureInTargetEpcEnbOrTargetSystem - Radio Network Layer Handover Failure in Target EPC/eNB or Target System - S1AP Radio Network Layer cause Handover Failure In Target EPC/eNB or Target System.
- RadioNetworkLayer_HandoverTargetNotAllowed - Radio Network Layer Handover Target Not Allowed - S1AP Radio Network Layer cause Handover Target not allowed.
- RadioNetworkLayer_TS1RelocOverallExpiry - Radio Network Layer TS1 Reloc Overall Expiry - S1AP Radio Network Layer cause TS1Relocoverall Expiry.
- RadioNetworkLayer_TS1RelocPrepExpiry - Radio Network Layer TS1 Reloc Prep Expiry - S1AP Radio Network Layer cause TS1RelocPrep Expiry.
- RadioNetworkLayer_CellNotAvailable - Radio Network Layer Cell Not Available - S1AP Radio Network Layer cause Cell Not Available.
- RadioNetworkLayer_UnknownTargetId - Radio Network Layer Unknown Target Id - S1AP Radio Network Layer cause Unknown Target Id.
- RadioNetworkLayer_NoRadioResourcesAvailableInTargetCell - Radio Network Layer No Resources Available in Target Cell - S1AP Radio Network Layer cause No Resources Available in Target Cell.

- RadioNetworkLayer_UnknownOrAlreadyAllocatedMmeUeS1apId - Radio Network Layer Unknown or Already Allocated MME UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated MME UE S1AP ID.
- RadioNetworkLayer_UnknownOrAlreadyAllocatedEnbUeS1apId - Radio Network Layer Unknown or Already Allocated eNB UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated eNB UE S1AP ID.
- RadioNetworkLayer_UnknownOrInconsistentPairOfUeS1apId - Radio Network Layer Unknown or Inconsistent Pair of S1AP UE ID - S1AP Radio Network Layer cause Unknown or inconsistent pair of S1AP UE ID.
- RadioNetworkLayer_HandoverDesirableForRadioReasons - Radio Network Layer Handover Desirable for Radio Reasons - S1AP Radio Network Layer cause Handover desirable for radio reasons.
- RadioNetworkLayer_TimeCriticalHandover - Radio Network Layer Time Critical Handover - S1AP Radio Network Layer cause Time critical handover.
- RadioNetworkLayer_ResourceOptimisationHandover - Radio Network Layer Resource Optimisation Handover - S1AP Radio Network Layer cause Resource optimisation handover.
- RadioNetworkLayer_ReduceLoadInServingCell - Radio Network Layer Reduce Load in Serving Cell - S1AP Radio Network Layer cause Reduce load in serving cell.
- RadioNetworkLayer_UserInactivity - Radio Network Layer User Inactivity - S1AP Radio Network Layer cause User Inactivity.
- RadioNetworkLayer_RadioConnectionWithUeLost - Radio Network Layer Radio Connection with UE Lost - S1AP Radio Network Layer cause Radio Connection With UE Lost.
- RadioNetworkLayer_LoadBalancingTauRequired - Radio Network Layer Load Balancing TAU Required - S1AP Radio Network Layer cause Load Balancing TAU Required.
- RadioNetworkLayer_CsFallbackTriggered - Radio Network Layer CS Fallback Triggered - S1AP Radio Network Layer cause CS Fallback Triggered.
- RadioNetworkLayer_UeNotAvailableForPsService - Radio Network Layer UE Not Available for PS Service - S1AP Radio Network Layer cause UE Not Available For PS Service.
- RadioNetworkLayer_RadioResourcesNotAvailable - Radio Network Layer Radio Resources Not Available - S1AP Radio Network Layer cause Radio resources not available.
- RadioNetworkLayer_FailureInTheRadioInterfaceProcedure - Radio Network Layer Failure in the Radio Interface Procedure - S1AP Radio Network Layer cause Failure in the Radio Interface Procedure.
- RadioNetworkLayer_InvalidQosCombination - Radio Network Layer Invalid QoS Combination - S1AP Radio Network Layer cause Invalid QoS combination.

- **RadioNetworkLayer_InterRatRedirection** - Radio Network Layer Inter-RAT Redirection - S1AP Radio Network Layer cause Inter-RAT redirection.
- **RadioNetworkLayer_InteractionWithOtherProcedure** - Radio Network Layer Interaction with Other Procedure - S1AP Radio Network Layer cause Interaction with other procedure.
- **RadioNetworkLayer_UnknownErabId** - Radio Network Layer Unknown E-RAB ID - S1AP Radio Network Layer cause Unknown E-RAB ID.
- **RadioNetworkLayer_MultipleErabIdInstances** - Radio Network Layer Multiple E-RAB ID Instances - S1AP Radio Network Layer cause Multiple E-RAB ID instances.
- **RadioNetworkLayer_EncryptionAndOrIntegrityProtectionAlgorithmsNotSupported** - Radio Network Layer Encryption and/or Integrity Protection Algorithms Not Supported - S1AP Radio Network Layer cause Encryption and/or Integrity protection algorithms not supported.
- **RadioNetworkLayer_S1IntraSystemHandoverTriggered** - Radio Network Layer S1 Intra System Handover Triggered - S1AP Radio Network Layer cause S1 intra system Handover triggered.
- **RadioNetworkLayer_S1InterSystemHandoverTriggered** - Radio Network Layer S1 Inter System Handover Triggered - S1AP Radio Network Layer cause S1 inter system Handover triggered.
- **RadioNetworkLayer_x2HandoverTriggered** - Radio Network Layer X2 Handover Triggered - S1AP Radio Network Layer cause X2 Handover triggered.
- **RadioNetworkLayer_redirectionTowards1xRtt** - Radio Network Layer Redirection Towards 1xRTT - S1AP Radio Network Layer cause Redirection towards 1xRTT.
- **RadioNetworkLayer_NotSupportedQciValue** - Radio Network Layer Not Supported QCI Value - S1AP Radio Network Layer cause Not Supported QCI Value.
- **RadioNetworkLayer_InvalidCsgId** - Radio Network Layer Invalid CSG Id - S1AP Radio Network Layer cause Invalid CSG Id.
- **RadioNetworkLayer_ReleaseDueToPreEmption** - Radio Network Layer Release Due to Pre-Emption - S1AP Radio Network Layer cause Release due to Pre-Emption.
- **RadioNetworkLayer_N26InterfaceNotAvailable** - Radio Network Layer N26 Interface Not Available - S1AP Radio Network Layer cause N26 interface not available.
- **TransportLayer_TransportResourceUnavailable** - Transport Layer Transport Resource Unavailable - S1AP Transport Layer cause Transport Resource Unavailable.
- **TransportLayer_Unspecified** - Transport Layer Unspecified - S1AP Transport Layer cause Unspecified.
- **Nas_NormalRelease** - NAS Normal Release - S1AP NAS cause Normal Release.
- **Nas_AuthenticationFailure** - NAS Authentication Failure - S1AP NAS cause Authentication failure.

- Nas_Detach - NAS Detach - S1AP NAS cause Detach.
- Nas_Unspecified - NAS Unspecified - S1AP NAS cause Unspecified.
- Nas_CsgSubscriptionExpiry - NAS CSG Subscription Expiry - S1AP NAS cause CSG Subscription Expiry.
- Protocol_TransferSyntaxError - Protocol Transfer Syntax Error - S1AP Protocol cause Transfer Syntax Error.
- Protocol_AbstractSyntaxErrorReject - Protocol Abstract Syntax Error (Reject) - S1AP Protocol cause Abstract Syntax Error (Reject).
- Protocol_AbstractSyntaxErrorIgnoreAndNotify - Protocol Abstract Syntax Error (Ignore and Notify) - S1AP Protocol cause Abstract Syntax Error (Ignore and Notify).
- Protocol_MessageNotCompatibleWithReceiverState - Protocol Message Not Compatible with Receiver State - S1AP Protocol cause Message not Compatible with Receiver State.
- Protocol_SemanticError - Protocol Semantic Error - S1AP Protocol cause Semantic Error.
- Protocol_AbstractSyntaxErrorFalselyConstructedMessage - Protocol Abstract Syntax Error (Falsely Constructed Message) - S1AP Protocol cause Abstract Syntax Error (Falsely Constructed Message).
- Protocol_Unspecified - Protocol Unspecified - S1AP Protocol cause Unspecified.
- Miscellaneous_ControlProcessingOverload - Miscellaneous Control Processing Overload - S1AP Miscellaneous cause Control Processing Overload.
- Miscellaneous_NotEnoughUserPlaneProcessingResources - Miscellaneous Not Enough User Plane Processing Resources - S1AP Miscellaneous cause Not enough User Plane Processing Resources.
- Miscellaneous_HardwareFailure - Miscellaneous Hardware Failure - S1AP Miscellaneous cause Hardware Failure.
- Miscellaneous_OmIntervention - Miscellaneous O&M Intervention - S1AP Miscellaneous cause O&M Intervention.
- Miscellaneous_Unspecified - Miscellaneous Unspecified - S1AP Miscellaneous cause Unspecified.
- Miscellaneous_UnknownPlmn - Miscellaneous Unknown PLMN - S1AP Miscellaneous cause Unknown PLMN.

Default

Disabled

Name

ueCtxtRelPcscfBrrReact - UE Context Release Command P-CSCF Detach Bearer Request

Syntax`--ueCtxtRelPcscfBrrReact <list-item>`

Description

The S1AP cause code include on UE context release command when P-CSCF detach bearer with reactivation requested.

Class

Optional.

List

- Disabled - The feature is disabled in the corresponding scenario. The MME does not override the S1AP cause code.
- RadioNetworkLayer_Unspecified - Radio Network Layer Unspecified - S1AP Radio Network Layer cause Unspecified.
- RadioNetworkLayer_TX2RelocOverallExpiry - Radio Network Layer TX2 Reloc Overall Expiry - S1AP Radio Network Layer cause TX2 Reloc Overall Expiry.
- RadioNetworkLayer_SuccessfulHandover - Radio Network Layer Successful Handover - S1AP Radio Network Layer cause Successful Handover.
- RadioNetworkLayer_ReleaseDueToEutranGeneratedReason - Radio Network Layer Release Due to E-UTRAN Generated Reason - S1AP Radio Network Layer cause Release Due to E-UTRAN Generated Reason.
- RadioNetworkLayer_HandoverCancelled - Radio Network Layer Handover Cancelled - S1AP Radio Network Layer cause Handover Cancelled.
- RadioNetworkLayer_PartialHandover - Radio Network Layer Partial Handover - S1AP Radio Network Layer cause Partial Handover.
- RadioNetworkLayer_HandoverFailureInTargetEpcEnbOrTargetSystem - Radio Network Layer Handover Failure in Target EPC/eNB or Target System - S1AP Radio Network Layer cause Handover Failure In Target EPC/eNB or Target System.
- RadioNetworkLayer_HandoverTargetNotAllowed - Radio Network Layer Handover Target Not Allowed - S1AP Radio Network Layer cause Handover Target not allowed.
- RadioNetworkLayer_TS1RelocOverallExpiry - Radio Network Layer TS1 Reloc Overall Expiry - S1AP Radio Network Layer cause TS1Relocoverall Expiry.
- RadioNetworkLayer_TS1RelocPrepExpiry - Radio Network Layer TS1 Reloc Prep Expiry - S1AP Radio Network Layer cause TS1RelocPrep Expiry.
- RadioNetworkLayer_CellNotAvailable - Radio Network Layer Cell Not Available - S1AP Radio Network Layer cause Cell Not Available.
- RadioNetworkLayer_UnknownTargetId - Radio Network Layer Unknown Target Id - S1AP Radio Network Layer cause Unknown Target Id.
- RadioNetworkLayer_NoRadioResourcesAvailableInTargetCell - Radio Network Layer No Resources Available in Target Cell - S1AP Radio Network Layer cause No Resources Available in Target Cell.

- `RadioNetworkLayer_UnknownOrAlreadyAllocatedMmeUeS1apId` - Radio Network Layer Unknown or Already Allocated MME UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated MME UE S1AP ID.
- `RadioNetworkLayer_UnknownOrAlreadyAllocatedEnbUeS1apId` - Radio Network Layer Unknown or Already Allocated eNB UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated eNB UE S1AP ID.
- `RadioNetworkLayer_UnknownOrInconsistentPairOfUeS1apId` - Radio Network Layer Unknown or Inconsistent Pair of S1AP UE ID - S1AP Radio Network Layer cause Unknown or inconsistent pair of S1AP UE ID.
- `RadioNetworkLayer_HandoverDesirableForRadioReasons` - Radio Network Layer Handover Desirable for Radio Reasons - S1AP Radio Network Layer cause Handover desirable for radio reasons.
- `RadioNetworkLayer_TimeCriticalHandover` - Radio Network Layer Time Critical Handover - S1AP Radio Network Layer cause Time critical handover.
- `RadioNetworkLayer_ResourceOptimisationHandover` - Radio Network Layer Resource Optimisation Handover - S1AP Radio Network Layer cause Resource optimisation handover.
- `RadioNetworkLayer_ReduceLoadInServingCell` - Radio Network Layer Reduce Load in Serving Cell - S1AP Radio Network Layer cause Reduce load in serving cell.
- `RadioNetworkLayer_UserInactivity` - Radio Network Layer User Inactivity - S1AP Radio Network Layer cause User Inactivity.
- `RadioNetworkLayer_RadioConnectionWithUeLost` - Radio Network Layer Radio Connection with UE Lost - S1AP Radio Network Layer cause Radio Connection With UE Lost.
- `RadioNetworkLayer_LoadBalancingTauRequired` - Radio Network Layer Load Balancing TAU Required - S1AP Radio Network Layer cause Load Balancing TAU Required.
- `RadioNetworkLayer_CsFallbackTriggered` - Radio Network Layer CS Fallback Triggered - S1AP Radio Network Layer cause CS Fallback Triggered.
- `RadioNetworkLayer_UeNotAvailableForPsService` - Radio Network Layer UE Not Available for PS Service - S1AP Radio Network Layer cause UE Not Available For PS Service.
- `RadioNetworkLayer_RadioResourcesNotAvailable` - Radio Network Layer Radio Resources Not Available - S1AP Radio Network Layer cause Radio resources not available.
- `RadioNetworkLayer_FailureInTheRadioInterfaceProcedure` - Radio Network Layer Failure in the Radio Interface Procedure - S1AP Radio Network Layer cause Failure in the Radio Interface Procedure.
- `RadioNetworkLayer_InvalidQosCombination` - Radio Network Layer Invalid QoS Combination - S1AP Radio Network Layer cause Invalid QoS combination.

- **RadioNetworkLayer_InterRatRedirection** - Radio Network Layer Inter-RAT Redirection - S1AP Radio Network Layer cause Inter-RAT redirection.
- **RadioNetworkLayer_InteractionWithOtherProcedure** - Radio Network Layer Interaction with Other Procedure - S1AP Radio Network Layer cause Interaction with other procedure.
- **RadioNetworkLayer_UnknownErabId** - Radio Network Layer Unknown E-RAB ID - S1AP Radio Network Layer cause Unknown E-RAB ID.
- **RadioNetworkLayer_MultipleErabIdInstances** - Radio Network Layer Multiple E-RAB ID Instances - S1AP Radio Network Layer cause Multiple E-RAB ID instances.
- **RadioNetworkLayer_EncryptionAndOrIntegrityProtectionAlgorithmsNotSupported** - Radio Network Layer Encryption and/or Integrity Protection Algorithms Not Supported - S1AP Radio Network Layer cause Encryption and/or Integrity protection algorithms not supported.
- **RadioNetworkLayer_S1IntraSystemHandoverTriggered** - Radio Network Layer S1 Intra System Handover Triggered - S1AP Radio Network Layer cause S1 intra system Handover triggered.
- **RadioNetworkLayer_S1InterSystemHandoverTriggered** - Radio Network Layer S1 Inter System Handover Triggered - S1AP Radio Network Layer cause S1 inter system Handover triggered.
- **RadioNetworkLayer_x2HandoverTriggered** - Radio Network Layer X2 Handover Triggered - S1AP Radio Network Layer cause X2 Handover triggered.
- **RadioNetworkLayer_redirectionTowards1xRtt** - Radio Network Layer Redirection Towards 1xRTT - S1AP Radio Network Layer cause Redirection towards 1xRTT.
- **RadioNetworkLayer_NotSupportedQciValue** - Radio Network Layer Not Supported QCI Value - S1AP Radio Network Layer cause Not Supported QCI Value.
- **RadioNetworkLayer_InvalidCsgId** - Radio Network Layer Invalid CSG Id - S1AP Radio Network Layer cause Invalid CSG Id.
- **RadioNetworkLayer_ReleaseDueToPreEmption** - Radio Network Layer Release Due to Pre-Emption - S1AP Radio Network Layer cause Release due to Pre-Emption.
- **RadioNetworkLayer_N26InterfaceNotAvailable** - Radio Network Layer N26 Interface Not Available - S1AP Radio Network Layer cause N26 interface not available.
- **TransportLayer_TransportResourceUnavailable** - Transport Layer Transport Resource Unavailable - S1AP Transport Layer cause Transport Resource Unavailable.
- **TransportLayer_Unspecified** - Transport Layer Unspecified - S1AP Transport Layer cause Unspecified.
- **Nas_NormalRelease** - NAS Normal Release - S1AP NAS cause Normal Release.
- **Nas_AuthenticationFailure** - NAS Authentication Failure - S1AP NAS cause Authentication failure.

- Nas_Detach - NAS Detach - S1AP NAS cause Detach.
- Nas_Unspecified - NAS Unspecified - S1AP NAS cause Unspecified.
- Nas_CsgSubscriptionExpiry - NAS CSG Subscription Expiry - S1AP NAS cause CSG Subscription Expiry.
- Protocol_TransferSyntaxError - Protocol Transfer Syntax Error - S1AP Protocol cause Transfer Syntax Error.
- Protocol_AbstractSyntaxErrorReject - Protocol Abstract Syntax Error (Reject) - S1AP Protocol cause Abstract Syntax Error (Reject).
- Protocol_AbstractSyntaxErrorIgnoreAndNotify - Protocol Abstract Syntax Error (Ignore and Notify) - S1AP Protocol cause Abstract Syntax Error (Ignore and Notify).
- Protocol_MessageNotCompatibleWithReceiverState - Protocol Message Not Compatible with Receiver State - S1AP Protocol cause Message not Compatible with Receiver State.
- Protocol_SemanticError - Protocol Semantic Error - S1AP Protocol cause Semantic Error.
- Protocol_AbstractSyntaxErrorFalselyConstructedMessage - Protocol Abstract Syntax Error (Falsely Constructed Message) - S1AP Protocol cause Abstract Syntax Error (Falsely Constructed Message).
- Protocol_Unspecified - Protocol Unspecified - S1AP Protocol cause Unspecified.
- Miscellaneous_ControlProcessingOverload - Miscellaneous Control Processing Overload - S1AP Miscellaneous cause Control Processing Overload.
- Miscellaneous_NotEnoughUserPlaneProcessingResources - Miscellaneous Not Enough User Plane Processing Resources - S1AP Miscellaneous cause Not enough User Plane Processing Resources.
- Miscellaneous_HardwareFailure - Miscellaneous Hardware Failure - S1AP Miscellaneous cause Hardware Failure.
- Miscellaneous_OmIntervention - Miscellaneous O&M Intervention - S1AP Miscellaneous cause O&M Intervention.
- Miscellaneous_Unspecified - Miscellaneous Unspecified - S1AP Miscellaneous cause Unspecified.
- Miscellaneous_UnknownPlmn - Miscellaneous Unknown PLMN - S1AP Miscellaneous cause Unknown PLMN.

Default

Disabled

Name

ueCtxtRelPdnReEstDetach - UE Context Release Command PDN Re-establishment Detach

Syntax

--ueCtxtRelPdnReEstDetach <list-item>

Description

The S1AP cause the MME includes on UE context release command on message level, when the UE context release is performed as part of a Detach procedure due to PDN connection re-establishment after SGW relocation functionality.

Class

Optional.

List

- Disabled - The feature is disabled in the corresponding scenario. The MME does not override the S1AP cause code.
- RadioNetworkLayer_Unspecified - Radio Network Layer Unspecified - S1AP Radio Network Layer cause Unspecified.
- RadioNetworkLayer_TX2RelocOverallExpiry - Radio Network Layer TX2 Reloc Overall Expiry - S1AP Radio Network Layer cause TX2 Reloc Overall Expiry.
- RadioNetworkLayer_SuccessfulHandover - Radio Network Layer Successful Handover - S1AP Radio Network Layer cause Successful Handover.
- RadioNetworkLayer_ReleaseDueToEutranGeneratedReason - Radio Network Layer Release Due to E-UTRAN Generated Reason - S1AP Radio Network Layer cause Release Due to E-UTRAN Generated Reason.
- RadioNetworkLayer_HandoverCancelled - Radio Network Layer Handover Cancelled - S1AP Radio Network Layer cause Handover Cancelled.
- RadioNetworkLayer_PartialHandover - Radio Network Layer Partial Handover - S1AP Radio Network Layer cause Partial Handover.
- RadioNetworkLayer_HandoverFailureInTargetEpcEnbOrTargetSystem - Radio Network Layer Handover Failure in Target EPC/eNB or Target System - S1AP Radio Network Layer cause Handover Failure In Target EPC/eNB or Target System.
- RadioNetworkLayer_HandoverTargetNotAllowed - Radio Network Layer Handover Target Not Allowed - S1AP Radio Network Layer cause Handover Target not allowed.
- RadioNetworkLayer_TS1RelocOverallExpiry - Radio Network Layer TS1 Reloc Overall Expiry - S1AP Radio Network Layer cause TS1Relocoverall Expiry.
- RadioNetworkLayer_TS1RelocPrepExpiry - Radio Network Layer TS1 Reloc Prep Expiry - S1AP Radio Network Layer cause TS1RelocPrep Expiry.
- RadioNetworkLayer_CellNotAvailable - Radio Network Layer Cell Not Available - S1AP Radio Network Layer cause Cell Not Available.
- RadioNetworkLayer_UnknownTargetId - Radio Network Layer Unknown Target Id - S1AP Radio Network Layer cause Unknown Target Id.

- **RadioNetworkLayer_NoRadioResourcesAvailableInTargetCell** - Radio Network Layer No Resources Available in Target Cell - S1AP Radio Network Layer cause No Resources Available in Target Cell.
- **RadioNetworkLayer_UnknownOrAlreadyAllocatedMmeUeS1apId** - Radio Network Layer Unknown or Already Allocated MME UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated MME UE S1AP ID.
- **RadioNetworkLayer_UnknownOrAlreadyAllocatedEnbUeS1apId** - Radio Network Layer Unknown or Already Allocated eNB UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated eNB UE S1AP ID.
- **RadioNetworkLayer_UnknownOrInconsistentPairOfUeS1apId** - Radio Network Layer Unknown or Inconsistent Pair of S1AP UE ID - S1AP Radio Network Layer cause Unknown or inconsistent pair of S1AP UE ID.
- **RadioNetworkLayer_HandoverDesirableForRadioReasons** - Radio Network Layer Handover Desirable for Radio Reasons - S1AP Radio Network Layer cause Handover desirable for radio reasons.
- **RadioNetworkLayer_TimeCriticalHandover** - Radio Network Layer Time Critical Handover - S1AP Radio Network Layer cause Time critical handover.
- **RadioNetworkLayer_ResourceOptimisationHandover** - Radio Network Layer Resource Optimisation Handover - S1AP Radio Network Layer cause Resource optimisation handover.
- **RadioNetworkLayer_ReduceLoadInServingCell** - Radio Network Layer Reduce Load in Serving Cell - S1AP Radio Network Layer cause Reduce load in serving cell.
- **RadioNetworkLayer_UserInactivity** - Radio Network Layer User Inactivity - S1AP Radio Network Layer cause User Inactivity.
- **RadioNetworkLayer_RadioConnectionWithUeLost** - Radio Network Layer Radio Connection with UE Lost - S1AP Radio Network Layer cause Radio Connection With UE Lost.
- **RadioNetworkLayer_LoadBalancingTauRequired** - Radio Network Layer Load Balancing TAU Required - S1AP Radio Network Layer cause Load Balancing TAU Required.
- **RadioNetworkLayer_CsFallbackTriggered** - Radio Network Layer CS Fallback Triggered - S1AP Radio Network Layer cause CS Fallback Triggered.
- **RadioNetworkLayer_UeNotAvailableForPsService** - Radio Network Layer UE Not Available for PS Service - S1AP Radio Network Layer cause UE Not Available For PS Service.
- **RadioNetworkLayer_RadioResourcesNotAvailable** - Radio Network Layer Radio Resources Not Available - S1AP Radio Network Layer cause Radio resources not available.
- **RadioNetworkLayer_FailureInTheRadioInterfaceProcedure** - Radio Network Layer Failure in the Radio Interface Procedure - S1AP Radio Network Layer cause Failure in the Radio Interface Procedure.

- **RadioNetworkLayer_InvalidQosCombination** - Radio Network Layer Invalid QoS Combination - S1AP Radio Network Layer cause Invalid QoS combination.
- **RadioNetworkLayer_InterRatRedirection** - Radio Network Layer Inter-RAT Redirection - S1AP Radio Network Layer cause Inter-RAT redirection.
- **RadioNetworkLayer_InteractionWithOtherProcedure** - Radio Network Layer Interaction with Other Procedure - S1AP Radio Network Layer cause Interaction with other procedure.
- **RadioNetworkLayer_UnknownErabId** - Radio Network Layer Unknown E-RAB ID - S1AP Radio Network Layer cause Unknown E-RAB ID.
- **RadioNetworkLayer_MultipleErabIdInstances** - Radio Network Layer Multiple E-RAB ID Instances - S1AP Radio Network Layer cause Multiple E-RAB ID instances.
- **RadioNetworkLayer_EncryptionAndOrIntegrityProtectionAlgorithmsNotSupported** - Radio Network Layer Encryption and/or Integrity Protection Algorithms Not Supported - S1AP Radio Network Layer cause Encryption and/or Integrity protection algorithms not supported.
- **RadioNetworkLayer_S1IntraSystemhandoverTriggered** - Radio Network Layer S1 Intra System Handover Triggered - S1AP Radio Network Layer cause S1 intra system Handover triggered.
- **RadioNetworkLayer_S1InterSystemHandoverTriggered** - Radio Network Layer S1 Inter System Handover Triggered - S1AP Radio Network Layer cause S1 inter system Handover triggered.
- **RadioNetworkLayer_x2HandoverTriggered** - Radio Network Layer X2 Handover Triggered - S1AP Radio Network Layer cause X2 Handover triggered.
- **RadioNetworkLayer_redirectionTowards1xRtt** - Radio Network Layer Redirection Towards 1xRTT - S1AP Radio Network Layer cause Redirection towards 1xRTT.
- **RadioNetworkLayer_NotSupportedQciValue** - Radio Network Layer Not Supported QCI Value - S1AP Radio Network Layer cause Not Supported QCI Value.
- **RadioNetworkLayer_InvalidCsgId** - Radio Network Layer Invalid CSG Id - S1AP Radio Network Layer cause Invalid CSG Id.
- **RadioNetworkLayer_ReleaseDueToPreEmption** - Radio Network Layer Release Due to Pre-Emption - S1AP Radio Network Layer cause Release due to Pre-Emption.
- **RadioNetworkLayer_N26InterfaceNotAvailable** - Radio Network Layer N26 Interface Not Available - S1AP Radio Network Layer cause N26 interface not available.
- **TransportLayer_TransportResourceUnavailable** - Transport Layer Transport Resource Unavailable - S1AP Transport Layer cause Transport Resource Unavailable.
- **TransportLayer_Unspecified** - Transport Layer Unspecified - S1AP Transport Layer cause Unspecified.
- **Nas_NormalRelease** - NAS Normal Release - S1AP NAS cause Normal Release.

- Nas_AuthenticationFailure - NAS Authentication Failure - S1AP NAS cause Authentication failure.
- Nas_Detach - NAS Detach - S1AP NAS cause Detach.
- Nas_Unspecified - NAS Unspecified - S1AP NAS cause Unspecified.
- Nas_CsgSubscriptionExpiry - NAS CSG Subscription Expiry - S1AP NAS cause CSG Subscription Expiry.
- Protocol_TransferSyntaxError - Protocol Transfer Syntax Error - S1AP Protocol cause Transfer Syntax Error.
- Protocol_AbstractSyntaxErrorReject - Protocol Abstract Syntax Error (Reject) - S1AP Protocol cause Abstract Syntax Error (Reject).
- Protocol_AbstractSyntaxErrorIgnoreAndNotify - Protocol Abstract Syntax Error (Ignore and Notify) - S1AP Protocol cause Abstract Syntax Error (Ignore and Notify).
- Protocol_MessageNotCompatibleWithReceiverState - Protocol Message Not Compatible with Receiver State - S1AP Protocol cause Message not Compatible with Receiver State.
- Protocol_SemanticError - Protocol Semantic Error - S1AP Protocol cause Semantic Error.
- Protocol_AbstractSyntaxErrorFalselyConstructedMessage - Protocol Abstract Syntax Error (Falsely Constructed Message) - S1AP Protocol cause Abstract Syntax Error (Falsely Constructed Message).
- Protocol_Unspecified - Protocol Unspecified - S1AP Protocol cause Unspecified.
- Miscellaneous_ControlProcessingOverload - Miscellaneous Control Processing Overload - S1AP Miscellaneous cause Control Processing Overload.
- Miscellaneous_NotEnoughUserPlaneProcessingResources - Miscellaneous Not Enough User Plane Processing Resources - S1AP Miscellaneous cause Not enough User Plane Processing Resources.
- Miscellaneous_HardwareFailure - Miscellaneous Hardware Failure - S1AP Miscellaneous cause Hardware Failure.
- Miscellaneous_OmIntervention - Miscellaneous O&M Intervention - S1AP Miscellaneous cause O&M Intervention.
- Miscellaneous_Unspecified - Miscellaneous Unspecified - S1AP Miscellaneous cause Unspecified.
- Miscellaneous_UnknownPlmn - Miscellaneous Unknown PLMN - S1AP Miscellaneous cause Unknown PLMN.

Default

Disabled

Name

ueCtxRelPgwrRestart - UE Context Release Command PGW Restart

Syntax

--ueCtxtRelPgwRestart <list-item>

Description

The S1AP cause code to include on UE context release command sent to UE if its detached due to PGW restart.

Class

Optional.

List

- Disabled - The feature is disabled in the corresponding scenario. The MME does not override the S1AP cause code.
- RadioNetworkLayer_Unspecified - Radio Network Layer Unspecified - S1AP Radio Network Layer cause Unspecified.
- RadioNetworkLayer_TX2RelocOverallExpiry - Radio Network Layer TX2 Reloc Overall Expiry - S1AP Radio Network Layer cause TX2 Reloc Overall Expiry.
- RadioNetworkLayer_SuccessfulHandover - Radio Network Layer Successful Handover - S1AP Radio Network Layer cause Successful Handover.
- RadioNetworkLayer_ReleaseDueToEutranGeneratedReason - Radio Network Layer Release Due to E-UTRAN Generated Reason - S1AP Radio Network Layer cause Release Due to E-UTRAN Generated Reason.
- RadioNetworkLayer_HandoverCancelled - Radio Network Layer Handover Cancelled - S1AP Radio Network Layer cause Handover Cancelled.
- RadioNetworkLayer_PartialHandover - Radio Network Layer Partial Handover - S1AP Radio Network Layer cause Partial Handover.
- RadioNetworkLayer_HandoverFailureInTargetEpcEnbOrTargetSystem - Radio Network Layer Handover Failure in Target EPC/eNB or Target System - S1AP Radio Network Layer cause Handover Failure In Target EPC/eNB or Target System.
- RadioNetworkLayer_HandoverTargetNotAllowed - Radio Network Layer Handover Target Not Allowed - S1AP Radio Network Layer cause Handover Target not allowed.
- RadioNetworkLayer_TS1RelocOverallExpiry - Radio Network Layer TS1 Reloc Overall Expiry - S1AP Radio Network Layer cause TS1Relocoverall Expiry.
- RadioNetworkLayer_TS1RelocPrepExpiry - Radio Network Layer TS1 Reloc Prep Expiry - S1AP Radio Network Layer cause TS1RelocPrep Expiry.
- RadioNetworkLayer_CellNotAvailable - Radio Network Layer Cell Not Available - S1AP Radio Network Layer cause Cell Not Available.
- RadioNetworkLayer_UnknownTargetId - Radio Network Layer Unknown Target Id - S1AP Radio Network Layer cause Unknown Target Id.

- **RadioNetworkLayer_NoRadioResourcesAvailableInTargetCell** - Radio Network Layer No Resources Available in Target Cell - S1AP Radio Network Layer cause No Resources Available in Target Cell.
- **RadioNetworkLayer_UnknownOrAlreadyAllocatedMmeUeS1apId** - Radio Network Layer Unknown or Already Allocated MME UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated MME UE S1AP ID.
- **RadioNetworkLayer_UnknownOrAlreadyAllocatedEnbUeS1apId** - Radio Network Layer Unknown or Already Allocated eNB UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated eNB UE S1AP ID.
- **RadioNetworkLayer_UnknownOrInconsistentPairOfUeS1apId** - Radio Network Layer Unknown or Inconsistent Pair of S1AP UE ID - S1AP Radio Network Layer cause Unknown or inconsistent pair of S1AP UE ID.
- **RadioNetworkLayer_HandoverDesirableForRadioReasons** - Radio Network Layer Handover Desirable for Radio Reasons - S1AP Radio Network Layer cause Handover desirable for radio reasons.
- **RadioNetworkLayer_TimeCriticalHandover** - Radio Network Layer Time Critical Handover - S1AP Radio Network Layer cause Time critical handover.
- **RadioNetworkLayer_ResourceOptimisationHandover** - Radio Network Layer Resource Optimisation Handover - S1AP Radio Network Layer cause Resource optimisation handover.
- **RadioNetworkLayer_ReduceLoadInServingCell** - Radio Network Layer Reduce Load in Serving Cell - S1AP Radio Network Layer cause Reduce load in serving cell.
- **RadioNetworkLayer_UserInactivity** - Radio Network Layer User Inactivity - S1AP Radio Network Layer cause User Inactivity.
- **RadioNetworkLayer_RadioConnectionWithUeLost** - Radio Network Layer Radio Connection with UE Lost - S1AP Radio Network Layer cause Radio Connection With UE Lost.
- **RadioNetworkLayer_LoadBalancingTauRequired** - Radio Network Layer Load Balancing TAU Required - S1AP Radio Network Layer cause Load Balancing TAU Required.
- **RadioNetworkLayer_CsFallbackTriggered** - Radio Network Layer CS Fallback Triggered - S1AP Radio Network Layer cause CS Fallback Triggered.
- **RadioNetworkLayer_UeNotAvailableForPsService** - Radio Network Layer UE Not Available for PS Service - S1AP Radio Network Layer cause UE Not Available For PS Service.
- **RadioNetworkLayer_RadioResourcesNotAvailable** - Radio Network Layer Radio Resources Not Available - S1AP Radio Network Layer cause Radio resources not available.
- **RadioNetworkLayer_FailureInTheRadioInterfaceProcedure** - Radio Network Layer Failure in the Radio Interface Procedure - S1AP Radio Network Layer cause Failure in the Radio Interface Procedure.

- **RadioNetworkLayer_InvalidQosCombination** - Radio Network Layer Invalid QoS Combination - S1AP Radio Network Layer cause Invalid QoS combination.
- **RadioNetworkLayer_InterRatRedirection** - Radio Network Layer Inter-RAT Redirection - S1AP Radio Network Layer cause Inter-RAT redirection.
- **RadioNetworkLayer_InteractionWithOtherProcedure** - Radio Network Layer Interaction with Other Procedure - S1AP Radio Network Layer cause Interaction with other procedure.
- **RadioNetworkLayer_UnknownErabId** - Radio Network Layer Unknown E-RAB ID - S1AP Radio Network Layer cause Unknown E-RAB ID.
- **RadioNetworkLayer_MultipleErabIdInstances** - Radio Network Layer Multiple E-RAB ID Instances - S1AP Radio Network Layer cause Multiple E-RAB ID instances.
- **RadioNetworkLayer_EncryptionAndOrIntegrityProtectionAlgorithmsNotSupported** - Radio Network Layer Encryption and/or Integrity Protection Algorithms Not Supported - S1AP Radio Network Layer cause Encryption and/or Integrity protection algorithms not supported.
- **RadioNetworkLayer_S1IntraSystemhandoverTriggered** - Radio Network Layer S1 Intra System Handover Triggered - S1AP Radio Network Layer cause S1 intra system Handover triggered.
- **RadioNetworkLayer_S1InterSystemHandoverTriggered** - Radio Network Layer S1 Inter System Handover Triggered - S1AP Radio Network Layer cause S1 inter system Handover triggered.
- **RadioNetworkLayer_x2HandoverTriggered** - Radio Network Layer X2 Handover Triggered - S1AP Radio Network Layer cause X2 Handover triggered.
- **RadioNetworkLayer_redirectionTowards1xRtt** - Radio Network Layer Redirection Towards 1xRTT - S1AP Radio Network Layer cause Redirection towards 1xRTT.
- **RadioNetworkLayer_NotSupportedQciValue** - Radio Network Layer Not Supported QCI Value - S1AP Radio Network Layer cause Not Supported QCI Value.
- **RadioNetworkLayer_InvalidCsgId** - Radio Network Layer Invalid CSG Id - S1AP Radio Network Layer cause Invalid CSG Id.
- **RadioNetworkLayer_ReleaseDueToPreEmption** - Radio Network Layer Release Due to Pre-Emption - S1AP Radio Network Layer cause Release due to Pre-Emption.
- **RadioNetworkLayer_N26InterfaceNotAvailable** - Radio Network Layer N26 Interface Not Available - S1AP Radio Network Layer cause N26 interface not available.
- **TransportLayer_TransportResourceUnavailable** - Transport Layer Transport Resource Unavailable - S1AP Transport Layer cause Transport Resource Unavailable.
- **TransportLayer_Unspecified** - Transport Layer Unspecified - S1AP Transport Layer cause Unspecified.
- **Nas_NormalRelease** - NAS Normal Release - S1AP NAS cause Normal Release.

- Nas_AuthenticationFailure - NAS Authentication Failure - S1AP NAS cause Authentication failure.
- Nas_Detach - NAS Detach - S1AP NAS cause Detach.
- Nas_Unspecified - NAS Unspecified - S1AP NAS cause Unspecified.
- Nas_CsgSubscriptionExpiry - NAS CSG Subscription Expiry - S1AP NAS cause CSG Subscription Expiry.
- Protocol_TransferSyntaxError - Protocol Transfer Syntax Error - S1AP Protocol cause Transfer Syntax Error.
- Protocol_AbstractSyntaxErrorReject - Protocol Abstract Syntax Error (Reject) - S1AP Protocol cause Abstract Syntax Error (Reject).
- Protocol_AbstractSyntaxErrorIgnoreAndNotify - Protocol Abstract Syntax Error (Ignore and Notify) - S1AP Protocol cause Abstract Syntax Error (Ignore and Notify).
- Protocol_MessageNotCompatibleWithReceiverState - Protocol Message Not Compatible with Receiver State - S1AP Protocol cause Message not Compatible with Receiver State.
- Protocol_SemanticError - Protocol Semantic Error - S1AP Protocol cause Semantic Error.
- Protocol_AbstractSyntaxErrorFalselyConstructedMessage - Protocol Abstract Syntax Error (Falsely Constructed Message) - S1AP Protocol cause Abstract Syntax Error (Falsely Constructed Message).
- Protocol_Unspecified - Protocol Unspecified - S1AP Protocol cause Unspecified.
- Miscellaneous_ControlProcessingOverload - Miscellaneous Control Processing Overload - S1AP Miscellaneous cause Control Processing Overload.
- Miscellaneous_NotEnoughUserPlaneProcessingResources - Miscellaneous Not Enough User Plane Processing Resources - S1AP Miscellaneous cause Not enough User Plane Processing Resources.
- Miscellaneous_HardwareFailure - Miscellaneous Hardware Failure - S1AP Miscellaneous cause Hardware Failure.
- Miscellaneous_OmIntervention - Miscellaneous O&M Intervention - S1AP Miscellaneous cause O&M Intervention.
- Miscellaneous_Unspecified - Miscellaneous Unspecified - S1AP Miscellaneous cause Unspecified.
- Miscellaneous_UnknownPlmn - Miscellaneous Unknown PLMN - S1AP Miscellaneous cause Unknown PLMN.

Default

Disabled

Name

ueCtxRelRejectionS1u - UE Context Release Command Rejection S1-U

Syntax

--ueCtxtRelRejectionS1u <list-item>

Description

S1AP cause code to include on UE context release command when UE requests to establish S1-U by sending TAU with active flag, SR or CPSR when a UE has all PDN connections data transport over CP.

Class

Optional.

List

- Disabled - The feature is disabled in the corresponding scenario. The MME does not override the S1AP cause code.
- RadioNetworkLayer_Unspecified - Radio Network Layer Unspecified - S1AP Radio Network Layer cause Unspecified.
- RadioNetworkLayer_TX2RelocOverallExpiry - Radio Network Layer TX2 Reloc Overall Expiry - S1AP Radio Network Layer cause TX2 Reloc Overall Expiry.
- RadioNetworkLayer_SuccessfulHandover - Radio Network Layer Successful Handover - S1AP Radio Network Layer cause Successful Handover.
- RadioNetworkLayer_ReleaseDueToEutranGeneratedReason - Radio Network Layer Release Due to E-UTRAN Generated Reason - S1AP Radio Network Layer cause Release Due to E-UTRAN Generated Reason.
- RadioNetworkLayer_HandoverCancelled - Radio Network Layer Handover Cancelled - S1AP Radio Network Layer cause Handover Cancelled.
- RadioNetworkLayer_PartialHandover - Radio Network Layer Partial Handover - S1AP Radio Network Layer cause Partial Handover.
- RadioNetworkLayer_HandoverFailureInTargetEpcEnbOrTargetSystem - Radio Network Layer Handover Failure in Target EPC/eNB or Target System - S1AP Radio Network Layer cause Handover Failure In Target EPC/eNB or Target System.
- RadioNetworkLayer_HandoverTargetNotAllowed - Radio Network Layer Handover Target Not Allowed - S1AP Radio Network Layer cause Handover Target not allowed.
- RadioNetworkLayer_TS1RelocOverallExpiry - Radio Network Layer TS1 Reloc Overall Expiry - S1AP Radio Network Layer cause TS1Relocoverall Expiry.
- RadioNetworkLayer_TS1RelocPrepExpiry - Radio Network Layer TS1 Reloc Prep Expiry - S1AP Radio Network Layer cause TS1RelocPrep Expiry.
- RadioNetworkLayer_CellNotAvailable - Radio Network Layer Cell Not Available - S1AP Radio Network Layer cause Cell Not Available.
- RadioNetworkLayer_UnknownTargetId - Radio Network Layer Unknown Target Id - S1AP Radio Network Layer cause Unknown Target Id.

- **RadioNetworkLayer_NoRadioResourcesAvailableInTargetCell** - Radio Network Layer No Resources Available in Target Cell - S1AP Radio Network Layer cause No Resources Available in Target Cell.
- **RadioNetworkLayer_UnknownOrAlreadyAllocatedMmeUeS1apId** - Radio Network Layer Unknown or Already Allocated MME UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated MME UE S1AP ID.
- **RadioNetworkLayer_UnknownOrAlreadyAllocatedEnbUeS1apId** - Radio Network Layer Unknown or Already Allocated eNB UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated eNB UE S1AP ID.
- **RadioNetworkLayer_UnknownOrInconsistentPairOfUeS1apId** - Radio Network Layer Unknown or Inconsistent Pair of S1AP UE ID - S1AP Radio Network Layer cause Unknown or inconsistent pair of S1AP UE ID.
- **RadioNetworkLayer_HandoverDesirableForRadioReasons** - Radio Network Layer Handover Desirable for Radio Reasons - S1AP Radio Network Layer cause Handover desirable for radio reasons.
- **RadioNetworkLayer_TimeCriticalHandover** - Radio Network Layer Time Critical Handover - S1AP Radio Network Layer cause Time critical handover.
- **RadioNetworkLayer_ResourceOptimisationHandover** - Radio Network Layer Resource Optimisation Handover - S1AP Radio Network Layer cause Resource optimisation handover.
- **RadioNetworkLayer_ReduceLoadInServingCell** - Radio Network Layer Reduce Load in Serving Cell - S1AP Radio Network Layer cause Reduce load in serving cell.
- **RadioNetworkLayer_UserInactivity** - Radio Network Layer User Inactivity - S1AP Radio Network Layer cause User Inactivity.
- **RadioNetworkLayer_RadioConnectionWithUeLost** - Radio Network Layer Radio Connection with UE Lost - S1AP Radio Network Layer cause Radio Connection With UE Lost.
- **RadioNetworkLayer_LoadBalancingTauRequired** - Radio Network Layer Load Balancing TAU Required - S1AP Radio Network Layer cause Load Balancing TAU Required.
- **RadioNetworkLayer_CsFallbackTriggered** - Radio Network Layer CS Fallback Triggered - S1AP Radio Network Layer cause CS Fallback Triggered.
- **RadioNetworkLayer_UeNotAvailableForPsService** - Radio Network Layer UE Not Available for PS Service - S1AP Radio Network Layer cause UE Not Available For PS Service.
- **RadioNetworkLayer_RadioResourcesNotAvailable** - Radio Network Layer Radio Resources Not Available - S1AP Radio Network Layer cause Radio resources not available.
- **RadioNetworkLayer_FailureInTheRadioInterfaceProcedure** - Radio Network Layer Failure in the Radio Interface Procedure - S1AP Radio Network Layer cause Failure in the Radio Interface Procedure.

- **RadioNetworkLayer_InvalidQosCombination** - Radio Network Layer Invalid QoS Combination - S1AP Radio Network Layer cause Invalid QoS combination.
- **RadioNetworkLayer_InterRatRedirection** - Radio Network Layer Inter-RAT Redirection - S1AP Radio Network Layer cause Inter-RAT redirection.
- **RadioNetworkLayer_InteractionWithOtherProcedure** - Radio Network Layer Interaction with Other Procedure - S1AP Radio Network Layer cause Interaction with other procedure.
- **RadioNetworkLayer_UnknownErabId** - Radio Network Layer Unknown E-RAB ID - S1AP Radio Network Layer cause Unknown E-RAB ID.
- **RadioNetworkLayer_MultipleErabIdInstances** - Radio Network Layer Multiple E-RAB ID Instances - S1AP Radio Network Layer cause Multiple E-RAB ID instances.
- **RadioNetworkLayer_EncryptionAndOrIntegrityProtectionAlgorithmsNotSupported** - Radio Network Layer Encryption and/or Integrity Protection Algorithms Not Supported - S1AP Radio Network Layer cause Encryption and/or Integrity protection algorithms not supported.
- **RadioNetworkLayer_S1IntraSystemhandoverTriggered** - Radio Network Layer S1 Intra System Handover Triggered - S1AP Radio Network Layer cause S1 intra system Handover triggered.
- **RadioNetworkLayer_S1InterSystemHandoverTriggered** - Radio Network Layer S1 Inter System Handover Triggered - S1AP Radio Network Layer cause S1 inter system Handover triggered.
- **RadioNetworkLayer_x2HandoverTriggered** - Radio Network Layer X2 Handover Triggered - S1AP Radio Network Layer cause X2 Handover triggered.
- **RadioNetworkLayer_redirectionTowards1xRtt** - Radio Network Layer Redirection Towards 1xRTT - S1AP Radio Network Layer cause Redirection towards 1xRTT.
- **RadioNetworkLayer_NotSupportedQciValue** - Radio Network Layer Not Supported QCI Value - S1AP Radio Network Layer cause Not Supported QCI Value.
- **RadioNetworkLayer_InvalidCsgId** - Radio Network Layer Invalid CSG Id - S1AP Radio Network Layer cause Invalid CSG Id.
- **RadioNetworkLayer_ReleaseDueToPreEmption** - Radio Network Layer Release Due to Pre-Emption - S1AP Radio Network Layer cause Release due to Pre-Emption.
- **RadioNetworkLayer_N26InterfaceNotAvailable** - Radio Network Layer N26 Interface Not Available - S1AP Radio Network Layer cause N26 interface not available.
- **TransportLayer_TransportResourceUnavailable** - Transport Layer Transport Resource Unavailable - S1AP Transport Layer cause Transport Resource Unavailable.
- **TransportLayer_Unspecified** - Transport Layer Unspecified - S1AP Transport Layer cause Unspecified.
- **Nas_NormalRelease** - NAS Normal Release - S1AP NAS cause Normal Release.

- Nas_AuthenticationFailure - NAS Authentication Failure - S1AP NAS cause Authentication failure.
- Nas_Detach - NAS Detach - S1AP NAS cause Detach.
- Nas_Unspecified - NAS Unspecified - S1AP NAS cause Unspecified.
- Nas_CsgSubscriptionExpiry - NAS CSG Subscription Expiry - S1AP NAS cause CSG Subscription Expiry.
- Protocol_TransferSyntaxError - Protocol Transfer Syntax Error - S1AP Protocol cause Transfer Syntax Error.
- Protocol_AbstractSyntaxErrorReject - Protocol Abstract Syntax Error (Reject) - S1AP Protocol cause Abstract Syntax Error (Reject).
- Protocol_AbstractSyntaxErrorIgnoreAndNotify - Protocol Abstract Syntax Error (Ignore and Notify) - S1AP Protocol cause Abstract Syntax Error (Ignore and Notify).
- Protocol_MessageNotCompatibleWithReceiverState - Protocol Message Not Compatible with Receiver State - S1AP Protocol cause Message not Compatible with Receiver State.
- Protocol_SemanticError - Protocol Semantic Error - S1AP Protocol cause Semantic Error.
- Protocol_AbstractSyntaxErrorFalselyConstructedMessage - Protocol Abstract Syntax Error (Falsely Constructed Message) - S1AP Protocol cause Abstract Syntax Error (Falsely Constructed Message).
- Protocol_Unspecified - Protocol Unspecified - S1AP Protocol cause Unspecified.
- Miscellaneous_ControlProcessingOverload - Miscellaneous Control Processing Overload - S1AP Miscellaneous cause Control Processing Overload.
- Miscellaneous_NotEnoughUserPlaneProcessingResources - Miscellaneous Not Enough User Plane Processing Resources - S1AP Miscellaneous cause Not enough User Plane Processing Resources.
- Miscellaneous_HardwareFailure - Miscellaneous Hardware Failure - S1AP Miscellaneous cause Hardware Failure.
- Miscellaneous_OmIntervention - Miscellaneous O&M Intervention - S1AP Miscellaneous cause O&M Intervention.
- Miscellaneous_Unspecified - Miscellaneous Unspecified - S1AP Miscellaneous cause Unspecified.
- Miscellaneous_UnknownPlmn - Miscellaneous Unknown PLMN - S1AP Miscellaneous cause Unknown PLMN.

Default

Disabled

Name

ueCtxRelServiceDenied - UE Context Release Command Service Denied

Syntax

--ueCtxRelServiceDenied <list-item>

Description

S1AP cause code to include on UE context release command when service denied.

Class

Optional.

List

- Disabled - The feature is disabled in the corresponding scenario. The MME does not override the S1AP cause code.
- RadioNetworkLayer_Unspecified - Radio Network Layer Unspecified - S1AP Radio Network Layer cause Unspecified.
- RadioNetworkLayer_TX2RelocOverallExpiry - Radio Network Layer TX2 Reloc Overall Expiry - S1AP Radio Network Layer cause TX2 Reloc Overall Expiry.
- RadioNetworkLayer_SuccessfulHandover - Radio Network Layer Successful Handover - S1AP Radio Network Layer cause Successful Handover.
- RadioNetworkLayer_ReleaseDueToEutranGeneratedReason - Radio Network Layer Release Due to E-UTRAN Generated Reason - S1AP Radio Network Layer cause Release Due to E-UTRAN Generated Reason.
- RadioNetworkLayer_HandoverCancelled - Radio Network Layer Handover Cancelled - S1AP Radio Network Layer cause Handover Cancelled.
- RadioNetworkLayer_PartialHandover - Radio Network Layer Partial Handover - S1AP Radio Network Layer cause Partial Handover.
- RadioNetworkLayer_HandoverFailureInTargetEpcEnbOrTargetSystem - Radio Network Layer Handover Failure in Target EPC/eNB or Target System - S1AP Radio Network Layer cause Handover Failure In Target EPC/eNB or Target System.
- RadioNetworkLayer_HandoverTargetNotAllowed - Radio Network Layer Handover Target Not Allowed - S1AP Radio Network Layer cause Handover Target not allowed.
- RadioNetworkLayer_TS1RelocOverallExpiry - Radio Network Layer TS1 Reloc Overall Expiry - S1AP Radio Network Layer cause TS1Relocoverall Expiry.
- RadioNetworkLayer_TS1RelocPrepExpiry - Radio Network Layer TS1 Reloc Prep Expiry - S1AP Radio Network Layer cause TS1RelocPrep Expiry.
- RadioNetworkLayer_CellNotAvailable - Radio Network Layer Cell Not Available - S1AP Radio Network Layer cause Cell Not Available.
- RadioNetworkLayer_UnknownTargetId - Radio Network Layer Unknown Target Id - S1AP Radio Network Layer cause Unknown Target Id.

- **RadioNetworkLayer_NoRadioResourcesAvailableInTargetCell** - Radio Network Layer No Resources Available in Target Cell - S1AP Radio Network Layer cause No Resources Available in Target Cell.
- **RadioNetworkLayer_UnknownOrAlreadyAllocatedMmeUeS1apId** - Radio Network Layer Unknown or Already Allocated MME UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated MME UE S1AP ID.
- **RadioNetworkLayer_UnknownOrAlreadyAllocatedEnbUeS1apId** - Radio Network Layer Unknown or Already Allocated eNB UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated eNB UE S1AP ID.
- **RadioNetworkLayer_UnknownOrInconsistentPairOfUeS1apId** - Radio Network Layer Unknown or Inconsistent Pair of S1AP UE ID - S1AP Radio Network Layer cause Unknown or inconsistent pair of S1AP UE ID.
- **RadioNetworkLayer_HandoverDesirableForRadioReasons** - Radio Network Layer Handover Desirable for Radio Reasons - S1AP Radio Network Layer cause Handover desirable for radio reasons.
- **RadioNetworkLayer_TimeCriticalHandover** - Radio Network Layer Time Critical Handover - S1AP Radio Network Layer cause Time critical handover.
- **RadioNetworkLayer_ResourceOptimisationHandover** - Radio Network Layer Resource Optimisation Handover - S1AP Radio Network Layer cause Resource optimisation handover.
- **RadioNetworkLayer_ReduceLoadInServingCell** - Radio Network Layer Reduce Load in Serving Cell - S1AP Radio Network Layer cause Reduce load in serving cell.
- **RadioNetworkLayer_UserInactivity** - Radio Network Layer User Inactivity - S1AP Radio Network Layer cause User Inactivity.
- **RadioNetworkLayer_RadioConnectionWithUeLost** - Radio Network Layer Radio Connection with UE Lost - S1AP Radio Network Layer cause Radio Connection With UE Lost.
- **RadioNetworkLayer_LoadBalancingTauRequired** - Radio Network Layer Load Balancing TAU Required - S1AP Radio Network Layer cause Load Balancing TAU Required.
- **RadioNetworkLayer_CsFallbackTriggered** - Radio Network Layer CS Fallback Triggered - S1AP Radio Network Layer cause CS Fallback Triggered.
- **RadioNetworkLayer_UeNotAvailableForPsService** - Radio Network Layer UE Not Available for PS Service - S1AP Radio Network Layer cause UE Not Available For PS Service.
- **RadioNetworkLayer_RadioResourcesNotAvailable** - Radio Network Layer Radio Resources Not Available - S1AP Radio Network Layer cause Radio resources not available.
- **RadioNetworkLayer_FailureInTheRadioInterfaceProcedure** - Radio Network Layer Failure in the Radio Interface Procedure - S1AP Radio Network Layer cause Failure in the Radio Interface Procedure.

- **RadioNetworkLayer_InvalidQosCombination** - Radio Network Layer Invalid QoS Combination - S1AP Radio Network Layer cause Invalid QoS combination.
- **RadioNetworkLayer_InterRatRedirection** - Radio Network Layer Inter-RAT Redirection - S1AP Radio Network Layer cause Inter-RAT redirection.
- **RadioNetworkLayer_InteractionWithOtherProcedure** - Radio Network Layer Interaction with Other Procedure - S1AP Radio Network Layer cause Interaction with other procedure.
- **RadioNetworkLayer_UnknownErabId** - Radio Network Layer Unknown E-RAB ID - S1AP Radio Network Layer cause Unknown E-RAB ID.
- **RadioNetworkLayer_MultipleErabIdInstances** - Radio Network Layer Multiple E-RAB ID Instances - S1AP Radio Network Layer cause Multiple E-RAB ID instances.
- **RadioNetworkLayer_EncryptionAndOrIntegrityProtectionAlgorithmsNotSupported** - Radio Network Layer Encryption and/or Integrity Protection Algorithms Not Supported - S1AP Radio Network Layer cause Encryption and/or Integrity protection algorithms not supported.
- **RadioNetworkLayer_S1IntraSystemHandoverTriggered** - Radio Network Layer S1 Intra System Handover Triggered - S1AP Radio Network Layer cause S1 intra system Handover triggered.
- **RadioNetworkLayer_S1InterSystemHandoverTriggered** - Radio Network Layer S1 Inter System Handover Triggered - S1AP Radio Network Layer cause S1 inter system Handover triggered.
- **RadioNetworkLayer_x2HandoverTriggered** - Radio Network Layer X2 Handover Triggered - S1AP Radio Network Layer cause X2 Handover triggered.
- **RadioNetworkLayer_redirectionTowards1xRtt** - Radio Network Layer Redirection Towards 1xRTT - S1AP Radio Network Layer cause Redirection towards 1xRTT.
- **RadioNetworkLayer_NotSupportedQciValue** - Radio Network Layer Not Supported QCI Value - S1AP Radio Network Layer cause Not Supported QCI Value.
- **RadioNetworkLayer_InvalidCsgId** - Radio Network Layer Invalid CSG Id - S1AP Radio Network Layer cause Invalid CSG Id.
- **RadioNetworkLayer_ReleaseDueToPreEmption** - Radio Network Layer Release Due to Pre-Emption - S1AP Radio Network Layer cause Release due to Pre-Emption.
- **RadioNetworkLayer_N26InterfaceNotAvailable** - Radio Network Layer N26 Interface Not Available - S1AP Radio Network Layer cause N26 interface not available.
- **TransportLayer_TransportResourceUnavailable** - Transport Layer Transport Resource Unavailable - S1AP Transport Layer cause Transport Resource Unavailable.
- **TransportLayer_Unspecified** - Transport Layer Unspecified - S1AP Transport Layer cause Unspecified.
- **Nas_NormalRelease** - NAS Normal Release - S1AP NAS cause Normal Release.

- Nas_AuthenticationFailure - NAS Authentication Failure - S1AP NAS cause Authentication failure.
- Nas_Detach - NAS Detach - S1AP NAS cause Detach.
- Nas_Unspecified - NAS Unspecified - S1AP NAS cause Unspecified.
- Nas_CsgSubscriptionExpiry - NAS CSG Subscription Expiry - S1AP NAS cause CSG Subscription Expiry.
- Protocol_TransferSyntaxError - Protocol Transfer Syntax Error - S1AP Protocol cause Transfer Syntax Error.
- Protocol_AbstractSyntaxErrorReject - Protocol Abstract Syntax Error (Reject) - S1AP Protocol cause Abstract Syntax Error (Reject).
- Protocol_AbstractSyntaxErrorIgnoreAndNotify - Protocol Abstract Syntax Error (Ignore and Notify) - S1AP Protocol cause Abstract Syntax Error (Ignore and Notify).
- Protocol_MessageNotCompatibleWithReceiverState - Protocol Message Not Compatible with Receiver State - S1AP Protocol cause Message not Compatible with Receiver State.
- Protocol_SemanticError - Protocol Semantic Error - S1AP Protocol cause Semantic Error.
- Protocol_AbstractSyntaxErrorFalselyConstructedMessage - Protocol Abstract Syntax Error (Falsely Constructed Message) - S1AP Protocol cause Abstract Syntax Error (Falsely Constructed Message).
- Protocol_Unspecified - Protocol Unspecified - S1AP Protocol cause Unspecified.
- Miscellaneous_ControlProcessingOverload - Miscellaneous Control Processing Overload - S1AP Miscellaneous cause Control Processing Overload.
- Miscellaneous_NotEnoughUserPlaneProcessingResources - Miscellaneous Not Enough User Plane Processing Resources - S1AP Miscellaneous cause Not enough User Plane Processing Resources.
- Miscellaneous_HardwareFailure - Miscellaneous Hardware Failure - S1AP Miscellaneous cause Hardware Failure.
- Miscellaneous_OmIntervention - Miscellaneous O&M Intervention - S1AP Miscellaneous cause O&M Intervention.
- Miscellaneous_Unspecified - Miscellaneous Unspecified - S1AP Miscellaneous cause Unspecified.
- Miscellaneous_UnknownPlmn - Miscellaneous Unknown PLMN - S1AP Miscellaneous cause Unknown PLMN.

Default

Disabled

Name

ueCtxRelSgwRestart - UE Context Release Command SGW Restart

Syntax

--ueCtxtRelSgwRestart <list-item>

Description

S1AP cause code to include on UE context release command when detach reason is SGW restart.

Class

Optional.

List

- Disabled - The feature is disabled in the corresponding scenario. The MME does not override the S1AP cause code.
- RadioNetworkLayer_Unspecified - Radio Network Layer Unspecified - S1AP Radio Network Layer cause Unspecified.
- RadioNetworkLayer_TX2RelocOverallExpiry - Radio Network Layer TX2 Reloc Overall Expiry - S1AP Radio Network Layer cause TX2 Reloc Overall Expiry.
- RadioNetworkLayer_SuccessfulHandover - Radio Network Layer Successful Handover - S1AP Radio Network Layer cause Successful Handover.
- RadioNetworkLayer_ReleaseDueToEutranGeneratedReason - Radio Network Layer Release Due to E-UTRAN Generated Reason - S1AP Radio Network Layer cause Release Due to E-UTRAN Generated Reason.
- RadioNetworkLayer_HandoverCancelled - Radio Network Layer Handover Cancelled - S1AP Radio Network Layer cause Handover Cancelled.
- RadioNetworkLayer_PartialHandover - Radio Network Layer Partial Handover - S1AP Radio Network Layer cause Partial Handover.
- RadioNetworkLayer_HandoverFailureInTargetEpcEnbOrTargetSystem - Radio Network Layer Handover Failure in Target EPC/eNB or Target System - S1AP Radio Network Layer cause Handover Failure In Target EPC/eNB or Target System.
- RadioNetworkLayer_HandoverTargetNotAllowed - Radio Network Layer Handover Target Not Allowed - S1AP Radio Network Layer cause Handover Target not allowed.
- RadioNetworkLayer_TS1RelocOverallExpiry - Radio Network Layer TS1 Reloc Overall Expiry - S1AP Radio Network Layer cause TS1Relocoverall Expiry.
- RadioNetworkLayer_TS1RelocPrepExpiry - Radio Network Layer TS1 Reloc Prep Expiry - S1AP Radio Network Layer cause TS1RelocPrep Expiry.
- RadioNetworkLayer_CellNotAvailable - Radio Network Layer Cell Not Available - S1AP Radio Network Layer cause Cell Not Available.
- RadioNetworkLayer_UnknownTargetId - Radio Network Layer Unknown Target Id - S1AP Radio Network Layer cause Unknown Target Id.

- **RadioNetworkLayer_NoRadioResourcesAvailableInTargetCell** - Radio Network Layer No Resources Available in Target Cell - S1AP Radio Network Layer cause No Resources Available in Target Cell.
- **RadioNetworkLayer_UnknownOrAlreadyAllocatedMmeUeS1apId** - Radio Network Layer Unknown or Already Allocated MME UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated MME UE S1AP ID.
- **RadioNetworkLayer_UnknownOrAlreadyAllocatedEnbUeS1apId** - Radio Network Layer Unknown or Already Allocated eNB UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated eNB UE S1AP ID.
- **RadioNetworkLayer_UnknownOrInconsistentPairOfUeS1apId** - Radio Network Layer Unknown or Inconsistent Pair of S1AP UE ID - S1AP Radio Network Layer cause Unknown or inconsistent pair of S1AP UE ID.
- **RadioNetworkLayer_HandoverDesirableForRadioReasons** - Radio Network Layer Handover Desirable for Radio Reasons - S1AP Radio Network Layer cause Handover desirable for radio reasons.
- **RadioNetworkLayer_TimeCriticalHandover** - Radio Network Layer Time Critical Handover - S1AP Radio Network Layer cause Time critical handover.
- **RadioNetworkLayer_ResourceOptimisationHandover** - Radio Network Layer Resource Optimisation Handover - S1AP Radio Network Layer cause Resource optimisation handover.
- **RadioNetworkLayer_ReduceLoadInServingCell** - Radio Network Layer Reduce Load in Serving Cell - S1AP Radio Network Layer cause Reduce load in serving cell.
- **RadioNetworkLayer_UserInactivity** - Radio Network Layer User Inactivity - S1AP Radio Network Layer cause User Inactivity.
- **RadioNetworkLayer_RadioConnectionWithUeLost** - Radio Network Layer Radio Connection with UE Lost - S1AP Radio Network Layer cause Radio Connection With UE Lost.
- **RadioNetworkLayer_LoadBalancingTauRequired** - Radio Network Layer Load Balancing TAU Required - S1AP Radio Network Layer cause Load Balancing TAU Required.
- **RadioNetworkLayer_CsFallbackTriggered** - Radio Network Layer CS Fallback Triggered - S1AP Radio Network Layer cause CS Fallback Triggered.
- **RadioNetworkLayer_UeNotAvailableForPsService** - Radio Network Layer UE Not Available for PS Service - S1AP Radio Network Layer cause UE Not Available For PS Service.
- **RadioNetworkLayer_RadioResourcesNotAvailable** - Radio Network Layer Radio Resources Not Available - S1AP Radio Network Layer cause Radio resources not available.
- **RadioNetworkLayer_FailureInTheRadioInterfaceProcedure** - Radio Network Layer Failure in the Radio Interface Procedure - S1AP Radio Network Layer cause Failure in the Radio Interface Procedure.

- **RadioNetworkLayer_InvalidQosCombination** - Radio Network Layer Invalid QoS Combination - S1AP Radio Network Layer cause Invalid QoS combination.
- **RadioNetworkLayer_InterRatRedirection** - Radio Network Layer Inter-RAT Redirection - S1AP Radio Network Layer cause Inter-RAT redirection.
- **RadioNetworkLayer_InteractionWithOtherProcedure** - Radio Network Layer Interaction with Other Procedure - S1AP Radio Network Layer cause Interaction with other procedure.
- **RadioNetworkLayer_UnknownErabId** - Radio Network Layer Unknown E-RAB ID - S1AP Radio Network Layer cause Unknown E-RAB ID.
- **RadioNetworkLayer_MultipleErabIdInstances** - Radio Network Layer Multiple E-RAB ID Instances - S1AP Radio Network Layer cause Multiple E-RAB ID instances.
- **RadioNetworkLayer_EncryptionAndOrIntegrityProtectionAlgorithmsNotSupported** - Radio Network Layer Encryption and/or Integrity Protection Algorithms Not Supported - S1AP Radio Network Layer cause Encryption and/or Integrity protection algorithms not supported.
- **RadioNetworkLayer_S1IntraSystemHandoverTriggered** - Radio Network Layer S1 Intra System Handover Triggered - S1AP Radio Network Layer cause S1 intra system Handover triggered.
- **RadioNetworkLayer_S1InterSystemHandoverTriggered** - Radio Network Layer S1 Inter System Handover Triggered - S1AP Radio Network Layer cause S1 inter system Handover triggered.
- **RadioNetworkLayer_x2HandoverTriggered** - Radio Network Layer X2 Handover Triggered - S1AP Radio Network Layer cause X2 Handover triggered.
- **RadioNetworkLayer_redirectionTowards1xRtt** - Radio Network Layer Redirection Towards 1xRTT - S1AP Radio Network Layer cause Redirection towards 1xRTT.
- **RadioNetworkLayer_NotSupportedQciValue** - Radio Network Layer Not Supported QCI Value - S1AP Radio Network Layer cause Not Supported QCI Value.
- **RadioNetworkLayer_InvalidCsgId** - Radio Network Layer Invalid CSG Id - S1AP Radio Network Layer cause Invalid CSG Id.
- **RadioNetworkLayer_ReleaseDueToPreEmption** - Radio Network Layer Release Due to Pre-Emption - S1AP Radio Network Layer cause Release due to Pre-Emption.
- **RadioNetworkLayer_N26InterfaceNotAvailable** - Radio Network Layer N26 Interface Not Available - S1AP Radio Network Layer cause N26 interface not available.
- **TransportLayer_TransportResourceUnavailable** - Transport Layer Transport Resource Unavailable - S1AP Transport Layer cause Transport Resource Unavailable.
- **TransportLayer_Unspecified** - Transport Layer Unspecified - S1AP Transport Layer cause Unspecified.
- **Nas_NormalRelease** - NAS Normal Release - S1AP NAS cause Normal Release.

- **Nas_AuthenticationFailure** - NAS Authentication Failure - S1AP NAS cause Authentication failure.
- **Nas_Detach** - NAS Detach - S1AP NAS cause Detach.
- **Nas_Unspecified** - NAS Unspecified - S1AP NAS cause Unspecified.
- **Nas_CsgSubscriptionExpiry** - NAS CSG Subscription Expiry - S1AP NAS cause CSG Subscription Expiry.
- **Protocol_TransferSyntaxError** - Protocol Transfer Syntax Error - S1AP Protocol cause Transfer Syntax Error.
- **Protocol_AbstractSyntaxErrorReject** - Protocol Abstract Syntax Error (Reject) - S1AP Protocol cause Abstract Syntax Error (Reject).
- **Protocol_AbstractSyntaxErrorIgnoreAndNotify** - Protocol Abstract Syntax Error (Ignore and Notify) - S1AP Protocol cause Abstract Syntax Error (Ignore and Notify).
- **Protocol_MessageNotCompatibleWithReceiverState** - Protocol Message Not Compatible with Receiver State - S1AP Protocol cause Message not Compatible with Receiver State.
- **Protocol_SemanticError** - Protocol Semantic Error - S1AP Protocol cause Semantic Error.
- **Protocol_AbstractSyntaxErrorFalselyConstructedMessage** - Protocol Abstract Syntax Error (Falsely Constructed Message) - S1AP Protocol cause Abstract Syntax Error (Falsely Constructed Message).
- **Protocol_Unspecified** - Protocol Unspecified - S1AP Protocol cause Unspecified.
- **Miscellaneous_ControlProcessingOverload** - Miscellaneous Control Processing Overload - S1AP Miscellaneous cause Control Processing Overload.
- **Miscellaneous_NotEnoughUserPlaneProcessingResources** - Miscellaneous Not Enough User Plane Processing Resources - S1AP Miscellaneous cause Not enough User Plane Processing Resources.
- **Miscellaneous_HardwareFailure** - Miscellaneous Hardware Failure - S1AP Miscellaneous cause Hardware Failure.
- **Miscellaneous_OmIntervention** - Miscellaneous O&M Intervention - S1AP Miscellaneous cause O&M Intervention.
- **Miscellaneous_Unspecified** - Miscellaneous Unspecified - S1AP Miscellaneous cause Unspecified.
- **Miscellaneous_UnknownPlmn** - Miscellaneous Unknown PLMN - S1AP Miscellaneous cause Unknown PLMN.

Default

- RadioNetworkLayer_SuccessfulHandover - Radio Network Layer Successful Handover - S1AP Radio Network Layer cause Successful Handover.
- RadioNetworkLayer_ReleaseDueToEutranGeneratedReason - Radio Network Layer Release Due to E-UTRAN Generated Reason - S1AP Radio Network Layer cause Release Due to E-UTRAN Generated Reason.
- RadioNetworkLayer_HandoverCancelled - Radio Network Layer Handover Cancelled - S1AP Radio Network Layer cause Handover Cancelled.
- RadioNetworkLayer_PartialHandover - Radio Network Layer Partial Handover - S1AP Radio Network Layer cause Partial Handover.
- RadioNetworkLayer_HandoverFailureInTargetEpcEnbOrTargetSystem - Radio Network Layer Handover Failure in Target EPC/eNB or Target System - S1AP Radio Network Layer cause Handover Failure In Target EPC/eNB or Target System.
- RadioNetworkLayer_HandoverTargetNotAllowed - Radio Network Layer Handover Target Not Allowed - S1AP Radio Network Layer cause Handover Target not allowed.
- RadioNetworkLayer_TS1RelocOverallExpiry - Radio Network Layer TS1 Reloc Overall Expiry - S1AP Radio Network Layer cause TS1Relocoverall Expiry.
- RadioNetworkLayer_TS1RelocPrepExpiry - Radio Network Layer TS1 Reloc Prep Expiry - S1AP Radio Network Layer cause TS1RelocPrep Expiry.
- RadioNetworkLayer_CellNotAvailable - Radio Network Layer Cell Not Available - S1AP Radio Network Layer cause Cell Not Available.
- RadioNetworkLayer_UnknownTargetId - Radio Network Layer Unknown Target Id - S1AP Radio Network Layer cause Unknown Target Id.

- RadioNetworkLayer_NoRadioResourcesAvailableInTargetCell - Radio Network Layer No Resources Available in Target Cell - S1AP Radio Network Layer cause No Resources Available in Target Cell.
- RadioNetworkLayer_UnknownOrAlreadyAllocatedMmeUeS1apId - Radio Network Layer Unknown or Already Allocated MME UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated MME UE S1AP ID.
- RadioNetworkLayer_UnknownOrAlreadyAllocatedEnbUeS1apId - Radio Network Layer Unknown or Already Allocated eNB UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated eNB UE S1AP ID.
- RadioNetworkLayer_UnknownOrInconsistentPairOfUeS1apId - Radio Network Layer Unknown or Inconsistent Pair of S1AP UE ID - S1AP Radio Network Layer cause Unknown or inconsistent pair of S1AP UE ID.
- RadioNetworkLayer_HandoverDesirableForRadioReasons - Radio Network Layer Handover Desirable for Radio Reasons - S1AP Radio Network Layer cause Handover desirable for radio reasons.
- RadioNetworkLayer_TimeCriticalHandover - Radio Network Layer Time Critical Handover - S1AP Radio Network Layer cause Time critical handover.
- RadioNetworkLayer_ResourceOptimisationHandover - Radio Network Layer Resource Optimisation Handover - S1AP Radio Network Layer cause Resource optimisation handover.
- RadioNetworkLayer_ReduceLoadInServingCell - Radio Network Layer Reduce Load in Serving Cell - S1AP Radio Network Layer cause Reduce load in serving cell.
- RadioNetworkLayer_UserInactivity - Radio Network Layer User Inactivity - S1AP Radio Network Layer cause User Inactivity.
- RadioNetworkLayer_RadioConnectionWithUeLost - Radio Network Layer Radio Connection with UE Lost - S1AP Radio Network Layer cause Radio Connection With UE Lost.
- RadioNetworkLayer_LoadBalancingTauRequired - Radio Network Layer Load Balancing TAU Required - S1AP Radio Network Layer cause Load Balancing TAU Required.
- RadioNetworkLayer_CsFallbackTriggered - Radio Network Layer CS Fallback Triggered - S1AP Radio Network Layer cause CS Fallback Triggered.
- RadioNetworkLayer_UeNotAvailableForPsService - Radio Network Layer UE Not Available for PS Service - S1AP Radio Network Layer cause UE Not Available For PS Service.
- RadioNetworkLayer_RadioResourcesNotAvailable - Radio Network Layer Radio Resources Not Available - S1AP Radio Network Layer cause Radio resources not available.
- RadioNetworkLayer_FailureInTheRadioInterfaceProcedure - Radio Network Layer Failure in the Radio Interface Procedure - S1AP Radio Network Layer cause Failure in the Radio Interface Procedure.

- **RadioNetworkLayer_InvalidQosCombination** - Radio Network Layer Invalid QoS Combination - S1AP Radio Network Layer cause Invalid QoS combination.
- **RadioNetworkLayer_InterRatRedirection** - Radio Network Layer Inter-RAT Redirection - S1AP Radio Network Layer cause Inter-RAT redirection.
- **RadioNetworkLayer_InteractionWithOtherProcedure** - Radio Network Layer Interaction with Other Procedure - S1AP Radio Network Layer cause Interaction with other procedure.
- **RadioNetworkLayer_UnknownErabId** - Radio Network Layer Unknown E-RAB ID - S1AP Radio Network Layer cause Unknown E-RAB ID.
- **RadioNetworkLayer_MultipleErabIdInstances** - Radio Network Layer Multiple E-RAB ID Instances - S1AP Radio Network Layer cause Multiple E-RAB ID instances.
- **RadioNetworkLayer_EncryptionAndOrIntegrityProtectionAlgorithmsNotSupported** - Radio Network Layer Encryption and/or Integrity Protection Algorithms Not Supported - S1AP Radio Network Layer cause Encryption and/or Integrity protection algorithms not supported.
- **RadioNetworkLayer_S1IntraSystemhandoverTriggered** - Radio Network Layer S1 Intra System Handover Triggered - S1AP Radio Network Layer cause S1 intra system Handover triggered.
- **RadioNetworkLayer_S1InterSystemHandoverTriggered** - Radio Network Layer S1 Inter System Handover Triggered - S1AP Radio Network Layer cause S1 inter system Handover triggered.
- **RadioNetworkLayer_x2HandoverTriggered** - Radio Network Layer X2 Handover Triggered - S1AP Radio Network Layer cause X2 Handover triggered.
- **RadioNetworkLayer_redirectionTowards1xRtt** - Radio Network Layer Redirection Towards 1xRTT - S1AP Radio Network Layer cause Redirection towards 1xRTT.
- **RadioNetworkLayer_NotSupportedQciValue** - Radio Network Layer Not Supported QCI Value - S1AP Radio Network Layer cause Not Supported QCI Value.
- **RadioNetworkLayer_InvalidCsgId** - Radio Network Layer Invalid CSG Id - S1AP Radio Network Layer cause Invalid CSG Id.
- **RadioNetworkLayer_ReleaseDueToPreEmption** - Radio Network Layer Release Due to Pre-Emption - S1AP Radio Network Layer cause Release due to Pre-Emption.
- **RadioNetworkLayer_N26InterfaceNotAvailable** - Radio Network Layer N26 Interface Not Available - S1AP Radio Network Layer cause N26 interface not available.
- **TransportLayer_TransportResourceUnavailable** - Transport Layer Transport Resource Unavailable - S1AP Transport Layer cause Transport Resource Unavailable.
- **TransportLayer_Unspecified** - Transport Layer Unspecified - S1AP Transport Layer cause Unspecified.
- **Nas_NormalRelease** - NAS Normal Release - S1AP NAS cause Normal Release.

- Nas_AuthenticationFailure - NAS Authentication Failure - S1AP NAS cause Authentication failure.
- Nas_Detach - NAS Detach - S1AP NAS cause Detach.
- Nas_Unspecified - NAS Unspecified - S1AP NAS cause Unspecified.
- Nas_CsgSubscriptionExpiry - NAS CSG Subscription Expiry - S1AP NAS cause CSG Subscription Expiry.
- Protocol_TransferSyntaxError - Protocol Transfer Syntax Error - S1AP Protocol cause Transfer Syntax Error.
- Protocol_AbstractSyntaxErrorReject - Protocol Abstract Syntax Error (Reject) - S1AP Protocol cause Abstract Syntax Error (Reject).
- Protocol_AbstractSyntaxErrorIgnoreAndNotify - Protocol Abstract Syntax Error (Ignore and Notify) - S1AP Protocol cause Abstract Syntax Error (Ignore and Notify).
- Protocol_MessageNotCompatibleWithReceiverState - Protocol Message Not Compatible with Receiver State - S1AP Protocol cause Message not Compatible with Receiver State.
- Protocol_SemanticError - Protocol Semantic Error - S1AP Protocol cause Semantic Error.
- Protocol_AbstractSyntaxErrorFalselyConstructedMessage - Protocol Abstract Syntax Error (Falsely Constructed Message) - S1AP Protocol cause Abstract Syntax Error (Falsely Constructed Message).
- Protocol_Unspecified - Protocol Unspecified - S1AP Protocol cause Unspecified.
- Miscellaneous_ControlProcessingOverload - Miscellaneous Control Processing Overload - S1AP Miscellaneous cause Control Processing Overload.
- Miscellaneous_NotEnoughUserPlaneProcessingResources - Miscellaneous Not Enough User Plane Processing Resources - S1AP Miscellaneous cause Not enough User Plane Processing Resources.
- Miscellaneous_HardwareFailure - Miscellaneous Hardware Failure - S1AP Miscellaneous cause Hardware Failure.
- Miscellaneous_OmIntervention - Miscellaneous O&M Intervention - S1AP Miscellaneous cause O&M Intervention.
- Miscellaneous_Unspecified - Miscellaneous Unspecified - S1AP Miscellaneous cause Unspecified.
- Miscellaneous_UnknownPlmn - Miscellaneous Unknown PLMN - S1AP Miscellaneous cause Unknown PLMN.

Default

Disabled

Name

ueCtxtRelSrvccError - UE Context Release Command SRVCC Error

Syntax

--ueCtxtRelSrvccError <list-item>

Description

The S1AP cause the MME includes on UE context release command on message level, when the MME releases the S1 after an error indicated on SRVCC PS to CS handover completion.

Class

Optional.

List

- Disabled - The feature is disabled in the corresponding scenario. The MME does not override the S1AP cause code.
- RadioNetworkLayer_Unspecified - Radio Network Layer Unspecified - S1AP Radio Network Layer cause Unspecified.
- RadioNetworkLayer_TX2RelocOverallExpiry - Radio Network Layer TX2 Reloc Overall Expiry - S1AP Radio Network Layer cause TX2 Reloc Overall Expiry.
- RadioNetworkLayer_SuccessfulHandover - Radio Network Layer Successful Handover - S1AP Radio Network Layer cause Successful Handover.
- RadioNetworkLayer_ReleaseDueToEutranGeneratedReason - Radio Network Layer Release Due to E-UTRAN Generated Reason - S1AP Radio Network Layer cause Release Due to E-UTRAN Generated Reason.
- RadioNetworkLayer_HandoverCancelled - Radio Network Layer Handover Cancelled - S1AP Radio Network Layer cause Handover Cancelled.
- RadioNetworkLayer_PartialHandover - Radio Network Layer Partial Handover - S1AP Radio Network Layer cause Partial Handover.
- RadioNetworkLayer_HandoverFailureInTargetEpcEnbOrTargetSystem - Radio Network Layer Handover Failure in Target EPC/eNB or Target System - S1AP Radio Network Layer cause Handover Failure In Target EPC/eNB or Target System.
- RadioNetworkLayer_HandoverTargetNotAllowed - Radio Network Layer Handover Target Not Allowed - S1AP Radio Network Layer cause Handover Target not allowed.
- RadioNetworkLayer_TS1RelocOverallExpiry - Radio Network Layer TS1 Reloc Overall Expiry - S1AP Radio Network Layer cause TS1Relocoverall Expiry.
- RadioNetworkLayer_TS1RelocPrepExpiry - Radio Network Layer TS1 Reloc Prep Expiry - S1AP Radio Network Layer cause TS1RelocPrep Expiry.
- RadioNetworkLayer_CellNotAvailable - Radio Network Layer Cell Not Available - S1AP Radio Network Layer cause Cell Not Available.
- RadioNetworkLayer_UnknownTargetId - Radio Network Layer Unknown Target Id - S1AP Radio Network Layer cause Unknown Target Id.

- **RadioNetworkLayer_NoRadioResourcesAvailableInTargetCell** - Radio Network Layer No Resources Available in Target Cell - S1AP Radio Network Layer cause No Resources Available in Target Cell.
- **RadioNetworkLayer_UnknownOrAlreadyAllocatedMmeUeS1apId** - Radio Network Layer Unknown or Already Allocated MME UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated MME UE S1AP ID.
- **RadioNetworkLayer_UnknownOrAlreadyAllocatedEnbUeS1apId** - Radio Network Layer Unknown or Already Allocated eNB UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated eNB UE S1AP ID.
- **RadioNetworkLayer_UnknownOrInconsistentPairOfUeS1apId** - Radio Network Layer Unknown or Inconsistent Pair of S1AP UE ID - S1AP Radio Network Layer cause Unknown or inconsistent pair of S1AP UE ID.
- **RadioNetworkLayer_HandoverDesirableForRadioReasons** - Radio Network Layer Handover Desirable for Radio Reasons - S1AP Radio Network Layer cause Handover desirable for radio reasons.
- **RadioNetworkLayer_TimeCriticalHandover** - Radio Network Layer Time Critical Handover - S1AP Radio Network Layer cause Time critical handover.
- **RadioNetworkLayer_ResourceOptimisationHandover** - Radio Network Layer Resource Optimisation Handover - S1AP Radio Network Layer cause Resource optimisation handover.
- **RadioNetworkLayer_ReduceLoadInServingCell** - Radio Network Layer Reduce Load in Serving Cell - S1AP Radio Network Layer cause Reduce load in serving cell.
- **RadioNetworkLayer_UserInactivity** - Radio Network Layer User Inactivity - S1AP Radio Network Layer cause User Inactivity.
- **RadioNetworkLayer_RadioConnectionWithUeLost** - Radio Network Layer Radio Connection with UE Lost - S1AP Radio Network Layer cause Radio Connection With UE Lost.
- **RadioNetworkLayer_LoadBalancingTauRequired** - Radio Network Layer Load Balancing TAU Required - S1AP Radio Network Layer cause Load Balancing TAU Required.
- **RadioNetworkLayer_CsFallbackTriggered** - Radio Network Layer CS Fallback Triggered - S1AP Radio Network Layer cause CS Fallback Triggered.
- **RadioNetworkLayer_UeNotAvailableForPsService** - Radio Network Layer UE Not Available for PS Service - S1AP Radio Network Layer cause UE Not Available For PS Service.
- **RadioNetworkLayer_RadioResourcesNotAvailable** - Radio Network Layer Radio Resources Not Available - S1AP Radio Network Layer cause Radio resources not available.
- **RadioNetworkLayer_FailureInTheRadioInterfaceProcedure** - Radio Network Layer Failure in the Radio Interface Procedure - S1AP Radio Network Layer cause Failure in the Radio Interface Procedure.

- **RadioNetworkLayer_InvalidQosCombination** - Radio Network Layer Invalid QoS Combination - S1AP Radio Network Layer cause Invalid QoS combination.
- **RadioNetworkLayer_InterRatRedirection** - Radio Network Layer Inter-RAT Redirection - S1AP Radio Network Layer cause Inter-RAT redirection.
- **RadioNetworkLayer_InteractionWithOtherProcedure** - Radio Network Layer Interaction with Other Procedure - S1AP Radio Network Layer cause Interaction with other procedure.
- **RadioNetworkLayer_UnknownErabId** - Radio Network Layer Unknown E-RAB ID - S1AP Radio Network Layer cause Unknown E-RAB ID.
- **RadioNetworkLayer_MultipleErabIdInstances** - Radio Network Layer Multiple E-RAB ID Instances - S1AP Radio Network Layer cause Multiple E-RAB ID instances.
- **RadioNetworkLayer_EncryptionAndOrIntegrityProtectionAlgorithmsNotSupported** - Radio Network Layer Encryption and/or Integrity Protection Algorithms Not Supported - S1AP Radio Network Layer cause Encryption and/or Integrity protection algorithms not supported.
- **RadioNetworkLayer_S1IntraSystemHandoverTriggered** - Radio Network Layer S1 Intra System Handover Triggered - S1AP Radio Network Layer cause S1 intra system Handover triggered.
- **RadioNetworkLayer_S1InterSystemHandoverTriggered** - Radio Network Layer S1 Inter System Handover Triggered - S1AP Radio Network Layer cause S1 inter system Handover triggered.
- **RadioNetworkLayer_x2HandoverTriggered** - Radio Network Layer X2 Handover Triggered - S1AP Radio Network Layer cause X2 Handover triggered.
- **RadioNetworkLayer_redirectionTowards1xRtt** - Radio Network Layer Redirection Towards 1xRTT - S1AP Radio Network Layer cause Redirection towards 1xRTT.
- **RadioNetworkLayer_NotSupportedQciValue** - Radio Network Layer Not Supported QCI Value - S1AP Radio Network Layer cause Not Supported QCI Value.
- **RadioNetworkLayer_InvalidCsgId** - Radio Network Layer Invalid CSG Id - S1AP Radio Network Layer cause Invalid CSG Id.
- **RadioNetworkLayer_ReleaseDueToPreEmption** - Radio Network Layer Release Due to Pre-Emption - S1AP Radio Network Layer cause Release due to Pre-Emption.
- **RadioNetworkLayer_N26InterfaceNotAvailable** - Radio Network Layer N26 Interface Not Available - S1AP Radio Network Layer cause N26 interface not available.
- **TransportLayer_TransportResourceUnavailable** - Transport Layer Transport Resource Unavailable - S1AP Transport Layer cause Transport Resource Unavailable.
- **TransportLayer_Unspecified** - Transport Layer Unspecified - S1AP Transport Layer cause Unspecified.
- **Nas_NormalRelease** - NAS Normal Release - S1AP NAS cause Normal Release.

- Nas_AuthenticationFailure - NAS Authentication Failure - S1AP NAS cause Authentication failure.
- Nas_Detach - NAS Detach - S1AP NAS cause Detach.
- Nas_Unspecified - NAS Unspecified - S1AP NAS cause Unspecified.
- Nas_CsgSubscriptionExpiry - NAS CSG Subscription Expiry - S1AP NAS cause CSG Subscription Expiry.
- Protocol_TransferSyntaxError - Protocol Transfer Syntax Error - S1AP Protocol cause Transfer Syntax Error.
- Protocol_AbstractSyntaxErrorReject - Protocol Abstract Syntax Error (Reject) - S1AP Protocol cause Abstract Syntax Error (Reject).
- Protocol_AbstractSyntaxErrorIgnoreAndNotify - Protocol Abstract Syntax Error (Ignore and Notify) - S1AP Protocol cause Abstract Syntax Error (Ignore and Notify).
- Protocol_MessageNotCompatibleWithReceiverState - Protocol Message Not Compatible with Receiver State - S1AP Protocol cause Message not Compatible with Receiver State.
- Protocol_SemanticError - Protocol Semantic Error - S1AP Protocol cause Semantic Error.
- Protocol_AbstractSyntaxErrorFalselyConstructedMessage - Protocol Abstract Syntax Error (Falsely Constructed Message) - S1AP Protocol cause Abstract Syntax Error (Falsely Constructed Message).
- Protocol_Unspecified - Protocol Unspecified - S1AP Protocol cause Unspecified.
- Miscellaneous_ControlProcessingOverload - Miscellaneous Control Processing Overload - S1AP Miscellaneous cause Control Processing Overload.
- Miscellaneous_NotEnoughUserPlaneProcessingResources - Miscellaneous Not Enough User Plane Processing Resources - S1AP Miscellaneous cause Not enough User Plane Processing Resources.
- Miscellaneous_HardwareFailure - Miscellaneous Hardware Failure - S1AP Miscellaneous cause Hardware Failure.
- Miscellaneous_OmIntervention - Miscellaneous O&M Intervention - S1AP Miscellaneous cause O&M Intervention.
- Miscellaneous_Unspecified - Miscellaneous Unspecified - S1AP Miscellaneous cause Unspecified.
- Miscellaneous_UnknownPlmn - Miscellaneous Unknown PLMN - S1AP Miscellaneous cause Unknown PLMN.

Default

Disabled

Name

ueCtxRelSystemFailure - UE Context Release Command System Failure

Syntax

--ueCtxtRelSystemFailure <list-item>

Description

S1AP cause code to include on UE context release command on System Failure.

Class

Optional.

List

- Disabled - The feature is disabled in the corresponding scenario. The MME does not override the S1AP cause code.
- RadioNetworkLayer_Unspecified - Radio Network Layer Unspecified - S1AP Radio Network Layer cause Unspecified.
- RadioNetworkLayer_TX2RelocOverallExpiry - Radio Network Layer TX2 Reloc Overall Expiry - S1AP Radio Network Layer cause TX2 Reloc Overall Expiry.
- RadioNetworkLayer_SuccessfulHandover - Radio Network Layer Successful Handover - S1AP Radio Network Layer cause Successful Handover.
- RadioNetworkLayer_ReleaseDueToEutranGeneratedReason - Radio Network Layer Release Due to E-UTRAN Generated Reason - S1AP Radio Network Layer cause Release Due to E-UTRAN Generated Reason.
- RadioNetworkLayer_HandoverCancelled - Radio Network Layer Handover Cancelled - S1AP Radio Network Layer cause Handover Cancelled.
- RadioNetworkLayer_PartialHandover - Radio Network Layer Partial Handover - S1AP Radio Network Layer cause Partial Handover.
- RadioNetworkLayer_HandoverFailureInTargetEpcEnbOrTargetSystem - Radio Network Layer Handover Failure in Target EPC/eNB or Target System - S1AP Radio Network Layer cause Handover Failure In Target EPC/eNB or Target System.
- RadioNetworkLayer_HandoverTargetNotAllowed - Radio Network Layer Handover Target Not Allowed - S1AP Radio Network Layer cause Handover Target not allowed.
- RadioNetworkLayer_TS1RelocOverallExpiry - Radio Network Layer TS1 Reloc Overall Expiry - S1AP Radio Network Layer cause TS1Relocoverall Expiry.
- RadioNetworkLayer_TS1RelocPrepExpiry - Radio Network Layer TS1 Reloc Prep Expiry - S1AP Radio Network Layer cause TS1RelocPrep Expiry.
- RadioNetworkLayer_CellNotAvailable - Radio Network Layer Cell Not Available - S1AP Radio Network Layer cause Cell Not Available.
- RadioNetworkLayer_UnknownTargetId - Radio Network Layer Unknown Target Id - S1AP Radio Network Layer cause Unknown Target Id.

- **RadioNetworkLayer_NoRadioResourcesAvailableInTargetCell** - Radio Network Layer No Resources Available in Target Cell - S1AP Radio Network Layer cause No Resources Available in Target Cell.
- **RadioNetworkLayer_UnknownOrAlreadyAllocatedMmeUeS1apId** - Radio Network Layer Unknown or Already Allocated MME UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated MME UE S1AP ID.
- **RadioNetworkLayer_UnknownOrAlreadyAllocatedEnbUeS1apId** - Radio Network Layer Unknown or Already Allocated eNB UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated eNB UE S1AP ID.
- **RadioNetworkLayer_UnknownOrInconsistentPairOfUeS1apId** - Radio Network Layer Unknown or Inconsistent Pair of S1AP UE ID - S1AP Radio Network Layer cause Unknown or inconsistent pair of S1AP UE ID.
- **RadioNetworkLayer_HandoverDesirableForRadioReasons** - Radio Network Layer Handover Desirable for Radio Reasons - S1AP Radio Network Layer cause Handover desirable for radio reasons.
- **RadioNetworkLayer_TimeCriticalHandover** - Radio Network Layer Time Critical Handover - S1AP Radio Network Layer cause Time critical handover.
- **RadioNetworkLayer_ResourceOptimisationHandover** - Radio Network Layer Resource Optimisation Handover - S1AP Radio Network Layer cause Resource optimisation handover.
- **RadioNetworkLayer_ReduceLoadInServingCell** - Radio Network Layer Reduce Load in Serving Cell - S1AP Radio Network Layer cause Reduce load in serving cell.
- **RadioNetworkLayer_UserInactivity** - Radio Network Layer User Inactivity - S1AP Radio Network Layer cause User Inactivity.
- **RadioNetworkLayer_RadioConnectionWithUeLost** - Radio Network Layer Radio Connection with UE Lost - S1AP Radio Network Layer cause Radio Connection With UE Lost.
- **RadioNetworkLayer_LoadBalancingTauRequired** - Radio Network Layer Load Balancing TAU Required - S1AP Radio Network Layer cause Load Balancing TAU Required.
- **RadioNetworkLayer_CsFallbackTriggered** - Radio Network Layer CS Fallback Triggered - S1AP Radio Network Layer cause CS Fallback Triggered.
- **RadioNetworkLayer_UeNotAvailableForPsService** - Radio Network Layer UE Not Available for PS Service - S1AP Radio Network Layer cause UE Not Available For PS Service.
- **RadioNetworkLayer_RadioResourcesNotAvailable** - Radio Network Layer Radio Resources Not Available - S1AP Radio Network Layer cause Radio resources not available.
- **RadioNetworkLayer_FailureInTheRadioInterfaceProcedure** - Radio Network Layer Failure in the Radio Interface Procedure - S1AP Radio Network Layer cause Failure in the Radio Interface Procedure.

- **RadioNetworkLayer_InvalidQosCombination** - Radio Network Layer Invalid QoS Combination - S1AP Radio Network Layer cause Invalid QoS combination.
- **RadioNetworkLayer_InterRatRedirection** - Radio Network Layer Inter-RAT Redirection - S1AP Radio Network Layer cause Inter-RAT redirection.
- **RadioNetworkLayer_InteractionWithOtherProcedure** - Radio Network Layer Interaction with Other Procedure - S1AP Radio Network Layer cause Interaction with other procedure.
- **RadioNetworkLayer_UnknownErabId** - Radio Network Layer Unknown E-RAB ID - S1AP Radio Network Layer cause Unknown E-RAB ID.
- **RadioNetworkLayer_MultipleErabIdInstances** - Radio Network Layer Multiple E-RAB ID Instances - S1AP Radio Network Layer cause Multiple E-RAB ID instances.
- **RadioNetworkLayer_EncryptionAndOrIntegrityProtectionAlgorithmsNotSupported** - Radio Network Layer Encryption and/or Integrity Protection Algorithms Not Supported - S1AP Radio Network Layer cause Encryption and/or Integrity protection algorithms not supported.
- **RadioNetworkLayer_S1IntraSystemHandoverTriggered** - Radio Network Layer S1 Intra System Handover Triggered - S1AP Radio Network Layer cause S1 intra system Handover triggered.
- **RadioNetworkLayer_S1InterSystemHandoverTriggered** - Radio Network Layer S1 Inter System Handover Triggered - S1AP Radio Network Layer cause S1 inter system Handover triggered.
- **RadioNetworkLayer_x2HandoverTriggered** - Radio Network Layer X2 Handover Triggered - S1AP Radio Network Layer cause X2 Handover triggered.
- **RadioNetworkLayer_redirectionTowards1xRtt** - Radio Network Layer Redirection Towards 1xRTT - S1AP Radio Network Layer cause Redirection towards 1xRTT.
- **RadioNetworkLayer_NotSupportedQciValue** - Radio Network Layer Not Supported QCI Value - S1AP Radio Network Layer cause Not Supported QCI Value.
- **RadioNetworkLayer_InvalidCsgId** - Radio Network Layer Invalid CSG Id - S1AP Radio Network Layer cause Invalid CSG Id.
- **RadioNetworkLayer_ReleaseDueToPreEmption** - Radio Network Layer Release Due to Pre-Emption - S1AP Radio Network Layer cause Release due to Pre-Emption.
- **RadioNetworkLayer_N26InterfaceNotAvailable** - Radio Network Layer N26 Interface Not Available - S1AP Radio Network Layer cause N26 interface not available.
- **TransportLayer_TransportResourceUnavailable** - Transport Layer Transport Resource Unavailable - S1AP Transport Layer cause Transport Resource Unavailable.
- **TransportLayer_Unspecified** - Transport Layer Unspecified - S1AP Transport Layer cause Unspecified.
- **Nas_NormalRelease** - NAS Normal Release - S1AP NAS cause Normal Release.

- Nas_AuthenticationFailure - NAS Authentication Failure - S1AP NAS cause Authentication failure.
- Nas_Detach - NAS Detach - S1AP NAS cause Detach.
- Nas_Unspecified - NAS Unspecified - S1AP NAS cause Unspecified.
- Nas_CsgSubscriptionExpiry - NAS CSG Subscription Expiry - S1AP NAS cause CSG Subscription Expiry.
- Protocol_TransferSyntaxError - Protocol Transfer Syntax Error - S1AP Protocol cause Transfer Syntax Error.
- Protocol_AbstractSyntaxErrorReject - Protocol Abstract Syntax Error (Reject) - S1AP Protocol cause Abstract Syntax Error (Reject).
- Protocol_AbstractSyntaxErrorIgnoreAndNotify - Protocol Abstract Syntax Error (Ignore and Notify) - S1AP Protocol cause Abstract Syntax Error (Ignore and Notify).
- Protocol_MessageNotCompatibleWithReceiverState - Protocol Message Not Compatible with Receiver State - S1AP Protocol cause Message not Compatible with Receiver State.
- Protocol_SemanticError - Protocol Semantic Error - S1AP Protocol cause Semantic Error.
- Protocol_AbstractSyntaxErrorFalselyConstructedMessage - Protocol Abstract Syntax Error (Falsely Constructed Message) - S1AP Protocol cause Abstract Syntax Error (Falsely Constructed Message).
- Protocol_Unspecified - Protocol Unspecified - S1AP Protocol cause Unspecified.
- Miscellaneous_ControlProcessingOverload - Miscellaneous Control Processing Overload - S1AP Miscellaneous cause Control Processing Overload.
- Miscellaneous_NotEnoughUserPlaneProcessingResources - Miscellaneous Not Enough User Plane Processing Resources - S1AP Miscellaneous cause Not enough User Plane Processing Resources.
- Miscellaneous_HardwareFailure - Miscellaneous Hardware Failure - S1AP Miscellaneous cause Hardware Failure.
- Miscellaneous_OmIntervention - Miscellaneous O&M Intervention - S1AP Miscellaneous cause O&M Intervention.
- Miscellaneous_Unspecified - Miscellaneous Unspecified - S1AP Miscellaneous cause Unspecified.
- Miscellaneous_UnknownPlmn - Miscellaneous Unknown PLMN - S1AP Miscellaneous cause Unknown PLMN.

Default

Disabled

Name

ueCtxtRelT3TunnelExpiry - UE Context Release Command T3 Tunnel Expiry

Syntax

--ueCtxtRelT3TunnelExpiry <list-item>

Description

The S1AP cause the MME includes on UE context release command on message level, when the S1 is released due to T3 tunnel timer expiry after IRAT RAU or successful handover.

Class

Optional.

List

- Disabled - The feature is disabled in the corresponding scenario. The MME does not override the S1AP cause code.
- RadioNetworkLayer_Unspecified - Radio Network Layer Unspecified - S1AP Radio Network Layer cause Unspecified.
- RadioNetworkLayer_TX2RelocOverallExpiry - Radio Network Layer TX2 Reloc Overall Expiry - S1AP Radio Network Layer cause TX2 Reloc Overall Expiry.
- RadioNetworkLayer_SuccessfulHandover - Radio Network Layer Successful Handover - S1AP Radio Network Layer cause Successful Handover.
- RadioNetworkLayer_ReleaseDueToEutranGeneratedReason - Radio Network Layer Release Due to E-UTRAN Generated Reason - S1AP Radio Network Layer cause Release Due to E-UTRAN Generated Reason.
- RadioNetworkLayer_HandoverCancelled - Radio Network Layer Handover Cancelled - S1AP Radio Network Layer cause Handover Cancelled.
- RadioNetworkLayer_PartialHandover - Radio Network Layer Partial Handover - S1AP Radio Network Layer cause Partial Handover.
- RadioNetworkLayer_HandoverFailureInTargetEpcEnbOrTargetSystem - Radio Network Layer Handover Failure in Target EPC/eNB or Target System - S1AP Radio Network Layer cause Handover Failure In Target EPC/eNB or Target System.
- RadioNetworkLayer_HandoverTargetNotAllowed - Radio Network Layer Handover Target Not Allowed - S1AP Radio Network Layer cause Handover Target not allowed.
- RadioNetworkLayer_TS1RelocOverallExpiry - Radio Network Layer TS1 Reloc Overall Expiry - S1AP Radio Network Layer cause TS1Relocoverall Expiry.
- RadioNetworkLayer_TS1RelocPrepExpiry - Radio Network Layer TS1 Reloc Prep Expiry - S1AP Radio Network Layer cause TS1RelocPrep Expiry.
- RadioNetworkLayer_CellNotAvailable - Radio Network Layer Cell Not Available - S1AP Radio Network Layer cause Cell Not Available.
- RadioNetworkLayer_UnknownTargetId - Radio Network Layer Unknown Target Id - S1AP Radio Network Layer cause Unknown Target Id.

- **RadioNetworkLayer_NoRadioResourcesAvailableInTargetCell** - Radio Network Layer No Resources Available in Target Cell - S1AP Radio Network Layer cause No Resources Available in Target Cell.
- **RadioNetworkLayer_UnknownOrAlreadyAllocatedMmeUeS1apId** - Radio Network Layer Unknown or Already Allocated MME UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated MME UE S1AP ID.
- **RadioNetworkLayer_UnknownOrAlreadyAllocatedEnbUeS1apId** - Radio Network Layer Unknown or Already Allocated eNB UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated eNB UE S1AP ID.
- **RadioNetworkLayer_UnknownOrInconsistentPairOfUeS1apId** - Radio Network Layer Unknown or Inconsistent Pair of S1AP UE ID - S1AP Radio Network Layer cause Unknown or inconsistent pair of S1AP UE ID.
- **RadioNetworkLayer_HandoverDesirableForRadioReasons** - Radio Network Layer Handover Desirable for Radio Reasons - S1AP Radio Network Layer cause Handover desirable for radio reasons.
- **RadioNetworkLayer_TimeCriticalHandover** - Radio Network Layer Time Critical Handover - S1AP Radio Network Layer cause Time critical handover.
- **RadioNetworkLayer_ResourceOptimisationHandover** - Radio Network Layer Resource Optimisation Handover - S1AP Radio Network Layer cause Resource optimisation handover.
- **RadioNetworkLayer_ReduceLoadInServingCell** - Radio Network Layer Reduce Load in Serving Cell - S1AP Radio Network Layer cause Reduce load in serving cell.
- **RadioNetworkLayer_UserInactivity** - Radio Network Layer User Inactivity - S1AP Radio Network Layer cause User Inactivity.
- **RadioNetworkLayer_RadioConnectionWithUeLost** - Radio Network Layer Radio Connection with UE Lost - S1AP Radio Network Layer cause Radio Connection With UE Lost.
- **RadioNetworkLayer_LoadBalancingTauRequired** - Radio Network Layer Load Balancing TAU Required - S1AP Radio Network Layer cause Load Balancing TAU Required.
- **RadioNetworkLayer_CsFallbackTriggered** - Radio Network Layer CS Fallback Triggered - S1AP Radio Network Layer cause CS Fallback Triggered.
- **RadioNetworkLayer_UeNotAvailableForPsService** - Radio Network Layer UE Not Available for PS Service - S1AP Radio Network Layer cause UE Not Available For PS Service.
- **RadioNetworkLayer_RadioResourcesNotAvailable** - Radio Network Layer Radio Resources Not Available - S1AP Radio Network Layer cause Radio resources not available.
- **RadioNetworkLayer_FailureInTheRadioInterfaceProcedure** - Radio Network Layer Failure in the Radio Interface Procedure - S1AP Radio Network Layer cause Failure in the Radio Interface Procedure.

- **RadioNetworkLayer_InvalidQoSCombination** - Radio Network Layer Invalid QoS Combination - S1AP Radio Network Layer cause Invalid QoS combination.
- **RadioNetworkLayer_InterRatRedirection** - Radio Network Layer Inter-RAT Redirection - S1AP Radio Network Layer cause Inter-RAT redirection.
- **RadioNetworkLayer_InteractionWithOtherProcedure** - Radio Network Layer Interaction with Other Procedure - S1AP Radio Network Layer cause Interaction with other procedure.
- **RadioNetworkLayer_UnknownErabId** - Radio Network Layer Unknown E-RAB ID - S1AP Radio Network Layer cause Unknown E-RAB ID.
- **RadioNetworkLayer_MultipleErabIdInstances** - Radio Network Layer Multiple E-RAB ID Instances - S1AP Radio Network Layer cause Multiple E-RAB ID instances.
- **RadioNetworkLayer_EncryptionAndOrIntegrityProtectionAlgorithmsNotSupported** - Radio Network Layer Encryption and/or Integrity Protection Algorithms Not Supported - S1AP Radio Network Layer cause Encryption and/or Integrity protection algorithms not supported.
- **RadioNetworkLayer_S1IntraSystemHandoverTriggered** - Radio Network Layer S1 Intra System Handover Triggered - S1AP Radio Network Layer cause S1 intra system Handover triggered.
- **RadioNetworkLayer_S1InterSystemHandoverTriggered** - Radio Network Layer S1 Inter System Handover Triggered - S1AP Radio Network Layer cause S1 inter system Handover triggered.
- **RadioNetworkLayer_x2HandoverTriggered** - Radio Network Layer X2 Handover Triggered - S1AP Radio Network Layer cause X2 Handover triggered.
- **RadioNetworkLayer_redirectionTowards1xRtt** - Radio Network Layer Redirection Towards 1xRTT - S1AP Radio Network Layer cause Redirection towards 1xRTT.
- **RadioNetworkLayer_NotSupportedQciValue** - Radio Network Layer Not Supported QCI Value - S1AP Radio Network Layer cause Not Supported QCI Value.
- **RadioNetworkLayer_InvalidCsgId** - Radio Network Layer Invalid CSG Id - S1AP Radio Network Layer cause Invalid CSG Id.
- **RadioNetworkLayer_ReleaseDueToPreEmption** - Radio Network Layer Release Due to Pre-Emption - S1AP Radio Network Layer cause Release due to Pre-Emption.
- **RadioNetworkLayer_N26InterfaceNotAvailable** - Radio Network Layer N26 Interface Not Available - S1AP Radio Network Layer cause N26 interface not available.
- **TransportLayer_TransportResourceUnavailable** - Transport Layer Transport Resource Unavailable - S1AP Transport Layer cause Transport Resource Unavailable.
- **TransportLayer_Unspecified** - Transport Layer Unspecified - S1AP Transport Layer cause Unspecified.
- **Nas_NormalRelease** - NAS Normal Release - S1AP NAS cause Normal Release.

- Nas_AuthenticationFailure - NAS Authentication Failure - S1AP NAS cause Authentication failure.
- Nas_Detach - NAS Detach - S1AP NAS cause Detach.
- Nas_Unspecified - NAS Unspecified - S1AP NAS cause Unspecified.
- Nas_CsgSubscriptionExpiry - NAS CSG Subscription Expiry - S1AP NAS cause CSG Subscription Expiry.
- Protocol_TransferSyntaxError - Protocol Transfer Syntax Error - S1AP Protocol cause Transfer Syntax Error.
- Protocol_AbstractSyntaxErrorReject - Protocol Abstract Syntax Error (Reject) - S1AP Protocol cause Abstract Syntax Error (Reject).
- Protocol_AbstractSyntaxErrorIgnoreAndNotify - Protocol Abstract Syntax Error (Ignore and Notify) - S1AP Protocol cause Abstract Syntax Error (Ignore and Notify).
- Protocol_MessageNotCompatibleWithReceiverState - Protocol Message Not Compatible with Receiver State - S1AP Protocol cause Message not Compatible with Receiver State.
- Protocol_SemanticError - Protocol Semantic Error - S1AP Protocol cause Semantic Error.
- Protocol_AbstractSyntaxErrorFalselyConstructedMessage - Protocol Abstract Syntax Error (Falsely Constructed Message) - S1AP Protocol cause Abstract Syntax Error (Falsely Constructed Message).
- Protocol_Unspecified - Protocol Unspecified - S1AP Protocol cause Unspecified.
- Miscellaneous_ControlProcessingOverload - Miscellaneous Control Processing Overload - S1AP Miscellaneous cause Control Processing Overload.
- Miscellaneous_NotEnoughUserPlaneProcessingResources - Miscellaneous Not Enough User Plane Processing Resources - S1AP Miscellaneous cause Not enough User Plane Processing Resources.
- Miscellaneous_HardwareFailure - Miscellaneous Hardware Failure - S1AP Miscellaneous cause Hardware Failure.
- Miscellaneous_OmIntervention - Miscellaneous O&M Intervention - S1AP Miscellaneous cause O&M Intervention.
- Miscellaneous_Unspecified - Miscellaneous Unspecified - S1AP Miscellaneous cause Unspecified.
- Miscellaneous_UnknownPlmn - Miscellaneous Unknown PLMN - S1AP Miscellaneous cause Unknown PLMN.

Default

Disabled

Name

ueCtxRelTargetNodeLte - UE Context Release Command LTE Target Access Restricted

Syntax

--ueCtxtRelTargetNodeLte <list-item>

Description

S1AP cause code to include on UE context release command when MME receives GTPv2 context response with cause code 'Target access restricted for the subscriber'.

Class

Optional.

List

- Disabled - The feature is disabled in the corresponding scenario. The MME does not override the S1AP cause code.
- RadioNetworkLayer_Unspecified - Radio Network Layer Unspecified - S1AP Radio Network Layer cause Unspecified.
- RadioNetworkLayer_TX2RelocOverallExpiry - Radio Network Layer TX2 Reloc Overall Expiry - S1AP Radio Network Layer cause TX2 Reloc Overall Expiry.
- RadioNetworkLayer_SuccessfulHandover - Radio Network Layer Successful Handover - S1AP Radio Network Layer cause Successful Handover.
- RadioNetworkLayer_ReleaseDueToEutranGeneratedReason - Radio Network Layer Release Due to E-UTRAN Generated Reason - S1AP Radio Network Layer cause Release Due to E-UTRAN Generated Reason.
- RadioNetworkLayer_HandoverCancelled - Radio Network Layer Handover Cancelled - S1AP Radio Network Layer cause Handover Cancelled.
- RadioNetworkLayer_PartialHandover - Radio Network Layer Partial Handover - S1AP Radio Network Layer cause Partial Handover.
- RadioNetworkLayer_HandoverFailureInTargetEpcEnbOrTargetSystem - Radio Network Layer Handover Failure in Target EPC/eNB or Target System - S1AP Radio Network Layer cause Handover Failure In Target EPC/eNB or Target System.
- RadioNetworkLayer_HandoverTargetNotAllowed - Radio Network Layer Handover Target Not Allowed - S1AP Radio Network Layer cause Handover Target not allowed.
- RadioNetworkLayer_TS1RelocOverallExpiry - Radio Network Layer TS1 Reloc Overall Expiry - S1AP Radio Network Layer cause TS1Relocoverall Expiry.
- RadioNetworkLayer_TS1RelocPrepExpiry - Radio Network Layer TS1 Reloc Prep Expiry - S1AP Radio Network Layer cause TS1RelocPrep Expiry.
- RadioNetworkLayer_CellNotAvailable - Radio Network Layer Cell Not Available - S1AP Radio Network Layer cause Cell Not Available.
- RadioNetworkLayer_UnknownTargetId - Radio Network Layer Unknown Target Id - S1AP Radio Network Layer cause Unknown Target Id.

- **RadioNetworkLayer_NoRadioResourcesAvailableInTargetCell** - Radio Network Layer No Resources Available in Target Cell - S1AP Radio Network Layer cause No Resources Available in Target Cell.
- **RadioNetworkLayer_UnknownOrAlreadyAllocatedMmeUeS1apId** - Radio Network Layer Unknown or Already Allocated MME UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated MME UE S1AP ID.
- **RadioNetworkLayer_UnknownOrAlreadyAllocatedEnbUeS1apId** - Radio Network Layer Unknown or Already Allocated eNB UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated eNB UE S1AP ID.
- **RadioNetworkLayer_UnknownOrInconsistentPairOfUeS1apId** - Radio Network Layer Unknown or Inconsistent Pair of S1AP UE ID - S1AP Radio Network Layer cause Unknown or inconsistent pair of S1AP UE ID.
- **RadioNetworkLayer_HandoverDesirableForRadioReasons** - Radio Network Layer Handover Desirable for Radio Reasons - S1AP Radio Network Layer cause Handover desirable for radio reasons.
- **RadioNetworkLayer_TimeCriticalHandover** - Radio Network Layer Time Critical Handover - S1AP Radio Network Layer cause Time critical handover.
- **RadioNetworkLayer_ResourceOptimisationHandover** - Radio Network Layer Resource Optimisation Handover - S1AP Radio Network Layer cause Resource optimisation handover.
- **RadioNetworkLayer_ReduceLoadInServingCell** - Radio Network Layer Reduce Load in Serving Cell - S1AP Radio Network Layer cause Reduce load in serving cell.
- **RadioNetworkLayer_UserInactivity** - Radio Network Layer User Inactivity - S1AP Radio Network Layer cause User Inactivity.
- **RadioNetworkLayer_RadioConnectionWithUeLost** - Radio Network Layer Radio Connection with UE Lost - S1AP Radio Network Layer cause Radio Connection With UE Lost.
- **RadioNetworkLayer_LoadBalancingTauRequired** - Radio Network Layer Load Balancing TAU Required - S1AP Radio Network Layer cause Load Balancing TAU Required.
- **RadioNetworkLayer_CsFallbackTriggered** - Radio Network Layer CS Fallback Triggered - S1AP Radio Network Layer cause CS Fallback Triggered.
- **RadioNetworkLayer_UeNotAvailableForPsService** - Radio Network Layer UE Not Available for PS Service - S1AP Radio Network Layer cause UE Not Available For PS Service.
- **RadioNetworkLayer_RadioResourcesNotAvailable** - Radio Network Layer Radio Resources Not Available - S1AP Radio Network Layer cause Radio resources not available.
- **RadioNetworkLayer_FailureInTheRadioInterfaceProcedure** - Radio Network Layer Failure in the Radio Interface Procedure - S1AP Radio Network Layer cause Failure in the Radio Interface Procedure.

- **RadioNetworkLayer_InvalidQosCombination** - Radio Network Layer Invalid QoS Combination - S1AP Radio Network Layer cause Invalid QoS combination.
- **RadioNetworkLayer_InterRatRedirection** - Radio Network Layer Inter-RAT Redirection - S1AP Radio Network Layer cause Inter-RAT redirection.
- **RadioNetworkLayer_InteractionWithOtherProcedure** - Radio Network Layer Interaction with Other Procedure - S1AP Radio Network Layer cause Interaction with other procedure.
- **RadioNetworkLayer_UnknownErabId** - Radio Network Layer Unknown E-RAB ID - S1AP Radio Network Layer cause Unknown E-RAB ID.
- **RadioNetworkLayer_MultipleErabIdInstances** - Radio Network Layer Multiple E-RAB ID Instances - S1AP Radio Network Layer cause Multiple E-RAB ID instances.
- **RadioNetworkLayer_EncryptionAndOrIntegrityProtectionAlgorithmsNotSupported** - Radio Network Layer Encryption and/or Integrity Protection Algorithms Not Supported - S1AP Radio Network Layer cause Encryption and/or Integrity protection algorithms not supported.
- **RadioNetworkLayer_S1IntraSystemhandoverTriggered** - Radio Network Layer S1 Intra System Handover Triggered - S1AP Radio Network Layer cause S1 intra system Handover triggered.
- **RadioNetworkLayer_S1InterSystemHandoverTriggered** - Radio Network Layer S1 Inter System Handover Triggered - S1AP Radio Network Layer cause S1 inter system Handover triggered.
- **RadioNetworkLayer_x2HandoverTriggered** - Radio Network Layer X2 Handover Triggered - S1AP Radio Network Layer cause X2 Handover triggered.
- **RadioNetworkLayer_redirectionTowards1xRtt** - Radio Network Layer Redirection Towards 1xRTT - S1AP Radio Network Layer cause Redirection towards 1xRTT.
- **RadioNetworkLayer_NotSupportedQciValue** - Radio Network Layer Not Supported QCI Value - S1AP Radio Network Layer cause Not Supported QCI Value.
- **RadioNetworkLayer_InvalidCsgId** - Radio Network Layer Invalid CSG Id - S1AP Radio Network Layer cause Invalid CSG Id.
- **RadioNetworkLayer_ReleaseDueToPreEmption** - Radio Network Layer Release Due to Pre-Emption - S1AP Radio Network Layer cause Release due to Pre-Emption.
- **RadioNetworkLayer_N26InterfaceNotAvailable** - Radio Network Layer N26 Interface Not Available - S1AP Radio Network Layer cause N26 interface not available.
- **TransportLayer_TransportResourceUnavailable** - Transport Layer Transport Resource Unavailable - S1AP Transport Layer cause Transport Resource Unavailable.
- **TransportLayer_Unspecified** - Transport Layer Unspecified - S1AP Transport Layer cause Unspecified.
- **Nas_NormalRelease** - NAS Normal Release - S1AP NAS cause Normal Release.

- Nas_AuthenticationFailure - NAS Authentication Failure - S1AP NAS cause Authentication failure.
- Nas_Detach - NAS Detach - S1AP NAS cause Detach.
- Nas_Unspecified - NAS Unspecified - S1AP NAS cause Unspecified.
- Nas_CsgSubscriptionExpiry - NAS CSG Subscription Expiry - S1AP NAS cause CSG Subscription Expiry.
- Protocol_TransferSyntaxError - Protocol Transfer Syntax Error - S1AP Protocol cause Transfer Syntax Error.
- Protocol_AbstractSyntaxErrorReject - Protocol Abstract Syntax Error (Reject) - S1AP Protocol cause Abstract Syntax Error (Reject).
- Protocol_AbstractSyntaxErrorIgnoreAndNotify - Protocol Abstract Syntax Error (Ignore and Notify) - S1AP Protocol cause Abstract Syntax Error (Ignore and Notify).
- Protocol_MessageNotCompatibleWithReceiverState - Protocol Message Not Compatible with Receiver State - S1AP Protocol cause Message not Compatible with Receiver State.
- Protocol_SemanticError - Protocol Semantic Error - S1AP Protocol cause Semantic Error.
- Protocol_AbstractSyntaxErrorFalselyConstructedMessage - Protocol Abstract Syntax Error (Falsely Constructed Message) - S1AP Protocol cause Abstract Syntax Error (Falsely Constructed Message).
- Protocol_Unspecified - Protocol Unspecified - S1AP Protocol cause Unspecified.
- Miscellaneous_ControlProcessingOverload - Miscellaneous Control Processing Overload - S1AP Miscellaneous cause Control Processing Overload.
- Miscellaneous_NotEnoughUserPlaneProcessingResources - Miscellaneous Not Enough User Plane Processing Resources - S1AP Miscellaneous cause Not enough User Plane Processing Resources.
- Miscellaneous_HardwareFailure - Miscellaneous Hardware Failure - S1AP Miscellaneous cause Hardware Failure.
- Miscellaneous_OmIntervention - Miscellaneous O&M Intervention - S1AP Miscellaneous cause O&M Intervention.
- Miscellaneous_Unspecified - Miscellaneous Unspecified - S1AP Miscellaneous cause Unspecified.
- Miscellaneous_UnknownPlmn - Miscellaneous Unknown PLMN - S1AP Miscellaneous cause Unknown PLMN.

Default

Disabled

NameueCtxRelUnsupportedFeatureRestriction - UE Context Release Command Roaming
Restricted Due to Unsupported Features

Syntax

--ueCtxRelUnsupportedFeatureRestriction <list-item>

Description

S1AP cause code to include on UE context release command when the procedure is rejected because of unsupported feature restrictions.

Class

Optional.

List

- Disabled - The feature is disabled in the corresponding scenario. The MME does not override the S1AP cause code.
- RadioNetworkLayer_Unspecified - Radio Network Layer Unspecified - S1AP Radio Network Layer cause Unspecified.
- RadioNetworkLayer_TX2RelocOverallExpiry - Radio Network Layer TX2 Reloc Overall Expiry - S1AP Radio Network Layer cause TX2 Reloc Overall Expiry.
- RadioNetworkLayer_SuccessfulHandover - Radio Network Layer Successful Handover - S1AP Radio Network Layer cause Successful Handover.
- RadioNetworkLayer_ReleaseDueToEutranGeneratedReason - Radio Network Layer Release Due to E-UTRAN Generated Reason - S1AP Radio Network Layer cause Release Due to E-UTRAN Generated Reason.
- RadioNetworkLayer_HandoverCancelled - Radio Network Layer Handover Cancelled - S1AP Radio Network Layer cause Handover Cancelled.
- RadioNetworkLayer_PartialHandover - Radio Network Layer Partial Handover - S1AP Radio Network Layer cause Partial Handover.
- RadioNetworkLayer_HandoverFailureInTargetEpcEnbOrTargetSystem - Radio Network Layer Handover Failure in Target EPC/eNB or Target System - S1AP Radio Network Layer cause Handover Failure In Target EPC/eNB or Target System.
- RadioNetworkLayer_HandoverTargetNotAllowed - Radio Network Layer Handover Target Not Allowed - S1AP Radio Network Layer cause Handover Target not allowed.
- RadioNetworkLayer_TS1RelocOverallExpiry - Radio Network Layer TS1 Reloc Overall Expiry - S1AP Radio Network Layer cause TS1Relocoverall Expiry.
- RadioNetworkLayer_TS1RelocPrepExpiry - Radio Network Layer TS1 Reloc Prep Expiry - S1AP Radio Network Layer cause TS1RelocPrep Expiry.
- RadioNetworkLayer_CellNotAvailable - Radio Network Layer Cell Not Available - S1AP Radio Network Layer cause Cell Not Available.
- RadioNetworkLayer_UnknownTargetId - Radio Network Layer Unknown Target Id - S1AP Radio Network Layer cause Unknown Target Id.

- **RadioNetworkLayer_NoRadioResourcesAvailableInTargetCell** - Radio Network Layer No Resources Available in Target Cell - S1AP Radio Network Layer cause No Resources Available in Target Cell.
- **RadioNetworkLayer_UnknownOrAlreadyAllocatedMmeUeS1apId** - Radio Network Layer Unknown or Already Allocated MME UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated MME UE S1AP ID.
- **RadioNetworkLayer_UnknownOrAlreadyAllocatedEnbUeS1apId** - Radio Network Layer Unknown or Already Allocated eNB UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated eNB UE S1AP ID.
- **RadioNetworkLayer_UnknownOrInconsistentPairOfUeS1apId** - Radio Network Layer Unknown or Inconsistent Pair of S1AP UE ID - S1AP Radio Network Layer cause Unknown or inconsistent pair of S1AP UE ID.
- **RadioNetworkLayer_HandoverDesirableForRadioReasons** - Radio Network Layer Handover Desirable for Radio Reasons - S1AP Radio Network Layer cause Handover desirable for radio reasons.
- **RadioNetworkLayer_TimeCriticalHandover** - Radio Network Layer Time Critical Handover - S1AP Radio Network Layer cause Time critical handover.
- **RadioNetworkLayer_ResourceOptimisationHandover** - Radio Network Layer Resource Optimisation Handover - S1AP Radio Network Layer cause Resource optimisation handover.
- **RadioNetworkLayer_ReduceLoadInServingCell** - Radio Network Layer Reduce Load in Serving Cell - S1AP Radio Network Layer cause Reduce load in serving cell.
- **RadioNetworkLayer_UserInactivity** - Radio Network Layer User Inactivity - S1AP Radio Network Layer cause User Inactivity.
- **RadioNetworkLayer_RadioConnectionWithUeLost** - Radio Network Layer Radio Connection with UE Lost - S1AP Radio Network Layer cause Radio Connection With UE Lost.
- **RadioNetworkLayer_LoadBalancingTauRequired** - Radio Network Layer Load Balancing TAU Required - S1AP Radio Network Layer cause Load Balancing TAU Required.
- **RadioNetworkLayer_CsFallbackTriggered** - Radio Network Layer CS Fallback Triggered - S1AP Radio Network Layer cause CS Fallback Triggered.
- **RadioNetworkLayer_UeNotAvailableForPsService** - Radio Network Layer UE Not Available for PS Service - S1AP Radio Network Layer cause UE Not Available For PS Service.
- **RadioNetworkLayer_RadioResourcesNotAvailable** - Radio Network Layer Radio Resources Not Available - S1AP Radio Network Layer cause Radio resources not available.
- **RadioNetworkLayer_FailureInTheRadioInterfaceProcedure** - Radio Network Layer Failure in the Radio Interface Procedure - S1AP Radio Network Layer cause Failure in the Radio Interface Procedure.

- **RadioNetworkLayer_InvalidQoSCombination** - Radio Network Layer Invalid QoS Combination - S1AP Radio Network Layer cause Invalid QoS combination.
- **RadioNetworkLayer_InterRatRedirection** - Radio Network Layer Inter-RAT Redirection - S1AP Radio Network Layer cause Inter-RAT redirection.
- **RadioNetworkLayer_InteractionWithOtherProcedure** - Radio Network Layer Interaction with Other Procedure - S1AP Radio Network Layer cause Interaction with other procedure.
- **RadioNetworkLayer_UnknownEranId** - Radio Network Layer Unknown E-RAB ID - S1AP Radio Network Layer cause Unknown E-RAB ID.
- **RadioNetworkLayer_MultipleEranIdInstances** - Radio Network Layer Multiple E-RAB ID Instances - S1AP Radio Network Layer cause Multiple E-RAB ID instances.
- **RadioNetworkLayer_EncryptionAndOrIntegrityProtectionAlgorithmsNotSupported** - Radio Network Layer Encryption and/or Integrity Protection Algorithms Not Supported - S1AP Radio Network Layer cause Encryption and/or Integrity protection algorithms not supported.
- **RadioNetworkLayer_S1IntraSystemHandoverTriggered** - Radio Network Layer S1 Intra System Handover Triggered - S1AP Radio Network Layer cause S1 intra system Handover triggered.
- **RadioNetworkLayer_S1InterSystemHandoverTriggered** - Radio Network Layer S1 Inter System Handover Triggered - S1AP Radio Network Layer cause S1 inter system Handover triggered.
- **RadioNetworkLayer_x2HandoverTriggered** - Radio Network Layer X2 Handover Triggered - S1AP Radio Network Layer cause X2 Handover triggered.
- **RadioNetworkLayer_redirectionTowards1xRtt** - Radio Network Layer Redirection Towards 1xRTT - S1AP Radio Network Layer cause Redirection towards 1xRTT.
- **RadioNetworkLayer_NotSupportedQciValue** - Radio Network Layer Not Supported QCI Value - S1AP Radio Network Layer cause Not Supported QCI Value.
- **RadioNetworkLayer_InvalidCsgId** - Radio Network Layer Invalid CSG Id - S1AP Radio Network Layer cause Invalid CSG Id.
- **RadioNetworkLayer_ReleaseDueToPreEmption** - Radio Network Layer Release Due to Pre-Emption - S1AP Radio Network Layer cause Release due to Pre-Emption.
- **RadioNetworkLayer_N26InterfaceNotAvailable** - Radio Network Layer N26 Interface Not Available - S1AP Radio Network Layer cause N26 interface not available.
- **TransportLayer_TransportResourceUnavailable** - Transport Layer Transport Resource Unavailable - S1AP Transport Layer cause Transport Resource Unavailable.
- **TransportLayer_Unspecified** - Transport Layer Unspecified - S1AP Transport Layer cause Unspecified.
- **Nas_NormalRelease** - NAS Normal Release - S1AP NAS cause Normal Release.

- Nas_AuthenticationFailure - NAS Authentication Failure - S1AP NAS cause Authentication failure.
- Nas_Detach - NAS Detach - S1AP NAS cause Detach.
- Nas_Unspecified - NAS Unspecified - S1AP NAS cause Unspecified.
- Nas_CsgSubscriptionExpiry - NAS CSG Subscription Expiry - S1AP NAS cause CSG Subscription Expiry.
- Protocol_TransferSyntaxError - Protocol Transfer Syntax Error - S1AP Protocol cause Transfer Syntax Error.
- Protocol_AbstractSyntaxErrorReject - Protocol Abstract Syntax Error (Reject) - S1AP Protocol cause Abstract Syntax Error (Reject).
- Protocol_AbstractSyntaxErrorIgnoreAndNotify - Protocol Abstract Syntax Error (Ignore and Notify) - S1AP Protocol cause Abstract Syntax Error (Ignore and Notify).
- Protocol_MessageNotCompatibleWithReceiverState - Protocol Message Not Compatible with Receiver State - S1AP Protocol cause Message not Compatible with Receiver State.
- Protocol_SemanticError - Protocol Semantic Error - S1AP Protocol cause Semantic Error.
- Protocol_AbstractSyntaxErrorFalselyConstructedMessage - Protocol Abstract Syntax Error (Falsely Constructed Message) - S1AP Protocol cause Abstract Syntax Error (Falsely Constructed Message).
- Protocol_Unspecified - Protocol Unspecified - S1AP Protocol cause Unspecified.
- Miscellaneous_ControlProcessingOverload - Miscellaneous Control Processing Overload - S1AP Miscellaneous cause Control Processing Overload.
- Miscellaneous_NotEnoughUserPlaneProcessingResources - Miscellaneous Not Enough User Plane Processing Resources - S1AP Miscellaneous cause Not enough User Plane Processing Resources.
- Miscellaneous_HardwareFailure - Miscellaneous Hardware Failure - S1AP Miscellaneous cause Hardware Failure.
- Miscellaneous_OmIntervention - Miscellaneous O&M Intervention - S1AP Miscellaneous cause O&M Intervention.
- Miscellaneous_Unspecified - Miscellaneous Unspecified - S1AP Miscellaneous cause Unspecified.
- Miscellaneous_UnknownPlmn - Miscellaneous Unknown PLMN - S1AP Miscellaneous cause Unknown PLMN.

Default

Disabled

Name

ueCtxRelVdpForbiddenArea - UE Context Release Command VDP Forbidden Area

Syntax

--ueCtxtRelVdpForbiddenArea <list-item>

Description

S1AP cause code to include on UE context release command when the MME releases the S1 connection after the MME has rejected the UE Attach, TAU or X2 Handover attempt due to the UE/eNB attempting to access a restricted area defined as part of the VDP Profile or VDP Range Services provisioning for this UE.

Class

Optional.

List

- Disabled - The feature is disabled in the corresponding scenario. The MME does not override the S1AP cause code.
- RadioNetworkLayer_Unspecified - Radio Network Layer Unspecified - S1AP Radio Network Layer cause Unspecified.
- RadioNetworkLayer_TX2RelocOverallExpiry - Radio Network Layer TX2 Reloc Overall Expiry - S1AP Radio Network Layer cause TX2 Reloc Overall Expiry.
- RadioNetworkLayer_SuccessfulHandover - Radio Network Layer Successful Handover - S1AP Radio Network Layer cause Successful Handover.
- RadioNetworkLayer_ReleaseDueToEutranGeneratedReason - Radio Network Layer Release Due to E-UTRAN Generated Reason - S1AP Radio Network Layer cause Release Due to E-UTRAN Generated Reason.
- RadioNetworkLayer_HandoverCancelled - Radio Network Layer Handover Cancelled - S1AP Radio Network Layer cause Handover Cancelled.
- RadioNetworkLayer_PartialHandover - Radio Network Layer Partial Handover - S1AP Radio Network Layer cause Partial Handover.
- RadioNetworkLayer_HandoverFailureInTargetEpcEnbOrTargetSystem - Radio Network Layer Handover Failure in Target EPC/eNB or Target System - S1AP Radio Network Layer cause Handover Failure In Target EPC/eNB or Target System.
- RadioNetworkLayer_HandoverTargetNotAllowed - Radio Network Layer Handover Target Not Allowed - S1AP Radio Network Layer cause Handover Target not allowed.
- RadioNetworkLayer_TS1RelocOverallExpiry - Radio Network Layer TS1 Reloc Overall Expiry - S1AP Radio Network Layer cause TS1Relocoverall Expiry.
- RadioNetworkLayer_TS1RelocPrepExpiry - Radio Network Layer TS1 Reloc Prep Expiry - S1AP Radio Network Layer cause TS1RelocPrep Expiry.
- RadioNetworkLayer_CellNotAvailable - Radio Network Layer Cell Not Available - S1AP Radio Network Layer cause Cell Not Available.

- **RadioNetworkLayer_UnknownTargetId** - Radio Network Layer Unknown Target Id - S1AP Radio Network Layer cause Unknown Target Id.
- **RadioNetworkLayer_NoRadioResourcesAvailableInTargetCell** - Radio Network Layer No Resources Available in Target Cell - S1AP Radio Network Layer cause No Resources Available in Target Cell.
- **RadioNetworkLayer_UnknownOrAlreadyAllocatedMmeUeS1apId** - Radio Network Layer Unknown or Already Allocated MME UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated MME UE S1AP ID.
- **RadioNetworkLayer_UnknownOrAlreadyAllocatedEnbUeS1apId** - Radio Network Layer Unknown or Already Allocated eNB UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated eNB UE S1AP ID.
- **RadioNetworkLayer_UnknownOrInconsistentPairOfUeS1apId** - Radio Network Layer Unknown or Inconsistent Pair of S1AP UE ID - S1AP Radio Network Layer cause Unknown or inconsistent pair of S1AP UE ID.
- **RadioNetworkLayer_HandoverDesirableForRadioReasons** - Radio Network Layer Handover Desirable for Radio Reasons - S1AP Radio Network Layer cause Handover desirable for radio reasons.
- **RadioNetworkLayer_TimeCriticalHandover** - Radio Network Layer Time Critical Handover - S1AP Radio Network Layer cause Time critical handover.
- **RadioNetworkLayer_ResourceOptimisationHandover** - Radio Network Layer Resource Optimisation Handover - S1AP Radio Network Layer cause Resource optimisation handover.
- **RadioNetworkLayer_ReduceLoadInServingCell** - Radio Network Layer Reduce Load in Serving Cell - S1AP Radio Network Layer cause Reduce load in serving cell.
- **RadioNetworkLayer_UserInactivity** - Radio Network Layer User Inactivity - S1AP Radio Network Layer cause User Inactivity.
- **RadioNetworkLayer_RadioConnectionWithUeLost** - Radio Network Layer Radio Connection with UE Lost - S1AP Radio Network Layer cause Radio Connection With UE Lost.
- **RadioNetworkLayer_LoadBalancingTauRequired** - Radio Network Layer Load Balancing TAU Required - S1AP Radio Network Layer cause Load Balancing TAU Required.
- **RadioNetworkLayer_CsFallbackTriggered** - Radio Network Layer CS Fallback Triggered - S1AP Radio Network Layer cause CS Fallback Triggered.
- **RadioNetworkLayer_UeNotAvailableForPsService** - Radio Network Layer UE Not Available for PS Service - S1AP Radio Network Layer cause UE Not Available For PS Service.
- **RadioNetworkLayer_RadioResourcesNotAvailable** - Radio Network Layer Radio Resources Not Available - S1AP Radio Network Layer cause Radio resources not available.

- **RadioNetworkLayer_FailureInTheRadioInterfaceProcedure** - Radio Network Layer Failure in the Radio Interface Procedure - S1AP Radio Network Layer cause Failure in the Radio Interface Procedure.
- **RadioNetworkLayer_InvalidQosCombination** - Radio Network Layer Invalid QoS Combination - S1AP Radio Network Layer cause Invalid QoS combination.
- **RadioNetworkLayer_InterRatRedirection** - Radio Network Layer Inter-RAT Redirection - S1AP Radio Network Layer cause Inter-RAT redirection.
- **RadioNetworkLayer_InteractionWithOtherProcedure** - Radio Network Layer Interaction with Other Procedure - S1AP Radio Network Layer cause Interaction with other procedure.
- **RadioNetworkLayer_UnknownErbId** - Radio Network Layer Unknown E-RAB ID - S1AP Radio Network Layer cause Unknown E-RAB ID.
- **RadioNetworkLayer_MultipleErbIdInstances** - Radio Network Layer Multiple E-RAB ID Instances - S1AP Radio Network Layer cause Multiple E-RAB ID instances.
- **RadioNetworkLayer_EncryptionAndOrIntegrityProtectionAlgorithmsNotSupported** - Radio Network Layer Encryption and/or Integrity Protection Algorithms Not Supported - S1AP Radio Network Layer cause Encryption and/or Integrity protection algorithms not supported.
- **RadioNetworkLayer_S1IntraSystemHandoverTriggered** - Radio Network Layer S1 Intra System Handover Triggered - S1AP Radio Network Layer cause S1 intra system Handover triggered.
- **RadioNetworkLayer_S1InterSystemHandoverTriggered** - Radio Network Layer S1 Inter System Handover Triggered - S1AP Radio Network Layer cause S1 inter system Handover triggered.
- **RadioNetworkLayer_x2HandoverTriggered** - Radio Network Layer X2 Handover Triggered - S1AP Radio Network Layer cause X2 Handover triggered.
- **RadioNetworkLayer_redirectionTowards1xRtt** - Radio Network Layer Redirection Towards 1xRTT - S1AP Radio Network Layer cause Redirection towards 1xRTT.
- **RadioNetworkLayer_NotSupportedQciValue** - Radio Network Layer Not Supported QCI Value - S1AP Radio Network Layer cause Not Supported QCI Value.
- **RadioNetworkLayer_InvalidCsgId** - Radio Network Layer Invalid CSG Id - S1AP Radio Network Layer cause Invalid CSG Id.
- **RadioNetworkLayer_ReleaseDueToPreEmption** - Radio Network Layer Release Due to Pre-Emption - S1AP Radio Network Layer cause Release due to Pre-Emption.
- **RadioNetworkLayer_N26InterfaceNotAvailable** - Radio Network Layer N26 Interface Not Available - S1AP Radio Network Layer cause N26 interface not available.
- **TransportLayer_TransportResourceUnavailable** - Transport Layer Transport Resource Unavailable - S1AP Transport Layer cause Transport Resource Unavailable.

- TransportLayer_Unspecified - Transport Layer Unspecified - S1AP Transport Layer cause Unspecified.
- Nas_NormalRelease - NAS Normal Release - S1AP NAS cause Normal Release.
- Nas_AuthenticationFailure - NAS Authentication Failure - S1AP NAS cause Authentication failure.
- Nas_Detach - NAS Detach - S1AP NAS cause Detach.
- Nas_Unspecified - NAS Unspecified - S1AP NAS cause Unspecified.
- Nas_CsgSubscriptionExpiry - NAS CSG Subscription Expiry - S1AP NAS cause CSG Subscription Expiry.
- Protocol_TransferSyntaxError - Protocol Transfer Syntax Error - S1AP Protocol cause Transfer Syntax Error.
- Protocol_AbstractSyntaxErrorReject - Protocol Abstract Syntax Error (Reject) - S1AP Protocol cause Abstract Syntax Error (Reject).
- Protocol_AbstractSyntaxErrorIgnoreAndNotify - Protocol Abstract Syntax Error (Ignore and Notify) - S1AP Protocol cause Abstract Syntax Error (Ignore and Notify).
- Protocol_MessageNotCompatibleWithReceiverState - Protocol Message Not Compatible with Receiver State - S1AP Protocol cause Message not Compatible with Receiver State.
- Protocol_SemanticError - Protocol Semantic Error - S1AP Protocol cause Semantic Error.
- Protocol_AbstractSyntaxErrorFalselyConstructedMessage - Protocol Abstract Syntax Error (Falsely Constructed Message) - S1AP Protocol cause Abstract Syntax Error (Falsely Constructed Message).
- Protocol_Unspecified - Protocol Unspecified - S1AP Protocol cause Unspecified.
- Miscellaneous_ControlProcessingOverload - Miscellaneous Control Processing Overload - S1AP Miscellaneous cause Control Processing Overload.
- Miscellaneous_NotEnoughUserPlaneProcessingResources - Miscellaneous Not Enough User Plane Processing Resources - S1AP Miscellaneous cause Not enough User Plane Processing Resources.
- Miscellaneous_HardwareFailure - Miscellaneous Hardware Failure - S1AP Miscellaneous cause Hardware Failure.
- Miscellaneous_OmIntervention - Miscellaneous O&M Intervention - S1AP Miscellaneous cause O&M Intervention.
- Miscellaneous_Unspecified - Miscellaneous Unspecified - S1AP Miscellaneous cause Unspecified.
- Miscellaneous_UnknownPlmn - Miscellaneous Unknown PLMN - S1AP Miscellaneous cause Unknown PLMN.

Default

Disabled

Name

ueCtxtRelWbEutranExceptLtemNotAllowed - UE Context Release Command WB-EUTRAN
Except LTE-M Not Allowed

Syntax

--ueCtxtRelWbEutranExceptLtemNotAllowed <list-item>

Description

S1AP cause code to include on UE context release command when UE is not allowed WB
EUTRAN except LTE-M access.

Class

Optional.

List

- Disabled - The feature is disabled in the corresponding scenario. The MME does not override the S1AP cause code.
- RadioNetworkLayer_Unspecified - Radio Network Layer Unspecified - S1AP Radio Network Layer cause Unspecified.
- RadioNetworkLayer_TX2RelocOverallExpiry - Radio Network Layer TX2 Reloc Overall Expiry - S1AP Radio Network Layer cause TX2 Reloc Overall Expiry.
- RadioNetworkLayer_SuccessfulHandover - Radio Network Layer Successful Handover - S1AP Radio Network Layer cause Successful Handover.
- RadioNetworkLayer_ReleaseDueToEutranGeneratedReason - Radio Network Layer Release Due to E-UTRAN Generated Reason - S1AP Radio Network Layer cause Release Due to E-UTRAN Generated Reason.
- RadioNetworkLayer_HandoverCancelled - Radio Network Layer Handover Cancelled - S1AP Radio Network Layer cause Handover Cancelled.
- RadioNetworkLayer_PartialHandover - Radio Network Layer Partial Handover - S1AP Radio Network Layer cause Partial Handover.
- RadioNetworkLayer_HandoverFailureInTargetEpcEnbOrTargetSystem - Radio Network Layer Handover Failure in Target EPC/eNB or Target System - S1AP Radio Network Layer cause Handover Failure In Target EPC/eNB or Target System.
- RadioNetworkLayer_HandoverTargetNotAllowed - Radio Network Layer Handover Target Not Allowed - S1AP Radio Network Layer cause Handover Target not allowed.
- RadioNetworkLayer_TS1RelocOverallExpiry - Radio Network Layer TS1 Reloc Overall Expiry - S1AP Radio Network Layer cause TS1Relocoverall Expiry.
- RadioNetworkLayer_TS1RelocPrepExpiry - Radio Network Layer TS1 Reloc Prep Expiry - S1AP Radio Network Layer cause TS1RelocPrep Expiry.

- **RadioNetworkLayer_CellNotAvailable** - Radio Network Layer Cell Not Available - S1AP Radio Network Layer cause Cell Not Available.
- **RadioNetworkLayer_UnknownTargetId** - Radio Network Layer Unknown Target Id - S1AP Radio Network Layer cause Unknown Target Id.
- **RadioNetworkLayer_NoRadioResourcesAvailableInTargetCell** - Radio Network Layer No Resources Available in Target Cell - S1AP Radio Network Layer cause No Resources Available in Target Cell.
- **RadioNetworkLayer_UnknownOrAlreadyAllocatedMmeUeS1apId** - Radio Network Layer Unknown or Already Allocated MME UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated MME UE S1AP ID.
- **RadioNetworkLayer_UnknownOrAlreadyAllocatedEnbUeS1apId** - Radio Network Layer Unknown or Already Allocated eNB UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated eNB UE S1AP ID.
- **RadioNetworkLayer_UnknownOrInconsistentPairOfUeS1apId** - Radio Network Layer Unknown or Inconsistent Pair of S1AP UE ID - S1AP Radio Network Layer cause Unknown or inconsistent pair of S1AP UE ID.
- **RadioNetworkLayer_HandoverDesirableForRadioReasons** - Radio Network Layer Handover Desirable for Radio Reasons - S1AP Radio Network Layer cause Handover desirable for radio reasons.
- **RadioNetworkLayer_TimeCriticalHandover** - Radio Network Layer Time Critical Handover - S1AP Radio Network Layer cause Time critical handover.
- **RadioNetworkLayer_ResourceOptimisationHandover** - Radio Network Layer Resource Optimisation Handover - S1AP Radio Network Layer cause Resource optimisation handover.
- **RadioNetworkLayer_ReduceLoadInServingCell** - Radio Network Layer Reduce Load in Serving Cell - S1AP Radio Network Layer cause Reduce load in serving cell.
- **RadioNetworkLayer_UserInactivity** - Radio Network Layer User Inactivity - S1AP Radio Network Layer cause User Inactivity.
- **RadioNetworkLayer_RadioConnectionWithUeLost** - Radio Network Layer Radio Connection with UE Lost - S1AP Radio Network Layer cause Radio Connection With UE Lost.
- **RadioNetworkLayer_LoadBalancingTauRequired** - Radio Network Layer Load Balancing TAU Required - S1AP Radio Network Layer cause Load Balancing TAU Required.
- **RadioNetworkLayer_CsFallbackTriggered** - Radio Network Layer CS Fallback Triggered - S1AP Radio Network Layer cause CS Fallback Triggered.
- **RadioNetworkLayer_UeNotAvailableForPsService** - Radio Network Layer UE Not Available for PS Service - S1AP Radio Network Layer cause UE Not Available For PS Service.

- **RadioNetworkLayer_RadioResourcesNotAvailable** - Radio Network Layer Radio Resources Not Available - S1AP Radio Network Layer cause Radio resources not available.
- **RadioNetworkLayer_FailureInTheRadioInterfaceProcedure** - Radio Network Layer Failure in the Radio Interface Procedure - S1AP Radio Network Layer cause Failure in the Radio Interface Procedure.
- **RadioNetworkLayer_InvalidQoSCombination** - Radio Network Layer Invalid QoS Combination - S1AP Radio Network Layer cause Invalid QoS combination.
- **RadioNetworkLayer_InterRatRedirection** - Radio Network Layer Inter-RAT Redirection - S1AP Radio Network Layer cause Inter-RAT redirection.
- **RadioNetworkLayer_InteractionWithOtherProcedure** - Radio Network Layer Interaction with Other Procedure - S1AP Radio Network Layer cause Interaction with other procedure.
- **RadioNetworkLayer_UnknownErabId** - Radio Network Layer Unknown E-RAB ID - S1AP Radio Network Layer cause Unknown E-RAB ID.
- **RadioNetworkLayer_MultipleErabIdInstances** - Radio Network Layer Multiple E-RAB ID Instances - S1AP Radio Network Layer cause Multiple E-RAB ID instances.
- **RadioNetworkLayer_EncryptionAndOrIntegrityProtectionAlgorithmsNotSupported** - Radio Network Layer Encryption and/or Integrity Protection Algorithms Not Supported - S1AP Radio Network Layer cause Encryption and/or Integrity protection algorithms not supported.
- **RadioNetworkLayer_S1IntraSystemhandoverTriggered** - Radio Network Layer S1 Intra System Handover Triggered - S1AP Radio Network Layer cause S1 intra system Handover triggered.
- **RadioNetworkLayer_S1InterSystemHandoverTriggered** - Radio Network Layer S1 Inter System Handover Triggered - S1AP Radio Network Layer cause S1 inter system Handover triggered.
- **RadioNetworkLayer_x2HandoverTriggered** - Radio Network Layer X2 Handover Triggered - S1AP Radio Network Layer cause X2 Handover triggered.
- **RadioNetworkLayer_redirectionTowards1xRtt** - Radio Network Layer Redirection Towards 1xRTT - S1AP Radio Network Layer cause Redirection towards 1xRTT.
- **RadioNetworkLayer_NotSupportedQciValue** - Radio Network Layer Not Supported QCI Value - S1AP Radio Network Layer cause Not Supported QCI Value.
- **RadioNetworkLayer_InvalidCsgId** - Radio Network Layer Invalid CSG Id - S1AP Radio Network Layer cause Invalid CSG Id.
- **RadioNetworkLayer_ReleaseDueToPreEmption** - Radio Network Layer Release Due to Pre-Emption - S1AP Radio Network Layer cause Release due to Pre-Emption.

- RadioNetworkLayer_N26InterfaceNotAvailable - Radio Network Layer N26 Interface Not Available - S1AP Radio Network Layer cause N26 interface not available.
- TransportLayer_TransportResourceUnavailable - Transport Layer Transport Resource Unavailable - S1AP Transport Layer cause Transport Resource Unavailable.
- TransportLayer_Unspecified - Transport Layer Unspecified - S1AP Transport Layer cause Unspecified.
- Nas_NormalRelease - NAS Normal Release - S1AP NAS cause Normal Release.
- Nas_AuthenticationFailure - NAS Authentication Failure - S1AP NAS cause Authentication failure.
- Nas_Detach - NAS Detach - S1AP NAS cause Detach.
- Nas_Unspecified - NAS Unspecified - S1AP NAS cause Unspecified.
- Nas_CsgSubscriptionExpiry - NAS CSG Subscription Expiry - S1AP NAS cause CSG Subscription Expiry.
- Protocol_TransferSyntaxError - Protocol Transfer Syntax Error - S1AP Protocol cause Transfer Syntax Error.
- Protocol_AbstractSyntaxErrorReject - Protocol Abstract Syntax Error (Reject) - S1AP Protocol cause Abstract Syntax Error (Reject).
- Protocol_AbstractSyntaxErrorIgnoreAndNotify - Protocol Abstract Syntax Error (Ignore and Notify) - S1AP Protocol cause Abstract Syntax Error (Ignore and Notify).
- Protocol_MessageNotCompatibleWithReceiverState - Protocol Message Not Compatible with Receiver State - S1AP Protocol cause Message not Compatible with Receiver State.
- Protocol_SemanticError - Protocol Semantic Error - S1AP Protocol cause Semantic Error.
- Protocol_AbstractSyntaxErrorFalselyConstructedMessage - Protocol Abstract Syntax Error (Falsely Constructed Message) - S1AP Protocol cause Abstract Syntax Error (Falsely Constructed Message).
- Protocol_Unspecified - Protocol Unspecified - S1AP Protocol cause Unspecified.
- Miscellaneous_ControlProcessingOverload - Miscellaneous Control Processing Overload - S1AP Miscellaneous cause Control Processing Overload.
- Miscellaneous_NotEnoughUserPlaneProcessingResources - Miscellaneous Not Enough User Plane Processing Resources - S1AP Miscellaneous cause Not enough User Plane Processing Resources.
- Miscellaneous_HardwareFailure - Miscellaneous Hardware Failure - S1AP Miscellaneous cause Hardware Failure.
- Miscellaneous_OmIntervention - Miscellaneous O&M Intervention - S1AP Miscellaneous cause O&M Intervention.

- Miscellaneous_Unspecified - Miscellaneous Unspecified - S1AP Miscellaneous cause Unspecified.
- Miscellaneous_UnknownPlmn - Miscellaneous Unknown PLMN - S1AP Miscellaneous cause Unknown PLMN.

Default

Disabled

Name

ueCtxtRelWithoutSmsGrpId - UE Context Release Command Without SMS Group ID

Syntax

- ueCtxtRelWithoutSmsGrpId <list-item>

Description

S1AP cause code to include on UE context release command when MME rejects attach or TAU request without SMS indication when bit 0 of local-group-id AVP is set to indicate that UE must indicate SMS request.

Class

Optional.

List

- Disabled - The feature is disabled in the corresponding scenario. The MME does not override the S1AP cause code.
- RadioNetworkLayer_Unspecified - Radio Network Layer Unspecified - S1AP Radio Network Layer cause Unspecified.
- RadioNetworkLayer_TX2RelocOverallExpiry - Radio Network Layer TX2 Reloc Overall Expiry - S1AP Radio Network Layer cause TX2 Reloc Overall Expiry.
- RadioNetworkLayer_SuccessfulHandover - Radio Network Layer Successful Handover - S1AP Radio Network Layer cause Successful Handover.
- RadioNetworkLayer_ReleaseDueToEutranGeneratedReason - Radio Network Layer Release Due to E-UTRAN Generated Reason - S1AP Radio Network Layer cause Release Due to E-UTRAN Generated Reason.
- RadioNetworkLayer_HandoverCancelled - Radio Network Layer Handover Cancelled - S1AP Radio Network Layer cause Handover Cancelled.
- RadioNetworkLayer_PartialHandover - Radio Network Layer Partial Handover - S1AP Radio Network Layer cause Partial Handover.
- RadioNetworkLayer_HandoverFailureInTargetEpcEnbOrTargetSystem - Radio Network Layer Handover Failure in Target EPC/eNB or Target System - S1AP Radio Network Layer cause Handover Failure In Target EPC/eNB or Target System.
- RadioNetworkLayer_HandoverTargetNotAllowed - Radio Network Layer Handover Target Not Allowed - S1AP Radio Network Layer cause Handover Target not allowed.

- **RadioNetworkLayer_TS1RelocOverallExpiry** - Radio Network Layer TS1 Reloc Overall Expiry - S1AP Radio Network Layer cause TS1Relocoverall Expiry.
- **RadioNetworkLayer_TS1RelocPrepExpiry** - Radio Network Layer TS1 Reloc Prep Expiry - S1AP Radio Network Layer cause TS1RelocPrep Expiry.
- **RadioNetworkLayer_CellNotAvailable** - Radio Network Layer Cell Not Available - S1AP Radio Network Layer cause Cell Not Available.
- **RadioNetworkLayer_UnknownTargetId** - Radio Network Layer Unknown Target Id - S1AP Radio Network Layer cause Unknown Target Id.
- **RadioNetworkLayer_NoRadioResourcesAvailableInTargetCell** - Radio Network Layer No Resources Available in Target Cell - S1AP Radio Network Layer cause No Resources Available in Target Cell.
- **RadioNetworkLayer_UnknownOrAlreadyAllocatedMmeUeS1apId** - Radio Network Layer Unknown or Already Allocated MME UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated MME UE S1AP ID.
- **RadioNetworkLayer_UnknownOrAlreadyAllocatedEnbUeS1apId** - Radio Network Layer Unknown or Already Allocated eNB UE S1AP ID - S1AP Radio Network Layer cause Unknown or already allocated eNB UE S1AP ID.
- **RadioNetworkLayer_UnknownOrInconsistentPairOfUeS1apId** - Radio Network Layer Unknown or Inconsistent Pair of S1AP UE ID - S1AP Radio Network Layer cause Unknown or inconsistent pair of S1AP UE ID.
- **RadioNetworkLayer_HandoverDesirableForRadioReasons** - Radio Network Layer Handover Desirable for Radio Reasons - S1AP Radio Network Layer cause Handover desirable for radio reasons.
- **RadioNetworkLayer_TimeCriticalHandover** - Radio Network Layer Time Critical Handover - S1AP Radio Network Layer cause Time critical handover.
- **RadioNetworkLayer_ResourceOptimisationHandover** - Radio Network Layer Resource Optimisation Handover - S1AP Radio Network Layer cause Resource optimisation handover.
- **RadioNetworkLayer_ReduceLoadInServingCell** - Radio Network Layer Reduce Load in Serving Cell - S1AP Radio Network Layer cause Reduce load in serving cell.
- **RadioNetworkLayer_UserInactivity** - Radio Network Layer User Inactivity - S1AP Radio Network Layer cause User Inactivity.
- **RadioNetworkLayer_RadioConnectionWithUeLost** - Radio Network Layer Radio Connection with UE Lost - S1AP Radio Network Layer cause Radio Connection With UE Lost.
- **RadioNetworkLayer_LoadBalancingTauRequired** - Radio Network Layer Load Balancing TAU Required - S1AP Radio Network Layer cause Load Balancing TAU Required.

- RadioNetworkLayer_CsFallbackTriggered - Radio Network Layer CS Fallback Triggered - S1AP Radio Network Layer cause CS Fallback Triggered.
- RadioNetworkLayer_UeNotAvailableForPsService - Radio Network Layer UE Not Available for PS Service - S1AP Radio Network Layer cause UE Not Available For PS Service.
- RadioNetworkLayer_RadioResourcesNotAvailable - Radio Network Layer Radio Resources Not Available - S1AP Radio Network Layer cause Radio resources not available.
- RadioNetworkLayer_FailureInTheRadioInterfaceProcedure - Radio Network Layer Failure in the Radio Interface Procedure - S1AP Radio Network Layer cause Failure in the Radio Interface Procedure.
- RadioNetworkLayer_InvalidQosCombination - Radio Network Layer Invalid QoS Combination - S1AP Radio Network Layer cause Invalid QoS combination.
- RadioNetworkLayer_InterRatRedirection - Radio Network Layer Inter-RAT Redirection - S1AP Radio Network Layer cause Inter-RAT redirection.
- RadioNetworkLayer_InteractionWithOtherProcedure - Radio Network Layer Interaction with Other Procedure - S1AP Radio Network Layer cause Interaction with other procedure.
- RadioNetworkLayer_UnknownErabId - Radio Network Layer Unknown E-RAB ID - S1AP Radio Network Layer cause Unknown E-RAB ID.
- RadioNetworkLayer_MultipleErabIdInstances - Radio Network Layer Multiple E-RAB ID Instances - S1AP Radio Network Layer cause Multiple E-RAB ID instances.
- RadioNetworkLayer_EncryptionAndOrIntegrityProtectionAlgorithmsNotSupported - Radio Network Layer Encryption and/or Integrity Protection Algorithms Not Supported - S1AP Radio Network Layer cause Encryption and/or Integrity protection algorithms not supported.
- RadioNetworkLayer_S1IntraSystemhandoverTriggered - Radio Network Layer S1 Intra System Handover Triggered - S1AP Radio Network Layer cause S1 intra system Handover triggered.
- RadioNetworkLayer_S1InterSystemHandoverTriggered - Radio Network Layer S1 Inter System Handover Triggered - S1AP Radio Network Layer cause S1 inter system Handover triggered.
- RadioNetworkLayer_x2HandoverTriggered - Radio Network Layer X2 Handover Triggered - S1AP Radio Network Layer cause X2 Handover triggered.
- RadioNetworkLayer_redirectionTowards1xRtt - Radio Network Layer Redirection Towards 1xRTT - S1AP Radio Network Layer cause Redirection towards 1xRTT.
- RadioNetworkLayer_NotSupportedQciValue - Radio Network Layer Not Supported QCI Value - S1AP Radio Network Layer cause Not Supported QCI Value.

- RadioNetworkLayer_InvalidCsgId - Radio Network Layer Invalid CSG Id - S1AP Radio Network Layer cause Invalid CSG Id.
- RadioNetworkLayer_ReleaseDueToPreEmption - Radio Network Layer Release Due to Pre-Emption - S1AP Radio Network Layer cause Release due to Pre-Emption.
- RadioNetworkLayer_N26InterfaceNotAvailable - Radio Network Layer N26 Interface Not Available - S1AP Radio Network Layer cause N26 interface not available.
- TransportLayer_TransportResourceUnavailable - Transport Layer Transport Resource Unavailable - S1AP Transport Layer cause Transport Resource Unavailable.
- TransportLayer_Unspecified - Transport Layer Unspecified - S1AP Transport Layer cause Unspecified.
- Nas_NormalRelease - NAS Normal Release - S1AP NAS cause Normal Release.
- Nas_AuthenticationFailure - NAS Authentication Failure - S1AP NAS cause Authentication failure.
- Nas_Detach - NAS Detach - S1AP NAS cause Detach.
- Nas_Unspecified - NAS Unspecified - S1AP NAS cause Unspecified.
- Nas_CsgSubscriptionExpiry - NAS CSG Subscription Expiry - S1AP NAS cause CSG Subscription Expiry.
- Protocol_TransferSyntaxError - Protocol Transfer Syntax Error - S1AP Protocol cause Transfer Syntax Error.
- Protocol_AbstractSyntaxErrorReject - Protocol Abstract Syntax Error (Reject) - S1AP Protocol cause Abstract Syntax Error (Reject).
- Protocol_AbstractSyntaxErrorIgnoreAndNotify - Protocol Abstract Syntax Error (Ignore and Notify) - S1AP Protocol cause Abstract Syntax Error (Ignore and Notify).
- Protocol_MessageNotCompatibleWithReceiverState - Protocol Message Not Compatible with Receiver State - S1AP Protocol cause Message not Compatible with Receiver State.
- Protocol_SemanticError - Protocol Semantic Error - S1AP Protocol cause Semantic Error.
- Protocol_AbstractSyntaxErrorFalselyConstructedMessage - Protocol Abstract Syntax Error (Falsely Constructed Message) - S1AP Protocol cause Abstract Syntax Error (Falsely Constructed Message).
- Protocol_Unspecified - Protocol Unspecified - S1AP Protocol cause Unspecified.
- Miscellaneous_ControlProcessingOverload - Miscellaneous Control Processing Overload - S1AP Miscellaneous cause Control Processing Overload.
- Miscellaneous_NotEnoughUserPlaneProcessingResources - Miscellaneous Not Enough User Plane Processing Resources - S1AP Miscellaneous cause Not enough User Plane Processing Resources.

- **Miscellaneous_HardwareFailure** - Miscellaneous Hardware Failure - S1AP Miscellaneous cause Hardware Failure.
- **Miscellaneous_OmIntervention** - Miscellaneous O&M Intervention - S1AP Miscellaneous cause O&M Intervention.
- **Miscellaneous_Unspecified** - Miscellaneous Unspecified - S1AP Miscellaneous cause Unspecified.
- **Miscellaneous_UnknownPlmn** - Miscellaneous Unknown PLMN - S1AP Miscellaneous cause Unknown PLMN.

6.128 cmm s1ConfigUpdate

S1-MME Configuration Update. Syntax, description, parameters, and roles for **cmm s1ConfigUpdate** command.

Syntax**Description**

This command will send an S1 MME Configuration Update to single eNB when non-zero linkindex value is specified or to all eNBs when linkindex=0.

Parameters**Name**

linkIndex - Link Index

Syntax

--linkIndex <integer>

Description

This parameter is the link index of the S1mme link to the eNB that MME will send an s1ap Configuration Update message. A link index of value '0' indicates all S1mme links resulting in a Configuration Update message to all eNBs

Class

Required.

Type / Range

Integer in the range of 0 to 4,294,967,295

Roles

sysadmin, manage

6.129 cmm s1Reset

S1 Reset. Syntax, description, parameters, and roles for cmm s1Reset command.

Syntax**Description**

This command will send an S1 Reset ALL message to the specified eNB to reset all the S1 connections from that eNB to the MME.

Parameters**Name**

linkIndex - Link Index

Syntax

--linkIndex <integer>

Description

This parameter is the link index of the S1mme link to be Reset

Class

Required.

Type / Range

Integer in the range of 0 to 4,294,967,295

Name

terminationName - TerminationName

Syntax

--terminationName <string>

Description

Termination Name. This is used for s1mme alone. This field is part of input for optional key fields. This field cannot be updated.

Class

Optional.

Type / Range

Digit string of length 0 or 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Roles

sysadmin, manage

6.130 cmm sbiChainedQueryConversionRule

SBI Chained Query Conversion Rule. Syntax, description, parameters, and roles for cmm sbiChainedQueryConversionRule command.

Syntax**Description**

Chained Query Conversion Rules are referenced by a single 'Operation only' and possibly multiple 'Condition only' Conversion Rules to create a Conversion rule with multiple Conditions

Parameters**Name**

name - Name

Syntax

--name <string>

Description

Chained Query Conversion Rule Name

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

6.131 cmm sbiCommunicationProfile

SBI Communication Profile. Syntax, description, parameters, and roles for cmm sbiCommunicationProfile command.

Syntax

Description

Defines the Communication Model per SBI Interface

Parameters

Name

name - Name

Syntax

--name <string>

Description

Profile name for SBI communication profile

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

amfConsumer - AMF Consumer

Syntax

--amfConsumer <list-item>

Description

SBI Communication Model to be used in the AMF Consumer interface (N14)

Class

Optional.

List

- DIRECT - Direct Communication without SCP
- INDIRECT_WITHOUT_DELEGATED_DISCOVERY - Indirect without Delegated Discovery - Indirect Communication without Delegated Discovery (Model C) where AMF selects the target Service Instance
- INDIRECT_DELEGATED_DISCOVERY - Indirect Delegated Discovery - Indirect Communication with Delegated Discovery (Model D)

Default

DIRECT

Name

ausfConsumer - AUSF Consumer

Syntax

--ausfConsumer <list-item>

Description

SBI Communication Model to be used in the AUSF Consumer interface (N12)

Class

Optional.

List

- DIRECT - Direct Communication without SCP
- INDIRECT_WITHOUT_DELEGATED_DISCOVERY - Indirect without Delegated Discovery - Indirect Communication without Delegated Discovery (Model C) where AMF selects the target Service Instance
- INDIRECT_DELEGATED_DISCOVERY - Indirect Delegated Discovery - Indirect Communication with Delegated Discovery (Model D)

Default

DIRECT

Name

communicationNotifications - Communication Notifications

Syntax

--communicationNotifications <list-item>

Description

SBI Communication Model to be used for AMF Communication Notifications.

Class

Optional.

List

- DIRECT - Direct Communication without SCP

- **INDIRECT_WITHOUT_DELEGATED_DISCOVERY** - Indirect without Delegated Discovery - Indirect Communication without Delegated Discovery (Model C) where AMF selects the target Service Instance
- **INDIRECT_DELEGATED_DISCOVERY** - Indirect Delegated Discovery - Indirect Communication with Delegated Discovery (Model D)

Default

DIRECT

Name

eir5gConsumer - EIR 5G Consumer

Syntax

--eir5gConsumer <list-item>

Description

SBI Communication Model to be used in the 5G EIR Consumer interface (N17)

Class

Optional.

List

- **DIRECT** - Direct Communication without SCP
- **INDIRECT_WITHOUT_DELEGATED_DISCOVERY** - Indirect without Delegated Discovery - Indirect Communication without Delegated Discovery (Model C) where AMF selects the target Service Instance
- **INDIRECT_DELEGATED_DISCOVERY** - Indirect Delegated Discovery - Indirect Communication with Delegated Discovery (Model D)

Default

DIRECT

Name

eventExposureNotifications - Event Exposure Notifications

Syntax

--eventExposureNotifications <list-item>

Description

SBI Communication Model to be used for AMF Event Exposure Notifications.

Class

Optional.

List

- **DIRECT** - Direct Communication without SCP

- **INDIRECT_WITHOUT_DELEGATED_DISCOVERY** - Indirect without Delegated Discovery - Indirect Communication without Delegated Discovery (Model C) where AMF selects the target Service Instance

Default

DIRECT

Name

lmfConsumer - LMF Consumer

Syntax

--lmfConsumer <list-item>

Description

SBI Communication Model to be used in the LMF Consumer interface (NL1)

Class

Optional.

List

- **DIRECT** - Direct Communication without SCP
- **INDIRECT_WITHOUT_DELEGATED_DISCOVERY** - Indirect without Delegated Discovery - Indirect Communication without Delegated Discovery (Model C) where AMF selects the target Service Instance
- **INDIRECT_DELEGATED_DISCOVERY** - Indirect Delegated Discovery - Indirect Communication with Delegated Discovery (Model D)

Default

DIRECT

Name

locationNotifications - Location Notifications

Syntax

--locationNotifications <list-item>

Description

SBI Communication Model to be used for AMF Location Notifications.

Class

Optional.

List

- **DIRECT** - Direct Communication without SCP
- **INDIRECT_WITHOUT_DELEGATED_DISCOVERY** - Indirect without Delegated Discovery - Indirect Communication without Delegated Discovery (Model C) where AMF selects the target Service Instance

- INDIRECT_DELEGATED_DISCOVERY - Indirect Delegated Discovery - Indirect Communication with Delegated Discovery (Model D)

Default

DIRECT

Name

nrfConsumer - NRF Consumer

Syntax

--nrfConsumer <list-item>

Description

SBI Communication Model to be used in the NRF Consumer interface

Class

Optional.

List

- DIRECT - Direct Communication without SCP
- INDIRECT_WITHOUT_DELEGATED_DISCOVERY - Indirect without Delegated Discovery - Indirect Communication without Delegated Discovery (Model C) where AMF selects the target Service Instance

Default

DIRECT

Name

nssaafConsumer - NSSAAF Consumer

Syntax

--nssaafConsumer <list-item>

Description

SBI Communication Model to be used in the NSSAAF Consumer interface

Class

Optional.

List

- DIRECT - Direct Communication without SCP
- INDIRECT_WITHOUT_DELEGATED_DISCOVERY - Indirect without Delegated Discovery - Indirect Communication without Delegated Discovery (Model C) where AMF selects the target Service Instance
- INDIRECT_DELEGATED_DISCOVERY - Indirect Delegated Discovery - Indirect Communication with Delegated Discovery (Model D)

Default

DIRECT

Name

nssfConsumer - NSSF Consumer

Syntax

--nssfConsumer <list-item>

Description

SBI Communication Model to be used in the NSSF Consumer interface (N22)

Class

Optional.

List

- DIRECT - Direct Communication without SCP
- INDIRECT_WITHOUT_DELEGATED_DISCOVERY - Indirect without Delegated Discovery - Indirect Communication without Delegated Discovery (Model C) where AMF selects the target Service Instance

Default

DIRECT

Name

pcfConsumer - PCF Consumer

Syntax

--pcfConsumer <list-item>

Description

SBI Communication Model to be used in the PCF Consumer interface (N15)

Class

Optional.

List

- DIRECT - Direct Communication without SCP
- INDIRECT_WITHOUT_DELEGATED_DISCOVERY - Indirect without Delegated Discovery - Indirect Communication without Delegated Discovery (Model C) where AMF selects the target Service Instance
- INDIRECT_DELEGATED_DISCOVERY - Indirect Delegated Discovery - Indirect Communication with Delegated Discovery (Model D)

Default

DIRECT

Name

sbiHttpProxySettingsProfileName - SBI HTTP Proxy Settings Profile Name

Syntax

--sbiHttpProxySettingsProfileName <string>

Description

Name of SBI HTTP Proxy Settings Profile that is applicable to the Communication Profile.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

default

Name

smfConsumer - SMF Consumer

Syntax

--smfConsumer <list-item>

Description

SBI Communication Model to be used in the SMF Consumer interface (N11)

Class

Optional.

List

- DIRECT - Direct Communication without SCP
- INDIRECT_WITHOUT_DELEGATED_DISCOVERY - Indirect without Delegated Discovery - Indirect Communication without Delegated Discovery (Model C) where AMF selects the target Service Instance
- INDIRECT_DELEGATED_DISCOVERY - Indirect Delegated Discovery - Indirect Communication with Delegated Discovery (Model D)

Default

DIRECT

Name

smsfConsumer - SMSF Consumer

Syntax

--smsfConsumer <list-item>

Description

SBI Communication Model to be used in the SMSF Consumer interface (N20)

Class

Optional.

List

- DIRECT - Direct Communication without SCP
- INDIRECT_WITHOUT_DELEGATED_DISCOVERY - Indirect without Delegated Discovery - Indirect Communication without Delegated Discovery (Model C) where AMF selects the target Service Instance
- INDIRECT_DELEGATED_DISCOVERY - Indirect Delegated Discovery - Indirect Communication with Delegated Discovery (Model D)

Default

DIRECT

Name

udmConsumer - UDM Consumer

Syntax

--udmConsumer <list-item>

Description

SBI Communication Model to be used in the UDM Consumer interface (N8)

Class

Optional.

List

- DIRECT - Direct Communication without SCP
- INDIRECT_WITHOUT_DELEGATED_DISCOVERY - Indirect without Delegated Discovery - Indirect Communication without Delegated Discovery (Model C) where AMF selects the target Service Instance
- INDIRECT_DELEGATED_DISCOVERY - Indirect Delegated Discovery - Indirect Communication with Delegated Discovery (Model D)

Default

DIRECT

6.132 cmm sbiConnectionTestUri

SBI Connection Test to URI. Syntax, description, parameters, and roles for cmm sbiConnectionTestUri command.

Syntax**Description**

This command performs a connection test by sending an HTTP Request to the target URI from the given HTTP Client Endpoint. A httpProxy may optionally be given as input parameter in order to issue the Request via indirect communication. The Response received from the remote peer is displayed in the command output.

Parameters**Name**

endPointName - Endpoint Name

Syntax

--endPointName <string>

Description

The amfConsumerLocalEndPointConfig or amfServicesEndPointConfig endPointName from which the test HTTP Request will be issued. Note: The referenced endPointName cannot be a NR10 interface.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Name

targetUri - Target URI

Syntax

--targetUri <string>

Description

The URI to which the HTTP Request message will be issued

Class

Required key.

Type / Range

Digit string of length 512 with the allowed pattern of (http:\\|https:\\)[0-9a-zA-Z\\.\\-\\~\$+*_;&=#?\\[\\]@,()\\!'%%]*

Name

connectionTestStatus - Connection Test Status

Syntax

--connectionTestStatus <string>

Description

HTTP2 status returned as response of the connection Test

Class

Read only.

Type / Range

Digit string of length 0 to 255

Default

""

Name

httpProxyName - HTTP Proxy Name

Syntax

--httpProxyName <string>

Description

When this parameter is not NULL it refers to a name of a provisioned HTTP proxy. This triggers the request to be send via Indirect communication

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\\.\\-_:@]*

Default

""

Name

requestMethod - Method

Syntax

--requestMethod <list-item>

Description

The HTTP Method of the Test Request

Class

Optional.

List

- DELETE - HTTP Method DELETE
- GET - HTTP Method GET
- OPTIONS - HTTP Method OPTIONS
- POST - HTTP Method POST
- PUT - HTTP Method PUT

Default

OPTIONS

Roles**List**

sysadmin, manage, monitor

6.133 cmm sbiCorrelationInfoGParms

SBI Correlation Info General Parameters. Syntax, description, parameters, and roles for cmm sbiCorrelationInfoGParms command.

Syntax**Description**

Configuration of 3gpp-Sbi-Correlation-Info HTTP Header handling

Parameters**Name**

amfGparmName - Parameter name

Syntax

--amfGparmName <list-item>

Description

Name of parameter

Class

Required key.

List

- includeImsi - Include IMSI - This parameter controls if AMF will add the IMSI in the 3gpp-Sbi-Correlation-Info in Requests and Responses sent by the AMF when the relevant feature is enabled

- mirrorCorrelationInfo - Mirror Correlation Info - This parameter controls if AMF will mirror all Correlation Info received in Service Requests and Subscriptions when the relevant feature is enabled
- sbiCorrelationInfoEnable - Enable - This parameter enables or disables sending 3gpp-Sbi-Correlation-Info in Requests and Responses

Name

amfGparmValue - Parameter value

Syntax

--amfGparmValue <string>

Description

Value of parameter

Class

Required on create.

Type / Range

Digit string of length 0 to 64

The amfGparmValue string is based on the amfGparmName parameter:

Name

includeImsi - Include IMSI

Syntax

--amfGparmName includeImsi --amfGparmValue <string>

Description

This parameter controls if AMF will add the IMSI in the 3gpp-Sbi-Correlation-Info in Requests and Responses sent by the AMF when the relevant feature is enabled

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

mirrorCorrelationInfo - Mirror Correlation Info

Syntax

--amfGparmName mirrorCorrelationInfo --amfGparmValue <string>

Description

This parameter controls if AMF will mirror all Correlation Info received in Service Requests and Subscriptions when the relevant feature is enabled

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

sbiCorrelationInfoEnable - Enable

Syntax

--amfGparmName sbiCorrelationInfoEnable --amfGparmValue <string>

Description

This parameter enables or disables sending 3gpp-Sbi-Correlation-Info in Requests and Responses

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

6.134 cmm sbiEnhancedLoadOverloadControl

Enhanced Load and Overload Control. Syntax, description, parameters, and roles for cmm sbiEnhancedLoadOverloadControl command.

Syntax**Description**

This command configures Enhanced Load and Overload Control related parameters related to 3gpp-sbi-oci 3gpp-sbi-lci HTTP headers

Parameters

Name

defaultLoadValueForScps - Default Load value for SCP/SEPPs

Syntax

--defaultLoadValueForScps <integer>

Description

This parameter determines the default load that is assumed for SCP/SEPPs in case no load information has previously been received via the 3gpp-sbi-lci header.

Class

Optional.

Type / Range

Integer in the range of 0 to 100

Default

0

Name

enable - Enable

Syntax

--enable <list-item>

Description

Enables or disables the Enhanced Load and Overload control functionality

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

supportNfLciRsp - Support NF LCI in Responses

Syntax

--supportNfLciRsp <list-item>

Description

This parameter controls whether 3gpp-sbi-lci header is evaluated in responses for remote NFs .

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

supportNfOciRsp - Support NF Oci in Responses

Syntax

--supportNfOciRsp <list-item>

Description

This parameter controls whether 3gpp-sbi-Oci header is evaluated in responses for remote NFs or not

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

supportScpLci - Support SCP/SEPP LCI

Syntax

--supportScpLci <list-item>

Description

This parameter controls whether 3gpp-sbi-Lci header is taken into account for SCP/SEPP Load control

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

6.135 cmm sbiHttpProxySettingsProfile

SBI HTTP Proxy Settings. Syntax, description, parameters, and roles for cmm sbiHttpProxySettingsProfile command.

Syntax

Description

This command opens the context for creating a profile for HTTP Proxy related parameters for the network. A default profile named 'default', is provided and can not be deleted.

Parameters

Name

name - Name

Syntax

--name <string>

Description

Name of the HTTP Proxy Setting Profile. A default profile named 'default' is provided

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

defaultScpFqdn - Default SCP FQDN

Syntax

--defaultScpFqdn <string>

Description

FQDN used to discover SCPs via SRV DNS Query. When the SRV FQDN is provided (i.e. is a non Null String) it replaces the SCP selection based on sbiHttpProxySettingsProfile

Class

Optional.

Type / Range

Digit string of length 0 or 1 to 128

Default

""

Name

defaultScpFqdnPrefix - defaultScpFqdnPrefix

Syntax

--defaultScpFqdnPrefix <string>

Description

Optional deployment-specific string to be pretended to the ':path' HTTP/2 pseudo-header when sending messages to a SCP discovered via SRV DNS query with the provisioned FQDN. This string is removed by the Proxy when the message is forwarded to the next hop. It is assumed that all SCP servers discovered in the profile use the same prefix

Class

Optional.

Type / Range

API Prefix as defined in 29.500. May be null otherwise shall have at least allowed character, shall not start with / and shall not end with /. When not-null, the leading / is implied and shall not be included.

Default

""

Name

defaultScpFqdnScheme - Default SCP FQDN Scheme

Syntax

--defaultScpFqdnScheme <list-item>

Description

Defines the scheme to be used when SCPs are discovered via SRV DNS query.

Class

Optional.

List

- http - The schema of Hypertext Transfer Protocol.
- https - The schema of Hypertext Transfer Protocol Secure.

Default

https

Name

defaultScpList - Default SCP HTTP Proxy List

Syntax

--defaultScpList <string>

Description

Name of the list with the http Proxies to be used by default when sending HTTP Request to target NF in own network. When the list name is provided, the AMF uses the Indirect Communication Model via SCP. When the list name is empty, the Direct Communication Model is followed.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

""

Name

defaultSeppList - Default SEPP Proxy List

Syntax

--defaultSeppList <string>

Description

Name of of the list with the http Proxies to be used when sending HTTP Request to target NF in Roamer's Home network. List must be set when Roaming is supported.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

""

Name

maxRetries - Max Retries

Syntax

--maxRetries <integer>

Description

Max number of retries to use a HTTP Proxy for indirect communication in a specific Request.

Class

Optional.

Type / Range

Integer in the range of 0 to 3

Default

0

Name

targetNfScheme - Target NF Scheme

Syntax

--targetNfScheme <list-item>

Description

HTTP scheme that should be supported by the target NF when communication is via an HTTP Proxy. Only Service instances that support the target Scheme are considered as valid candidates.

Class

Optional.

List

- both - Both HTTP/HTTPS schemes
- http - Hypertext Transfer Protocol scheme.
- https - Hypertext Transfer Protocol Secure scheme.

Default

https

6.136 cmm sbiIndirectCommunicationErrorRule

SBI Indirect Communication Error Rule. Syntax, description, parameters, and roles for cmm sbiIndirectCommunicationErrorRule command.

Syntax

Description

Defines rules for deducing the error response originator based on the received HTTP/2 status code - application error combination.

Parameters

Name

statusCode - Status Code

Syntax

--statusCode <list-item>

Description

The HTTP Status Code

Class

Required key.

List

- 400_Bad_Request - 400 Bad Request
- 401_Unauthorized - 401 Unauthorized
- 403_Forbidden - 403 Forbidden
- 404_Not_Found - 404 Not Found
- 405_Method_Not_Allowed - 405 Method Not Allowed
- 406_Not_Acceptable - 406 Not Acceptable
- 408_Request_Timeout - 408 Request Timeout
- 409_Conflict - 409 Conflict
- 410_Gone - 410 Gone
- 411_Length_Required - 411 Length Required
- 412_Precondition_Failed - 412 Precondition Failed
- 413_Payload_Too_Large - 413 Payload Too Large
- 414_URI_Too_Long - 414 URI Too Long
- 415_Unsupported_Media_Type - 415 Unsupported Media Type
- 429_Too_Many_Requests - 429 Too Many Requests
- 500_Internal_Server_Error - 500 Internal Server Error
- 501_Not_Implemented - 501 Not Implemented

- 502_Bad_Gateway - 502 Bad Gateway
- 503_Service_Unavailable - 503 Service Unavailable
- 504_Gateway_Timeout - 504 Gateway Timeout

Name

errorCause - Error Cause

Syntax

--errorCause <string>

Description

Application Error Cause value. Used to applies string match with the Cause in the response. 'NULL' string literal has special meaning and is used to match cases where Response did not include Application Error Cause

Class

Required key.

Type / Range

SBI Application Error Cause value. Digit string of length 1 to 64 with the allowed pattern of [A-Z_]*

Default

"NULL"

Name

errorOriginator - Error Originator

Syntax

--errorOriginator <list-item>

Description

The entity that produced the received SBI error response

Class

Required on create.

List

- NF - Error response originator is the NF that received the request by the AMF
- HTTP_PROXY - HTTP Proxy - Error response originator is the HTTP Proxy

Name

enable - Enable

Syntax

--enable <list-item>

Description

Controls whether the rule is enabled or disabled. User created and System inserted rules (i.e. rules automatically created by the system during initial deployment) may be enabled or disabled but only user created rules may be deleted.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

6.137 cmm sbiIndirectCommunicationGParams

SBI Indirect Communication Global Params. Syntax, description, parameters, and roles for cmm sbiIndirectCommunicationGParams command.

Syntax**Description**

This command configures Indirect Communication related parameters for AMF

Parameters**Name**

amfGparmName - Parameter Name

Syntax

--amfGparmName <list-item>

Description

Name of parameter

Class

Required key.

List

- action429 - Action 429 - Default action for 429 Status Responses
- action4xx - Action 4xx - Default action for 4XX Status class Responses
- action503 - Action 503 - Default action for 503 Status Responses
- action5xx - Action 5xx - Default action for 5XX Status class Responses
- actionTimeout - Action Timeout - Action for Timeouts
- conveyAuthDiscoveryParams - Convey oAuth Discovery Params - This parameters controls whether the AMF sends the Discovery '3gpp-Sbi-Discovery-*' headers related to oAuth in an HTTP/2 request targeting an existing resource context in the NF service producer to enable the SCP to perform the Service access authorization procedures.
- discoverSeppViaNrf - Discover SEPP Via NRF - When this parameter is set to true CMM will select the SEPP via issuing a Discovery query to the NRF. This functionality is for TEST ONLY purposes.
- enhancedErrorDetection - Enhanced Error Detection - This Parameter enables Enhanced Error detection for Indirect communication refer to the following aspects: - Support of handling Single Server header with multiple Producers. For example, Server Header may include both NF-instance and SCP-FQDN or multiple SCP-FQDNs. - Overruling the Server header logic when specific Error/application code combinations are received (e.g. NF_SERVICE_FAILOVER should be attributed to NF even if Server header includes the SCP)
- fallbackToDirectCommunication - Fallback to Direct Communication - This parameter controls if CMM will fallback to direct communication if no SCP is available. Fallback to Direct communication is not applicable in Roaming scenarios where SEPP must be used.
- fallbackToLocalSeppList - Fallback To Local Sepp List - This parameter controls if CMM will fallback to locally provisioned SEPP list in case NRF-based SEPP discovery fails.
- includeHttpServerHeaderInErrorResponses - Include HTTP Server Header In Error Responses - When this parameter is set to true, CMM inserts the HTTP Server header in Error Responses (4xx, 5xx)
- includeHttpServerHeaderInSuccessResponses - Include HTTP Server Header In Success Responses - When this parameter is set to true, CMM inserts the HTTP Server header in Success Responses (2xx)

- **isolateLastHttpProxy** - Isolate last HTTP proxy - When this parameter is set to true CMM will isolate the last available HTTP proxy even if **fallbackToDirectCommunication** parameter is disabled.
- **kpiIsolationDuration** - KPI Isolation Duration - Duration (in sec) a HTTP Proxy is Isolated due to low KPI or other reasons such as a 503 Response that indicates congestion.
- **kpiIsolationThreshold** - KPI isolation threshold - Threshold of Success/Attempts percent under which a HTTP proxy will be Isolated. Only Proxy related failures and timeouts are considered as HTTP proxy failures. Failures attributed to NFs are considered as Successes from HTTP Proxy perspective. Default value is 0 which means that Proxy are not isolated based on KPIs.
- **kpiMinSamples** - KPI Minimum Samples - Minimum number of Requests that are required in order to consider blacklisting a httpProxy based on KPI. Sample window is 10 seconds.
- **kpiSamplingPeriod** - KPI Sampling Period - Sampling Period for which response success and failures are aggregated to produce KPI for specific httpProxy.
- **nrfSubscriptionsInModelD** - Support NRF Subscriptions in Model D - When this parameter is enabled, CMM will support Subscribing to NRF for NF Profiles learned in Model D via the 3gpp-Sbi-Producer-Id
- **prefSchemeForCallbacksInModelD** - Preferred Scheme for Callbacks in Model D - When Model D is used and the SBI request contains a Callback URI for which both schemes are supported, this parameter defines which one is preferred. If only one scheme is supported it is used irrelevant of the value of this parameter
- **supportScpManagedServiceRedirects** - Support SCP Managed Service Redirects - This parameter controls if AMF evaluates the 3gpp-sbi-target-apiRoute and 3gpp-Producer-id HTTP headers added from SCP and altered HTTP Location header in subsequent Responses.
- **supportTokenCachingInModelD** - Support Token Caching in Model D - This parameter controls whether AMF supports Caching Authentication Token when conveyed back to CMM in a response via the 3gpp-Sbi-Access-Scope and 3gpp-Sbi-Access-Token Headers and sending them in relevant subsequent requests
- **unblockKpiBlockedScps** - Unblock KPI Blocked SCPs - This parameter Controls if SCPs that were isolated due to low KPI will be unblocked when no SCP is available.

Name

amfGparmValue - Parameter Value

Syntax

--amfGparmValue <string>

Description

Value of parameter

Class

Required on create.

Type / Range

Digit string of length 0 to 64

The amfGparmValue string is based on the amfGparmName parameter:

Name

action429 - Action 429

Syntax

```
--amfGparmName action429 --amfGparmValue <string>
```

Description

Default action for 429 Status Responses

List

- Isolate - Isolate the Service Instance
- KPI_Fail - KPI Fail - Increase the Failure Counter used for the Service Instance KPI
- KPI_Success - KPI Success - Increase the Success counter used for the Service Instance KPI

Default

Isolate

Name

action4xx - Action 4xx

Syntax

```
--amfGparmName action4xx --amfGparmValue <string>
```

Description

Default action for 4XX Status class Responses

List

- Isolate - Isolate the Service Instance
- KPI_Fail - KPI Fail - Increase the Failure Counter used for the Service Instance KPI
- KPI_Success - KPI Success - Increase the Success counter used for the Service Instance KPI

Default

KPI_Fail

Name

action503 - Action 503

Syntax

```
--amfGparmName action503 --amfGparmValue <string>
```

Description

Default action for 503 Status Responses

List

- Isolate - Isolate the Service Instance
- KPI_Fail - KPI Fail - Increase the Failure Counter used for the Service Instance KPI
- KPI_Success - KPI Success - Increase the Success counter used for the Service Instance KPI

Default

Isolate

Name

action5xx - Action 5xx

Syntax

--amfGparmName action5xx --amfGparmValue <string>

Description

Default action for 5XX Status class Responses

List

- Isolate - Isolate the Service Instance
- KPI_Fail - KPI Fail - Increase the Failure Counter used for the Service Instance KPI
- KPI_Success - KPI Success - Increase the Success counter used for the Service Instance KPI

Default

KPI_Fail

Name

actionTimeout - Action Timeout

Syntax

--amfGparmName actionTimeout --amfGparmValue <string>

Description

Action for Timeouts

List

- Isolate - Isolate the Service Instance
- KPI_Fail - KPI Fail - Increase the Failure Counter used for the Service Instance KPI
- KPI_Success - KPI Success - Increase the Success counter used for the Service Instance KPI

Default

KPI_Fail

Name

conveyAuthDiscoveryParams - Convey oAuth Discovery Params

Syntax

--amfGparmName conveyAuthDiscoveryParams --amfGparmValue <string>

Description

This parameters controls whether the AMF sends the Discovery '3gpp-Sbi-Discovery-*' headers related to oAuth in an HTTP/2 request targeting an existing resource context in the NF service producer to enable the SCP to perform the Service access authorization procedures.

List

- always - Always add oAuth related Discovery Parameters
- never - Never add oAuth related Discovery Parameters
- noCachedToken - No Cached Token - Add oAuth related Discovery Parameters only when there is no cached oAuth token to convey

Default

never

Name

discoverSeppViaNrf - Discover SEPP Via NRF

Syntax

--amfGparmName discoverSeppViaNrf --amfGparmValue <string>

Description

When this parameter is set to true CMM will select the SEPP via issuing a Discovery query to the NRF. This functionality is for TEST ONLY purposes.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

enhancedErrorDetection - Enhanced Error Detection

Syntax

--amfGparmName enhancedErrorDetection --amfGparmValue <string>

Description

This Parameter enables Enhanced Error detection for Indirect communication refer to the following aspects: - Support of handling Single Server header with multiple Producers. For example, Server Header may include both NF-instance and SCP-FQDN or multiple SCP-FQDNs. - Overruling the Server header logic when specific Error/application code combinations are received (e.g. NF_SERVICE_FAILOVER should be attributed to NF even if Server header includes the SCP)

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

fallbackToDirectCommunication - Fallback to Direct Communication

Syntax

```
--amfGparmName fallbackToDirectCommunication --amfGparmValue <string>
```

Description

This parameter controls if CMM will fallback to direct communication if no SCP is available. Fallback to Direct communication is not applicable in Roaming scenarios where SEPP must be used.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

fallbackToLocalSepplList - Fallback To Local Sepp List

Syntax

```
--amfGparmName fallbackToLocalSepplList --amfGparmValue <string>
```

Description

This parameter controls if CMM will fallback to locally provisioned SEPP list in case NRF-based SEPP discovery fails.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

includeHttpServerHeaderInErrorResponses - Include HTTP Server Header In Error Responses

Syntax

```
--amfGparmName includeHttpServerHeaderInErrorResponses --  
amfGparmValue <string>
```

Description

When this parameter is set to true, CMM inserts the HTTP Server header in Error Responses (4xx, 5xx)

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

includeHttpServerHeaderInSuccessResponses - Include HTTP Server Header In Success Responses

Syntax

```
--amfGparmName includeHttpServerHeaderInSuccessResponses --  
amfGparmValue <string>
```

Description

When this parameter is set to true, CMM inserts the HTTP Server header in Success Responses (2xx)

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

isolateLastHttpProxy - Isolate last HTTP proxy

Syntax

```
--amfGparmName isolateLastHttpProxy --amfGparmValue <string>
```

Description

When this parameter is set to true CMM will isolate the last available HTTP proxy even if fallbackToDirectCommunication parameter is disabled.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

kpiIsolationDuration - KPI Isolation Duration

Syntax

```
--amfGparmName kpiIsolationDuration --amfGparmValue <string>
```

Description

Duration (in sec) a HTTP Proxy is Isolated due to low KPI or other reasons such as a 503 Response that indicates congestion.

Type / Range

Integer in the range of 0 to 3,600

Default

30

Name

kpiIsolationThreshold - KPI isolation threshold

Syntax

```
--amfGparmName kpiIsolationThreshold --amfGparmValue <string>
```

Description

Threshold of Success/Attempts percent under which a HTTP proxy will be Isolated. Only Proxy related failures and timeouts are considered as HTTP proxy failures. Failures attributed to NFs are considered as Successes from HTTP Proxy perspective. Default value is 0 which means that Proxy are not isolated based on KPIs.

Type / Range

Integer in the range of 0 to 100

Default

0

Name

kpiMinSamples - KPI Minimum Samples

Syntax

```
--amfGparmName kpiMinSamples --amfGparmValue <string>
```

Description

Minimum number of Requests that are required in order to consider blacklisting a httpProxy based on KPI. Sample window is 10 seconds.

Type / Range

Integer in the range of 1 to 100000

Default

100

Name

kpiSamplingPeriod - KPI Sampling Period

Syntax

```
--amfGparmName kpiSamplingPeriod --amfGparmValue <string>
```

Description

Sampling Period for which response success and failures are aggregated to produce KPI for specific httpProxy.

Type / Range

Integer in the range of 5 to 300

Default

30

Name

nrfSubscriptionsInModelD - Support NRF Subscriptions in Model D

Syntax

```
--amfGparmName nrfSubscriptionsInModelD --amfGparmValue <string>
```

Description

When this parameter is enabled, CMM will support Subscribing to NRF for NF Profiles learned in Model D via the 3gpp-Sbi-Producer-Id

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

prefSchemeForCallbacksInModelD - Preferred Scheme for Callbacks in Model D

Syntax

```
--amfGparmName prefSchemeForCallbacksInModelD --amfGparmValue  
<string>
```

Description

When Model D is used and the SBI request contains a Callback URI for which both schemes are supported, this parameter defines which one is preferred. If only one scheme is supported it is used irrelevant of the value of this parameter

List

- http - The schema of Hypertext Transfer Protocol.
- https - The schema of Hypertext Transfer Protocol Secure.

Default

http

Name

supportScpManagedServiceRedirects - Support SCP Managed Service Redirects

Syntax

```
--amfGparmName supportScpManagedServiceRedirects --amfGparmValue  
<string>
```

Description

This parameter controls if AMF evaluates the 3gpp-sbi-target-apiRoute and 3gpp-Producer-id HTTP headers added from SCP and altered HTTP Location header in subsequent Responses.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

supportTokenCachingInModelD - Support Token Caching in Model D

Syntax

```
--amfGparmName supportTokenCachingInModelD --amfGparmValue <string>
```

Description

This parameter controls whether AMF supports Caching Authentication Token when conveyed back to CMM in a response via the 3gpp-Sbi-Access-Scope and 3gpp-Sbi-Access-Token Headers and sending them in relevant subsequent requests

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

unlockKpiBlockedScps - Unblock KPI Blocked SCPs

Syntax

```
--amfGparmName unlockKpiBlockedScps --amfGparmValue <string>
```

Description

This parameter Controls if SCPs that were isolated due to low KPI will be unblocked when no SCP is available.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

6.138 cmm sbiInitialRequestReselectionProfile

SBI Initial Request Reselection Profile. Syntax, description, parameters, and roles for cmm sbiInitialRequestReselectionProfile command.

Syntax**Description**

Used to enable or disable reselection for Initial Requests based on Rules for the interfaces where this feature is supported. Only one Profile exists named 'default' . The default profile can be modified but cannot be deleted nor new one can be created.

Parameters**Name**

name - Name

Syntax

--name <string>

Description

Profile Name

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Name

ausfConsumer - AUSF Consumer Enable

Syntax

--ausfConsumer <list-item>

Description

Enables Reselection for AUSF consumer interface

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

enable - Enable

Syntax

--enable <list-item>

Description

When this parameter is false the feature is turned off for all interfaces (no rule is checked, retries are not supported). Otherwise enabling is per interface.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

udmConsumer - UDM Consumer Enable

Syntax

--udmConsumer <list-item>

Description

Enables Reselection for UDM consumer interface

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

6.139 cmm sbiInitialRequestReselectionRule

SBI Initial Request Reselection Rule. Syntax, description, parameters, and roles for cmm sbiInitialRequestReselectionRule command.

Syntax**Description**

This command provisions the Reselection logic for Initial Requests .The rule with the lowest numbered rule order that matches all conditions defines the action. Rules with a higher numbered rule order are not checked once a match is found. A Default Rule that matches any condition is always placed last and cannot be deleted nor modified except for the action.

Parameters**Name**

sbiInitialRequestReselectionRuleListName - SBI Subsequent Request Reselection Rule List
Name

Syntax

--sbiInitialRequestReselectionRuleListName <string>

Description

The List the rule belongs

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

ruleOrder - Rule Order

Syntax

--ruleOrder <integer>

Description

The order the rule is evaluated.

Class

Required key.

Type / Range

Integer in the range of 1 to 65,535

Name

action - Action

Syntax

--action <list-item>

Description

Reselection action.

Class

Optional.

List

- Abort - Abort
- Reselect_Furthest - Reselect Furthest

Default

Abort

Name

communicationModel - Communication Model

Syntax

--communicationModel <list-item>

Description

Communication Model.

Class

Optional.

List

- ANY - Any
- DIRECT - Direct Communication (Model A/B)

Default

ANY

Name

description - Description

Syntax

--description <string>

Description

Descriptive name of the Rule

Class

Optional.

Type / Range

Digit string of length 0 to 128

Default

""

Name

error - Error

Syntax

--error <list-item>

Description

Error that triggered the reselection

Class

Optional.

List

- Any - Any
- 400_Bad_Request - 400 Bad Request
- 403_Forbidden - 403 Forbidden
- 404_Not_Found - 404 Not Found
- 405_Method_Not_Allowed - 405 Method Not Allowed
- 406_Not_Acceptable - 406 Not Acceptable
- 408_Request_Timeout - 408 Request Timeout

- 409_Conflict - 409 Conflict
- 410_Gone - 410 Gone
- 412_Precondition_Failed - 412 Precondition Failed
- 413_Payload_Too_Large - 413 Payload Too Large
- 414_URI_Too_Long - 414 URI Too Long
- 415_Unsupported_Media_Type - 415 Unsupported Media Type
- 429_Too_Many_Requests - 429 Too Many Requests
- 4xx_Client_Error - 4xx Client Error
- 500_Internal_Server_Error - 500 Internal Server Error
- 501_Not_Implemented - 501 Not Implemented
- 502_Bad_Gateway - 502 Bad Gateway
- 503_Service_Unavailable - 503 Service Unavailable
- 504_Gateway_Timeout - 504 Gateway Timeout
- 5xx_Server_Error - 5xx Server Error

Default

Any

Name

errorCause - Error Cause

Syntax

--errorCause <string>

Description

Application Error Cause value. String literal 'ANY' has special meaning and is applies to any Error Cause (including no Error Cause Value). When not set it matches the cases where no Error Cause Value is provided in the Response.

Class

Optional.

Type / Range

SBI Application Error Cause value

Default

"ANY"

Name

nfServiceOperation - NF Service Operation

Syntax

--nfServiceOperation <list-item>

Description

The NF Service Operation

Class

Optional.

List

- ANY - Any
- Nausf_UEAuthentication_Authenticate - Nausf UEAuthentication Authenticate
- Nudm_SubscriberDataManagement_Get - Nudm SubscriberDataManagement Get
- Nudm_SubscriberDataManagement_Subscribe - Nudm SubscriberDataManagement Subscribe
- Nudm_UEContextManagement_Registration - Nudm UEContextManagement Registration

Default

ANY

Name

nfType - NF Type

Syntax

--nfType <list-item>

Description

Type of the NF

Class

Optional.

List

- ANY - Any
- AUSF - AUSF
- UDM - UDM

Default

ANY

Name

reselectAttempt - Reselect Attempt

Syntax

--reselectAttempt <list-item>

Description

Reselect Attempt

Class

Optional.

List

- ANY - Any
- First - First

Default

ANY

6.140 cmm sbiInitialRequestReselectionRuleList

SBI Initial Request Reselection Rule List. Syntax, description, parameters, and roles for cmm sbiInitialRequestReselectionRuleList command.

Syntax

Description

List of Initial Request Reselection Rules

Parameters

Name

name - Name

Syntax

--name <string>

Description

List name

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Roles**Show**

sysadmin, manage, monitor

List

sysadmin, manage, monitor

6.141 cmm sbiNfSetSupportProfile

SBI NF Set Support Profile. Syntax, description, parameters, and roles for cmm sbiNfSetSupportProfile command.

Syntax**Description**

SBI NF Set Support Profile

Parameters**Name**

name - Name

Syntax

--name <string>

Description

Name

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

addSuffixInCallbackUris - Add suffix in Callback URIs

Syntax

--addSuffixInCallbackUris <list-item>

Description

When this parameter is enabled, AMF will add pt appended with AMF Pointer ID as extra suffix in the paths in all Callback URIs it sends as extra suffix in the paths in all Callback URIs it sends. This suffix may be used by the AMF to distinguish between Notifications originally sent to this AMF vs. notifications received after redirection within AMFs in the Set.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

amfSetRegionSeparator - AMF Set Region Separator

Syntax

--amfSetRegionSeparator <list-item>

Description

Separator used to construct the Set ID(i.e. '<AMF Set ID>-region<AMF Region ID>' instead of '<AMF Set ID>.region<AMF Region ID>').

Class

Optional.

List

- hyphen - hyphen (-)
- period - period (.)

Default

hyphen

Name

indirectCommunicationBindingSupport - Binding Support for Indirect Communication

Syntax

--indirectCommunicationBindingSupport <list-item>

Description

This parameter controls whether AMF supports binding for Indirect Communication. When enabled, AMF will store the binding information send by a Producer UDM, AUSF, SMSF and PCF and convey it as 3gpp-Sbi-Routing-Binding HTTP Header in subsequent Requests sent via indirect communication. AMF will also store the binding information Consumers send when subscribing to amf-comm and amf-event services and send it as the 3gpp-Sbi-Routing-

Binding HTTP Header in Notifications sent via Indirect Communication. (Note: SMF binding is supported via separate parameters)

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

rel16OwnAmfSetConsumer - Rel-16 Own AMS-Set as Consumer

Syntax

--rel16OwnAmfSetConsumer <list-item>

Description

When this parameter is set to true, sends binding information in the relevant Service Requests and Notification Responses.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

rel16OwnAmfSetProducer - Rel-16 Own AMS-Set as Producer

Syntax

--rel16OwnAmfSetProducer <list-item>

Description

When this parameter is set to true, AMF includes the NF Sets it belongs to in the nfSetIdList IE of the NFProfile it Registers in NRF. Furthermore, it sends binding information in the Service Producer and Subscription Responses and Notification Requests

Class

Optional.

List

- false - Boolean value of false.

- true - Boolean value of true.

Default

false

Name

smfBindingSupportMode - SMF Binding Support Mode

Syntax

--smfBindingSupportMode <list-item>

Description

The Binding support mode for SMF. Possible values are: - None: Binding Headers/IEs are ignored and not conveyed. - NFSet_Instance_ServiceInstance: Binding Headers/IEs are used and conveyed.

Class

Optional.

List

- NFSet_Instance_ServiceInstance - NFSet NFInstance NF Service Instance - NFSet, NFInstance and NF Service Instance
- None - None

Default

None

Name

smfConveyNfSetAsDiscoveryHeaderToScp - SMF Convey NF Set as Discovery Header to SCP

Syntax

--smfConveyNfSetAsDiscoveryHeaderToScp <list-item>

Description

This parameter controls if AMF will convey the NF Set via the 3gpp-sbi-Discovery-target-nf-set HTTP header for subsequent requests. This allows the SCP perform reselection in case of failures. This Header will be included only if target NF belongs to a NF Set and Route-Binding information is not available. Recommended value is Always as AMF based Reselection in case of Indirect Communication is supported only for Test purposes.

Class

Optional.

List

- Always - Always
- Never - Never

Default

Always

Name

smfNfSetSupportMode - SMF NF Set Support Mode

Syntax

--smfNfSetSupportMode <list-item>

Description

SMF NF Set Support Mode. Possible values are: - None: NFSets are not stored nor conveyed in any API. NFServicePersistence in the NFProfile is not evaluated. - NF_Instance: NFSets are not stored and not conveyed in any API but NFServicePersistence is evaluated. - NF_Set: NFSets are stored and conveyed in all API and NFServicePersistence is evaluated.

Class

Optional.

List

- NF_Instance - NF Instance - NF Instance.
- NF_Set - NF set - NF Set
- None - None

Default

None

Name

smfSupportRedirectForSubsequentServiceRequests - Support Redirect for Subsequent Requests

Syntax

--smfSupportRedirectForSubsequentServiceRequests <list-item>

Description

Defines if AMF will support redirect for Subsequent Requests towards SMF.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

6.142 cmm sbiPeerInfoGParms

SBI Peer Info General Parameters. Syntax, description, parameters, and roles for cmm sbiPeerInfoGParms command.

Syntax

Description

Configuration of 3gpp-Sbi-Peer-Info HTTP Header handling

Parameters

Name

amfGparmName - Parameter name

Syntax

--amfGparmName <list-item>

Description

Name of Parameter

Class

Required key.

List

- enable - This parameter enables or disables sending 3gpp-Sbi-Peer-Info in Requests and Responses. When enabled AMF will include own NF (Service) Instance Info as the Source NF
- includeDestinationNfInfo - Include Destination NF Info - This parameter controls if AMF will add the Destination NF (Service) Instance in Requests and Responses sent by the AMF when the relevant feature is enabled.
- includeScpSeppInfo - Include SCP/SEPP Info - This parameter controls if AMF will add the SCP/SEPP Info in Requests and Responses sent by the AMF when the relevant feature is enabled.

Name

amfGparmValue - Parameter value

Syntax

--amfGparmValue <string>

Description

Value of the Parameter

Class

Required on create.

Type / Range

Digit string of length 0 to 64

The amfGparmValue string is based on the amfGparmName parameter:

Name

enable - Enable

Syntax

--amfGparmName enable --amfGparmValue <string>

Description

This parameter enables or disables sending 3gpp-Sbi-Peer-Info in Requests and Responses. When enabled AMF will include own NF (Service) Instance Info as the Source NF

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

includeDestinationNfInfo - Include Destination NF Info

Syntax

--amfGparmName includeDestinationNfInfo --amfGparmValue <string>

Description

This parameter controls if AMF will add the Destination NF (Service) Instance in Requests and Responses sent by the AMF when the relevant feature is enabled.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

includeScpSeppInfo - Include SCP/SEPP Info

Syntax

--amfGparmName includeScpSeppInfo --amfGparmValue <string>

Description

This parameter controls if AMF will add the SCP/SEPP Info in Requests and Responses sent by the AMF when the relevant feature is enabled.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

6.143 cmm sbiQueryConversionRule

SBI Query Conversion Rule. Syntax, description, parameters, and roles for cmm sbiQueryConversionRule command.

Syntax**Description**

Manages the Conversion Rules applied in Query Parameters of SBI APIs

Parameters**Name**

ruleName - Rule Name

Syntax

--ruleName <string>

Description

Query Conversion Rule Name

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

queryServiceName - NF Service Name

Syntax

--queryServiceName <list-item>

Description

NF service for which the conversion Rule is relevant

Class

Required on create, not modifiable.

List

- nnrfNFDiscovery - Nnrf NF Discovery - NRF Network Function Discovery Service

Name

resource - Resource

Syntax

--resource <string>

Description

Resource for which the conversion Rule is relevant. Must start with '/' and must not end with '/'. E.g. '/nf-instances'

Class

Required on create, not modifiable.

Type / Range

Digit string of length 2 to 254

Name

ruleOrder - Rule order

Syntax

--ruleOrder <integer>

Description

Order with which the rule will be executed compared to other rules.

Class

Required on create.

Type / Range

Integer in the range of 1 to 10,000

Name

chainedQueryConversionRuleName - Chained Query Conversion Rule Name

Syntax

--chainedQueryConversionRuleName <string>

Description

This parameter is used exclusively by rules of type Only Condition and Only Operation. When Multiple Only Condition type rules are linked to the same Chained rule they are combined with logical AND. Each Chained Query Conversion Rule can have max one Only Operation Rule

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

comparison - Comparison

Syntax

--comparison <list-item>

Description

Used to compare a Query Parameter or Information Element to a Value

Class

Optional.

List

- eq - Equal
- gt - Greater Than
- gte - Greater Than or Equal to
- lt - Less Than
- lte - Less Than or Equal to
- neq - Not Equal
- na - Not applicable

Default

na

Name

comparisonValue - Comparison Value

Syntax

```
--comparisonValue <string>
```

Description

Value against which the query parameter is compared in a condition. Can be of any type but Format /structure must match the structure of the referenced Parameter

Class

Optional.

Type / Range

Digit string of length 0 to 352

Default

""

Name

conditionQueryParam - Condition Query Param

Syntax

```
--conditionQueryParam <string>
```

Description

Query Param used in the condition of a Rule. May be empty in which case the Rule's operation is applied unconditionally.

Class

Optional.

Type / Range

Digit string of length 0 to 128

Default

""

Name

conditionQueryParamOperator - Condition Query Param Operator

Syntax

```
--conditionQueryParamOperator <list-item>
```

Description

Operator applied to the Information Element. It is not applicable when and only when there is not an IE in the condition. Otherwise it must be one of the following types: 1) val: can be used for any type of primitive or object. 2) length: can be applied only to strings. 3) itemCount: can be applied only to arrays. 4) exists: any type of primitive or object. 5) notExists: any type of primitive or object.

Class

Optional.

List

- exists - Exists. Can be used for Any type of primitive or object. Condition is met if the Query Parameter or Information Element exists.
- itemCount - Item Count - Item Count. Can be applied only if the Query Parameter or Information Element is an array.
- length - Length. Can be applied only if the the Query Parameter or Information Element is a string.
- notExists - Not Exists - Not Exists. Can be used for any type of primitive or object. Condition is met if the Query Parameter or Information Element does not exist.
- val - Value - Value. The value of the Query Parameter or Information Element. Can be used for any type of primitive or object Parameter.
- na - Not applicable - Operator is not applicable. This value is used when and only when no Query parameter or Information Element is referenced in the condition.

Default

na

Name

httpMessageType - HTTP Message Type

Syntax

--httpMessageType <list-item>

Description

HTTP Message Type (Request or Response) for which the conversion Rule is relevant

Class

Optional.

List

- request - HTTP Request

Default

request

Name

httpMethod - HTTP Method

Syntax

--httpMethod <list-item>

Description

HTTP Method for which the conversion Rule is relevant

Class

Optional.

List

- get - HTTP method GET

Default

get

Name

operationAction - Operation Action

Syntax

--operationAction <list-item>

Description

Action that will be applied to the Operation Query Parameter.

Class

Optional.

List

- copy - Set the Operation Query Parameter or Information Element to the value of the Query Parameter or Information Element indicated in the operation Value
- remove - Removes the operation Query Parameter. or Information Element
- rename - Rename the Operation Query Parameter or Information Element to the Name indicated in the operation Value
- set - Set the Set the Operation Query Parameter or Information Element to the Operation value. If the Query Parameter or Information Element does not exists it is added. Otherwise its value is replaced.
- truncate - Can be used only for for arrays. The value refers to the max number of array elements the Operation Query Parameter of Information Element will contain.
- na - Not applicable - Not applicable

Default

na

Name

operationQueryParam - Operation Query Param

Syntax

--operationQueryParam <string>

Description

Query Param (optional) to which the operation of a Rule applies

Class

Optional.

Type / Range

Digit string of length 0 to 128

Default

""

Name

operationValue - Operation Value

Syntax

--operationValue <string>

Description

Usage of Value depends on the operation action: 1) set: can be of any type but format / structure must match the structure of the referenced Parameter.2)Copy: value indicates the Query Parameter from which the value will be copied 3)Truncate: refers to the max number of array elements operation Query Param will contain 4) Rename: refers to the new name of the operation Parameter. 5)It is not applicable in other cases

Class

Optional.

Type / Range

Digit string of length 0 to 352

Default

""

Name

queryApiMajorVersion - Major Version

Syntax

--queryApiMajorVersion <list-item>

Description

API Major Version for which the conversion Rule is relevant

Class

Optional.

List

- v1 - Version 1 - Major Version 1

Default

v1

Name

ruleDescription - Description

Syntax

--ruleDescription <string>

Description

Description of the Rule

Class

Optional.

Type / Range

Digit string of length 0 to 160 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

""

Name

ruleState - Rule State

Syntax

--ruleState <list-item>

Description

State of the Rule (enabled. disabled, test only)

Class

Optional.

List

- disabled - Rule is Disabled.
- enabled - Rule is Enabled.
- testOnly - Test Only - Rule is not applied messages sent to external NF. However conversion input and outcome is reported to testlog when rule condition is met.

Default

disabled

Name

ruleType - Rule Type

Syntax

--ruleType <list-item>

Description

Type of Rule. There are three types of rules. 1) Complete conversion rules: They are not associated to other conversion Rules (however condition is optional). 2. Condition only rules. These are Rules which include only a Condition. Must be associated with an Operation only Rule. If multiple condition rules point to the same Operation only Rule they are combined with logical 'AND'. 3) Operation only Rules which include only an Operation. Used by only Condition Rules.

Class

Not modifiable.

List

- **complete** - Complete/ conversion Rule which is autonomously executed. Not associated to other conversion Rules.
- **onlyCondition** - Only Condition - Rule which includes only a Condition. Must be associated with an only Operation Rule
- **onlyOperation** - Only Operation - Rule which includes only an Operation. Used by only Condition Rules

Default

complete

6.144 cmm sbiSubsequentRequestReselectionRule

SBI Subsequent Request Reselection Profile. Syntax, description, parameters, and roles for cmm sbiSubsequentRequestReselectionRule command.

Syntax**Description**

This command provisions the Reselection logic for Subsequent Requests .The rule with the lowest numbered rule order that matches all conditions defines the action. Rules with a higher numbered rule order are not checked once a match is found. A Default Rule that matches any condition is always placed last and cannot be deleted nor modified except for the action.

Parameters**Name**

sbiSubsequentRequestReselectionRuleListName - SBI Subsequent Request Reselection Rule List Name

Syntax

--sbiSubsequentRequestReselectionRuleListName <string>

Description

The List the rule belongs

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

ruleOrder - Rule Order

Syntax

--ruleOrder <integer>

Description

The order the rule is evaluated.

Class

Required key.

Type / Range

Integer in the range of 1 to 65,535

Name

action - Action

Syntax

--action <list-item>

Description

Reselection action.

Class

Optional.

List

- Abort - Abort
- Reselect_Binding_Closest - Reselect Binding Closest - Reselect First based on Binding. If Binding does not exist reselect Closest
- Reselect_Binding_Furthest - Reselect Binding Furthest - Reselect First based on Binding. If Binding does not exist reselect Furthest
- Reselect_Closest - Reselect Closest - Reselect Closest (ignore binding level priority)
- Reselect_Furthest - Reselect Furthest - Reselect Furthest (ignore binding level priority)

Default

Abort

Name

communicationModel - Communication Model

Syntax

--communicationModel <list-item>

Description

Communication Model. Only Direct officially Supported. Any and Indirect is only for test purposes.

Class

Optional.

List

- ANY - Any (test only) - Any - For Test Purposes Only
- DIRECT - Direct communication
- INDIRECT - Indirect (Test only) - Indirect communication - For Test Purposes Only

Default

DIRECT

Name

description - Description

Syntax

--description <string>

Description

Descriptive name of the Rule

Class

Optional.

Type / Range

Digit string of length 0 to 128

Default

""

Name

error - Error

Syntax

--error <list-item>

Description

Error that triggered the reselection

Class

Optional.

List

- 400_Bad_Request - 400 Bad Request
- 403_Forbidden - 403 Forbidden
- 404_Not_Found - 404 Not Found
- 405_Method_Not_Allowed - 405 Method Not Allowed
- 406_Not_Acceptable - 406 Not Acceptable
- 408_Request_Timeout - 408 Request Timeout
- 409_Conflict - 409 Conflict
- 410_Gone - 410 Gone
- 411_Length_Required - 411 Length Required
- 412_Precondition_Failed - 412 Precondition Failed
- 413_Payload_Too_Large - 413 Payload Too Large
- 414_URI_Too_Long - 414 URI Too Long
- 415_Unsupported_Media_Type - 415 Unsupported Media Type
- 429_Too_Many_Requests - 429 Too Many Requests
- 4XX_Client_Error - 4xx Client Error
- 500_Internal_Server_Error - 500 Internal Server Error
- 501_Not_Implemented - 501 Not Implemented
- 502_Bad_Gateway - 502 Bad Gateway
- 503_Service_Unavailable - 503 Service Unavailable
- 504_Gateway_Timeout - 504 Gateway Timeout
- 5xx_Server_Error - 5xx ServerError - 5xx Server Error
- Any - Any
- Link_Error - Link Error - Link Error (TCP/HTTP connection failure)
- Timeout - Timeout

Default

Any

Name

errorCause - Error Cause

Syntax

--errorCause <string>

Description

Application Error Cause value. String literal 'ANY' has special meaning and is applies to any Error Cause (including no Error Cause Value). When not set it matches the cases where no Error Cause Value is provided in the Response.

Class

Optional.

Type / Range

SBI Application Error Cause value

Default

"ANY"

Name

nfServiceOperation - NF Service Operation

Syntax

--nfServiceOperation <list-item>

Description

The NF Service Operation

Class

Optional.

List

- ANY - Any
- Nsmf_PDUSession_ReleaseSMContext - Nsmf PDUSession ReleaseSMContext
- Nsmf_PDUSession_RetrieveSMContext - Nsmf PDUSession RetrieveSMContext
- Nsmf_PDUSession_UpdateSMContext - Nsmf PDUSession UpdateSMContext - Nsmf_PDUSession UpdateSMContext

Default

ANY

Name

nfType - NF Type

Syntax

--nfType <list-item>

Description

Type of the NF

Class

Optional.

List

- ANY - Any
- SMF - SMF

Default

ANY

Name

reselectAttempt - Reselect Attempt

Syntax

--reselectAttempt <list-item>

Description

Reselect Attempt

Class

Optional.

List

- ANY - Any
- First - First

Default

ANY

sysadmin, manage, monitor

List

sysadmin, manage, monitor

6.146 cmm sbiTimersProfile

Service Based Interface Message Response Wait Timer. Syntax, description, parameters, and roles for cmm sbiTimersProfile command.

Syntax

Description

This profile consists of message wait response timer for all other NF services operation message responses used by the AMF as a consumer. The profile is provisioned to a local consumer AMF endpoint.

Parameters

Name

sbiTimersProfileListName - Profile Name

Syntax

--sbiTimersProfileListName <string>

Description

Name of the profile. The AMF will provide a default profile named `sbiTimersAttemptsDefaultProfile`. By default all UE PLMNs will use the default profile.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of `[0-9a-zA-Z\.\_:@]*`

Name

`sbiTimerName` - Timer name

Syntax

```
--sbiTimerName <list-item>
```

Description

Name of timer.

Class

Required key.

List

- `ausfResponse` - Guard timer for receiving response from AUSF - When the AMF invokes any AUSF service operation, this parameter defines the default timer to be used unless a dedicated timer is defined for the particular service or service operation procedure. The AMF expects to receive a response from the AUSF. If the timer expires while waiting for this response, the AMF considers that the service or service operation utilizing the timer has failed
- `cancelRelocateUeContext` - Namf Cancel Relocate UE Context Request - Supervises receipt of Cancel Relocate UE Context Response from the target AMF. If no response is received, the service operation is considered as failed.
- `cbcfResponse` - Guard timer for receiving response from CBCF - When the AMF invokes any CBCF or CBCF IWF service operation, this parameter defines the default timer to be used unless a dedicated timer is defined for the particular service or service operation procedure. The AMF expects to receive a response from the CBCF. If the timer expires while waiting for this response, the AMF considers that the service or service operation utilising the timer has failed.
- `createUeContext` - Namf Create UE Context Request - Supervises receipt of Create UE Context Response from the target AMF. If no response is received, the service operation is considered as failed.
- `defaultBlacklist` - Default Blacklist Timer - The timer defines the duration that a NF service instance or remote endpoint is blacklisted when considered unavailable.
- `eirResponse` - EIR Response Waiting Timer - When the AMF invokes any EIR service operation, this parameter defines the default timer to be used unless a dedicated timer

is defined for the particular service or service operation procedure. The AMF expects to receive a response from the EIR. If the timer expires while waiting for this response, the AMF considers that the service or service operation utilizing the timer has failed.

- **gmlcResponse** - Guard timer for receiving response from GMLC - When the AMF invokes any GMLC service operation, this parameter defines the default timer to be used unless a dedicated timer is defined for the particular service or service operation procedure. The AMF expects to receive a response from the GMLC. If the timer expires while waiting for this response, the AMF considers that the service or service operation utilizing the timer has failed.
- **lmfResponse** - Guard timer for receiving response from LMF - When the AMF invokes any LMF service operation, this parameter defines the default timer to be used unless a dedicated timer is defined for the particular service or service operation procedure. The AMF expects to receive a response from the LMF. If the timer expires while waiting for this response, the AMF considers that the service or service operation utilizing the timer has failed.
- **n1MessageNotify** - N1 Message Notify - Supervises receipt of N1 Message Notify Response from the destination NF. If no response is received, the service operation is considered as failed.
- **n2InfoNotify** - Namf n2InfoNotify - Supervises receipt of n2InfoNoity Ack from the source AMF. If no response is received, the service operation is considered as failed.
- **nrfAccessTokenBlacklist** - NRF Access Token Service Blacklist Timer - The timer defines the duration that an AccessToken service instance is blacklisted when considered unavailable.
- **nrfDeRegister** - NRF NF Deregister Timer - The NRF NF De-register operation response timer.
- **nrfDiscoveryBlacklist** - NRF NF Discovery Service Blacklist Timer - The timer defines the duration that an NfDiscovery service instance is blacklisted when considered unavailable.
- **nrfDiscoveryResponse** - NRF Discovery Response - When the AMF invokes the NRF Discovery service operation, this parameter defines the default timer to be used unless a dedicated timer is defined for the particular NF Type (e.g SMF Discovery). The AMF expects to receive a response from the NRF. If the timer expires while waiting for this response, the AMF considers that the service operation utilizing the timer has failed.
- **nrfManagementBlacklist** - NRF NF Management Service Blacklist Timer - The timer defines the duration that an NfManagement service instance is blacklisted when considered unavailable.
- **nrfPurgeExpiredNfTimer** - Purge Expired NF Timer - This timer defines how long expired Entries continue to be selected for use by Connection management after the availability time has expired. These entries can be used up to 1 day for cases where the NRF is not responding.

- **nrfRegister** - NRF Register Operation Wait Timer - The timer is used to wait for response from NRF for NFRegister operation.
- **nrfRegisterBlacklist** - NRF Register Operation Wait Timer - The timer defines the duration a NRF Management Service Instance is blacklisted during NF Register failure.
- **nrfRegisterRetry** - NRF NFRegister Retry Wait Timer - The timer defines the wait period between the a failed NRF NFRegister operation and its retry. When value is set to 0 the AMF does not retry the operation
- **nrfResponse** - NRF Response - When the AMF invokes any NRF service operation, this parameter defines the default timer to be used unless a dedicated timer is defined for the particular service operation. The AMF expects to receive a response from the NRF. If the timer expires while waiting for this response, the AMF considers that the service operation utilizing the timer has failed.
- **nrfUpdateRetry** - NRF NFUpdate Retry Wait Timer - The timer defines the wait period between the a failed NRF NFUpdate via PATCH operation and its retry. When value is set to 0 the AMF does not retry the operation
- **nssaafResponse** - Guard Timer For Receiving Response From NSSAAF - When the AMF invokes any NSSAAF service operation, this parameter defines the default timer to be used unless a dedicated timer is defined for the particular service or service operation procedure. The AMF expects to receive a response from the NSSAAF. If the timer expires while waiting for this response, the AMF considers that the service or service operation utilising the timer has failed.
- **nssfAvailabilityPeriodicUpdate** - NSSF Availability Periodic Update - Time in minutes between 2 consecutive Nnssf_NSSAIAvailability Updates from AMF to the NSSF. Upon timer expiration, the AMF will send an Update to the NSSF irrelevant if there are any changes in the AMF Slice/TA information. When value is 0 (default) this mechanism is disabled.
- **nssfAvailabilityRetry** - NSSF Availability Retry Wait Timer - The timer defines the wait period between the a failed NSSF Availability update operation and its retry. When value is set to 0 the AMF does not retry the operation
- **nssfAvailabilityUpdateWait** - NSSF Availability Periodic Update Timer - Defines the period the AMF waits since last change regarding supported Slices/Tracking areas before it sends Nnssf_NSSAIAvailabilityUpdate. This timer is added in order to avoid excessive signalling to NSSF during network re-planning.
- **nssfBlacklist** - NSSF Blacklist Timer - The timer defines the duration a NSSF Instance is blacklisted when considered unavailable.
- **nssfResponse** - NSSF Response Timer - The timer is used to monitor responses from NSSF to the AMF sent requests.
- **nssfSubscribeExpiration** - NSSF Subscribe Expiration - Used to define the suggested time after which the AMF subscription to NSSF becomes invalid. The time is added in

the 'expires' IE during the Subscription towards the NSSF. When this value is set to 0, the AMF will omit the 'expires' IE.

- **nwdafResponse** - NWDAF Response - Guard Timer For Receiving Response From NWDAF. When the AMF invokes any NWDAF service operation, this parameter defines the default timer to be used unless a dedicated timer is defined for the particular service or service operation procedure. The AMF expects to receive a response from the NWDAF. If the timer expires while waiting for this response, the AMF considers that the service or service operation has failed.
- **pcfResponse** - Guard timer for receiving response from PCF - When the AMF invokes any PCF service operation, this parameter defines the default timer to be used unless a dedicated timer is defined for the particular service or service operation procedure. The AMF expects to receive a response from the PCF. If the timer expires while waiting for this response, the AMF considers that the service or service operation utilizing the timer has failed.
- **pduSessEstWt4N1N2Msg** - PDU Session establishment Wait for N1N2 Message Transfer - Defines the time the AMF waits for N1N2 Message Transfer trigger from SMF during PDU session setup procedure, when AMF has received Create SM context response from the SMF.
- **pduSmCtxStatusNotify** - PDU SM Context Status Notify - Defines the time the AMF waits for SM context status notify when the AMF expects to receive SM context status notify. AMF expects to receive SM context status notify during -UE/AMF/SMF triggered PDU session release procedures, -PDU session setup procedures that have been rejected towards the UE after SM context create, and -PDU session setup procedures when the AMF already has a PDU session established for the requested PDU session id. The cmm amfGParam defined setting smContextStatusNotifyRequired further defines the AMF behaviour after this timer expires.
- **releaseUeContext** - Namf Release UE Context Request - Supervises receipt of Release UE Context Response from the target AMF. If no response is received, the service operation is considered as successful
- **relocateUeContext** - Namf Relocate UE Context Request - Supervises receipt of Relocate UE Context Response from the target AMF. If no response is received, the service operation is considered as failed.
- **retrieveSmCtx5g4gHo** - Retrieve SM Context 5G to 4G Handover - When the AMF invokes Retrieve Sm Context service operation, as part of 5G to 4G handover, this parameter defines the default timer to be used for the particular service operation and its dedicated use case. If the timer expires while waiting for this response, the AMF considers that the service operation utilizing the timer has failed i.e. Sm Context Retrieval for the associated PDU Session has failed.
- **retrieveSmCtx5g4gIdleMob** - Retrieve SM Context 5G to 4G Idle Mobility - When the AMF invokes Retrieve Sm Context service operation, as part of 5G to 4G Idle mobility, this parameter defines the default timer to be used for the particular service operation

and its dedicated use case. If the timer expires while waiting for this response, the AMF considers that the service operation utilizing the timer has failed i.e. Sm Context Retrieval for the associated PDU Session has failed.

- smfDisc - SMF Discovery Operation Wait Timer - The timer is used to wait for response from NRF for SMF Discovery operation.
- smfIsolation - SMF Isolation Timer - The timer defines the duration that an SMF service instance is isolated when considered unavailable.
- smfResponse - SMF Response Timer - When the AMF invokes any SMF service operation, this parameter defines the default timer to be used unless a dedicated timer is defined for the particular service operation and its dedicated use case. The AMF expects to receive a response from the SMF. If the timer expires while waiting for this response, the AMF considers that the service operation utilizing the timer has failed.
- smfReuse - SMF Reuse - Defines time to wait for PDU session re-establishment request when SMF has triggered N1N2 Message Transfer service of AMF, and provided SMF Reallocation indication attribute and set this indication as true.
- smsfResponse - Guard timer for receiving response from SMSF - When the AMF invokes any SMSF service operation, this parameter defines the default timer to be used unless a dedicated timer is defined for the particular service or service operation procedure. The AMF expects to receive a response from the SMSF. If the timer expires while waiting for this response, the AMF considers that the service or service operation utilizing the timer has failed.
- udmResponse - Guard timer for receiving response from UDM - When the AMF invokes any UDM service operation, this parameter defines the default timer to be used unless a dedicated timer is defined for the particular service or service operation procedure. The AMF expects to receive a response from the UDM. If the timer expires while waiting for this response, the AMF considers that the service or service operation utilizing the timer has failed.
- ueContextTransfer - UE Context Transfer - Supervises the receipt of the UE Context Transfer response from the old AMF. If no response is received, the operation is considered as failed.
- waitRelocateCancelSrcMme - Wait Relocate Cancel from Source MME - Supervises receipt of Relocate Cancel Request from source MME after receiving Relocate UE Context Response from target AMF in EPS to 5GS with AMF relocation scenario. When timer expires, initial AMF shall release local resources

Name

sbiTimerUnit - Timer unit

Syntax

--sbiTimerUnit <list-item>

Description

Unit of measurement.

Class

Required on create, not modifiable.

List

- 320Hour - 320 hour - Specify timer unit of 320 hours.
- Millisecond - Specify timer unit of 1 millisecond.
- Second - Specify timer unit of 1 second.
- 2Second - 2 second - Specify timer unit of 2 seconds.
- 30Second - 30 second - Specify timer unit of 30 seconds.
- Minute - Specify timer unit of 1 minute.
- DeciHour - Specify timer unit of 1 decihour (6 minutes).
- 10Minute - 10 minute - Specify timer unit of 10 minutes.
- Hour - Specify timer unit of 1 hour.
- 10Hour - 10 hour - Specify timer unit of 10 hours.

Name

sbiTimerValue - Timer value

Syntax

```
--sbiTimerValue <integer>
```

Description

Numeric value of timer.

Class

Optional.

Type / Range

Integer in the range of 0 to 4,294,967,295

The sbiTimerValue string is based on the sbiTimerName parameter:

Name

ausfResponse - Guard timer for receiving response from AUSF

Syntax

```
--sbiTimersProfileListName <string> --sbiTimerName ausfResponse --  
sbiTimerValue <string> [ --sbiTimerUnit Millisecond ]
```

Description

When the AMF invokes any AUSF service operation, this parameter defines the default timer to be used unless a dedicated timer is defined for the particular service or service operation procedure. The AMF expects to receive a response from the AUSF. If the timer expires while waiting for this response, the AMF considers that the service or service operation utilizing the timer has failed

Type / Range

Integer in the range of 10 to 10,000 in units of Millisecond

Default

5000

Name

cancelRelocateUeContext - Namf Cancel Relocate UE Context Request

Syntax

```
--sbiTimersProfileListName <string> --sbiTimerName  
cancelRelocateUeContext --sbiTimerValue <string> [ --sbiTimerUnit  
Millisecond ]
```

Description

Supervises receipt of Cancel Relocate UE Context Response from the target AMF. If no response is received, the service operation is considered as failed.

Type / Range

Integer in the range of 100 to 30,000 in units of Millisecond

Default

2000

Name

cbcfResponse - Guard timer for receiving response from CBCF

Syntax

```
--sbiTimersProfileListName <string> --sbiTimerName cbcfResponse --  
sbiTimerValue <string> [ --sbiTimerUnit Millisecond ]
```

Description

When the AMF invokes any CBCF or CBCF IWF service operation, this parameter defines the default timer to be used unless a dedicated timer is defined for the particular service or service operation procedure. The AMF expects to receive a response from the CBCF. If the timer expires while waiting for this response, the AMF considers that the service or service operation utilising the timer has failed.

Type / Range

Integer in the range of 100 to 30,000 in units of Millisecond

Default

5000

Name

createUeContext - Namf Create UE Context Request

Syntax

```
--sbiTimersProfileListName <string> --sbiTimerName createUeContext --  
sbiTimerValue <string> [ --sbiTimerUnit Millisecond ]
```

Description

Supervises receipt of Create UE Context Response from the target AMF. If no response is received, the service operation is considered as failed.

Type / Range

Integer in the range of 100 to 30,000 in units of Millisecond

Default

10000

Name

defaultBlacklist - Default Blacklist Timer

Syntax

```
--sbiTimersProfileListName <string> --sbiTimerName defaultBlacklist  
--sbiTimerValue <string> [ --sbiTimerUnit Second ]
```

Description

The timer defines the duration that a NF service instance or remote endpoint is blacklisted when considered unavailable.

Type / Range

Integer in the range of 0 to 3,600 in units of Second

Default

5

Name

eirResponse - EIR Response Waiting Timer

Syntax

```
--sbiTimersProfileListName <string> --sbiTimerName eirResponse --  
sbiTimerValue <string> [ --sbiTimerUnit Millisecond ]
```

Description

When the AMF invokes any EIR service operation, this parameter defines the default timer to be used unless a dedicated timer is defined for the particular service or service operation procedure. The AMF expects to receive a response from the EIR. If the timer expires while waiting for this response, the AMF considers that the service or service operation utilizing the timer has failed.

Type / Range

Integer in the range of 100 to 30,000 in units of Millisecond

Default

5000

Name

gmlcResponse - Guard timer for receiving response from GMLC

Syntax

```
--sbiTimersProfileListName <string> --sbiTimerName gmlcResponse --  
sbiTimerValue <string> [ --sbiTimerUnit Millisecond ]
```

Description

When the AMF invokes any GMLC service operation, this parameter defines the default timer to be used unless a dedicated timer is defined for the particular service or service operation procedure. The AMF expects to receive a response from the GMLC. If the timer expires while waiting for this response, the AMF considers that the service or service operation utilising the timer has failed.

Type / Range

Integer in the range of 100 to 30,000 in units of Millisecond

Default

5000

Name

lmfResponse - Guard timer for receiving response from LMF

Syntax

```
--sbiTimersProfileListName <string> --sbiTimerName lmfResponse --  
sbiTimerValue <string> [ --sbiTimerUnit Millisecond ]
```

Description

When the AMF invokes any LMF service operation, this parameter defines the default timer to be used unless a dedicated timer is defined for the particular service or service operation procedure. The AMF expects to receive a response from the LMF. If the timer expires while waiting for this response, the AMF considers that the service or service operation utilizing the timer has failed.

Type / Range

Integer in the range of 100 to 180000 in units of Millisecond

Default

5000

Name

n1MessageNotify - N1 Message Notify

Syntax

```
--sbiTimersProfileListName <string> --sbiTimerName n1MessageNotify --  
sbiTimerValue <string> [ --sbiTimerUnit Millisecond ]
```

Description

Supervises receipt of N1 Message Notify Response from the destination NF. If no response is received, the service operation is considered as failed.

Type / Range

Integer in the range of 100 to 30,000 in units of Millisecond

Default

5000

Name

n2InfoNotify - Namf n2InfoNotify

Syntax

```
--sbiTimersProfileListName <string> --sbiTimerName n2InfoNotify --  
sbiTimerValue <string> [ --sbiTimerUnit Millisecond ]
```

Description

Supervises receipt of n2InfoNoity Ack from the source AMF. If no response is received, the service operation is considered as failed.

Type / Range

Integer in the range of 100 to 30,000 in units of Millisecond

Default

5000

Name

nrfAccessTokenBlacklist - NRF Access Token Service Blacklist Timer

Syntax

```
--sbiTimersProfileListName <string> --sbiTimerName  
nrfAccessTokenBlacklist --sbiTimerValue <string> [ --sbiTimerUnit  
Second ]
```

Description

The timer defines the duration that an AccessToken service instance is blacklisted when considered unavailable.

Type / Range

Integer in the range of 0 to 3,600 in units of Second

Default

5

Name

nrfDeRegister - NRF NF Deregister Timer

Syntax

```
--sbiTimersProfileListName <string> --sbiTimerName nrfDeRegister --  
sbiTimerValue <string> [ --sbiTimerUnit Millisecond ]
```

Description

The NRF NF De-register operation response timer.

Type / Range

Integer in the range of 100 to 30,000 in units of Millisecond

Default

5000

Name

nrfDiscoveryBlacklist - NRF NF Discovery Service Blacklist Timer

Syntax

```
--sbiTimersProfileListName <string> --sbiTimerName  
nrfDiscoveryBlacklist --sbiTimerValue <string> [ --sbiTimerUnit  
Second ]
```

Description

The timer defines the duration that an NFDISCOVERY service instance is blacklisted when considered unavailable.

Type / Range

Integer in the range of 0 to 3,600 in units of Second

Default

5

Name

nrfDiscoveryResponse - NRF Discovery Response

Syntax

```
--sbiTimersProfileListName <string> --sbiTimerName  
nrfDiscoveryResponse --sbiTimerValue <string> [ --sbiTimerUnit  
Millisecond ]
```

Description

When the AMF invokes the NRF Discovery service operation, this parameter defines the default timer to be used unless a dedicated timer is defined for the particular NF Type (e.g SMF Discovery). The AMF expects to receive a response from the NRF. If the timer expires while waiting for this response, the AMF considers that the service operation utilizing the timer has failed.

Type / Range

Integer in the range of 100 to 30,000 in units of Millisecond

Default

5000

Name

nrfManagementBlacklist - NRF NF Management Service Blacklist Timer

Syntax

```
--sbiTimersProfileListName <string> --sbiTimerName  
nrfManagementBlacklist --sbiTimerValue <string> [ --sbiTimerUnit  
Second ]
```

Description

The timer defines the duration that an NFManagement service instance is blacklisted when considered unavailable.

Type / Range

Integer in the range of 0 to 3,600 in units of Second

Default

5

Name

nrfPurgeExpiredNfTimer - Purge Expired NF Timer

Syntax

```
--sbiTimersProfileListName <string> --sbiTimerName  
nrfPurgeExpiredNfTimer --sbiTimerValue <string> [ --sbiTimerUnit  
Second ]
```

Description

This timer defines how long expired Entries continue to be selected for use by Connection management after the availability time has expired. These entries can be used up to 1 day for cases where the NRF is not responding.

Type / Range

Integer in the range of 0 or 30 to 86,400 in units of Second

Default

60

Name

nrfRegister - NRF Register Operation Wait Timer

Syntax

```
--sbiTimersProfileListName <string> --sbiTimerName nrfRegister --  
sbiTimerValue <string> [ --sbiTimerUnit Millisecond ]
```

Description

The timer is used to wait for response from NRF for NFRegister operation.

Type / Range

Integer in the range of 100 to 30,000 in units of Millisecond

Default

5000

Name

nrfRegisterBlacklist - NRF Register Operation Wait Timer

Syntax

```
--sbiTimersProfileListName <string> --sbiTimerName  
nrfRegisterBlacklist --sbiTimerValue <string> [ --sbiTimerUnit  
Second ]
```

Description

The timer defines the duration a NRF Management Service Instance is blacklisted during NF Register failure.

Type / Range

Integer in the range of 0 to 3,600 in units of Second

Default

300

Name

nrfRegisterRetry - NRF NFRegister Retry Wait Timer

Syntax

```
--sbiTimersProfileListName <string> --sbiTimerName nrfRegisterRetry  
--sbiTimerValue <string> [ --sbiTimerUnit Second ]
```

Description

The timer defines the wait period between the a failed NRF NFRegister peration and its retry. When value is set to 0 the AMF does not retry the operation

Type / Range

Integer in the range of 0 to 300 in units of Second

Default

10

Name

nrfResponse - NRF Response

Syntax

```
--sbiTimersProfileListName <string> --sbiTimerName nrfResponse --  
sbiTimerValue <string> [ --sbiTimerUnit Millisecond ]
```

Description

When the AMF invokes any NRF service operation, this parameter defines the default timer to be used unless a dedicated timer is defined for the particular service operation. The AMF expects to receive a response from the NRF. If the timer expires while waiting for this response, the AMF considers that the service operation utilizing the timer has failed.

Type / Range

Integer in the range of 100 to 30,000 in units of Millisecond

Default

5000

Name

nrfUpdateRetry - NRF NFUpdate Retry Wait Timer

Syntax

```
--sbiTimersProfileListName <string> --sbiTimerName nrfUpdateRetry --  
sbiTimerValue <string> [ --sbiTimerUnit Second ]
```

Description

The timer defines the wait period between the a failed NRF NFUpdate via PATCH operation and its retry. When value is set to 0 the AMF does not retry the operation

Type / Range

Integer in the range of 0 to 60 in units of Second

Default

10

Name

nssaafResponse - Guard Timer For Receiving Response From NSSAAF

Syntax

```
--sbiTimersProfileListName <string> --sbiTimerName nssaafResponse --  
sbiTimerValue <string> [ --sbiTimerUnit Millisecond ]
```

Description

When the AMF invokes any NSSAAF service operation, this parameter defines the default timer to be used unless a dedicated timer is defined for the particular service or service operation procedure. The AMF expects to receive a response from the NSSAAF. If the timer expires while waiting for this response, the AMF considers that the service or service operation utilising the timer has failed.

Type / Range

Integer in the range of 100 to 60,000 in units of Millisecond

Default

5000

Name

nssfAvailabilityPeriodicUpdate - NSSF Availability Periodic Update

Syntax

```
--sbiTimersProfileListName <string> --sbiTimerName  
nssfAvailabilityPeriodicUpdate --sbiTimerValue <string> [ --  
sbiTimerUnit Minute ]
```

Description

Time in minutes between 2 consecutive Nnssf_NSSAIAvailability Updates from AMF to the NSSF. Upon timer expiration, the AMF will sent an Update to the NSSF irrelevant if there are any changes in the AMF Slice/TA information. When value is 0 (default) this mechanism is disabled.

Type / Range

Integer in the range of 0 or 10 to 14400 in units of Minute

Default

0

Name

nssfAvailabilityRetry - NSSF Availaiblity Retry Wait Timer

Syntax

```
--sbiTimersProfileListName <string> --sbiTimerName
nssfAvailabilityRetry --sbiTimerValue <string> [ --sbiTimerUnit
Second ]
```

Description

The timer defines the wait period between the a failed NSSF Availaiblity update operation and its retry. When value is set to 0 the AMF does not retry the operation

Type / Range

Integer in the range of 0 to 300 in units of Second

Default

10

Name

nssfAvailabilityUpdateWait - NSSF Availability Periodic Update Timer

Syntax

```
--sbiTimersProfileListName <string> --sbiTimerName
nssfAvailabilityUpdateWait --sbiTimerValue <string> [ --sbiTimerUnit
Second ]
```

Description

Defines the period the AMF waits since last change regarding supported Slices/Tracking areas before it sends Nnssf_NSSAIAvailabilityUpdate. This timer is added in order to avoid excessive signalling to NSSF during network re-planning.

Type / Range

Integer in the range of 10 to 300 in units of Second

Default

60

Name

nssfBlacklist - NSSF Blacksit Timer

Syntax

```
--sbiTimersProfileListName <string> --sbiTimerName nssfBlacklist --
sbiTimerValue <string> [ --sbiTimerUnit Second ]
```

Description

The timer defines the duuration a NSSF Instance is blacklisted when considered unavailable.

Type / Range

Integer in the range of 0 to 3,600 in units of Second

Default

300

Name

nssfResponse - NSSF Response Timer

Syntax

```
--sbiTimersProfileListName <string> --sbiTimerName nssfResponse --  
sbiTimerValue <string> [ --sbiTimerUnit Millisecond ]
```

Description

The timer is used to monitor responses from NSSF to the AMF sent requests.

Type / Range

Integer in the range of 100 to 30,000 in units of Millisecond

Default

5000

Name

nssfSubscribeExpiration - NSSF Subscribe Expiration

Syntax

```
--sbiTimersProfileListName <string> --sbiTimerName  
nssfSubscribeExpiration --sbiTimerValue <string> [ --sbiTimerUnit  
Minute ]
```

Description

Used to define the suggested time after which the AMF subscription to NSSF becomes invalid. The time is added in the 'expires' IE during the Subscription towards the NSSF. When this value is set to 0, the AMF will omit the 'expires' IE.

Type / Range

Integer in the range of 0 to 14,400 in units of Minute

Default

1440

Name

nwdafResponse - NWDAF Response

Syntax

```
--sbiTimersProfileListName <string> --sbiTimerName nwdafResponse --  
sbiTimerValue <string> [ --sbiTimerUnit Millisecond ]
```

Description

Guard Timer For Receiving Response From NWDAF. When the AMF invokes any NWDAF service operation, this parameter defines the default timer to be used unless a dedicated timer is defined for the particular service or service operation procedure. The AMF expects to receive

a response from the NWDAF. If the timer expires while waiting for this response, the AMF considers that the service or service operation has failed.

Type / Range

Integer in the range of 100 to 30,000 in units of Millisecond

Default

5000

Name

pcfResponse - Gurad timer for receiving response from PCF

Syntax

```
--sbiTimersProfileListName <string> --sbiTimerName pcfResponse --  
sbiTimerValue <string> [ --sbiTimerUnit Millisecond ]
```

Description

When the AMF invokes any PCF service operation, this parameter defines the default timer to be used unless a dedicated timer is defined for the particular service or service operation procedure. The AMF expects to receive a response from the PCF. If the timer expires while waiting for this response, the AMF considers that the service or service operation utilizing the timer has failed.

Type / Range

Integer in the range of 10 to 10,000 in units of Millisecond

Default

5000

Name

pduSessEstWt4N1N2Msg - PDU Session establishment Wait for N1N1 Message Transfer

Syntax

```
--sbiTimersProfileListName <string> --sbiTimerName  
pduSessEstWt4N1N2Msg --sbiTimerValue <string> [ --sbiTimerUnit  
Second ]
```

Description

Defines the time the AMF waits for N1N2 Message Transfer trigger from SMF during PDU session setup procedure, when AMF has received Create SM context response from the SMF.

Type / Range

Integer in the range of 1 to 60 in units of Second

Default

5

Name

pduSmCtxStatusNotify - PDU SM Context Status Notify

Syntax

```
--sbiTimersProfileListName <string> --sbiTimerName  
pduSmCtxStatusNotify --sbiTimerValue <string> [ --sbiTimerUnit  
Second ]
```

Description

Defines the time the AMF waits for SM context status notify when the AMF expects to receive SM context status notify. AMF expects to receive SM context status notify during -UE/AMF/ SMF triggered PDU session release procedures, -PDU session setup procedures that have been rejected towards the UE after SM context create, and -PDU session setup procedures when the AMF already has a PDU session established for the requested PDU session id. The cmm amfGParm defined setting smContextStatusNotifyRequired further defines the AMF behaviour after this timer expires.

Type / Range

Integer in the range of 1 to 10 in units of Second

Default

8

Name

releaseUeContext - Namf Release UE Context Request

Syntax

```
--sbiTimersProfileListName <string> --sbiTimerName releaseUeContext  
--sbiTimerValue <string> [ --sbiTimerUnit Millisecond ]
```

Description

Supervises receipt of Release UE Context Response from the target AMF. If no response is received, the service operation is considered as successful

Type / Range

Integer in the range of 100 to 30,000 in units of Millisecond

Default

10000

Name

relocateUeContext - Namf Relocate UE Context Request

Syntax

```
--sbiTimersProfileListName <string> --sbiTimerName relocateUeContext  
--sbiTimerValue <string> [ --sbiTimerUnit Millisecond ]
```

Description

Supervises receipt of Relocate UE Context Response from the target AMF. If no response is received, the service operation is considered as failed.

Type / Range

Integer in the range of 100 to 30,000 in units of Millisecond

Default

2000

Name

retrieveSmCtx5g4gHo - Retrieve SM Context 5G to 4G Handover

Syntax

```
--sbiTimersProfileListName <string> --sbiTimerName
retrieveSmCtx5g4gHo --sbiTimerValue <string> [ --sbiTimerUnit
Millisecond ]
```

Description

When the AMF invokes Retrieve Sm Context service operation, as part of 5G to 4G handover, this parameter defines the default timer to be used for the particular service operation and its dedicated use case. If the timer expires while waiting for this response, the AMF considers that the service operation utilizing the timer has failed i.e. Sm Context Retrieval for the associated PDU Session has failed.

Type / Range

Integer in the range of 100 to 30,000 in units of Millisecond

Default

5000

Name

retrieveSmCtx5g4gIdleMob - Retrieve SM Context 5G to 4G Idle Mobility

Syntax

```
--sbiTimersProfileListName <string> --sbiTimerName
retrieveSmCtx5g4gIdleMob --sbiTimerValue <string> [ --sbiTimerUnit
Millisecond ]
```

Description

When the AMF invokes Retrieve Sm Context service operation, as part of 5G to 4G Idle mobility, this parameter defines the default timer to be used for the particular service operation and its dedicated use case. If the timer expires while waiting for this response, the AMF considers that the service operation utilizing the timer has failed i.e. Sm Context Retrieval for the associated PDU Session has failed.

Type / Range

Integer in the range of 100 to 30,000 in units of Millisecond

Default

5000

Name

smfDisc - SMF Discovery Operation Wait Timer

Syntax

```
--sbiTimersProfileListName <string> --sbiTimerName smfDisc --
sbiTimerValue <string> [ --sbiTimerUnit Second ]
```

Description

The timer is used to wait for response from NRF for SMF Discovery operation.

Type / Range

Integer in the range of 1 to 30 in units of Second

Default

5

Name

smfIsolation - SMF Isolation Timer

Syntax

```
--sbiTimersProfileListName <string> --sbiTimerName smfIsolation --  
sbiTimerValue <string> [ --sbiTimerUnit Second ]
```

Description

The timer defines the duration that an SMF service instance is isolated when considered unavailable.

Type / Range

Integer in the range of 0 to 3,600 in units of Second

Default

5

Name

smfResponse - SMF Response Timer

Syntax

```
--sbiTimersProfileListName <string> --sbiTimerName smfResponse --  
sbiTimerValue <string> [ --sbiTimerUnit Millisecond ]
```

Description

When the AMF invokes any SMF service operation, this parameter defines the default timer to be used unless a dedicated timer is defined for the particular service operation and its dedicated use case. The AMF expects to receive a response from the SMF. If the timer expires while waiting for this response, the AMF considers that the service operation utilizing the timer has failed.

Type / Range

Integer in the range of 100 to 30,000 in units of Millisecond

Default

5000

Name

smfReuse - SMF Reuse

Syntax

```
--sbiTimersProfileListName <string> --sbiTimerName smfReuse --  
sbiTimerValue <string> [ --sbiTimerUnit Second ]
```

Description

Defines time to wait for PDU session re-establishment request when SMF has triggered N1N2 Message Transfer service of AMF, and provided SMF Reallocation indication attribute and set this indication as true.

Type / Range

Integer in the range of 1 to 10 in units of Second

Default

2

Name

smsfResponse - Guard timer for receiving response from SMSF

Syntax

```
--sbiTimersProfileListName <string> --sbiTimerName smsfResponse --  
sbiTimerValue <string> [ --sbiTimerUnit Millisecond ]
```

Description

When the AMF invokes any SMSF service operation, this parameter defines the default timer to be used unless a dedicated timer is defined for the particular service or service operation procedure. The AMF expects to receive a response from the SMSF. If the timer expires while waiting for this response, the AMF considers that the service or service operation utilising the timer has failed.

Type / Range

Integer in the range of 100 to 30,000 in units of Millisecond

Default

5000

Name

udmResponse - Guard timer for receiving response from UDM

Syntax

```
--sbiTimersProfileListName <string> --sbiTimerName udmResponse --  
sbiTimerValue <string> [ --sbiTimerUnit Millisecond ]
```

Description

When the AMF invokes any UDM service operation, this parameter defines the default timer to be used unless a dedicated timer is defined for the particular service or service operation procedure. The AMF expects to receive a response from the UDM. If the timer expires while waiting for this response, the AMF considers that the service or service operation utilizing the timer has failed.

Type / Range

Integer in the range of 100 to 30,000 in units of Millisecond

Default

5000

Name

ueContextTransfer - UE Context Transfer

Syntax

```
--sbiTimersProfileListName <string> --sbiTimerName ueContextTransfer  
--sbiTimerValue <string> [ --sbiTimerUnit Millisecond ]
```

Description

Supervises the receipt of the UE Context Transfer response from the old AMF. If no response is received, the operation is considered as failed.

Type / Range

Integer in the range of 100 to 30,000 in units of Millisecond

Default

5000

Name

waitRelocateCancelSrcMme - Wait Relocate Cancel from Source MME

Syntax

```
--sbiTimersProfileListName <string> --sbiTimerName  
waitRelocateCancelSrcMme --sbiTimerValue <string> [ --sbiTimerUnit  
Millisecond ]
```

Description

Supervises receipt of Relocate Cancel Request from source MME after receiving Relocate UE Context Response from target AMF in EPS to 5GS with AMF relocation scenario. When timer expires, initial AMF shall release local resources

Type / Range

Integer in the range of 10 to 1000 in units of Millisecond

Default

500

6.147 cmm sbiTimersProfileList

SBI Timer Profile List. Syntax, description, parameters, and roles for cmm sbiTimersProfileList command.

Syntax

Description

SBI Timer profile list.

Parameters

Name

name - Name of the SBI Timer Profile List

Syntax

```
--name <string>
```

Description

Name of the SBI Timer Profile List.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Roles

Create

sysadmin, manage

Show

6.148 cmm sbiVersionControlProfile

SBI Version Control Profile. Syntax, description, parameters, and roles for cmm sbiVersionControlProfile command.

Syntax

Description

Defines the allowed major API versions for each of the API services the AMF consumes in the given Profile. At least one API version must be defined for each API. An API may have more than one allowed full version. When a new profile is created by default for all APIs are assigned to v1.0.0.

Parameters

Name

sbiVersionControlProfileListName - SBI Version Control Profile List Name

Syntax

--sbiVersionControlProfileListName <string>

Description

Name of SBI version control profile list

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Name

nfServiceName - Network Function Service Name

Syntax

--nfServiceName <list-item>

Description

Network Function Service Name

Class

Required key.

List

- n5gEirEquipmentIdentityCheck - N5G EIR EquipmentIdentity Check - 5GEIR Equipment Identity Check Service
- namfCommunication - Namf Communication - AMF Communication Service
- nausfUEAuthentication - Nausf UEAuthentication - AUSF Authentication Service
- nchfConvergedCharging - Nchf Converged Charging - CHF ConvergedCharging service
- nlmfLocation - Nlmf Location - LMF Location Service
- nnrfAccessToken - Nnrf Access Token Service - NRF Access Token Service

- nrfNFDiscovery - Nrf NF Discovery - NRF Network Function Discovery Service
- nrfNFManagement - Nrf NF Management - NRF Network Function Management Service
- nssaafNssaaService - Nssaaf NSSAA Service - NSSAAF NSSAA service
- nssfNSSAIAvailability - Nssf NSSAI Availability - NSSF Network Slice Availability Update Service
- nssfNSSelection - Nssf NS Selection - NSSF Network Slice Selection Service
- nwdafAnalyticsInfo - NWDAF Analytics Info - NWDAF Analytics Information Service
- nwdafEventsSubscription - NWDAF Events Subscription - NWDAF Events Subscription Service
- npcAMPolicyControl - Npcf AM Policy Control - PCF AM Policy Control Service
- npcUEPolicyControl - Npcf UE Policy Control - PCF UE Policy Control Service
- nsmfPDUSession - Nsmf PDU Session - SMF PDU Session Service
- nsmsfSMSservice - Nsmf SM Service - SMSF SM Service
- nudmSubscriberDataManagement - Nudm Subscriber Data Management - UDM Subscriber Data Management Service
- nudmUEContextManagement - Nudm UE Context Management - UDM UE Context Management Service
- nudsfDataRepository - Nudsf Data Repository - UDSF Data Repository Service

Name

fullVersion - Version

Syntax

--fullVersion <list-item>

Description

The full version of the SBI API.

Class

Required key.

List

- 1.0.0 - v1.0.0 - API version v1.0.0
- 1.0.1 - v1.0.1 - API version v1.0.1
- 1.0.2 - v1.0.2 - API version v1.0.2
- 1.0.3 - v1.0.3 - API version v1.0.3
- 1.0.4 - v1.0.4 - API version v1.0.4

- 1.0.5 - v1.0.5 - API version v1.0.5
- 1.0.6 - v1.0.6 - API version v1.0.6
- 1.0.8 - v1.0.8 - API version v1.0.8
- 1.1.2 - v1.1.2 - API version v1.1.2
- 1.1.3 - v1.1.3 - API version v1.1.3
- 1.1.4 - v1.1.4 - API version v1.1.4
- 1.1.5 - v1.1.5 - API version v1.1.5
- 1.1.6 - v1.1.6 - API version v1.1.6
- 1.1.7 - v1.1.7 - API version v1.1.7
- 1.1.8 - v1.1.8 - API version v1.1.8
- 1.1.10 - v1.1.10 - API version v1.1.10
- 1.1.0 - v1.1.0 - API version 1.1.0
- 1.1.1 - v1.1.1 - API version v1.1.1
- 1.1.11 - v1.1.11 - API version v1.1.11
- 1.2.0 - v1.2.0 - API version v1.2.0
- 1.2.1 - v1.2.1 - API version v1.2.1
- 1.2.2 - v1.2.2 - API version v1.2.2
- 1.2.3 - v1.2.3 - API version v1.2.3
- 1.2.4 - v1.2.4 - API v1.2.4
- 1.2.5 - v1.2.5 - API version v1.2.5
- 1.2.6 - v1.2.6 - API version v1.2.6
- 1.2.7 - v1.2.7 - API version v1.2.7
- 2.0.0 - v2.0.0 - API version v2.0.0
- 2.0.1 - v2.0.1 - API version v2.0.1
- 2.0.2 - v2.0.2 - API version v2.0.2
- 2.0.3 - v2.0.3 - API version v2.0.3
- 2.0.4 - v2.0.4 - API version v2.0.4
- 2.0.5 - v2.0.5 - API version v2.0.5
- 2.1.1 - v2.1.1 - API version v2.1.1
- 2.1.2 - v2.1.2 - API version v2.1.1
- 2.1.3 - v2.1.3 - API version v2.1.3

- 2.1.4 - v2.1.4 - API version v2.1.4
- 2.1.6 - v2.1.6 - API version v2.1.6
- 2.1.7 - v2.1.7 - API version v2.1.7
- 2.2.0 - v2.2.0 - API version v2.2.0
- 2.2.1 - v2.2.1 - API version v2.2.1
- 2.2.2 - v2.2.2 - API version v2.2.2
- 2.2.3 - v2.2.3 - API version v2.2.3
- 2.2.5 - v2.2.5 - API version v2.2.5
- 3.0.0 - v3.0.0 - API version v3.0.0
- 3.1.0 - v3.1.0 - API version v3.1.0

Name

applyVersionControlInDecode - Apply Version Control In Decode

Syntax

--applyVersionControlInDecode <list-item>

Description

This parameter defines if the Full API version is taken into account when Decoding the JSON body of received messages (either Requests or Responses). If set to true IEs that are not supported in that Full API version are ignored.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

enable - Enable

Syntax

--enable <list-item>

Description

This parameter is used to enable or disable sbiVersionControlProfile tuples. User created and System inserted tuples (i.e. tuples automatically created by the system during initial deployment) may be enabled or disabled but only user created tuples may be deleted. At any time at least one enabled sbiVersionControlProfile per nf service must exist.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

6.149 cmm sbiVersionControlProfileList

SBI Version Control Profile List. Syntax, description, parameters, and roles for cmm sbiVersionControlProfileList command.

Syntax**Description**

SBI Version Control Profile List

Parameters**Name**

name - SBI Version Control Profile Name

Syntax

--name <string>

Description

Name of SBI version control profile name

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

useMinVersionAsDefault - Use Minimum Version as Default

Syntax

--useMinVersionAsDefault <list-item>

Description

Defines whether the the highest or lowest supported minor/patch Version that matches the Producer major version will be used when the full version of is unknown.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Roles**Create**

7 CMM CLI commands: cmm sbiVersionProducerControlProfile - cmm zoneCode

CMM CLI command descriptions: syntax, usage, parameters, and user roles.

7.1 cmm sbiVersionProducerControlProfile

SBI Version Producer Control Profile. Syntax, description, parameters, and roles for cmm sbiVersionProducerControlProfile command.

Syntax

Description

Defines the allowed API versions for each of the API services the own AMF supports as a Producer. Only one Profile List ('default') is supported.

Parameters

Name

sbiVersionProducerControlProfileListName - SBI Version Producer Control Profile List Name

Syntax

```
--sbiVersionProducerControlProfileListName <string>
```

Description

Name of SBI version producer control profile list.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

nfServiceName - Network Function Service Name

Syntax

```
--nfServiceName <list-item>
```

Description

Name of the AMF producer service.

Class

Required key.

List

- namfCommunication - Namf Communication - Namf Communication Service

- namfEventExposure - Namf Event Exposure - Namf Event Exposure Service
- namfLocation - Namf Location - Namf Location Service
- namfMT - Namf MT - Namf Mobile Terminated Service

Name

majorVersion - Major Version

Syntax

--majorVersion <list-item>

Description

The major version of the SBI API.

Class

Required key.

List

- v1 - Version 1

Name

fullVersion - Full Version

Syntax

--fullVersion <list-item>

Description

The full version to be used as the default for the specified AMF producer service and major version

Class

Required on create.

List

- 1.0.1 - v1.0.1 - API version v1.0.1
- 1.0.2 - v1.0.2 - API version v1.0.2
- 1.0.3 - v1.0.3 - API version v1.0.3
- 1.0.4 - v1.0.4 - API version v1.0.4
- 1.0.5 - v1.0.5 - API version v1.0.5
- 1.0.6 - v1.0.6 - API version v1.0.6
- 1.0.8 - v1.0.8 - API version v1.0.8
- 1.1.2 - v1.1.2 - API version v1.1.2
- 1.1.3 - v1.1.3 - API version v1.1.3
- 1.1.4 - v1.1.4 - API version v1.1.4

- 1.1.7 - v1.1.7 - API version v1.1.7
- 1.1.8 - v1.1.8 - API version v1.1.8
- 1.1.10 - v1.1.10 - API version v1.1.10
- 1.1.11 - v1.1.11 - API version v1.1.11
- 1.2.1 - v1.2.1 - API version v1.2.1
- 1.2.2 - v1.2.2 - API version v1.2.2
- 1.2.3 - v1.2.3 - API version v1.2.3
- 1.2.4 - v1.2.4 - API version v1.2.4

Name

applyVersionControlInDecode - Apply Version Control In Decode

Syntax

--applyVersionControlInDecode <list-item>

Description

This parameter defines if the Full API version is taken into account when Decoding the JSON body of received messages (either Requests or Responses). If set to true IEs that are not supported in that Full API version are ignored.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

fourthVersionField - Fourth Version Field

Syntax

--fourthVersionField <string>

Description

Additional optional version field in the API version of the Service Instance. When set this string field is appended to the full major.minor.patch API version registered to the NRF using a '.' as a delimiter.

Class

Optional.

Type / Range

Default

""

Roles**Show**

sysadmin, manage, monitor

Modify

sysadmin, manage

List

sysadmin, manage, monitor

7.2 cmm sbiVersionProducerControlProfileList

SBI Version Producer Control Profile List. Syntax, description, parameters, and roles for cmm sbiVersionProducerControlProfileList command.

Syntax**Description**

SBI Version Producer Control Profile List. Only one list 'default' is supported.

Parameters**Name**

name - SBI Version Producer Control Profile Name

Syntax

--name <string>

Description

Name of SBI version producer control profile name

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Roles**Show**

sysadmin, manage, monitor

List

sysadmin, manage, monitor

7.3 cmm sccpSignallingPoint

SCCP Signalling Point. Syntax, description, parameters, and roles for cmm sccpSignallingPoint command.

Syntax

Description

Configure, list and show SCCP signalling point.

Parameters

Name

signallingPointId - SCCP signalling point identifier

Syntax

--signallingPointId <integer>

Description

SCCP signalling point identifier.

Class

Required key.

Type / Range

Integer in the range of 0 to 12000

Name

signallingNetwork - Signalling network

Syntax

--signallingNetwork <list-item>

Description

Identify signalling network IN0 ... international network number 0 IN1 ... international network number 1 NAO ... national network number 0 NA1 ... national network number 1.

Class

Required on create, not modifiable.

List

- IN0 - International network number 0.
- IN1 - International network number 1.
- NAO - National network number 0.

- NA1 - National network number 1.

Name

signallingPointCode - Signalling point code

Syntax

--signallingPointCode <integer>

Description

Identify signalling point code decimal number 0 ... 16777215.

Class

Required on create, not modifiable.

Type / Range

Integer in the range of 0 to 16,777,215

Name

spcState - Signalling point code state

Syntax

--spcState <list-item>

Description

Identify state change: ACT ... activate INA ... inactivate.

Class

Required on create.

List

- ACT - Activate - Specify state change activate.
- INA - Inactivate - Specify state change inactivate.

Name

csbg - Concerned signalling points broadcast group

Syntax

--csbg <integer>

Description

Broadcast group of concerned signalling points for SP broadcast.

Class

Optional.

Type / Range

Integer in the range of 0 to 65,535

Default

0

Name

spcParamSetName - Signalling point code parameter set name

Syntax

--spcParamSetName <string>

Description

Identify signalling point parameter set name The following parameter sets are predefined:
blue ... BLUE for signalling parameters defined by International Telecommunications Union (ITU) in Q.700 - Q.716, Blue Book
aint ... A-INT for A interface e.g. between MSC and BSC
white ... WHITE for signalling parameters defined by International Telecommunications Union (ITU) in Q.700 - Q.716 3/93, White Book or ... use own created set name (in spcParamSet)

Restrictions

a record must exist in spcParamSet with name of spcParamSetName

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Default

blue

Show

sysadmin, manage, monitor

Modify

sysadmin, manage

Delete

sysadmin, manage

List

sysadmin, manage, monitor

7.4 cmm sccpSubsystem

SCCP Subsystem. Syntax, description, parameters, and roles for cmm sccpSubsystem command.

Syntax

Description

Configure, list and show SCCP signalling point subsystem.

Parameters

Name

subsystemId - SCCP subsystem identifier

Syntax

--subsystemId <integer>

Description

SCCP subsystem identifier.

Class

Required key.

Type / Range

Integer in the range of 0 to 12000

Name

subsystemName - SCCP subsystem name

Syntax

--subsystemName <string>

Description

Identify subsystem name: identifier 1 ... 5 character.

Restrictions

subsystemName must be unique within sccpSubsystem

Class

Required on create, not modifiable.

Type / Range

Digit string of length 1 to 5 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Name

subsystemNumber - SCCP subsystem number

Syntax

--subsystemNumber <string>

Description

Identify subsystem number: hexadecimal number 2 ... FE.

Restrictions

subsystemNumber must be unique within sccpSubsystem

Class

Required on create, not modifiable.

Type / Range

Digit string of length 1 to 2 with the allowed pattern of ([2-9a-fA-F][0][2-9a-fA-F][fF][0-9a-eA-E][1-9a-eA-E][0-9a-fA-F])

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Modify

sysadmin, manage

Delete

sysadmin, manage

List

sysadmin, manage, monitor

7.5 cmm sccpSubsystemInfo

SCCP Subsystem Info. Syntax, description, parameters, and roles for cmm sccpSubsystemInfo command.

Syntax**Description**

Display the SCCP subsystems configured for a specific point code and display them together with the currently known status.

Parameters**Name**

network - Signalling Network

Syntax

--network <list-item>

Description

Use this parameter to specify the symbolic name of the signalling network. Allowed values IN0,IN1,NA0,NA1

Restrictions

This parameter is required if --spc has been also used.

Class

Required on create.

List

- IN0 - International network number 0.
- IN1 - International network number 1.
- NA0 - National network number 0.
- NA1 - National network number 1.

Name

spc - Signalling Point Code

Syntax

--spc <integer>

Description

Use this parameter to specify the signalling point codes of those signalling points where the signalling link sets, whose state data you wish to output, lead to

Restrictions

If this parameter is specified, then also --network parameter is required.

Class

Optional.

Type / Range

Integer in the range of 0 to 16,777,215

Roles**List**

sysadmin, manage, monitor

7.6 cmm sccpSubsystemList

SCCP Subsystem List. Syntax, description, parameters, and roles for cmm sccpSubsystemList command.

Syntax**Description**

Configure, list and show SCCP subsystem list.

Parameters

Name

signallingPointId - SCCP signalling point identifier

Syntax

```
--signallingPointId <integer>
```

Description

SCCP signalling point identifier.

Restrictions

record with this id must exist in sccpSignallingPoint. Max number of list entries per sccpSignallingPoint is 20.

Class

Required key.

Type / Range

Integer in the range of 0 to 12000

Name

subsystemId - SCCP subsystem identifier

Syntax

```
--subsystemId <integer>
```

Description

SCCP subsystem identifier.

Restrictions

record with this id must exist in sccpSubsystem

Class

Required key.

Type / Range

Integer in the range of 0 to 12000

Name

albfg - Broadcast group of affected subsystems for local broadcast

Syntax

```
--albfg <integer>
```

Description

Broadcast group of affected subsystems for local broadcast.

Class

Optional.

Type / Range

Integer in the range of 0 to 65,535

Default

0

Name

asbg - Broadcast group of affected subsystems for sp broadcast

Syntax

--asbg <integer>

Description

Broadcast group of affected subsystems for sp broadcast.

Class

Optional.

Type / Range

Integer in the range of 0 to 65,535

Default

0

Name

subParamSetName - SCCP subsystem parameter set name

Syntax

--subParamSetName <string>

Description

identify subsystem parameter set name The following parameter sets are predefined (in sccpsubsystemparamsetdefault): gener ... GENER for general use in other than with A interface aint ... A-INT for A interface, for example, between MSC and BSC or ... use own created set name (in subParamSet)

Restrictions

a record must exist in subParamSet with name of subParamSetName

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Default

gener

Name

subStatusTest - SCCP subsystem test

Syntax

--subStatusTest <list-item>

Description

Identify subsystem status test: yes ... subsystem test is allowed no ... subsystem test is not allowed parameter is valid, only if the white book management is used in signalling point parameter set. default is yes.

Class

Optional.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

Yes

Name

subsystemState - SCCP subsystem state

Syntax

--subsystemState <list-item>

Description

Identify state change: ACT ... active INA ... inactivate CINA ... inactivate coordinated way.

Class

Optional.

List

- ACT - Active - Active.
- CINA - Inactive coordinated - Inactive coordinated.
- INA - Inactive - Inactive.

Default

ACT

7.7 cmm scefGrp

SCEF Group Profile. Syntax, description, parameters, and roles for cmm scefGrp command.

Syntax**Description**

Administer SCEF Group Profile.

Parameters**Name**

scefGrpListName - SCEF group profile name

Syntax

--scefGrpListName <string>

Description

SCEF group profile name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

scefOrderId - SCEF order in group

Syntax

--scefOrderId <integer>

Description

SCEF order in group.

Class

Required key.

Type / Range

Integer in the range of 1 to 16

Name

scefName - SCEF name

Syntax

--scefName <string>

Description

SCEF name specified in remote end point configuration.

Class

Required on create, not modifiable.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

lbWeight - Weight for load balancing

Syntax

--lbWeight <integer>

Description

Weight for load balancing algorithm.

Class

Optional.

Type / Range

Integer in the range of 0 to 100

Default

0

Roles**Create**

sysadmin, manage

sysadmin, manage

Delete

sysadmin, manage

List

sysadmin, manage, monitor

7.8 cmm scefGrpList

SCEF Group Profile List. Syntax, description, parameters, and roles for cmm scefGrpList command.

Syntax

Description

Administer SCEF Group Profile List.

Parameters

Name

name - SCEF group profile name

Syntax

--name <string>

Description

SCEF group profile name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Roles

Create

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

sysadmin, manage, monitor

7.9 cmm sceflnputSet

SCEF Input Set. Syntax, description, parameters, and roles for cmm sceflnputSet command.

Syntax

Description

SCEF input set.

Parameters

Name

scefInputSetListName - SCEF input set list name

Syntax

--scefInputSetListName <string>

Description

SCEF input set list name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

scefInputFqdnName - SCEF input set FQDN name

Syntax

--scefInputFqdnName <string>

Description

List name of SCEF input set FQDN.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Roles

Create

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

sysadmin, manage, monitor

7.10 cmm scefInputSetList

SCEF Input Set List. Syntax, description, parameters, and roles for cmm scefInputSetList command.

Syntax

Description

SCEF Input Set List.

Parameters

Name

name - SCEF input set list name

Syntax

--name <string>

Description

Name of SCEF input set list.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Roles

Create

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

sysadmin, manage, monitor

7.11 cmm scefProfile

SCEF Profile. Syntax, description, parameters, and roles for `cmm scefProfile` command.

Syntax

Description

Defines profile for SCEF settings

Parameters

Name

name - Profile Name

Syntax

--name <string>

Description

Profile Name

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

allowExtScefRefId - Allow Extended SCEF Reference ID

Syntax

--allowExtScefRefId <list-item>

Description

Specifies whether the MME is to allow negotiation of the use of extended SCEF reference IDs for the UEs-in-Area Monitoring Event configured by the SCEF directly to the MME. The default is false.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Recommended

true

Name

enbTargetIdWithoutHeader - eNodeB-ID Target Without Header

Syntax

--enbTargetIdWithoutHeader <list-item>

Description

When the MME receives an event configuration for 'UEs in Area' that contains eNodeB-ID, and when the MME sends an event report for 'UEs in Area' that contains eNodeB-ID, this

flag specifies whether the leading octets 1-4 for the eNodeB-ID AVP are to be excluded. See 29.274 Section 8.51 for encoding details. The default is false.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

imsiGroupSupported - IMSI Group Supported

Syntax

--imsiGroupSupported <list-item>

Description

Specifies whether the IMSI Group Identifier is supported. This is used for filtering the Number of UEs Present in a Geographical Area Monitoring Event Report.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

includeServingPlmnRateControl - Include Serving PLMN Rate Control

Syntax

--includeServingPlmnRateControl <list-item>

Description

Specifies whether the MME is to include serving PLMN rate control in the T6a:CMR message to the SCEF, if applicable for the UE. The default is false.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

locationReportTargetIdWithoutHeader - Location Report Target ID Without Header

Syntax

--locationReportTargetIdWithoutHeader <list-item>

Description

When the MME sends a Location Event Report containing an ENodeB-Identifier, this flag specifies whether the eNodeB-ID should be sent without leading octets 1-4. See 29.274 Section 8.51 for the message layout. The default is False.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

monNumberUesInGeographicArea - Number of UEs in Geographic Area Monitoring

Syntax

--monNumberUesInGeographicArea <list-item>

Description

Specifies whether a SCEF is allowed to request the Number of UEs in a Geographic Location Monitoring Event.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Roles**Create**

7.12 cmm scefToGrp

SCEF To Group. Syntax, description, parameters, and roles for `cmm scefToGrp` command.

Syntax

Description

This command is used to administer the SCEF To Group Mapping. The 'shutdown' parameter is used to enable/disable the mapping rule.

Parameters

Name

mappingId - Mapping ID

Syntax`--mappingId <integer>`**Description**

Mapping ID.

Class

Required key.

Type / Range

Integer in the range of 1 to 128

Name

cirDestHostFqdnName - CIR Destination Host FQDN Name

Syntax`--cirDestHostFqdnName <string>`**Description**

Specifies the Destination Host FQDN to be used when routing a CIR to an IWK-SCEF

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

cirDestRealmFqdnName - CIR Destination Realm FQDN Name

Syntax

--cirDestRealmFqdnName <string>

Description

Specifies the Destination Realm FQDN to be used when routing a CIR to an IWK-SCEF.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

draDestHostFqdnName - DRA destination host name

Syntax

--draDestHostFqdnName <string>

Description

If MME does not have destination host in VLR (UE shows up for the first time), and the destination is a DRA, MME uses the value of this new field to populate destination host AVP in AIR and ULR.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

draDestRealmFqdnName - DRA destination realm name

Syntax

--draDestRealmFqdnName <string>

Description

If MME does not have destination realm in VLR (UE shows up for the first time), and the destination is a DRA, MME uses the value of this new field to populate destination realm AVP in AIR and ULR.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

hssGrpListName - HSS group list name

Syntax

--hssGrpListName <string>

Description

Name of HSS group list.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

iwkScef - IWK-SCEF

Syntax

--iwkScef <list-item>

Description

Specifies whether the peer supports the 3GPP IWK-SCEF function.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

loadBalance - Load balance

Syntax

--loadBalance <list-item>

Description

Indicates load balancing options.

Class

Optional.

List

- all - Balance load on all S6ad links based on weight.
- none - No load balancing between S65ad links.
- priority group - Balance load on all S6ad links based on group priority. the primary group is the set of HSS/DRA that have the same highest weight. the secondary group is the set of HSS/DRA that have the same second highest weight value, etc. the last N-ary group is always the group with 0 weight (if used).

Default

none

Name

plmnName - Mobile network name

Syntax

--plmnName <string>

Description

Name that identifies the mobile network.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

scefGrpListName - SCEF group list name

Syntax

--scefGrpListName <string>

Description

Name of SCEF group list.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

scefInputSetListName - SCEF input set list name

Syntax

--scefInputSetListName <string>

Description

SCEF input set list name.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

scefMappingType - SCEF mapping type

Syntax

--scefMappingType <list-item>

Description

SCEF mapping type.

Class

Optional.

List

- all - Specify SCEF mapping type of set.
- set - Specify SCEF mapping type of set.

Default

all

Name

shutdown - Shutdown

Syntax

--shutdown <list-item>

Description

Indicates if the mapping rule is active. if shutdown is true, the rule behaves as if it is deleted.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Modify

sysadmin, manage

Delete

sysadmin, manage

List

sysadmin, manage, monitor

7.13 cmm schedule

schedule. Syntax, description, parameters, and roles for **cmm schedule** command.

Syntax**Description**

Create, list, modify, delete and show schedule jobs.

Parameters**Name**

schedJobName - Job name

Syntax

--schedJobName <list-item>

Description

Schedule-job name.

Class

Required key.

List

- backup - Specify schedule job of backup.
- remote-copy - Specify schedule job of remote copy.
- rsp - Specify schedule job of RSP.
- secure-copy - Specify schedule job of secure copy.

Name

dayOfMonth - Day of month

Syntax

--dayOfMonth <string>

Description

Schedule-job day of month.

Class

Required on create.

Type / Range

Digit string of length 1 to 50 with the allowed pattern of `(\*(?:\d+)?(?:3[01][12]\d|0?[1-9])(?:-(?:3[01][12]\d|0?[1-9])(?:\d+)?(?:,|(?:3[01][12]\d|0?[1-9])(?:-(?:3[01][12]\d|0?[1-9])(?:\d+)?)?*))`

Name

dayOfWeek - Day of week

Syntax

--dayOfWeek <string>

Description

Schedule-job day of week.

Class

Required on create.

Type / Range

Digit string of length 1 to 50 with the allowed pattern of `(\*(?:\d+)?(?:[0-6])(?:-(?:[0-6])(?:\d+)?(?:,|(?:[0-6])(?:-(?:[0-6])(?:\d+)?)*((?:Mon|Tue|Wed|Thu|Fri|Sat|Sun)(?:-(?:Mon|Tue|Wed|Thu|Fri|Sat|Sun)(?:\d+)?(?:,|(?:Mon|Tue|Wed|Thu|Fri|Sat|Sun)(?:-(?:Mon|Tue|Wed|Thu|Fri|Sat|Sun)(?:\d+)?)*))`

Name

hour - Hour

Syntax

--hour <string>

Description

Schedule-job hour.

Class

Required on create.

Type / Range

Digit string of length 1 to 50 with the allowed pattern of (*(?:\V\d+)?(?:2[0-3][01]?d)(?:- (?:2[0-3][01]?d)(?:\V\d+)?(?:, (?:2[0-3][01]?d)(?:-(?:2[0-3][01]?d)(?:\V\d+)?))*))

Name

minute - Minute

Syntax

--minute <string>

Description

Schedule-job minute.

Class

Required on create.

Type / Range

Digit string of length 1 to 50 with the allowed pattern of (*(?:\V\d+)?(?:[0-5]?d)(?:-(?: [0-5]?d)(?:\V\d+)?(?:, (?:[0-5]?d)(?:-(?:[0-5]?d)(?:\V\d+)?))*))

Name

month - Month

Syntax

--month <string>

Description

Schedule-job month.

Class

Required on create.

Type / Range

Digit string of length 1 to 50 with the allowed pattern of (*(?:\V\d+)?(?:1[012][1-9])(?:- (?:1[012][1-9])(?:\V\d+)?(?:, (?:1[012][1-9])(?:-(?:1[012][1-9])(?:\V\d+)?))**(?:Jan|Feb| Mar|Apr|May|Jun|Jul|Aug|Sep|Oct|Nov|Dec)(?:-(?:Jan|Feb|Mar|Apr|May|Jun|Jul|Aug|Sep|Oct| Nov|Dec)(?:\V\d+)?(?:, (?:Jan|Feb|Mar|Apr|May|Jun|Jul|Aug|Sep|Oct|Nov|Dec)(?:-(?:Jan|Feb| Mar|Apr|May|Jun|Jul|Aug|Sep|Oct|Nov|Dec)(?:\V\d+)?))*))

7.14 cmm scpDomain

SCP Domain. Syntax, description, parameters, and roles for `cmm scpDomain` command.

Syntax

Description

Links a Domain to the CMM scpDomain list. A SCP Domain may be added only once in a list.

Parameters

Name

scpDomainListName - SCP Domain List Name

Syntax

--scpDomainListName <string>

Description

SCP Domain List Name

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of `[0-9a-zA-Z\.\_:@]*`

Name

domain - SCP Domain

Syntax

--domain <string>

Description

SCP Domain

Class

Required key.

Type / Range

Digit string of length 1 to 100 with the allowed pattern of [0-9a-zA-Z.-]*

Roles**Create**

sysadmin, manage

7.15 cmm scpDomainList

SCP Domain List. Syntax, description, parameters, and roles for cmm scpDomainList command.

Syntax**Description**

The list of SCP Domains CMM belongs to. Only one default List named 'default' exists. The list can have up to 127 domains.

Parameters**Name**

name - Name

Syntax

--name <string>

Description

Name of the list. Only one list exists

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

"default"

Roles**Show**

sysadmin, manage, monitor

List

sysadmin, manage, monitor

7.16 cmm sctpAssociationInfo

M3UA/SCTP Association Information. Syntax, description, parameters, and roles for cmm sctpAssociationInfo command.

Syntax**Description**

Displays the status of the SCTP associations that are used for M3UA signaling. Shows all the SCTP associations used by M3UA along with their respective status.

Parameters

N/A

Roles**List**

sysadmin, manage, monitor

7.17 cmm sctpProfile

SCTP Profile. Syntax, description, parameters, and roles for cmm sctpProfile command.

Syntax

Description

This command is used to administer an SCTP Profile and includes parameters for defining the maximum number of retransmissions, retransmission timeouts, SCTP acknowledgement frequency and period, and heartbeat interval.

Parameters

Name

name - SCTP profile name

Syntax

--name <string>

Description

SCTP profile name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Name

assoMaxRetrans - Max association retrans

Syntax

--assoMaxRetrans <integer>

Description

Maximum association retransmissions.

Class

Optional.

Type / Range

Integer in the range of 1 to 50

Default

10

Name

cookieLife - Cookie life

Syntax

--cookieLife <integer>

Description

Valid cookie life time frame in units of seconds.

Class

Optional.

Type / Range

Integer in the range of 5 to 120 in units of Second

Default

60

Name

description - Description

Syntax

--description <string>

Description

Profile description.

Class

Optional.

Type / Range

Digit string of length 0 to 160 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

"

Name

hbInterval - Heartbeat interval

Syntax

--hbInterval <integer>

Description

Heartbeat interval in units of seconds.

Class

Optional.

Type / Range

Integer in the range of 1 to 300 in units of Second

Default

30

Name

maxInitRetrans - Max init retrans

Syntax

--maxInitRetrans <integer>

Description

Maximum initial retransmissions.

Class

Optional.

Type / Range

Integer in the range of 1 to 25

Default

8

Name

mtuSize - MTU Size

Syntax

--mtuSize <integer>

Description

Maximum transmission unit size in bytes.

Class

Optional.

Type / Range

Integer in the range of 512 to 9000 in units of Byte

Default

1500

Name

pathMaxRetrans - Max path retrans

Syntax

--pathMaxRetrans <integer>

Description

Maximum path retransmissions.

Class

Optional.

Type / Range

Integer in the range of 1 to 25

Default

5

Name

rtoInitValid - RTO initial value

Syntax

--rtoInitValid <integer>

Description

Initial retransmission timeout in units of ms.

Class

Optional.

Type / Range

Integer in the range of 10 to 10,000 in units of Millisecond

Default

300

Name

rtoMax - RTO maximum

Syntax

--rtoMax <integer>

Description

Maximum retransmission timeout in units of ms.

Class

Optional.

Type / Range

Integer in the range of 20 to 10,000 in units of Millisecond

Default

400

Name

rtoMin - RTO minimum

Syntax

--rtoMin <integer>

Description

Minimum retransmission timeout in units of ms.

Class

Optional.

Type / Range

Integer in the range of 10 to 5,000 in units of Millisecond

Default

50

Name

sackFreq - SACK frequency

Syntax

--sackFreq <integer>

Description

SCTP acknowledgment frequency.

Class

Optional.

Type / Range

Integer in the range of 1 to 5

Default

2

Name

sackPeriod - SACK period

Syntax

--sackPeriod <integer>

Description

SCTP acknowledgment period in units of ms.

Class

Optional.

Type / Range

Integer in the range of 0 to 500 in units of Millisecond

Default

200

7.18 cmm secureCopySetup

Secure Copy Setup. Syntax, description, parameters, and roles for cmm secureCopySetup command.

Syntax

Description

Create, list, modify, delete and show secure-copy parameters.

Parameters

Name

secureId - Secure Copy Name

Syntax

--secureId <list-item>

Description

Secure Copy Name

Class

Required key.

List

- remote-config - Specify remote copy of remote-config.

Name

privateKeyFile - Private key file name

Syntax

--privateKeyFile <string>

Description

Absolute path of the private key file name. Example: /tmp/privkey.pem

Class

Required on create.

Type / Range

Digit string of length 1 to 100 with the allowed pattern of [0-9a-zA-Z\._&(),/]*

Name

signedCertFile - Signed certificate file name

Syntax

--signedCertFile <string>

Description

Absolute path of the signed certificate file name. Example: /tmp/certificate

Class

Required on create.

Type / Range

Digit string of length 1 to 100 with the allowed pattern of [0-9a-zA-Z\._&(),/]*

Name

remoteDir - Remote directory

Syntax

--remoteDir <string>

Description

Remote-copy directory.

Class

Optional.

Type / Range

Digit string of length 1 to 512 with the allowed pattern of ^/(/?[\w\-\~\.\,])+/?\$

Name

remotelp - Remote IP Address

Syntax

--remoteIp <string>

Description

Remote IP-address.

Class

Optional.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

remoteLogin - Remote login name

Syntax

--remoteLogin <string>

Description

Remote login name.

Class

Optional.

Type / Range

User name in Linux format. Username must start with a letter, a digit, an underscore or a full stop. The last character must be a letter, a digit, an underscore, a hyphen, a dollar sign or a full stop. The other characters must be letters, digits, underscores, hyphens or full stops. The length must be between 1 and 32 characters.

Name

secondaryRemotelp - Secondary Remote IP Address

Syntax

--secondaryRemoteIp <string>

Description

Secondary Remote IP Address. If backup to the first remotelP fails, this IP will be attempted. If not populated there will be no secondary attempt.

Class

Optional.

Type / Range

Digit string of length 0 or 2 to 39 with the allowed pattern of [0-9a-f\.:]*

7.19 cmm securityParam

securityParam. Syntax, description, parameters, and roles for **cmm securityParam** command.

Syntax**Description**

Configure and show security parameters.

Parameters**Name**

attachRestriction - Attach restriction

Syntax

--attachRestriction <list-item>

Description

This parameter defines the non ciphering subscriber attach restriction in flexi NS SGSN in the 2G access, true ... attach restriction is in use false ... attach restriction is not in use.

Class

Optional, not filterable on list.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

authenticationMode - Authentication mode

Syntax

```
--authenticationMode <list-item>
```

Description

This parameter defines the authentication mode, act ... Authentication is in use deact ... Authentication is not in use whenNeeded ... Authentication when needed Note, when act is in use, SGSN follows repetition rates configured under plmnParam like iuPeriodicRaAuth etc

Class

Optional, not filterable on list.

List

- act - Active - Active.
- deact - Deactive - Deactive.
- whenNeeded - When needed - When needed.

Default

whenNeeded

Name

cipheringMode - Ciphering mode

Syntax

```
--cipheringMode <list-item>
```

Description

This parameter defines the ciphering mode in flexi NS SGSN in 2G access mode. the parameter deals with non-standard A5 algorithms, true ... ciphering mode is in use false ... ciphering mode is not in use.

Class

Optional, not filterable on list.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

imeiCheckMode - IMEI check mode

Syntax

--imeiCheckMode <list-item>

Description

This parameter defines the IMEI check mode, true ... IMEI check is in use false ... IMEI check is not in use.

Class

Optional, not filterable on list.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

imeiRequestMode - IMEI request mode

Syntax

--imeiRequestMode <list-item>

Description

This parameter defines the IMEI request mode, true ... IMEI request optimization mode is in use. when IMEI is already known, SGSN does not request the IMEI from ME false ... IMEI request optimization mode is not in use. SGSN requests the IMEI from ME, even if IMEI is already known.

Class

Optional, not filterable on list.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

ptmsiSignatureMode - PTMSI signature mode

Syntax

--ptmsiSignatureMode <list-item>

Description

This parameter defines the packet temporary mobile subscriber identity (PTMSI) signature reallocation mode, true ... PTMSI signature is in use false ... PTMSI signature is not in use.

Class

Optional, not filterable on list.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

umtsAttachRestriction - UMTS attach restriction

Syntax

--umtsAttachRestriction <list-item>

Description

This parameter defines the usage of non ciphering subscriber UMTS attach restriction, true ... UMTS attach restriction is in use false ... UMTS attach restriction is not in use.

Class

Optional, not filterable on list.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

umtsCipheringMode - UMTS ciphering mode

Syntax

--umtsCipheringMode <list-item>

Description

This parameter defines the UMTS ciphering mode in flexi NS SGSN. the parameter deals with non-standard A5 algorithms, true ... UMTS ciphering mode is in use false ... UMTS ciphering mode is not in use.

Class

Optional, not filterable on list.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

id - SecurityParams id

Syntax

config

Description

SecurityParams ID. just type 'config' here.

Class

Required value.

List

- config - Specify security parameters identifier of config.

Roles**Show**

sysadmin, manage, monitor

Modify

sysadmin, manage

7.20 cmm serviceAreaRestrictionItem

Service Area Restriction Item. Syntax, description, parameters, and roles for cmm serviceAreaRestrictionItem command.

Syntax

Description

Service Area Restriction Item

Parameters

Name

serviceAreaRestrictionListName - Service Area Restriction List Name

Syntax

--serviceAreaRestrictionListName <string>

Description

Service Area Restriction List Name

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

minTac - Min Tracking Area Code

Syntax

--minTac <integer>

Description

Minimum TAC value in defining set of TACs to update, used with maxtac. TAC range can only be up to 16 and the max number of serviceAreaRestrictionItem is 2.

Class

Required key.

Type / Range

Integer in the range of 0 to 16777215

Name

maxTac - Max Tracking Area Code

Syntax

--maxTac <integer>

Description

Maximum TAC value in defining set of TACs to update, used with mintac. TAC range can only be up to 16 and the max number of serviceAreaRestrictionItem is 2.

Class

Required key.

Type / Range

Integer in the range of 0 to 16777215

7.21 cmm serviceAreaRestrictionList

Service Area Restriction List. Syntax, description, parameters, and roles for cmm serviceAreaRestrictionList command.

Syntax

Description

Service Area Restriction List

Parameters

Name

name - Service Area Restriction List Name

Syntax

--name <string>

Description

Service Area Restriction List Name. Maximum of 1024 list entries can be created.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

sysadmin, manage, monitor

7.22 cmm servicelp

Service IP. Syntax, description, parameters, and roles for cmm serviceIp command.

Syntax

Description

This command is used to administer a Service IP and includes parameters for defining the pool type, ID, and member ID, service IP address, subnet ID and location, network interface type, and assignment type. For Multiple IPDS, the Service IPs have to be defined on all non 0 IPDS pools for the following interfaces: - S1MME* - Meaning any S1MME Interface 1-9 and Multihoming - M3 - M3INTF1 - M3INTF2 - S11 - S11U For Multiple IPDS the remaining IPDS interfaces can only be defined on IPDS pool 0.

Parameters

Name

poolType - Pool type

Syntax

--poolType <list-item>

Description

Pool (service) type.

Class

Required key.

List

- ALMS - Alarm Service - Alarm Service.
- CPPS - Control plane processing service - Control plane processing service.
- CTCS - Call Trace Collection service - Call Trace Collection service.
- DBS - Database service - Database service.
- EEMS - Event Exposure Management service - Event Exposure Management service.
- IPDS - IP director service - IP director service.

- IPPS - IP packet processing service - IP packet processing service.
- LIHS - Lawful Interception Handling service
- MLIS - Machine Learning Intelligence Service
- NECC - Network element cluster controller - Network element cluster controller.
- NWDS - Network Data Service - NWDAF service
- PAPS - Packet processing service - Packet processing service.
- PCMS - Per Call Measurements Data Service - Per Call Measurements Data (PCMD) Service
- RCIS - Radio Capability Information storage Service
- SFDS - SCTP flow distributor service
- UCDS - User equipment Context Data-dump Service
- UFDS - UDP flow distributor service

Name

poolId - Pool id

Syntax

--poolId <integer>

Description

Pool identification number.

Class

Required key.

Type / Range

Integer in the range of 0 to 63

Name

poolMemberId - Pool member ID

Syntax

--poolMemberId <integer>

Description

Pool member identification number.

Class

Required key.

Type / Range

Integer in the range of 0 to 10

Name

niType - Network interface type

Syntax

--niType <list-item>

Description

Network interface type.

Class

Required key.

List

- AIML_DATA_STREAM - AI ML Data Stream - Specify network interface of AIML_DATA_STREAM interface.
- ALMS_ACCESS - Specify the network interface of the ALMS service.
- AMF - Specify the network interface of AMF on IPDS
- ANALYTICSSRV - Specify network interface ANALYTICSSRV interface on the NECC.
- BFDSVC - Specify the network interface of BFDSVC for the L3NS on IPDS
- BFDTRANS - BFSTRANS - Specify network interface of bidirectional forwarding transmission interface.
- BP - Specify network interface of Bp interface for CDR access by the billing domain.
- CTSTREAM - Specify network interface CTSTREAM on CTCS.
- DEFAULT - Specify network interface of default.
- DNS - Specify network interface of DNS interface to the domain name server.
- GA - Specify network interface of Ga interface to a charging gateway.
- GBAUTO - Specify network interface of gb auto interface to a BSC.
- GBNS - Specify network interface of gb NS interface to a BSC.
- GN - Specify network interface of Gn interface to an SGSN.
- GN_2G_DATA - Specify network interface of Gn interface for 2G data.
- GN_3G_DATA - Specify network interface of Gn interface for 3G data.
- GN_C - Specify network interface of Gn control interface to a GGSN.
- INFRA_ACCESS - Specify network interface of infra access interface.
- IU_DATA - Specify network interface of iu interface for data to an RNC.
- M3 - Specify network interface of M3 interface to an eNodeB.
- M3INTF1 - Specify network interface of M3 multi-homed interface 1 to an eNodeB.
- M3INTF2 - Specify network interface of M3 multi-homed interface 2 to an eNodeB.
- M3UA1MHA - Specify network interface of 1st M3UA multi-homed interface a.

- M3UA1MHB - Specify network interface of 1st M3UA multi-homed interface b.
- M3UA1SH - Specify network interface of 1st M3UA single homed interface.
- M3UA2MHA - Specify network interface of 2nd M3UA multi-homed interface a.
- M3UA2MHB - Specify network interface of 2nd M3UA multi-homed interface b.
- M3UA2SH - Specify network interface of 2nd M3UA single homed interface.
- M3UA3MHA - Specify network interface of 3rd M3UA multi-homed interface a.
- M3UA3MHB - Specify network interface of 3rd M3UA multi-homed interface b.
- M3UA3SH - Specify network interface of 3rd M3UA single homed interface.
- M3UA4MHA - Specify network interface of 4th M3UA multi-homed interface a.
- M3UA4MHB - Specify network interface of 4th M3UA multi-homed interface b.
- M3UA4SH - Specify network interface of 4th M3UA single homed interface.
- M3UA5MHA - Specify network interface of 5th M3UA multi-homed interface a.
- M3UA5MHB - Specify network interface of 5th M3UA multi-homed interface b.
- M3UA5SH - Specify network interface of 5th M3UA single homed interface.
- M3UA6MHA - Specify network interface of 6th M3UA multi-homed interface a.
- M3UA6MHB - Specify network interface of 6th M3UA multi-homed interface b.
- M3UA6SH - Specify network interface of 6th M3UA single homed interface.
- M3UA7MHA - Specify network interface of 7th M3UA multi-homed interface a.
- M3UA7MHB - Specify network interface of 7th M3UA multi-homed interface a.
- M3UA7SH - Specify network interface of 7th M3UA single homed interface.
- M3UA8MHA - Specify network interface of 8th M3UA multi-homed interface a.
- M3UA8MHB - Specify network interface of 8th M3UA multi-homed interface b.
- M3UA8SH - Specify network interface of 8th M3UA single homed interface.
- M3UA9MHA - Specify network interface of 9th M3UA multi-homed interface a.
- M3UA9MHB - Specify network interface of 9th M3UA multi-homed interface b.
- M3UA9SH - Specify network interface of 9th M3UA single homed interface.
- N26 - Specify network interface of N26 between the MME and 5GS AMF.
- NETWORK_TRACE - Specify the network interface of the NETWORK TRACE (tapping) interface on the IPDS.
- OAM_ACCESS - OAM access - Specify network interface of OAM access interface.
- ONAP_DCAE - Specify network interface of ONAP DCAE interface on the NECC.

- PROMETHEUS - Specify network interface PROMETHEUS interface on the NECC.
- RS10 - Specify network interface of RS10 interface to an SRS.
- S10 - Specify network interface of S10 interface to another MME.
- S101 - Specify network interface of S101 interface to an IWF.
- S102 - Specify network interface of S102 interface to an IWF.
- S11 - Specify network interface of S10 interface to another MME.
- S11U - Specify network interface of S11u interface to a SGW.
- S13 - Specify network interface of S13 interface to an EIR.
- S13INTF1 - Specify network interface of S13 multi-homed interface 1 to an EIR.
- S13INTF2 - Specify network interface of S13 multi-homed interface 2 to an EIR.
- S16 - Specify network interface of S16 interface loop around to this SGSN.
- S1MME - Specify network interface of S1-MME single homed interface to an eNodeB.
- S1MME2 - Specify network interface of 2nd S1-MME single homed interface to an eNodeB.
- S1MME2INTF1 - Specify network interface of 2nd S1-MME multi-homed interface 1 to an eNodeB.
- S1MME2INTF2 - Specify network interface of 2nd S1-MME multi-homed interface 2 to an eNodeB.
- S1MME3 - Specify network interface of 3rd S1-MME single homed interface to an eNodeB.
- S1MME3INTF1 - Specify network interface of 3rd S1-MME multi-homed interface 1 to an eNodeB.
- S1MME3INTF2 - Specify network interface of 3rd S1-MME multi-homed interface 2 to an eNodeB.
- S1MME4 - Specify network interface of 4th S1-MME single homed interface to an eNodeB.
- S1MME4INTF1 - Specify network interface of 4th S1-MME multi-homed interface 1 to an eNodeB.
- S1MME4INTF2 - Specify network interface of 4th S1-MME multi-homed interface 2 to an eNodeB.
- S1MME5 - Specify network interface of 5th S1-MME single homed interface to an eNodeB.
- S1MME5INTF1 - Specify network interface of 5th S1-MME multi-homed interface 1 to an eNodeB.

- S1MME5INTF2 - Specify network interface of 5th S1-MME multi-homed interface 2 to an eNodeB.
- S1MME6 - Specify network interface of 6th S1-MME single homed interface to an eNodeB.
- S1MME6INTF1 - Specify network interface of 6th S1-MME multi-homed interface 1 to an eNodeB.
- S1MME6INTF2 - Specify network interface of 6th S1-MME multi-homed interface 2 to an eNodeB.
- S1MME7 - Specify network interface of 7th S1-MME single homed interface to an eNodeB.
- S1MME7INTF1 - Specify network interface of 7th S1-MME multi-homed interface 1 to an eNodeB.
- S1MME7INTF2 - Specify network interface of 7th S1-MME multi-homed interface 2 to an eNodeB.
- S1MME8 - Specify network interface of 8th S1-MME single homed interface to an eNodeB.
- S1MME8INTF1 - Specify network interface of 8th S1-MME multi-homed interface 1 to an eNodeB.
- S1MME8INTF2 - Specify network interface of 8th S1-MME multi-homed interface 2 to an eNodeB.
- S1MME9 - Specify network interface of 9th S1-MME single homed interface to an eNodeB.
- S1MME9INTF1 - Specify network interface of 9th S1-MME multi-homed interface 1 to an eNodeB.
- S1MME9INTF2 - Specify network interface of 9th S1-MME multi-homed interface 2 to an eNodeB.
- S1MMEINTF1 - Specify network interface of S1-MME multi-homed interface 1 to an eNodeB.
- S1MMEINTF2 - Specify network interface of S1-MME multi-homed interface 2 to an eNodeB.
- S3 - Specify network interface of S3 interface from the MME to an SGSN.
- S3SGSN - Specify network interface of S3 interface from the SGSN to an SGSN.
- S4 - Specify network interface of S4 interface to an SGW.
- S4_2G_DATA - Specify network interface of S4 interface for 2G data to an SGW.
- S4_3G_DATA - Specify network interface of S4 interface for 3G data to an SGW.
- S6A - Specify network interface of S6a interface to an HSS.

- S6AINTF1 - Specify network interface of S6a multi-homed interface 1 to an HSS.
- S6AINTF2 - Specify network interface of S6a multi-homed interface 2 to an HSS.
- SBC - Specify network interface of SBc interface to a CBC.
- SBCINTF1 - Specify network interface of SBc multi-homed interface 1 to a CBC.
- SBCINTF2 - Specify network interface of SBc multi-homed interface 2 to a CBC.
- SERVICE_MIRROR - Specify network interface of service mirror interface.
- SGD - Specify network interface of SGd single homed interface to an SMSC/SMS router.
- SGDINTF1 - Specify network interface of SGd multi-homed interface 1 to an SMSC/SMS router.
- SGDINTF2 - Specify network interface of SGd multi-homed interface 2 to an SMSC/SMS router.
- SGS - Specify network interface of SGs interface to a GSM/UMTS MSC.
- SGSINTF1 - Specify network interface of SGs multi-homed interface 1 to a GSM/UMTS MSC.
- SGSINTF2 - Specify network interface of SGs multi-homed interface 2 to a GSM/UMTS MSC.
- SGSLITE - Specify network interface of SGs lite interface to an IWF.
- SLG - Specify network interface of Slg interface to a GMLC.
- SLGINTF1 - Specify network interface of Slg multi-homed interface 1 to a GMLC.
- SLGINTF2 - Specify network interface of Slg multi-homed interface 2 to a GMLC.
- SLS - Specify network interface of Sls interface to an E-SMLC.
- SLSINTF1 - Specify network interface of Sls multi-homed interface 1 to an E-SMLC.
- SLSINTF2 - Specify network interface of Sls multi-homed interface 1 to an E-SMLC.
- SM - Specify network interface of sm interface to an MBMS gateway.
- SV - Specify network interface of Sv interface to a GSM/UMTS MSC.
- T6A - Specify network interface of T6a single homed interface to a SCEF.
- T6AINTF1 - Specify network interface of T6a multi-homed interface 1 to a SCEF.
- T6AINTF2 - Specify network interface of T6a multi-homed interface 2 to a SCEF.
- UNASSIGNED - Specify network interface of unassigned.
- VIA_TRANS - Via_Transport - This NI type is for the Via transport network between the IPDSs and VSRs for Multiple IPDSs.
- X1_1 - Specify network interface of X1_1 interface to an ADMF.
- X1_MME - Specify network interface of X1 interface for MME.

- X1_SGSN - Specify network interface of X1 interface for SGSN.
- X2 - Specify network interface of X2 interface to a DF2.
- X2_MME - Specify network interface of X2 interface for MME.
- X2_SGSN - Specify network interface of X2 interface for SGSN.
- X3_2G - Specify network interface of X3 interface for 2G.
- X3_3G - Specify network interface of X3 interface for 3G.
- X3_IPDS - Specify network interface of X3 interface on the IPDS.
- SBI_NR10 - Specify network interface of SBI_NR10 interface on the IPDS.
- SBI_NR10_2 - Specify network interface of SBI_NR10_2 interface on the IPDS.
- SBI_NR10_3 - Specify network interface of SBI_NR10_3 interface on the IPDS.
- SBI_NR10_4 - Specify network interface of SBI_NR10_4 interface on the IPDS.
- SBI_NR10_5 - Specify network interface of SBI_NR10_5 interface on the IPDS.
- SBI_NR10_6 - Specify network interface of SBI_NR10_6 interface on the IPDS.
- SBI_NR10_7 - Specify network interface of SBI_NR10_7 interface on the IPDS.
- SBI_NR10_8 - Specify network interface of SBI_NR10_8 interface on the IPDS.
- SBI_NR10_9 - Specify network interface of SBI_NR10_9 interface on the IPDS.
- SBI_NR10_10 - Specify network interface of SBI_NR10_10 interface on the IPDS.
- SBI_NR10_11 - Specify network interface of SBI_NR10_11 interface on the IPDS.
- SBI_NR10_12 - Specify network interface of SBI_NR10_12 interface on the IPDS.
- SBI_NR10_13 - Specify network interface of SBI_NR10_13 interface on the IPDS.
- SBI_NR10_14 - Specify network interface of SBI_NR10_14 interface on the IPDS.
- SBI_NR10_15 - Specify network interface of SBI_NR10_15 interface on the IPDS.
- SBI_NR10_16 - Specify network interface of SBI_NR10_16 interface on the IPDS.

Name

svclp - Service IP address

Syntax

--svcIp <string>

Description

Service IP address.

Class

Required key.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

assignmentType - Assignment type

Syntax

--assignmentType <list-item>

Description

Assignment type: fixed or floating.

Class

Optional.

List

- fixed - Fixed.
- floating - Floating.

Default

floating

Name

bfdGatewayLeft - BFD gateway left IP address

Syntax

--bfdGatewayLeft <string>

Description

For a service IP using a BFD service subnet, the gateway of the associated BFD left transport subnet.

Class

Read only.

Type / Range

Digit string of length 0 or 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

bfdGatewayRight - BFD gateway right IP address

Syntax

--bfdGatewayRight <string>

Description

For a service IP using a BFD service subnet, the gateway of the associated BFD right transport subnet.

Class

Read only.

Type / Range

Digit string of length 0 or 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

bfdReachableLeft - BFD reachable via left IP address

Syntax

--bfdReachableLeft <string>

Description

For a service IP using a BFD service subnet, the associated BFD left transport subnet base.

Class

Read only.

Type / Range

Digit string of length 0 or 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

bfdReachableRight - BFD reachable via right IP address

Syntax

--bfdReachableRight <string>

Description

For a service IP using a BFD service subnet, the associated BFD right transport subnet base.

Class

Read only.

Type / Range

Digit string of length 0 or 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

subnetId - Subnet ID

Syntax

--subnetId <integer>

Description

Subnet identification.

Class

Read only.

Type / Range

Integer in the range of 0 to 63

Name

subnetLoc - Subnet location

Syntax

--subnetLoc <list-item>

Description

Subnet location: internal or external.

Class

Optional.

List

- external - External subnet - External subnet.
- internal - Internal subnet - Internal subnet.

Default

external

Name

useFds - Use Flow Distributor

Syntax

--useFds <list-item>

Description

Indicates whether this service IP shall be used as back-end for single-ip flow distributor

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

viaNexthop - VIA Nexthop Left IP address

Syntax

--viaNexthop <string>

Description

For a service IP using a VIA service subnet, the Nexthop of the associated VIA left transport subnet.

Class

Read only.

Type / Range

Digit string of length 0 or 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

viaReachable - VIA reachable by left IP address

Syntax

--viaReachable <string>

Description

For a service IP using a VIA service subnet, the associated VIA left transport subnet base.

Class

Read only.

Type / Range

Digit string of length 0 or 2 to 39 with the allowed pattern of [0-9a-f\.:]*

7.23 cmm serviceMirror

Port mirroring capability. Syntax, description, parameters, and roles for cmm serviceMirror command.

Syntax

Description

Port mirroring allowing external traffic to be replicated in real time. Service Mirror is only supported on VNF. Service Mirror is only supported on single IPDS configurations. Service Mirror must be deactivated before executing an SU. Service Mirror will be deactivated when greater than 100,000 packets per second are received by the IPDS. Service Mirror will be deactivated if a single packet from any interface is dropped.

Parameters

Name

hostName - Internal host name

Syntax

--hostName <string>

Description

Customer defined VM identifier.

Class

Required key.

Type / Range

Digit string of length 1 to 255

Name

localMirrorIp - Local mirror IP address

Syntax

--localMirrorIp <string>

Description

Local service mirror IPv4 address.

Class

Required on create, not modifiable.

Type / Range

Digit string of length 0 or 7 to 15 with the allowed pattern of [0-9\.]*

Name

remoteGreTunnelIp - Remote tunnel IP address

Syntax

--remoteGreTunnelIp <string>

Description

Remote GRE tunnel IP address.

Class

Required on create.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

remoteMirrorIp - Remote service mirror IP address

Syntax

--remoteMirrorIp <string>

Description

Remote service mirror IPv4 address.

Class

Required on create, not modifiable.

Type / Range

Digit string of length 0 or 7 to 15 with the allowed pattern of [0-9\.]*

Name

adminState - Admin state

Syntax

--adminState <list-item>

Description

Admin state of the services.

Class

Optional.

List

- locked - Locked.
- unlocked - Unlocked.

Default

unlocked

Name

destinationAddress - Destination address

Syntax

--destinationAddress <string>

Description

Destination IP mask.

Class

Optional.

Type / Range

Digit string of length 0 or 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

destinationPorts - Destination ports

Syntax

--destinationPorts <string>

Description

Destination ports.

Class

Optional.

Type / Range

Digit string of length 0 to 11 with the allowed pattern of ((([0-9]{1,4}|[1-5][0-9]{4}|6[0-4][0-9]{3}|65[0-4][0-9]{2}|655[0-2][0-9]|6553[0-5]))|([0-9]{1,4}|[1-5][0-9]{4}|6[0-4][0-9]{3}|

65[0-4][0-9]{2}|655[0-2][0-9]|6553[0-5])-([0-9]{1,4}|[1-5][0-9]{4}|6[0-4][0-9]{3}|65[0-4][0-9]{2}|655[0-2][0-9]|6553[0-5]))))

Name

externalInterface - External interface

Syntax

--externalInterface <string>

Description

External interface - for example eth2 or eth2.<vlan_id>.

Class

Optional.

Type / Range

Digit string of length 0 to 20 with the allowed pattern of ((\w+|\w+\.\d{1,5})|(\w+|\w+\.\d{1,5}),(\w+|\w+\.\d{1,5})))\$

Name

ipv - IP version

Syntax

--ipv <list-item>

Description

Internet protocol version number.

Class

Optional.

List

- " - Blank
- 4 - 4
- 6 - 6

Name

localMirrorIp6 - Local mirror IP6 address

Syntax

--localMirrorIp6 <string>

Description

Local service mirror IPv6 address.

Class

Optional.

Type / Range

Digit string of length 0 or 2 to 39 with the allowed pattern of '[0-9a-f:]*'

Name

localMirrorIp6PrefixLength - Local service mirror IPv6 prefix length

Syntax

--localMirrorIp6PrefixLength <integer>

Description

Prefix length for local service mirror IPv6.

Class

Optional.

Type / Range

Integer in the range of 0 to 128

Default

128

Name

localMirrorIpPrefixLength - Local service mirror IP prefix length

Syntax

--localMirrorIpPrefixLength <integer>

Description

Prefix length for local service mirror IP.

Class

Optional.

Type / Range

Integer in the range of 0 to 32

Default

32

Name

packetDirection - Packet direction

Syntax

--packetDirection <list-item>

Description

Packet direction - ingress/egress.

Class

Optional.

List

- " - Empty - Packet direction not specified.
- egress - Specify packet direction of egress.

- ingress - Specify packet direction of ingress.

Name

protocol - Protocol

Syntax

--protocol <list-item>

Description

Protocol to monitor.

Class

Optional.

List

- " - Empty - Do not specify a service protocol.
- icmp - Specify service protocol of ICMP.
- icmpv6 - Specify service protocol of ICMPv6.
- sctp - Specify service protocol of SCTP.
- tcp - Specify service protocol of TCP.
- udp - Specify service protocol of UDP.

Name

remoteMirrorIp6 - Remote service mirror IPv6 address

Syntax

--remoteMirrorIp6 <string>

Description

Remote service mirror IPv6 address.

Class

Optional.

Type / Range

Digit string of length 0 or 2 to 39 with the allowed pattern of '[0-9a-f:]'

Name

sourceAddress - Source address

Syntax

--sourceAddress <string>

Description

Source address IP mask.

Class

Optional.

Type / Range

Digit string of length 0 or 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

sourcePorts - Source ports

Syntax

--sourcePorts <string>

Description

Source port(s) (0-65535): <port|port1-port2>

Class

Optional.

Type / Range

Digit string of length 0 to 11 with the allowed pattern of ((([0-9]{1,4}|[1-5][0-9]{4}|6[0-4][0-9]{3}|65[0-4][0-9]{2}|655[0-2][0-9]|6553[0-5])|((([0-9]{1,4}|[1-5][0-9]{4}|6[0-4][0-9]{3}|65[0-4][0-9]{2}|655[0-2][0-9]|6553[0-5])-[0-9]{1,4}|[1-5][0-9]{4}|6[0-4][0-9]{3}|65[0-4][0-9]{2}|655[0-2][0-9]|6553[0-5])))

Name

timeLimit - Time Limit

Syntax

--timeLimit <integer>

Description

A mirror should be able to run indefinitely under normal operation. This parameter is the time limit in hours. Value 0 means unlimited

Class

Optional.

Type / Range

Integer in the range of 0 to 24 in units of Hour

Default

24

Name

timeStamp - Time Stamp

Syntax

--timeStamp <string>

Description

The time when this record was last created or modified.

Class

Read only.

Type / Range

Digit string of length 0 to 26

Roles**Create**

sysadmin, manage

sysadmin, manage

List

sysadmin, manage, monitor

7.24 cmm serviceMirrorStatus

Port mirroring capability status. Syntax, description, parameters, and roles for cmm serviceMirrorStatus command.

Syntax**Description**

Status of port mirroring allowing external traffic to be replicated in real time. Service Mirror is only supported on VNF. Service Mirror is only supported on single IPDS configurations. Service Mirror must be deactivated before executing an SU. Service Mirror will be deactivated when greater than 100,000 packets per second are received by the IPDS. Service Mirror will be deactivated if a single packet from any interface is dropped.

Parameters**Name**

errorState - Error State

Syntax

--errorState <integer>

Description

Error State

Class

Optional.

Type / Range

Integer in the range of 0 to 499

Name

errorString - Error String

Syntax

--errorString <string>

Description

Error String

Class

Optional.

Type / Range

Digit string of length 0 or 1 to 255

Name

hostName - Internal Host Name

Syntax

--hostName <string>

Description

Customer defined VM identifier

Class

Optional.

Type / Range

Digit string of length 1 to 255

Name

operState - Operation State

Syntax

--operState <integer>

Description

Operation State

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Roles**List**

sysadmin, manage, monitor

7.25 cmm serviceState

Service state. Syntax, description, parameters, and roles for cmm serviceState command.

Syntax

Description

This command is used to administer a service state and includes parameters for defining the pool (service) type, pool ID, and service state. Modification of the service state is allowed on CPPS, IPPS, DBS, PAPS and IPDS (for AMF only). NECC, ALMS, CTCS are Not Applicable.

Parameters

Name

poolType - Pool type

Syntax

--poolType <list-item>

Description

Pool (service) type. Note: Although the syntax allows all poolType values, some might not be modifiable or displayed. See command Description.

Class

Required key.

List

- ALMS - Alarm Service - Alarm Service.
- CPPS - Control plane processing service - Control plane processing service.
- CTCS - Call Trace Collection service - Call Trace Collection service.
- DBS - Database service - Database service.
- EEMS - Event Exposure Management service - Event Exposure Management service.
- IPDS - IP director service - IP director service.
- IPPS - IP packet processing service - IP packet processing service.
- LIHS - Lawful Interception Handling service
- MLIS - Machine Learning Intelligence Service
- NECC - Network element cluster controller - Network element cluster controller.
- NWDS - Network Data Service - NWDAF service

- PAPS - Packet processing service - Packet processing service.
- PCMS - Per Call Measurements Data Service - Per Call Measurements Data (PCMD) Service
- RCIS - Radio Capability Information storage Service
- SFDS - SCTP flow distributor service
- UCDS - User equipment Context Data-dump Service
- UFDS - UDP flow distributor service

Name

poolId - Pool id

Syntax

--poolId <integer>

Description

Pool identification number.

Class

Required key.

Type / Range

Integer in the range of 0 to 63

Name

force - Force

Syntax

--force <list-item>

Description

Bypass crosschecks when locking last service for a pool type.

Restrictions

This field is write only field. Will be set to false when read.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

personality - personality

Syntax

--personality <list-item>

Description

This field indicates the personality of a service. CPPS can have AMMS or EMMS personalities. EMMS indicates the CPPS serves 4G traffic. AMMS indicates the CPPS serves 5G traffic. MLIS can have MLGS (General) or MLUS (UE Group Specific) personalities.

Class

Read only.

List

- - - None Personality
- EMMS - EMMS Personality
- AMMS - AMMS Personality
- MLGS - MLGS Personality
- MLUS - MLUS Personality

Default

-

Name

svcState - Service state

Syntax

--svcState <list-item>

Description

Service state of the pool.

Class

Optional.

List

- blocked - Specify service state of blocked.
- locked - Specify service state of locked.
- shuttingDown - Shutting down - Specify service state of shutting down.
- unknown - Specify service state of unknown.
- unlocked - Specify service state of unlocked.

Roles**Show**

sysadmin, manage, monitor

Modify

sysadmin, manage

List

sysadmin, manage, monitor

7.26 cmm serviceStatus

Service Status. Syntax, description, parameters, and roles for cmm serviceStatus command.

Syntax**Description**

CMM Service Status

Parameters**Name**

poolType - Pool type

Syntax

--poolType <list-item>

Description

Pool (service) type.

Class

Required key.

List

- ALMS - Alarm Service - Alarm Service.
- CPPS - Control plane processing service - Control plane processing service.
- CTCS - Call Trace Collection service - Call Trace Collection service.
- DBS - Database service - Database service.
- EEMS - Event Exposure Management service - Event Exposure Management service.
- IPDS - IP director service - IP director service.
- IPPS - IP packet processing service - IP packet processing service.
- LIHS - Lawful Interception Handling service
- MLIS - Machine Learning Intelligence Service
- NECC - Network element cluster controller - Network element cluster controller.
- NWDS - Network Data Service - NWDAF service

- PAPS - Packet processing service - Packet processing service.
- PCMS - Per Call Measurements Data Service - Per Call Measurements Data (PCMD) Service
- RCIS - Radio Capability Information storage Service
- SFDS - SCTP flow distributor service
- UCDS - User equipment Context Data-dump Service
- UFDS - UDP flow distributor service

Name

poolId - PoolId

Syntax

--poolId <integer>

Description

Pool id of the service.

Class

Required key.

Type / Range

Integer in the range of 0 to 63

Name

poolMemberId - PoolMember

Syntax

--poolMemberId <integer>

Description

Pool member of the service.

Class

Required key.

Type / Range

Integer in the range of 0 to 10

Name

hostName - Host Name

Syntax

--hostName <string>

Description

Name of host

Class

Optional.

Type / Range

Digit string of length 1 to 63 with the allowed pattern of [0-9a-zA-Z\._:-]*

Name

hostNameLabel - Host name label

Syntax

--hostNameLabel <string>

Description

Host name label.

Class

Optional.

Type / Range

Digit string of length 1 to 128 with the allowed pattern of [0-9a-zA-Z\._:-]*

Name

personality - personality

Syntax

--personality <list-item>

Description

This field indicates the personality of a service. CPPS can have AMMS or EMMS personalities. EMMS indicates the CPPS serves 4G traffic. AMMS indicates the CPPS serves 5G traffic. MLIS can have MLGS (General) or MLUS (UE Group Specific) personalities.

Class

Optional.

List

- - - None Personality
- EMMS - EMMS Personality
- AMMS - AMMS Personality
- MLGS - MLGS Personality
- MLUS - MLUS Personality

Default

-

Name

svclp - Service IpAddress

Syntax

--svcIp <string>

Description

Ip Address of the service.

Class

Optional.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

svcStatus - Service Status

Syntax

--svcStatus <string>

Description

Status of the service.

Class

Optional.

Type / Range

Status of a CMM Service

Name

uuid - UUID

Syntax

--uuid <string>

Description

UUID of the service.

Class

Optional.

Type / Range

Digit string of length 1 to 128 with the allowed pattern of [0-9a-zA-Z\.\-_:]*

Roles**Show**

sysadmin, manage, monitor

List

sysadmin, manage, monitor

7.27 cmm sGdDiamRpMappingProfile

SGd Diameter RP Mapping Profile. Syntax, description, parameters, and roles for cmm sGdDiamRpMappingProfile command.

Syntax

Description

This command is used to administer the SGd Diameter causes to RP causes mapping. The profile is used when an error occurs on native SMS delivery and the SMSC/SMS router reports an error on the delivery towards the MME. The MME uses this mapping profile to provide a corresponding SMS Relay Protocol error further towards the UE. The maximum number of profiles supported is 128.

Parameters

Name

name - SGd Diameter to RP cause code mapping profile name

Syntax

--name <string>

Description

Defines all SGd interface Diameter code to SMS Relay Protocol (RP) cause code mapping.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Default

default

Name

absentUser - Absent user

Syntax

--absentUser <integer>

Description

Mapping for Diameter Absent user to RP error cause code.

Class

Optional.

Type / Range

Integer in the range of 1, 8, 10, 11, 21, 27-30, 38, 41, 42, 47, 50, 69, 81, 95-99, 111, 127

Default

38

Name

appUnsupported - Application unsupported

Syntax

--appUnsupported <integer>

Description

Mapping for Diameter application unsupported to RP error cause code.

Class

Optional.

Type / Range

Integer in the range of 1, 8, 10, 11, 21, 27-30, 38, 41, 42, 47, 50, 69, 81, 95-99, 111, 127

Default

38

Name

authenticationRejected - Authentication rejected

Syntax

--authenticationRejected <integer>

Description

Mapping for Diameter authentication rejected to RP error cause code.

Class

Optional.

Type / Range

Integer in the range of 1, 8, 10, 11, 21, 27-30, 38, 41, 42, 47, 50, 69, 81, 95-99, 111, 127

Default

38

Name

authorizationRejected - Authorization rejected

Syntax

--authorizationRejected <integer>

Description

Mapping for Diameter authorization rejected to RP error cause code.

Class

Optional.

Type / Range

Integer in the range of 1, 8, 10, 11, 21, 27-30, 38, 41, 42, 47, 50, 69, 81, 95-99, 111, 127

Default

38

Name

avpNotAllowed - AVP not allowed

Syntax

--avpNotAllowed <integer>

Description

Mapping for Diameter AVP not allowed to RP error cause code.

Class

Optional.

Type / Range

Integer in the range of 1, 8, 10, 11, 21, 27-30, 38, 41, 42, 47, 50, 69, 81, 95-99, 111, 127

Default

38

Name

avpOccursTooManyTimes - AVP occurs too many times

Syntax

--avpOccursTooManyTimes <integer>

Description

Mapping for Diameter AVP occurs too many times to RP error cause code.

Class

Optional.

Type / Range

Integer in the range of 1, 8, 10, 11, 21, 27-30, 38, 41, 42, 47, 50, 69, 81, 95-99, 111, 127

Default

38

Name

avpUnsupported - AVP unsupported

Syntax

--avpUnsupported <integer>

Description

Mapping for Diameter AVP unsupported to RP error cause code.

Class

Optional.

Type / Range

Integer in the range of 1, 8, 10, 11, 21, 27-30, 38, 41, 42, 47, 50, 69, 81, 95-99, 111, 127

Default

38

Name

commandUnsupported - Command unsupported

Syntax

--commandUnsupported <integer>

Description

Mapping for Diameter command unsupported to RP error cause code.

Class

Optional.

Type / Range

Integer in the range of 1, 8, 10, 11, 21, 27-30, 38, 41, 42, 47, 50, 69, 81, 95-99, 111, 127

Default

38

Name

contradictingAvps - Contradicting AVPs

Syntax

--contradictingAvps <integer>

Description

Mapping for Diameter contradicting AVPs to RP error cause code.

Class

Optional.

Type / Range

Integer in the range of 1, 8, 10, 11, 21, 27-30, 38, 41, 42, 47, 50, 69, 81, 95-99, 111, 127

Default

38

Name

electionLost - Election lost

Syntax

--electionLost <integer>

Description

Mapping for Diameter election lost to RP error cause code.

Class

Optional.

Type / Range

Integer in the range of 1, 8, 10, 11, 21, 27-30, 38, 41, 42, 47, 50, 69, 81, 95-99, 111, 127

Default

38

Name

facilityNotSupported - Facility not supported

Syntax

--facilityNotSupported <integer>

Description

Mapping for Diameter facility not supported to RP error cause code.

Class

Optional.

Type / Range

Integer in the range of 1, 8, 10, 11, 21, 27-30, 38, 41, 42, 47, 50, 69, 81, 95-99, 111, 127

Default

69

Name

invalidAvpBitCombo - Invalid AVP bit combo

Syntax

--invalidAvpBitCombo <integer>

Description

Mapping for Diameter invalid AVP bit combo to RP error cause code.

Class

Optional.

Type / Range

Integer in the range of 1, 8, 10, 11, 21, 27-30, 38, 41, 42, 47, 50, 69, 81, 95-99, 111, 127

Default

38

Name

invalidAvpBits - Invalid AVP bits

Syntax

--invalidAvpBits <integer>

Description

Mapping for Diameter invalid AVP bits to RP error cause code.

Class

Optional.

Type / Range

Integer in the range of 1, 8, 10, 11, 21, 27-30, 38, 41, 42, 47, 50, 69, 81, 95-99, 111, 127

Default

38

Name

invalidAvpLength - Invalid AVP length

Syntax`--invalidAvpLength <integer>`**Description**

Mapping for Diameter invalid AVP length to RP error cause code.

Class

Optional.

Type / Range

Integer in the range of 1, 8, 10, 11, 21, 27-30, 38, 41, 42, 47, 50, 69, 81, 95-99, 111, 127

Default

38

Name

invalidAvpValue - Invalid AVP value

Syntax`--invalidAvpValue <integer>`**Description**

Mapping for Diameter invalid AVP value to RP error cause code.

Class

Optional.

Type / Range

Integer in the range of 1, 8, 10, 11, 21, 27-30, 38, 41, 42, 47, 50, 69, 81, 95-99, 111, 127

Default

38

Name

invalidBitHeader - Invalid bit in header

Syntax`--invalidBitHeader <integer>`**Description**

Mapping for Diameter invalid bit in header to RP error cause code.

Class

Optional.

Type / Range

Integer in the range of 1, 8, 10, 11, 21, 27-30, 38, 41, 42, 47, 50, 69, 81, 95-99, 111, 127

Default

38

Name

invalidHdrBits - Invalid hearer bits

Syntax`--invalidHdrBits <integer>`**Description**

Mapping for Diameter invalid header bits to RP error cause code.

Class

Optional.

Type / Range

Integer in the range of 1, 8, 10, 11, 21, 27-30, 38, 41, 42, 47, 50, 69, 81, 95-99, 111, 127

Default

38

Name

invalidMessageLength - Invalid message length

Syntax`--invalidMessageLength <integer>`**Description**

Mapping for Diameter invalid message length to RP error cause code.

Class

Optional.

Type / Range

Integer in the range of 1, 8, 10, 11, 21, 27-30, 38, 41, 42, 47, 50, 69, 81, 95-99, 111, 127

Default

38

Name

loopDetected - Loop detected

Syntax`--loopDetected <integer>`**Description**

Mapping for Diameter loop detected to RP error cause code.

Class

Optional.

Type / Range

Integer in the range of 1, 8, 10, 11, 21, 27-30, 38, 41, 42, 47, 50, 69, 81, 95-99, 111, 127

Default

38

Name

missingAvp - Missing AVP

Syntax

--missingAvp <integer>

Description

Mapping for Diameter missing AVP to RP error cause code.

Class

Optional.

Type / Range

Integer in the range of 1, 8, 10, 11, 21, 27-30, 38, 41, 42, 47, 50, 69, 81, 95-99, 111, 127

Default

38

Name

multiRoundAuth - Multi round authorization

Syntax

--multiRoundAuth <integer>

Description

Mapping for Diameter multi round authorization to RP error cause code.

Class

Optional.

Type / Range

Integer in the range of 1, 8, 10, 11, 21, 27-30, 38, 41, 42, 47, 50, 69, 81, 95-99, 111, 127

Default

38

Name

noCommonApplication - No common application

Syntax

--noCommonApplication <integer>

Description

Mapping for Diameter no common application to RP error cause code.

Class

Optional.

Type / Range

Integer in the range of 1, 8, 10, 11, 21, 27-30, 38, 41, 42, 47, 50, 69, 81, 95-99, 111, 127

Default

38

Name

noCommonSecurity - No common security

Syntax

--noCommonSecurity <integer>

Description

Mapping for Diameter no common security to RP error cause code.

Class

Optional.

Type / Range

Integer in the range of 1, 8, 10, 11, 21, 27-30, 38, 41, 42, 47, 50, 69, 81, 95-99, 111, 127

Default

38

Name

noProvisionedSmsc - No provisioned SMSC

Syntax

--noProvisionedSmsc <integer>

Description

Mapping for no provisioned SMSC to RP error cause code.

Class

Optional.

Type / Range

Integer in the range of 1, 8, 10, 11, 21, 27-30, 38, 41, 42, 47, 50, 69, 81, 95-99, 111, 127

Default

38

Name

outOfSpace - Out of space

Syntax

--outOfSpace <integer>

Description

Mapping for Diameter out of space to RP error cause code.

Class

Optional.

Type / Range

Integer in the range of 1, 8, 10, 11, 21, 27-30, 38, 41, 42, 47, 50, 69, 81, 95-99, 111, 127

Default

38

Name

realmNotServed - Realm not served

Syntax

--realmNotServed <integer>

Description

Mapping for Diameter realm not served to RP error cause code.

Class

Optional.

Type / Range

Integer in the range of 1, 8, 10, 11, 21, 27-30, 38, 41, 42, 47, 50, 69, 81, 95-99, 111, 127

Default

38

Name

redirectionIndication - Redirection indication

Syntax

--redirectionIndication <integer>

Description

Mapping for Redirection indication to RP error cause code.

Class

Optional.

Type / Range

Integer in the range of 1, 8, 10, 11, 21, 27-30, 38, 41, 42, 47, 50, 69, 81, 95-99, 111, 127

Default

38

Name

resourcesExceeded - Resources exceeded

Syntax

--resourcesExceeded <integer>

Description

Mapping for Diameter resources exceeded to RP error cause code.

Class

Optional.

Type / Range

Integer in the range of 1, 8, 10, 11, 21, 27-30, 38, 41, 42, 47, 50, 69, 81, 95-99, 111, 127

Default

38

Name

serviceBarred - Service barred

Syntax

--serviceBarred <integer>

Description

Mapping for Diameter Service barred to RP error cause code.

Class

Optional.

Type / Range

Integer in the range of 1, 8, 10, 11, 21, 27-30, 38, 41, 42, 47, 50, 69, 81, 95-99, 111, 127

Default

8

Name

serviceNotSubscribed - Service not subscribed

Syntax

--serviceNotSubscribed <integer>

Description

Mapping for Diameter Service not subscribed to RP error cause code.

Class

Optional.

Type / Range

Integer in the range of 1, 8, 10, 11, 21, 27-30, 38, 41, 42, 47, 50, 69, 81, 95-99, 111, 127

Default

50

Name

smDelFailureInvSmeAddr - SM delivery failure invalid SME address

Syntax

--smDelFailureInvSmeAddr <integer>

Description

Mapping for Experimental-Result-Code AVP indicating SGd specific error
'DIAMETER_ERROR_SM_DELIVERY_FAILURE' and SM-Delivery-Failure-Cause indicating
INVALID_SME-ADDRESS to RP error cause value.

Class

Optional.

Type / Range

Integer in the range of 1, 8, 10, 11, 21, 27-30, 38, 41, 42, 47, 50, 69, 81, 95-99, 111, 127

Default

21

Name

smDelFailureNotScUser - SM delivery failure not SC user

Syntax

--smDelFailureNotScUser <integer>

Description

Mapping for Experimental-Result-Code AVP indicating SGd specific error
'DIAMETER_ERROR_SM_DELIVERY_FAILURE' and SM-Delivery-Failure-Cause indicating
USER_NOT_SC-USER to RP error cause value.

Class

Optional.

Type / Range

Integer in the range of 1, 8, 10, 11, 21, 27-30, 38, 41, 42, 47, 50, 69, 81, 95-99, 111, 127

Default

28

Name

smDelFailureScCongestion - SM delivery failure SC congestion

Syntax

--smDelFailureScCongestion <integer>

Description

Mapping for Experimental-Result-Code AVP indicating SGd specific error
'DIAMETER_ERROR_SM_DELIVERY_FAILURE' and SM-Delivery-Failure-Cause indicating SC-
CONGESTION to RP error cause value.

Class

Optional.

Type / Range

Integer in the range of 1, 8, 10, 11, 21, 27-30, 38, 41, 42, 47, 50, 69, 81, 95-99, 111, 127

Default

42

Name

smDelFailureUnknownSC - SM delivery failure unknown SC

Syntax

--smDelFailureUnknownSC <integer>

Description

Mapping for Experimental-Result-Code AVP indicating SGd specific error
'DIAMETER_ERROR_SM_DELIVERY_FAILURE' and SM-Delivery-Failure-Cause indicating
UNKNOWN_SERVICE_CENTRE to RP error cause value.

Class

Optional.

Type / Range

Integer in the range of 1, 8, 10, 11, 21, 27-30, 38, 41, 42, 47, 50, 69, 81, 95-99, 111, 127

Default

1

Name

smscDown - SMSC down

Syntax

--smscDown <integer>

Description

Mapping for SMSC down to RP error cause code.

Class

Optional.

Type / Range

Integer in the range of 1, 8, 10, 11, 21, 27-30, 38, 41, 42, 47, 50, 69, 81, 95-99, 111, 127

Default

38

Name

unableToComply - Unable to comply

Syntax

--unableToComply <integer>

Description

Mapping for Diameter Unable to comply to RP error cause code.

Class

Optional.

Type / Range

Integer in the range of 1, 8, 10, 11, 21, 27-30, 38, 41, 42, 47, 50, 69, 81, 95-99, 111, 127

Default

38

Name

unableToDeliver - Unable to deliver

Syntax`--unableToDeliver <integer>`**Description**

Mapping for Diameter unable to deliver to RP error cause code.

Class

Optional.

Type / Range

Integer in the range of 1, 8, 10, 11, 21, 27-30, 38, 41, 42, 47, 50, 69, 81, 95-99, 111, 127

Default

38

Name

unknownPeer - Unknown peer

Syntax`--unknownPeer <integer>`**Description**

Mapping for Diameter unknown peer to RP error cause code.

Class

Optional.

Type / Range

Integer in the range of 1, 8, 10, 11, 21, 27-30, 38, 41, 42, 47, 50, 69, 81, 95-99, 111, 127

Default

38

Name

unknownSessionId - Unknown session ID

Syntax`--unknownSessionId <integer>`**Description**

Mapping for Diameter unknown session id to RP error cause code.

Class

Optional.

Type / Range

Integer in the range of 1, 8, 10, 11, 21, 27-30, 38, 41, 42, 47, 50, 69, 81, 95-99, 111, 127

Default

38

Name

unsupportedVersion - Unsupported version

Syntax

--unsupportedVersion <integer>

Description

Mapping for Diameter unsupported version to RP error cause code.

Class

Optional.

Type / Range

Integer in the range of 1, 8, 10, 11, 21, 27-30, 38, 41, 42, 47, 50, 69, 81, 95-99, 111, 127

Default

38

Name

userUnknown - User unknown

Syntax

--userUnknown <integer>

Description

Mapping for Diameter User unknown error to RP error cause code.

Class

Optional.

Type / Range

Integer in the range of 1, 8, 10, 11, 21, 27-30, 38, 41, 42, 47, 50, 69, 81, 95-99, 111, 127

Default

30

7.28 cmm sgnsGsnsLocalEndPtCfg

GBNS SGSN Local Endpoint Configuration. Syntax, description, parameters, and roles for cmm sgnsGsnsLocalEndPtCfg command.

Syntax**Description**

Configure, list and show parameters related to GBNS interface.

Parameters**Name**

id - Interface name

Syntax

<list-item>

Description

Interface name.

Class

Required value.

List

- GBNS - Specify gbns interface.
- GNSGSN - Specify Gn interface to an SGSN.
- Gr - Specify gr interface to an HLR.
- lu - Specify iu interface to an RNC.
- S13 - Specify S13 interface to an EIR.
- S3S16 - Specify S3/S16 interface to an SGSN.
- S4 - Specify S4 interface to an SGW.
- S6d - Specify S6d interface to an HSS.

Name

bvcResetRetries - BVC reset retries

Syntax

--bvcResetRetries <integer>

Description

This parameter defines the number of retries in the BVC reset procedure. the values range from 0 to 255.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 0 to 255

Default

3

Name

bvcResetTimer - BVC reset timer

Syntax

--bvcResetTimer <integer>

Description

This parameter defines the BSSGP virtual connection (BVC) reset timer. the parameter guards the reset procedure of the BVC. the values range from 1 to 120 seconds.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 120

Default

3

Name

i6hcack - IPv6 acknowledged data header compression

Syntax

--i6hcack <list-item>

Description

This parameter defines the IPv6 unacknowledged data header compression, true ... IPv6 unacknowledged data header compression is in use false ... IPv6 unacknowledged data header compression is not in use.

Class

Optional, not filterable on list.

List

- false - Boolean value of false.

- true - Boolean value of true.

Default

false

Name

i6hcunack - IPv6 unacknowledged data header compression

Syntax

--i6hcunack <list-item>

Description

This parameter defines the IPv6 acknowledged data header compression, true ... IPv6 acknowledged data header compression is in use false ... IPv6 acknowledged data header compression is not in use.

Class

Optional, not filterable on list.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

icp - Gb over IP configuration UDP port

Syntax

--icp <integer>

Description

This parameter defines the pre-configured UDP port number for dynamic gb over IP. the values range from 49999 to 65535.

Class

Output only.

Type / Range

Integer in the range of 49,999 to 65,535

Default

49999

Name

llcRetransmCounter - LLC retransmission count, SGSN proposed value

Syntax

--llcRetransmCounter <integer>

Description

This parameter defines the logical link control (LLC) retransmission count, SGSN proposed value. the values range from 1 to 15.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 15

Default

3

Name

llcRetransmTimer - LLC retransmission timer, SGSN proposed value

Syntax

--llcRetransmTimer <integer>

Description

This parameter defines the logical link control (LLC) retransmission timer, SGSN proposed value. the values range from 0 to 410 seconds.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 0 to 410

Default

10

Name

nsAliveRetries - NS alive retries

Syntax

--nsAliveRetries <integer>

Description

This parameter defines the number of retries in the network service (NS) alive procedure. the values range from 0 to 255.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 0 to 255

Default

10

Name

nsAliveTimer - NS alive timer

Syntax

--nsAliveTimer <integer>

Description

This parameter defines the network service (NS) alive timer. the parameter guards the test procedure of the network service virtual connections (NS-VC). the values range from 1 to 60 seconds.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 60

Default

3

Name

nsTestTimer - NS test timer

Syntax

--nsTestTimer <integer>

Description

This parameter defines the test procedure of the network service virtual connections (NS-VC). the values range from 1 to 60 seconds.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 60

Default

60

Name

snsAddRetries - SNS add retries

Syntax

--snsAddRetries <integer>

Description

This parameter defines the number of SNS-ADD PDU retries in the SNS add procedure. the values range from 0 to 255.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 0 to 255

Default

3

Name

snsChangeWeightRetries - SNS changeweight retries

Syntax

--snsChangeWeightRetries <integer>

Description

This parameter defines the number of SNS-CHANGEWEIGHT PDU retries in the SNS changeweight procedure. the values range from 0 to 255.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 0 to 255

Default

3

Name

snsConfigRetries - SNS config retries

Syntax

--snsConfigRetries <integer>

Description

This parameter defines the number of SNS-CONFIG PDU retries in the SNS configuration procedure. the values range from 0 to 255.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 0 to 255

Default

3

Name

snsDeleteRetries - SNS delete retries

Syntax

--snsDeleteRetries <integer>

Description

This parameter defines the number of SNS-DELETE PDU retries in the SNS delete procedure. the values range from 0 to 255.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 0 to 255

Default

3

Name

snsProvTimer - SNS prov timer

Syntax

--snsProvTimer <integer>

Description

This parameter defines the interval of sub-network service (SNS) prov timer. the SNS prov timer guards the internet protocol (IP) SNS procedures. the values range from 1 to 10 seconds.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 10

Default

5

7.29 cmm sgsgnGnLocalEndPtCfg

GNSGSN Local Endpoint Configuration. . Syntax, description, parameters, and roles for cmm sgsgnGnLocalEndPtCfg command.

Syntax

Description

Configure, list and show parameters related to GNSGSN interface.

Parameters

Name

id - Interface name

Syntax

<list-item>

Description

Interface name.

Class

Required value.

List

- GBNS - Specify gbns interface.
- GNSGSN - Specify Gn interface to an SGSN.
- Gr - Specify gr interface to an HLR.
- lu - Specify iu interface to an RNC.
- S13 - Specify S13 interface to an EIR.
- S3S16 - Specify S3/S16 interface to an SGSN.
- S4 - Specify S4 interface to an SGW.
- S6d - Specify S6d interface to an HSS.

Name

gni - GGSN IPv4 network identifier

Syntax

--gni <string>

Description

This parameter defines the external network the GGSN is connected to. in the GPRS backbone, the access point name is a reference to the GGSN to be used. this parameter is also applicable for S4.

Class

Optional, not filterable on list.

Type / Range

Digit string of length 0 to 63 with the allowed pattern of [0-9a-zA-Z\._:]*

Default

""

Name

gni6 - GGSN IPv6 network identifier

Syntax

--gni6 <string>

Description

This parameter defines the external network the GGSN is connected to. in the GPRS backbone, the access point name (APN) is a reference to the GGSN to be used. this parameter is also applicable for S4.

Class

Optional, not filterable on list.

Type / Range

Digit string of length 0 to 63 with the allowed pattern of [0-9a-zA-Z\._:]*

Default

""

Name

gniv4v6 - GGSN IPv4v6 network identifier

Syntax

--gniv4v6 <string>

Description

This parameter is used to store the primary default gateway network identifier for a dual stack PDP context (IPv4v6). this parameter is also applicable for S4.

Class

Optional, not filterable on list.

Type / Range

Digit string of length 0 to 63 with the allowed pattern of [0-9a-zA-Z\._:]*

Default

""

Name

goi - GGSN operator identifier

Syntax

--goi <string>

Description

This parameter defines in which PLMN GPRS backbone the GGSN is located. GOI last part has to be .gprs. this parameter is also applicable for S4.

Class

Optional, not filterable on list.

Type / Range

Digit string of length 0 to 37 with the allowed pattern of [0-9a-zA-Z\.\-_:]*

Default

""

Name

n3CreatePdp - N3-requests counter for create PDP context requests

Syntax

--n3CreatePdp <integer>

Description

This parameter defines the value for the counter that holds the maximum number of attempts made by the GPRS tunnelling protocol (GTP) to send a create PDP context request message. the values range from 1 to 7.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 7

Default

5

Name

n3DelPdp - N3-requests counter for delete PDP context requests

Syntax

--n3DelPdp <integer>

Description

This parameter defines the value for the counter that holds the maximum number of attempts made by the GPRS tunnelling protocol (GTP) to send a delete PDP context request message. the values range from 1 to 7.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 7

Default

5

Name

n3EchoUP - N3-requests counter for echo requests of user plane

Syntax

--n3EchoUP <integer>

Description

This parameter defines the value for the counter that holds the maximum number of attempts made by the GPRS tunnelling protocol (GTP) to send an echo request message concerning user plane. the values range from 1 to 7.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 7

Default

5

Name

n3ForwReloc - N3-requests counter for forward relocation requests

Syntax

--n3ForwReloc <integer>

Description

This parameter defines the value for the counter that holds the maximum number of attempts made by the GPRS tunnelling protocol (GTP) to send a forward relocation request message. the values range from 1 to 7.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 7

Default

5

Name

n3Id - N3-requests counter for identification requests GTPv1

Syntax

--n3Id <integer>

Description

This parameter defines the value for the counter that holds the maximum number of attempts made by the GPRS tunnelling protocol (GTP) to send an identification request message. the values range from 1 to 7.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 7

Default

5

Name

n3SgsnCtxt - N3-requests counter for SGSN context requests

Syntax

--n3SgsnCtxt <integer>

Description

This parameter defines the value for the counter that holds the maximum number of attempts made by the GPRS tunnelling protocol (GTP) to send an SGSN context request message. the values range from 1 to 7.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 7

Default

5

Name

n3UpdPdp - N3-requests counter for update PDP context requests

Syntax

--n3UpdPdp <integer>

Description

This parameter defines the value for the counter that holds the maximum number of attempts made by the GPRS tunnelling protocol (GTP) to send an update PDP context request message. the values range from 1 to 7.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 7

Default

5

Name

secgni - Secondary GGSN IPv4 network identifier

Syntax

--secgni <string>

Description

This parameter defines which PDP subscription from the HLR is used in the override of requested APN and IMEI based APN override features, remove parameter value using SECGNI=0. this parameter is also applicable for S4.

Class

Optional, not filterable on list.

Type / Range

Digit string of length 0 to 63 with the allowed pattern of [0-9a-zA-Z\._ :]*

Default

""

Name

secgni6 - Secondary GGSN IPv6 network identifier

Syntax

--secgni6 <string>

Description

This parameter defines which PDP subscription from the HLR is used in the override of requested APN and IMEI based APN override features, remove parameter value using SECGNI6=0. this parameter is also applicable for S4.

Class

Optional, not filterable on list.

Type / Range

Digit string of length 0 to 63 with the allowed pattern of [0-9a-zA-Z\._ :]*

Default

""

Name

secgniv4v6 - Secondary GGSN IPv4v6 network identifier

Syntax

--secgniv4v6 <string>

Description

This parameter is used to store the secondary default gateway network identifier for a dual stack PDP context (IPv4v6), remove parameter value using SECGNIV4V6=0. this parameter is also applicable for S4.

Class

Optional, not filterable on list.

Type / Range

Digit string of length 0 to 63 with the allowed pattern of [0-9a-zA-Z\._:\]*

Default

""

Name

t3CreatePdp - T3-response timer of create PDP context response

Syntax

--t3CreatePdp <integer>

Description

This parameter defines the value for the timer that holds the maximum waiting time for a create PDP context response message to a create PDP context request message. the values range from 1 to 10 seconds in 1 second steps.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 10

Default

3

Name

t3DelPdp - T3-response timer of delete PDP context response

Syntax

--t3DelPdp <integer>

Description

This parameter defines the value for the timer that holds the maximum waiting time for a delete PDP context response message to a delete PDP context request message. the values range from 1 to 10 seconds in 1 second steps.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 10

Default

3

Name

t3EchoUP - T3-response timer of echo response of user plane, from 3 to 15 seconds in 3 second steps

Syntax

--t3EchoUP <integer>

Description

This parameter defines the value for the timer that holds the maximum waiting time for an echo response message to an echo request message concerning user plane. the values range from 3 to 15 seconds.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 3 to 15

Default

3

Name

t3ForwReloc - T3-response timer of forward relocation response

Syntax

--t3ForwReloc <integer>

Description

This parameter defines the value for the timer that holds the maximum waiting time for a forward relocation response message to a forward relocation request message. the values range from 1 to 10 seconds in 1 second steps.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 10

Default

3

Name

t3Id - T3-response timer of identification response GTPv1

Syntax

--t3Id <integer>

Description

This parameter defines the value for the timer that holds the maximum waiting time for an identification response message to an identification request message. the values range from 1 to 10 seconds in 1 second steps.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 10

Default

3

Name

t3SgsnCtxt - T3-response timer of SGSN context response

Syntax

--t3SgsnCtxt <integer>

Description

This parameter defines the value for the timer that holds the maximum waiting time for an SGSN context response message to an SGSN context request message. the values range from 1 to 10 seconds in 1 second steps.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 10

Default

3

Name

t3tunnel - T3 tunnel

Syntax

--t3tunnel <integer>

Description

This parameter defines the T3 tunnel. the T3 tunnel parameter defines the timer that controls the time when protocol data units (PDUs) are forwarded from the old SGSN to the new SGSN as part of the inter-sgsn routing area update procedure. the values range from 20 to 60 seconds in 1 second steps. this parameter is also applicable for S3S16.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 20 to 60

Default

20

Name

t3UpdPdp - T3-response timer of update PDP context response

Syntax

--t3UpdPdp <integer>

Description

This parameter defines the value for the timer that holds the maximum waiting time for an update PDP context response message to an update PDP context request message. the values range from 1 to 10 seconds in 1 second steps.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 10

Default

3

Name

techo - Techo

Syntax

--techo <integer>

Description

This parameter defines the timer that holds the time interval for the path validation procedure. the values range from 60 to 600 seconds.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 60 to 600

Default

120

7.30 cmm sgsnGParms

sgsnGParms. Syntax, description, parameters, and roles for **cmm sgsnGParms** command.

Syntax

Description

This command is used to administer SGSN Global Parameters, old profiles

Parameters

Name

sgsnGparmName - sgsnGparmName

Syntax

--sgsnGparmName <list-item>

Description

Name of SGSN parameter, old prfile name

Class

Required key.

List

- **ackDataSupported** - Acknowledged mode PDP context supported - This parameter determines if the acknowledged mode PDP context is supported.
- **aliasApnUsedInConversion** - Alias APN Used In APN Conversion - Alias APN Used in APN Conversion Feature. SGSN feature APN conversion function will be enhanced for Alias APN use case. If this gParm is set, then converted APN will be not checked against HLR subscription. Otherwise (by default), the parameter will not be set, no change to existing APN conversion function
- **allowedApnniEnable** - Active status of APNNI access restriction in SGSN - Active status of APNNI access restriction in SGSN.
- **alternateLineServ** - Alternate line service
- **altImeiChkNasCause** - Alternative NAS cause for IMEI checking in MME/SGSN - Enables or disables the alternative NAS cause for IMEI checking in MME/SGSN.
- **ansiMapSupport** - ANSI MAP allowed or not - ANSI MAP allowed to the operator or not.
- **apnOverrideEnhance** - Apn Override Enhance - Parameter controls feature activation. By default, flag shall be disabled. When enabled, Gn SGSN shall override enhancements to existing APN override feature.

- **apnWithLowestPdpId** - Select APN with lowest PDP id from HLR subscription - Parameter controls whether the APN with lowest PDP id is used from HLR subscription instead of that PDP context is activated with an APN according to the first HLR subscription record.
- **callRedirection** - Call redirection
- **cancelLocationCc** - Cancel location cause code - When HLR sends cancel location message to SGSN, SGSN shall send the detach message without cause code value. in current implementation SGSN uses cause code value 7.
- **cancelLocRes** - Cancel location response - Parameter determines if the cancel location is acknowledged immediately after the cancel location is received.
- **cgfDualStackSupport** - SGSN dual stack PDP context support (3GPP rel 9, gn/gp) for charging gateway - Parameter determines whether the charging gateway is capable of supporting dual stack PDP contexts or not.
- **checkImeiMode** - Check IMEI Mode - This parameter is used to define the check Imei mode. The default value is 0 which means that SGSN will include only IMEI in IMEI check. Possible values (0 to 2), 0 for SGSN will include only IMEI in IMEI check, 1 for SGSN add IMSI in MAP part of IMEI Check, 2 for SGSN add IMSI and MSISDN in TCAP part of IMEI Check.
- **checkImeiSv** - Check IMEI Sv - This parameter is used to define if IMEISV is used for the IMEI check procedure to the EIR over the Gf Interface. When this parameter is set to true SGSN will request from the UE to include the IMEISV in the authentication and ciphering or Identification messages and accordingly use the IMEISV in the IMEI check procedure. Default value is false.
- **delayedIratMod** - Delayed IRAT modification
- **directDelResToGgsn** - Direct delete PDP context response message to GGSN - Parameter controls whether SGSN responds to delete PDP context request from GGSN immediately without waiting for answer from MS.
- **disableSecPdpCtx** - Disable secondary PDP context - Parameter defines if secondary PDP context is supported.
- **dnsFailureCause** - Changed cause code for DNS lookup failure - Parameter controls the cause code for DNS failure, i.e. when a DNS error is detected in internal SGSN RAU the cause code returned to MS is changed from protocol error, unspecified to implicitly detached.
- **dnsFallbackEnabled** - DNS query fallback check - Parameter determines whether a DNS query gets fallback to pre-release 8 in case the post-release 8 DNS query is failed.
- **doubleDnsQuery** - Double DNS query - Double DNS query to determine old node (SGSN or MME) in attach/rau.
- **dtRestrBasedOnTimer** - DT restriction based on timer - Parameter determines whether DT establishment is restricted after consecutive DT establishment/re-establishment happens during the defined time period.

- **dualStackPdpCtxt** - SGSN dual stack PDP context support
- **enforceSubscribedApn** - Enforce subscribed APN - Parameter controls whether the APN override is done in case the subscriber does not have an APN as a 'wild card' (*) defined in the HLR subscription.
- **enhancedPtmsiHandling** - Enhanced P-TMSI handling in SGSN
- **enhOffIdleSubsRate** - Idle subscribers offloading rate - This parameter determines with what rate idle subscribers should be offloaded when subscriber offloading feature is executed in phase 1.
- **enterpriseld** - Enterprise ID - This parameter specifies the enterprise id. all enterprise id's defined in the list.
- **epsBearerMapping** - EPS bearer mapping
- **epsCapability** - EPS capability - Parameter controls whether rel7 or rel8 (if HLR/HSS provides EPS subscription) query will be done.
- **fallbackNormalDns** - Fallback To Normal DNS - With this control parameter set to true, fallback to normal DNS query without tag is supported. Otherwise, if the parameter is not set (default), fallback is not supported
- **followOnProceed** - Support for follow-on proceed information in attach/rau accept - Parameter defines whether follow-on proceed information can be sent to UE.
- **forceAuthentication** - Force Authentication - When true, this parameter forces authentication in all 'SGSN' procedures for 1 hour after PAPS scale out/restart. When false, CMM performs authentication according to 'cmm securityParam' and 'cmm plmnParam' provisioning.
- **forceDnsOverTcp** - Force DNS over TCP - Parameter is used to force DNS queries over TCP instead of UDP.
- **forcefulCtxRem** - Forceful removal of PDP contexts from GGSN - With this parameter, the SGSN will in some abnormal cases send a delete PDP context request to the GGSN in order to remove hanging contexts.
- **ggsnPgwFqdnleCtrl** - PGW node name delivery on SGSN
- **grIfEnhancements** - Gr interface enhancements in SGSN - With this parameter it is possible to command SGSN to perform IMSI analysis for a subscriber before SGSN sends a location update to HLR after a reset indication is received from HLR. it is useful in HLR migration cases to get SGSN quickly to update the new HLR address to SGSN subscriber database and to get SGSN address to the new HLR. with this parameter it is also possible to command SGSN to not send a location update to HLR after a reset indication is received from HLR, until the first routing area update (RAU) request is received from MS. it is useful to decrease SS7 signalling load peak after HLR reset if there are not enough SS7 signalling links between SGSN and HLR.
- **gsIfEnhancements** - Gs interface enhancements in SGSN - This parameter is used to define the support for gs interface enhancement package, which is to avoid paging

problems of combined GPRS and IMSI attached subscribers. Some of the possible allowed values are: 0 Paging requests from VLR are not accepted if subscriber does not have Gs association. Location update to VLR only in case of a combined RA&LA update and LAI changes. 1 Paging requests from VLR are accepted even if subscriber does not have Gs association. 2 Location update to VLR always in case of a combined RA&LA update even if LAI does not change. 3 Location update to VLR always in case of a periodic RA update and when subscriber has Gs association. 4 Location update to VLR always in case of a combined RA&LA update even if LAI does not change or in case of a periodic RA update when subscriber has Gs association. 5 Paging requests from VLR are accepted even if subscriber does not have Gs association. Location update to VLR always in case of a combined RA&LA update even if LAI does not change. 6 Paging requests from VLR are accepted even if subscriber does not have Gs association. Location update to VLR always in case of a periodic RA update and when subscriber has Gs association. 7 Paging requests from VLR are accepted even if subscriber does not have Gs association. Location update to VLR always in case of a combined RA&LA update even if LAI does not change or in case of a periodic RA update and when subscriber has Gs association.

- **gsUpdateLocationThres** - Gs update location threshold - The parameter defines the GS update location overload control limit. Default value is off (10001) and other values define max number of Update Location for nonGPRS services operations on Gs interface that are ongoing in parallel.
- **gtpHopCounter** - Hop counter - Hop counter is used in SGSN pool to control infinite looping. this IE is used in `gtp_sgsn_context_req_s` and `gtp_identification_req_s`. decrease the value of hop counter if the optional parameter hop counter is present in the receiving signal. otherwise, it may include a hop counter with a value of max-1 (where max is the maximum defined value of hop counter) and forward it to other network element. configured value will be included in the very first request b/w SGSN and keeps on decreasing when it moves between SGSN. this decreasing will not result in any change in configured value.
- **gtpTargetIdEncoding** - GTP target identification information element encoding - This parameter controls how the target identification information element is encoded and decoded to the GTP messages. by default, the target identification information element is encoded or decoded to the GTP messages as defined in 3GPP TS 29.060 specification version 6.17.0 or older versions. by changing the parameter, it is possible to encode or decode the target identification information element as defined in 3GPP TS 29.060 change request CR 0668 (i.e. in version 6.18.0 or newer) or change request CR 0808 (i.e. in version 8.14.0 or newer).
- **gtpv1UeNwCapSupport** - UE network capability support - Parameter control whether UE network capability has to be sent in relocation request/context response.
- **hlrQosMbrDLLimit** - HLR QoS maximum bit rate for downlink override limit - This parameter defines bit rate override trigger limit for quality of service (QoS) parameters maximum bit rate (MBR) for downlink (DL) field. if the maximum bit rate (MBR) for downlink (DL) value received from HLR in PDP contexts QoS parameter is equal

or greater than the value of this parameter, the maximum bit rate for downlink value received from HLR is replaced with bit rate value defined in parameter HLR_QOS_MBR_DL_VALUE.

- **hlrQosMbrDlValue** - HLR QoS maximum bit rate for downlink override value - This parameter defines bit rate value for quality of service (QoS) parameters maximum bit rate (MBR) for downlink (DL) field. the given value overrides the maximum bit rate for downlink value received from HLR in PDP contexts QoS parameter, if value received from HLR is equal or greater than value defined in parameter HLR_QOS_MBR_DL_LIMIT.
- **hlrQosMbrUlLimit** - HLR QoS maximum bit rate for uplink override limit - This parameter defines bit rate override trigger limit for quality of service (QoS) parameters maximum bit rate (MBR) for uplink (UL) field. if the maximum bit rate (MBR) for uplink (UL) value received from HLR in PDP contexts QoS parameter is equal or greater than the value of this parameter, the maximum bit rate for uplink value received from HLR is replaced with bit rate value defined in parameter HLR_QOS_MBR_UL_VALUE.
- **hlrQosMbrUlValue** - HLR QoS maximum bit rate for uplink override value - This parameter defines bit rate value for quality of service (QoS) parameters maximum bit rate (MBR) for uplink (UL) field. the given value overrides the maximum bit rate for uplink value received from HLR in PDP contexts QoS parameter, if value received from HLR is equal or greater than value defined in parameter HLR_QOS_MBR_UL_LIMIT.
- **imsApnRouting** - SGW relocation based on IMS or sos substring
- **intCauseMapIllMsMe** - Cause code mapping change in statistics - Cause code mapping change in statistics.
- **ipv6DnsQueriesInUse** - IPv6 address fetching for GSNs in DNS query - Parameter defines, whether SGSN is trying to get IPv6 address for some network element in DNS query or just the IPv4 address.
- **iuQosOverride** - Iu QoS override
- **lboAllowedGnSgsn** - LBO allowed Gn SGSN - Parameter indicates whether Gn SGSN LBO control is allowed or not.
- **ll3MmFilters** - Filtering GPRS layer 3 mobility management messages
- **locationBasedGwSelection** - Location Based Gateway Selection - Based on this control parameter (set to true), location based GW selection feature will be enabled. Gn SGSN will insert a Tag (either zone name or RAC/LAC) to the DNS query for certain APNs. Otherwise (by default), it's not enable.
- **locationInfoInCdr** - LOCATION INFO IN CDR - With this parameter set, UE's location info in RAU will be added to the CDR. If it's not set (by default), UE's location info in RAU will not add to the CDR as existing function.
- **locationRptCtrlFlg** - Location report control - Parameter determines whether SGSN sends the location control messages to RNC.

- **locChangeInfoUpd** - Active status of location change information update to GGSN/PGW
- Parameter controls whether the location change information update to GGSN/PGW feature is active or inactive for subscribers.
- **lrasLoadBalancing** - LRAS load balancing - This parameter determines how load balancing is applied. Default value 0 means is disabled. Other allowed values are: 1 Load Balancing for new subscribers is enabled. 2 Load Balancing for old subscribers RAU request is enabled. 3 Load Balancing for new subscribers and for old subscribers RAU request is enabled.
- **lrasLoadBalancingPerRat** - LRAS load balancing per Radio Access Type - Parameter determines whether load balancing is applied per Radio Access Type or per total of UEs.
- **mapGtNatForm** - MAP use only national GT in own country
- **mapUnhaMsgsLimIn** - Unhandled messages limit for incoming MAP operations - The parameter gives the limit for the unhandled messages. when this limit is exceeded, the outgoing MAP operation start messages to the network are rejected.
- **mapUnhaMsgsLimOut** - Unhandled messages limit for outgoing MAP operations - The parameter gives the limit for unhandled messages. when this limit is exceeded, the MAP operation start messages, coming from the network are rejected.
- **massRabReleaseSpeed** - Speed of controllable mass RAB release procedure - Warning: For Nokia personnel only. Speed of controllable mass RAB release procedure
- **msisdnPgwDnsFallback** - MSISDN PGW DNS fallback - This parameter is used to define the support for fallback to release 8 or 7 DNS without MSISDN. 0 - no fallback 1 - fallback to rel8 DNS without MSISDN 2 - fallback to rel7 DNS fallback without MSISDN.
- **networkNamePlmn** - Network Name Per PLMN - This parameter control network name (short and full) in PLMN level. Normally, They are defined in SGSN level for network operator. With this feature, since MVNO is used, different PLMN with different network names are used. Thus, with this parameter enable, network name can be defined Per PLMN. Otherwise, existing function will be kept (default).
- **nonDrxState** - If the SGSN has valid DRX parameters for a TLLI, the SGSN includes them in the PDU. nevertheless, the SGSN can omit the DRX parameters if the MS identified with the TLLI is in MM non-drx mode period to speed up the transmission of the LLC-PDU on the radio interface. the SGSN does not send a DL-UNITDATA PDU without the DRX parameters IE if the MS identified with the TLLI is not in MM non-drx mode period.
- **oldImsiCoding** - Old IMSI (rel 97) encoding used in RAUs
- **originalCcInCdr** - Original charging characteristics in CDR - This parameter can be used for sending the original charging characteristics received in Mobility Management/Session Management/SMS messages in the corresponding CDRs generated by the SGSN.
- **override2gDowngrade** - QoS downgrade prevention in GERAN access - This parameter determines whether the QoS downgrade in GERAN access is prevented

- **overridePlmn** - Override on PLMN - This parameter will control PLMN (MCCMNC) override function can be applied. If the parameter is set to True, then PLMN level override will apply. If it's false, then no PLMN level control override function. By default, it will be set to false.
- **overrideRoamingApn** - Active status of override requested APN - Active status of override requested APN in SGSN feature for roaming subscribers.
- **overrideWithModApn** - APN override with modified APN - The parameter controls whether the APN is overridden with the modified APN. the modified APN is the same APN as is used for dynamic GGSN selection in the DNS query.in the SG01218 GGSN selection based on charging characteristics feature, this parameter also controls whether subscribed charging characteristics (CC) is required for dynamic GGSN selection (DNS query) and APN override.
- **pagingBufferActive** - Paging Buffer Active - The parameter defines the usage of the SGSN buffer for unacknowledged mode user data during ps-paging procedure
- **papsPortMirror** - PAPS port mirroring - This parameter enables/Disables port mirroring in paps unit.
- **papuBIMassDetachSpd** - Speed of controllable mass detach procedure - This parameter controls the speed of the controllable mass detach procedure, mass detaches per second. the range of the parameter is 1-100. default value is 10.
- **pdpAddrTypeTag** - Intelligent GGSN/PGW selection based on PDP address type - Parameter controls whether the PDN type tag will be included in the DNS query performed from SGSN to select a GGSN/PGW.
- **pdpCntxMassDeactAct** - The active status of controllable PDP context mass deactivation - Parameter controls whether or not the feature controllable PDP context mass deactivation is activated.
- **pdpCntxMassDeactSpd** - The speed of controllable PDP context mass deactivation - This parameter controls the speed of controllable PDP context mass deactivation, deactivations per second. the range of the parameter is 1 - 25. default value is 10.
- **pdpRejIfRabFails** - PDP activation reject if RAB setup procedure fails - Parameter determines whether the PDP activation is rejected if RAB setup procedure fails during PDP activation procedure.
- **poolingCombiSgsnMme** - Pooling SGSN/MME - Parameter enables/disables the support for SGSN/MME in the same hardware and supporting pooling functionality.
- **preemptionSupR8** - Preemption support for R8 subscribers
- **privateNbrPlan** - Private numbering plan
- **pshoBtwSgsnMme** - Support for relocation procedures between S4-SGSN and MME
- **qciMapR8ToR99** - Active status of QCI mapping - Parameter enables or disables the QCI mapping from rel.8 to rel.99 and vice versa.

- qciTrafficClassMap - QCI mapping to traffic class for rel 8 to rel 7 QoS conversion - Parameter determines whether the QCI values 8 and 9 will be mapped to traffic class interactive 2 and interactive 3 respectively in case of rel 8 to rel 7 QoS mapping.
- qosEvolAllRetPrior - Support for QoS parameters evolved allocation/retention priority parameters - Parameter defines whether evolved allocation/retention priority parameters are supported on SGSN for 3G QoS.
- qosHandlingInlsho - Parameter determines whether the QoS profile is renegotiated in case the radio access is changed from GERAN to UTRAN.
- qosSubBr2to3lsho - Negotiated bitrates in case of inter SGSN and inter system RAU - Parameter defines in case of inter SGSN and inter system RAU (2G -> 3G) if HLR max bitrate and guaranteed bitrate are used towards the new SGSN as negotiated bitrates.
- r8DnsEnhancementPool - R8 DNS enhancement pool - Parameter is used to control the 'R8 DNS enhancement in pooling multipoint iu' feature.
- r8DnsR7EpcSubs - r8DnsR7EpcSubs - The parameter is used to control access for R8 DNS Query Support for Gn-SGSN. 1 - roaming subscribers 2 - home subscribers 3 - both home and roaming subscribers
- raileInGtpTunneling - Inclusion of MCC and MNC in the RAI IE of create/update PDP context requests - Parameter defines whether the control of content served to subscribers based on their location is enabled or not.
- randomTlliRemTimer - Random TLLI remove time from SGSN - This parameter determines how long time random format TLLIs are stored in the SGSN after the mobile has completed the attach procedure.
- raStatLevelInUse - RA based statistics reporting resolution - RA based statistics reporting resolution.
- rauCsPsCoordination - CS/PS coordination in RAU procedure
- reAuthActive - Re-Authentication usage - Parameter defines the usage of the re-authentication.
- reAuthSupport - Re-Authentication support
- rel14LrRejectCauses - Release 14 Lr reject causes
- rel8RncQosChgRej1 - REL8 RNC QoS change reject - For Release 8 subscribers, the parameter decides whether to reject the QOS or to accept it when the RNC changes QOS in RAB assignment.
- relAccessBearerCtrl - S4 bearer retainability during iu/rab release procedure triggered from RNC - This parameter provides support for controlling the Release Access Bearer request messages being sent towards SGW during lu/RAB release procedure triggered from RNC, so that the signaling traffic towards SGW interface is not overloaded. If this parameter is enabled, SGSN follows the standard procedure for sending Release Access Bearer request messages towards SGW. If this parameter is disabled, Release Access Bearer request messages will not be sent towards SGW when lu/RAB release happens.

- **restrict11PdpCtx** - Restriction of the maximum allowed PDP contexts - Parameter is used to restrict the maximum allowed PDP contexts from 11 to 4.
- **rfspIndexSelectionOption** - RFSP Index Selection Option - When this parameter is enabled, then gn SGSN enables using rfspIndexSelectionOption option, available under plmn, to decide the way for assigning RFSP Index for the UE
- **rimRel8DnsAllowed** - RIM release 8 DNS allowed - Parameter indicates whether rel8 DNS is allowed or not.
- **s6dRoamingNotAllowedToNasCc11** - S6d CC Roaming Not Allowed Map To CC 11 in NAS - Cause code DIAMETER_ERROR_ROAMING_NOT_ALLOWED (5004) without Error Diagnostic shall be mapped to cause code #11 based on TS29.272 Annex B when sgsnGParms s6dRoamingNotAllowedToNasCc11 is set
- **sgsnNumberInUlr** - Control of SGSN-Number sending to HSS - This parameter controls sending of SGSN-Number AVP to HSS in diameter message update location request (ULR).
- **sgsnSS7Statistics** - SGSN SS7 Statistics
- **sgsnUseCcInApnForR8DnsPgwFallback** - SGSN use CC in APN For R8 DNS PGW Fallback - When this parameter is enabled and MSISDN was not included as an extra tag in parallel with Charging Characteristics, SGSN will retry the R8 DNS query without the CC tag before falling back to pre-R7 DNS queries for P-GW selection.
- **sgwDualStackSupport** - SGW dual stack support
- **signalingIndication** - Support for signaling indication information - Parameter defines whether signaling indication information is set in iu-interface when interactive PDP context is activated.
- **solc** - SGSN overload control - This parameter is used to switch on/off the overload control in paps
- **ss7ResrcStarvCRefCause** - SS7 Refusal cause - Depending on the value of ss7ResrcStarvCRefCause will give operator the following refusal cause options, Default value is 2 (access congestion). Possible values (1 to 4), 1 access failure, 2 access congestion, 3 unqualified, 4 SCCP failure
- **staticGwForBlockService** - Static GW Selection For Block Service - Static GW Selection feature will be used for Blocking Services. Certain IMSIs (configured) access configured APNs, will lead for Gn SGSN to select the configured GW IP address. This will make GGSN/GW to block service for such UE (IMSI) (e.g. what'sApp etc.). With this parameter set, Gn SGSN, will make static GW selection from configured IP addresses for such user(IMSI). Since the IMSIs might be any type of users (home, roamer etc.), only when this parameter is set, new parameter mcc and mnc will be used. Range type will be always IMSI. Otherwise, no change to the existing system.
- **streamingOptAct** - Streaming quality optimization feature - The parameter defines how the streaming quality optimization feature is configured in the SGSN.

- **streamWoPfcSupport** - Streaming PDP supported in gb access without PFC support.
- **supportEpcCapability** - EPC capability check for S/P-GW selection - Parameter determines whether the SGSN supports serving-gw/pdn-gw connectivity for EPC capable mobiles.
- **supportOfImsvops** - Support of IMSVOPS - Parameter is used to support IMS voice flags on the S4-SGSN feature.
- **suspendAcknowledge** - Suspend request acknowledge - When BSS sends a suspend request message to SGSN, this parameter determines whether or not the message is acknowledged at once if the subscriber is not in this PAPU unit.
- **threeDigitMncMcc** - Three digit MNC and MCC usage in DNS query - Parameter controls whether three digit MNC and MCC is used in DNS query.
- **throttleAlarms** - Throttle RAISE and/or CANCEL alarms - Warning: For Nokia personnel only. Throttle RAISE and/or CANCEL alarms of SGSN processes according to the sgsnGparms throttleAlarmsTimeWindow and throttleAlarmsThresholdNumber. value = 0 means the feature is OFF, value = 1 means RAISE alarms are throttled, value = 2 means RAISE and CANCEL alarms are throttled. default value is 1.
- **throttleAlarmsThresholdNumber** - Threshold number for alarm throttling - Warning: For Nokia personnel only. Depending on the value of throttleAlarms sgsnGparmName, if number of alarms with same alarmid that are raised/canceled during the time window configured by throttleAlarmsTimeWindow sgsnGparmName, exceeds this value then throttling starts. throttling stops when the time window ends. default value is 40 alarms.
- **throttleAlarmsTimeWindow** - Time window for alarm throttling - Warning: For Nokia personnel only. Depending on the value of throttleAlarms sgsnGparmName, if number of alarms with same alarmid that are raised/canceled during this time window, exceeds the value of throttleAlarmsThresholdNumber sgsnGparmName, then throttling starts. throttling stops when the time window ends. default value is 60 seconds.
- **timeZoneEncode** - TimeZoneEncode - This parameter controls the encoded time zone format.
- **tripletsToQuintuplets** - Triplets to quintuplets - Parameter defines if new authentication vectors are asked from the HLR when triplets are received from the previous SGSN during inter SGSN RAU in gb or iu access.
- **twoByteChargingChar** - This parameter is used to define the support for two-byte charging characteristics value in SGSN, received from HLR. it is configurable to use four-bit, one-byte, or two-byte charging characteristics in SGSN.
- **ueAmbrDI** - UE AMBR downlink default value - Default value to be used as subscribed UE-AMBR downlink when this QoS parameter is not received from HSS (TS 23.060 par.15.2.2 if no values of UE-AMBR are received from the HSS, the SGSN shall set the UE-AMBR according to implementation specific policies (e.g. a pre-configured maximum UEAMBR).).

- **ueAmbrSupportRanap** - UE-AMBR support - Parameter determines whether SGSN sends UE-AMBR IE in RAB assignment request and relocation request messages to RNC.
- **ueAmbrUI** - ueAmbrUI - Default value to be used as subscribed UE-AMBR uplink when this QoS parameter is not received from HSS (TS 23.060 par.15.2.2 if no values of UE-AMBR are received from the HSS, the SGSN shall set the UE-AMBR according to implementation specific policies (e.g. a pre-configured maximum UEAMBR).).
- **updQosSuppFlg** - Upgrade QoS supported bit in common flag IE for GTPv1 - Parameter is used to control sending the upgrade QoS supported bit in the common flag IE from SGSN to GGSN/PCRF.
- **usedGtpVersion** - Used GTP version - The parameter defines which version of the GTP is used towards the operators own GGSNs.
- **userPlaneEchoSending** - UserPlaneEchoSending - This parameter controls where the GTP user plane echoes are sent. By default (value 4), the echoes are not sent to neither RNC nor GGSN. By changing the parameter, it is possible to enable echo sending to either RNC or GGSN, or enable it for both. Some RNCs do not respond to SGSNs echo requests if the Direct Tunnel is in use. The GTP user plane echo sending is optional in the 29.060 (GTP) specification. Allowed values are: 1 The user plane echoes are sent to RNCs and GGSNs. 2 The user plane echoes are sent only to RNCs. 3 The user plane echoes are sent only to GGSNs. 4 SGSN does not send user plane echoes.
- **zeroNonDrxTimer** - Parameter enables setting the DRX-mode 'ON' to mobiles that send an attach request message with zero non-drx-timer value.
- **zoneSw** - Zone Switch - This parameter controls whether or not the mapping between zone names and RACs/LACs is enabled (switch on). If the parameter is set, zone name will be used as tag in the APN query. Otherwise, RAC+LAC will be used as tag in the APN query.

Name

sgsnGparmValue - sgsnGparmValue

Syntax

- -sgsnGparmValue <string>

Description

Value of SGSN parameter, old prfile value

Class

Optional.

Type / Range

Digit string of length 0 to 64

The sgsnGparmValue string is based on the sgsnGparmName parameter:

Name

ackDataSupported - Acknowledged mode PDP context supported

Syntax

```
--sgsnGparmName ackDataSupported --sgsnGparmValue <string>
```

Description

This parameter determines if the acknowledged mode PDP context is supported.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

aliasApnUsedInConversion - Alias APN Used In APN Conversion

Syntax

```
--sgsnGparmName aliasApnUsedInConversion --sgsnGparmValue <string>
```

Description

Alias APN Used in APN Conversion Feature. SGSN feature APN conversion function will be enhanced for Alias APN use case. If this gParm is set, then converted APN will be not checked against HLR subscription. Otherwise (by default), the parameter will not be set, no change to existing APN conversion function

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

allowedApnniEnable - Active status of APNNI access restriction in SGSN

Syntax

```
--sgsnGparmName allowedApnniEnable --sgsnGparmValue <string>
```

Description

Active status of APNNI access restriction in SGSN.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

alternateLineServ - Alternate line service

Syntax

--sgsnGparmName alternateLineServ --sgsnGparmValue <string>

Description

Alternate line service

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

altImeiChkNasCause - Alternative NAS cause for IMEI checking in MME/SGSN

Syntax

--sgsnGparmName altImeiChkNasCause --sgsnGparmValue <string>

Description

Enables or disables the alternative NAS cause for IMEI checking in MME/SGSN.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

ansiMapSupport - ANSI MAP allowed or not

Syntax

--sgsnGparmName ansiMapSupport --sgsnGparmValue <string>

Description

ANSI MAP allowed to the operator or not.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

apnOverrideEnhance - Apn Override Enhance

Syntax

```
--sgsnGparmName apnOverrideEnhance --sgsnGparmValue <string>
```

Description

Parameter controls feature activation. By default, flag shall be disabled. When enabled, Gn SGSN shall override enhancements to existing APN override feature.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

apnWithLowestPdpId - Select APN with lowest PDP id from HLR subscription

Syntax

```
--sgsnGparmName apnWithLowestPdpId --sgsnGparmValue <string>
```

Description

Parameter controls whether the APN with lowest PDP id is used from HLR subscription instead of that PDP context is activated with an APN according to the first HLR subscription record.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

callRedirection - Call redirection

Syntax

```
--sgsnGparmName callRedirection --sgsnGparmValue <string>
```

Description

Call redirection

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

cancelLocationCc - Cancel location cause code

Syntax

```
--sgsnGparmName cancelLocationCc --sgsnGparmValue <string>
```

Description

When HLR sends cancel location message to SGSN, SGSN shall send the detach message without cause code value. in current implementation SGSN uses cause code value 7.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

cancelLocRes - Cancel location response

Syntax

```
--sgsnGparmName cancelLocRes --sgsnGparmValue <string>
```

Description

Parameter determines if the cancel location is acknowledged immediately after the cancel location is received.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

cgfDualStackSupport - SGSN dual stack PDP context support (3GPP rel 9, gn/gp) for charging gateway

Syntax

```
--sgsnGparmName cgfDualStackSupport --sgsnGparmValue <string>
```

Description

Parameter determines whether the charging gateway is capable of supporting dual stack PDP contexts or not.

List

- false - Boolean value of false.

- true - Boolean value of true.

Default

false

Name

checkImeiMode - Check IMEI Mode

Syntax

--sgsnGparmName checkImeiMode --sgsnGparmValue <string>

Description

This parameter is used to define the check Imei mode. The default value is 0 which means that SGSN will include only IMEI in IMEI check. Possible values (0 to 2), 0 for SGSN will include only IMEI in IMEI check, 1 for SGSN add IMSI in MAP part of IMEI Check, 2 for SGSN add IMSI and MSISDN in TCAP part of IMEI Check.

Type / Range

Integer in the range of 0 to 2

Default

0

Name

checkImeiSv - Check IMEI Sv

Syntax

--sgsnGparmName checkImeiSv --sgsnGparmValue <string>

Description

This parameter is used to define if IMEISV is used for the IMEI check procedure to the EIR over the Gf Interface. When this parameter is set to true SGSN will request from the UE to include the IMEISV in the authentication and ciphering or Identification messages and accordingly use the IMEISV in the IMEI check procedure. Default value is false.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

delayedIratMod - Delayed IRAT modification

Syntax

--sgsnGparmName delayedIratMod --sgsnGparmValue <string>

Description

Delayed IRAT modification

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

directDelResToGgsn - Direct delete PDP context response message to GGSN

Syntax

--sgsnGparmName directDelResToGgsn --sgsnGparmValue <string>

Description

Parameter controls whether SGSN responds to delete PDP context request from GGSN immediately without waiting for answer from MS.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

disableSecPdpCtx - Disable secondary PDP context

Syntax

--sgsnGparmName disableSecPdpCtx --sgsnGparmValue <string>

Description

Parameter defines if secondary PDP context is supported.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

dnsFailureCause - Changed cause code for DNS lookup failure

Syntax

--sgsnGparmName dnsFailureCause --sgsnGparmValue <string>

Description

Parameter controls the cause code for DNS failure, i.e. when a DNS error is detected in internal SGSN RAU the cause code returned to MS is changed from protocol error, unspecified to implicitly detached.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

dnsFallbackEnabled - DNS query fallback check

Syntax

```
--sgsnGparmName dnsFallbackEnabled --sgsnGparmValue <string>
```

Description

Parameter determines whether a DNS query gets fallback to pre-release 8 in case the post-release 8 DNS query is failed.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

doubleDnsQuery - Double DNS query

Syntax

```
--sgsnGparmName doubleDnsQuery --sgsnGparmValue <string>
```

Description

Double DNS query to determine old node (SGSN or MME) in attach/rau.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

dtRestrBasedOnTimer - DT restriction based on timer

Syntax

```
--sgsnGparmName dtRestrBasedOnTimer --sgsnGparmValue <string>
```

Description

Parameter determines whether DT establishment is restricted after consecutive DT establishment/re-establishment happens during the defined time period.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

dualStackPdpCtxt - SGSN dual stack PDP context support

Syntax

```
--sgsnGparmName dualStackPdpCtxt --sgsnGparmValue <string>
```

Description

SGSN dual stack PDP context support

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

enforceSubscribedApn - Enforce subscribed APN

Syntax

```
--sgsnGparmName enforceSubscribedApn --sgsnGparmValue <string>
```

Description

Parameter controls whether the APN override is done in case the subscriber does not have an APN as a 'wild card' (*) defined in the HLR subscription.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

enhancedPtmsiHandling - Enhanced P-TMSI handling in SGSN

Syntax

```
--sgsnGparmName enhancedPtmsiHandling --sgsnGparmValue <string>
```

Description

Enhanced P-TMSI handling in SGSN

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

enhOfflIdleSubsRate - Idle subscribers offloading rate

Syntax

```
--sgsnGparmName enhOfflIdleSubsRate --sgsnGparmValue <string>
```

Description

This parameter determines with what rate idle subscribers should be offloaded when subscriber offloading feature is executed in phase 1.

Type / Range

Integer in the range of 0 to 50

Default

10

Name

enterpriseId - Enterprise ID

Syntax

```
--sgsnGparmName enterpriseId --sgsnGparmValue <string>
```

Description

This parameter specifies the enterprise id. all enterprise id's defined in the list.

Type / Range

Integer in the range of 1 to 38,101

Default

28458

Name

epsBearerMapping - EPS bearer mapping

Syntax

```
--sgsnGparmName epsBearerMapping --sgsnGparmValue <string>
```

Description

EPS bearer mapping

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

epsCapability - EPS capability

Syntax`--sgsnGparmName epsCapability --sgsnGparmValue <string>`**Description**

Parameter controls whether rel7 or rel8 (if HLR/HSS provides EPS subscription) query will be done.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

fallbackNormalDns - Fallback To Normal DNS

Syntax`--sgsnGparmName fallbackNormalDns --sgsnGparmValue <string>`**Description**

With this control parameter set to true, fallback to normal DNS query without tag is supported. Otherwise, if the parameter is not set (default), fallback is not supported

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

followOnProceed - Support for follow-on proceed information in attach/rau accept

Syntax`--sgsnGparmName followOnProceed --sgsnGparmValue <string>`**Description**

Parameter defines whether follow-on proceed information can be sent to UE.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

forceAuthentication - Force Authentication

Syntax

```
--sgsnGparmName forceAuthentication --sgsnGparmValue <string>
```

Description

When true, this parameter forces authentication in all 'SGSN' procedures for 1 hour after PAPS scale out/restart. When false, CMM performs authentication according to 'cmm securityParam' and 'cmm plmnParam' provisioning.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

forceDnsOverTcp - Force DNS over TCP

Syntax

```
--sgsnGparmName forceDnsOverTcp --sgsnGparmValue <string>
```

Description

Parameter is used to force DNS queries over TCP instead of UDP.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

forcefulCtxRem - Forceful removal of PDP contexts from GGSN

Syntax

```
--sgsnGparmName forcefulCtxRem --sgsnGparmValue <string>
```

Description

With this parameter, the SGSN will in some abnormal cases send a delete PDP context request to the GGSN in order to remove hanging contexts.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

ggsnPgwFqdnIeCtrl - PGW node name delivery on SGSN

Syntax

```
--sgsnGparmName ggsnPgwFqdnIeCtrl --sgsnGparmValue <string>
```

Description

PGW node name delivery on SGSN

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

grIfEnhancements - Gr interface enhancements in SGSN

Syntax

```
--sgsnGparmName grIfEnhancements --sgsnGparmValue <string>
```

Description

With this parameter it is possible to command SGSN to perform IMSI analysis for a subscriber before SGSN sends a location update to HLR after a reset indication is received from HLR. it is useful in HLR migration cases to get SGSN quickly to update the new HLR address to SGSN subscriber database and to get SGSN address to the new HLR. with this parameter it is also possible to command SGSN to not send a location update to HLR after a reset indication is received from HLR, until the first routing area update (RAU) request is received from MS. it is useful to decrease SS7 signalling load peak after HLR reset if there are not enough SS7 signalling links between SGSN and HLR.

Type / Range

Integer in the range of 0 to 255

Default

0

Name

gsIfEnhancements - Gs interface enhancements in SGSN

Syntax

--sgsnGparmName gsIfEnhancements --sgsnGparmValue <string>

Description

This parameter is used to define the support for gs interface enhancement package, which is to avoid paging problems of combined GPRS and IMSI attached subscribers. Some of the possible allowed values are: 0 Paging requests from VLR are not accepted if subscriber does not have Gs association. Location update to VLR only in case of a combined RA&LA update and LAI changes. 1 Paging requests from VLR are accepted even if subscriber does not have Gs association. 2 Location update to VLR always in case of a combined RA&LA update even if LAI does not change. 3 Location update to VLR always in case of a periodic RA update and when subscriber has Gs association. 4 Location update to VLR always in case of a combined RA&LA update even if LAI does not change or in case of a periodic RA update when subscriber has Gs association. 5 Paging requests from VLR are accepted even if subscriber does not have Gs association. Location update to VLR always in case of a combined RA&LA update even if LAI does not change. 6 Paging requests from VLR are accepted even if subscriber does not have Gs association. Location update to VLR always in case of a periodic RA update and when subscriber has Gs association. 7 Paging requests from VLR are accepted even if subscriber does not have Gs association. Location update to VLR always in case of a combined RA&LA update even if LAI does not change or in case of a periodic RA update and when subscriber has Gs association.

Type / Range

Integer in the range of 0 to 255

Default

0

Name

gsUpdateLocationThres - Gs update location threshold

Syntax

--sgsnGparmName gsUpdateLocationThres --sgsnGparmValue <string>

Description

The parameter defines the GS update location overload control limit. Default value is off (10001) and other values define max number of Update Location for nonGPRS services operations on Gs interface that are ongoing in parallel.

Type / Range

Integer in the range of 0 to 10,001

Default

10001

Name

gtpHopCounter - Hop counter

Syntax

```
--sgsnGparmName gtpHopCounter --sgsnGparmValue <string>
```

Description

Hop counter is used in SGSN pool to control infinite looping. this IE is used in gtp_sgsn_context_req_s and gtp_identification_req_s. decrease the value of hop counter if the optional parameter hop counter is present in the receiving signal. otherwise, it may include a hop counter with a value of max-1 (where max is the maximum defined value of hop counter) and forward it to other network element. configured value will be included in the very first request b/w SGSN and keeps on decreasing when it moves between SGSN. this decreasing will not result in any change in configured value.

Type / Range

Integer in the range of 0 to 255

Default

0

Name

gtpTargetIdEncoding - GTP target identification information element encoding

Syntax

```
--sgsnGparmName gtpTargetIdEncoding --sgsnGparmValue <string>
```

Description

This parameter controls how the target identification information element is encoded and decoded to the GTP messages. by default, the target identification information element is encoded or decoded to the GTP messages as defined in 3GPP TS 29.060 specification version 6.17.0 or older versions. by changing the parameter, it is possible to encode or decode the target identification information element as defined in 3GPP TS 29.060 change request CR 0668 (i.e. in version 6.18.0 or newer) or change request CR 0808 (i.e. in version 8.14.0 or newer).

List

- 0 - Specify GTP target encoding of 0.
- 1 - Specify GTP target encoding of 1.
- 2 - Specify GTP target encoding of 2.
- 255 - Specify GTP target encoding of 255.

Default

0

Name

gtpv1UeNwCapSupport - UE network capability support

Syntax

```
--sgsnGparmName gtpv1UeNwCapSupport --sgsnGparmValue <string>
```

Description

Parameter control whether UE network capability has to be sent in relocation request/context response.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

h1rQosMbrDLLimit - HLR QoS maximum bit rate for downlink override limit

Syntax

```
--sgsnGparmName h1rQosMbrDLLimit --sgsnGparmValue <string>
```

Description

This parameter defines bit rate override trigger limit for quality of service (QoS) parameters maximum bit rate (MBR) for downlink (DL) field. if the maximum bit rate (MBR) for downlink (DL) value received from HLR in PDP contexts QoS parameter is equal or greater than the value of this parameter, the maximum bit rate for downlink value received from HLR is replaced with bit rate value defined in parameter HLR_QOS_MBR_DL_VALUE.

Type / Range

Integer in the range of 0 to 8

Default

0

Name

h1rQosMbrDLValue - HLR QoS maximum bit rate for downlink override value

Syntax

```
--sgsnGparmName h1rQosMbrDLValue --sgsnGparmValue <string>
```

Description

This parameter defines bit rate value for quality of service (QoS) parameters maximum bit rate (MBR) for downlink (DL) field. the given value overrides the maximum bit rate for downlink value received from HLR in PDP contexts QoS parameter, if value received from HLR is equal or greater than value defined in parameter HLR_QOS_MBR_DL_LIMIT.

Type / Range

Integer in the range of 0 to 168

Default

0

Name

hlrQosMbrULLimit - HLR QoS maximum bit rate for uplink override limit

Syntax

```
--sgsnGparmName hlrQosMbrULLimit --sgsnGparmValue <string>
```

Description

This parameter defines bit rate override trigger limit for quality of service (QoS) parameters maximum bit rate (MBR) for uplink (UL) field. if the maximum bit rate (MBR) for uplink (UL) value received from HLR in PDP contexts QoS parameter is equal or greater than the value of this parameter, the maximum bit rate for uplink value received from HLR is replaced with bit rate value defined in parameter HLR_QOS_MBR_UL_VALUE.

Type / Range

Integer in the range of 0 to 8

Default

0

Name

hlrQosMbrULValue - HLR QoS maximum bit rate for uplink override value

Syntax

```
--sgsnGparmName hlrQosMbrULValue --sgsnGparmValue <string>
```

Description

This parameter defines bit rate value for quality of service (QoS) parameters maximum bit rate (MBR) for uplink (UL) field. the given value overrides the maximum bit rate for uplink value received from HLR in PDP contexts QoS parameter, if value received from HLR is equal or greater than value defined in parameter HLR_QOS_MBR_UL_LIMIT.

Type / Range

Integer in the range of 0 to 46

Default

0

Name

imsApnRouting - SGW relocation based on IMS or sos substring

Syntax

```
--sgsnGparmName imsApnRouting --sgsnGparmValue <string>
```

Description

SGW relocation based on IMS or sos substring

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

intCauseMapIllMsMe - Cause code mapping change in statistics

Syntax

```
--sgsnGparmName intCauseMapIllMsMe --sgsnGparmValue <string>
```

Description

Cause code mapping change in statistics.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

ipv6DnsQueriesInUse - IPv6 address fetching for GSNs in DNS query

Syntax

```
--sgsnGparmName ipv6DnsQueriesInUse --sgsnGparmValue <string>
```

Description

Parameter defines, whether SGSN is trying to get IPv6 address for some network element in DNS query or just the IPv4 address.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

iuQosOverride - Iu QoS override

Syntax

```
--sgsnGparmName iuQosOverride --sgsnGparmValue <string>
```

Description

Iu QoS override

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

lboAllowedGnSgsn - LBO allowed Gn SGSN

Syntax

--sgsnGparmName lboAllowedGnSgsn --sgsnGparmValue <string>

Description

Parameter indicates whether Gn SGSN LBO control is allowed or not.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

ll3MmFilters - Filtering GPRS layer 3 mobility management messages

Syntax

--sgsnGparmName ll3MmFilters --sgsnGparmValue <string>

Description

Filtering GPRS layer 3 mobility management messages

Type / Range

Integer in the range of 0 to 255

Default

0

Name

locationBasedGwSelection - Location Based Gateway Selection

Syntax

--sgsnGparmName locationBasedGwSelection --sgsnGparmValue <string>

Description

Based on this control parameter (set to true), location based GW selection feature will be enabled. Gn SGSN will insert a Tag (either zone name or RAC/LAC) to the DNS query for certain APNs. Otherwise (by default), it's not enable.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

locationInfoInCdr - LOCATION INFO IN CDR

Syntax

--sgsnGparmName locationInfoInCdr --sgsnGparmValue <string>

Description

With this parameter set, UE's location info in RAU will be added to the CDR. If it's not set (by default), UE's location info in RAU will not add to the CDR as existing function.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

locationRptCtrlFlg - Location report control

Syntax

--sgsnGparmName locationRptCtrlFlg --sgsnGparmValue <string>

Description

Parameter determines whether SGSN sends the location control messages to RNC.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

locChangeInfoUpd - Active status of location change information update to GGSN/PGW

Syntax

--sgsnGparmName locChangeInfoUpd --sgsnGparmValue <string>

Description

Parameter controls whether the location change information update to GGSN/PGW feature is active or inactive for subscribers.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

lrasLoadBalancing - LRAS load balancing

Syntax

--sgsnGparmName lrasLoadBalancing --sgsnGparmValue <string>

Description

This parameter determines how load balancing is applied. Default value 0 means is disabled. Other allowed values are: 1 Load Balancing for new subscribers is enabled. 2 Load Balancing for old subscribers RAU request is enabled. 3 Load Balancing for new subscribers and for old subscribers RAU request is enabled.

Type / Range

Integer in the range of 0 to 3

Default

0

Name

lrasLoadBalancingPerRat - LRAS load balancing per Radio Access Type

Syntax

--sgsnGparmName lrasLoadBalancingPerRat --sgsnGparmValue <string>

Description

Parameter determines whether load balancing is applied per Radio Access Type or per total of UEs.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

mapGtNatForm - MAP use only national GT in own country

Syntax

--sgsnGparmName mapGtNatForm --sgsnGparmValue <string>

Description

MAP use only national GT in own country

List

- false - Boolean value of false.

- true - Boolean value of true.

Default

false

Name

mapUnhaMsgsLimIn - Unhandled messages limit for incoming MAP operations

Syntax

```
--sgsnGparmName mapUnhaMsgsLimIn --sgsnGparmValue <string>
```

Description

The parameter gives the limit for the unhandled messages. when this limit is exceeded, the outgoing MAP operation start messages to the network are rejected.

Type / Range

Integer in the range of 0 to 65,535

Default

300

Name

mapUnhaMsgsLimOut - Unhandled messages limit for outgoing MAP operations

Syntax

```
--sgsnGparmName mapUnhaMsgsLimOut --sgsnGparmValue <string>
```

Description

The parameter gives the limit for unhandled messages. when this limit is exceeded, the MAP operation start messages, coming from the network are rejected.

Type / Range

Integer in the range of 0 to 65,535

Default

300

Name

massRabReleaseSpeed - Speed of controllable mass RAB release procedure

Syntax

```
--sgsnGparmName massRabReleaseSpeed --sgsnGparmValue <string>
```

Description

Warning: For Nokia personnel only. Speed of controllable mass RAB release procedure

Type / Range

Integer in the range of 1 to 100

Default

20

Name

msisdnPgwDnsFallback - MSISDN PGW DNS fallback

Syntax

```
--sgsnGparmName msisdnPgwDnsFallback --sgsnGparmValue <string>
```

Description

This parameter is used to define the support for fallback to release 8 or 7 DNS without MSISDN. 0 - no fallback 1 - fallback to rel8 DNS without MSISDN 2 - fallback to rel7 DNS fallback without MSISDN.

Type / Range

Integer in the range of 0 to 2

Default

0

Name

networkNamePlmn - Network Name Per PLMN

Syntax

```
--sgsnGparmName networkNamePlmn --sgsnGparmValue <string>
```

Description

This parameter control network name (short and full) in PLMN level. Normally, They are defined in SGSN level for network operator. With this feature, since MVNO is used, different PLMN with different network names are used. Thus, with this parameter enable, network name can be defined Per PLMN. Otherwise, existing function will be kept (default).

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

nonDrxState - NonDrxState

Syntax

```
--sgsnGparmName nonDrxState --sgsnGparmValue <string>
```

Description

If the SGSN has valid DRX parameters for a TLLI, the SGSN includes them in the PDU. nevertheless, the SGSN can omit the DRX parameters if the MS identified with the TLLI is in MM non-drx mode period to speed up the transmission of the LLC-PDU on the radio interface. the SGSN does not send a DL-UNITDATA PDU without the DRX parameters IE if the MS identified with the TLLI is not in MM non-drx mode period.

Type / Range

Integer in the range of 0 to 3

Default

0

Name

oldImsiCoding - Old IMSI (rel 97) encoding used in RAUs

Syntax

```
--sgsnGparmName oldImsiCoding --sgsnGparmValue <string>
```

Description

Old IMSI (rel 97) encoding used in RAUs

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

originalCcInCdr - Original charging characteristics in CDR

Syntax

```
--sgsnGparmName originalCcInCdr --sgsnGparmValue <string>
```

Description

This parameter can be used for sending the original charging characteristics received in Mobility Management/Session Management/SMS messages in the corresponding CDRs generated by the SGSN.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

override2gDowngrade - QoS downgrade prevention in GERAN access

Syntax

```
--sgsnGparmName override2gDowngrade --sgsnGparmValue <string>
```

Description

This parameter determines whether the QoS downgrade in GERAN access is prevented

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

overridePlmn - Override on PLMN

Syntax

```
--sgsnGparmName overridePlmn --sgsnGparmValue <string>
```

Description

This parameter will control PLMN (MCCMNC) override function can be applied. If the parameter is set to True, then PLMN level override will apply. If it's false, then no PLMN level control override function. By default, it will be set to false.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

overrideRoamingApn - Active status of override requested APN

Syntax

```
--sgsnGparmName overrideRoamingApn --sgsnGparmValue <string>
```

Description

Active status of override requested APN in SGSN feature for roaming subscribers.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

overrideWithModApn - APN override with modified APN

Syntax

```
--sgsnGparmName overrideWithModApn --sgsnGparmValue <string>
```

Description

The parameter controls whether the APN is overridden with the modified APN. the modified APN is the same APN as is used for dynamic GGSN selection in the DNS query.in the SG01218

GGSN selection based on charging characteristics feature, this parameter also controls whether subscribed charging characteristics (CC) is required for dynamic GGSN selection (DNS query) and APN override.

List

- 0 - Specify override of 0.
- 1 - Specify override of 1.
- 16 - Specify override of 16.
- 17 - Specify override of 17.

Default

0

Name

pagingBufferActive - Paging Buffer Active

Syntax

```
--sgsnGparmName pagingBufferActive --sgsnGparmValue <string>
```

Description

The parameter defines the usage of the SGSN buffer for unacknowledged mode user data during ps-paging procedure

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

papsPortMirror - PAPS port mirroring

Syntax

```
--sgsnGparmName papsPortMirror --sgsnGparmValue <string>
```

Description

This parameter enables/Disables port mirroring in paps unit.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

papuBlMassDetachSpd - Speed of controllable mass detach procedure

Syntax

--sgsnGparmName papuBlMassDetachSpd --sgsnGparmValue <string>

Description

This parameter controls the speed of the controllable mass detach procedure, mass detaches per second. the range of the parameter is 1-100. default value is 10.

Type / Range

Integer in the range of 1 to 100

Default

50

Name

pdpAddrTypeTag - Intelligent GGSN/PGW selection based on PDP address type

Syntax

--sgsnGparmName pdpAddrTypeTag --sgsnGparmValue <string>

Description

Parameter controls whether the PDN type tag will be included in the DNS query performed from SGSN to select a GGSN/PGW.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

pdpCntxMassDeactAct - The active status of controllable PDP context mass deactivation

Syntax

--sgsnGparmName pdpCntxMassDeactAct --sgsnGparmValue <string>

Description

Parameter controls whether or not the feature controllable PDP context mass deactivation is activated.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

pdpCntxMassDeactSpd - The speed of controllable PDP context mass deactivation

Syntax

--sgsnGparmName pdpCntxMassDeactSpd --sgsnGparmValue <string>

Description

This parameter controls the speed of controllable PDP context mass deactivation, deactivations per second. the range of the parameter is 1 - 25. default value is 10.

Type / Range

Integer in the range of 1 to 25

Default

10

Name

pdpRejIfRabFails - PDP activation reject if RAB setup procedure fails

Syntax

--sgsnGparmName pdpRejIfRabFails --sgsnGparmValue <string>

Description

Parameter determines whether the PDP activation is rejected if RAB setup procedure fails during PDP activation procedure.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

poolingCombiSgsnMme - Pooling SGSN/MME

Syntax

--sgsnGparmName poolingCombiSgsnMme --sgsnGparmValue <string>

Description

Parameter enables/disables the support for SGSN/MME in the same hardware and supporting pooling functionality.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

preemptionSupR8 - Preemption support for R8 subscribers

Syntax

```
--sgsnGparmName preemptionSupR8 --sgsnGparmValue <string>
```

Description

Preemption support for R8 subscribers

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

privateNbrPlan - Private numbering plan

Syntax

```
--sgsnGparmName privateNbrPlan --sgsnGparmValue <string>
```

Description

Private numbering plan

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

pshoBtwSgsnMme - Support for relocation procedures between S4-SGSN and MME

Syntax

```
--sgsnGparmName pshoBtwSgsnMme --sgsnGparmValue <string>
```

Description

Support for relocation procedures between S4-SGSN and MME

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

qciMapR8ToR99 - Active status of QCI mapping

Syntax

```
--sgsnGparmName qciMapR8ToR99 --sgsnGparmValue <string>
```

Description

Parameter enables or disables the QCI mapping from rel.8 to rel.99 and vice versa.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

qciTrafficClassMap - QCI mapping to traffic class for rel 8 to rel 7 QoS conversion

Syntax

```
--sgsnGparmName qciTrafficClassMap --sgsnGparmValue <string>
```

Description

Parameter determines whether the QCI values 8 and 9 will be mapped to traffic class interactive 2 and interactive 3 respectively in case of rel 8 to rel 7 QoS mapping.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

qosEvolAllRetPrior - Support for QoS parameters evolved allocation/retention priority parameters

Syntax

```
--sgsnGparmName qosEvolAllRetPrior --sgsnGparmValue <string>
```

Description

Parameter defines whether evolved allocation/retention priority parameters are supported on SGSN for 3G QoS.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

qosHandlingInIsho - qosHandlingInIsho

Syntax

--sgsnGparmName qosHandlingInIsho --sgsnGparmValue <string>

Description

Parameter determines whether the QoS profile is renegotiated in case the radio access is changed from GERAN to UTRAN.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

qosSubBr2to3Isho - Negotiated bitrates in case of inter SGSN and inter system RAU

Syntax

--sgsnGparmName qosSubBr2to3Isho --sgsnGparmValue <string>

Description

Parameter defines in case of inter SGSN and inter system RAU (2G -> 3G) if HLR max bitrate and guaranteed bitrate are used towards the new SGSN as negotiated bitrates.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

r8DnsEnhancementPool - R8 DNS enhancement pool

Syntax

--sgsnGparmName r8DnsEnhancementPool --sgsnGparmValue <string>

Description

Parameter is used to control the 'R8 DNS enhancement in pooling multipoint iu' feature.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

r8DnsR7EpcSubs - r8DnsR7EpcSubs

Syntax

--sgsnGparmName r8DnsR7EpcSubs --sgsnGparmValue <string>

Description

The parameter is used to control access for R8 DNS Query Support for Gn-SGSN. 1 - roaming subscribers 2 - home subscribers 3 - both home and roaming subscribers

Type / Range

Integer in the range of 1 to 3

Default

1

Name

raiInGtpTunneling - Inclusion of MCC and MNC in the RAI IE of create/update PDP context requests

Syntax

--sgsnGparmName raiInGtpTunneling --sgsnGparmValue <string>

Description

Parameter defines whether the control of content served to subscribers based on their location is enabled or not.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

randomTlliRemTimer - Random TLLI remove time from SGSN

Syntax

--sgsnGparmName randomTlliRemTimer --sgsnGparmValue <string>

Description

This parameter determines how long time random format TLLIs are stored in the SGSN after the mobile has completed the attach procedure.

Type / Range

Integer in the range of 0 to 120

Default

0

Name

raStatLevelInUse - RA based statistics reporting resolution

Syntax

--sgsnGparmName raStatLevelInUse --sgsnGparmValue <string>

Description

RA based statistics reporting resolution.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

rauCsPsCoordination - CS/PS coordination in RAU procedure

Syntax

--sgsnGparmName rauCsPsCoordination --sgsnGparmValue <string>

Description

CS/PS coordination in RAU procedure

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

reAuthActive - Re-Authentication usage

Syntax

--sgsnGparmName reAuthActive --sgsnGparmValue <string>

Description

Parameter defines the usage of the re-authentication.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

reAuthSupport - Re-Authentication support

Syntax

--sgsnGparmName reAuthSupport --sgsnGparmValue <string>

Description

Re-Authentication support

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

rel14LrRejectCauses - Release 14 lr reject causes

Syntax

--sgsnGparmName rel14LrRejectCauses --sgsnGparmValue <string>

Description

Release 14 lr reject causes

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

rel8RncQosChgRej1 - REL8 RNC QoS change reject

Syntax

--sgsnGparmName rel8RncQosChgRej1 --sgsnGparmValue <string>

Description

For Release 8 subscribers, the parameter decides whether to reject the QOS or to accept it when the RNC changes QOS in RAB assignment.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

relAccessBearerCtrl - S4 bearer retainability during lu/rab release procedure triggered from RNC

Syntax

```
--sgsnGparmName relAccessBearerCtrl --sgsnGparmValue <string>
```

Description

This parameter provides support for controlling the Release Access Bearer request messages being sent towards SGW during lu/RAB release procedure triggered from RNC, so that the signaling traffic towards SGW interface is not overloaded. If this parameter is enabled, SGSN follows the standard procedure for sending Release Access Bearer request messages towards SGW. If this parameter is disabled, Release Access Bearer request messages will not be sent towards SGW when lu/RAB release happens.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

restrict11PdpCtx - Restriction of the maximum allowed PDP contexts

Syntax

```
--sgsnGparmName restrict11PdpCtx --sgsnGparmValue <string>
```

Description

Parameter is used to restrict the maximum allowed PDP contexts from 11 to 4.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

rfspIndexSelectionOption - RFSP Index Selection Option

Syntax

```
--sgsnGparmName rfspIndexSelectionOption --sgsnGparmValue <string>
```

Description

When this parameter is enabled, then gn SGSN enables using rfspIndexSelectionOption option, available under plmn, to decide the way for assigning RFSP Index for the UE

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

rimRel8DnsAllowed - RIM release 8 DNS allowed

Syntax

```
--sgsnGparmName rimRel8DnsAllowed --sgsnGparmValue <string>
```

Description

Parameter indicates whether rel8 DNS is allowed or not.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

s6dRoamingNotAllowedToNasCc11 - S6d CC Roaming Not Allowed Map To CC 11 in NAS

Syntax

```
--sgsnGparmName s6dRoamingNotAllowedToNasCc11 --sgsnGparmValue  
<string>
```

Description

Cause code DIAMETER_ERROR_ROAMING_NOT_ALLOWED (5004) without Error Diagnostic shall be mapped to cause code #11 based on TS29.272 Annex B when sgsnGParms s6dRoamingNotAllowedToNasCc11 is set

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

sgsnNumberInUlr - Control of SGSN-Number sending to HSS

Syntax

```
--sgsnGparmName sgsnNumberInUlr --sgsnGparmValue <string>
```

Description

This parameter controls sending of SGSN-Number AVP to HSS in diameter message update location request (ULR).

Type / Range

Integer in the range of 0 to 2

Default

0

Name

sgsnSS7Statistics - sgsnSS7Statistics

Syntax

```
--sgsnGparmName sgsnSS7Statistics --sgsnGparmValue <string>
```

Description

SGSN SS7 Statistics

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

sgsnUseCcInApnForR8DnsPgWFallback - SGSN use CC in APN For R8 DNS PGW Fallback

Syntax

```
--sgsnGparmName sgsnUseCcInApnForR8DnsPgWFallback --sgsnGparmValue  
<string>
```

Description

When this parameter is enabled and MSISDN was not included as an extra tag in parallel with Charging Characteristics, SGSN will retry the R8 DNS query without the CC tag before falling back to pre-R7 DNS queries for P-GW selection.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

sgwDualStackSupport - SGW dual stack support

Syntax

```
--sgsnGparmName sgwDualStackSupport --sgsnGparmValue <string>
```

Description

SGW dual stack support

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

signalingIndication - Support for signaling indication information

Syntax

```
--sgsnGparmName signalingIndication --sgsnGparmValue <string>
```

Description

Parameter defines whether signaling indication information is set in iu-interface when interactive PDP context is activated.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

solc - SGSN overload control

Syntax

```
--sgsnGparmName solc --sgsnGparmValue <string>
```

Description

This parameter is used to switch on/off the overload control in paps

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

ss7ResrcStarvCRefCause - SS7 Refusal cause

Syntax

```
--sgsnGparmName ss7ResrcStarvCRefCause --sgsnGparmValue <string>
```

Description

Depending on the value of ss7ResrcStarvCRefCause will give operator the following refusal cause options, Default value is 2 (access congestion). Possible values (1 to 4), 1 access failure, 2 access congestion, 3 unqualified, 4 SCCP failure

Type / Range

Integer in the range of 1 to 4

Default

2

Name

staticGwForBlockService - Static GW Selection For Block Service

Syntax

```
--sgsnGparmName staticGwForBlockService --sgsnGparmValue <string>
```

Description

Static GW Selection feature will be used for Blocking Services. Certain IMSIs (configured) access configured APNs, will lead for Gn SGSN to select the configured GW IP address. This will make GGSN/GW to block service for such UE (IMSI) (e.g. what'sApp etc.). With this parameter set, Gn SGSN, will make static GW selection from configured IP addresses for such user(IMSI). Since the IMSIs might be any type of users (home, roamer etc.), only when this parameter is set, new parameter mcc and mnc will be used. Range type will be always IMSI. Otherwise, no change to the existing system.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

streamingOptAct - Streaming quality optimization feature

Syntax

```
--sgsnGparmName streamingOptAct --sgsnGparmValue <string>
```

Description

The parameter defines how the streaming quality optimization feature is configured in the SGSN.

Type / Range

Integer in the range of 0 to 10 or 255

Default

255

Name

streamWoPfcSupport - Streaming PDP supported in gb access without PFC support.

Syntax

```
--sgsnGparmName streamWoPfcSupport --sgsnGparmValue <string>
```

Description

Streaming PDP supported in gb access without PFC support.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

supportEpcCapability - EPC capability check for S/P-GW selection

Syntax

```
--sgsnGparmName supportEpcCapability --sgsnGparmValue <string>
```

Description

Parameter determines whether the SGSN supports serving-gw/pdn-gw connectivity for EPC capable mobiles.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

supportOfImsvops - Support of IMSVOPS

Syntax

```
--sgsnGparmName supportOfImsvops --sgsnGparmValue <string>
```

Description

Parameter is used to support IMS voice flags on the S4-SGSN feature.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

suspendAcknowledge - Suspend request acknowledge

Syntax

```
--sgsnGparmName suspendAcknowledge --sgsnGparmValue <string>
```

Description

When BSS sends a suspend request message to SGSN, this parameter determines whether or not the message is acknowledged at once if the subscriber is not in this PAPU unit.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

threeDigitMncMcc - Three digit MNC and MCC usage in DNS query

Syntax

```
--sgsnGparmName threeDigitMncMcc --sgsnGparmValue <string>
```

Description

Parameter controls whether three digit MNC and MCC is used in DNS query.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

throttleAlarms - Throttle RAISE and/or CANCEL alarms

Syntax

```
--sgsnGparmName throttleAlarms --sgsnGparmValue <string>
```

Description

Warning: For Nokia personnel only. Throttle RAISE and/or CANCEL alarms of SGSN processes according to the sgsnGParms throttleAlarmsTimeWindow and throttleAlarmsThresholdNumber. value = 0 means the feature is OFF, value = 1 means RAISE alarms are throttled, value = 2 means RAISE and CANCEL alarms are throttled. default value is 1.

Type / Range

Integer in the range of 0 to 2

Default

1

Name

throttleAlarmsThresholdNumber - Threshold number for alarm throttling

Syntax

```
--sgsnGparmName throttleAlarmsThresholdNumber --sgsnGparmValue  
<string>
```

Description

Warning: For Nokia personnel only. Depending on the value of throttleAlarms sgsnGparmName, if number of alarms with same alarmid that are raised/canceled during the time window configured by throttleAlarmsTimeWindow sgsnGparmName, exceeds this value then throttling starts. throttling stops when the time window ends. default value is 40 alarms.

Type / Range

Integer in the range of 1 to 100

Default

40

Name

throttleAlarmsTimeWindow - Time window for alarm throttling

Syntax

```
--sgsnGparmName throttleAlarmsTimeWindow --sgsnGparmValue <string>
```

Description

Warning: For Nokia personnel only. Depending on the value of throttleAlarms sgsnGparmName, if number of alarms with same alarmid that are raised/canceled during this time window, exceeds the value of throttleAlarmsThresholdNumber sgsnGparmName, then throttling starts. throttling stops when the time window ends. default value is 60 seconds.

Type / Range

Integer in the range of 1 to 300

Default

60

Name

timeZoneEncode - TimeZoneEncode

Syntax

```
--sgsnGparmName timeZoneEncode --sgsnGparmValue <string>
```

Description

This parameter controls the encoded time zone format.

Type / Range

Integer in the range of 0 to 1

Default

0

Name

tripletsToQuintuplets - Triplets to quintuplets

Syntax`--sgsnGparmName tripletsToQuintuplets --sgsnGparmValue <string>`**Description**

Parameter defines if new authentication vectors are asked from the HLR when triplets are received from the previous SGSN during inter SGSN RAU in gb or iu access.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

twoByteChargingChar - twoByteChargingChar

Syntax`--sgsnGparmName twoByteChargingChar --sgsnGparmValue <string>`**Description**

This parameter is used to define the support for two-byte charging characteristics value in SGSN, received from HLR. It is configurable to use four-bit, one-byte, or two-byte charging characteristics in SGSN.

Type / Range

Integer in the range of 0 to 2

Default

0

Name

ueAmbrDI - UE AMBR downlink default value

Syntax`--sgsnGparmName ueAmbrDI --sgsnGparmValue <string>`**Description**

Default value to be used as subscribed UE-AMBR downlink when this QoS parameter is not received from HSS (TS 23.060 par.15.2.2 if no values of UE-AMBR are received from the HSS, the SGSN shall set the UE-AMBR according to implementation specific policies (e.g. a pre-configured maximum UEAMBR)).

Type / Range

Integer in the range of 1 to 256

Default

16

Name

ueAmbrSupportRanap - UE-AMBR support

Syntax

```
--sgsnGparmName ueAmbrSupportRanap --sgsnGparmValue <string>
```

Description

Parameter determines whether SGSN sends UE-AMBR IE in RAB assignment request and relocation request messages to RNC.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

ueAmbrUI - ueAmbrUI

Syntax

```
--sgsnGparmName ueAmbrUI --sgsnGparmValue <string>
```

Description

Default value to be used as subscribed UE-AMBR uplink when this QoS parameter is not received from HSS (TS 23.060 par.15.2.2 if no values of UE-AMBR are received from the HSS, the SGSN shall set the UE-AMBR according to implementation specific policies (e.g. a pre-configured maximum UEAMBR).).

Type / Range

Integer in the range of 1 to 256

Default

12

Name

updQosSuppFlg - Upgrade QoS supported bit in common flag IE for GTPv1

Syntax

```
--sgsnGparmName updQosSuppFlg --sgsnGparmValue <string>
```

Description

Parameter is used to control sending the upgrade QoS supported bit in the common flag IE from SGSN to GGSN/PCRF.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

usedGtpVersion - Used GTP version

Syntax

```
--sgsnGparmName usedGtpVersion --sgsnGparmValue <string>
```

Description

The parameter defines which version of the GTP is used towards the operators own GGSNs.

List

- 0 - Specify GTP version of 0.
- 1 - Specify GTP version of 1.
- 255 - Specify GTP version of 255.

Default

255

Name

userPlaneEchoSending - UserPlaneEchoSending

Syntax

```
--sgsnGparmName userPlaneEchoSending --sgsnGparmValue <string>
```

Description

This parameter controls where the GTP user plane echoes are sent. By default (value 4), the echoes are not sent to neither RNC nor GGSN. By changing the parameter, it is possible to enable echo sending to either RNC or GGSN, or enable it for both. Some RNCs do not respond to SGSNs echo requests if the Direct Tunnel is in use. The GTP user plane echo sending is optional in the 29.060 (GTP) specification. Allowed values are: 1 The user plane echoes are sent to RNCs and GGSNs. 2 The user plane echoes are sent only to RNCs. 3 The user plane echoes are sent only to GGSNs. 4 SGSN does not send user plane echoes.

Type / Range

Integer in the range of 1 to 4

Default

4

Name

zeroNonDrxTimer - zeroNonDrxTimer

Syntax

```
--sgsnGparmName zeroNonDrxTimer --sgsnGparmValue <string>
```

Description

Parameter enables setting the DRX-mode 'ON' to mobiles that send an attach request message with zero non-drx-timer value.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

zoneSw - Zone Switch

Syntax

```
--sgsnGparmName zoneSw --sgsnGparmValue <string>
```

Description

This parameter controls whether or not the mapping between zone names and RACs/LACs is enabled (switch on). If the parameter is set, zone name will be used as tag in the APN query. Otherwise, RAC+LAC will be used as tag in the APN query.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

7.31 cmm sgsnLai

sgsn location area identifiers. Syntax, description, parameters, and roles for cmm sgsnLai command.

Syntax

Description

Configure, list and show sgsn Location Area Identification.

Parameters

Name

mcc - MCC

Syntax

--mcc <digits>

Description

MCC digits of broadcasted PLMN.

Class

Required key.

Type / Range

Digit string of length 3

Name

mnc - MNC

Syntax

--mnc <digits>

Description

MNC digits of broadcasted PLMN.

Class

Required key.

Type / Range

Digit string of length 2 to 3

Name

lac - LAC

Syntax

--lac <integer>

Description

Location area code.

Class

Required key.

Type / Range

Integer in the range of 1 to 65,533

Name

epind - Epind

Syntax

--epind <integer>

Description

Equivalent PLMN list index the EPIND parameter defines to which location areas (LA) the listed MCC+MNC item is relevant. if the value of the LA's EPIND matches with the EPIND in the 'PLMN parameters' or if the EPIND in the 'PLMN parameters' is 0/all, the listed MCC+MNC item is relevant to the current LA. all relevant MCC+MNC values are collected into the EPLMN list sent to the MS. allowed values 1 ... 5, 0, 255 0 ... all 255 ... remove EPLMN index

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

0

Name

homeSubscriber - Home subscriber

Syntax

--homeSubscriber <list-item>

Description

Control roaming flag for home subscriber on the LA level.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

visitorSubscriber - Visitor subscriber

Syntax

--visitorSubscriber <list-item>

Description

Control roaming flag for visitor subscriber on the LA level.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

7.32 cmm sgsnLboAllowedApn

LBO PGW Selection allowed APN. Syntax, description, parameters, and roles for cmm sgsnLboAllowedApn command.

Syntax**Description**

This command is used to provision allowed APNs list for the selection of PGW for a roamer UE LBO PDN connection.

Parameters**Name**

sgsnLboAllowedApnListName - name of sgsn LBO Allowed Apn List

Syntax

--sgsnLboAllowedApnListName <string>

Description

name of sgsn LBO Allowed Apn List

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

apnNi - APN network identifier

Syntax

--apnNi <string>

Description

APN network identifier

Class

Required key.

Type / Range

Digit string of length 1 to 62 with the allowed pattern of [0-9a-zA-Z\._]*

7.34 cmm sgsnLocalEndPtCfg

SGSN Local End Point Configuration. Syntax, description, parameters, and roles for cmm sgsnLocalEndPtCfg command.

Syntax**Description**

Configure, list and show interface configurations.

Parameters**Name**

bvcResetRetries - BVC reset retries

Syntax

--bvcResetRetries <integer>

Description

This parameter defines the number of retries in the BVC reset procedure. the values range from 0 to 255.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 0 to 255

Default

3

Name

bvcResetTimer - BVC reset timer

Syntax

--bvcResetTimer <integer>

Description

This parameter defines the BSSGP virtual connection (BVC) reset timer. the parameter guards the reset procedure of the BVC. the values range from 1 to 120 seconds.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 120

Default

3

Name

gni - GGSN IPv4 network identifier

Syntax

--gni <string>

Description

This parameter defines the external network the GGSN is connected to. in the GPRS backbone, the access point name is a reference to the GGSN to be used. this parameter is also applicable for S4.

Class

Optional, not filterable on list.

Type / Range

Digit string of length 0 to 63 with the allowed pattern of [0-9a-zA-Z\._:]*

Name

gni6 - GGSN IPv6 network identifier

Syntax

--gni6 <string>

Description

This parameter defines the external network the GGSN is connected to. in the GPRS backbone, the access point name (APN) is a reference to the GGSN to be used. this parameter is also applicable for S4.

Class

Optional, not filterable on list.

Type / Range

Digit string of length 0 to 63 with the allowed pattern of [0-9a-zA-Z\._:]*

Name

gniv4v6 - GGSN IPv4v6 network identifier

Syntax

--gniv4v6 <string>

Description

This parameter is used to store the primary default gateway network identifier for a dual stack PDP context (IPv4v6). this parameter is also applicable for S4.

Class

Optional, not filterable on list.

Type / Range

Digit string of length 0 to 63 with the allowed pattern of [0-9a-zA-Z\._:]*

Name

goi - GGSN operator identifier

Syntax

--goi <string>

Description

This parameter defines in which PLMN GPRS backbone the GGSN is located. GOI last part has to be .gprs. this parameter is also applicable for S4.

Class

Optional, not filterable on list.

Type / Range

Digit string of length 0 to 37 with the allowed pattern of [0-9a-zA-Z\._:]*

Name

i6hcack - IPv6 acknowledged data header compression

Syntax

--i6hcack <list-item>

Description

This parameter defines the IPv6 unacknowledged data header compression, true ... IPv6 unacknowledged data header compression is in use false ... IPv6 unacknowledged data header compression is not in use.

Class

Optional, not filterable on list.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

i6hcunack - IPv6 unacknowledged data header compression

Syntax

--i6hcunack <list-item>

Description

This parameter defines the IPv6 acknowledged data header compression, true ... IPv6 acknowledged data header compression is in use false ... IPv6 acknowledged data header compression is not in use.

Class

Optional, not filterable on list.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

icp - Gb over IP configuration UDP port

Syntax

--icp <integer>

Description

This parameter defines the pre-configured UDP port number for dynamic gb over IP. the values range from 49999 to 65535.

Class

Output only.

Type / Range

Integer in the range of 49,999 to 65,535

Default

49999

Name

IndDataFwdTimer - Timer for indirect data forwarding

Syntax

--IndDataFwdTimer <integer>

Description

This timer is used to determine the duration for which indirect data forwarding tunnel will be established during a handover procedure. the values range from 1 to 10.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 10

Default

3

Name

llcRetransmCounter - LLC retransmission count, SGSN proposed value

Syntax

--llcRetransmCounter <integer>

Description

This parameter defines the logical link control (LLC) retransmission count, SGSN proposed value. the values range from 1 to 15.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 15

Default

3

Name

llcRetransmTimer - LLC retransmission timer, SGSN proposed value

Syntax

--llcRetransmTimer <integer>

Description

This parameter defines the logical link control (LLC) retransmission timer, SGSN proposed value. the values range from 0 to 410 seconds.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 0 to 410

Default

10

Name

multihoming - Whether multihoming is in use or not

Syntax

--multihoming <list-item>

Description

Whether multihoming is in use or not.

Class

Optional, not filterable on list.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

n3CreatePdp - N3-requests counter for create PDP context requests

Syntax

--n3CreatePdp <integer>

Description

This parameter defines the value for the counter that holds the maximum number of attempts made by the GPRS tunnelling protocol (GTP) to send a create PDP context request message. the values range from 1 to 7.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 7

Default

5

Name

n3CreIndDataFwdTunnel - N3-request counter for create indirect data fwd tunnel request

Syntax

--n3CreIndDataFwdTunnel <integer>

Description

This parameter defines the value for the counter that holds the maximum number of attempts made by the GPRS tunneling protocol v2 (GTPv2) to send a create indirect data forwarding tunnel request message. the values range from 1 to 7.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 7

Default

5

Name

n3CreSession - N3-request counter for create session request

Syntax

--n3CreSession <integer>

Description

This parameter defines the value for the counter that holds the maximum number of attempts made by the GPRS tunneling protocol V2 (GTPv2) to send a create session request message. the values range from 1 to 7.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 7

Default

5

Name

n3Ctxtv2 - N3-request counter for context request, GTPv2

Syntax

--n3Ctxtv2 <integer>

Description

This parameter defines the value for the counter that holds the maximum number of attempts made by the GPRS tunneling protocol v2 (GTPv2) to send a context request message. the values range from 1 to 7.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 7

Default

5

Name

n3DelIndDataFwdTunnel - N3-request counter for delete indirect data fwd tunnel request

Syntax

--n3DelIndDataFwdTunnel <integer>

Description

This parameter defines the value for the counter that holds the maximum number of attempts made by the GPRS tunneling protocol v2 (GTPv2) to send a delete indirect data forwarding tunnel request message. the values range from 1 to 7.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 7

Default

5

Name

n3DelPdp - N3-requests counter for delete PDP context requests

Syntax

--n3DelPdp <integer>

Description

This parameter defines the value for the counter that holds the maximum number of attempts made by the GPRS tunnelling protocol (GTP) to send a delete PDP context request message. the values range from 1 to 7.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 7

Default

5

Name

n3DelSession - N3-request counter for delete session request

Syntax

--n3DelSession <integer>

Description

This parameter defines the value for the counter that holds the maximum number of attempts made by the GPRS tunneling protocol v2 (GTPv2) to send a delete session request message. the values range from 1 to 7.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 7

Default

5

Name

n3EchoCP - N3-requests counter for echo requests of control plane

Syntax**Description**

This parameter defines the value for the counter that holds the maximum number of attempts made by the GPRS tunnelling protocol (GTP) to send an echo request message concerning control plane. the values range from 1 to 7.

Class

Output only.

Type / Range

Digit string of length 1 to 255

Default

5

Name

n3EchoCPv2 - N3-request counter for echo requests of control plane, GTPv2

Syntax

--n3EchoCPv2 <integer>

Description

This parameter defines the value for the counter that holds the maximum number of attempts made by the GPRS tunneling protocol v2 (GTPv2) to send an echo request message concerning control plane. the values range from 1 to 7. this parameter is also applicable for S3S16.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 7

Default

5

Name

n3EchoUP - N3-requests counter for echo requests of user plane

Syntax

- -n3EchoUP <integer>

Description

This parameter defines the value for the counter that holds the maximum number of attempts made by the GPRS tunnelling protocol (GTP) to send an echo request message concerning user plane. the values range from 1 to 7.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 7

Default

5

Name

n3ForwReloc - N3-requests counter for forward relocation requests

Syntax

- -n3ForwReloc <integer>

Description

This parameter defines the value for the counter that holds the maximum number of attempts made by the GPRS tunnelling protocol (GTP) to send a forward relocation request message. the values range from 1 to 7.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 7

Default

5

Name

n3ForwRelocv2 - N3-request counter for fwd relocation request, GTPv2

Syntax

- -n3ForwRelocv2 <integer>

Description

This parameter defines the value for the counter that holds the maximum number of attempts made by the GPRS tunneling protocol v2 (GTPv2) to send a forward relocation request message. the values range from 1 to 7.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 7

Default

5

Name

n3Id - N3-requests counter for identification requests GTPv1

Syntax

--n3Id <integer>

Description

This parameter defines the value for the counter that holds the maximum number of attempts made by the GPRS tunnelling protocol (GTP) to send an identification request message. the values range from 1 to 7.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 7

Default

5

Name

n3Idv2 - N3-request counter for identification request, GTPv2

Syntax

--n3Idv2 <integer>

Description

This parameter defines the value for the counter that holds the maximum number of attempts made by the GPRS tunneling protocol v2 (GTPv2) to send a identification request message. the values range from 1 to 7.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 7

Default

5

Name

n3ModBearer - N3-request counter for modify bearer request

Syntax

--n3ModBearer <integer>

Description

This parameter defines the value for the counter that holds the maximum number of attempts made by the GPRS tunneling protocol v2 (GTPv2) to send a modify bearer request message. the values range from 1 to 7.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 7

Default

5

Name

n3RelBearer - N3-request counter for release access bearer request

Syntax

--n3RelBearer <integer>

Description

This parameter defines the value for the counter that holds the maximum number of attempts made by the GPRS tunneling protocol v2 (GTPv2) to send a release access bearer request message. the values range from 1 to 7.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 7

Default

5

Name

n3RelocCancelv2 - N3-request counter for relocation cancel request, GTPv2

Syntax

--n3RelocCancelv2 <integer>

Description

This parameter defines the value for the counter that holds the maximum number of attempts made by the GPRS tunneling protocol v2 (GTPv2) to send a relocation cancel request message. the values range from 1 to 7.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 7

Default

5

Name

n3SgsnCtxt - N3-requests counter for SGSN context requests

Syntax

--n3SgsnCtxt <integer>

Description

This parameter defines the value for the counter that holds the maximum number of attempts made by the GPRS tunnelling protocol (GTP) to send an SGSN context request message. the values range from 1 to 7.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 7

Default

5

Name

n3UpdPdp - N3-requests counter for update PDP context requests

Syntax

--n3UpdPdp <integer>

Description

This parameter defines the value for the counter that holds the maximum number of attempts made by the GPRS tunnelling protocol (GTP) to send an update PDP context request message. the values range from 1 to 7.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 7

Default

5

Name

nsAliveRetries - NS alive retries

Syntax

--nsAliveRetries <integer>

Description

This parameter defines the number of retries in the network service (NS) alive procedure. the values range from 0 to 255.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 0 to 255

Default

10

Name

nsAliveTimer - NS alive timer

Syntax

--nsAliveTimer <integer>

Description

This parameter defines the network service (NS) alive timer. the parameter guards the test procedure of the network service virtual connections (NS-VC). the values range from 1 to 60 seconds.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 60

Default

3

Name

nsTestTimer - NS test timer

Syntax

--nsTestTimer <integer>

Description

This parameter defines the test procedure of the network service virtual connections (NS-VC). the values range from 1 to 60 seconds.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 60

Default

60

Name

secgni - Secondary GGSN IPv4 network identifier

Syntax`--secgni <string>`**Description**

This parameter defines which PDP subscription from the HLR is used in the override of requested APN and IMEI based APN override features, remove parameter value using SECGNI=0. this parameter is also applicable for S4.

Class

Optional, not filterable on list.

Type / Range

Digit string of length 0 to 63 with the allowed pattern of [0-9a-zA-Z\._:]*

Name

secgni6 - Secondary GGSN IPv6 network identifier

Syntax`--secgni6 <string>`**Description**

This parameter defines which PDP subscription from the HLR is used in the override of requested APN and IMEI based APN override features, remove parameter value using SECGNI6=0. this parameter is also applicable for S4.

Class

Optional, not filterable on list.

Type / Range

Digit string of length 0 to 63 with the allowed pattern of [0-9a-zA-Z\._:]*

Name

secgniv4v6 - Secondary GGSN IPv4v6 network identifier

Syntax`--secgniv4v6 <string>`**Description**

This parameter is used to store the secondary default gateway network identifier for a dual stack PDP context (IPv4v6), remove parameter value using SECGNIV4V6=0. this parameter is also applicable for S4.

Class

Optional, not filterable on list.

Type / Range

Digit string of length 0 to 63 with the allowed pattern of [0-9a-zA-Z\._:]*

Name

snsAddRetries - SNS add retries

Syntax

--snsAddRetries <integer>

Description

This parameter defines the number of SNS-ADD PDU retries in the SNS add procedure. the values range from 0 to 255.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 0 to 255

Default

3

Name

snsChangeWeightRetries - SNS changeweight retries

Syntax

--snsChangeWeightRetries <integer>

Description

This parameter defines the number of SNS-CHANGEWEIGHT PDU retries in the SNS changeweight procedure. the values range from 0 to 255.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 0 to 255

Default

3

Name

snsConfigRetries - SNS config retries

Syntax

--snsConfigRetries <integer>

Description

This parameter defines the number of SNS-CONFIG PDU retries in the SNS configuration procedure. the values range from 0 to 255.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 0 to 255

Default

3

Name

snsDeleteRetries - SNS delete retries

Syntax

--snsDeleteRetries <integer>

Description

This parameter defines the number of SNS-DELETE PDU retries in the SNS delete procedure. the values range from 0 to 255.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 0 to 255

Default

3

Name

snsProvTimer - SNS prov timer

Syntax

--snsProvTimer <integer>

Description

This parameter defines the interval of sub-network service (SNS) prov timer. the SNS prov timer guards the internet protocol (IP) SNS procedures. the values range from 1 to 10 seconds.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 10

Default

5

Name

t3Cnxtv2 - T3-response timer of context response, GTPv2

Syntax

--t3Cnxtv2 <integer>

Description

This parameter defines the value for the timer that holds the maximum waiting time for a context response message to a context request message (GTPv2). the values range from 1 to 10.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 10

Default

3

Name

t3CreatePdp - T3-response timer of create PDP context response

Syntax

--t3CreatePdp <integer>

Description

This parameter defines the value for the timer that holds the maximum waiting time for a create PDP context response message to a create PDP context request message. the values range from 1 to 10 seconds in 1 second steps.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 10

Default

3

Name

t3CreIndDataFwdTunnel - T3-response timer of create indirect data fwd tunnel response

Syntax

--t3CreIndDataFwdTunnel <integer>

Description

This parameter defines the value for the timer that holds the maximum waiting time for a create indirect data forwarding tunnel response message to a create indirect data forwarding tunnel request message. the values range from 1 to 10.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 10

Default

3

Name

t3CreSession - T3-response timer of create session response in seconds

Syntax`--t3CreSession <integer>`**Description**

This parameter defines the value for the timer that holds the maximum waiting time for a create session response message to a create session request message. the values range from 1 to 10.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 10

Default

3

Name

t3DelIndDataFwdTunnel - T3-response timer of delete indirect data fwd tunnel response

Syntax`--t3DelIndDataFwdTunnel <integer>`**Description**

This parameter defines the value for the timer that holds the maximum waiting time for a delete indirect data forwarding tunnel response message to a delete indirect data forwarding tunnel request message. the values range from 1 to 10.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 10

Default

3

Name

t3DelPdp - T3-response timer of delete PDP context response

Syntax`--t3DelPdp <integer>`**Description**

This parameter defines the value for the timer that holds the maximum waiting time for a delete PDP context response message to a delete PDP context request message. the values range from 1 to 10 seconds in 1 second steps.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 10

Default

3

Name

t3DelSession - T3-response timer of delete session response

Syntax

--t3DelSession <integer>

Description

This parameter defines the value for the timer that holds the maximum waiting time for a delete session response message to a delete session request message. the values range from 1 to 10.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 10

Default

3

Name

t3EchoCP - T3-response timer of echo response of control plane

Syntax**Description**

This parameter defines the value for the timer that holds the maximum waiting time for an echo response message to an echo request message concerning control plane. the values range from 3 to 15 seconds.

Class

Output only.

Type / Range

Digit string of length 1 to 255

Default

3

Name

t3EchoCPv2 - T3-response timer of echo response of control plane, GTPv2

Syntax

--t3EchoCPv2 <integer>

Description

This parameter defines the value for the timer that holds the maximum waiting time for an echo response message to an echo request message concerning control plane (GTPv2). the values range from 3 to 15 seconds. this parameter is also applicable for S3S16.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 3 to 15

Default

3

Name

t3EchoUP - T3-response timer of echo response of user plane, from 3 to 15 seconds in 3 second steps

Syntax

--t3EchoUP <integer>

Description

This parameter defines the value for the timer that holds the maximum waiting time for an echo response message to an echo request message concerning user plane. the values range from 3 to 15 seconds.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 3 to 15

Default

3

Name

t3ForwReloc - T3-response timer of forward relocation response

Syntax

--t3ForwReloc <integer>

Description

This parameter defines the value for the timer that holds the maximum waiting time for a forward relocation response message to a forward relocation request message. the values range from 1 to 10 seconds in 1 second steps.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 10

Default

3

Name

t3ForwRelocv2 - T3-response timer of fwd relocation response, GTPv2

Syntax

--t3ForwRelocv2 <integer>

Description

This parameter defines the value for the timer that holds the maximum waiting time for a forward relocation request message to a forward relocation response message (GTPv2). the values range from 1 to 10.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 10

Default

3

Name

t3Id - T3-response timer of identification response GTPv1

Syntax

--t3Id <integer>

Description

This parameter defines the value for the timer that holds the maximum waiting time for an identification response message to an identification request message. the values range from 1 to 10 seconds in 1 second steps.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 10

Default

3

Name

t3Idv2 - T3-response timer of identification response, GTPv2

Syntax

--t3Idv2 <integer>

Description

This parameter defines the value for the timer that holds the maximum waiting time for a identification response message to a identification request message (GTPv2). the values range from 1 to 10.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 10

Default

3

Name

t3ModBearer - T3-response timer of modify bearer response

Syntax

--t3ModBearer <integer>

Description

This parameter defines the value for the timer that holds the maximum waiting time for a modify bearer response message to a modify bearer request message. the values range from 1 to 10.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 10

Default

3

Name

t3RelBearer - T3-response timer of release access bearer response

Syntax

--t3RelBearer <integer>

Description

This parameter defines the value for the timer that holds the maximum waiting time for a release access bearer response message to a release access bearer request message. the values range from 1 to 10.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 10

Default

3

Name

t3RelocCancelv2 - T3-response timer of relocation cancel response, GTPv2

Syntax

--t3RelocCancelv2 <integer>

Description

This parameter defines the value for the timer that holds the maximum waiting time for a relocation cancel response message to a relocation cancel request (GTPv2). the values range from 1 to 10.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 10

Default

3

Name

t3SgsnCtxt - T3-response timer of SGSN context response

Syntax

--t3SgsnCtxt <integer>

Description

This parameter defines the value for the timer that holds the maximum waiting time for an SGSN context response message to an SGSN context request message. the values range from 1 to 10 seconds in 1 second steps.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 10

Default

3

Name

t3tunnel - T3 tunnel

Syntax

--t3tunnel <integer>

Description

This parameter defines the T3 tunnel. the T3 tunnel parameter defines the timer that controls the time when protocol data units (PDUs) are forwarded from the old SGSN to the new SGSN as part of the inter-sgsn routing area update procedure. the values range from 20 to 60 seconds in 1 second steps. this parameter is also applicable for S3S16.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 20 to 60

Default

20

Name

t3UpdPdp - T3-response timer of update PDP context response

Syntax

--t3UpdPdp <integer>

Description

This parameter defines the value for the timer that holds the maximum waiting time for an update PDP context response message to an update PDP context request message. the values range from 1 to 10 seconds in 1 second steps.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 10

Default

3

Name

techo - Techo

Syntax

--techo <integer>

Description

This parameter defines the timer that holds the time interval for the path validation procedure. the values range from 60 to 600 seconds.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 60 to 600

Default

120

Name

techoV2 - Techo, GTPv2

Syntax`--techoV2 <integer>`**Description**

This parameter defines the timer that holds the time interval for the path validation procedure (GTPv2). the values range from 60 to 600 seconds. this parameter is also applicable for S3S16.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 60 to 600

Default

120

Name

id - Interface name

Syntax`<list-item>`**Description**

Interface name.

Class

Required value.

List

- GBNS - Specify gbns interface.
- GNSGSN - Specify Gn interface to an SGSN.
- Gr - Specify gr interface to an HLR.
- lu - Specify iu interface to an RNC.
- S13 - Specify S13 interface to an EIR.
- S3S16 - Specify S3/S16 interface to an SGSN.
- S4 - Specify S4 interface to an SGW.
- S6d - Specify S6d interface to an HSS.

7.35 cmm sgsnPagingGroup

rnc paging group members. Syntax, description, parameters, and roles for cmm sgsnPagingGroup command.

Syntax

Description

This command is used to add RNC members in a paging group. Every group can have up to 32 RNCs.

Parameters

Name

groupId - GroupId of RNC

Syntax

--groupId <integer>

Description

GroupId of RNC.

Class

Required key.

Type / Range

Integer in the range of 1 to 4,900

Name

rncName - RNC name

Syntax

--rncName <string>

Description

RNC name. this parameter should match parameter rncname of table rnc.

Class

Required key.

Type / Range

Digit string of length 1 to 10 with the allowed pattern of [0-9a-zA-Z\._:-]*

Name

rncRole - RNC role

Syntax

--rncRole <integer>

Description

RNC role in group, 1 normal, 2 master, 3 standby.

Class

Optional.

Type / Range

Integer in the range of 1 to 3

Default

1

7.36 cmm sgsnPagingGroupList

paging groups. Syntax, description, parameters, and roles for cmm sgsnPagingGroupList command.

Syntax

Description

This command is used to configure the paging groups under SGSN. The maximum number of paging groups supported is 1000.

Parameters

Name

groupId - GroupId

Syntax

--groupId <integer>

Description

Paging group id.

Class

Required key.

Type / Range

Integer in the range of 1 to 65,535

Name

name - Name

Syntax

--name <string>

Description

Paging group name.

Class

Required on create.

Type / Range

Digit string of length 1 to 10 with the allowed pattern of [0-9a-zA-Z\._ :]*

Name

masterRncName - MasterId

Syntax

--masterRncName <string>

Description

Master id. this parameter should match parameter rncname of table rnc. updated automatically.

Class

Read only.

Type / Range

Digit string of length 0 to 10 with the allowed pattern of [0-9a-zA-Z\.\-:]*

Default

""

Name

standbyRncName - MasterId

Syntax

--standbyRncName <string>

Description

Standby id. this parameter should match parameter rncname of table rnc. updated automatically.

Class

Read only.

Type / Range

Digit string of length 0 to 10 with the allowed pattern of [0-9a-zA-Z\.\-:]*

Default

""

7.37 cmm sgsnPgwSelectionRangeServices

Services based on PGW/GGSN selection range. Syntax, description, parameters, and roles for cmm sgsnPgwSelectionRangeServices command.

Syntax

Description

Services based on PGW/GGSN selection range

Parameters

Name

entryId - Entry Id

Syntax

--entryId <integer>

Description

Entry Id

Class

Required key.

Type / Range

Integer in the range of 1 to 500

Name

apnNi - APN network identifier

Syntax

--apnNi <string>

Description

APN network identifier

Class

Required on create.

Type / Range

Use this parameter to specify the APN Domain Name

Name

ggsnIpAddress - GGSN IP Address

Syntax

--ggsnIpAddress <string>

Description

Use this parameter to specify the GGSN IP Address

Class

Required on create.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

maxMsin - Maximum MSIN

Syntax

--maxMsin <digits>

Description

The maximum IMSI MSIN value or MSISDN. The length 2-15 is only allowed for an MSISDN type. For an IMSI the allowed length is 8-10.

Restrictions

The length 2-15 is only allowed for an MSISDN type. For an IMSI the allowed length is 8-10.

Class

Required on create.

Type / Range

Digit string of length 2 to 15

Name

minMsin - Minimum MSIN

Syntax

--minMsin <digits>

Description

The minimum IMSI MSIN value or MSISDN. The length 2-15 is only allowed for an MSISDN type. For an IMSI the allowed length is 8-10.

Restrictions

The length 2-15 is only allowed for an MSISDN type. For an IMSI the allowed length is 8-10.

Class

Required on create.

Type / Range

Digit string of length 2 to 15

Name

rangeServiceType - Range service type

Syntax

--rangeServiceType <list-item>

Description

Range service type

Class

Required on create, not modifiable.

List

- imsi - Specify range service type of IMSI.

- msisdn - Specify range service type of MSISDN.

Name

mcc - Mobile Country Code

Syntax

--mcc <digits>

Description

Mobile Country Code. Rules including the UE's MCC and MNC will be ignored if sgsnGParms staticGwForBlockService is disabled.

Class

Optional.

Type / Range

Digit string of length 0 or 3

Default

"

Name

mnc - Mobile Network Code

Syntax

--mnc <digits>

Description

Mobile Network Code. Rules including the UE's MCC and MNC will be ignored if sgsnGParms staticGwForBlockService is disabled.

Class

Optional.

Type / Range

Digit string of length 0 or 2 to 3

Default

"

7.38 cmm sgsnS13LocalEndPtCfg

S13 SGSN Local Endpoint Configuration. Syntax, description, parameters, and roles for cmm sgsnS13LocalEndPtCfg command.

Syntax

Description

Configure, list and show parameters related to S13 interface.

Parameters

Name

id - Interface name

Syntax

<list-item>

Description

Interface name.

Class

Required value.

List

- GBNS - Specify gbns interface.
- GNSGSN - Specify Gn interface to an SGSN.
- Gr - Specify gr interface to an HLR.
- lu - Specify iu interface to an RNC.
- S13 - Specify S13 interface to an EIR.
- S3S16 - Specify S3/S16 interface to an SGSN.
- S4 - Specify S4 interface to an SGW.
- S6d - Specify S6d interface to an HSS.

Name

multihoming - Whether multihoming is in use or not

Syntax

--multihoming <list-item>

Description

Whether multihoming is in use or not.

Class

Optional, not filterable on list.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Roles**Create**

sysadmin, manage

7.39 cmm sgsnS3S16LocalEndPtCfg

S13S16 SGSN Local Endpoint Configuration. Syntax, description, parameters, and roles for cmm sgsnS3S16LocalEndPtCfg command.

Syntax**Description**

Configure, list and show parameters related to S13S16 interface.

Parameters**Name**

id - Interface name

Syntax

<list-item>

Description

Interface name.

Class

Required value.

List

- GBNS - Specify gbns interface.
- GNSGSN - Specify Gn interface to an SGSN.
- Gr - Specify gr interface to an HLR.
- lu - Specify iu interface to an RNC.
- S13 - Specify S13 interface to an EIR.
- S3S16 - Specify S3/S16 interface to an SGSN.
- S4 - Specify S4 interface to an SGW.
- S6d - Specify S6d interface to an HSS.

Name

n3Ctxtv2 - N3-request counter for context request, GTPv2

Syntax

--n3Ctxtv2 <integer>

Description

This parameter defines the value for the counter that holds the maximum number of attempts made by the GPRS tunneling protocol v2 (GTPv2) to send a context request message. the values range from 1 to 7.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 7

Default

5

Name

n3ForwRelocv2 - N3-request counter for fwd relocation request, GTPv2

Syntax

--n3ForwRelocv2 <integer>

Description

This parameter defines the value for the counter that holds the maximum number of attempts made by the GPRS tunneling protocol v2 (GTPv2) to send a forward relocation request message. the values range from 1 to 7.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 7

Default

5

Name

n3Idv2 - N3-request counter for identification request, GTPv2

Syntax

--n3Idv2 <integer>

Description

This parameter defines the value for the counter that holds the maximum number of attempts made by the GPRS tunneling protocol v2 (GTPv2) to send a identification request message. the values range from 1 to 7.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 7

Default

5

Name

n3RelocCancelv2 - N3-request counter for relocation cancel request, GTPv2

Syntax

--n3RelocCancelv2 <integer>

Description

This parameter defines the value for the counter that holds the maximum number of attempts made by the GPRS tunneling protocol v2 (GTPv2) to send a relocation cancel request message. the values range from 1 to 7.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 7

Default

5

Name

t3Cnxtv2 - T3-response timer of context response, GTPv2

Syntax

--t3Cnxtv2 <integer>

Description

This parameter defines the value for the timer that holds the maximum waiting time for a context response message to a context request message (GTPv2). the values range from 1 to 10.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 10

Default

3

Name

t3ForwRelocv2 - T3-response timer of fwd relocation response, GTPv2

Syntax

--t3ForwRelocv2 <integer>

Description

This parameter defines the value for the timer that holds the maximum waiting time for a forward relocation request message to a forward relocation response message (GTPv2). the values range from 1 to 10.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 10

Default

3

Name

t3Idv2 - T3-response timer of identification response, GTPv2

Syntax

--t3Idv2 <integer>

Description

This parameter defines the value for the timer that holds the maximum waiting time for a identification response message to a identification request message (GTPv2). the values range from 1 to 10.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 10

Default

3

Name

t3RelocCancelv2 - T3-response timer of relocation cancel response, GTPv2

Syntax

--t3RelocCancelv2 <integer>

Description

This parameter defines the value for the timer that holds the maximum waiting time for a relocation cancel response message to a relocation cancel request (GTPv2). the values range from 1 to 10.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 10

Default

3

7.40 cmm sgsnS4LocalEndPtCfg

SGSN S4 Local Endpoint Configuration.. Syntax, description, parameters, and roles for cmm sgsnS4LocalEndPtCfg command.

Syntax

Description

Configure, list and show parameters related to S4 interface.

Parameters

Name

id - Interface name

Syntax

<list-item>

Description

Interface name.

Class

Required value.

List

- GBNS - Specify gbns interface.
- GNSGSN - Specify Gn interface to an SGSN.
- Gr - Specify gr interface to an HLR.
- lu - Specify iu interface to an RNC.
- S13 - Specify S13 interface to an EIR.
- S3S16 - Specify S3/S16 interface to an SGSN.
- S4 - Specify S4 interface to an SGW.
- S6d - Specify S6d interface to an HSS.

Name

IndDataFwdTimer - Timer for indirect data forwarding

Syntax

--IndDataFwdTimer <integer>

Description

This timer is used to determine the duration for which indirect data forwarding tunnel will be established during a handover procedure. the values range from 1 to 10.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 10

Default

3

Name

n3CreIndDataFwdTunnel - N3-request counter for create indirect data fwd tunnel request

Syntax`--n3CreIndDataFwdTunnel <integer>`**Description**

This parameter defines the value for the counter that holds the maximum number of attempts made by the GPRS tunneling protocol v2 (GTPv2) to send a create indirect data forwarding tunnel request message. the values range from 1 to 7.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 7

Default

5

Name

n3CreSession - N3-request counter for create session request

Syntax`--n3CreSession <integer>`**Description**

This parameter defines the value for the counter that holds the maximum number of attempts made by the GPRS tunneling protocol V2 (GTPv2) to send a create session request message. the values range from 1 to 7.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 7

Default

5

Name

n3DelIndDataFwdTunnel - N3-request counter for delete indirect data fwd tunnel request

Syntax`--n3DelIndDataFwdTunnel <integer>`**Description**

This parameter defines the value for the counter that holds the maximum number of attempts made by the GPRS tunneling protocol v2 (GTPv2) to send a delete indirect data forwarding tunnel request message. the values range from 1 to 7.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 7

Default

5

Name

n3DelSession - N3-request counter for delete session request

Syntax

--n3DelSession <integer>

Description

This parameter defines the value for the counter that holds the maximum number of attempts made by the GPRS tunneling protocol v2 (GTPv2) to send a delete session request message. the values range from 1 to 7.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 7

Default

5

Name

n3EchoCPv2 - N3-request counter for echo requests of control plane, GTPv2

Syntax

--n3EchoCPv2 <integer>

Description

This parameter defines the value for the counter that holds the maximum number of attempts made by the GPRS tunneling protocol v2 (GTPv2) to send an echo request message concerning control plane. the values range from 1 to 7. this parameter is also applicable for S3S16.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 7

Default

5

Name

n3ModBearer - N3-request counter for modify bearer request

Syntax`--n3ModBearer <integer>`**Description**

This parameter defines the value for the counter that holds the maximum number of attempts made by the GPRS tunneling protocol v2 (GTPv2) to send a modify bearer request message. the values range from 1 to 7.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 7

Default

5

Name

n3RelBearer - N3-request counter for release access bearer request

Syntax`--n3RelBearer <integer>`**Description**

This parameter defines the value for the counter that holds the maximum number of attempts made by the GPRS tunneling protocol v2 (GTPv2) to send a release access bearer request message. the values range from 1 to 7.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 7

Default

5

Name

t3CreIndDataFwdTunnel - T3-response timer of create indirect data fwd tunnel response

Syntax`--t3CreIndDataFwdTunnel <integer>`**Description**

This parameter defines the value for the timer that holds the maximum waiting time for a create indirect data forwarding tunnel response message to a create indirect data forwarding tunnel request message. the values range from 1 to 10.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 10

Default

3

Name

t3CreSession - T3-response timer of create session response in seconds

Syntax

--t3CreSession <integer>

Description

This parameter defines the value for the timer that holds the maximum waiting time for a create session response message to a create session request message. the values range from 1 to 10.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 10

Default

3

Name

t3DelIndDataFwdTunnel - T3-response timer of delete indirect data fwd tunnel response

Syntax

--t3DelIndDataFwdTunnel <integer>

Description

This parameter defines the value for the timer that holds the maximum waiting time for a delete indirect data forwarding tunnel response message to a delete indirect data forwarding tunnel request message. the values range from 1 to 10.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 10

Default

3

Name

t3DelSession - T3-response timer of delete session response

Syntax

--t3DelSession <integer>

Description

This parameter defines the value for the timer that holds the maximum waiting time for a delete session response message to a delete session request message. the values range from 1 to 10.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 10

Default

3

Name

t3EchoCPv2 - T3-response timer of echo response of control plane, GTPv2

Syntax

--t3EchoCPv2 <integer>

Description

This parameter defines the value for the timer that holds the maximum waiting time for an echo response message to an echo request message concerning control plane (GTPv2). the values range from 3 to 15 seconds. this parameter is also applicable for S3S16.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 3 to 15

Default

3

Name

t3ModBearer - T3-response timer of modify bearer response

Syntax

--t3ModBearer <integer>

Description

This parameter defines the value for the timer that holds the maximum waiting time for a modify bearer response message to a modify bearer request message. the values range from 1 to 10.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 10

Default

3

Name

t3RelBearer - T3-response timer of release access bearer response

Syntax

--t3RelBearer <integer>

Description

This parameter defines the value for the timer that holds the maximum waiting time for a release access bearer response message to a release access bearer request message. the values range from 1 to 10.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 10

Default

3

Name

techoV2 - Techo, GTPv2

Syntax

--techoV2 <integer>

Description

This parameter defines the timer that holds the time interval for the path validation procedure (GTPv2). the values range from 60 to 600 seconds. this parameter is also applicable for S3S16.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 60 to 600

Default

120

7.41 cmm sgsnS6dLocalEndPtCfg

S6d SGSN Local Endpoint Configuration. Syntax, description, parameters, and roles for cmm sgsnS6dLocalEndPtCfg command.

Syntax

Description

Configure, list and show parameters related to S6d interface.

Parameters

Name

id - Interface name

Syntax

<list-item>

Description

Interface name.

Class

Required value.

List

- GBNS - Specify gbns interface.
- GNSGSN - Specify Gn interface to an SGSN.
- Gr - Specify gr interface to an HLR.
- lu - Specify lu interface to an RNC.

- S13 - Specify S13 interface to an EIR.
- S3S16 - Specify S3/S16 interface to an SGSN.
- S4 - Specify S4 interface to an SGW.
- S6d - Specify S6d interface to an HSS.

Name

multihoming - Whether multihoming is in use or not

Syntax

--multihoming <list-item>

Description

Whether multihoming is in use or not.

Class

Optional, not filterable on list.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

7.42 cmm sgsnTimer

timer configurations. Syntax, description, parameters, and roles for cmm sgsnTimer command.

Syntax

Description

Configure generic timers that are used in SGSN. Interface related timers are defined with the interface group.

Parameters

Name

cert - Cert

Syntax

--cert <integer>

Description

Timeout for diameter base connection establishment in seconds.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 5

Default

3

Name

cit - Cit

Syntax

--cit <integer>

Description

Inactivity timer for diameter connections in seconds.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 5 to 60

Default

30

Name

csPagingTimer - CS paging timer

Syntax

--csPagingTimer <integer>

Description

CS paging sending time to unknown MS after reset in seconds.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 0 to 255

Default

20

Name

detachTimer - Detach timer

Syntax

--detachTimer <integer>

Description

Defines the timer that indicates when an inactive subscriber is detached, format <HH>:<MM>

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 0 to 1,440

Default

0

Name

diaConnRetryCount - Dia conn retry count

Syntax

--diaConnRetryCount <integer>

Description

Diameter connection retry after connection lost[0 equals infinite retries].

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 0 to 100

Default

0

Name

dtEstabTimer - Dt estab timer

Syntax

--dtEstabTimer <integer>

Description

Direct tunnel establishment timer in seconds.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 120

Default

30

Name

dwrr - Dwrr

Syntax

--dwrr <integer>

Description

Number of retries for DWR diameter message if not responded.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 0 to 10

Default

2

Name

dwr - Dwrt

Syntax

--dwr <integer>

Description

Timeout for DWR diameter message in seconds.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 5

Default

2

Name

eirResponseTimer - EIR Response Timer

Syntax

--eirResponseTimer <integer>

Description

Time to wait for receiving CheckIMEI response from EIR (Gf)

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 500 to 9000 in units of Millisecond

Default

3000

Name

gsmsRetransmCount - Gsms retransm count

Syntax

--gsmsRetransmCount <integer>

Description

Retransmission.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 3

Default

2

Name

msReachabTimer - Ms reachab timer

Syntax

--msReachabTimer <integer>

Description

Ms reachable timer in seconds.

Class

Output only.

Type / Range

Integer in the range of 0 to 11,160

Default

7200

Name

offloadPrauTimer - Offload prau timer

Syntax

--offloadPrauTimer <integer>

Description

Offload periodic RA update timer in seconds.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 0 to 14,400

Default

4

Name

olct - Olct

Syntax

--olct <integer>

Description

Overload control timer for diameter connections in seconds.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 0 to 600

Default

0

Name

overwriteMsRdy - Overwrite ms rdy

Syntax

--overwriteMsRdy <list-item>

Description

Override MS ready state timer.

Class

Optional, not filterable on list.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

perRaUpTimer - Per ra up timer

Syntax

--perRaUpTimer <integer>

Description

Periodic RA update timer in seconds.

Class

Output only.

Type / Range

Integer in the range of 0 to 10,800

Default

3240

Name

psPagingInterval2g - PS paging interval 2g

Syntax

--psPagingInterval2g <integer>

Description

Paging interval timer for 2G in seconds.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 0 or 60 to 11,160

Default

0

Name

psPagingInterval3g - PS paging interval 3g

Syntax

--psPagingInterval3g <integer>

Description

Paging interval timer for 3G in seconds.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 0 or 60 to 11,160

Default

0

Name

psPagingRaCount2g - PS paging ra count 2g

Syntax

--psPagingRaCount2g <integer>

Description

RA paging area for 2G.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 5

Default

2

Name

psPagingRaCount3g - PS paging ra count 3g

Syntax

--psPagingRaCount3g <integer>

Description

RA paging area for 3G.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 5

Default

2

Name

psPagingSgsnCount2g - PS paging sgsn count 2g

Syntax

--psPagingSgsnCount2g <integer>

Description

SGSN paging area for 2G.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 0 to 5

Default

0

Name

psPagingSgsnCount3g - PS paging sgsn count 3g

Syntax

--psPagingSgsnCount3g <integer>

Description

SGSN paging area for 3G.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 0 to 5

Default

0

Name

psPagingTimer2g - PS paging timer 2g

Syntax

--psPagingTimer2g <integer>

Description

RA paging repetition for 2G in seconds by 0.1 seconds step.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 25

Default

4

Name

psPagingTimer3g - PS paging timer 3g

Syntax

--psPagingTimer3g <integer>

Description

RA paging repetition for 3G in seconds.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 25

Default

4

Name

readyTimer - Ready timer

Syntax`--readyTimer <integer>`**Description**

Ready state timer in seconds.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 0 to 11,160

Default

44

Name

rest - Rest

Syntax`--rest <integer>`**Description**

Resend timer for diameter application interface requests in seconds.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 3

Default

2

Name

standbyTimer - Standby timer

Syntax`--standbyTimer <integer>`**Description**

Standby state timer in seconds.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 0 to 11,160

Default

44

Name

tct - Tct

Syntax

--tct <integer>

Description

Transport connection retry timeout for diameter connections in seconds.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 60

Default

30

Name

id - Id

Syntax

config

Description

Automatic.

Class

Required value.

List

- config - Configuration - The id for the configuration list.

7.43 cmm sgw

Serving Gateway. Syntax, description, parameters, and roles for cmm sgw command.

Syntax

Description

This command is used to administer a Serving Gateway and includes parameters for defining the serving gateway name, pool ID, IP address, and SGW network protocol.

Parameters

Name

s11Ip - S11 IP

Syntax

--s11Ip <string>

Description

Provisions the MME, for each SGW pool ID, with the S11 IP address of each SGW node that is a member of that SGW pool.

Class

Required key.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

hostName - SGW host name

Syntax

--hostName <string>

Description

SGW host name.

Class

Required on create.

Type / Range

Digit string of length 1 to 255

Name

name - SGW name

Syntax

--name <string>

Description

Serving gateway name.

Class

Required on create.

Type / Range

Digit string of length 1 to 64 with the allowed pattern of [0-9a-zA-Z\.\-_:]*

Name

sgwPoolId - SGW pool ID

Syntax

--sgwPoolId <string>

Description

Serving gateway pool ID this serving gateway is assigned to.

Class

Required on create, not modifiable.

Type / Range

Digit string of length 1 to 20 with the allowed pattern of [0-9a-zA-Z\.\-_:]*

Name

netProtocol - Inter-Gateway protocol

Syntax

--netProtocol <list-item>

Description

Provisions the MME with the specification with the SGW network protocol.

Class

Optional.

List

- BOTH - Specify SGW supports S5/S8 based on GTP and also based on PMIP.
- GTP - Specify SGW supports S5/S8 based on GTP.
- PMIP - Specify SGW supports S5/S8 based on PMIP.

Default

GTP

7.44 cmm sgwPoolTai

Serving Gateway Pool to TAI. Syntax, description, parameters, and roles for `cmm sgwPoolTai` command.

Syntax

Description

This command is used to administer a Serving Gateway Pool to TAI mapping and includes parameters for defining the mobile network name, serving gateway pool ID, and Tracking Area Code (TAC).

Parameters

Name

plmnName - Mobile network name

Syntax

--plmnName <string>

Description

Name that identifies mobile network (alternate key).

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

sgwPoolId - SGW pool ID

Syntax

--sgwPoolId <string>

Description

ID for a serving gateway pool.

Class

Required key.

Type / Range

Digit string of length 1 to 20 with the allowed pattern of [0-9a-zA-Z\._ :]*

Name

tac - Tracking area code

Syntax

--tac <integer>

Description

Tracking area code.

Class

Required key.

Type / Range

Integer in the range of 1 to 65,535

Roles**Create**

sysadmin, manage

7.45 cmm sgwSelectionRangeServices

Services based on SGW selection range. Syntax, description, parameters, and roles for cmm sgwSelectionRangeServices command.

Syntax**Description**

Services based on SGW selection range.

Parameters**Name**

uePlmnServicesName - Name of services based on UE network and served network

Syntax

--uePlmnServicesName <string>

Description

Name that identifies roaming agreement.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

entryId - Entry ID

Syntax

--entryId <integer>

Description

Entry ID.

Class

Required key.

Type / Range

Integer in the range of 1 to 10,000

Name

gwPoolName - SGW pool name

Syntax

--gwPoolName <string>

Description

Gateway pool name this gateway is assigned to.

Class

Required on create.

Type / Range

Digit string of length 1 to 20 with the allowed pattern of [0-9a-zA-Z\.\-_:]*

Name

maxMsin - Maximum MSIN

Syntax

--maxMsin <digits>

Description

The maximum IMSI MSIN value.

Restrictions

The length 2-15 is only allowed for an MSISDN type. For an IMSI the allowed length is 8-10.

Class

Required on create.

Type / Range

Digit string of length 0 or 2 to 15

Name

minMsin - Minimum MSIN

Syntax

--minMsin <digits>

Description

The minimum IMSI MSIN value.

Restrictions

The length 2-15 is only allowed for an MSISDN type. For an IMSI the allowed length is 8-10.

Class

Required on create.

Type / Range

Digit string of length 0 or 2 to 15

Name

rangeServiceType - Range service type

Syntax

--rangeServiceType <list-item>

Description

Range service type.

Class

Required on create, not modifiable.

List

- imsi - Specify range service type of IMSI.
- msisdn - Specify range service type of MSISDN.

Name

areaListName - Name of TAI list

Syntax

--areaListName <string>

Description

Name of TAI list.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\- _:@]*

7.46 cmm sgwSelectionService

Service based on SGW selection. Syntax, description, parameters, and roles for cmm sgwSelectionService command.

Syntax**Description**

Service based on SGW selection.

Parameters**Name**

areaListName - Name of TAI list

Syntax

--areaListName <string>

Description

Name of TAI list.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

gwPoolName - SGW pool name

Syntax

--gwPoolName <string>

Description

Gateway pool name this gateway is assigned to.

Class

Required key.

Type / Range

Digit string of length 1 to 20 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

servedPlmnName - Served PLMN Name

Syntax

--servedPlmnName <string>

Description

The name of the served PLMN.

Class

Required on create, not modifiable.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

7.47 cmm smfIsolationGeneralSettings

SMF Isolation General Settings. Syntax, description, parameters, and roles for cmm smfIsolationGeneralSettings command.

Syntax

Description

Includes general settings related to SMF Isolation.

Parameters

Name

service - Service

Syntax

--service <list-item>

Description

SMF service for which the settings in the other parameters apply.

Class

Required key.

List

- Nsmf_PDUSession - SMF PDU Session Service - The network function service type of Session Management Function PDU session.

Default

Nsmf_PDUSession

Name

action3xx - Action 3xx

Syntax

--action3xx <list-item>

Description

Default action for 3xx status class responses.

Class

Optional.

List

- Isolate - Isolate the Service Instance
- KPI_Fail - KPI Fail - Increase the Failure Counter used for the Service Instance KPI
- KPI_Success - KPI Success - Increase the Success counter used for the Service Instance KPI

Default

KPI_Fail

Name

action4xx - Action 4xx

Syntax

--action4xx <list-item>

Description

Default action for 4xx status class responses.

Class

Optional.

List

- Isolate - Isolate the Service Instance
- KPI_Fail - KPI Fail - Increase the Failure Counter used for the Service Instance KPI
- KPI_Success - KPI Success - Increase the Success counter used for the Service Instance KPI

Default

KPI_Success

Name

action5xx - Action 5xx

Syntax

--action5xx <list-item>

Description

Default action for 5xx status class responses.

Class

Optional.

List

- Isolate - Isolate the Service Instance
- KPI_Fail - KPI Fail - Increase the Failure Counter used for the Service Instance KPI
- KPI_Success - KPI Success - Increase the Success counter used for the Service Instance KPI

Default

KPI_Fail

Name

actionTimeout - Action Timeout

Syntax

--actionTimeout <list-item>

Description

Action for Timeout.

Class

Optional.

List

- Isolate - Isolate the Service Instance
- KPI_Fail - KPI Fail - Increase the Failure Counter used for the Service Instance KPI
- KPI_Success - KPI Success - Increase the Success counter used for the Service Instance KPI

Default

KPI_Fail

Name

enable - Enable

Syntax

--enable <list-item>

Description

Enables the SMF Service Instance Isolation functionality.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

isolationDuration - Isolation Duration

Syntax

--isolationDuration <integer>

Description

Duration (in seconds) the isolation lasts. 0 effectively means no isolation takes place.

Class

Optional.

Type / Range

Integer in the range of 0 to 3,600 in units of Second

Default

300

Name

kpiIsolationThreshold - KPI Isolation Threshold

Syntax

--kpiIsolationThreshold <integer>

Description

Threshold of success/attempts percent under which a service (set) instance will be isolated.
When value is set to 0 the service instance is not isolated based on KPIs.

Class

Optional.

Type / Range

Integer in the range of 0 to 100

Default

90

Name

kpiMinSamples - KPI Minimum Samples

Syntax

--kpiMinSamples <integer>

Description

Minimum number of requests that are required in order to consider isolation for a service (set) instance based on KPIs.

Class

Optional.

Type / Range

Integer in the range of 1 to 1,000,000

Default

100

Name

kpiSamplingPeriod - KPI Sampling Period

Syntax

--kpiSamplingPeriod <integer>

Description

Sampling period (in seconds) for which response success and failures are aggregated to produce KPI for specific service (set) instance.

Class

Optional.

Type / Range

Integer in the range of 5 to 300 in units of Second

Default

30

7.48 cmm smfIsolationPerCauseCodeSettings

SMF Isolation Per Cause Code Settings. Syntax, description, parameters, and roles for cmm smfIsolationPerCauseCodeSettings command.

Syntax**Description**

Includes SMF isolation related rules for specific Cause/Status codes. Used when the action for a Causes/Status codes combination for a service needs to differentiate from the default behaviour provisioned within the SMF Isolation General Settings command.

Parameters**Name**

service - Service

Syntax

--service <list-item>

Description

SMF service for which the settings in the other parameters apply.

Class

Required key.

List

- Nsmf_PDUSession - SMF PDU Session Service - The network function service type of Session Management Function PDU session.

Default

Nsmf_PDUSession

Name

statusCode - Status Code

Syntax

--statusCode <list-item>

Description

HTTP Status Code.

Class

Required key.

List

- 400_Bad_Request - 400 Bad Request
- 401_Unauthorized - 401 Unauthorized
- 403_Forbidden - 403 Forbidden
- 404_Not_Found - 404 Not Found
- 405_Method_Not_Allowed - 405 Method Not Allowed
- 406_Not_Acceptable - 406 Not Acceptable
- 408_Request_Timeout - 408 Request Timeout
- 409_Conflict - 409 Conflict
- 410_Gone - 410 Gone
- 411_Length_Required - 411 Length Required
- 412_Precondition_Failed - 412 Precondition Failed
- 413_Payload_Too_Large - 413 Payload Too Large
- 414_URI_Too_Long - 414 URI Too Long
- 415_Unsupported_Media_Type - 415 Unsupported Media Type
- 429_Too_Many_Requests - 429 Too Many Requests
- 500_Internal_Server_Error - 500 Internal Server Error
- 501_Not_Implemented - 501 Not Implemented
- 502_Bad_Gateway - 502 Bad Gateway
- 503_Service_Unavailable - 503 Service Unavailable
- 504_Gateway_Timeout - 504 Gateway Timeout

Name

errorCause - Error Cause

Syntax

--errorCause <string>

Description

Application Error Cause value. The provided string needs to match with the Cause in the response. 'NULL' string literal has special meaning and is used to match cases where Response did not include Application Error Cause.

Class

Required key.

Type / Range

SBI Application Error Cause value. Digit string of length 1 to 64 with the allowed pattern of [A-Z_]*

Default

"NULL"

Name

action - Action

Syntax

--action <list-item>

Description

Action to be applied for specific status code and error cause.

Class

Optional.

List

- Isolate - Isolate the Service Instance
- KPI_Fail - KPI Fail - Increase the Failure Counter used for the Service Instance KPI
- KPI_Success - KPI Success - Increase the Success counter used for the Service Instance KPI

Default

KPI_Fail

7.49 cmm smscGrp

SMSC Group Profile. Syntax, description, parameters, and roles for cmm smscGrp command.

Syntax

Description

Administer SMSC Group Profile

Parameters

Name

smscGrpListName - SMSC Group List Name

Syntax

--smscGrpListName <string>

Description

SMSC Group List Name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Name

smscOrderId - SMSC Order Id

Syntax

--smscOrderId <integer>

Description

SMSC order in group.

Class

Required key.

Type / Range

Integer in the range of 1 to 16

Name

smscName - SMSC Name

Syntax

--smscName <string>

Description

SMSC name specified in remote end point configuration.

Class

Required on create, not modifiable.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

lbWeight - Weight for load balancing

Syntax

--lbweight <integer>

Description

Weight for load balancing algorithm.

Class

Optional.

Type / Range

Integer in the range of 0 to 100

Default

0

SMSC Group List. Syntax, description, parameters, and roles for cmm smscGrpList command.

Syntax

Description

Administer SMSC Group List.

Parameters

Name

name - SMSC Group Profile Name

Syntax

--name <string>

Description

SMSC Group Profile Name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Roles

Create

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

sysadmin, manage, monitor

7.51 cmm smscToGrp

SMSC Number to Diameter Destination. Syntax, description, parameters, and roles for cmm smscToGrp command.

Syntax

Description

This command defines for the SMS in MME feature the mapping from a UE provided SMSC address to an SMSC group. The mapping is used for finding the SMSC to which to forward a mobile originated SMS.

Parameters

Name

mappingId - Mapping ID

Syntax

--mappingId <integer>

Description

Identifier for the mapping from SMSC to Group.

Class

Required key.

Type / Range

Integer in the range of 1 to 128

Name

draDestHostFqdnName - DRA destination host name

Syntax

--draDestHostFqdnName <string>

Description

If MME does not have destination host in VLR (UE shows up for the first time), and the destination is a DRA, MME uses the value of this new field to populate destination host AVP in OFR.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

""

Name

draDestRealmFqdnName - DRA destination realm name

Syntax

--draDestRealmFqdnName <string>

Description

If MME does not have destination realm in VLR (UE shows up for the first time), and the destination is a DRA, MME uses the value of this new field to populate destination realm AVP in OFR.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

hssGrpListName - HSS Group List Name

Syntax

--hssGrpListName <string>

Description

HSS group list name for routing SMSC messages when the SGd application is combined with S6a.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

"

Name

loadBalance - Load balance

Syntax

--loadBalance <list-item>

Description

Indicates load balancing options.

Class

Optional.

List

- all - Balance load on all S6ad links based on weight.
- none - No load balancing between S65ad links.
- priority group - Balance load on all S6ad links based on group priority. the primary group is the set of HSS/DRA that have the same highest weight. the secondary group is the

set of HSS/DRA that have the same second highest weight value, etc. the last N-ary group is always the group with 0 weight (if used).

Default

none

Name

shutdown - Shutdown

Syntax

--shutdown <list-item>

Description

Indicates if the mapping rule is active. if shutdown is true, the rule behaves as if it is deleted.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

smScGrpListName - SMSC Group List Name

Syntax

--smScGrpListName <string>

Description

Name of SMSC group list.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

smScMappingType - SMSC Mapping Type

Syntax

--smScMappingType <list-item>

Description

SMSC Mapping Type.

Class

Optional.

List

- all - SMSC mapping type all
- num - Number - SMSC mapping type Number (mapping for an SMSC number)

Default

all

Name

smscNumber - SMSC Number

Syntax

--smscNumber <digits>

Description

The SMSC number (international number format as described in ITU-T Recommendation E.164) that the UE provides when it sends a mobile originated SMS

Class

Optional.

Type / Range

Digit string of length 0 or 9 to 15

Default

""

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

7.52 cmm smsProfile

SMS profile for SMS delivery parameters. Syntax, description, parameters, and roles for cmm smsProfile command.

Syntax

Description

This command is used to administer SMS delivery related parameters for the feature SMS in MME.

Parameters

Name

name - SMS profile name

Syntax

--name <string>

Description

The profile name for the profile containing SMS delivery related parameters.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Default

default

Name

mmelsdn - MME ISDN

Syntax

--mmeIsdn <digits>

Description

MME ISDN for SMS services. When SMS in MME feature is used, the MME registers itself as the SMS service provider towards the HSS for the UE. The MME provides its own number for MT SMS delivery in international ITU-T Rec E-164 format.

Class

Optional.

Type / Range

Digit string of length 9 to 15

Name

mtSmsResendUponCollision - MT SMS Resend Upon Collision

Syntax

--mtSmsResendUponCollision <list-item>

Description

Defines whether the MME attempts to resend the SGd received MT SMS after procedure collision when the MT SMS delivery was aborted by the MME due to the collision.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Recommended

true

Name

nasResends - NAS Resends

Syntax

--nasResends <integer>

Description

The amount of retransmissions sending the DL NAS Transport messages that carry Short Message Control Protocol and Short Message Relay Protocol requests when timer TC1* has expired.

Class

Optional.

Type / Range

Integer in the range of 0 to 3

Default

2

Name

sgdAla - SGd ALA

Syntax

--sgdAla <integer>

Description

Timer to wait for SGd Alert Service Center Answer (ALA) from the SMSC/SMS router when MME has sent SGd Alert Service Center Request (ALR).

Class

Optional.

Type / Range

Integer in the range of 100 to 30,000 in units of Millisecond

Default

5000

Name

sgdOfa - SGd OFA

Syntax`--sgdOfa <integer>`**Description**

Timer to wait for SGd MO Forward Short Message Answer (OFA) from the SMSC when MME has sent SGd MO Forward Short Message Request (OFR).

Class

Optional.

Type / Range

Integer in the range of 100 to 30,000 in units of Millisecond

Default

5000

Name

smsBufferingTime - MT SMS Buffering Time

Syntax`--smsBufferingTime <integer>`**Description**

Time during which the MME buffers an MT SMS. During this timer the MME waits either if the terminating UE is busy with another procedure (e.g delivery of another SMS) or if the UE is currently not reachable due to eDRX but is expected to make contact shortly. This timer should be set lower than the DRA timeout. After this timer expires the MME responds to the TFR. Note: The provisioned retransmission times * 'TC1*' need to be lower than the provisioned MT SMS Buffering Time. Note: the MME does not make use of this timer if the UE is not expected to be reachable before the timer expiry.

Class

Optional.

Type / Range

Integer in the range of 100 to 10,000 in units of Millisecond

Default

5000

Name

smsRegistrationPreference - SMS Registration Preference

Syntax`--smsRegistrationPreference <list-item>`

Description

Defines which interface is used for SMS delivery when both SGd and SGs are possible for a UE.

Class

Optional.

List

- smsRegRequired - SMS Registration Required - SMS registration to HSS is required i.e. SGd interface based SMS delivery is forced when both SGs and SGd interface use is possible.
- smsRegNotPref - SMS Registration Not Preferred - SMS registration to HSS is not preferred i.e. SGs interface based SMS delivery is preferred when both SGs and SGd use is possible.
- noPreference - No Preference - The MME indicates no preference to use either SGd or SGs interface for the SMS delivery. Both options are available from MME perspective and HSS is left to make the choice to register the UE via HSS (use the SGd) or not.

Default

smsRegNotPref

Name

tc1Star - TC1*

Syntax

--tc1Star <integer>

Description

Timer to wait for acknowledgement messages from the UE for MME sent DL NAS Transport messages that carry Short Message Control Protocol and Short Message Relay Protocol requests.

Class

Optional.

Type / Range

Integer in the range of 1 to 5,000,000 in units of Millisecond

Default

8000

7.53 cmm snssai

S-NSSAI. Syntax, description, parameters, and roles for cmm snssai command.

Syntax

Description

Create a S-NSSAI with Name, Service Type and Service Differentiator.

Parameters

Name

name - S-NSSAI Name

Syntax`--name <string>`**Description**

Name of the S-NSSAI.

Class

Required key.

Type / RangeDigit string of length 1 to 31 with the allowed pattern of `[0-9a-zA-Z\.\- _:@]*`**Name**

sliceServiceType - Slice Service Type

Syntax`--sliceServiceType <integer>`**Description**

The S-NSSAI consists of a Slice Service Type (SST) and a Slice Differentiator (SD). Each slice must have SST and SD is optional.

Class

Required on create.

Type / Range

5G Slice Service Type

Name

sliceDifferentiator - Slice Differentiator

Syntax

--sliceDifferentiator <string>

Description

The S-NSSAI consists of a Slice Service Type (SST) and a Slice Differentiator (SD). Each slice must have SST and SD is optional. A SST may have multiple SDs.

Class

Optional.

Type / Range

Identifies Slice Differentiator (SD)

Default

FFFFFF

Name

sliceDifferentiatorRangeEnd - Slice Differentiator Range End

Syntax

--sliceDifferentiatorRangeEnd <string>

Description

This is used when snssai represents an Extended S-NSSAI that consists of a Slice Service Type and a Range of Slice Differentiator (SD). For an Extended S-NSSAI, the Slice Differentiator Range End must be larger than the Slice Differentiator parameter. Otherwise, when the snssai represents a single S-NSSAI, the value must be set to '000000'.

Class

Optional.

Type / Range

Identifies Slice Differentiator (SD)

Default

"000000"

Name

supportedInAllTa - Allow S-NSSAI in all Tracking Areas

Syntax

--supportedInAllTa <list-item>

Description

This parameter is deprecated (was used only for PoC purposes). Should be set to 'false'. If the parameter is set to 'true' then, the S-NSSAI is supported in all TA. If the parameter is set to 'false' then the S-NSSAI is not supported in all TAs served by this AMF but may be supported in a TA or a subset of the available TAs. If S-NSSAI is supported in a TA or subset of the available TAs then use the 'amfTais' command to provision the support.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

7.54 cmm snssaiList

S-NSSAI list. Syntax, description, parameters, and roles for `cmm snssaiList` command.

Syntax**Description**

Create a list for S-NSSAI.

Parameters**Name**

name - List Name

Syntax

--name <string>

Description

S-NSSAI list name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Roles**Create**

sysadmin, manage, monitor

7.55 cmm snssaiListItem

S-NSSAI List Item. Syntax, description, parameters, and roles for `cmm snssaiListItem` command.

Syntax**Description**

Add or delete a S-NSSAI to the named list. The list consists of the name of a S-NSSAI and STS and SD fields of the S-NSSAI.

Parameters**Name**

snssaiListName - S-NSSAI List

Syntax

--snssaiListName <string>

Description

List consisting up to 256 network slice instances IDs.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Name

snssaiName - S-NSSAI Name

Syntax

--snssaiName <string>

Description

Name of the S-NSSAI.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

7.56 cmm snssaisOfTaiQuery

Query SNSSAIs of TAI. Syntax, description, parameters, and roles for cmm snssaisOfTaiQuery command.

Syntax

Description

Lists all SNSSAIs supported in a specific TAI. The NG-RAN 'taiMcc', 'taiMnc' and 'tac' are required input filters. If any of these are not given query will return empty list

Parameters

Name

taiMcc - TAI MCC

Syntax

--taiMcc <digits>

Description

3-digit number used to represent the mobile country code for TAI.

Class

Required key.

Type / Range

Digit string of length 3

Name

taiMnc - TAI MNC

Syntax

--taiMnc <digits>

Description

Digits used to represent mobile network code for TAI.

Class

Required key.

Type / Range

Digit string of length 2 to 3

Name

tac - Tracking Area Code

Syntax

--tac <integer>

Description

5G TAC. 5G TAC is 3 octets long.

Class

Required key.

Type / Range

Integer in the range of 0 to 16777215

Name

assignMode - Assignment Mode

Syntax

--assignMode <integer>

Description

This field depicts the assignment mode for the SNPN

Class

Optional.

Type / Range

Integer in the range of 0 to 2

Default

0

Name

nidValue - Nid value

Syntax

--nidValue <integer>

Description

This field depicts the Nid value of the NID for the SNPN

Class

Optional.

Type / Range

Integer in the Range 0 to 1099511627775

Default

0

Name

sliceDifferentiator - Slice Differentiator

Syntax

--sliceDifferentiator <string>

Description

The S-NSSAI consists of a Slice Service Type (SST) and a Slice Differentiator (SD). Each slice must have SST and SD is optional. A SST may have multiple SDs.

Class

Read only.

Type / Range

Identifies Slice Differentiator (SD)

Default

FFFFFF

Name

sliceServiceType - Slice Service Type

Syntax

--sliceServiceType <integer>

Description

The S-NSSAI consists of a Slice Service Type (SST) and a Slice Differentiator (SD). Each slice must have SST and SD is optional.

Class

Optional.

Type / Range

5G Slice Service Type

Roles**List**

sysadmin, manage, monitor

7.57 cmm snssaiToDnn

S-NSSAI to DNN. Syntax, description, parameters, and roles for cmm snssaiToDnn command.

Syntax**Description**

Add or delete a S-NSSAI to the named list. The list consists of the name of a S-NSSAI and STS and SD fields of the S-NSSAI.

Parameters**Name**

snssaiToDnnListName - S-NSSAI to Default DNN List Name

Syntax

--snssaiToDnnListName <string>

Description

S-NSSAI to Default DNN List Name

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

snssaiName - S-NSSAI Name

Syntax

--snssaiName <string>

Description

Name of the S-NSSAI.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

dataNetworkName - Data Network Name

Syntax

--dataNetworkName <string>

Description

Data Network Name (DNN)

Class

Required on create.

Type / Range

Data Network Name is basically APN Ni.

Roles

Create

sysadmin, manage

Show

sysadmin, manage, monitor

Modify

sysadmin, manage

Delete

sysadmin, manage

List

sysadmin, manage, monitor

7.58 cmm snssaiToDnnList

S-NSSAI to Default DNN List. Syntax, description, parameters, and roles for cmm snssaiToDnnList command.

Syntax

Description

List for configuring S-NSSAI to default DNN.

Parameters

Name

name - Name of the List

Syntax

--name <string>

Description

Name of the SNNSAI to default DNN mapping list name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Roles

Create

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

sysadmin, manage, monitor

7.59 cmm spcParamSet

SCCP signalling point parameter set. Syntax, description, parameters, and roles for **cmm spcParamSet** command.

Syntax

Description

Configure, list and show SCCP signalling point parameter set.

Parameters

Name

name - SCCP signalling point parameter set name

Syntax

--name <string>

Description

SCCP signalling point parameter set name.

Class

Required key.

Type / Range

Digit string of length 1 to 5 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Name

addDpcIfRiGt - Add dpc if route ind on GT

Syntax

--addDpcIfRiGt <list-item>

Description

21. DPC insertion to called address, when routing indicator is route on GT.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

addDpcIfRiSsn - Add dpc if route ind on ssn

Syntax

--addDpcIfRiSsn <list-item>

Description

19. DPC insertion to called address, when routing indicator is route on SSN.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

addGtIfRiSsn - Add GT if route ind on ssn

Syntax

--addGtIfRiSsn <list-item>

Description

20. GT insertion to called address, when routing indicator is route on SSN.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

aInterface - A interface

Syntax

--aInterface <list-item>

Description

11. interface to signalling point is A-interface.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

allowedGtiValues - Allowed gti values

Syntax

--allowedGtiValues <string>

Description

23. indicates the allowed GTI values of calling address messages with other GTI values are screened. this must be a comma separated list of numbers and ranges of numbers. ITU-T

recommended values 1-4 ANSI recommended values 1-2 ETSI recommended values 4 all values 1-15.

Class

Optional.

Type / Range

Digit string of length 0 to 35 with the allowed pattern of [0-9,-]*

Name

analyseRootOfCallingGt - Analyse root of calling GT

Syntax

--analyseRootOfCallingGt <list-item>

Description

22. indicates whether the translator selector of calling address is analysed.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

coSegmUsed - Co segm used

Syntax

--coSegmUsed <list-item>

Description

27. usage of connection oriented segmentation.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

gtAddrFixedLen - GT addr fixed len

Syntax

--gtAddrFixedLen <list-item>

Description

28. indicates whether the called GT space reservation is optimized in (X)UDT message. if the parameter value is true, no extra space is reserved for GT expansion due to GT modifications in intermediate nodes. the parameter concerns messages coming from a local SCCP user. the parameter value is set in the parameter set of the destination signalling point.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

ludtUsed - Ludt used

Syntax

--ludtUsed <list-item>

Description

26. usage of long unitdata (LUDT) messages.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

q714TConnEst - q714TConnEst

Syntax

--q714TConnEst <integer>

Description

1. connection establishment timer, time unit is 1 s.

Class

Optional.

Type / Range

Integer in the range of 30 to 240

Default

90

Name

q714Tlar - q714Tlar

Syntax

--q714TIar <integer>

Description

3. receive inactivity timer, time unit is 1 s.

Class

Optional.

Type / Range

Integer in the range of 150 to 1,260

Default

270

Name

q714Tlas - q714Tlas

Syntax

--q714TIas <integer>

Description

2. send inactivity timer, time unit is 1 s.

Class

Optional.

Type / Range

Integer in the range of 60 to 600

Default

90

Name

q714TInt - q714TInt

Syntax

--q714TInt <integer>

Description

5. connection release timer, time unit is 1 s.

Class

Optional.

Type / Range

Integer in the range of 45 to 90

Default

60

Name

q714TRel - q714TRel

Syntax

--q714TRel <integer>

Description

4. repetition timer of connection release message, time unit is 100 ms.

Class

Optional.

Type / Range

Integer in the range of 100 to 200

Default

150

Name

q714TRepRel - q714TRepRel

Syntax

--q714TRepRel <integer>

Description

7. repetition timer of connection release message, time unit is 100 ms.

Class

Optional.

Type / Range

Integer in the range of 40 to 200

Default

100

Name

q714TRes - q714TRes

Syntax

--q714TRes <integer>

Description

6. signalling connection reset timer, time unit is 1 s.

Class

Optional.

Type / Range

Integer in the range of 10 to 20

Default

15

Name

q714TStatInf1st - q714TStatInf1st

Syntax

--q714TStatInf1st <integer>

Description

8. subsystem status test send interval or time out limit for the first test attempt, time unit is 100 ms.

Class

Optional.

Type / Range

Integer in the range of 50 to 600

Default

100

Name

q714TStatInfInc - q714TStatInfInc

Syntax

--q714TStatInfInc <integer>

Description

9. increment value of subsystem status test, send interval, time unit is 100 ms.

Class

Optional.

Type / Range

Integer in the range of 150 to 3,000

Default

300

Name

q714TStatInfMax - q714TStatInfMax

Syntax

--q714TStatInfMax <integer>

Description

10. maximum value of subsystem status test, send interval, time unit is 100 ms.

Class

Optional.

Type / Range

Integer in the range of 600 to 12,000

Default

9000

Name

segXThres - Seg x threshold

Syntax

--segXThres <integer>

Description

16. lower segmentation threshold.

Class

Optional.

Type / Range

Integer in the range of 1 to 272

Default

272

Name

segYThres - Seg y threshold

Syntax

--segYThres <integer>

Description

17. higher segmentation threshold.

Class

Optional.

Type / Range

Integer in the range of 67 to 272

Default

272

Name

ssaFilterTimer - Ssa filter timer

Syntax

--ssaFilterTimer <integer>

Description

24. delay of local broadcast of subsystem allowed state information, time unit is 100 ms.

Class

Optional.

Type / Range

Integer in the range of 5 to 3,000

Default

10

Name

ssManagementUsed - Ss management used

Syntax

--ssManagementUsed <list-item>

Description

13. usage of subsystem management functions.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

sspFilterTimer - Ssp filter timer

Syntax

--sspFilterTimer <integer>

Description

25. delay of local broadcast of subsystem prohibited state information, time unit is 100 ms.

Class

Optional.

Type / Range

Integer in the range of 5 to 3,000

Default

10

Name

tcapLoadSharingUsed - Tcap load sharing used

Syntax

--tcapLoadSharingUsed <list-item>

Description

18. load sharing used for TCAP messages.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

udtDenied - Udt denied

Syntax

--udtDenied <list-item>

Description

15. deny usage of unitdata (UDT) messages.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

whiteBookMgmtUsed - White book management used

Syntax

--whiteBookMgmtUsed <list-item>

Description

12. usage of white book management procedures.

Class

Optional.

List

- false - Boolean value of false.

- true - Boolean value of true.

Default

false

Name

xudtUsed - Xudt used

Syntax

--xudtUsed <list-item>

Description

14. usage of extended unitdata (XUDT) messages.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

sysadmin, manage

List

sysadmin, manage, monitor

7.60 cmm specialApn

Special Apn. Syntax, description, parameters, and roles for cmm specialApn command.

Syntax

Description

Special Apn handling

Parameters

Name

specialApnListName - Special Apn List Name

Syntax

--specialApnListName <string>

Description

Special Apn List Name

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Name

apnNi - APN NI

Syntax

--apnNi <string>

Description

APN NI

Class

Required key.

Type / Range

Digit string of length 1 to 62 with the allowed pattern of [0-9a-zA-Z_\. \-]*

Name

specialTreatmentForUnsubscribedApn - Special Treatment For Unsubscribed Apn

Syntax

--specialTreatmentForUnsubscribedApn <list-item>

Description

Special Treatment handling For Unsubscribed Apn

Class

Optional.

List

- applyGenTreatmentUnsubs - Apply General Treatment For Unsubs - Apply General Treatment For Unsubscribed

- noConvertAndReject - No Convert And Reject - No Convert And Reject PDP

Default

applyGenTreatmentUnsubs

Roles**Create**

sysadmin, manage

sysadmin, manage, monitor

7.61 cmm specialApnList

Special Apn List. Syntax, description, parameters, and roles for `cmm specialApnList` command.

Syntax**Description**

This command shall be used for special Apn handling

Parameters**Name**

name - APNNI

Syntax

--name <string>

Description

special APNNI configured by operator

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Roles

Create

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

sysadmin, manage, monitor

7.62 cmm ss7DestInfo

SS7 Destination Info. Syntax, description, parameters, and roles for `cmm ss7DestInfo` command.

Syntax

Description

Display the top-down status of a destination in the SS7 network.

Parameters

Name

dpc - Destination point code

Syntax

--dpc <integer>

Description

Use this parameter to specify the destination signalling point code. Please, check that this destination point code has been configured through `cmm muaRoute` list, and that the `destinationSignallingNetwork` is the same as the given network.

Class

Optional.

Type / Range

Integer in the range of 0 to 16,777,215

Name

gt - GT analysis digits identifier

Syntax

--gt <digits>

Description

Use this parameter to specify the global title (GT) analysis digits identifier. Please, check that this GT analysis digits identifier (gtald) has been configured through `cmm gtAnalysis show`.

Class

Optional.

Type / Range

Digit string of length 1 to 24 with the allowed pattern of [0-9]*

Name

network - Destination Signalling Network

Syntax

--network <list-item>

Description

Use this parameter to specify the destination signalling network. Allowed values
IN0,IN1,NA0,NA1

Class

Optional.

List

- IN0 - International network number 0.
- IN1 - International network number 1.
- NA0 - National network number 0.
- NA1 - National network number 1.

Roles**List**

sysadmin, manage, monitor

7.63 cmm ss7DestInfoAll

SS7 Destination Info. Syntax, description, parameters, and roles for `cmm ss7DestInfoAll` command.

Syntax**Description**

Display the top-down status of a destination in the SS7 network.

Parameters**Name**

dpc - Destination point code

Syntax

--dpc <integer>

Description

Use this parameter to specify the destination signalling point code. Please, check that this destination point code has been configured through cmm muaRoute list, and that the destinationSignallingNetwork is the same as the given network.

Class

Optional.

Type / Range

Integer in the range of 0 to 16,777,215

Name

network - Destination Signalling Network

Syntax

--network <list-item>

Description

Use this parameter to specify the destination signalling network. Allowed values
IN0,IN1,NA0,NA1

Class

Optional.

List

- IN0 - International network number 0.
- IN1 - International network number 1.
- NA0 - National network number 0.
- NA1 - National network number 1.

Roles**List**

sysadmin, manage, monitor

7.64 cmm ss7DestInfoGt

SS7 Destination Info With gt. Syntax, description, parameters, and roles for cmm ss7DestInfoGt command.

Syntax

Description

Display the top-down status of a destination in the SS7 network for given gt digits

Parameters

Name

gt - GT analysis digits identifier

Syntax

--gt <digits>

Description

Use this parameter to specify the global title (GT) analysis digits identifier. Please, check that this GT analysis digits identifier (gtald) has been configured through cmm gtAnalysis show.

Class

Optional.

Type / Range

Digit string of length 1 to 24 with the allowed pattern of [0-9]*

Roles

List

sysadmin, manage, monitor

7.65 cmm staticRoute

Static route. Syntax, description, parameters, and roles for cmm staticRoute command.

Syntax

Description

Administer static route

Parameters

Name

poolType - Pool type

Syntax

--poolType <list-item>

Description

Pool (service) type.

Class

Required key.

List

- ALMS - Alarm Service - Alarm Service.
- CPPS - Control plane processing service - Control plane processing service.
- CTCS - Call Trace Collection service - Call Trace Collection service.
- DBS - Database service - Database service.
- EEMS - Event Exposure Management service - Event Exposure Management service.
- IPDS - IP director service - IP director service.
- IPPS - IP packet processing service - IP packet processing service.
- LIHS - Lawful Interception Handling service
- MLIS - Machine Learning Intelligence Service
- NECC - Network element cluster controller - Network element cluster controller.
- NWDS - Network Data Service - NWDAF service
- PAPS - Packet processing service - Packet processing service.
- PCMS - Per Call Measurements Data Service - Per Call Measurements Data (PCMD) Service
- RCIS - Radio Capability Information storage Service
- SFDS - SCTP flow distributor service
- UCDS - User equipment Context Data-dump Service
- UFDS - UDP flow distributor service

Name

poolId - Pool id

Syntax

--poolId <integer>

Description

Pool identification number.

Class

Required key.

Type / Range

Integer in the range of 0 to 39

Name

poolMemberId - Pool member ID

Syntax

--poolMemberId <integer>

Description

Pool member identification number.

Class

Required key.

Type / Range

Integer in the range of 0 to 2

Name

assignmentType - Assignment type

Syntax

--assignmentType <list-item>

Description

Assignment type: fixed or floating

Class

Required key.

List

- fixed - Fixed.
- floating - Floating.

Name

routeId - Route ID

Syntax

--routeId <integer>

Description

Route identification.

Class

Required key.

Type / Range

Integer in the range of 1 to 63

Name

ipv - IP version

Syntax

--ipv <integer>

Description

Internet protocol version number.

Class

Required key.

Type / Range

Integer in the range of 4 or 6

Name

base - Base IP

Syntax

--base <string>

Description

Base IP address for IPv4, or base prefix for IPv6.

Class

Required on create.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

gateway - Gateway IP

Syntax

--gateway <string>

Description

Gateway IP address.

Class

Required on create.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

prefixLen - Base prefix length

Syntax

--prefixLen <integer>

Description

Base prefix length. allowed only for IPv6.

Class

Optional.

Type / Range

Integer in the range of 0 to 128

Name

srcIp - Source IP

Syntax

--srcIp <string>

Description

Source IP address.

Class

Optional.

Type / Range

Digit string of length 0 or 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

subnetMask - Subnet mask

Syntax

--subnetMask <string>

Description

Subnet IP mask. allowed only for IPv4.

Class

Optional.

Type / Range

Digit string of length 0 or 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

sysadmin, manage, monitor

7.66 cmm subnet

Subnet. Syntax, description, parameters, and roles for cmm subnet command.

Syntax

Description

Administer Subnet. For Multiple IPDS in VNF configurations these subnets are non routable VIA subnets between the IPDSs and the L3NS VNFCs. The Redundancy mode eipm_via must be used for the interfaces (except OAM). There is no Default Gateway IP address. The interfaces and vlans must be aligned to the transport subnets established during Cloud Init. Administer Subnet. For Multiple IPDS in CNF configurations these subnets are non routable subnets between the IPDS PODs and the SFDS/UFDS PODs. The Redundancy mode eipm_arpn dp must be used for these subnets. When multiple interfaces are presented to the SFDS/UFDS pod for interface redundancy, the --fdsMateInterface parameter must be configured to specify the standby interface. The Default Gateway IP address should be configured as an accessible IP, but the IP does not have to have L3 functionality as it is only used as an ARP target for reachability. It is not used for routing purposes. The interfaces and vlans must be aligned to the subnets established during Cloud Init.

Parameters

Name

subnetId - Subnet ID

Syntax

--subnetId <integer>

Description

Subnet identification.

Class

Required key.

Type / Range

Integer in the range of 0 to 63

Name

ipv - IP version

Syntax

--ipv <integer>

Description

Internet protocol version number.

Class

Required key.

Type / Range

Integer in the range of 4 or 6

Name

base - Base IP

Syntax

--base <string>

Description

Base IP address for IPv4, or base prefix for IPv6.

Class

Required on create, not modifiable.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

broadcastIp - Broadcast IP

Syntax

--broadcastIp <string>

Description

Broadcast IP address. allowed only for IPv4.

Class

Read only.

Type / Range

Digit string of length 0 or 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

defaultGateway - Default gateway IP

Syntax

--defaultGateway <string>

Description

Default gateway IP address.

Class

Not modifiable.

Type / Range

Digit string of length 0 or 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Default

"

Name

desiredMinTxInterval - Desired minimum transmission interval

Syntax

--desiredMinTxInterval <integer>

Description

Desired minimum transmission interval, in units of 100 milliseconds.

Class

Optional.

Type / Range

Integer in the range of 0 to 1,000

Name

detectionMultiplier - Detection multiplier

Syntax

--detectionMultiplier <integer>

Description

Detection multiplier.

Class

Optional.

Type / Range

Integer in the range of 0 or 3 to 50

Name

fdsMateInterface - Mate Interface on flow distributor service

Syntax

--fdsMateInterface <string>

Description

Mate interface used for duplex networking on flow distributor service

Restrictions

Applicable to CNF only.

Class

Not modifiable.

Type / Range

Digit string of length 0 to 5 with the allowed pattern of ([a-zA-Z][a-zA-Z0-9]{1,4})|

Default

"

Name

interfaceLabelL - Interface label left

Syntax

--interfaceLabelL <string>

Description

Interface label left.

Class

Not modifiable.

Type / Range

Digit string of length 0 to 5 with the allowed pattern of ([a-zA-Z][a-zA-Z0-9]{1,4})|

Default

"

Name

interfaceLabelR - Interface label right

Syntax

--interfaceLabelR <string>

Description

Interface label right.

Class

Not modifiable.

Type / Range

Digit string of length 0 to 5 with the allowed pattern of ([a-zA-Z][a-zA-Z0-9]{1,4})|

Default

"

Name

prefixLen - Base prefix length

Syntax

--prefixLen <integer>

Description

Base prefix length. allowed only for IPv6.

Class

Not modifiable.

Type / Range

Integer in the range of 0 to 128

Default

0

Name

redundancyMode - Redundancy mode

Syntax

--redundancyMode <list-item>

Description

Redundancy mode.

Class

Not modifiable.

List

- bfd_rsr - Specify redundancy mode of bidirectional forwarding detection transport with reduced state routing.
- bfd_transport - Specify redundancy mode of bidirectional forwarding detection transport.
- eipm_acm - Specify redundancy mode of external internetwork performance monitor with ACM.
- eipm_arpndp - Specify redundancy mode of EIPM with address resolution protocol / network discovery protocol.
- eipm_bfd - Specify redundancy mode of external internetwork performance monitor with bidirectional forwarding detection.
- eipm_via - Specify redundancy mode for Multiple IPDS with VSR routers. This mode is used between the IPDSs and the VSRs. The subnet must not contain a Default Gateway IP address. This mode is applicable for all interface types except OA&M.
- iipm - Specify redundancy mode of internal internetwork performance monitor.
- none - Specify redundancy mode of none.

Default

none

Name

requiredMinRxInterval - Required minimum reception interval

Syntax

--requiredMinRxInterval <integer>

Description

Required minimum reception interval, in units of 100 milliseconds.

Class

Optional.

Type / Range

Integer in the range of 0 to 1,000

Name

rteTableName - Routing table name

Syntax

--rteTableName <string>

Description

The name of the source based routing table if it exists for this subnet.

Class

Read only.

Type / Range

Digit string of length 0 to 20

Name

rteTableNum - Routing table number

Syntax

--rteTableNum <integer>

Description

Table number for source based routing, if applicable. a value of zero implies source based routing is not active for this subnet.

Class

Read only.

Type / Range

Integer in the range of 0 to 255

Name

subnetMask - Subnet mask

Syntax

--subnetMask <string>

Description

Subnet IP mask. allowed only for IPv4.

Class

Not modifiable.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Default

0.0.0.0

Name

subnetName - Subnet name

Syntax

--subnetName <string>

Description

Subnet name.

Class

Not modifiable.

Type / Range

Digit string of length 0 to 20 with the allowed pattern of [0-9a-zA-Z\.\-:]*

Default

"

Name

vlanL - VLAN left

Syntax

--vlanL <integer>

Description

Virtual local area network left.

Class

Not modifiable.

Type / Range

Integer in the range of 0 to 4,094

Default

0

Name

vlanR - VLAN right

Syntax

--vlanR <integer>

Description

Virtual local area network right.

Class

Not modifiable.

Type / Range

Integer in the range of 0 to 4,094

Default

0

7.67 cmm subParamSet

SCCP subsystem parameter set. Syntax, description, parameters, and roles for **cmm subParamSet** command.

Syntax

Description

Configure, list and show SCCP subsystem parameter set.

Parameters

Name

name - SCCP subsystem parameter set name

Syntax

--name <string>

Description

SCCP subsystem parameter set name.

Class

Required key.

Type / Range

Digit string of length 1 to 5 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Name

addClgGtIfRiSsn - Add clg GT if route ssn

Syntax

--addClgGtIfRiSsn <list-item>

Description

18. indicates whether the GT is left to the calling party address, when the routing indicator of the called party address is route on SSN. the parameter concerns messages coming from a local TC user and destined to network. the parameter value is set in the parameter set of the calling subsystem.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

aInterfApplic - A interf applic

Syntax

--aInterfApplic <list-item>

Description

3. a interface type of SP applicable to SS.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

aInterfErrIgnored - A interf err ignored

Syntax

--aInterfErrIgnored <list-item>

Description

4. error message from a interface is ignored with SS.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

callingAddrModification - Calling addr modification

Syntax

--callingAddrModification <list-item>

Description

6. indicates whether calling address is modified when global title translation result is routed on SSN and message is coming from SCCP user part.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

cscAllowedIn - Csc allowed in

Syntax

--cscAllowedIn <list-item>

Description

8. indicates whether coordinated state change request is delivered to subsystem.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

cscAllowedOut - Csc allowed out

Syntax

--cscAllowedOut <list-item>

Description

7. indicates whether subsystem is allowed to request coordinated state change.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

immediateStateInfo - Immediate state info

Syntax

--immediateStateInfo <list-item>

Description

14. indicates whether subsystem state information is transferred immediately to a local SCCP user.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

keepCldGtIfRiSsn - Keep cld GT if route ssn

Syntax

--keepCldGtIfRiSsn <list-item>

Description

13. indicates if the GT is kept in the called address, even if routing of the called address is based on SSN. the parameter concerns messages going to a local SCCP user.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

q714TCoordChg - q714T coord chg

Syntax

--q714TCoordChg <integer>

Description

1. waiting to subsystem out of service grant, time unit is 1 s.

Class

Optional.

Type / Range

Integer in the range of 30 to 240

Default

90

Name

q714TlgnSst - q714Tl gnsst

Syntax

--q714TlgnSst <integer>

Description

2. subsystem status test ignoring time, time unit is 1 s.

Class

Optional.

Type / Range

Integer in the range of 30 to 300

Default

60

Name

removeSpcClgAddr - Remove spc clg addr

Syntax

--removeSpcClgAddr <list-item>

Description

17. indicates whether the SPC is left out from the calling party address. if the parameter is false, no action is taken. if the parameter value is true, the possible SPC is left out from the calling party address. the parameter concerns messages coming from a local TC user and destined to network. the parameter value is set in the parameter set of the calling subsystem.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

sendCallingSpcSsnIfRiGt - Send calling spc ssn if route GT

Syntax

--sendCallingSpcSsnIfRiGt <list-item>

Description

12. indicates whether calling address is modified so that it includes only SSN when the routing of called address is based on GT.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

sendCallingSsnIfRiSsn - Send calling ssn if route ssn

Syntax

--sendCallingSsnIfRiSsn <list-item>

Description

11. indicates whether calling address is modified so that it includes only SSN when the routing of called address is based on SSN.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

tcProtocolVersExcluded - Tc protocol vers excluded

Syntax

--tcProtocolVersExcluded <list-item>

Description

15. indicates whether the optional protocol version field is included in the outgoing TCAP message. if the parameter value is true, the protocol version field is not included. the parameter concerns messages coming from a local TC user. the parameter value is set in the parameter set of the calling subsystem.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

tcTransactionIdsThreshold - Tc transaction ids threshold

Syntax

--tcTransactionIdsThreshold <integer>

Description

10. threshold for open TC transaction if the threshold is exceeded a statistics event log is set.

Class

Optional.

Type / Range

Integer in the range of 25 to 90

Default

75

Name

translateAtDpcIfDpcSsnGt - Translate at dpc if dpc ssn GT

Syntax

--translateAtDpcIfDpcSsnGt <list-item>

Description

9. translation selection when DPC, GT and SSN are present and message is coming from SCCP user part.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

translationSelection - Translation selection

Syntax

--translationSelection <list-item>

Description

5. special global title translation method selections to messages from MTP, when translation result is own signalling point and routing indicator in the record is routed on GT.

Class

Optional.

List

- REDIGO - This option is not supported.
- SCCP - Specify translation selection of SCCP.

Default

SCCP

7.68 cmm subsBulkAction

Subscriber Bulk Action. Syntax, description, parameters, and roles for **cmm subsBulkAction** command.

Syntax

Description

Subscriber Bulk Action is a maintenance command to count, deregister/detach or completely purge subscribers bases on subscriber bulk action profile.

Parameters

Name

bulkAction - Bulk Action

Syntax

```
--bulkAction <list-item>
```

Description

Defines Bulk Subscriber Process Action

Class

Required key.

List

- start - start the command
- stop - stop the command

Name

subsBulkActionProfileName - Subscriber Bulk Action Profile Name

Syntax

```
--subsBulkActionProfileName <string>
```

Description

Subscriber Bulk Action Profile Name

Class

Required on create.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Roles

Modify

sysadmin, manage

7.69 cmm subsBulkActionProfile

Subscriber Bulk Action Profile. Syntax, description, parameters, and roles for cmm subsBulkActionProfile command.

Syntax

Description

Subscriber Bulk Action Profile. Profile should not be updated or deleted when used by ongoing subsBulkAction Command. The only filter for Bulk Action in this release is all UEs.

Parameters

Name

name - Name

Syntax

--name <string>

Description

Subscriber Bulk Action Profile Name

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

radioType - Radio Type

Syntax

--radioType <list-item>

Description

Radio Type

Class

Required on create, not modifiable.

List

- 4g - 4g
- 5g - 5g

Name

amfDeleteUeContextCc - AMF Delete UE context cause code

Syntax

--amfDeleteUeContextCc <integer>

Description

NAS Cause code to include in Deregistration Request when UE context is deleted for AMF

Class

Optional.

Type / Range

5GMM Cause Code.

Default

10

Name

amfDeleteUeContextDeregistrationType - AMF Delete UE context deregistration type

Syntax

--amfDeleteUeContextDeregistrationType <list-item>

Description

Deregistration type when UE context is deleted via administrative action e.g. cli command for AMF

Class

Optional.

List

- registrationNotRequired - Registration not required - Specifies registration type of registration not required
- registrationRequired - Registration required - Specifies registration type of registration required

Default

registrationRequired

Name

amfDeleteUeContextSendCc - AMF Delete UE context send cause code

Syntax

--amfDeleteUeContextSendCc <list-item>

Description

Include cause code in deregistration request when deregistration reason is due to deleting UE context for AMF

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

guardTimer - Guard Timer

Syntax

--guardTimer <integer>

Description

Maximum duration once started.

Class

Optional.

Type / Range

Integer in the range of 1 to 1,440 in units of Minute

Default

1440

Name

includeEmergency - Include Emergency

Syntax

--includeEmergency <list-item>

Description

Include Emergency. When the value is set to false, emergency UEs, emergency PDNs and emergency PDUs are not affected

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

mmeDeleteUeContextCc - MME Delete UE context cause code

Syntax

--mmeDeleteUeContextCc <integer>

Description

NAS Cause code to include in Detach Request when UE context is deleted for MME

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

10

Name

mmeDeleteUeContextDetachType - MME Delete UE context detach type

Syntax

- -mmeDeleteUeContextDetachType <list-item>

Description

Detach type when UE context is deleted via administrative action e.g. cli command for MME

Class

Optional.

List

- Reattach not required - Reattached not required - Specifies detach type of reattach not required.
- Reattach required - Specifies detach type of reattach required.

Default

Reattach required

Name

mmeDeleteUeContextSendCc - MME Delete UE context send cause code

Syntax

- -mmeDeleteUeContextSendCc <list-item>

Description

Include cause code in detach request when detach reason is due to deleting UE context for MME

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

purgeContext - Purge Context

Syntax

--purgeContext <list-item>

Description

Detach/De-Register or Detach/De-Register and purge the UE Context from CMM. When set to false only Detach/De-Register is done. When set to true, Detach/De-Register and purge the context from CMM. Also HSS and UDM shall be notified of the context removal.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Roles

Create

sysadmin, manage

Show

sysadmin, manage, monitor

Modify

sysadmin, manage

Delete

sysadmin, manage

List

sysadmin, manage, monitor

7.70 cmm subsBulkActionStats

Subscriber Bulk Action Status. Syntax, description, parameters, and roles for cmm subsBulkActionStats command.

Syntax

Description

Displays the statistics of the subscriber bulk action command. The stat include radio type, duration, profile name used.

Parameters

Name

commandStatus - Command Status

Syntax

--commandStatus <list-item>

Description

Command Status

Class

Read only.

List

- aborted - Aborted
- timeout - Timeout
- completed - Completed
- failed - Failed
- running - Running
- stopped - Stopped

Name

radioType - Radio Type

Syntax

--radioType <list-item>

Description

Radio Type

Class

Read only.

List

- 4g - 4g
- 5g - 5g

Name

runTime - Run Time

Syntax

--runTime <string>

Description

Run time of the command in hh:mm:ss

Class

Read only.

Type / Range

Digit string of length 0 to 8 with the allowed pattern of [0-9a-zA-Z\.\-_:]*

Name

startDateTime - Start Date and Time

Syntax

--startDateTime <string>

Description

Records the date and time at which the command was entered.

Class

Read only.

Type / Range

Date and Time Digit string of length 0 to 20 with the allowed pattern of '20[0-9][0-9]/[0-1][0-9]/[0-3][0-9] [0-2][0-9]:[0-5][0-9]:[0-5][0-9]'

Name

subsBulkActionProfileName - Subscriber Bulk Action Profile Name

Syntax

--subsBulkActionProfileName <string>

Description

Subscriber Bulk Action Profile Name

Class

Read only.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-:@]*

Roles**List**

sysadmin, manage, monitor

7.71 cmm subsCount

subsCount. Syntax, description, parameters, and roles for cmm subsCount command.

Syntax

Description

Count subscribers per RAT.

Parameters

Name

ecmState - ECM state

Syntax

--ecmState <string>

Description

ECM state.

Class

Optional.

Type / Range

Digit string of length

Name

emmState - EMM state

Syntax

--emmState <string>

Description

EMM state.

Class

Optional.

Type / Range

Digit string of length

Name

filterType - Filter type

Syntax

--filterType <string>

Description

Filter type. Allowed values include: - attachedPerPapsPerRat

Class

Optional.

Type / Range

Digit string of length

Name

papsId - PapsId

Syntax

--papsId <integer>

Description

PAPS index.

Class

Optional.

Type / Range

Integer in the range of 0 to 19

Roles**List**

sysadmin, manage, monitor

7.72 cmm subscriber

Subscriber. Syntax, description, parameters, and roles for **cmm subscriber** command.

Syntax**Description**

This command has three operations: The count operation is used to count subscribers. The delete operation is used to delete subscribers. The show operation is used to show subscribers. The parameter radioType is only applicable on show and delete for imsi or srsImsi. The parameter radioType is only applicable on delete for srsImsi.

Parameters**Name**

amfCmState - AMF CM state

Syntax

--amfCmState <list-item>

Description

AMF Connection Management State

Class

Optional.

List

- connected - AMF Connected - AMF Connected state

- idle - AMF Idle - AMF Idle State

Name

amfNon3gppCmState - AMF Non-3GPP Access CM State

Syntax

--amfNon3gppCmState <list-item>

Description

AMF Non-3GPP Access Connection Management State.

Class

Optional.

List

- connected - AMF Connected - AMF Connected state
- idle - AMF Idle - AMF Idle State

Name

amfNon3gppRmState - AMF Non-3GPP Access RM state

Syntax

--amfNon3gppRmState <list-item>

Description

AMF Non-3GPP Access Registration Management state.

Class

Optional.

List

- deregistered - AMF Deregistered - AMF Deregistered State
- registered - AMF Registered - AMF Registered State

Name

amfRmState - AMF RM state

Syntax

--amfRmState <list-item>

Description

AMF Registration Management state.

Class

Optional.

List

- deregistered - AMF Deregistered - AMF Deregistered State
- registered - AMF Registered - AMF Registered State

Name

bearerImsi - Bearer IMSI

Syntax

--bearerImsi <digits>

Description

Imsi of Bearer.

Class

Optional.

Type / Range

Digit string of length 5 to 15

Name

ecmState - ECM state

Syntax

--ecmState <list-item>

Description

ECM state.

Class

Optional.

List

- connected - ECM state of connected.
- idle - ECM state of idle.

Name

emmState - EMM state

Syntax

--emmState <list-item>

Description

EMM state.

Class

Optional.

List

- deregistered - Specifies de-registered EMM state.
- registered - Specifies registered EMM state.

Name

filterType - Filter type

Syntax

--filterType <list-item>

Description

Count filtering type {attachedperpaps,attachedperpapserrat}.

Class

Optional.

List

- attachedPerPaps - Attached per PAPS - Attached per PAPS count
- attachedPerPapsPerRat - Attached per PAPS per RAT - Attached per PAPS per RAT.
- dualConnUeCount - Dual Connectivity UE Count - Allowed 4G Dual Connectivity UE Count.
- restrictedDualConn5gUeCount - Restricted Dual Connectivity 5G UE Count - Restricted 5G Dual Connectivity UE Count.
- srs - Session Restoration Count - Session Restoration Context UE count

Name

imei - IMEI

Syntax

--imei <digits>

Description

This item is the first 14 digits of the IMEI.

Class

Optional.

Type / Range

Digit string of length 1 to 14

Name

imsi - IMSI

Syntax

--imsi <digits>

Description

IMSI.

Class

Optional.

Type / Range

Digit string of length 5 to 15

Name

msisdn - MSISDN

Syntax

--msisdn <digits>

Description

MSISDN.

Class

Optional.

Type / Range

Digit string of length 5 to 18

Name

radioType - Radio Access Type

Syntax

--radioType <list-item>

Description

This parameter specifies the Radio Access Type of the srsimsi to be shown/deleted. The parameter also specifies the Radio Access Type of the imsi to be shown.

Class

Optional.

List

- 2G3G - SGSN 2G/3G access
- 4G - 4G LTE access
- 5G - 5G access

Default

5G

Name

srsImsi - SRS IMSI

Syntax

--srsImsi <digits>

Description

IMSI of session restoration context UE.

Class

Optional.

Type / Range

Digit string of length 5 to 15

Roles

Count

sysadmin, manage, monitor

Delete

sysadmin, manage

Show

sysadmin, manage, monitor

7.73 cmm subscriberBearerAdmin

Subscriber Bearer Administration. Syntax, description, parameters, and roles for cmm subscriberBearerAdmin command.

Syntax

Description

The subscriber Bearer Admin command is used to display or delete specific subscriber bearers. It may also be used to restart or reset the S1AP connection for a subscriber, Available operations: - S1release - S1AP Release, Release the S1AP connection for the subscriber using detach procedure - deleteBearer - Delete Bearer, Delete a subscriber Bearer - displayBearers - Display Bearers, Display all subscriber Bearers

Parameters

Name

s1operation - Bearer Operation

Syntax

--s1operation <list-item>

Description

The operation to perform on the subscriber: Delete Bearer Display Bearers S1AP Release

Class

Required.

List

- DeleteBearer - Delete Bearer - Delete a subscriber Bearer
- DisplayBearers - Display Bearers - Display all subscriber Bearers
- S1APRelease - S1AP Release - Release the S1AP connection for the subscriber using detach procedure

Name

bearerId - Bearer Id

Syntax

--bearerId <integer>

Description

The bearer ID to delete. This parameter is required with a delete Bearer operation.

Class

Optional.

Type / Range

Integer in the range of 5 to 15

Name

imsi - IMSI

Syntax

--imsi <digits>

Description

International Mobile Subscriber Identity

Class

Optional.

Type / Range

Digit string of length 5 to 15

Roles

sysadmin, manage, monitor

7.74 cmm subscriberDataDump

Subscriber data dump . Syntax, description, parameters, and roles for cmm subscriberDataDump command.

Syntax**Description**

Subscriber data dump parameters.

Parameters**Name**

name - Profile Name

Syntax

--name <string>

Description

Name of the parameter set

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Name

collect2G3GSubscriberData - Collect 2G3G Subscriber Data

Syntax

--collect2G3GSubscriberData <list-item>

Description

When enabled, periodically collect subscriber data for 2G3G subscribers.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

collect4GSubscriberData - Collect 4G Subscriber Data

Syntax

--collect4GSubscriberData <list-item>

Description

When enabled, periodically collect subscriber data for 4G subscribers.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

collect5GSubscriberData - Collect 5G Subscriber Data

Syntax

--collect5GSubscriberData <list-item>

Description

When enabled, periodically collect subscriber data for 5G subscribers.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

dataRetentionInterval - Subscriber Data Files Retention Interval

Syntax

--dataRetentionInterval <integer>

Description

Time interval for retention of subscriber data dump files.

Class

Optional.

Type / Range

Integer in the range of 1 to 96 in units of Hour

Default

24

Roles**Show**

sysadmin, manage, monitor

Modify

sysadmin, manage

List

sysadmin, manage, monitor

7.75 cmm subsForceDetach

Subscriber Force Detach. Syntax, description, parameters, and roles for cmm subsForceDetach command.

Syntax

Description

The Subscriber Force Detach command is used to manage the subscriber force detach for the UE PLMN (mcc, mnc and mncLength) entered. When a PLMN is input, will initiate a walk of the UE Contexts in CMM matching UE's PLMN and detach all UEs for that PLMN. A single Subscriber force Detach process may be ongoing at a time. Process to detach is controlled by 'Force Detach Operation' parameter. Force Detach Operation is 'start' restarts the Force Detach process with new parameters, if the previous Start action is performed is already completed or stopped or this the first time it is run. Force Detach Operation is 'stop' stops a currently Started Force Detach process. This command is blocked during ISSU.

Parameters

Name

forceDetachOp - Force Detach Operation

Syntax

--forceDetachOp <list-item>

Description

Force Detach Operation

Class

Required key.

List

- start - start force detach
- stop - stop force detach

Name

mcc - Mobile Country Code

Syntax

--mcc <digits>

Description

3-digit number used to represent the mobile country code.

Class

Required key.

Type / Range

Digit string of length 3

Name

mnc - Mobile Network Code

Syntax

--mnc <digits>

Description

Digits used to represent mobile network code.

Class

Required key.

Type / Range

Digit string of length 2 to 3

Name

mncDigits - Number of MNC Digits

Syntax

--mncDigits <list-item>

Description

Number of digits used to represent the mobile network code.

Class

Required key.

List

- 2/3Digits - 2 or 3 digits - 2 or 3 digits.
- 2Digits - 2 digits - 2 digits.
- 3Digits - 3 digits - 3 digits.

Default

3Digits

Name

detachGuardTimer - Force Detach Guard Timer

Syntax

--detachGuardTimer <integer>

Description

Subscriber Force Detach Guard Timer in unit of minutes

Class

Optional.

Type / Range

Integer in the range of 1 to 10

Default

2

Name

nasCauseCode3g2g - NAS Cause Code for 3g2g

Syntax`--nasCauseCode3g2g <integer>`**Description**

Nas Cause Code for 3g2g

Class

Optional.

Type / Range

Integer in the range of 2-17, 20-23, 25, 28, 32-34, 40, 95- 101, 111

Default

11

Name

nasCauseCode4g - NAS Cause Code for 4g

Syntax`--nasCauseCode4g <integer>`**Description**

Nas Cause Code for 4g UE

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

11

Name

nasCauseCode5g - NAS Cause Code for 5g

Syntax`--nasCauseCode5g <integer>`**Description**

Nas Cause Code for 5g

Class

Optional.

Type / Range

5GMM Cause Code.

Default

11

Name

removeEmergency - Force Remove Emergency UEs

Syntax

--removeEmergency <list-item>

Description

Force Remove Emergency UEs belonging to the PLMN entered

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Roles**Modify**

sysadmin, manage

7.76 cmm subsForceDetachStatus

Subscriber Force Detach Status. Syntax, description, parameters, and roles for cmm subsForceDetachStatus command.

Syntax**Description**

Displays the status of the Subscriber Force Detach Command

Parameters**Name**

detachGuardTimer - Force Detach Guard Timer

Syntax

--detachGuardTimer <integer>

Description

Force Detach Guard Timer

Class

Read only.

Type / Range

Integer in the range of 1 to 10 in units of Minute

Name

forceDetachCmdStatus - Force Detach Command Status

Syntax

--forceDetachCmdStatus <list-item>

Description

Force Detach Command Status

Class

Read only.

List

- completed - Force Detach Command Completed
- failed - Force Detach Command failed with error
- running - Force Detach Command Running
- stopped - Force Detach Command Stopped

Name

forceDetachOp - Force Detach Operation

Syntax

--forceDetachOp <list-item>

Description

Force Detach Operation

Class

Read only.

List

- start - start force detach
- stop - stop force detach

Name

mcc - Mobile Country Code

Syntax

--mcc <digits>

Description

3-digit number used to represent the mobile country code

Class

Optional.

Type / Range

Digit string of length 3

Name

mnc - Mobile Network Code

Syntax

--mnc <digits>

Description

Digits used to represent mobile network code.

Class

Optional.

Type / Range

Digit string of length 2 to 3

Name

mncDigits - Number of MNC Digits

Syntax

--mncDigits <list-item>

Description

Number of digits used to represent the mobile network code.

Class

Optional.

List

- 2/3Digits - 2 or 3 digits - 2 or 3 digits.
- 2Digits - 2 digits - 2 digits.
- 3Digits - 3 digits - 3 digits.

Name

removeEmergency - Force Remove Emergency UEs

Syntax

--removeEmergency <list-item>

Description

Force Remove Emergency UEs belonging to the PLMN entered

Class

Read only.

List

- false - Boolean value of false.
- true - Boolean value of true.

Roles**List**

sysadmin, manage, monitor

7.77 cmm subsImsiDisplay

Subscriber Imsi Display. Syntax, description, parameters, and roles for cmm subsImsiDisplay command.

Syntax**Description**

Display representative IMSIs for an input PLMN.. Operator needs to run subsImsiDisplayAdmin Command before to trigger the IPDS to collect the data.

Parameters**Name**

index - Index

Syntax

--index <integer>

Description

Index

Class

Required key.

Type / Range

Integer in the range of 1 to 100

Name

mcc - Mobile country code

Syntax

--mcc <digits>

Description

3-digit number used to represent the mobile country code.

Class

Required key.

Type / Range

Digit string of length 3

Name

mnc - Mobile network code

Syntax

--mnc <digits>

Description

Digits used to represent mobile network code.

Class

Required key.

Type / Range

Digit string of length 2 to 3

Name

imsi - IMSI

Syntax

--imsi <digits>

Description

IMSI

Class

Read only.

Type / Range

Digit string of length 5 to 15

Name

radioType2g3g - RadioType3g2g

Syntax

--radioType2g3g <list-item>

Description

Indicates if IMSI is radio type is 3g2g

Class

Read only.

List

- false - Boolean value of false.

- true - Boolean value of true.

Name

radioType4g - RadioType4g

Syntax

--radioType4g <list-item>

Description

Indicates if IMSI is radio type 4g

Class

Read only.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

radioType5g - RadioType5g

Syntax

--radioType5g <list-item>

Description

Indicates if IMSI is radio type 5g

Class

Read only.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Roles**List**

sysadmin, manage, monitor

7.78 cmm subslmsiDisplayAdmin

sublmsiDisplayAdmin. Syntax, description, parameters, and roles for cmm subslmsiDisplayAdmin command.

Syntax

Description

SubImsiDisplayAdmin command is to used to start the Display representative IMSIs for an input PLMN

Parameters

Name

mcc - Mobile country code

Syntax

--mcc <digits>

Description

3-digit number used to represent the mobile country code.

Class

Required key.

Type / Range

Digit string of length 3

Name

mnc - Mobile network code

Syntax

--mnc <digits>

Description

Digits used to represent mobile network code

Class

Required key.

Type / Range

Digit string of length 2 to 3

Name

taskOp - Task Operation

Syntax

--taskOp <list-item>

Description

Defines Task Operation

Restrictions

Required for Modify case

Class

Required on create.

List

- clear - Clear Collected IMSIs - Defines Clearing Collected IMSIs operation
- status - Show status of dump - Status query
- dump - Dump IMSIs - Defines Dump IMSIs operation

Name

imsiCount - IMSI Count

Syntax

--imsiCount <integer>

Description

Count of IMSIs requested 1..100. In status message the number of IMSIs found during dump operation.

Class

Optional.

Type / Range

Integer in the range of 0 to 100

Default

20

Name

taskStatus - Task Status

Syntax

--taskStatus <list-item>

Description

Task Status

Class

Read only.

List

- cleared - cleared the collected list. IMSI are not deleted.
- completed - Dump command is completed
- failed - Command failed
- notRunning - Not Running - Command not running
- running - Dump command is running

Roles

Show

sysadmin, manage, monitor

Modify

sysadmin, manage

7.79 cmm subslmsiOffload

subslmsiOffload. Syntax, description, parameters, and roles for cmm subslmsiOffload command.

Syntax

Description

This command is used in order to control the IMSI Offloading Procedure. It will be possible to create/list/show IMSI based offloading parameters like IMSI and NRI.

Parameters

Name

subsnri - NRI of Target SGSN for offloading subscribers

Syntax

--subsnri <integer>

Description

This parameter defines the target SGSN NRI configuration. The value ranges from 0 to 127.

Class

Required on create, not filterable on list.

Type / Range

Integer in the range of 0 to 127

Name

id - IMSI digits of the subscriber to offload

Syntax

<digits>

Description

Use this parameter to indicate the IMSI number of the subscriber to be offloaded

Restrictions

This parameter is also the key for the REDIS DB in order to make sure that it will not be possible to add the same IMSI twice

Class

Required value.

Type / Range

Digit string of length 6 to 15

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Modify

sysadmin, manage

Delete

sysadmin, manage

List

sysadmin, manage, monitor

7.80 cmm subsOffloadCount

subsOffloadCount. Syntax, description, parameters, and roles for cmm subsOffloadCount command.

Syntax**Description**

Show paps offloading subscriber percentages and total counts.

Parameters**Name**

currentCount - Offload rate of target SGSN for offloading subscribers

Syntax

--currentCount <string>

Description

This parameter shows the current number of subscribers offloaded.

Class

Optional.

Type / Range

Digit string of length 1 to 10 with the allowed pattern of [0-9a-zA-Z\._ :]*

Name

nri - Nri

Syntax

--nri <string>

Description

Target SGSN NRI.

Class

Optional.

Type / Range

Digit string of length 1 to 5 with the allowed pattern of [0-9a-zA-Z\._ :]*

Name

percent - Offload count of target SGSN for offloading subscribers

Syntax

--percent <string>

Description

This parameter defines the percentage of subscribers offloaded from source SGSN.

Class

Optional.

Type / Range

Digit string of length 1 to 5 with the allowed pattern of [0-9a-zA-Z\._ :]*

Name

statusCode - Offloading status

Syntax

--statusCode <string>

Description

Status of offloading process.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._ : @]*

Name

targetId - Id of target SGSN for offloading subscribers info

Syntax

--targetId <integer>

Description

This parameter defines the index of the target SGSN configuration record. the values range from 1 to 16.

Class

Optional.

Type / Range

Integer in the range of 1 to 16

Name

totalCount - Total number of subscribers in target SGSN for offloading

Syntax

--totalCount <string>

Description

This parameter shows the total number of subscribers to be offloaded.

Class

Optional.

Type / Range

Digit string of length 1 to 10 with the allowed pattern of [0-9a-zA-Z\._ :]*

Roles**List**

sysadmin, manage, monitor

7.81 cmm subsOffloadTarget

subsOffloadTarget. Syntax, description, parameters, and roles for cmm subsOffloadTarget command.

Syntax**Description**

Configure, list and show Target SGSN for offloading subscriber info.

Parameters**Name**

subsNri - NRI of target SGSN for offloading subscribers

Syntax

--subsNri <integer>

Description

This parameter defines the target SGSN NRI configuration. the value range from 0 to 127.

Class

Required on create, not filterable on list.

Type / Range

Integer in the range of 0 to 127

Name

subsOffPercentage - Offload count of target SGSN for offloading subscribers

Syntax

--subsOffPercentage <integer>

Description

This parameter defines the percentage of subscribers to be offloaded from source SGSN.

Class

Required on create, not filterable on list.

Type / Range

Integer in the range of 0 to 100

Name

subsOffrate - Offload rate of target SGSN for offloading subscribers

Syntax

--subsOffrate <integer>

Description

This parameter defines the number of subscribers to be offloaded per second per PAPS. The values range from 1 to 255

Class

Required on create, not filterable on list.

Type / Range

Integer in the range of 1 to 255

Name

id - Id of target SGSN for offloading subscribers info

Syntax

<integer>

Description

This parameter defines the index of the target SGSN configuration record. the values range from 1 to 16.

Class

Required value.

Type / Range

Integer in the range of 1 to 16

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Modify

sysadmin, manage

Delete

sysadmin, manage

List

sysadmin, manage, monitor

7.82 cmm subsStateInfo

subsStateInfo. Syntax, description, parameters, and roles for **cmm subsStateInfo** command.

Syntax**Description**

Count subscribers per RAT.

Parameters**Name**

imei - IMEI

Syntax

--imei <digits>

Description

IMEI.

Class

Optional.

Type / Range

Digit string of length 1 to 14

Name

imsi - IMSI

Syntax

--imsi <digits>

Description

IMSI.

Class

Optional.

Type / Range

Digit string of length 5 to 15

Name

msisdn - MSISDN

Syntax

--msisdn <digits>

Description

MSISDN.

Class

Optional.

Type / Range

Digit string of length 5 to 18

Name

papsId - PapsId

Syntax

--papsId <integer>

Description

PAPS index.

Class

Optional.

Type / Range

Integer in the range of 0 to 19

Name

ptmsi - PTMSI

Syntax

--ptmsi <digits>

Description

IMSI.

Class

Optional.

Type / Range

Digit string of length 4

Roles**List**

sysadmin, manage, monitor

7.83 cmm suciSchemeAllowedList

UEs SUCI Scheme Output Allowed List. Syntax, description, parameters, and roles for cmm suciSchemeAllowedList command.

Syntax**Description**

Administer the UEs SUCI Scheme Output allowed list.

Parameters**Name**

name - UEs Suci Scheme Output Allow List Name

Syntax

--name <string>

Description

Identifies the name of the UEs SUCI Scheme Output allowed list. The allowed list includes the SUCI Scheme Output of the inbound roaming UEs SUCIs to be allowed in the visited PLMN.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

sysadmin, manage, monitor

7.84 cmm suciSchemeAllowedListItem

UE SUCI Scheme Output Allow List Item. Syntax, description, parameters, and roles for cmm suciSchemeAllowedListItem command.

Syntax

Description

Configures the inbound roaming UEs Scheme Output allow list with each of the UE individual SUCI Scheme Output that is allowed to roam into the visited PLMN network.

Parameters

Name

suciSchemeAllowedListName - UE Suci Scheme Output Allow List Name

Syntax

```
--suciSchemeAllowedListName <string>
```

Description

Identifies the name of the SUCI Scheme Output allow list.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

ueSuciSchemeOutput - UE SUCI Scheme Output

Syntax

```
--ueSuciSchemeOutput <string>
```

Description

Identifies the Scheme Output part of the UE SUCI provided by the UE during UE initial registration.

Class

Required key.

Type / Range

Hexadecimal string of length 1 to 92 with allowed pattern [0-9a-f]*

Roles

7.85 cmm suMaintenance

SU Maintenance. Syntax, description, parameters, and roles for cmm suMaintenance command.

Syntax

Description

Set SU Maintenance State.

Parameters

Name

maintState - Maintenance state

Syntax

--maintState <list-item>

Description

Maintenance state.

Class

Optional.

List

- nodata - No data - Specify maintenance state of no data.
- normal - Specify maintenance state of normal.
- su - Specify maintenance state of software update.

Default

normal

Roles

Show

sysadmin, manage, monitor

Modify

sysadmin, manage

List

sysadmin, manage, monitor

7.86 cmm supiRange

SUPI Range. Syntax, description, parameters, and roles for cmm supiRange command.

Syntax

Description

Add or delete SUPI range to a named list consisting of SUPI range.

Parameters

Name

supiRangeListName - SUPI Range List

Syntax

--supiRangeListName <string>

Description

Name of the list consisting of one more SUPI ranges.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

startSupi - Starting of the SUPI range

Syntax

--startSupi <digits>

Description

Starting of the SUPI range.

Class

Required key.

Type / Range

Digit string of length 9 to 15

Name

endSupi - End of the SUPI range

Syntax

--endSupi <digits>

Description

End of the SUPI range.

Class

Required key.

Type / Range

Digit string of length 9 to 15

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

sysadmin, manage, monitor

7.87 cmm supiRangeList

SUPI Range List. Syntax, description, parameters, and roles for cmm supiRangeList command.

Syntax**Description**

List for SUPI ranges.

Parameters**Name**

name - List Name

Syntax

--name <string>

Description

SUPI ranges list name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

supiRangeListType - AMF Supi Range Type

Syntax

--supiRangeListType <list-item>

Description

Identifies the AMF Supi Range Type associated or linked

Class

Required on create, not modifiable.

List

- amfPolicySelection - Supi Range for AMF Policy Selection - Identifies Supi Range(s) associated or linked to AMF Policy Selection.
- nfnInstance - Supi Range for Network Function Instance(s) - Identifies Supi Range(s) associated or linked to network function instance(s) such as UDM, AUSF and PCF.
- supiRangeServices - Supi Range for Supi Range Services - Identifies Supi Range(s) associated or linked to Supi Range Services.

Roles**Create**

sysadmin, manage

sysadmin, manage, monitor

Delete

sysadmin, manage

List

sysadmin, manage, monitor

7.88 cmm sustDelApnList

Sustained or Delayed APN List. Syntax, description, parameters, and roles for cmm sustDelApnList command.

Syntax

Description

Define APN lists that either -disable the UE detaching by regions due to UE connecting to an APN that has to be sustained despite of the mobility, or -delay the UE detaching by regions due to UE connecting to an APN that can only be deleted when dedicated bearers are deleted. An APN list can include max 64 APNs. A single APN NI can only be included in either type of APN list.

Parameters

Name

sustDelApnListName - Sustained or Delayed APN List Name

Syntax

--sustDelApnListName <string>

Description

APN list name for enhanced detach UE move regions functionality.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Name

listType - List Type

Syntax

--listType <list-item>

Description

Defines the list type of the APN list.

Class

Required on create.

List

- APNLISTTYPE_DELAYED - APN List Type Delayed - APN list of type Delayed.
- APNLISTTYPE_SUSTAINED - APN List Type Sustained - APN list of type Sustained.

Roles

Create

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

sysadmin, manage, monitor

7.89 cmm sustDelApnNi

Sustained or Delayed APN Network Identifier. Syntax, description, parameters, and roles for cmm sustDelApnNi command.

Syntax

Description

Define APN that requires enhanced functionality related to detach UE move regions feature Define APN that either -disables the UE detaching by regions due to UE connecting to an APN that has to be sustained despite of the mobility, or -delays the UE detaching by regions due to UE connecting to an APN that can only be deleted when dedicated bearers are deleted. A single APN NI can only be included in either type of APN list.

Parameters

Name

sustDelApnListName - Sustained or Delayed APN List Name

Syntax

--sustDelApnListName <string>

Description

APN list name for enhanced detach UE move regions functionality.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Name

apnNi - APN Network Identifier

Syntax

--apnNi <string>

Description

APN Network Identifier.

Class

Required key.

Type / Range

Digit string of length 1 to 62 with the allowed pattern of [0-9a-zA-Z\.\-]*

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

sysadmin, manage, monitor

7.90 cmm svcAgreementProfile

UE PLMN and Served PLMN Service Agreement Profile. Syntax, description, parameters, and roles for cmm svcAgreementProfile command.

Syntax**Description**

This command is used to administer a UE PLMN and Served PLMN Service Agreement Profile and includes parameters for defining RAT networks to which handover is not allowed, support for emergency services, and parameters for configuring CSFB, IMS, LPA, MPS, ODB, power save mode, S102, SMS, and VPLMN.

Parameters**Name**

name - Service agreement profile name

Syntax

--name <string>

Description

Defines the PLMN service agreement profile to be used for service.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Name

accRestCdma2000 - CDMA2000 access restricted

Syntax

--accRestCdma2000 <list-item>

Description

RAT network types to which handover is not allowed from the current (MME home) network. if no options are checked (indicating that handover is not allowed), then the inter-rat handover restrictions received from the HSS/HLR in the UE home network are used.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

accRestEutran - EUTRAN access restricted

Syntax

--accRestEutran <list-item>

Description

RAT network types to which handover is not allowed from the current (MME home) network. if no options are checked (indicating that handover is not allowed), then the inter-rat handover restrictions received from the HSS/HLR in the UE home network are used.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

accRestEutranExceptLtem - Access Restrictions E-UTRAN Except LTE-M

Syntax

--accRestEutranExceptLtem <list-item>

Description

Specifies whether a UE is restricted from accessing LTE but is allowed access to LTE-M RAT. This field applies for home, roamer, shared, and TAHS plmns. If the field allows the access, the MME still checks the UE's access restriction data from the HSS (if any) prior to allowing access to the LTE RAT. The eNB informs the MME whether the UE is using LTE-M via the S1AP UE Capability Info Indication message.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

accRestGeran - GERAN access restricted

Syntax

--accRestGeran <list-item>

Description

RAT network types to which handover is not allowed from the current (MME home) network. if no options are checked (indicating that handover is not allowed), then the inter-rat handover restrictions received from the HSS/HLR in the UE home network are used.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

accRestLtem - Access Restrictions LTE-M

Syntax

--accRestLtem <list-item>

Description

Specifies whether a UE is restricted from accessing LTE-M IoT RAT. This field applies for home, roamer, shared, and TAHS plmns. If the field allows LTE-M RAT, the MME still checks the UE's access restriction data from the HSS (if any) prior to allowing access to LTE-M RAT. The eNB informs the MME whether the UE is using LTE-M via the S1AP UE Capability Info Indication message.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

accRestNbiot - Access Restrictions NB-IoT

Syntax

--accRestNbiot <list-item>

Description

Specifies whether a UE is restricted from accessing NB-IoT RAT. This field applies for home, roamer, shared, and TAHS plmns. If the field allows NB-IoT RAT, the MME still checks the UE's access restriction data from the HSS (if any) prior to allowing access to NB-IoT RAT.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

accRestUtran - UTRAN access restricted

Syntax

--accRestUtran <list-item>

Description

RAT network types to which handover is not allowed from the current (MME home) network. if no options are checked (indicating that handover is not allowed), then the inter-rat handover restrictions received from the HSS/HLR in the UE home network are used.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

checkSrvccCapaForVopsHomogeneous - Check SRVCC Capability for VoPS Homogeneous

Syntax

--checkSrvccCapaForVopsHomogeneous <list-item>

Description

This parameter defines whether the MME checks UE SRVCC capability for indicating homogeneous IMS voice over PS support towards the HSS. When set to 'yes' and the UE supports SRVCC, MME indicates homogeneous support for the UE towards the HSS, if the TAs support voice. When set to 'yes' and the UE does not support SRVCC, MME indicates homogeneous non-support for the UE. When set to 'no', MME indicates homogeneous support based on voice over PS support of the TAs, the UE support for VoPS and the other VoPS impacting parameters.

Class

Optional.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

csCapSupported - CS capability supported

Syntax

--csCapSupported <list-item>

Description

The level of CSFB capability supported for this PLMN.

Class

Optional.

List

- CSFB_2G3G - CSFB 2G/3G - Both SMS and CS are supported.

- CSFB_Not_Preferred - CSFB not preferred - This option supports both SMS and CSFB. the MME indicates csfb-not-preferred to the UE, which indicates to the UE to invoke voice services only in the CS domain and use IMS voice, if supported.
- SGS_None - SGS none - All CS based services (CSFB and SMS based on CS) are restricted.
- SMS_Only - SMS only - Only SMS is supported.
- SMS_Only_Faked_Full - SMS only faked full combined - MME fakes towards the UE to support full combined attach i.e. both SMS and CSFB, but locally restricts the service to SMS only. The MME rejects CSFB attempts for regular calls with provisioned causes. The MME follows an additional provisioning parameter to reject or not reject emergency attempts.

Default

SGS_None

Name

csfbDtr - CSFB DTR

Syntax

--csfbDtr <list-item>

Description

Indicates a list of services that UEs can utilize when roaming into the MME home network from the given network.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

csPrefRfsp - CS preferred RFSP

Syntax

--csPrefRfsp <integer>

Description

CS preferred RFSP.

Class

Optional.

Type / Range

Integer in the range of 0 to 256

Default

255

Name

csPrefRfspDataCentricUe - CS preferred RFSP for data centric UE

Syntax

--csPrefRfspDataCentricUe <integer>

Description

CS preferred RFSP for data centric ue.

Class

Optional.

Type / Range

Integer in the range of 0 to 256

Default

256

Name

csRfsp - CS RFSP

Syntax

--csRfsp <integer>

Description

Indicates whether (zero value) or not (non-zero value) the index value for CS RAT/Frequency selection priority (RFSPindex) received from the HSS in the UE home PLMN is to be used. "0" indicates the HSS-provided value should be used. if a non-zero value is provisioned, this numerical value over-rides the value received from the HSS in the home network of the UE.

Class

Optional.

Type / Range

Integer in the range of 0 to 256

Default

255

Name

csRfspDataCentricUe - CS RFSP for data centric UE

Syntax

--csRfspDataCentricUe <integer>

Description

Indicates whether (zero value) or not (non-zero value) the index value for CS RAT/Frequency selection priority (RFSPindex) received from the HSS in the UE home PLMN is to be used. "0" indicates the HSS-provided value should be used. if a non-zero value is provisioned, this numerical value over-rides the value received from the HSS in the home network of the UE.

Class

Optional.

Type / Range

Integer in the range of 0 to 256

Default

256

Name

description - Description

Syntax

--description <string>

Description

Profile description.

Class

Optional.

Type / Range

Digit string of length 0 to 160 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

"

Name

emergencySupported - Emergency supported

Syntax

--emergencySupported <list-item>

Description

This command is used to enable indication of emergency service supported or not to a UE in Attach Accept or TAU Accept message. The no form of the command will result in indicate to a UE that emergency service is not supported. By default the emergency service is disabled. The emergency Service can only be enabled if IMS voice is enabled. However, the emergency service can be enabled irrespective of IMS voice support if the gParm imsEmergencySupportIndication is set to Yes. Based on the emergency bearer provisioning and IMS voice support, MME will set the Emergency bearer services indicator bit (emergency bearer services in S1 mode supported or emergency bearer services in S1 mode not supported) of the EPS network feature support information IE of the Attach Accept or TAU Accept message sent to a UE. UE uses this information to access LTE network when

initiating an emergency call. MME rejects a UE Attach Request for emergency service and PDN Connectivity Request for emergency APN if the emergency service is not enabled.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

fakedFullCombSmsSgsEmerSrvRejCause - Faked Full Combined SMS SGs Emergency Service Reject Cause

Syntax

--fakedFullCombSmsSgsEmerSrvRejCause <integer>

Description

Defines the EMM cause code used to reject Extended Service Request attempts for CSFB for emergency calls when the MME fakes full combined attach/TAU but locally restricts the CS services to SMS only, and MME is provisioned to reject emergency call attempts.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

39

Name

fakedFullCombSmsSgsRejectEmerCalls - Faked Full Combined SMS SGs Reject Emergency Calls

Syntax

--fakedFullCombSmsSgsRejectEmerCalls <list-item>

Description

Defines whether the MME rejects emergency call attempts (Extended Service Requests indicating emergency), when the MME fakes full combined attach/TAU but locally restricts the CS services to SMS only.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

fakedFullCombSmsSgsSgsapPagingRejCause - Faked Full Combined SMS SGs SGsAP Paging Reject Cause

Syntax

--fakedFullCombSmsSgsSgsapPagingRejCause <integer>

Description

The cause the MME uses on SGsAP-PAGING-REJECT to reject MT CSFB attempts, when the MME fakes full combined attach/TAU but locally restricts the CS services to SMS only.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

13

Name

fakedFullCombSmsSgsSrvRejCause - Faked Full Combined SMS SGs Service Reject Cause

Syntax

--fakedFullCombSmsSgsSrvRejCause <integer>

Description

Defines the EMM cause code used to to reject Extended Service Request attempts for CSFB when the MME fakes full combined attach/TAU but locally restricts the CS services to SMS only.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

39

Name

imsOverPs - IMS voice over PS

Syntax

--imsOverPs <list-item>

Description

Indicates a list of services that UEs can utilize when roaming into the MME home network from the given network.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

imsPrefRfsp - IMS preferred RFSP

Syntax

--imsPrefRfsp <integer>

Description

IMS preferred RFSP.

Class

Optional.

Type / Range

Integer in the range of 0 to 256

Default

256

Name

imsPrefRfspDataCentricUe - IMS preferred RFSP for data centric UE

Syntax

--imsPrefRfspDataCentricUe <integer>

Description

IMS preferred RFSP for data centric ue.

Class

Optional.

Type / Range

Integer in the range of 0 to 256

Default

256

Name

imsRfsp - IMS RFSP

Syntax

--imsRfsp <integer>

Description

Indicates whether (zero value) or not (non-zero value) the index value for IMS RAT/Frequency selection priority (RFSPindex) received from the HSS in the UE home PLMN is to be used. "0" indicates the HSS-provided value should be used. if a non-zero value is provisioned, this numerical value over-rides the value received from the HSS in the home network of the UE.

Class

Optional.

Type / Range

Integer in the range of 0 to 256

Default

256

Name

imsRfspDataCentricUe - IMS RFSP for data centric UE

Syntax

--imsRfspDataCentricUe <integer>

Description

Indicates whether (zero value) or not (non-zero value) the index value for IMS RAT/Frequency selection priority (RFSPindex) received from the HSS in the UE home PLMN is to be used. "0" indicates the HSS-provided value should be used. if a non-zero value is provisioned, this numerical value over-rides the value received from the HSS in the home network of the UE.

Class

Optional.

Type / Range

Integer in the range of 0 to 256

Default

256

Name

lowPriorityAccess - Low priority access

Syntax

--lowPriorityAccess <list-item>

Description

Configure to allow a LPA UE to access network.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

lpaMmRejectCc - LPA mobility manager reject cause code

Syntax

--lpaMmRejectCc <integer>

Description

Configure NAS MM CC to be sent to a LPA UE when a LPA mobility management request is rejected due to restricted LPA.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

35

Name

lpaSmRejectCc - LPA session manager reject cause code

Syntax

--lpaSmRejectCc <integer>

Description

Configure NAS SM CC to be sent to a LPA UE when a LPA session management request is rejected due to restricted LPA.

Class

Optional.

Type / Range

Integer in the range of 8, 26-35, 38, 50-51, 53-55, 65-66, 95-112

Default

32

Name

lpaT3412TimerSrc - LPA T3412 timer source

Syntax

```
--lpaT3412TimerSrc <list-item>
```

Description

Configure source of the T3412 timer for LPA UE.

Class

Optional.

List

- HSS - The duration of T3412 is set to the value received from the HSS.
- Local - The duration of T3412 is determined from the MME-provisioned settings.
- Max - Maximum - The duration of T3412 is whatever duration is longer between the value provisioned on the MME or the duration received from the HSS.

Default

Local

Name

mpsCsAllowed - MPS CS allowed

Syntax

```
--mpsCsAllowed <list-item>
```

Description

MPS CS allowed.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

mpsEpsAllowed - MPS EPS allowed

Syntax

```
--mpsEpsAllowed <list-item>
```

Description

MPS EPS allowed.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

networkAccessMode - LTE network access mode

Syntax

--networkAccessMode <list-item>

Description

Determines processing mode for UEs that roam into the MME home network.

Class

Optional.

List

- Packet and Circuit - Specifies network access mode of packet and circuit.
- Packet only - Specifies network access mode of packet only.

Default

Packet and Circuit

Name

odbAllApn - All APN barred

Syntax

--odbAllApn <list-item>

Description

Specifies whether the MME supports receipt of operator determined barring of all packet oriented services (ODB-all-APN) from the HSS. if unchecked (disabled), the MME will not set the corresponding bits in the supported-features IE sent to the HSS in the ULR and IDA message, and the HSS must handle barring locally. if checked, then the MME sets the corresponding bits in the supported-features IE to inform the HSS that the MME will enforce ODB barring restrictions received in a ULA or IDR message.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

odbHplmnApn - HPLMN APN barred

Syntax

--odbHplmnApn <list-item>

Description

Specifies whether the MME supports receipt of operator determined barring of all packet oriented services within the UE home PLMN (ODB-HPLMN-APN) from the HSS. if unchecked (disabled), the MME will not set the corresponding bits in the supported-features IE sent to the HSS in the ULR and IDA message, and the HSS must handle barring locally. if checked, then the MME sets the corresponding bits in the supported-features IE to inform the HSS that the MME will enforce ODB barring restrictions received in a ULA or IDR message.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

odbVplmnApn - VPLMN APN barred

Syntax

--odbVplmnApn <list-item>

Description

Specifies whether the MME supports receipt of all packet oriented services in the MME home PLMN (ODB-VPLMN-APN) from the HSS. if unchecked (disabled), the MME will not set the corresponding bits in the supported-features IE sent to the HSS in the ULR and IDA message, and the HSS must handle barring locally. if checked, then the MME sets the corresponding bits in the supported-features IE to inform the HSS that the MME will enforce ODB barring restrictions received in a ULA or IDR message.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

overwriteRfspIndex - Overwrite RFSP Index

Syntax

--overwriteRfspIndex <integer>

Description

When gParm rfspIndexSelectionOption is enabled and rfspSelOption equals overwriteRfspIndex then the MME sends locally provisioned RFSP value, as defined in current field, ignoring whatever value may have been received from the HSS

Class

Optional.

Type / Range

Integer in the range of 0 to 256

Default

0

Name

pgwRstApnList - PGW restart APN LIST

Syntax

--pgwRstApnList <string>

Description

PGW restart APN NI list name.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

''

Name

psmT3324Timer - Power savings mode T3324 timer

Syntax

--psmT3324Timer <integer>

Description

Configure T3324 timer value to support UE power savings mode.

Class

Optional.

Type / Range

Integer in the range of 0 to 11,160

Default

300

Name

psmT3324TimerSrc - Power savings mode T3324 timer source

Syntax

--psmT3324TimerSrc <list-item>

Description

Configure source of T3324 timer value.

Class

Optional.

List

- HSS - Specify source of T3324 HSS
- Local - Specify source of T3324 timer of local.
- UE - Specify source of T3324 timer of UE.

Default

Local

Name

psmT3412MinTimer - PSM T3412 Minimum Timer Value

Syntax

--psmT3412MinTimer <integer>

Description

This parameter is used to provision T3412 timer to be used for UE supporting PSM. If the provisioned T3412 timer source is UE for UE supporting PSM and T3412 timer received in attach/TAU request from the UE is less than the provisioned minimum T3412 timer then MME sends the provisioned minimum T3412 timer in Attach/TAU accept.

Class

Optional.

Type / Range

Integer in the range of 1 to 31

Default

31

Name

psmT3412MinTimerUnit - Power Savings Mode T3412 Min Timer Unit

Syntax

--psmT3412MinTimerUnit <list-item>

Description

Power savings mode minimum T3412 timer unit.

Class

Optional.

List

- 10Hours - Specify unit of T3412 timer of 10 hours.
- 10Minutes - Specify unit of T3412 timer of 10 minutes.
- 2Seconds - Specify unit of T3412 timer of 2 seconds.
- 30Seconds - Specify unit of T3412 timer of 30 seconds.
- Hour - Specify unit of T3412 timer of hours.
- Minute - Specify unit of T3412 timer of minutes.
- 320Hours - Specify unit of T3412 timer of 320 hours.

Default

Hour

Name

psmT3412Timer - Power savings mode T3412 timer

Syntax

--psmT3412Timer <integer>

Description

Configure T3412 timer to be used for a UE that supports PSM.

Class

Optional.

Type / Range

Integer in the range of 1 to 31

Default

31

Name

psmT3412TimerSrc - Power savings mode T3412 timer source

Syntax

--psmT3412TimerSrc <list-item>

Description

Power savings mode T3412 timer source.

Class

Optional.

List

- HSS - Specify source of T3412 timer of HSS.
- Local - Specify source of T3412 timer of local.
- UE - Specify source of T3412 timer of UE.

Default

Local

Name

psmT3412TimerUnit - Power savings mode T3412 timer unit

Syntax

--psmT3412TimerUnit <list-item>

Description

Power savings mode T3412 timer unit.

Class

Optional.

List

- 10Hours - Specify unit of T3412 timer of 10 hours.
- 10Minutes - Specify unit of T3412 timer of 10 minutes.
- 2Seconds - Specify unit of T3412 timer of 2 seconds.
- 30Seconds - Specify unit of T3412 timer of 30 seconds.
- Hour - Specify unit of T3412 timer of hours.
- Minute - Specify unit of T3412 timer of minutes.
- 320Hours - Specify unit of T3412 timer of 320 hours.

Default

10Minutes

Name

rfspIndex - RFSP index

Syntax

--rfspIndex <integer>

Description

Indicate whether or not the index value for RAT/Frequency selection priority received from the HSS in the UE home PLMN should be used.

Class

Optional.

Type / Range

Integer in the range of 0 to 256

Default

100

Name

rfspIndexVoiceCapableUe - RFSP index for voice capable UEs

Syntax`--rfspIndexVoiceCapableUe <integer>`**Description**

RFSP index for voice capable UEs.

Class

Optional.

Type / Range

Integer in the range of 0 to 128

Default

0

Name

rfspSelOption - RFSP Selection Option

Syntax`--rfspSelOption <list-item>`**Description**

This field defines the way that RFSP Index is selected for the UE. Options are (a) (feature) disabled (b) apply local value as configured in `overwriteRfspIndex` field, (c) use the HSS subscribed value

Class

Optional.

List

- disabled - Feature is disabled at the Service Agreement Profile
- overwriteRfspIndex - Overwrite RFSP Index - MME assigns to the UE the RFSP Index as defined in Overwrite RFSP Index field in Service Agreement Profile.
- sendHssSubRfspIndex - Send HSS Subscription RFSP Index - MME assigns to the UE the RFSP Index as received from the HSS as part of subscription data

Default

disabled

Name

roamerImsPdnConnOption - Roamer IMS PDN connection option

Syntax`--roamerImsPdnConnOption <list-item>`

Description

Roamer IMS PDN connection option. dependency with imsapnroamingcontrol parameter in UE PLMN services.

Class

Optional.

List

- BOTH - Specify roamer IMS PDN connection option of both.
- HRT - Specify roamer IMS PDN connection option of home routed traffic.
- LBO - Specify roamer IMS PDN connection option of local breakout.
- NONE - Specify roamer IMS PDN connection option of none.

Default

BOTH

Name

s102Allowed - S102 services allowed

Syntax

--s102Allowed <list-item>

Description

Indicates whether or not S102 services are allowed.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

s102SrvccAllowed - S102 SRVCC allowed

Syntax

--s102SrvccAllowed <list-item>

Description

This parameter controls activation of S102 1x RTT SRVCC flavor.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

sgdAllowed - SGd Allowed

Syntax

--sgdAllowed <list-item>

Description

Defines whether SGd is allowed i.e. whether the MME is allowed to register the user in HSS for SMS delivery.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

smsOnlyLac - LAC of LAI to be used for SMS only

Syntax

--smsOnlyLac <integer>

Description

Location area code, used in combination with smsonlyPlmnname to define the LAI to be used for SMS only.

Class

Optional.

Type / Range

Integer in the range of 0 to 65,535

Default

0

Name

smsOnlyPlmnName - PLMN name of LAI to be used for SMS only

Syntax

--smsOnlyPlmnName <string>

Description

Mobile network name, used in combination with smsonlylac to define the LAI to be used for SMS only.

Class

Optional.

Type / Range

Digit string of length 0 or 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

"

Name

srvccPsToCs - SRVCC-Based PS to CS handover

Syntax

--srvccPsToCs <list-item>

Description

Indicates whether handover of a packet switched call to a circuit switched network using the SRVCC protocol is supported.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

t3412Max320HourValue - T3412 Max 320Hour Value

Syntax

--t3412Max320HourValue <integer>

Description

Defines the maximum value for the '320 Hour' Unit for the extended T3412 timer. If a greater value is specified elsewhere in the system (e.g psmAPN), the system will override that value with this provisioned value. Permissible values are 1-31 inclusive. This field is applicable for both lpaT3412 and psmT3412 timers negotiated with the UE.

Class

Optional.

Type / Range

Integer in the range of 1 to 31

Default

1

Name

t3412src - T3412 source

Syntax`--t3412src <list-item>`**Description**

Determines how the T3412 timer is set. this field provides the ability to override the provisioned T3412 timer with subscribed-periodic-rau-tau-timer subscription data or to use the maximum of provisioned and subscription data.

Class

Optional.

List

- MaxProvSub - Maximum of provisioned and subscription - Use maximum value of provisioned T3412 timer and subscribed-periodic-rau-tau-timer subscription data.
- Provisioned - Use provisioned T3412 timer.
- Subscription - Use subscribed-periodic-rau-tau-timer from subscription data.

Default

Provisioned

Name

useLocalRfspHssRfspNotSub - Use Local RFSP if RFSP isn't subscribed at the HSS

Syntax`--useLocalRfspHssRfspNotSub <list-item>`**Description**

Current parameter enables using the locally provisioned RFSP value when local configuration at the uePlmnServices or imsiRangeServices indicates applying the HSS subscribed value but no RFSP value is received from the HSS.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

vplmnAllowed - Honor VPLMN requests

Syntax

--vplmnAllowed <list-item>

Description

Indicates whether a UE is allowed to select a PGW in the VPLMN. if checked, the UE is allowed to use a PGW from the UE HPLMN (home-routed) or from the VPLMN (local-breakout). if unchecked, only home-routed scenario is supported and the roaming UE must use the PGW in their home PLMN.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

vplmnCsgAllowed - CSG allowed

Syntax

--vplmnCsgAllowed <list-item>

Description

CSG allowed.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

vplmnLipaAllowed - LIPA allowed

Syntax

--vplmnLipaAllowed <list-item>

Description

LIPA allowed.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

7.91 cmm syslogAdmin

Syslog Server Administration. Syntax, description, parameters, and roles for cmm syslogAdmin command.

Syntax

Description

This command will administer the IP address, port and protocol of the remote (r)syslog server

Parameters

Name

syslogConfigName - Syslog Configuration Name

Syntax

--syslogConfigName <string>

Description

Syslog Configuration Name identifies a syslog instance

Class

Required key.

Type / Range

Digit string of length 1 to 50 with the allowed pattern of [0-9a-zA-Z\.\-_:]*

Name

syslogRemoteIp - Syslog server IP Address

Syntax

--syslogRemoteIp <string>

Description

Syslog server IP Address

Class

Required on create.

Type / Range

Digit string of length 2 to 43 with the allowed pattern of [0-9a-fA-F\.:/*]

Name

oamTlsProfileName - OAM TLS Profile

Syntax

--oamTlsProfileName <string>

Description

This parameter contains the profile for TLS. It contains the certificate names needed for establishing secure communication.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

"

Name

permittedPeerName - Name of Remote Peer

Syntax

--permittedPeerName <string>

Description

DNS resolvable remote logging server domain name and this shall be given if --tlsCertificateName has been given.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

syslogProtocol - Syslog Protocol

Syntax

--syslogProtocol <list-item>

Description

Protocol used for streaming transmission of syslog

Class

Optional.

List

- tcp - Specify syslog protocol of TCP.
- udp - Specify syslog protocol of UDP.

Default

tcp

Name

syslogRemotePort - Syslog Remote Port

Syntax

--syslogRemotePort <string>

Description

Syslog Remote Port

Class

Optional.

Type / Range

Digit string of length 0 to 11 with the allowed pattern of ((([0-9]{1,4})[1-5][0-9]{4})6[0-4][0-9]{3})65[0-4][0-9]{2}|655[0-2][0-9]|6553[0-5])|((([0-9]{1,4})[1-5][0-9]{4})6[0-4][0-9]{3}|65[0-4][0-9]{2})655[0-2][0-9]|6553[0-5])-(|[0-9]{1,4})[1-5][0-9]{4}|6[0-4][0-9]{3}|65[0-4][0-9]{2}|655[0-2][0-9]|6553[0-5]))

7.92 cmm system

system. Syntax, description, parameters, and roles for **cmm system** command.

Syntax

Description

Configure and show generic system configuration for SGSN.

Parameters

Name

ardMode - Access restriction data

Syntax`--ardMode <list-item>`**Description**

This parameter defines whether the HLR sent access restriction data ARD parameter and the features related to this parameter are used in SGSN or not.

Class

Optional, not filterable on list.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

cc - Country code

Syntax`--cc <digits>`**Description**

Digits characterising the subscribers own country.

Class

Optional, not filterable on list.

Type / Range

Digit string of length 0 to 18

Default

""

Name

cnId - CN identifier

Syntax

--cnId <integer>

Description

This parameter is core network identifier, CNID. possible values range from 0 to 4095 and 65535 (undefined).

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 0 to 4,095 or 65,535

Default

65535

Name

csps2g - CS/PS coordination for 2G

Syntax

--csps2g <list-item>

Description

This parameter defines whether CS/PS coordination is requested from the BSC.

Class

Optional, not filterable on list.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

elddf - Indirect downlink data forwarding value

Syntax

--eIddf <integer>

Description

This parameter is used during the IRAT handovers, so that operator can optimize the user plane route. the possible values are, 1 ... does not apply 2 ... applies always.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 2

Default

1

Name

eir - Equipment identification register ISDN number

Syntax

--eir <digits>

Description

This parameter is an equipment identity register number. when you give the EIR number, give both the numbering plan and the type of number in the second parameter block. the maximum length of the number is 18 digits.

Class

Optional, not filterable on list.

Type / Range

Digit string of length 0 to 18

Default

""

Name

fullNetwName - Full network name

Syntax

--fullNetwName <string>

Description

This parameter defines the full network name of the network operator.

Class

Optional, not filterable on list.

Type / Range

Digit string of length 0 to 64

Default

""

Name

gbBufThPri1 - Priority buffer 1 length

Syntax

--gbBufThPri1 <integer>

Description

This parameter defines the buffer length for the scheduling in priority one gb buffer, which is defined as a percent of the total memory. possible values range from 5 to 85.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 5 to 85

Default

10

Name

gbBufThPri2 - Priority buffer 2 length

Syntax

--gbBufThPri2 <integer>

Description

This parameter defines the buffer length for the scheduling in priority two gb buffer, which is defined as a percent of the total memory. possible values range from 5 to 85.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 5 to 85

Default

20

Name

gbBufThPri3 - Priority buffer 3 length

Syntax

--gbBufThPri3 <integer>

Description

This parameter defines the buffer length for the scheduling in priority three gb buffer, which is defined as a percent of the total memory. possible values range from 5 to 85.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 5 to 85

Default

30

Name

gbBufThPri4 - Priority buffer 4 length

Syntax

--gbBufThPri4 <integer>

Description

This parameter defines the buffer length for the scheduling in priority four gb buffer, which is defined as a percent of the total memory. possible values range from 5 to 85.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 5 to 85

Default

40

Name

gsMode - Existence of gs interface

Syntax

--gsMode <list-item>

Description

This parameter defines whether the gs interface exists towards the MSC/VLR.

Class

Optional, not filterable on list.

List

- exists - Specifies the gs interface exists.
- notExists - Not exists - Specifies the gs interface does not exist.

Default

notExists

Name

homeSubs - Home subscriber group controlled roaming

Syntax

--homeSubs <list-item>

Description

This parameter defines whether the home subscriber group controlled roaming is in use in flexi NS SGSN.

Class

Optional, not filterable on list.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

imsiEndDigit - End digit of IMSI digits used in HOME GGSN selection

Syntax

--imsiEndDigit <integer>

Description

This parameter defines the possible range values of IMSI end digits used in HOME GGSN selection. the values range from 1 to 15.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 15

Default

7

Name

imsiStartDigit - Start digit of IMSI digits used in HOME GGSN selection

Syntax

--imsiStartDigit <integer>

Description

This parameter defines the possible range values of IMSI start digits used in HOME GGSN selection. the values range from 1 to 15.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 15

Default

6

Name

ipv4Tag - PDN type tag for IPv4 to be used in DNS query for GGSN/PGW selection

Syntax

--ipv4Tag <string>

Description

PDN type tag for IPv4 to be used in DNS query for GGSN/PGW selection.

Class

Optional, not filterable on list.

Type / Range

Digit string of length 0 to 10 with the allowed pattern of [0-9a-zA-Z\.\-:]*

Default

""

Name

ipv4v6Tag - PDN type tag for IPv4v6 to be used in DNS query for GGSN/PGW selection

Syntax

--ipv4v6Tag <string>

Description

PDN type tag for IPv4v6 to be used in DNS query for GGSN/PGW selection.

Class

Optional, not filterable on list.

Type / Range

Digit string of length 0 to 10 with the allowed pattern of [0-9a-zA-Z\.\-:]*

Default

""

Name

ipv6Tag - PDN type tag for IPv6 to be used in DNS query for GGSN/PGW selection

Syntax

--ipv6Tag <string>

Description

PDN type tag for IPv6 to be used in DNS query for GGSN/PGW selection.

Class

Optional, not filterable on list.

Type / Range

Digit string of length 0 to 10 with the allowed pattern of [0-9a-zA-Z\.\-:]*

Default

""

Name

lboImsi - Local breakout at IMSI NS level

Syntax

--lboImsi <list-item>

Description

Local breakout at IMSI NS level.

Class

Optional, not filterable on list.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

llcMaxIFrame - Maximum number of outstanding i frames in LLC layer

Syntax

--llcMaxIFrame <integer>

Description

This parameter defines the maximum number of outstanding i frames in the logical link control LLC layer. possible values range from 1 to 255.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 255

Default

8

Name

llcMaxN201I - Maximum number of octets in information field N201I

Syntax

--llcMaxN201I <integer>

Description

This parameter defines the maximum number of octets in the information field N201I. possible values range from 140 to 1520.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 140 to 1,520

Default

1250

Name

mcc - Mobile country code, MCC

Syntax

--mcc <digits>

Description

This parameter defines the mobile country code number. the value can be three digits.

Class

Optional, not filterable on list.

Type / Range

Digit string of length 0 or 3

Default

""

Name

mnc - Mobile network code, MNC

Syntax

--mnc <digits>

Description

This parameter defines the mobile network code number. the value can be two or three digits.

Class

Optional, not filterable on list.

Type / Range

Digit string of length 0 or 2 to 3

Default

""

Name

msisdnsSubLen - MSISDN subrange starting position for home PGW selection

Syntax

--msisdnsSubLen <integer>

Description

MSISDN subrange length for home PGW selection.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 3 to 7

Default

7

Name

msisdnSubPos - MSISDN subrange starting position for home PGW selection

Syntax

--msisdnSubPos <integer>

Description

MSISDN subrange starting position for home PGW selection.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 3 to 7

Default

3

Name

msStandbyForced - Force to standby

Syntax

--msStandbyForced <list-item>

Description

This parameter defines whether the SGSN forces the MS to the STANDBY state after GMM procedures or not.

Class

Optional, not filterable on list.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

nblac - Non-broadcast location area code, LAC

Syntax

--nblac <integer>

Description

This parameter defines the non-broadcast location area code. possible values range from 1 to 65533. if you enter a value for the nblac parameter, you must enter values also for the nbmcc, nmmnc and nbrac.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 65,535

Default

65535

Name

nbmcc - Non-broadcast mobile country code, MCC

Syntax

--nbmcc <digits>

Description

This parameter defines the non-broadcast mobile country code. if you enter a value for the nbmcc parameter, you must enter values also for the nbmnc, nblac and nbrac.

Class

Optional, not filterable on list.

Type / Range

Digit string of length 0 or 3

Default

""

Name

nbmnc - Non-broadcast mobile network code, MNC

Syntax

--nbmnc <digits>

Description

This parameter defines the non-broadcast mobile network code. if you enter a value for the nbmnc parameter, you must enter values also for the nbmcc, nblac and nbrac.

Class

Optional, not filterable on list.

Type / Range

Digit string of length 0 or 2 to 3

Default

""

Name

nbrac - Non-broadcast routing area code, RAC

Syntax

--nbrac <integer>

Description

This parameter defines the non-broadcast routing area code. possible values range from 0 to 255. if you enter a value for the nbrac parameter, you must enter values also for the nbmcc, nbmnc and nblac.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 0 to 255

Default

255

Name

ndc - National destination code

Syntax

--ndc <digits>

Description

Digits characterising the called network and/or trunk code.

Class

Optional, not filterable on list.

Type / Range

Digit string of length 0 or 1 to 18

Default

""

Name

npForCc - Numbering plan indicator for country code

Syntax

--npForCc <list-item>

Description

Numbering plan indicator for country code.

Class

Optional, not filterable on list.

List

- " - No numbering plan - No numbering plan.
- E164 - Numbering plan E164 - Numbering plan E164.
- E212 - Numbering plan E212 - Numbering plan E212.
- E214 - Numbering plan E214 - Numbering plan E214.

Default

"

Name

npForEir - Numbering plan indicator for equipment identity register number

Syntax

--npForEir <list-item>

Description

Numbering plan indicator for equipment identity register number.

Class

Optional, not filterable on list.

List

- " - No numbering plan - No numbering plan.
- E164 - Numbering plan E164 - Numbering plan E164.
- E212 - Numbering plan E212 - Numbering plan E212.
- E214 - Numbering plan E214 - Numbering plan E214.

Default

"

Name

npForNdc - Numbering plan indicator for national destination code

Syntax

--npForNdc <list-item>

Description

Numbering plan indicator for national destination code.

Class

Optional, not filterable on list.

List

- " - No numbering plan - No numbering plan.
- E164 - Numbering plan E164 - Numbering plan E164.

- E212 - Numbering plan E212 - Numbering plan E212.
- E214 - Numbering plan E214 - Numbering plan E214.

Default

"

Name

npForSgsn - Numbering plan indicator for serving GPRS support node

Syntax

--npForSgsn <list-item>

Description

This parameter is the code which refers to the standardised numbering instruction described by the ITU T.

Class

Optional, not filterable on list.

List

- " - No numbering plan - No numbering plan.
- E164 - Numbering plan E164 - Numbering plan E164.
- E212 - Numbering plan E212 - Numbering plan E212.
- E214 - Numbering plan E214 - Numbering plan E214.

Default

"

Name

numbOfProcAttemptsInInterval - Number of procedure attempts allowed within one interval

Syntax

--numbOfProcAttemptsInInterval <integer>

Description

This parameter defines the number of procedure attempts allowed within one interval.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 1000

Default

5

Name

originHost - Origin realm for diameter connections

Syntax

--originHost <string>

Description

Origin host name for diameter connections.

Class

Optional, not filterable on list.

Type / Range

Digit string of length 0 to 110 with the allowed pattern of [0-9a-zA-Z\.\-_:]*

Default

""

Name

originRealm - Origin realm for diameter connections

Syntax

--originRealm <string>

Description

Origin realm for diameter connections.

Class

Optional, not filterable on list.

Type / Range

Digit string of length 0 to 49 with the allowed pattern of [0-9a-zA-Z\.\-_:]*

Default

""

Name

pdpActProcMonitoring - PDP activation procedure monitoring

Syntax

--pdpActProcMonitoring <list-item>

Description

This parameter enables and disables the PDP activation procedure monitoring.

Class

Optional, not filterable on list.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

pgwtag - PGW tag name

Syntax

--pgwtag <string>

Description

This is the user defined TAG which is used in pre - release 8 DNS query for selecting PGW. the length of the tag ranges from 1 to 10 alphanumeric characters.

Class

Optional, not filterable on list.

Type / Range

Digit string of length 1 to 10 with the allowed pattern of [0-9a-zA-Z\._ :]*

Default

LTE

Name

procAttemptsInterval - Interval in which the SGSN monitors procedure attempts

Syntax

--procAttemptsInterval <integer>

Description

This parameter defines the interval in which the SGSN monitors procedure attempts.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 3,600

Default

60

Name

restartCount - Restart count

Syntax

--restartCount <integer>

Description

Restart count.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 0 to 255

Default

0

Name

rncIdDigits - Number of RNCID digits used in DNS query

Syntax`--rncIdDigits <integer>`**Description**

This parameter defines the number of RNCID digits used in DNS query. the values range from 1 to 5.

Class

Optional, not filterable on list.

Type / Range

Integer in the range of 1 to 5

Default

2

Name

s6dSelect - S6D or gr mode for roamers

Syntax`--s6dSelect <list-item>`**Description**

This parameter is added with the purpose of selecting either S6d interface or gr interface, y ... S6D n ... gr.

Class

Optional, not filterable on list.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

sgsn - Serving GPRS support node, SGSN

Syntax`--sgsn <digits>`**Description**

This parameter is an SGSN number. in the international format the first digits of the number must contain the country code. when you give the SGSN number, give also the numbering plan in the second parameter block. the maximum length of the number is 18 digits.

Class

Optional, not filterable on list.

Type / Range

Digit string of length 0 or 1 to 18

Default

""

Name

shortNetwName - Short network name

Syntax

--shortNetwName <string>

Description

This parameter defines the short network name of the network operator.

Class

Optional, not filterable on list.

Type / Range

Digit string of length 0 to 64

Default

""

Name

subsDataKeepMode - Store subscriber data

Syntax

--subsDataKeepMode <list-item>

Description

This parameter defines whether the subscriber data received from the HLR is stored in flexi NS SGSN subscriber database or not, when the subscriber's access to the SGSN is rejected due to access restriction data parameter value received from the HLR.

Class

Optional, not filterable on list.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

tonForEir - Type of number for equipment identity register number

Syntax

--tonForEir <list-item>

Description

Type of number for equipment identity register number.

Class

Optional, not filterable on list.

List

- " - No nature of address - No nature of address.
- INT - Nature of address INT - Nature of address INT.
- NAT - Nature of address NAT - Nature of address NAT.

Default

"

Name

visitorSubs - Visitor subscriber group controlled roaming

Syntax

--visitorSubs <list-item>

Description

This parameter defines whether the visitor subscriber group controlled roaming is in use in flexi NS SGSN.

Class

Optional, not filterable on list.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

vlr - Visitor location register number

Syntax

--vlr <digits>

Description

This parameter is a visitor location register number. the number must be in the E.164 international format and therefore the first digits of the number must contain the country code. the maximum length of the number is 18 digits.

Class

Optional, not filterable on list.

Type / Range

Digit string of length 0 or 1 to 18

Default

""

Name

id - Id

Syntax

<string>

Description

Just type 'config' here.

Class

Required value.

Type / Range

Digit string of length 6 to 6 with the allowed pattern of [0-9a-zA-Z\.\-_:]*

7.93 cmm systemInfo

System Information. Syntax, description, parameters, and roles for cmm systemInfo command.

Syntax**Description**

This command is used to list System Information and includes parameters describing the system switch name, application type, hardware type, time zone, and software release/build information.

Parameters

Name

application - Application type

Syntax

--application <list-item>

Description

Application type that is configured.

Class

Optional.

List

- AMF - Access and Mobility management Function - Access and Mobility management Function supports 5G.
- MME - Mobility management element - Mobility management element supports 4G.
- QA - Quad Access - Quad Access supports 2G/3G/4G/5G or 4G/5G
- SGSN - Serving GPRS support node - Serving GPRS support node supports 2G and 3G.
- TA - Triple access - Triple access supports 2G, 3G, and 4G.

Name

buildNum - Build number

Syntax

--buildNum <string>

Description

Build number for the release.

Class

Optional.

Type / Range

Digit string of length 1 to 20 with the allowed pattern of [0-9a-zA-Z\.\-_:]*

Name

hwType - Hardware type

Syntax

--hwType <list-item>

Description

Hardware type of the CMM.

Class

Optional.

List

- ATE - Specify hardware type ATE.
- CMM - Specify hardware type CMM.
- UnKnown - Specify hardware type unknown.

Name

model - Network Function Model

Syntax

--model <list-item>

Description

This parameter indicates if this CMM is a Virtual Network Function or Container Network Function

Class

Optional.

List

- CNF - Containerized Network Function
- VNF - Virtualized Network Function

Name

releaseName - Release name

Syntax

--releaseName <string>

Description

Software release name.

Class

Optional.

Type / Range

Digit string of length 1 to 20 with the allowed pattern of [0-9a-zA-Z\._:]*

Name

releaseNum - Release number

Syntax

--releaseNum <string>

Description

Software release number.

Class

Optional.

Type / Range

Digit string of length 1 to 20 with the allowed pattern of [0-9a-zA-Z\._:]*

Name

switchName - Switch name

Syntax

--switchName <string>

Description

Name for this CMM.

Class

Optional.

Type / Range

Digit string of length 1 to 40 with the allowed pattern of [0-9a-zA-Z\.-]*

Name

timeZone - Time zone

Syntax

--timeZone <string>

Description

Time zone that this CMM is in.

Class

Optional.

Type / Range

Digit string of length 1 to 16 with the allowed pattern of [0-9a-zA-Z\._:]*

Roles**Show**

sysadmin, manage, monitor

List

sysadmin, manage, monitor

7.94 cmm t6aDiamNasMappingProfile

T6A Diam NAS Mapping Profile. Syntax, description, parameters, and roles for cmm t6aDiamNasMappingProfile command.

Syntax

Description

T6A Diam NAS Mapping Profile.

Parameters

Name

t6aDiamNasMappingProfileName - T6A diam NAS mapping profile name

Syntax

--t6aDiamNasMappingProfileName <string>

Description

T6A diam NAS mapping profile name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Name

t6aDiamCauseCode - T6A diam cause code

Syntax

--t6aDiamCauseCode <list-item>

Description

T6A diam cause code.

Class

Required key.

List

- avpNotAllowed - AVP not allowed - A message was received with an AVP that MUST NOT be present. the failed-avp AVP MUST be included and contain a copy of the offending AVP.
- avpOccursTooManyTimes - AVP occurs too many times - A message was received that included an AVP that appeared more often than permitted in the message definition. the failed-avp AVP MUST be included and contain a copy of the first instance of the offending AVP that exceeded the maximum number of occurrences.
- avpUnsupported - AVP unsupported - The peer received a message that contained an AVP that is not recognized or supported and was marked with the 'M' (Mandatory) bit. a diameter message with this error MUST contain one or more failed-avp AVPs containing the AVPs that caused the failure.
- commandUnsupported - Command unsupported - This error code is used when a diameter entity receives a message with a command code that it does not support.

- **contradictingAvps** - Contradicting AVPs - The home diameter server has detected AVPs in the request that contradicted each other, and it is not willing to provide service to the user. the failed-avp AVP MUST be present, which contain the AVPs that contradicted each other.
- **electionLost** - Election lost - The peer has determined that it has lost the election process and has therefore disconnected the transport connection.
- **featureUnsupported** - Feature unsupported - The peer received a message that contained an AVP that is not recognized or supported.
- **invalidAvpBitCombination** - Invalid AVP bit combination - The request contained an AVP with which is not allowed to have the given value in the AVP flags field. a diameter message indicating this error MUST include the offending AVPs within a failed-avp AVP.
- **invalidAvpBits** - Invalid AVP bits - A request was received that included an AVP whose flag bits are set to an unrecognized value or that is inconsistent with the AVP's definition.
- **invalidAvpLength** - Invalid AVP length - The request contained an AVP with an invalid length. a diameter message indicating this error MUST include the offending AVPs within a failed-avp AVP. in cases where the erroneous AVP length value exceeds the message length or is less than the minimum AVP header length, it is sufficient to include the offending AVP header and a zero filled payload of the minimum required length for the payloads data type. if the AVP is a grouped AVP, the grouped AVP header with an empty payload would be sufficient to indicate the offending AVP. in the case where the offending AVP header cannot be fully decoded when the AVP length is less than the minimum AVP header length, it is sufficient to include an offending AVP header that is formulated by padding the incomplete AVP header with zero up to the minimum AVP header length.
- **invalidAvpValue** - Invalid AVP value - The request contained an AVP with an invalid value in its data portion. a diameter message indicating this error MUST include the offending AVPs within a failed-avp AVP.
- **invalidBitInHeader** - Invalid bit in header - This error is returned when a reserved bit in the diameter header is set to one (1) or the bits in the diameter header are set incorrectly.
- **invalidEpsBearer** - Invalid EPS bearer - This result code shall be sent by the SCEF or the MME to indicate that there is no existing EPS bearer context for the user.
- **invalidHeaderBits** - Invalid header bits - A request was received whose bits in the diameter header were set either to an invalid combination or to a value that is inconsistent with the command code's definition.
- **invalidMessageLength** - Invalid message length - This error is returned when a request is received with an invalid message length.
- **loopDetected** - Loop detected - An agent detected a loop while trying to get the message to the intended recipient. the message MAY be sent to an alternate peer, if one is available, but the peer reporting the error has identified a configuration problem.

- **missingAvp** - Missing AVP - The request did not contain an AVP that is required by the command code definition. if this value is sent in the result-code AVP, a failed-avp AVP SHOULD be included in the message. the failed-avp AVP MUST contain an example of the missing AVP complete with the vendor-id if applicable. the value field of the missing AVP should be of correct minimum length and contain zeroes.
- **niddConfigurationNotAvailable** - NIDD configuration not available - This result code shall be sent by the SCEF to indicate that there is no valid NIDD configuration available.
- **noCommonApplication** - No common application - This error is returned by a diameter node that receives a CER whereby no applications are common between the CER sending peer and the CER receiving peer.
- **noScefAvailable** - No SCEF available - No SCEF is available to send a request or answer over T6A.
- **operationNotAllowed** - Operation not allowed - This result code shall be sent by the SCEF to indicate that the operation is not allowed when an EPS bearer context exists for the user.
- **outOfSpace** - Out of space - A diameter node received the accounting request but was unable to commit it to stable storage due to a temporary lack of space.
- **redirectionIndication** - Redirection indication - A redirect agent has determined that the request could not be satisfied locally, and the initiator of the request SHOULD direct the request directly to the server.
- **resourcesExceeded** - Resources exceeded - A request was received that cannot be authorized because the user has already expended allowed resources.
- **scefConnectionDown** - SCEF connection down - The target SCEF connection is down while a request or answer is being processed.
- **scefReferenceIdUnknown** - SCEF reference unknown - This result code shall be sent by the SCEF to indicate that the SCEF reference ID is not known by the SCEF.
- **tooBusy** - Too busy - When returned, a diameter node SHOULD attempt to send the message to an alternate peer. this error MUST only be used when a specific server is requested, and it cannot provide the requested service.
- **unableToComply** - Unable to comply - This error is returned when a request is rejected for unspecified reasons.
- **unableToDeliver** - Unable to deliver - This error is given when diameter cannot deliver the message to the destination, either because no host within the realm supporting the required application was available to process the request or because the destination-host AVP was given without the associated destination-realm AVP.
- **unknownPeer** - Unknown peer - A CER was received from an unknown peer.
- **unknownSessionId** - Unknown session ID - The request contained an unknown session-id.

- unsupportedVersion - Unsupported version - This error is returned when a request was received, whose version number is unsupported.
- userUnknown - User unknown - This result code shall be sent by the SCEF or the MME to indicate that the user identified by the IMSI is unknown.

Name

t6aEmmCauseCode - T6A EMM cause code

Syntax

--t6aEmmCauseCode <integer>

Description

T6A EMM cause code.

Class

Optional.

Type / Range

Integer in the range of 2-17, 20-23, 25, 28, 32-34, 40, 95- 101, 111

Name

t6aEsmCauseCode - T6A ESM cause code

Syntax

--t6aEsmCauseCode <integer>

Description

T6A ESM cause code.

Class

Optional.

Type / Range

Integer in the range of 8, 26-35, 38, 50-51, 53-55, 65-66, 95-112

7.95 cmm t6aDiamNasMappingProfileList

T6A Diam NAS Mapping Profile List. Syntax, description, parameters, and roles for cmm t6aDiamNasMappingProfileList command.

Syntax

Description

T6A Diam NAS Mapping Profile List.

Parameters

Name

name - T6A diam NAS mapping profile list name

Syntax

--name <string>

Description

T6A diam NAS mapping profile list name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

7.96 cmm tac

tac. Syntax, description, parameters, and roles for cmm tac command.

Syntax

Description

Configure, list and show TACs.

Parameters

Name

id - ID of TAC

Syntax

<digits>

Description

Id of TAC, which is first eight digits of IMEI.

Class

Required value.

Type / Range

Digit string of length 8

7.97 cmm tacacsAuthRoleMapping

TACACS Authorizaiton Role Mapping. Syntax, description, parameters, and roles for cmm tacacsAuthRoLeMapping command.

Syntax

Description

This command allows mapping of External Authorization Roles to the Internal CMM Roles

Parameters

Name

tacacsMappingName - TACACS Role Mappng Name

Syntax

--tacacsMappingName <string>

Description

Name of this TACACS Mapping

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Name

tacacsExternalRole - TACACS External Role

Syntax

--tacacsExternalRole <integer>

Description

Value of the external TACACS Defined Role

Class

Required key.

Type / Range

Integer in the range of 0 to 15

Name

rbacRole - RBAC Role

Syntax

--rbacRole <list-item>

Description

The internal RBAC Role Allowed

Class

Required key.

List

- Admin - Admin Role
- Configurator - Configurator Role
- LI - Lawful Intercept - Lawful Intercept Role
- Monitor - Monitor Role
- SecAdmin - Security Admin - Security Admin Role

7.98 cmm taCountQuery

TA Count Query. Syntax, description, parameters, and roles for cmm taCountQuery command.

Syntax

Description

Show TA Count Query.

Parameters

Name

uePlmnName - UE Mobile Network

Syntax`--uePlmnName <string>`**Description**

Name that identifies roaming network

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

servingPlmnName - Mobile Network Name of TAI

Syntax`--servingPlmnName <string>`**Description**

Name that identifies Mobile Network (alternate key) of the tracking area in this mapping.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

allTac - All Tracking Area Codes

Syntax

--allTac <list-item>

Description

Parameter is used to select all TAC of the serving PLMN. If this parameter is set to 'True' then MME ignores the TAC parameter and shows the total number of registered UEs from all the TAC of the serving PLMN.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

regUeCount - Registered UE Count

Syntax

--regUeCount <integer>

Description

Number of registered users in a serving TA for a roamer PLMN

Class

Read only.

Type / Range

Integer in the range of 0 to 65,535

Default

0

Name

tac - Tracking Area Code

Syntax

--tac <integer>

Description

Tracking Area Code.

Class

Optional.

Type / Range

Integer in the range of 0 to 65,535

Default

0

Roles**List**

sysadmin, manage, monitor

7.99 cmm tai

Tracking Area Identifier. Syntax, description, parameters, and roles for **cmm tai** command.

Syntax**Description**

This command is used to administer an MME Tracking Area and includes parameters for defining the mobile network name, Tracking Area Code, ESMC mapping, whether emergency and IMS services are supported, time zone, and ESMC selection algorithms indicating whether they will load share or function as primary/secondary.

Parameters**Name**

plmnName - Mobile network name

Syntax

--plmnName <string>

Description

Name that identifies the mobile network.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

tac - Tracking area code

Syntax

--tac <integer>

Description

Tracking area code.

Class

Required key.

Type / Range

Integer in the range of 1 to 65,535

Name

aerialUeSupported - Aerial UE Supported

Syntax

--aerialUeSupported <list-item>

Description

This field identifies whether the TAI eNodeBs support Aerial UE operation.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

ciotEmmRegisterdWithoutPdn - Enable EMM-REGISTERED without PDN connection for C-IOT UE

Syntax

--ciotEmmRegisterdWithoutPdn <list-item>

Description

Enable EMM-REGISTERED without PDN connection for C-IOT UE.

Restrictions

This element is not applicable when plmnType is Other Network.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

cpCIoT - CP CIOT

Syntax

--cpCIoT <list-item>

Description

Enable CP CIOT optimization.

Restrictions

This element is not applicable when plmnType is Other Network.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

dcnrSupported - DCNR Supported

Syntax

--dcnrSupported <list-item>

Description

This field specifies whether a NSA operation is supported anywhere within this TAI. This field is not automatically provisioned by the system. Instead, it is manually set.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

emergencySupported - Emergency supported

Syntax

--emergencySupported <list-item>

Description

Indicates if emergency is supported. only allowed if IMS supported is true.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

emmInfoOverride - EMM info override

Syntax

--emmInfoOverride <list-item>

Description

Flag defining whether the emmInfo message should be overridden with profile information in the emmInfoOverrideTacSv table.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

esmlcIdentity1 - ESMC identity 1

Syntax

--esmlcIdentity1 <digits>

Description

First TAI to E-SMLC (Evolved serving mobile location center) mapping.

Class

Optional.

Type / Range

Digit string of length 0 to 3

Default

"

Name

esmlcIdentity2 - ESMC identity 2

Syntax

--esmlcIdentity2 <digits>

Description

Second TAI to E-SMLC (Evolved serving mobile location center) mapping.

Class

Optional.

Type / Range

Digit string of length 0 to 3

Default

"

Name

esmlcIdentity3 - ESMC identity 3

Syntax

--esmlcIdentity3 <digits>

Description

Third TAI to E-SMLC (Evolved serving mobile location center) mapping. The E-SMLC is used for emergency services.

Class

Optional.

Type / Range

Digit string of length 0 to 3

Name

esmlcIdentity4 - ESMC identity 4

Syntax

--esmlcIdentity4 <digits>

Description

Fourth TAI to E-SMLC (Evolved serving mobile location center) mapping. The set of 4 ESMC are used for emergency services

Class

Optional.

Type / Range

Digit string of length 0 to 3

Name

forbiddenTailListName - Forbidden TAI list name

Syntax

--forbiddenTailListName <string>

Description

Forbidden TAI list name.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

''

Name

imsSupported - IMS supported

Syntax

--imsSupported <list-item>

Description

Indicates if IMS is supported.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

liSelectionAlgorithm - Lawful Intercept location services selection algorithm

Syntax

--liSelectionAlgorithm <list-item>

Description

Indicates for the set of lawful intercept location services ESMLCs (Evolved Serving Mobile Location Center) whether they will load share or function as primary/secondary.

Class

Optional.

List

- LoadShare - Load share - Load share.

- PrimarySecondary - Primary / secondary - Function as primary / secondary.

Default

PrimarySecondary

Name

mmeRelCapacity - MME relative capacity

Syntax

--mmeRelCapacity <integer>

Description

Provision MME relative capacity per tracking area.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

5

Name

mtEdtCp - mtEdtCp

Syntax

--mtEdtCp <list-item>

Description

Mobile-Terminated Early Data Transfer over Control Plan

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

mtEdtUp - mtEdtUp

Syntax

--mtEdtUp <list-item>

Description

Mobile Terminated Early Data Transfer over User Plane

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

nbiotSmsWithoutCombinedAttach - Enable SMS without combined Attach For NB-IOT UE

Syntax

--nbiotSmsWithoutCombinedAttach <list-item>

Description

Enable SMS without combined Attach For NB-IOT UE

Restrictions

This element is not applicable when plmnType is Other Network.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

operSelectionAlgorithm - Operator location services selection algorithm

Syntax

--operSelectionAlgorithm <list-item>

Description

Indicates for the set of operator location services ESMCs (Evolved serving mobile location center) whether they will load share or function as primary/secondary.

Class

Optional.

List

- LoadShare - Load share - Load share.
- PrimarySecondary - Primary / secondary - Function as primary / secondary.

Default

PrimarySecondary

Name

provisionedStatus - TAI provisioned satuts

Syntax

--provisionedStatus <list-item>

Description

Indicator of whether TAI was provisioned, discovered, or initially discovered with subsequent explicit provisioning changes involving TAI were made.

Class

Read only.

List

- Discovered - TAI was explicitly discovered.
- DiscoveredAndProvisioned - Discovered and provisioned - TAI was initially discovered, but additional provisioning using TAI was done.
- Provisioned - TAI was explicitly provisioned.
- RangeDiscovered - Range Discovered - TAI was explicitly range discovered.
- RangeDiscoveredAndProvisioned - Range Discovered and provisioned - TAI was initially range discovered, but additional provisioning using TAI was done.

Name

s1uDataTrans - S1U data transfer

Syntax

--s1uDataTrans <list-item>

Description

Enable S1-U data transfer.

Restrictions

This element is not applicable when plmnType is Other Network.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

selectionAlgorithm - Selection algorithm

Syntax

--selectionAlgorithm <list-item>

Description

Indicates for the set of ESMLCs, (Evolved serving mobile location center) whether they will load share or function as primary/secondary.

Class

Optional.

List

- LoadShare - Load share - Load share.
- PrimarySecondary - Primary / secondary - Function as primary / secondary.

Default

PrimarySecondary

Name

supportedRatType - Supported RAT type for this TAC

Syntax

--supportedRatType <list-item>

Description

Supported RAT type for this TAC. it can only be wbeutran or nbior.

Restrictions

This element is not applicable when plmnType is Other Network.

Class

Optional.

List

- nbior - Narrow band internet of things - Specify type of narrow band internet of things.
- wbeutran - Wide band EUTRAN - Specify type of wide band EUTRAN.

Default

wbeutran

Name

timeZoneName - Time zone name

Syntax

--timeZoneName <list-item>

Description

Provides time zone names that correspond to the region selected.

Restrictions

See comments on TIME_ZONE type in CfgDataType.xsd.

Class

Optional.

List

- Africa/Abidjan - Timezone for africa/abidjan UTC offset of +00:00.
- Africa/Accra - Timezone for africa/accra UTC offset of +00:00.
- Africa/Addis_Ababa - Timezone for africa/addis_ababa UTC offset of +03:00.
- Africa/Algiers - Timezone for africa/algiers UTC offset of +01:00.
- Africa/Asmara - Timezone for africa/asmara UTC offset of +03:00.
- Africa/Asmera - Timezone for africa/asmera UTC offset of +03:00.
- Africa/Bamako - Timezone for africa/bamako UTC offset of +00:00.
- Africa/Bangui - Timezone for africa/bangui UTC offset of +01:00.
- Africa/Banjul - Timezone for africa/banjul UTC offset of +00:00.
- Africa/Bissau - Timezone for africa/bissau UTC offset of +00:00.
- Africa/Blantyre - Timezone for africa/blantyre UTC offset of +02:00.
- Africa/Brazzaville - Timezone for africa/brazzaville UTC offset of +01:00.
- Africa/Bujumbura - Timezone for africa/bujumbura UTC offset of +02:00.
- Africa/Cairo - Timezone for africa/cairo UTC offset of +02:00.
- Africa/Casablanca - Timezone for africa/casablanca UTC offset of +00:00.
- Africa/Ceuta - Timezone for africa/ceuta UTC offset of +01:00.
- Africa/Conakry - Timezone for africa/conakry UTC offset of +00:00.
- Africa/Dakar - Timezone for africa/dakar UTC offset of +00:00.
- Africa/Dar_es_Salaam - Timezone for africa/dar_es_salaam UTC offset of +03:00.
- Africa/Djibouti - Timezone for africa/djibouti UTC offset of +03:00.
- Africa/Douala - Timezone for africa/douala UTC offset of +01:00.
- Africa/El_Aaiun - Timezone for africa/el_aaiun UTC offset of +00:00.
- Africa/Freetown - Timezone for africa/freetown UTC offset of +00:00.
- Africa/Gaborone - Timezone for africa/gaborone UTC offset of +02:00.
- Africa/Harare - Timezone for africa/harare UTC offset of +02:00.
- Africa/Johannesburg - Timezone for africa/johannesburg UTC offset of +02:00.

- Africa/Juba - Timezone for africa/juba UTC offset of +03:00.
- Africa/Kampala - Timezone for africa/kampala UTC offset of +03:00.
- Africa/Khartoum - Timezone for africa/khartoum UTC offset of +03:00.
- Africa/Kigali - Timezone for africa/kigali UTC offset of +02:00.
- Africa/Kinshasa - Timezone for africa/kinshasa UTC offset of +01:00.
- Africa/Lagos - Timezone for africa/lagos UTC offset of +01:00.
- Africa/Libreville - Timezone for africa/libreville UTC offset of +01:00.
- Africa/Lome - Timezone for africa/lome UTC offset of +00:00.
- Africa/Luanda - Timezone for africa/luanda UTC offset of +01:00.
- Africa/Lubumbashi - Timezone for africa/lubumbashi UTC offset of +02:00.
- Africa/Lusaka - Timezone for africa/lusaka UTC offset of +02:00.
- Africa/Malabo - Timezone for africa/malabo UTC offset of +01:00.
- Africa/Maputo - Timezone for africa/maputo UTC offset of +02:00.
- Africa/Maseru - Timezone for africa/maseru UTC offset of +02:00.
- Africa/Mbabane - Timezone for africa/mbabane UTC offset of +02:00.
- Africa/Mogadishu - Timezone for africa/mogadishu UTC offset of +03:00.
- Africa/Monrovia - Timezone for africa/monrovia UTC offset of +00:00.
- Africa/Nairobi - Timezone for africa/nairobi UTC offset of +03:00.
- Africa/Ndjamena - Timezone for africa/ndjamena UTC offset of +01:00.
- Africa/Niamey - Timezone for africa/niamey UTC offset of +01:00.
- Africa/Nouakchott - Timezone for africa/nouakchott UTC offset of +00:00.
- Africa/Ouagadougou - Timezone for africa/ouagadougou UTC offset of +00:00.
- Africa/Porto-Novo - Timezone for africa/porto-novo UTC offset of +01:00.
- Africa/Sao_Tome - Timezone for africa/sao_tome UTC offset of +00:00.
- Africa/Timbuktu - Timezone for africa/timbuktu UTC offset of +00:00.
- Africa/Tripoli - Timezone for africa/tripoli UTC offset of +02:00.
- Africa/Tunis - Timezone for africa/tunis UTC offset of +01:00.
- Africa/Windhoek - Timezone for africa/windhoek UTC offset of +02:00.
- America/Adak - Timezone for america/adak UTC offset of -10:00.
- America/Anchorage - Timezone for america/anchorage UTC offset of -09:00.
- America/Anguilla - Timezone for america/anguilla UTC offset of -04:00.

- America/Antigua - Timezone for america/antigua UTC offset of -04:00.
- America/Araguaina - Timezone for america/araguaina UTC offset of -03:00.
- America/Argentina/Buenos_Aires - Timezone for america/argentina/buenos_aires UTC offset of -03:00.
- America/Argentina/Catamarca - Timezone for america/argentina/catamarca UTC offset of -03:00.
- America/Argentina/ComodRivadavia - Timezone for america/argentina/comodrivadavia UTC offset of -03:00.
- America/Argentina/Cordoba - Timezone for america/argentina/cordoba UTC offset of -03:00.
- America/Argentina/Jujuy - Timezone for america/argentina/jujuy UTC offset of -03:00.
- America/Argentina/La_Rioja - Timezone for america/argentina/la_rioja UTC offset of -03:00.
- America/Argentina/Mendoza - Timezone for america/argentina/mendoza UTC offset of -03:00.
- America/Argentina/Rio_Gallegos - Timezone for america/argentina/rio_gallegos UTC offset of -03:00.
- America/Argentina/Salta - Timezone for america/argentina/salta UTC offset of -03:00.
- America/Argentina/San_Juan - Timezone for america/argentina/san_juan UTC offset of -03:00.
- America/Argentina/San_Luis - Timezone for america/argentina/san_luis UTC offset of -03:00.
- America/Argentina/Tucuman - Timezone for america/argentina/tucuman UTC offset of -03:00.
- America/Argentina/Ushuaia - Timezone for america/argentina/ushuaia UTC offset of -03:00.
- America/Aruba - Timezone for america/aruba UTC offset of -04:00.
- America/Asuncion - Timezone for america/asuncion UTC offset of -03:00.
- America/Atikokan - Timezone for america/atikokan UTC offset of -05:00.
- America/Atka - Timezone for america/atka UTC offset of -10:00.
- America/Bahia - Timezone for america/bahia UTC offset of -03:00.
- America/Bahia_Banderas - Timezone for america/bahia_banderas UTC offset of -06:00.
- America/Barbados - Timezone for america/barbados UTC offset of -04:00.
- America/Belem - Timezone for america/belem UTC offset of -03:00.

- America/Belize - Timezone for america/belize UTC offset of -06:00.
- America/Blanc-Sablon - Timezone for america/blanc-sablon UTC offset of -04:00.
- America/Boa_Vista - Timezone for america/boa_vista UTC offset of -04:00.
- America/Bogota - Timezone for america/bogota UTC offset of -05:00.
- America/Boise - Timezone for america/boise UTC offset of -07:00.
- America/Buenos_Aires - Timezone for america/buenos_aires UTC offset of -03:00.
- America/Cambridge_Bay - Timezone for america/cambridge_bay UTC offset of -07:00.
- America/Campo_Grande - Timezone for america/campo_grande UTC offset of -03:00.
- America/Cancun - Timezone for america/cancun UTC offset of -05:00.
- America/Caracas - Timezone for america/caracas UTC offset of -04:00.
- America/Catamarca - Timezone for america/catamarca UTC offset of -03:00.
- America/Cayenne - Timezone for america/cayenne UTC offset of -03:00.
- America/Cayman - Timezone for america/cayman UTC offset of -05:00.
- America/Chicago - Timezone for america/chicago UTC offset of -06:00.
- America/Chihuahua - Timezone for america/chihuahua UTC offset of -07:00.
- America/Coral_Harbour - Timezone for america/coral_harbour UTC offset of -05:00.
- America/Cordoba - Timezone for america/cordoba UTC offset of -03:00.
- America/Costa_Rica - Timezone for america/costa_rica UTC offset of -06:00.
- America/Creston - Timezone for america/creston UTC offset of -07:00.
- America/Cuiaba - Timezone for america/cuiaba UTC offset of -03:00.
- America/Curacao - Timezone for america/curacao UTC offset of -04:00.
- America/Danmarkshavn - Timezone for america/danmarkshavn UTC offset of +00:00.
- America/Dawson - Timezone for america/dawson UTC offset of -08:00.

- WET - Timezone for WET UTC offset of +00:00.
- Zulu - Timezone for zulu UTC offset of +00:00.
- jdj_tz - Timezone for jdj_tz UTC offset of +00:00.

Default

Default

Name

upCloT - UP CloT

Syntax

--upCIoT <list-item>

Description

Enable User Plane Cellular Internet of Things Optimization

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

vaSelectionAlgorithm - Value added location services selection algorithm

Syntax

--vaSelectionAlgorithm <list-item>

Description

Indicates for the set of value added location services ESMLCs (Evolved serving mobile location center) whether they will load share or function as primary/secondary.

Class

Optional.

List

- LoadShare - Load share - Load share.
- PrimarySecondary - Primary / secondary - Function as primary / secondary.

Default

PrimarySecondary

Name

vdpProfileName - VDP profile name

Syntax

--vdpProfileName <string>

Description

Voice domain preference profile name.

Class

Optional.

Type / Range

Digit string of length 0 or 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Default

"

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Modify

sysadmin, manage

Delete

sysadmin, manage

List

sysadmin, manage, monitor

7.100 cmm taiDiscoveryDefaults

TAI Discovery Default values. Syntax, description, parameters, and roles for cmm taiDiscoveryDefaults command.

Syntax**Description**

Specifies default values for the TAI when the MME discovers the TAI through the auto-discovery feature.

Parameters**Name**

plmnName - PLMN Name

Syntax

--plmnName <string>

Description

Name that identifies the mobile network

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

aerialUeSupported - Aerial UE Supported

Syntax

--aerialUeSupported <list-item>

Description

This field identifies whether the TAI eNodeBs support Aerial UE operation

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

ciotEmmRegisteredWithoutPdn - Enable EMM-REGISTERED without PDN connection for C-IOT UE

Syntax

--ciotEmmRegisteredWithoutPdn <list-item>

Description

Enable EMM-REGISTERED without PDN connection for C-IOT UE

Restrictions

This element is not applicable when plmnType is Other Network

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

cpCIoT - CP CIOT

Syntax

--cpCIoT <list-item>

Description

Enable CP CIOT optimization.

Restrictions

This element is not applicable when plmnType is Other Network

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

emergencySupported - Emergency supported

Syntax

--emergencySupported <list-item>

Description

Indicates if emergency is supported. only allowed if IMS supported is true.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

esmlcIdentity1 - ESMLC identity 1

Syntax

--esmlcIdentity1 <digits>

Description

First TAI to E-SMLC (Evolved serving mobile location center) mapping

Class

Optional.

Type / Range

Digit string of length 0 to 3

Default

"

Name

esmlcIdentity2 - ESMC identity 2

Syntax

--esmlcIdentity2 <digits>

Description

Second TAI to E-SMLC (Evolved serving mobile location center) mapping.

Class

Optional.

Type / Range

Digit string of length 0 to 3

Default

"

Name

esmlcIdentity3 - ESMC identity 3

Syntax

--esmlcIdentity3 <digits>

Description

Third TAI to E-SMLC (Evolved serving mobile location center) mapping. The E-SMLC is used for emergency services.

Class

Optional.

Type / Range

Digit string of length 0 to 3

Default

"

Name

esmlcIdentity4 - ESMC identity 4

Syntax

--esmlcIdentity4 <digits>

Description

Fourth TAI to E-SMLC (Evolved serving mobile location center) mapping. The set of 4 ESMC are used for emergency services

Class

Optional.

Type / Range

Digit string of length 0 to 3

Default

"

Name

forbiddenTailListName - Forbidden TAI list name

Syntax

--forbiddenTailListName <string>

Description

Forbidden TAI list name

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

"

Name

imsSupported - IMS supported

Syntax

--imsSupported <list-item>

Description

Indicates if IMS is supported.

Class

Optional.

List

- false - Boolean value of false.

- true - Boolean value of true.

Default

false

Name

mmeRelCapacity - MME relative capacity

Syntax

--mmeRelCapacity <integer>

Description

Provision MME relative capacity per tracking area.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

5

Name

mtEdtCp - mtEdtCp

Syntax

--mtEdtCp <list-item>

Description

Mobile-Terminated Early Data Transfer over Control Plan

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

mtEdtUp - MT EDT User Plane

Syntax

--mtEdtUp <list-item>

Description

Mobile Terminated Early Data Transfer over User Plane

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

nbiotSmsWithoutCombinedAttach - Enable SMS without combined Attach For NB-IOT UE

Syntax

- nbiotSmsWithoutCombinedAttach <list-item>

Description

Enable SMS without combined Attach For NB-IOT UE

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

s1uDataTrans - S1U data transfer

Syntax

--s1uDataTrans <list-item>

Description

Enable S1-U data transfer.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

selectionAlgorithm - Selection algorithm

Syntax

--selectionAlgorithm <list-item>

Description

Indicates for the set of ESMLCs, (Evolved serving mobile location center) whether they will load share or function as primary/secondary.

Class

Optional.

List

- LoadShare - Load share - Load share.
- PrimarySecondary - Primary / secondary - Function as primary / secondary.

Default

PrimarySecondary

Name

supportedRatType - Supported RAT type for the auto-provisioned TAC

Syntax

--supportedRatType <list-item>

Description

Supported RAT Type for this TAC. It can only be wbeutran or nbio

Restrictions

Supported RAT type for the auto-provisioned TAC. it can only be wbeutran or nbio

Class

Optional.

List

- nbio - Narrow band internet of things - Specify type of narrow band internet of things.
- wbeutran - Wide band EUTRAN - Specify type of wide band EUTRAN.

Default

wbeutran

Name

timeZoneName - Time zone name

Syntax

--timeZoneName <list-item>

Description

Provides time zone names that correspond to the region selected

Restrictions

See comments on TIME_ZONE type in CfgDataType.xsd

Class

Optional.

List

- Africa/Abidjan - Timezone for africa/abidjan UTC offset of +00:00.
- Africa/Accra - Timezone for africa/accra UTC offset of +00:00.
- Africa/Addis_Ababa - Timezone for africa/addis_ababa UTC offset of +03:00.
- Africa/Algiers - Timezone for africa/algiers UTC offset of +01:00.
- Africa/Asmara - Timezone for africa/asmara UTC offset of +03:00.
- Africa/Asmera - Timezone for africa/asmera UTC offset of +03:00.
- Africa/Bamako - Timezone for africa/bamako UTC offset of +00:00.
- Africa/Bangui - Timezone for africa/bangui UTC offset of +01:00.
- Africa/Banjul - Timezone for africa/banjul UTC offset of +00:00.
- Africa/Bissau - Timezone for africa/bissau UTC offset of +00:00.
- Africa/Blantyre - Timezone for africa/blantyre UTC offset of +02:00.
- Africa/Brazzaville - Timezone for africa/brazzaville UTC offset of +01:00.
- Africa/Bujumbura - Timezone for africa/bujumbura UTC offset of +02:00.
- Africa/Cairo - Timezone for africa/cairo UTC offset of +02:00.
- Africa/Casablanca - Timezone for africa/casablanca UTC offset of +00:00.
- Africa/Ceuta - Timezone for africa/ceuta UTC offset of +01:00.
- Africa/Conakry - Timezone for africa/conakry UTC offset of +00:00.
- Africa/Dakar - Timezone for africa/dakar UTC offset of +00:00.
- Africa/Dar_es_Salaam - Timezone for africa/dar_es_salaam UTC offset of +03:00.
- Africa/Djibouti - Timezone for africa/djibouti UTC offset of +03:00.
- Africa/Douala - Timezone for africa/douala UTC offset of +01:00.
- Africa/El_Aaiun - Timezone for africa/el_aaiun UTC offset of +00:00.
- Africa/Freetown - Timezone for africa/freetown UTC offset of +00:00.
- Africa/Gaborone - Timezone for africa/gaborone UTC offset of +02:00.
- Africa/Harare - Timezone for africa/harare UTC offset of +02:00.
- Africa/Johannesburg - Timezone for africa/johannesburg UTC offset of +02:00.
- Africa/Juba - Timezone for africa/juba UTC offset of +03:00.

- Africa/Kampala - Timezone for africa/kampala UTC offset of +03:00.
- Africa/Khartoum - Timezone for africa/khartoum UTC offset of +03:00.
- Africa/Kigali - Timezone for africa/kigali UTC offset of +02:00.
- Africa/Kinshasa - Timezone for africa/kinshasa UTC offset of +01:00.
- Africa/Lagos - Timezone for africa/lagos UTC offset of +01:00.
- Africa/Libreville - Timezone for africa/libreville UTC offset of +01:00.
- Africa/Lome - Timezone for africa/lome UTC offset of +00:00.
- Africa/Luanda - Timezone for africa/luanda UTC offset of +01:00.
- Africa/Lubumbashi - Timezone for africa/lubumbashi UTC offset of +02:00.
- Africa/Lusaka - Timezone for africa/lusaka UTC offset of +02:00.
- Africa/Malabo - Timezone for africa/malabo UTC offset of +01:00.
- Africa/Maputo - Timezone for africa/maputo UTC offset of +02:00.
- Africa/Maseru - Timezone for africa/maseru UTC offset of +02:00.
- Africa/Mbabane - Timezone for africa/mbabane UTC offset of +02:00.
- Africa/Mogadishu - Timezone for africa/mogadishu UTC offset of +03:00.
- Africa/Monrovia - Timezone for africa/monrovia UTC offset of +00:00.
- Africa/Nairobi - Timezone for africa/nairobi UTC offset of +03:00.
- Africa/Ndjamena - Timezone for africa/ndjamena UTC offset of +01:00.
- Africa/Niamey - Timezone for africa/niamey UTC offset of +01:00.
- Africa/Nouakchott - Timezone for africa/nouakchott UTC offset of +00:00.
- Africa/Ouagadougou - Timezone for africa/ouagadougou UTC offset of +00:00.
- Africa/Porto-Novo - Timezone for africa/porto-novo UTC offset of +01:00.
- Africa/Sao_Tome - Timezone for africa/sao_tome UTC offset of +00:00.
- Africa/Timbuktu - Timezone for africa/timbuktu UTC offset of +00:00.
- Africa/Tripoli - Timezone for africa/tripoli UTC offset of +02:00.
- Africa/Tunis - Timezone for africa/tunis UTC offset of +01:00.
- Africa/Windhoek - Timezone for africa/windhoek UTC offset of +02:00.
- America/Adak - Timezone for america/adak UTC offset of -10:00.
- America/Anchorage - Timezone for america/anchorage UTC offset of -09:00.
- America/Anguilla - Timezone for america/anguilla UTC offset of -04:00.
- America/Antigua - Timezone for america/antigua UTC offset of -04:00.

- America/Araguaina - Timezone for america/araguaina UTC offset of -03:00.
- America/Argentina/Buenos_Aires - Timezone for america/argentina/buenos_aires UTC offset of -03:00.
- America/Argentina/Catamarca - Timezone for america/argentina/catamarca UTC offset of -03:00.
- America/Argentina/ComodRivadavia - Timezone for america/argentina/comodrivadavia UTC offset of -03:00.
- America/Argentina/Cordoba - Timezone for america/argentina/cordoba UTC offset of -03:00.
- America/Argentina/Jujuy - Timezone for america/argentina/jujuy UTC offset of -03:00.
- America/Argentina/La_Rioja - Timezone for america/argentina/la_rioja UTC offset of -03:00.
- America/Argentina/Mendoza - Timezone for america/argentina/mendoza UTC offset of -03:00.
- America/Argentina/Rio_Gallegos - Timezone for america/argentina/rio_gallegos UTC offset of -03:00.
- America/Argentina/Salta - Timezone for america/argentina/salta UTC offset of -03:00.
- America/Argentina/San_Juan - Timezone for america/argentina/san_juan UTC offset of -03:00.
- America/Argentina/San_Luis - Timezone for america/argentina/san_luis UTC offset of -03:00.
- America/Argentina/Tucuman - Timezone for america/argentina/tucuman UTC offset of -03:00.
- America/Argentina/Ushuaia - Timezone for america/argentina/ushuaia UTC offset of -03:00.
- America/Aruba - Timezone for america/aruba UTC offset of -04:00.
- America/Asuncion - Timezone for america/asuncion UTC offset of -03:00.
- America/Atikokan - Timezone for america/atikokan UTC offset of -05:00.
- America/Atka - Timezone for america/atka UTC offset of -10:00.
- America/Bahia - Timezone for america/bahia UTC offset of -03:00.
- America/Bahia_Banderas - Timezone for america/bahia_banderas UTC offset of -06:00.
- America/Barbados - Timezone for america/barbados UTC offset of -04:00.
- America/Belem - Timezone for america/belem UTC offset of -03:00.
- America/Belize - Timezone for america/belize UTC offset of -06:00.

- America/Blanc-Sablon - Timezone for america/blanc-sablon UTC offset of -04:00.
- America/Boa_Vista - Timezone for america/boa_vista UTC offset of -04:00.
- America/Bogota - Timezone for america/bogota UTC offset of -05:00.
- America/Boise - Timezone for america/boise UTC offset of -07:00.
- America/Buenos_Aires - Timezone for america/buenos_aires UTC offset of -03:00.
- America/Cambridge_Bay - Timezone for america/cambridge_bay UTC offset of -07:00.
- America/Campo_Grande - Timezone for america/campo_grande UTC offset of -03:00.
- America/Cancun - Timezone for america/cancun UTC offset of -05:00.
- America/Caracas - Timezone for america/caracas UTC offset of -04:00.
- America/Catamarca - Timezone for america/catamarca UTC offset of -03:00.
- America/Cayenne - Timezone for america/cayenne UTC offset of -03:00.
- America/Cayman - Timezone for america/cayman UTC offset of -05:00.
- America/Chicago - Timezone for america/chicago UTC offset of -06:00.
- America/Chihuahua - Timezone for america/chihuahua UTC offset of -07:00.
- America/Coral_Harbour - Timezone for america/coral_harbour UTC offset of -05:00.
- America/Cordoba - Timezone for america/cordoba UTC offset of -03:00.
- America/Costa_Rica - Timezone for america/costa_rica UTC offset of -06:00.
- America/Creston - Timezone for america/creston UTC offset of -07:00.
- America/Cuiaba - Timezone for america/cuiaba UTC offset of -03:00.
- America/Curacao - Timezone for america/curacao UTC offset of -04:00.
- America/Danmarkshavn - Timezone for america/danmarkshavn UTC offset of +00:00.
- America/Dawson - Timezone for america/dawson UTC offset of -08:00.

Default

Default

Name

upCloT - UP CloT

Syntax

--upCIoT <list-item>

Description

Enable User Plane Cellular Internet of Things Optimization

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

vdpProfileName - VDP profile name

Syntax

--vdpProfileName <string>

Description

Voice domain preference profile name.

Class

Optional.

Type / Range

Digit string of length 0 or 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Default

''

Roles**Show**

sysadmin, manage, monitor

Modify

sysadmin, manage

List

sysadmin, manage, monitor

7.101 cmm taiEnbQuery

TAI eNB Query. Syntax, description, parameters, and roles for cmm taiEnbQuery command.

Syntax

Description

List eNBs with TAI.

Parameters

Name

taiMcc - TAI MCC

Syntax

--taiMcc <digits>

Description

3-digit number used to represent the mobile country code for TAI.

Class

Required key.

Type / Range

Digit string of length 3

Name

taiMnc - TAI MNC

Syntax

--taiMnc <digits>

Description

Digits used to represent mobile network code for TAI.

Class

Required key.

Type / Range

Digit string of length 2 to 3

Name

tac - Tracking area code

Syntax

--tac <integer>

Description

Tracking Area Code.

Class

Required key.

Type / Range

Integer in the range of 1 to 65,535

Name

enbId - eNB id

Syntax

--enbId <integer>

Description

eNB identifier as specified in TS 36.413 v8.6.1.

Class

Read only.

Type / Range

Integer in the range of 0 to 268,435,455

Name

enbIpAddress - eNB IP address

Syntax

--enbIpAddress <string>

Description

eNB IP address.

Class

Read only.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

enbName - eNB name

Syntax

--enbName <string>

Description

eNB name.

Class

Read only.

Type / Range

Digit string of length 0 or 1 to 255

Name

enbType - EnodeB type

Syntax

--enbType <list-item>

Description

Specifies which enodeb type of the enodeb.

Class

Read only.

List

- home - Specify home eNodeB.
- macro - Specify macro eNodeB.

Name

linkAdminState - Link admin state

Syntax

--linkAdminState <list-item>

Description

Link admin state.

Class

Read only.

List

- locked - Locked.
- unlocked - Unlocked.

Name

linkOperationState - Link operation state

Syntax

--linkOperationState <list-item>

Description

Link operation state.

Class

Read only.

List

- disabled - Disabled state.
- enabled - Enabled state.

Name

maxTac - Maximum Tracking Area Code

Syntax

--maxTac <integer>

Description

Maximum Tracking Area Code. Enter a value equal to minTac to display output for a single TAC or a value greater than 'minTac' to display output for a range of TACs.

Restrictions

The value of this parameter must be greater than or equal to the value of parameter 'minTac'.

Class

Optional.

Type / Range

Integer in the range of 1 to 65,535

Default

65535

Name

mcc - Mobile country code

Syntax

--mcc <digits>

Description

3-digit number used to represent the mobile country code.

Class

Read only.

Type / Range

Digit string of length 3

Name

minTac - Minimum Tracking Area Code

Syntax

--minTac <integer>

Description

Minimum Tracking Area Code. Enter a value equal to maxTac to display output for a single TAC or a value greater than 'maxTac' to display output for a range of TACs.

Restrictions

The value of this parameter must be less than or equal to the value of parameter 'maxTac'.

Class

Optional.

Type / Range

Integer in the range of 1 to 65,535

Default

1

Name

mnc - Mobile network code

Syntax

--mnc <digits>

Description

Digits used to represent mobile network code.

Class

Read only.

Type / Range

Digit string of length 2 to 3

Roles**List**

sysadmin, manage, monitor

7.102 cmm taiEsmcList

TAI E-SMLC List. Syntax, description, parameters, and roles for cmm taiEsmcList command.

Syntax**Description**

Create, delete, list and show TAI E-SMLC List

Parameters**Name**

plmnName - Mobile network name

Syntax

--plmnName <string>

Description

Name that identifies the mobile network.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

tac - Tracking area code

Syntax

--tac <integer>

Description

Tracking area code.

Class

Required key.

Type / Range

Integer in the range of 1 to 65,535

Name

lcsType - Location services type

Syntax

--lcsType <list-item>

Description

Specifies the location services type associated with ESMLC for this tracking area.

Class

Required key.

List

- LawfullIntercept - Lawful interception location services - Lawful interception location services.
- Operator - Operator location services - Operator location services.
- Value Added - Value added location services - Value added location services.

Name

lcsEntryId - Location services entry id

Syntax

--lcsEntryId <integer>

Description

Unique id for this association of E-SMLC to tracking area and location services type. This field is used as the priority when MME TAI selection algorithm matching location services type is primarySecondary.

Class

Required key.

Type / Range

Integer in the range of 1 to 6

Name

esmlcIdentity - ESMC identifier

Syntax

--esmlcIdentity <integer>

Description

Indicates the ESMC being provisioned for a given tracking area and location services type.

Restrictions

esmlcIdentity must be unique for a given plmnName, tac, and lcsType combination.

Class

Required on create, not modifiable.

Type / Range

Integer in the range of 0 to 255

Roles

Create

sysadmin, manage

Show

sysadmin, manage, monitor

7.103 cmm taiLaiMapping

TAI to LAI Mapping. Syntax, description, parameters, and roles for cmm taiLaiMapping command.

Syntax

Description

This command is used to administer TAI to LAI Mapping and includes parameters for defining the mobile network names of the Tracking Area and Location Areas, the Tracking Area Code and Location Area Code, and record retrieval sort type.

Parameters

Name

taiPlmnName - Mobile network name of TAI

Syntax

--taiPlmnName <string>

Description

Name that identifies mobile network (alternate key) of the tracking area in this mapping.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\- _:@]*

Name

tac - Tracking area code

Syntax

--tac <integer>

Description

Tracking area code.

Class

Required key.

Type / Range

Integer in the range of 1 to 65,535

Name

laiPlmnName - Mobile network name of LAI

Syntax

--laiPlmnName <string>

Description

Name that identifies mobile network (alternate key) of the location area in this mapping.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

lac - Location area code

Syntax

--lac <integer>

Description

Location area code.

Class

Required key.

Type / Range

Integer in the range of 1 to 65,535

Name

sortType - Sort type

Syntax

--sortType <list-item>

Description

Sort type of records retrieved via get-config operation.

Class

Optional.

List

- NoSort - No sort - No sort of records via get-config operation.
- Sort1 - Sort 1 - Sort algorithm 1 applied to records retrieved via get-config operation.

Default

NoSort

7.104 cmm taiList

List of TAI. Syntax, description, parameters, and roles for cmm taiList command.

Syntax

Description

This command is used to administer a list of TAIs and includes parameters for defining the TAI list name, served PLMN name, and Tracking Area Code.

Parameters

Name

areaListName - Name of TAI list

Syntax

--areaListName <string>

Description

Name of TAI list.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Name

servedPlmnName - Served mobile network name

Syntax

--servedPlmnName <string>

Description

Served mobile network name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Name

tac - Tracking area code

Syntax

--tac <integer>

Description

Tracking area code.

Class

Required key.

Type / Range

Integer in the range of 1 to 65,535

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

7.105 cmm taiNb

TAI Neighbor List. Syntax, description, parameters, and roles for cmm taiNb command.

Syntax**Description**

This command is used to administer a TAI Neighbor List and includes parameters for defining the mobile network name, neighbor mobile network name, Tracking Area Code, and neighbor Tracking Area Code. A maximum of 15 tracking area codes from the same mobile network and/or from the equivalent networks can be added as neighbors.

Parameters**Name**

servedPlmnName - Mobile network name

Syntax

--servedPlmnName <string>

Description

Name that identifies mobile network (alternate key).

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

tac - Tracking area code

Syntax

--tac <integer>

Description

Tracking area code.

Class

Required key.

Type / Range

Integer in the range of 1 to 65,535

Name

nbPlmnName - Mobile network name of neighbor

Syntax

--nbPlmnName <string>

Description

Name that identifies mobile network (alternate key) of the neighbor TAI.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

tacNb - Neighbor tracking area code

Syntax

--tacNb <integer>

Description

Neighbor tracking area code.

Class

Required key.

Type / Range

Integer in the range of 1 to 65,535

Roles

Create

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

sysadmin, manage, monitor

7.106 cmm taiNgRanQuery

TAI NG-RAN Query. Syntax, description, parameters, and roles for cmm taiNgRanQuery command.

Syntax

Description

Lists NG-RAN (gNB or ng-eNB) with TAI. 'taiMcc', 'taiMnc' and 'tac' are required input filters. If any of these are not given query will return empty list.

Parameters

Name

taiMcc - TAI MCC

Syntax

--taiMcc <digits>

Description

3-digit number used to represent the mobile country code for TAI.

Class

Required key.

Type / Range

Digit string of length 3

Name

taiMnc - TAI MNC

Syntax

--taiMnc <digits>

Description

Digits used to represent mobile network code for TAI.

Class

Required key.

Type / Range

Digit string of length 2 to 3

Name

tac - Tracking area code

Syntax

--tac <integer>

Description

Tracking area code.

Class

Required key.

Type / Range

Integer in the range of 1 to 16,777,215

Name

assignMode - Assignment Mode

Syntax

--assignMode <integer>

Description

This field depicts the assignment mode for the SNPN

Class

Optional.

Type / Range

Integer in the range of 0 to 2

Default

0

Name

mcc - Mobile country code

Syntax

--mcc <digits>

Description

3-digit number used to represent the mobile country code.

Class

Read only.

Type / Range

Digit string of length 3

Name

mnc - Mobile network code

Syntax

--mnc <digits>

Description

Digits used to represent mobile network code.

Class

Read only.

Type / Range

Digit string of length 2 to 3

Name

ngRanId - Global RAN Node ID

Syntax

--ngRanId <integer>

Description

Specifies Global RAN Node identifier as specified in TS 38.413

Class

Read only.

Type / Range

Integer in the range of 0 to 268,435,455

Name

ngRanIpAddress - RAN IP address

Syntax

--ngRanIpAddress <string>

Description

Specifies RAN IP address

Class

Read only.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

ngRanName - ngRan node name

Syntax

--ngRanName <string>

Description

Specifies RAN node name

Class

Read only.

Type / Range

Digit string of length 0 or 1 to 255

Name

ngRanType - NG-RAN Type

Syntax

--ngRanType <list-item>

Description

Specifies the NG-RAN type.

Class

Optional.

List

- gnb - GNB
- n3iwf - N3IWF

Name

nidValue - Nid value

Syntax

--nidValue <integer>

Description

This field depicts the Nid value of the NID for the SNPN

Class

Optional.

Type / Range

Integer in the Range 0 to 1099511627775

Default

0

Roles**List**

sysadmin, manage, monitor

7.107 cmm taiRangeDiscoveryProfile

TAI Range Discovery Profile Default values. Syntax, description, parameters, and roles for cmm taiRangeDiscoveryProfile command.

Syntax

Description

This command used to define a Profile associated with range of TAI value. The profile specifies default attributes for the TAI when the MME discovers a TAI through the auto-discovery feature.

Parameters

Name

name - TAI Range Discovery Profile name

Syntax

--name <string>

Description

TAI Range Discovery Profile name

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

maxTac - Max Tracking Area Code

Syntax

--maxTac <integer>

Description

Ending TAC of a TA range.

Class

Required on create.

Type / Range

Integer in the range of 0 to 65,535

Name

minTac - Min Tracking Area Code

Syntax

--minTac <integer>

Description

The starting Tracking Area Code of a TA range.

Class

Required on create.

Type / Range

Integer in the range of 0 to 65,535

Name

plmnName - Mobile network name

Syntax

--plmnName <string>

Description

Name that identifies the mobile network.

Class

Required on create, not modifiable.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Name

adminState - Administrative state

Syntax

--adminState <list-item>

Description

Administrative state of the TA Range Profile. The auto-provisioning insertion of new records will not occur for a profile in a locked admin state.

Class

Optional.

List

- locked - Locked.
- unlocked - Unlocked.

Default

locked

Name

aerialUeSupported - Aerial UE Supported

Syntax

--aerialUeSupported <list-item>

Description

This field identifies whether the TAI eNodeBs support Aerial UE operation

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

ciotEmmRegisterdWithoutPdn - Enable EMM-REGISTERED without PDN connection for C-IOT UE

Syntax

--ciotEmmRegisterdWithoutPdn <list-item>

Description

Enable EMM-REGISTERED without PDN connection for C-IOT UE

Restrictions

This element is not applicable when plmnType is Other Network

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

cpCIoT - CP CIOT

Syntax

--cpCIoT <list-item>

Description

Enable CP CIOT optimization.

Restrictions

This element is not applicable when plmnType is Other Network

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

createMmeGrpTai - Create mmeGrpTai

Syntax

--createMmeGrpTai <list-item>

Description

Enable the auto-provisioning of a new mmeGrpTai entry using the mmeGi profile attribute.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

emergencySupported - Emergency supported

Syntax

--emergencySupported <list-item>

Description

Indicates if emergency is supported. only allowed if IMS supported is true.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

esmlcIdentity1 - ESMLC identity 1

Syntax

```
--esmlcIdentity1 <digits>
```

Description

First TAI to E-SMLC (Evolved serving mobile location center) mapping

Class

Optional.

Type / Range

Digit string of length 0 to 3

Default

"

Name

esmlcIdentity2 - ESMC identity 2

Syntax

```
--esmlcIdentity2 <digits>
```

Description

Second TAI to E-SMLC (Evolved serving mobile location center) mapping.

Class

Optional.

Type / Range

Digit string of length 0 to 3

Default

"

Name

esmlcIdentity3 - ESMC identity 3

Syntax

```
--esmlcIdentity3 <digits>
```

Description

Third TAI to E-SMLC (Evolved serving mobile location center) mapping. The E-SMLC is used for emergency services.

Class

Optional.

Type / Range

Digit string of length 0 to 3

Default

"

Name

esmlcIdentity4 - ESMC identity 4

Syntax

--esmlcIdentity4 <digits>

Description

Fourth TAI to E-SMLC (Evolved serving mobile location center) mapping. The set of 4 ESMC are used for emergency services

Class

Optional.

Type / Range

Digit string of length 0 to 3

Default

"

Name

forbiddenTailListName - Forbidden TAI list name

Syntax

--forbiddenTailListName <string>

Description

Forbidden TAI list name

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

"

Name

imsSupported - IMS supported

Syntax

--imsSupported <list-item>

Description

Indicates if IMS is supported.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

liEsmIcIdentity1 - Lawful Intercept ESMC identifier 1

Syntax

--liEsmIcIdentity1 <digits>

Description

Indicates the First TAI to Lawful Intercept E-SMLC (Evolved serving mobile location center) mapping.

Class

Optional.

Type / Range

Digit string of length 0 to 3

Default

"

Name

liEsmIcIdentity2 - Lawful Intercept ESMC identifier 2

Syntax

--liEsmIcIdentity2 <digits>

Description

Indicates the Second TAI to Lawful Intercept E-SMLC (Evolved serving mobile location center) mapping.

Class

Optional.

Type / Range

Digit string of length 0 to 3

Default

"

Name

liSelectionAlgorithm - Lawful Intercept location services selection algorithm

Syntax

--liSelectionAlgorithm <list-item>

Description

Indicates for the set of lawful intercept location services ESMC (Evolved Serving Mobile Location Center) whether they will load share or function as primary/secondary.

Class

Optional.

List

- LoadShare - Load share - Load share.
- PrimarySecondary - Primary / secondary - Function as primary / secondary.

Default

PrimarySecondary

Name

mmeGi - MME group ID

Syntax

--mmeGi <integer>

Description

MME group ID

Class

Optional.

Type / Range

Integer in the range of 0 to 65,535

Default

0

Name

mmeRelCapacity - MME relative capacity

Syntax

--mmeRelCapacity <integer>

Description

Provision MME relative capacity per tracking area.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

5

Name

mtEdtCp - mtEdtCp

Syntax

--mtEdtCp <list-item>

Description

Mobile Terminated Early Data Transfer over Control Plan

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

mtEdtUp - mtEdtUp

Syntax

--mtEdtUp <list-item>

Description

Mobile Terminated Early Data Transfer over User Plane

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

nbiotSmsWithoutCombinedAttach - Enable SMS without combined Attach For NB-IOT UE

Syntax

--nbiotSmsWithoutCombinedAttach <list-item>

Description

Enable SMS without combined Attach For NB-IOT UE

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

operEsmlcIdentity1 - Operator ESMC identifier 1

Syntax

--operEsmlcIdentity1 <digits>

Description

Indicates the First TAI to Operator E-SMLC (Evolved serving mobile location center) mapping.

Class

Optional.

Type / Range

Digit string of length 0 to 3

Default

"

Name

operEsmlcIdentity2 - Operator ESMC identifier 2

Syntax

--operEsmlcIdentity2 <digits>

Description

Indicates the Second TAI to Operator E-SMLC (Evolved serving mobile location center) mapping.

Class

Optional.

Type / Range

Digit string of length 0 to 3

Default

"

Name

operSelectionAlgorithm - Operator location services selection algorithm

Syntax

--operSelectionAlgorithm <list-item>

Description

Indicates for the set of operator location services ESMC (Evolved serving mobile location center) whether they will load share or function as primary/secondary.

Class

Optional.

List

- LoadShare - Load share - Load share.
- PrimarySecondary - Primary / secondary - Function as primary / secondary.

Default

PrimarySecondary

Name

s1uDataTrans - S1U data transfer

Syntax

--s1uDataTrans <list-item>

Description

Enable S1-U data transfer.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

selectionAlgorithm - Selection algorithm

Syntax

--selectionAlgorithm <list-item>

Description

Indicates for the set of ESMCs, (Evolved serving mobile location center) whether they will load share or function as primary/secondary.

Class

Optional.

List

- LoadShare - Load share - Load share.
- PrimarySecondary - Primary / secondary - Function as primary / secondary.

Default

PrimarySecondary

Name

supportedRatType - Supported RAT type for the auto-provisioned TAC

Syntax

--supportedRatType <list-item>

Description

Supported RAT Type for this TAC. It can only be wbeutran or nbiot

Restrictions

Supported RAT type for the auto-provisioned TAC. it can only be wbeutran or nbiot

Class

Optional.

List

- nbiot - Narrow band internet of things - Specify type of narrow band internet of things.
- wbeutran - Wide band EUTRAN - Specify type of wide band EUTRAN.

Default

wbeutran

Name

timeZoneName - Time zone name

Syntax

--timeZoneName <list-item>

Description

Provides time zone names that correspond to the region selected

Restrictions

See comments on TIME_ZONE type in CfgDataType.xsd

Class

Optional.

List

- Africa/Abidjan - Timezone for africa/abidjan UTC offset of +00:00.
- Africa/Accra - Timezone for africa/accra UTC offset of +00:00.
- Africa/Addis_Ababa - Timezone for africa/addis_ababa UTC offset of +03:00.
- Africa/Algiers - Timezone for africa/algiers UTC offset of +01:00.
- Africa/Asmara - Timezone for africa/asmara UTC offset of +03:00.
- Africa/Asmera - Timezone for africa/asmera UTC offset of +03:00.
- Africa/Bamako - Timezone for africa/bamako UTC offset of +00:00.
- Africa/Bangui - Timezone for africa/bangui UTC offset of +01:00.
- Africa/Banjul - Timezone for africa/banjul UTC offset of +00:00.
- Africa/Bissau - Timezone for africa/bissau UTC offset of +00:00.

- Africa/Blantyre - Timezone for africa/blantyre UTC offset of +02:00.
- Africa/Brazzaville - Timezone for africa/brazzaville UTC offset of +01:00.
- Africa/Bujumbura - Timezone for africa/bujumbura UTC offset of +02:00.
- Africa/Cairo - Timezone for africa/cairo UTC offset of +02:00.
- Africa/Casablanca - Timezone for africa/casablanca UTC offset of +00:00.
- Africa/Ceuta - Timezone for africa/ceuta UTC offset of +01:00.
- Africa/Conakry - Timezone for africa/conakry UTC offset of +00:00.
- Africa/Dakar - Timezone for africa/dakar UTC offset of +00:00.
- Africa/Dar_es_Salaam - Timezone for africa/dar_es_salaam UTC offset of +03:00.
- Africa/Djibouti - Timezone for africa/djibouti UTC offset of +03:00.
- Africa/Douala - Timezone for africa/douala UTC offset of +01:00.
- Africa/El_Aaiun - Timezone for africa/el_aaiun UTC offset of +00:00.
- Africa/Freetown - Timezone for africa/freetown UTC offset of +00:00.
- Africa/Gaborone - Timezone for africa/gaborone UTC offset of +02:00.
- Africa/Harare - Timezone for africa/harare UTC offset of +02:00.
- Africa/Johannesburg - Timezone for africa/johannesburg UTC offset of +02:00.
- Africa/Juba - Timezone for africa/juba UTC offset of +03:00.
- Africa/Kampala - Timezone for africa/kampala UTC offset of +03:00.
- Africa/Khartoum - Timezone for africa/khartoum UTC offset of +03:00.
- Africa/Kigali - Timezone for africa/kigali UTC offset of +02:00.
- Africa/Kinshasa - Timezone for africa/kinshasa UTC offset of +01:00.
- Africa/Lagos - Timezone for africa/lagos UTC offset of +01:00.
- Africa/Libreville - Timezone for africa/libreville UTC offset of +01:00.
- Africa/Lome - Timezone for africa/lome UTC offset of +00:00.
- Africa/Luanda - Timezone for africa/luanda UTC offset of +01:00.
- Africa/Lubumbashi - Timezone for africa/lubumbashi UTC offset of +02:00.
- Africa/Lusaka - Timezone for africa/lusaka UTC offset of +02:00.
- Africa/Malabo - Timezone for africa/malabo UTC offset of +01:00.
- Africa/Maputo - Timezone for africa/maputo UTC offset of +02:00.
- Africa/Maseru - Timezone for africa/maseru UTC offset of +02:00.
- Africa/Mbabane - Timezone for africa/mbabane UTC offset of +02:00.

- Africa/Mogadishu - Timezone for africa/mogadishu UTC offset of +03:00.
- Africa/Monrovia - Timezone for africa/monrovia UTC offset of +00:00.
- Africa/Nairobi - Timezone for africa/nairobi UTC offset of +03:00.
- Africa/Ndjamena - Timezone for africa/ndjamena UTC offset of +01:00.
- Africa/Niamey - Timezone for africa/niamey UTC offset of +01:00.
- Africa/Nouakchott - Timezone for africa/nouakchott UTC offset of +00:00.
- Africa/Ouagadougou - Timezone for africa/ouagadougou UTC offset of +00:00.
- Africa/Porto-Novo - Timezone for africa/porto-novo UTC offset of +01:00.
- Africa/Sao_Tome - Timezone for africa/sao_tome UTC offset of +00:00.
- Africa/Timbuktu - Timezone for africa/timbuktu UTC offset of +00:00.
- Africa/Tripoli - Timezone for africa/tripoli UTC offset of +02:00.
- Africa/Tunis - Timezone for africa/tunis UTC offset of +01:00.
- Africa/Windhoek - Timezone for africa/windhoek UTC offset of +02:00.
- America/Adak - Timezone for america/adak UTC offset of -10:00.
- America/Anchorage - Timezone for america/anchorage UTC offset of -09:00.
- America/Anguilla - Timezone for america/anguilla UTC offset of -04:00.
- America/Antigua - Timezone for america/antigua UTC offset of -04:00.
- America/Araguaina - Timezone for america/araguaina UTC offset of -03:00.
- America/Argentina/Buenos_Aires - Timezone for america/argentina/buenos_aires UTC offset of -03:00.
- America/Argentina/Catamarca - Timezone for america/argentina/catamarca UTC offset of -03:00.
- America/Argentina/ComodRivadavia - Timezone for america/argentina/comodrivadavia UTC offset of -03:00.
- America/Argentina/Cordoba - Timezone for america/argentina/cordoba UTC offset of -03:00.
- America/Argentina/Jujuy - Timezone for america/argentina/jujuy UTC offset of -03:00.
- America/Argentina/La_Rioja - Timezone for america/argentina/la_rioja UTC offset of -03:00.
- America/Argentina/Mendoza - Timezone for america/argentina/mendoza UTC offset of -03:00.
- America/Argentina/Rio_Gallegos - Timezone for america/argentina/rio_gallegos UTC offset of -03:00.

- America/Argentina/Salta - Timezone for america/argentina/salta UTC offset of -03:00.
- America/Argentina/San_Juan - Timezone for america/argentina/san_juan UTC offset of -03:00.
- America/Argentina/San_Luis - Timezone for america/argentina/san_luis UTC offset of -03:00.
- America/Argentina/Tucuman - Timezone for america/argentina/tucuman UTC offset of -03:00.
- America/Argentina/Ushuaia - Timezone for america/argentina/ushuaia UTC offset of -03:00.
- America/Aruba - Timezone for america/aruba UTC offset of -04:00.
- America/Asuncion - Timezone for america/asuncion UTC offset of -03:00.
- America/Atikokan - Timezone for america/atikokan UTC offset of -05:00.
- America/Atka - Timezone for america/atka UTC offset of -10:00.
- America/Bahia - Timezone for america/bahia UTC offset of -03:00.
- America/Bahia_Banderas - Timezone for america/bahia_banderas UTC offset of -06:00.
- America/Barbados - Timezone for america/barbados UTC offset of -04:00.
- America/Belem - Timezone for america/belem UTC offset of -03:00.
- America/Belize - Timezone for america/belize UTC offset of -06:00.
- America/Blanc-Sablon - Timezone for america/blanc-sablon UTC offset of -04:00.
- America/Boa_Vista - Timezone for america/boa_vista UTC offset of -04:00.
- America/Bogota - Timezone for america/bogota UTC offset of -05:00.
- America/Boise - Timezone for america/boise UTC offset of -07:00.
- America/Buenos_Aires - Timezone for america/buenos_aires UTC offset of -03:00.
- America/Cambridge_Bay - Timezone for america/cambridge_bay UTC offset of -07:00.
- America/Campo_Grande - Timezone for america/campo_grande UTC offset of -03:00.
- America/Cancun - Timezone for america/cancun UTC offset of -05:00.
- America/Caracas - Timezone for america/caracas UTC offset of -04:00.
- America/Catamarca - Timezone for america/catamarca UTC offset of -03:00.
- America/Cayenne - Timezone for america/cayenne UTC offset of -03:00.
- America/Cayman - Timezone for america/cayman UTC offset of -05:00.
- America/Chicago - Timezone for america/chicago UTC offset of -06:00.
- America/Chihuahua - Timezone for america/chihuahua UTC offset of -07:00.

- America/Coral_Harbour - Timezone for america/coral_harbour UTC offset of -05:00.
- America/Cordoba - Timezone for america/cordoba UTC offset of -03:00.
- America/Costa_Rica - Timezone for america/costa_rica UTC offset of -06:00.
- America/Creston - Timezone for america/creston UTC offset of -07:00.
- America/Cuiaba - Timezone for america/cuiaba UTC offset of -03:00.
- America/Curacao - Timezone for america/curacao UTC offset of -04:00.
- America/Danmarkshavn - Timezone for america/danmarkshavn UTC offset of +00:00.
- America/Dawson - Timezone for america/dawson UTC offset of -08:00.
- America/Dawson_Creek - Timezone for america/dawson_creek UTC offset of -07:00.
- America/Denver - Timezone for america/denver UTC offset of -07:00.
- America/Detroit - Timezone for america/detroit UTC offset of -05:00.
- America/Dominica - Timezone for america/dominica UTC offset of -04:00.
- America/Edmonton - Timezone for america/edmonton UTC offset of -07:00.
- America/Eirunepe - Timezone for america/eirunepe UTC offset of -05:00.
- America/El_Salvador - Timezone for america/el_salvador UTC offset of -06:00.

Default

Default

Name

upCloT - UP CloT

Syntax

--upCIoT <list-item>

Description

Enable User Plane Cellular Internet of Things Optimization

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

vaEsmIcIdentity1 - Value Added ESMC identifier 1

Syntax

--vaEsmIcIdentity1 <digits>

Description

Indicates the First TAI to Value Added E-SMC (Evolved serving mobile location center) mapping.

Class

Optional.

Type / Range

Digit string of length 0 to 3

Default

"

Name

vaEsmIcIdentity2 - Value Added ESMC identifier 2

Syntax

--vaEsmIcIdentity2 <digits>

Description

Indicates the Second TAI to Value Added E-SMC (Evolved serving mobile location center) mapping.

Class

Optional.

Type / Range

Digit string of length 0 to 3

Default

"

Name

vaSelectionAlgorithm - Value added location services selection algorithm

Syntax

--vaSelectionAlgorithm <list-item>

Description

Indicates for the set of value added location services ESMLCs (Evolved serving mobile location center) whether they will load share or function as primary/secondary.

Class

Optional.

List

- LoadShare - Load share - Load share.
- PrimarySecondary - Primary / secondary - Function as primary / secondary.

Default

PrimarySecondary

Name

vdpProfileName - VDP profile name

Syntax

--vdpProfileName <string>

Description

Voice domain preference profile name.

Class

Optional.

Type / Range

Digit string of length 0 or 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Default

"

7.108 cmm taiRangeList

TAI Range List. Syntax, description, parameters, and roles for cmm taiRangeList command.

Syntax

Description

This command administers a list of TAIs. The list is specified via TAI ranges. Up to 16 ranges can be specified. Corresponding TAIs need not be provisioned in the tai translation.

Parameters

Name

servedPlmnName - Served mobile network name

Syntax

--servedPlmnName <string>

Description

Served mobile network name

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

areaListName - Name of TAI Range List

Syntax

--areaListName <string>

Description

Name of TAI Range List

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

minTac - Min Tracking Area Code

Syntax

--minTac <integer>

Description

The starting Tracking Area Code of a TA range

Class

Required key.

Type / Range

Integer in the range of 0 to 65,535

Name

maxTac - Max Tracking Area Code

Syntax

--maxTac <integer>

Description

Ending TAC of a TA Range

Class

Required key.

Type / Range

Integer in the range of 0 to 65,535

7.109 cmm taisOfSnssaiQuery

TAs of S-NSSAI. Syntax, description, parameters, and roles for cmm taisOfSnssaiQuery command.

Syntax**Description**

Lists all TAs that based on NG-RAN information can serve a specific S-NSSAI. Slice Service Type is a required input filter. If not given query will return empty list. Slice Differentiator is optional input. If not

given query will return TAs where S-NSSAI SST matches the given Slice Service Type and have any SD (including SST with no SD)

Parameters

Name

sliceServiceType - Slice Service Type

Syntax

--sliceServiceType <integer>

Description

The S-NSSAI consists of a Slice Service Type (SST) and a Slice Differentiator (SD). Each slice must have SST and SD is optional.

Class

Required key.

Type / Range

5G Slice Service Type

Name

assignMode - Assignment Mode

Syntax

--assignMode <integer>

Description

This field depicts the assignment mode for the SNPN

Class

Optional.

Type / Range

Integer in the range of 0 to 2

Default

0

Name

nidValue - Nid value

Syntax

--nidValue <integer>

Description

This field depicts the Nid value of the NID for the SNPN

Class

Optional.

Type / Range

Integer in the Range 0 to 1099511627775

Default

0

Name

sliceDifferentiator - Slice Differentiator

Syntax

--sliceDifferentiator <string>

Description

The S-NSSAI consists of a Slice Service Type (SST) and a Slice Differentiator (SD). Each slice must have SST and SD is optional. A SST may have multiple SDs.

Class

Read only.

Type / Range

Identifies Slice Differentiator (SD)

Default

FFFFFF

Name

tac - Tracking Area Code

Syntax

--tac <integer>

Description

5G TAC. 5G TAC is 3 octets long.

Class

Read only.

Type / Range

Integer in the range of 0 to 16777215

Name

taiMcc - TAI MCC

Syntax

--taiMcc <digits>

Description

3-digit number used to represent the mobile country code for TAI.

Class

Read only.

Type / Range

Digit string of length 3

Name

taiMnc - TAI MNC

Syntax

--taiMnc <digits>

Description

Digits used to represent mobile network code for TAI.

Class

Read only.

Type / Range

Digit string of length 2 to 3

Roles**List**

sysadmin, manage, monitor

7.110 cmm taiToLaiImsiRangeServices

TAI to LAI IMSI Range Service. Syntax, description, parameters, and roles for cmm taiToLaiImsiRangeServices command.

Syntax**Description**

This command is used to administer TAI to LAI Mapping with IMSI range as the key.

Parameters**Name**

uePlmnServicesName - UE PLMN Services Name

Syntax

--uePlmnServicesName <string>

Description

Name that identifies the assigned network.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

entryId - Entry ID

Syntax

--entryId <integer>

Description

Entry ID

Class

Required key.

Type / Range

Integer in the range of 1 to 10,000

Name

lac - Location Area Code

Syntax

--lac <integer>

Description

Location Area Code

Class

Required on create.

Type / Range

Integer in the range of 1 to 65,535

Name

laiPlmnName - Mobile network name of LAI

Syntax

--laiPlmnName <string>

Description

Name that identifies mobile network (alternate key) of the location area in this mapping.

Class

Required on create.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

maxMsin - Maximum MSIN value

Syntax

--maxMsin <digits>

Description

The maximum IMSI MSIN value

Class

Optional.

Type / Range

Digit string of length 0 or 8 to 10

Default

""

Name

minMsin - Minimum MSIN

Syntax

--minMsin <digits>

Description

The minimum IMSI MSIN value.

Class

Optional.

Type / Range

Digit string of length 0 or 8 to 10

Default

""

Name

taiAreaListName - Tracking Area Identity List

Syntax

--taiAreaListName <string>

Description

Tracking Area Identity List

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

7.111 cmm taiZoneMapping

TAI Zone Mapping. Syntax, description, parameters, and roles for `cmm taiZoneMapping` command.

Syntax

Description

Command maps zone name with a given TAC. It is used to compare with current location of UEs. If current location of UE (TAC) matches with a zone's name then the zone name will be used as a tag with the DNS query.

Parameters

Name

taiZoneMappingListName - TAI Zone Mapping List Name

Syntax`--taiZoneMappingListName <string>`**Description**

TAI Zone Mapping List Name

Class

Required key.

Type / RangeDigit string of length 1 to 31 with the allowed pattern of `[0-9a-zA-Z\.\_:@]*`**Name**

plmnName - PLMN Name

Syntax`--plmnName <string>`**Description**

Identifies the name of the PLMN which can be Home or Roamer PLMN mobile network name

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

tac - Tracking Area Code

Syntax

--tac <integer>

Description

Tracking Area Code

Restrictions

Only one to one association between TAC and ZoneName is allowed.

Class

Required key.

Type / Range

Integer in the range of 1 to 65,535

Name

zoneName - Zone Name

Syntax

--zoneName <string>

Description

Name that identifies a Zone.

Class

Required on create.

Type / Range

Digit string of length 1 to 32 with the allowed pattern of [A-Za-z0-9.-]* A Zone name can not start or end with hyphen (-) or period (.)

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

7.113 cmm tcpProfile

TCP Profile. Syntax, description, parameters, and roles for `cmm tcpProfile` command.

Syntax

Description

This command is used to administer a TCP Profile and includes parameters for defining the profile name and keep-alive timer, interval, and maximum number of re-transmissions. A default profile, named 'default', is provided.

Parameters

Name

name - TCP profile name

Syntax

--name <string>

Description

TCP profile name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

keepAliveIdleTimer - Keep alive idle timer

Syntax

--keepAliveIdleTimer <integer>

Description

Keep alive idle timer in units of seconds.

Class

Optional.

Type / Range

Integer in the range of 1 to 300 in units of Second

Default

30

Name

keepAliveInterval - Keep alive interval

Syntax

--keepAliveInterval <integer>

Description

Specify keep alive interval in seconds.

Class

Optional.

Type / Range

Integer in the range of 1 to 3,600 in units of Second

Default

30

Name

keepAliveRetry - Keep alive retry

Syntax

--keepAliveRetry <integer>

Description

Maximum number of keep alive re-transmissions.

Class

Optional.

Type / Range

Integer in the range of 1 to 100

Default

10

Roles**Create**

sysadmin, manage

7.114 cmm timer

MME Timers. Syntax, description, parameters, and roles for `cmm timer` command.

Syntax

Description

Administer MME Timers

Parameters

Name

timerName - Timer name

Syntax

--timerName <list-item>

Description

Name of timer.

Class

Required key.

List

- alertMessageHoldingTime - Alert message holding time - The time in seconds that a SBC CMAS message will be queued for while waiting for a previously received SBC CMAS message to finish processing.
- connectionManagementAnswer - Connection management answer - Configure timer to wait for connection management answer message after sending connection management request. this timer is also used to respond CMA to CMR received in the case of CMR release request from SCEF.
- controlPlaneUserInactivity - Control plane user inactivity - This timer is used to detect user inactivity and release S1 connection of UE that have user data over NAS only. The cmm subscriber show command may show NB UEs as IDLE if the UE undergoing CP user inactivity timing. This can occur if the inactivity timer has been running for less than 20 seconds when the command is entered. The MME controlPlaneUserInactivity timer is recommended to have a value greater than the the eNB inactivity timers.
- cpiotUndeliveredNasWait - This timer defines the time that the MME will wait for NAS non Delivery Indication msg(s) from source eNB as part of eNB CP Relocation Indication procedure
- cppsRemHeartbeat - CPPS REM heartbeat - Configure REM heartbeat interval for CPPS service. VNF: Default is 200, Range is 200 to 20000 CNF: Default is 600, Range is 600 to 20000

- **critDnsAlarmSustainedInterval** - Critical DNS Alarm Sustained Internal - The interval of time the critical DNS alarm threshold conditions shall be exceeded and sustained before the 42014 CommunicationDegradationOrLost alarm will be raised.
- **csOpsBearerDel** - CS HO procedure delete bearer timer - Used in an EUTRAN to GERAN CS handover procedure to time for the release of UE resources.
- **dbsRemHeartbeat** - DBS REM heartbeat - Configure REM heartbeat interval for DBS service. VNF: Default is 200, Range is 200 to 20000 CNF: Default is 600, Range is 600 to 20000
- **ddnDlBufExtEdrx** - DDN DL Buffer Extend for eDRX - Specifies the amount that the DL Buffer Duration IE in the DDN Ack message should be extended for a UE in eDRX. If this field is set to 0, no additional time is added and the value continues to be set to when the UE will exit its next paging time window.
- **ddnDlBufExtPsm** - DDN DL Buffer Extend for PSM - Specifies the amount that the DL Buffer Duration IE in the DDN Ack message should be extended for a UE in power saving mode. If this field is set to 0, no additional time is added and the value continues to be set to the expected time until the UE performs a TAU.
- **delBearerAtSrcSgw** - Delete bearer at source SGW timer - This timer starts when the MME receives a create session response from the target SGW, and the UE bearers are removed at the source SGW when the timer expires. a value of 0 indicates that the UE bearers at the source SGW are deleted once the bearers are set up at the target SGW.
- **deleteGbr** - Delete guaranteed bit rate - This command is used to configure how long to keep GBR bearers after the completion of an abnormal release (i.e. S1 release cause is other than user inactivity or redirection to UTRAN/GERAN or 1xrtt) of S1 connection of a UE. the no form of the command sets the timer value to zero.
- **dnsApplicationTimer** - DNS application timer - When a DNS query is made, a request is sent to the DNS resolver. the resolver either finds the result in a local cache, or makes a request of a local DNS server. when this occurs, the resolver starts a two-second timer for getting a result. it either returns the result, or no result is returned if the two-second timer expires. this timer allows for changing the 2 second default for proceeding with call processing.
- **eemsRemHeartbeat** - EEMS REM Heartbeat - Configure REM heartbeat interval for EEMS service. VNF: Default is 200, Range is 200 to 20000 CNF: Default is 600, Range is 600 to 20000
- **emergencyMobileReachable** - Emergency mobile reachable - Emergency mobile reachable timer.
- **erabHoFailureTimer** - E-RAB Setup Failure For HO Operations - E-RAB setup failure for HO operations. Includes X2-handover-triggered and dS1-intra-system-handover-triggered.

- **eRabModify** - E-RAB modify - When the MME sends a message to the eNB related to a bearer request, it expects to receive a response. if the timer expires while waiting for this response, the MME considers that this class 1 procedure failed.
- **eRabRelease** - E-RAB release - When the MME sends a message to the eNB related to a bearer request, it expects to receive a response. if the timer expires while waiting for this response, the MME considers that this class 1 procedure failed.
- **eRabSetup** - E-RAB setup - When the MME sends a message to the eNB related to a bearer request, it expects to receive a response. if the timer expires while waiting for this response, the MME considers that this class 1 procedure failed.
- **gutiStalenessTimer** - GUTI Staleness Timer - a GUTI Re-Allocation staleness timer. Timer value range from 0-24 hours. If it's set to 0 (by default), then no timer force GUTI re-allocation (this feature function) would take Place. It means that MME follows existing GUTI allocation function. If it's set to a non-zero value, at timer expiry, MME forces GUTI Re-Allocation at next UE event (e.g. Attach, TAU, Service request etc.).
- **gwtsDelayS1release** - GWTS delay S1 release - Configure delay S1 connection release timer for SDS UE.
- **gwtsTcpLinkFailureDeclaration** - GWTS tcp link failure declaration - Configure TCP link failure declaration timer.
- **handoverRequest** - Hand over request - When the MME sends a handover request message to the eNB, it expects to receive an acknowledgment response message from the eNB. if the timer expires while waiting for this response, the MME considers that this class 1 procedure failed.
- **ho2g3gDeletion** - HO 2G to 3G deletion - Used to handle the deletion of the UE bearers during a handover to a UTRAN or GERAN network. the timer is started when the MME receives the SGSN context request message from the new SGSN. when the timer expires, the MME deletes the UE bearers.
- **hoRcvCsSvcNotifyNasNonDeliveryRadioConnLost** - Handover Received CS Service Notify NAS Non-Delivery Radio Conn Lost - When MME receives NAS Non-Delivery Indication (cause 'radio connection with ue lost') as response to SGs Downlink service operation, it uses this timer to safeguard reception of X2 Ho Request, at expiration of which it will re-attempt sending downlink message
- **hoTauRequestWait** - HO TAU request wait - Configure how long to wait for TAU request after X2 HO or S1 HO.
- **hssUnavailBlacklisting** - HSS unavailable blacklisting - The time to apply extended HSS disabling/blacklisting.
- **hssUnavailFailedPercentCalc** - HSS unavailable failed percentage calculation - Time interval to calculate the failure percentage for HSS blacklisting/disabling detection.
- **imsPdnActivation** - IMS PDN Activation Timer - Timer to wait for IMS PDN activation for IMS supervision functionality. The timer is started after performing Attach and

inter MME/IRAT TAU if the IMS PDN is not already activated and the IMS supervision is configured for the UE.

- **imsRegistration** - IMS Registration Timer - Timer for IMS registration for IMS supervision functionality. The timer is started after IMS PDN activation or after inter MME/IRAT TAU procedures when either the MME does not yet have an STN-SR for the UE, or the STN-SR indicates unsuccessful IMS registration and the IMS supervision is configured for the UE.
- **initContextSetup** - Initial context setup - When the MME sends a message to the eNB for an initial context setup request, it expects to receive a response message from the eNB (Initial context setup response or initial context setup failure). If the timer expires while waiting for this response, the MME considers that this class 1 procedure failed.
- **internalIpIsolationThreshold** - Internal IP isolation threshold - Threshold to be used for determining internal IP isolation of VMs. For VNF and a8 appliance the default is 5. For CNF and a2 appliance the default is 0 and cannot be changed.
- **iotPurgeTimer** - IoT Purge Timer - This timer starts after the MME-initiated detach timer fires. If this timer fires before the IoT UE contacts the MME again, the UE VLR data is purged.
- **ipdsRemHeartbeat** - IPDS REM heartbeat - Configure REM heartbeat interval for IPDS service. VNF: Default is 200, Range is 200 to 20000 CNF: Default is 600, Range is 600 to 20000
- **ippsRemHeartbeat** - IPPS REM heartbeat - Configure REM heartbeat interval for IPPS service. VNF: Default is 200, Range is 200 to 20000 CNF: Default is 600, Range is 600 to 20000
- **iuUeLocationReport** - IU UE location report - Specifies the length of time SGSN waits for the receipt of a location report response from the RNC.
- **keepCtxAfterN26HoFail** - Keep Context After N26 Handover Fail - This timer starts when serving S1 Release by which the ongoing N26 handover is decided as failed at target MME. While the timer is running the MME discards (silent drop) any DDN (or other SM message) received from the SGW. When the timer expires, the MME shall remove resources associated with the N26 handover
- **lihsRemHeartbeat** - LIHS REM Heartbeat - Configure REM heartbeat interval for LIHS service. VNF: Default is 200, Range is 200 to 20000 CNF: Default is 600, Range is 600 to 20000
- **mapM** - Map m to HLR - Defines the map m (medium) protocol when interfacing to an HLR.
- **mbmsResponseFromMce** - MBMS response from MCE - MBMS response from MCE.
- **mBReachable** - Timer beyond T3412 - Minutes beyond T3412 for taking actions when a UE does not send TAU. Timer stops when a NAS message is received.
- **minTimeToMbmsDataTransfer** - Min time to MBMS data transfer - Min time to MBMS data transfer.

- mmeCnfgUpdate - MME config update - When the MME sends a configuration update message to the eNB, it expects to receive an update acknowledgment response message from the eNB. if the timer expires while waiting for this response, the MME considers that this class 1 procedure failed.
- mmelnitDetach - MME Initiated Detach - Timer starts when 'Mobile Reachable' timer expires. Timer stops when a NAS message is received.
- mobileReachableLpa - Mobile reachable LPA - Mobile reachable time for the LPA UE.
- moDataAnswer - MO data answer - Time to wait for ODA after sending ODR (MO-Data-Request).
- monitorArrivalDownlinkData - Monitor arrival downlink data - Monitor arrival of downlink data if downlink data is expected.
- mtDataAnswer - MT data answer - This timer is used for responding to SCEF with TDA when SCEF sends TDR and does not include SCEF-Wait-Time AVP.
- mtDataRequest - MT data request - This timer is started to wait for MT data request before releasing the S1 connection. this timer is started immediately after sending connection-management-request (CMR) with connection-action AVP set to CONNECTION-UPDATE.
- n26rmUeDataAtSrcMme - N26 remove Ue Data at source MME
- nwdsRemHeartbeat - NWDS REM heartbeat - Configure REM heartbeat interval for NWDS service. Applicable only for CNF. Default is 600. Range is 600 to 20000.
- pagingGapTimer - Paging gap timer - This timer indicates the interval in which the MME will suppress paging for a UE after multiple consecutive page response failures have occurred for the UE. a value of 0 indicates that paging should not be suppressed due to previous page response failures.
- papsRemHeartbeat - PAPS REM heartbeat - Configure REM heartbeat interval for PAPS service.
- pcmsRemHeartbeat - PCMS REM Heartbeat - Configure REM heartbeat interval for PCMS service. VNF: Default is 200, Range is 200 to 20000 CNF: Default is 600, Range is 600 to 20000
- pdnConnectAfterEcmlidle - PDN connect after ECM idle - Defines how long the subscriber needs to be in ECM-IDLE state before the PDN re-connection is initiated.
- pgwIsolationDeclarationTimer - PGW isolation declaration timer - If the number of the P-GW faults (remote peer not responding cause received in the S11/S4 create session response) exceed the provisioned threshold in this timer, MME will isolate the S-GW/P-GW pair that reported this fault for new PDN connections for a configurable isolation duration. changes to the timer will take into effect whenever MME checks whether total faults exceeded the fault threshold in the timer that is either triggered by a new fault or some other event.

- **pgwIsolationDuration** - PGW isolation duration - This command is used to provision the duration of PGW isolation once it is declared that the PGW is isolated for any new PDN connections. WMM will start selecting the PGW once the duration expires. This duration can be stopped and PGW selection can be resumed by using the sig-link CLI command
- **pgwRestartRecovery** - PGW restart recovery - It is used to provision a duration in which MME would attempt to re-establish PDN connections associated with a PGW indicated by the PGW restart notification message of the ECM-IDLE UE. MME would start the timer when it starts the recovery. once the timer expires, MME will stop the recovery and deletes the PDN session of the left over UEs.
- **praDcConnectedIn** - PRA Dual Connectivity Connected In - Specifies the timer for Segment Based Dual Connectivity PRA reporting functionality, during which the MME suppresses the PRA status change report when the UE is in ECM-CONNECTED state and the last reported PRA status was 'inside'. The timer helps the MME to skip sequential back and forth status updates related to the segment based reporting. If MME receives new radio transport layer endpoint(s) for user plane, it waits for possible subsequential next update or UE context release before sending the PRA report towards the SGW/PGW.
- **praDcConnectedOut** - PRA Dual Connectivity Connected Out - Specifies the timer for Segment Based Dual Connectivity PRA reporting functionality, during which the MME suppresses the PRA status change report when the UE is in ECM-CONNECTED state and the last reported PRA status was 'outside'. The timer helps the MME to skip sequential back and forth status updates related to the segment based reporting. If MME receives new radio transport layer endpoint(s) for user plane, it waits for possible subsequential next update or UE context release before sending the PRA report towards the SGW/PGW.
- **praDcIdle** - PRA Dual Connectivity Idle - Defines a timer for Presence Reporting Area (PRA) functionality for optimizing Dual Connectivity related reporting when the UE was previously ECM-IDLE. MME starts this timer when the UE was ECM-IDLE previously and the MME receives new RAN endpoints (receives Initial Context Setup Response during Service Request, Control Plane Service Request or Intra MME TAU). MME stops this timer when it receives either new RAN endpoints (Path Switch Request, Handover Request Ack, Initial Context Setup Response or E-RAB modification indication) or UE context release complete. MME sends PRA Information towards the SGW/PGW when timer either expires or was stopped and reporting is required to be done i.e. status differs from previous reported and the UE is still ECM-CONNECTED.
- **praDcSegmentOptServReq** - PRA DC Segment Optimization Service Request - Specifies the timer for IPv6 Address Segment Based Dual Connectivity PRA reporting feature and the Service Request optimization functionality. The timer helps the MME to skip any sequential back and forth status updates related to the segment based reporting related to the idle to connected transferring and the possible subsequent gNB addition. When MME receives a Service Request message for a UE for which address segment based PRA reporting has previously been requested, the MME waits during this timer for a subsequent E-RAB modification indication before sending any PRA status update

towards the SGW/PGW/PCRF, if such would still be needed due to the Service request. If the timer is running and the MME receives an E-RAB Modification Indication, the MME stops the timer. The MME reports the segment based status at either the receipt of the E-RAB modification indication, or the timer expiry (if status at that point is different from the previously sent status).

- **praDcSingleTimer** - PRA DC Single Timer - Specifies the single optimisation timer for Segment Based Dual Connectivity PRA reporting functionality, during which the MME suppresses the PRA status change reports. The MME starts the timer when the timer is not yet running and the MME receives new RAN endpoints that would trigger status update for any PRA id that is reported for the UE. The timer is stopped when the MME receives new RAN endpoints and the PRA status of all UE's PRA ids is back to the previously reported status, or when the UE context is released. The MME restarts the timer when the MME receives new RAN endpoints that cause the status of a different PRA id to be updated to a status that is not yet reported.
- **praStdSuppressionCancel** - PRA Standard Suppression Cancel - PRA Suppression cancel timer for 3GPP standard based Presence Area Reporting. Effective when PRA standard suppression is set to Yes. The functionality includes two time definitions- PRA suppression time and PRA suppression cancel time. MME suppresses a subsequent PRA report after a PRA report (PRA Information) has been sent out towards the SGW/PGW (during the time defined by the PRA suppression time), unless the PRA reporting status stays the same for a suppress cancel defined time period. When more time than the provisioned PRA suppression time has passed since the last delivered PRA report, the MME sends any PRA report to SGW/PGW and stores the timestamp of the report sending. If MME detects next PRA status change before the provisioned suppression time has passed since previous PRA report, MME (suppresses the report for a while and) starts the suppression cancelling timer to wait for another status change. If MME detects another status change before the suppression cancel timer expires, the MME discards the report since the status is back to the same as already reported. If the suppression cancel timer expires, MME sends the latest (suppressed) PRA report towards the SGW/PGW. The timer can be provisioned with 100ms granularity.
- **praStdSuppressionPeriod** - PRA Standard Suppression Period - Defines the time period during which the MME suppresses a subsequent PRA report after a PRA report (PRA Information) has been sent out towards the SGW/PGW, unless the PRA status stays the same during a time period defined by the suppression cancel time. The timer can be provisioned with 100ms granularity.
- **purgeTimer** - Purge timer - This timer starts after the MME-initiated detach timer fires. If this timer fires before the UE contacts the MME again, the UE VLR data is purged.
- **rcisPurgeTimer** - RCIS Purge Timer
- **rcisRemHeartbeat** - RCIS REM Heartbeat - Configure REM heartbeat interval for RCIS service. VNF: Default is 200, Range is 200 to 20000 CNF: Default is 600, Range is 600 to 20000

- **receiveNotificationReturnFromUe** - Receive notification return from UE - Receive notification return from UE.
- **reserveUeSubscriptionIratMob** - Reserve UE Subscription IRAT Mobility - This command is used to provision the duration of preserving UE subscription data. Timer shall be restarted upon UE transitioning back to MME. UE's subscription data shall be kept until the timer expires, however if UE comes back before timer expiration, NOR instead of ULR shall be sent to HSS in TAU procedure.
- **s102tack** - S102 tack - S102 tack.
- **s10rmUeDataAtSrcMme** - S10 remove UE data at source MME - Used in S10 interactions to remove UE data at the source MME after a handover with MME relocation.
- **s1hoComplete** - S1 HO complete - Used to time the receipt of either a handover notify message from the target eNB or a forward relocation complete message from the target MME in the case of MME relocation. the handover is not successful if either of these messages is not received before the expiration of the timer.
- **s1hoCompleteExtended** - Extended S1 HO complete - This timer is introduced to handle extra latency introduced by CIOT and CAT-M1 CE mode b devices in completing S1HO. for S1HO without MME relocation, the timer is used to monitor handover notify reception. for S1HO with MME relocation, this timer covers the extra latency to execute the handover, get the handover notify and receive forward relocation complete notification.
- **s1hoResourceRelease** - S1 HO resource release - During a relocation request (SGW only or MME and SGW), the timer starts upon receipt of a forward relocation complete acknowledge. if the release does not occur before the timer expires, the target MME sends a delete indirect data forwarding message to the target SGW to delete it if the target MME has setup indirect forward paths on the target SGW. the source MME deletes any bearers on the source SGW (with SGW relocation) and deletes the tunnel by sending a delete indirect data forwarding message if the source MME has setup indirect forward paths on the source SGW. the source MME also releases S1 UE connections with the source eNB.
- **s1hoResourceReleaseWithNoMmeSgwRel** - S1 Handover Resource Release With No MME SGW Relocation - During intra-mme intra-sgw s1-based ho request, the timer starts after Handover Notify message and once the timer expires, MME shall send UE Context Release Command to the source eNB and the source eNodeB releases its resources related to the UE and responds with a UE Context Release Complete message. When the timer is set to 0, the S1 Handover Resource Release timer shall be used.
- **s1releaseOnCsgExpiration** - S1 release on CSG expiration - This timer is to specify the time to wait to do an S1 release when CSG registration expires.
- **s1Reset** - S1 reset - When the MME sends a S1 reset message to the eNB, it expects to receive a reset acknowledgment response message from the eNB. if the timer expires while waiting for this response, the MME considers that this class 1 procedure failed.

- **s1UeCapInfoIndForLtemWaitTime - s1UeCapInfoIndWaitTime** - Specifies the timeout for the MME to receive the S1 UE Capability Information Indication message from the eNB. The timer applies if the MME needs to find out from the eNB whether the UE is capable of LTE-M. The timer is started when the MME sends the UE Capability Match Request to the eNB as part of an attach or TAU procedure.
- **s1ueLocationReport - S1 UE location report** - This timer specifies the length of time to wait for the receipt of a location report from the eNB.
- **s3gnHoComplete - S3 Gn HO complete** - Supports inter-rat handover procedures.
- **s3gnIndirectForwarding - S3 Gn indirect forwarding** - Used to time for resource release for indirect forwarding of UE data. when the timer expires, the MME releases the resources that have been allocated for indirect forwarding.
- **scefCmrAnswer - SCEF CMR answer** - This timer is used for responding with connection management answer to SCEF for SCEF sent connection management request (CMR) for an update. the timer applies to SCEF CMR updates other than T6a connection release. CMR for release from SCEF answer uses connectionmanagementanwer timer.
- **scefExpiredTimeReject** - If the MME receives a T6a (SCEF) MT Data Request that contains the Maximum-Retransmission-Time AVP and/or SCEF-Wait-Time AVP, this timer defines how much in the past each AVP value can be in order for the MME to consider it as a still valid AVP. The default is 30 seconds to align with the prior hard-coded value.
- **secondaryRatUsageReportingDelay - Secondary Rat Usage Reporting Delay during Handover** - Timer to delay forwarding the Secondary RAT Usage report to the S/PGW during Handover
- **serviceGapTimerOverrideValue - Service Gap Timer Override Value** - Specifies the timer value to use for the UE's service gap timer
- **sessionOrientedLinkMoDeletionTimer - Session oriented link MO deletion timer** - Session oriented link MO deletion timer for GTP based interfaces. value of 0 means do not do inactivity deletion.
- **sfdsRemHeartbeat - SFDS REM Heartbeat** - Configure REM heartbeat interval for SCTP Flow Distributor Service. VNF: N/A CNF: Default is 600, Range is 600 to 20000
- **sgsLiteDetachIndicationAck - SGs lite detach indication ack** - Configure SGsLite-IMSI-DETACH-ACK timeout in milliseconds.
- **sgsLiteLocationUpdateAck - SGs lite location update ack** - Configure timer for the reception of SGsLite-LOCATION-UPDATE-ACK timer.
- **sgsLiteUplinkDataAck - SGs lite uplink data ack** - Configure SGsLite-UPLINK-ACK timeout.
- **sgsPaging - SGs paging** - Defines the value for receiving responses to a SG paging request. this timer should be set slightly lower than the paging timer value provisioned in the MSC/VLR.

- **sgwIsolationDeclarationTimer** - SGW isolation declaration timer - This command is used to provision SGW isolation declaration timer. If the number of the SGW faults (remote peer not responding cause received in the S11/S4 create session response) exceed the provisioned threshold in this provisioned timer then WMM will isolate the SGW from the selection. A sliding window will be used in counting the total number faults for the isolation declaration duration.
- **sgwIsolationDuration** - SGW isolation duration - This command is used to provision the duration of SGW isolation once it is declared that the SGW is isolated from selection. WMM will start selecting the SGW once the duration expires. This duration can be stopped and PGW selection can be resumed by using the sig-link CLI command
- **sgwRestorationTimer** - SGW restoration timer - This timer is used to guard the MME attempt to assign UE associated with a failed SGW or restarted SGW.
- **srnsCompletion** - SRNS completion - Used to time for receipt of an SRNS completion message from the target SGSN.
- **srnsHoRauRequestWait** - SRNS HO RAU request wait - Specify how long 3G-SGSN waits for a RAU request after SRNS relocation or 4G to 3G HO.
- **srsDataPurge** - SRS Data Purge - SRS Data Purge time
- **srsResponse** - SRS response - SRS response time.
- **srvccPsToCsComplete** - SRVCC PS to CS complete - Time to wait for the SRVCC PS to CS complete message from an MSC.
- **srvccTo1xHoComplete** - SRVCC to 1x HO complete - This is guard timer that is started when S102 signaling with HO status IE (SUCCESS) is received and shall be stopped when S1 UE context release request with cause CIOT cell redirection is received.
- **srvccTo1xHoPreparation** - SRVCC to 1x HO preparation - This is a guard timer that is started when S1 UL CDMA2000 tunneling with HO required IE is received and stopped when S102 Signaling with HO status IE is received.
- **suspendReq** - Suspend request - Used in an EUTRAN to GERAN CS handover procedure to time for the receipt of the suspend request message from the SGSN in the network to which the UE has moved.
- **t3346attachRejectMaximum** - T3346 attach reject maximum - Specifies the maximum value to consider when randomly assigning the T3346 timer value to be used for an attach procedure rejection due to IPDS CPU overload, CPPS CPU overload, and CXN object overloads with NAS cause code #22 (Congestion).
- **t3346attachRejectMinimum** - T3346 attach reject minimum - Specifies the minimum value to consider when randomly assigning the T3346 timer value to be used for an attach procedure rejection due to IPDS CPU overload, CPPS CPU overload, and CXN object overloads with NAS cause code #22 (Congestion).

- **t3346gtpVolEsrMax** - T3346 GTP VOL ESR max - The maximum value to consider when randomly assigning the T3346 timer value to be used for an ESR procedure rejection due to GTP overload.
- **t3346gtpVolEsrMin** - T3346 GTP VOL ESR min - The minimum value to consider when randomly assigning the T3346 timer value to be used for an SR procedure rejection due to GTP overload.
- **t3346gtpVolSrMax** - T3346 GTP VOL SR max - The maximum value to consider when randomly assigning the T3346 timer value to be used for an SR procedure rejection due to GTP overload.
- **t3346gtpVolSrMin** - T3346 GTP VOL SR min - The minimum value to consider when randomly assigning the T3346 timer value to be used for an SR procedure rejection due to GTP overload.
- **t3346gtpVolTauMax** - T3346 GTP VOL TAU max - The maximum value to consider when randomly assigning the T3346 timer value to be used for a TAU procedure rejection due to GTP overload.
- **t3346gtpVolTauMin** - T3346 GTP VOL TAU min - The minimum value to consider when randomly assigning the T3346 timer value to be used for a TAU procedure rejection due to GTP overload.
- **t3346NblotAttachRejectMaximum** - T3346 NB-IOT Attach Reject Maximum - Specifies the maximum value to consider when randomly assigning the T3346 NB-IOT timer value to be used for an attach procedure rejection due to IPDS CPU overload, CPPS CPU overload, and CXN object overloads with NAS cause code #22 (Congestion).
- **t3346NblotAttachRejectMinimum** - T3346 NB-IOT Attach Reject Minimum - Specifies the minimum value to consider when randomly assigning the T3346 NB-IOT timer value to be used for an attach procedure rejection due to IPDS CPU overload, CPPS CPU overload, and CXN object overloads with NAS cause code #22 (Congestion).
- **t3346NblotCpsrRejectMaximum** - T3346 NB-IOT Control Plane SR Reject Maximum - Specifies the maximum value to consider when randomly assigning the T3346 NB-IOT timer value to be used for an Control Plane SR procedure rejection due to IPDS CPU overload, CPPS CPU overload, and CXN object overloads with NAS cause code #22 (Congestion).
- **t3346NblotCpsrRejectMinimum** - T3346 NB-IOT Control Plane SR Reject Minimum - Specifies the minimum value to consider when randomly assigning the T3346 NB-IOT timer value to be used for an Control Plane SR procedure rejection due to IPDS CPU overload, CPPS CPU overload, and CXN object overloads with NAS cause code #22 (Congestion).
- **t3346NblotOdbRejectMaximum** - t3346 NB-IOT ODB Reject Maximum - Specifies the maximum value backoff timer value in Seconds randomly assigned to a NB-IoT UE with ODB trying to access the MME. This timer applies when the MME is provisioned to provide cause 22 to the UE (in the restNasMappingProfile).

- **t3346NblotOdbRejectMinimum** - t3346 NB-IOT ODB Reject Minimum - Specifies the minimum value backoff timer value in Seconds randomly assigned to a NB-IoT UE with ODB trying to access the MME. This timer applies when the MME is provisioned to provide cause 22 to the UE (in the restNasMappingProfile).
- **t3346NblotSrRejectMaximum** - T3346 NB-IOT SR Reject Maximum - Specifies the maximum value to consider when randomly assigning the T3346 NB-IOT timer value to be used for an SR procedure rejection due to IPDS CPU overload, CPPS CPU overload, and CXN object overloads with NAS cause code #22 (Congestion).
- **t3346NblotSrRejectMinimum** - T3346 NB-IOT SR Reject Minimum - Specifies the minimum value to consider when randomly assigning the T3346 NB-IOT timer value to be used for an SR procedure rejection due to IPDS CPU overload, CPPS CPU overload, and CXN object overloads with NAS cause code #22 (Congestion).
- **t3346NblotTauRejectMaximum** - T3346 NB-IOT TAU Reject Maximum - Specifies the maximum value to consider when randomly assigning the T3346 NB-IOT timer value to be used for a TAU procedure rejection due to IPDS CPU overload, CPPS CPU overload, and CXN object overloads with NAS cause code #22 (Congestion).
- **t3346NblotTauRejectMinimum** - T3346 NB-IOT TAU Reject Minimum - Specifies the minimum value to consider when randomly assigning the T3346 NB-IOT timer value to be used for a TAU procedure rejection due to IPDS CPU overload, CPPS CPU overload, and CXN object overloads with NAS cause code #22 (Congestion).
- **t3346srRejectMaximum** - T3346 SR reject maximum - Specifies the maximum value to consider when randomly assigning the T3346 timer value to be used for an SR procedure rejection due to IPDS CPU overload, CPPS CPU overload, and CXN object overloads with NAS cause code #22 (Congestion).
- **t3346srRejectMinimum** - T3346 SR reject minimum - Specifies the minimum value to consider when randomly assigning the T3346 timer value to be used for an SR procedure rejection due to IPDS CPU overload, CPPS CPU overload, and CXN object overloads with NAS cause code #22 (Congestion).
- **t3346tauRejectMaximum** - T3346 TAU reject maximum - Specifies the maximum value to consider when randomly assigning the T3346 timer value to be used for a TAU procedure rejection due to IPDS CPU overload, CPPS CPU overload, and CXN object overloads with NAS cause code #22 (Congestion).
- **t3346tauRejectMinimum** - T3346 TAU reject minimum - Specifies the minimum value to consider when randomly assigning the T3346 timer value to be used for a TAU procedure rejection due to IPDS CPU overload, CPPS CPU overload, and CXN object overloads with NAS cause code #22 (Congestion).
- **t3396genmax** - T3396 gen max - Parameter t3396genmax indicates maximum value to consider when assigning the T3396gen timer value to be used when MME rejects an IMS PDN Connectivity request (standalone or attach) When the timer has value > 0, then whenever the MME rejects an IMS PDN Connectivity Request (standalone or Attach) due to not subscribed IMS APN (or IMS APN is subscribed only via the wildcard APN

and GPARM is enabled) then the T3396 IE shall be included in PDN Connectivity Reject message to force the UE re-attempt only after the back off timer expires,

- **t3396genmin** - T3396 gen min - Parameter t3396genmin indicates minimum value to consider when assigning the T3396gen timer value to be used when MME rejects an IMS PDN Connectivity request (standalone or attach)
- **t3396gtpVolMax** - T3396 GTP VOL max - The maximum value to consider when randomly assigning the T3396 timer value to be used for an SM request rejection due to GTP overload.
- **t3396gtpVolMin** - T3396 GTP VOL min - The minimum value to consider when randomly assigning the T3396 timer value to be used for an SM request rejection due to GTP overload.
- **t3396max** - T3396 max - The maximum value to consider when randomly assigning the T3396 timer value to be used for an SM request rejection due to overload.
- **t3396min** - T3396 min - The minimum value to consider when randomly assigning the T3396 timer value to be used for an SM request rejection due to overload.
- **t3402** - T3402 reattach request - Part of UE attach accept message. used by UE to initiate the next attach or TAU procedure in case of a failure of a previous attach or TAU procedure.
- **t3402AttachReject** - T3402 Attach Reject - Specifies the wait time for another attach request if the UEs attach counter has reached 5 to the Attach Reject message.
- **t3412** - T3412 periodic TAU - Part of UE attach accept message. used by the UE for periodic TAU. the MME starts this timer when the UE state is changed to the ECM-IDLE state.
- **t3412extendedForLpaUe** - T3412 extended for LPA UE - Periodic TAU timer that MME sends to UE in attach accept message to a UE configured for low priority access.
- **t3412withTauSuppression** - T3412 with TAU suppression - This timer is used instead of the standard T3412 timer when TAU suppression has been triggered by the MME. a value of 0 indicates that the standard T3412 timer should be used even when the MME has triggered TAU suppression.
- **t3422** - T3422 retransmit detach request - Retransmit detach request.
- **t3422Wbs1CeMode** - T3422 for WB-S1 CE mode - T3422 timer value for the maximum interval MME waits after sending a detach request before retry for UE in WB-S1 coverage enhancement (CE) mode.
- **t3442rejectEsrNoSrvcc** - T3442 reject ESR no SRVCC - T3442 timer to be included in the service reject message when ESR is rejected due to UE with IMS voice bearer.
- **t3448Max** - T3448 Maximum - Specifies the maximum value of control plane data back-off timer. If the UE supports the control plane data back-off timer T3448, the UE shall set the CP backoff bit to back-off timer for transport of user data via the control plane supported in the UE network capability IE of the ATTACH REQUEST message.

- **t3448Min** - T3448 Minimum - Specifies the minimum value of control plane data back-off timer. If the UE supports the control plane data back-off timer T3448, the UE shall set the CP backoff bit to back-off timer for transport of user data via the control plane supported in the UE network capability IE of the ATTACH REQUEST message.
- **t3450** - T3450 retransmit attach and TAU accept or GUTI reallocation - Retransmit attach accept, TAU accept, or GUTI reallocation command. timer starts if an attach request is accepted by the network and the MME sends an ATTACH ACCEPT message to the UE. timer stops after receiving an ATTACH COMPLETE message and considers the GUTI sent in the ATTACH ACCEPT message as valid.
- **t3450Wbs1CeMode** - T3450 for WB-S1 CE mode - T3450 timer which is used to supervise the retransmit of attach accept, TAU accept, or GUTI reallocation commands of UE in WB-S1 coverage enhancement (CE) mode.
- **t3460** - T3460 retransmit auth or sec mode command - Retransmit auth request, or security mode command. timer starts when a security mode command is sent. normal stop occurs when security mode complete or security mode reject is received.
- **t3460Wbs1CeMode** - T3460 for WB-S1 CE mode - T3460 timer which is used to supervise the response to the transmission by the MME of the authentication request or security mode command for UE in WB-S1 coverage enhancement(ce) mode.
- **t3470** - T3470 retransmit identity command - Retransmit identity command. timer starts when IDENTITY REQUEST is received. timer stops when IDENTITY REQUEST is received.
- **t3470Wbs1CeMode** - T3470 for WB-S1 CE mode - T3470 timer which is used to supervise the network initiated identification procedure for UE in WB-S1 coverage enhancement (CE) mode.
- **t3485** - T3485 retransmit activate def or ded bearer request - Retransmit activate default bearer request, or activate dedicated bearer request. timer starts when an ACTIVATE DEFAULT/ DEDICATED EPS BEARER CONTEXT REQUEST is sent. timer stops when ACTIVATE DEFAULT EPS BEARER CONTEXT ACCEPT/REJECT or ACTIVATE DEDICATED EPS BEARER CONTEXT ACCEPT/REJECT is received.
- **t3485Wbs1CeMode** - T3485 for WB-S1 CE mode - T3485 timer which is used to supervise the response to the transmission by the MME of the activate default bearer request, or activate dedicated bearer request for UE in WB-S1 coverage enhancement (CE) mode.
- **t3486** - T3486 retransmit mod bearer request - Retransmit modify bearer request.
- **t3486Wbs1CeMode** - T3486 for WB-S1 CE mode - T3486 timer which is used to supervise the response to the transmission by the MME of the modify EPS bearer context request for UE in WB-S1 coverage enhancement (CE) mode.
- **t3489** - T3489 retransmit ESM info request timeout - Timeout before retransmission of ESM information request.

- **t3489Wbs1CeMode** - T3489 for WB-S1 CE mode - T3489 timer which is used to supervise the response to the transmission by the MME of the ESM information request for UE in WB-S1 coverage enhancement (CE) mode.
- **t3495** - T3495 retransmit deactivate bearer request - Retransmit deactivate bearer request. timer starts when DEACTIVATE EPS BEARER CONTEXT REQUEST is sent. timer stops when DEACTIVATE EPS BEARER CONTEXT ACCEPT is received.
- **t3495Wbs1CeMode** - T3495 for WB-S1 CE mode - T3495 timer which is used to supervise the EPS bearer context deactivation procedure for UE in WB-S1 coverage enhancement (CE) mode.
- **t3x01** - T3X01 receive location response from E-SMLC via SLs timer - Timer to receive location response from the E-SMLC via SLs. (timer to transition from location state to LCS-IDLE state for a UE).
- **t3x02** - T3X02 receive reset ack after send reset to E-SMLC timer - Timer to receive reset ack after sending reset to the E-SMLC (SLs).
- **tauAfterHo** - TAU after HO - This command is used to set the value of the tauAfterHo timer which supervises the exchange between the MME and UE after handover occurs from LTE S1, UTRAN or GERAN. The MME detaches the UE if the timer expires before the TAU Request is Received. This timer only applies when a TAU is expected, e.g. if the TAI changed in an LTE-to-LTE HO. Caution! this value should only be set to '0' for troubleshooting purposes. The '0' value is not recommended by Nokia for service operation. If this value is set to '0', the MME does not start the timer, does not detach the UE, and does not start a new AKA as part of the handover procedure. this can generate security vulnerabilities in the EPS that a UE can exploit.
- **tauAfterN26Ho** - TAU after N26 HO - This timer supervises the exchange between the MME and UE after handover occurs from NR. The MME detaches the UE if the timer expires before the TAU Request is Received. Caution! this value should only be set to '0' for troubleshooting purposes. The '0' value is not recommended by Nokia for service operation. If this value is set to '0', the MME does not start the timer, does not detach the UE, and does not start a new AKA as part of the handover procedure. This can generate security vulnerabilities in the EPS that a UE can exploit.
- **tauSuppressionThreshold** - TAU suppression threshold - This timer indicates the maximum interval for cyclic movement between tracking areas that will trigger TAU suppression by MME. a value of 0 indicates that TAU suppression is performed without regard to the interval of the cyclic movement between tracking areas.
- **tDynMO** - Indicates the interval to wait for an interface to return an operational state, before deleting the interface. As of CMM23.2.0, tDynMO is used for the Link Disable timer which only applies to links in DISABLED operational state. S1mme, S11, S10, N26, NR10 and other dynamical MME links except for Gn, S3, and S16 are subject to the tDynMO. Statically provisioned links and administrative locked links are not subject to the Link Disable timer. Disabled N2 links are subject to the tDynMO disable timer. The MME N26 links are subject to the tDynMO timer or Transaction Oriented MO

delete timer depending on the operational state of the links, either being enabled and disabled. Those are exclusive states.

- transactionOrientedLinkMoDeletionTimer - Transaction oriented link MO deletion timer
 - Transaction oriented link MO deletion timer for GTP based interfaces. Value 0 means do not do inactivity deletion. Transaction Oriented Link MO Deletion Time is used for Link Inactivity timer and only applies to operational ENABLED links. Only SGSN Gn, S3, S16, S10 and N26 are subject to this time. GGSN is subjective to Session Oriented Link MO Deletion Time. Administrative locked links are not subject to the inactivity timer.
- tS10 - TS10 implicit IMSI detach from non-eps services procedure guard timer - Guards implicit IMSI detach from non-eps services procedure.
- tS12_1 - TS12-1 MME reset variable guard timer - Controls the resetting of the 'MME-Reset' variable.
- tS12_2 - TS12-2 MME reset procedure guard timer - Guards the MME reset procedure. there is one ts12-2 timer per MME SGs association with a VLR.
- tS13 - T13 SGs MME implicit detach guard timer - Configure SGs TS13 timer for MME implicit detach.
- tS6_1 - T6-1 location update procedure guard timer - Guards the location update procedure.
- tS8 - TS8 explicit IMSI detach from EPS services procedure guard timer - Guards explicit IMSI detach from the EPS services procedure.
- tS9 - TS9 explicit IMSI detach from non-eps services procedure guard timer - Guards explicit IMSI detach from non-eps services procedure.
- tslrAckFromGmlc - TSLR ack from GMLC - TSLR ack from GMLC.
- ucDsRemHeartbeat - UCDS REM Heartbeat - Configure REM heartbeat interval for the UCDS service. VNF: Default is 1400, Range is 1400 to 20000 CNF: Default is 1400, Range is 1400 to 20000
- ueContextModify - UE context modify - When the MME sends a context modification message to the eNB, it expects to receive a modification response message from the eNB. if the timer expires while waiting for this response, the MME considers that this class 1 procedure failed.
- ueContextRelease - UE context release - When the MME sends a context release message to the eNB, it expects to receive a release complete response message from the eNB. if the timer expires while waiting for this response, the MME considers that this class 1 procedure failed.
- ueCtxtEpsMovedTo5gPurgeTimer - 4G Purge Timer for UE Contexts Moved to 5GC - Purge timer starts after the UE moves to 5GC. The UE gets purged either because of the global purge timer or current timer, whichever expires first.
- ueRadioCapabilityMatchRequest - UE radio capability match request - Specifies the time to wait for UE radio capability match request.

- **ufdsRemHeartbeat** - UFDS REM Heartbeat - Configure REM heartbeat interval for UDP Flow Distributor Service. VNF: N/A CNF: Default is 600, Range is 600 to 20000
- **vlrCleanupIratUeCtxt** - VLR Cleanup IRAT UE Contexts - This parameter specifies the time for deleting from the VLR the preserved UE Contexts of the deregistered UEs that have moved to 5GC.
- **warningMessage** - Warning message - This is the timer value that MME waits before re-transmitting the WRWR (Write Replace Warning Request) message to an eNB if the CMAS response is not received from the eNB.

Name

timerUnit - Timer unit

Syntax

--timerUnit <list-item>

Description

Unit of measurement.

Class

Optional.

List

- **320Hour** - 320 hour - Specify timer unit of 320 hours.
- **Millisecond** - Specify timer unit of 1 millisecond.
- **Second** - Specify timer unit of 1 second.
- **2Second** - 2 second - Specify timer unit of 2 seconds.
- **30Second** - 30 second - Specify timer unit of 30 seconds.
- **Minute** - Specify timer unit of 1 minute.
- **DeciHour** - Specify timer unit of 1 decihour (6 minutes).
- **10Minute** - 10 minute - Specify timer unit of 10 minutes.
- **Hour** - Specify timer unit of 1 hour.
- **10Hour** - 10 hour - Specify timer unit of 10 hours.

Default

DeciHour

Name

timerValue - Timer value

Syntax

--timerValue <integer>

Description

Numeric value of timer.

Class

Optional.

Type / Range

Integer in the range of 0 to 4,294,967,295

The timerValue string is based on the timerName parameter:

Name

alertMessageHoldingTime - Alert message holding time

Syntax

```
--timerName alertMessageHoldingTime --timerValue <string> [ --  
timerUnit Second ]
```

Description

The time in seconds that a SBC CMAS message will be queued for while waiting for a previously received SBC CMAS message to finish processing.

Type / Range

Integer in the range of 0 to 300 in units of Second

Default

0

Name

connectionManagementAnswer - Connection management answer

Syntax

```
--timerName connectionManagementAnswer --timerValue <string> [ --  
timerUnit Millisecond ]
```

Description

Configure timer to wait for connection management answer message after sending connection management request. this timer is also used to respond CMA to CMR received in the case of CMR release request from SCEF.

Type / Range

Integer in the range of 100 to 6,000 in units of Millisecond

Default

1000

Name

controlPlaneUserInactivity - Control plane user inactivity

Syntax

```
--timerName controlPlaneUserInactivity --timerValue <string> [ --  
timerUnit Millisecond ]
```

Description

This timer is used to detect user inactivity and release S1 connection of UE that have user data over NAS only. The cmm subscriber show command may show NB UEs as IDLE if the UE undergoing CP user inactivity timing. This can occur if the inactivity timer has been running for less than 20 seconds when the command is entered. The MME controlPlaneUserInactivity timer is recommended to have a value greater than the eNB inactivity timers.

Type / Range

Used for Control Plane User Inactivity Timer in units of Millisecond

Default

3000

Name

cpiotUndeliveredNasWait - cpiotUndeliveredNasWait

Syntax

```
--timerName cpiotUndeliveredNasWait --timerValue <string> [ --  
timerUnit Millisecond ]
```

Description

This timer defines the time that the MME will wait for NAS non Delivery Indication msg(s) from source eNB as part of eNB CP Relocation Indication procedure

Type / Range

Integer in the range of 0 to 3,000 in units of Millisecond

Default

1000

Name

cppsRemHeartbeat - CPPS REM heartbeat

Syntax

```
--timerName cppsRemHeartbeat --timerValue <string> [ --timerUnit  
Millisecond ]
```

Description

Configure REM heartbeat interval for CPPS service. VNF: Default is 200, Range is 200 to 20000 CNF: Default is 600, Range is 600 to 20000

Type / Range

Integer in the range of 200 to 20,000 in units of Millisecond

Default

200

Name

critDnsAlarmSustainedInterval - Critical DNS Alarm Sustained Internal

Syntax

```
--timerName critDnsAlarmSustainedInterval --timerValue <string> [ --  
timerUnit Minute ]
```

Description

The interval of time the critical DNS alarm threshold conditions shall be exceeded and sustained before the 42014 CommunicationDegradationOrLost alarm will be raised.

Type / Range

Integer in the range of 0 to 120 in units of Minute

Default

0

Name

csOpsBearerDel - CS HO procedure delete bearer timer

Syntax

```
--timerName csOpsBearerDel --timerValue <string> [ --timerUnit  
Minute ]
```

Description

Used in an EUTRAN to GERAN CS handover procedure to time for the release of UE resources.

Type / Range

Integer in the range of 10 to 480 in units of Minute

Default

120

Name

dbbRemHeartbeat - DBS REM heartbeat

Syntax

```
--timerName dbbRemHeartbeat --timerValue <string> [ --timerUnit  
Millisecond ]
```

Description

Configure REM heartbeat interval for DBS service. VNF: Default is 200, Range is 200 to 20000 CNF: Default is 600, Range is 600 to 20000

Type / Range

Integer in the range of 200 to 20,000 in units of Millisecond

Default

200

Name

ddnDlBufExtEdrx - DDN DL Buffer Extend for eDRX

Syntax

```
--timerName ddndlBufExtEdrx --timerValue <string> [ --timerUnit  
Second ]
```

Description

Specifies the amount that the DL Buffer Duration IE in the DDN Ack message should be extended for a UE in eDRX. If this field is set to 0, no additional time is added and the value continues to be set to when the UE will exit its next paging time window.

Type / Range

Integer in the range of 0 to 60 in units of Second

Default

1

Name

ddndlBufExtPsm - DDN DL Buffer Extend for PSM

Syntax

```
--timerName ddndlBufExtPsm --timerValue <string> [ --timerUnit  
Second ]
```

Description

Specifies the amount that the DL Buffer Duration IE in the DDN Ack message should be extended for a UE in power saving mode. If this field is set to 0, no additional time is added and the value continues to be set to the expected time until the UE performs a TAU.

Type / Range

Integer in the range of 0 to 60 in units of Second

Default

1

Name

delBearerAtSrcSgw - Delete bearer at source SGW timer

Syntax

```
--timerName delBearerAtSrcSgw --timerValue <string> [ --timerUnit  
Millisecond ]
```

Description

This timer starts when the MME receives a create session response from the target SGW, and the UE bearers are removed at the source SGW when the timer expires. a value of 0 indicates that the UE bearers at the source SGW are deleted once the bearers are set up at the target SGW.

Type / Range

Integer in the range of 0 to 5,000 in units of Millisecond

Default

500

Name

deleteGbr - Delete guaranteed bit rate

Syntax

```
--timerName deleteGbr --timerValue <string> [ --timerUnit Second ]
```

Description

This command is used to configure how long to keep GBR bearers after the completion of an abnormal release (i.e. S1 release cause is other than user inactivity or redirection to UTRAN/ GERAN or 1xrtt) of S1 connection of a UE. the no form of the command sets the timer value to zero.

Type / Range

Integer in the range of 0 to 20 in units of Second

Default

0

Name

dnsApplicationTimer - DNS application timer

Syntax

```
--timerName dnsApplicationTimer --timerValue <string> [ --timerUnit Millisecond ]
```

Description

When a DNS query is made, a request is sent to the DNS resolver. the resolver either finds the result in a local cache, or makes a request of a local DNS server. when this occurs, the resolver starts a two-second timer for getting a result. it either returns the result, or no result is returned if the two-second timer expires. this timer allows for changing the 2 second default for proceeding with call processing.

Type / Range

Integer in the range of 100 to 5,000 in units of Millisecond

Default

5000

Name

eemsRemHeartbeat - EEMS REM Heartbeat

Syntax

```
--timerName eemsRemHeartbeat --timerValue <string> [ --timerUnit Millisecond ]
```

Description

Configure REM heartbeat interval for EEMS service. VNF: Default is 200, Range is 200 to 20000 CNF: Default is 600, Range is 600 to 20000

Type / Range

Integer in the range of 200 to 20,000 in units of Millisecond

Default

200

Name

emergencyMobileReachable - Emergency mobile reachable

Syntax

```
--timerName emergencyMobileReachable --timerValue <string> [ --  
timerUnit Minute ]
```

Description

Emergency mobile reachable timer.

Type / Range

Integer in the range of 1 to 1,500 in units of Minute

Default

124

Name

erabHoFailureTimer - E-RAB Setup Failure For HO Operations

Syntax

```
--timerName erabHoFailureTimer --timerValue <string> [ --timerUnit  
Millisecond ]
```

Description

E-RAB setup failure for HO operations. Includes X2-handover-triggered an dS1-intra-system-handover-triggered.

Type / Range

Integer range from 300 to 2000 in units of Millisecond

Default

300

Name

eRabModify - E-RAB modify

Syntax

```
--timerName eRabModify --timerValue <string> [ --timerUnit Second ]
```

Description

When the MME sends a message to the eNB related to a bearer request, it expects to receive a response. if the timer expires while waiting for this response, the MME considers that this class 1 procedure failed.

Type / Range

Integer in the range of 1 to 60 in units of Second

Default

8

Name

eRabRelease - E-RAB release

Syntax

```
--timerName eRabRelease --timerValue <string> [ --timerUnit Second ]
```

Description

When the MME sends a message to the eNB related to a bearer request, it expects to receive a response. if the timer expires while waiting for this response, the MME considers that this class 1 procedure failed.

Type / Range

Integer in the range of 1 to 60 in units of Second

Default

8

Name

eRabSetup - E-RAB setup

Syntax

```
--timerName eRabSetup --timerValue <string> [ --timerUnit Second ]
```

Description

When the MME sends a message to the eNB related to a bearer request, it expects to receive a response. if the timer expires while waiting for this response, the MME considers that this class 1 procedure failed.

Type / Range

Integer in the range of 1 to 60 in units of Second

Default

8

Name

gutiStalenessTimer - GUTI Staleness Timer

Syntax

```
--timerName gutiStalenessTimer --timerValue <string> [ --timerUnit Minute ]
```

Description

a GUTI Re-Allocation staleness timer. Timer value range from 0-24 hours. If it's set to 0 (by default), then no timer force GUTI re-allocation (this feature function) would take Place. It means that MME follows existing GUTI allocation function. If it's set to a non-zero value, at timer expiry, MME forces GUTI Re-Allocation at next UE event (e.g. Attach, TAU, Service request etc.).

Type / Range

Integer in the range of 5 to 1440, allowed 0 value also. in units of Minute

Default

0

Name

gwtsDelayS1release - GWTS delay S1 release

Syntax

```
--timerName gwtsDelayS1release --timerValue <string> [ --timerUnit  
Millisecond ]
```

Description

Configure delay S1 connection release timer for SDS UE.

Type / Range

Integer in the range of 0 to 10,000 in units of Millisecond

Default

0

Name

gwtsTcpLinkFailureDeclaration - GWTS tcp link failure declaration

Syntax

```
--timerName gwtsTcpLinkFailureDeclaration --timerValue <string> [ --  
timerUnit Second ]
```

Description

Configure TCP link failure declaration timer.

Type / Range

Integer in the range of 1 to 300 in units of Second

Default

2

Name

handoverRequest - Hand over request

Syntax

```
--timerName handoverRequest --timerValue <string> [ --timerUnit  
Second ]
```

Description

When the MME sends a handover request message to the eNB, it expects to receive an acknowledgment response message from the eNB. if the timer expires while waiting for this response, the MME considers that this class 1 procedure failed.

Type / Range

Integer in the range of 1 to 60 in units of Second

Default

8

Name

ho2g3gDeletion - HO 2G to 3G deletion

Syntax

```
--timerName ho2g3gDeletion --timerValue <string> [ --timerUnit  
Millisecond ]
```

Description

Used to handle the deletion of the UE bearers during a handover to a UTRAN or GERAN network. the timer is started when the MME receives the SGSN context request message from the new SGSN. when the timer expires, the MME deletes the UE bearers.

Type / Range

Integer in the range of 100 to 5,000 in units of Millisecond

Default

1000

Name

hoRcvCsSvcNotifyNasNonDeliveryRadioConnLost - Handover Received CS Service Notify NAS Non-Delivery Radio Conn Lost

Syntax

```
--timerName hoRcvCsSvcNotifyNasNonDeliveryRadioConnLost --timerValue  
<string> [ --timerUnit Millisecond ]
```

Description

When MME receives NAS Non-Delivery Indication (cause 'radio connection with ue lost') as response to SGs Downlink service operation, it uses this timer to safeguard reception of X2 Ho Request, at expiration of which it will re-attempt sending downlink message

Type / Range

Integer in the range of 100 to 3,000 in units of Millisecond

Default

2000

Name

hoTauRequestWait - HO TAU request wait

Syntax

```
--timerName hoTauRequestWait --timerValue <string> [ --timerUnit  
Millisecond ]
```

Description

Configure how long to wait for TAU request after X2 HO or S1 HO.

Type / Range

Integer in the range of 100 to 10,000 in units of Millisecond

Default

200

Name

hssUnavailBlacklisting - HSS unavailable blacklisting

Syntax

```
--timerName hssUnavailBlacklisting --timerValue <string> [ --  
timerUnit Second ]
```

Description

The time to apply extended HSS disabling/blacklisting.

Type / Range

Integer in the range of 0 to 900 in units of Second

Default

0

Name

hssUnavailFailedPercentCalc - HSS unavailable failed percentage calculation

Syntax

```
--timerName hssUnavailFailedPercentCalc --timerValue <string> [ --  
timerUnit Second ]
```

Description

Time interval to calculate the failure percentage for HSS blacklisting/disabling detection.

Type / Range

Integer in the range of 5 to 900 in units of Second

Default

300

Name

imsPdnActivation - IMS PDN Activation Timer

Syntax

```
--timerName imsPdnActivation --timerValue <string> [ --timerUnit  
Second ]
```

Description

Timer to wait for IMS PDN activation for IMS supervision functionality. The timer is started after performing Attach and inter MME/IRAT TAU if the IMS PDN is not already activated and the IMS supervision is configured for the UE.

Type / Range

Integer in the range of 2 to 60 in units of Second

Default

5

Name

imsRegistration - IMS Registration Timer

Syntax

```
--timerName imsRegistration --timerValue <string> [ --timerUnit  
Second ]
```

Description

Timer for IMS registration for IMS supervision functionality. The timer is started after IMS PDN activation or after inter MME/IRAT TAU procedures when either the MME does not yet have an STN-SR for the UE, or the STN-SR indicates unsuccessful IMS registration and the IMS supervision is configured for the UE.

Type / Range

Integer in the range of 5 to 600 in units of Second

Default

300

Name

initContextSetup - Initial context setup

Syntax

```
--timerName initContextSetup --timerValue <string> [ --timerUnit  
Second ]
```

Description

When the MME sends a message to the eNB for an initial context setup request, it expects to receive a response message from the eNB (Initial context setup response or initial context setup failure). If the timer expires while waiting for this response, the MME considers that this class 1 procedure failed.

Type / Range

Integer in the range of 1 to 60 in units of Second

Default

8

Name

internalIpIsolationThreshold - Internal IP isolation threshold

Syntax

```
--timerName internalIpIsolationThreshold --timerValue <string> [ --  
timerUnit Second ]
```

Description

Threshold to be used for determining internal IP isolation of VMs. For VNF and a8 appliance the default is 5. For CNF and a2 appliance the default is 0 and cannot be changed.

Type / Range

Integer in the range of 0 to 60 in units of Second

Default

5

Name

iotPurgeTimer - IoT Purge Timer

Syntax

```
--timerName iotPurgeTimer --timerValue <string> [ --timerUnit Hour ]
```

Description

This timer starts after the MME-initiated detach timer fires. If this timer fires before the IoT UE contacts the MME again, the UE VLR data is purged.

Type / Range

Integer in the range of 0 to 720 in units of Hour

Default

0

Name

ipdsRemHeartbeat - IPDS REM heartbeat

Syntax

```
--timerName ipdsRemHeartbeat --timerValue <string> [ --timerUnit  
Millisecond ]
```

Description

Configure REM heartbeat interval for IPDS service. VNF: Default is 200, Range is 200 to 20000 CNF: Default is 600, Range is 600 to 20000

Type / Range

Integer in the range of 200 to 20,000 in units of Millisecond

Default

200

Name

ippsRemHeartbeat - IPPS REM heartbeat

Syntax

```
--timerName ippsRemHeartbeat --timerValue <string> [ --timerUnit  
Millisecond ]
```

Description

Configure REM heartbeat interval for IPPS service. VNF: Default is 200, Range is 200 to 20000
CNF: Default is 600, Range is 600 to 20000

Type / Range

Integer in the range of 200 to 20,000 in units of Millisecond

Default

200

Name

iuUeLocationReport - IU UE location report

Syntax

```
--timerName iuUeLocationReport --timerValue <string> [ --timerUnit  
Millisecond ]
```

Description

Specifies the length of time SGSN waits for the receipt of a location report response from the RNC.

Type / Range

Integer in the range of 100 to 8,000 in units of Millisecond

Default

2000

Name

keepCtxAfterN26HoFail - Keep Context After N26 Handover Fail

Syntax

```
--timerName keepCtxAfterN26HoFail --timerValue <string> [ --timerUnit  
Second ]
```

Description

This timer starts when serving S1 Release by which the ongoing N26 handover is decided as failed at target MME. While the timer is running the MME discards (silent drop) any DDN (or other SM message) received from the SGW. When the timer expires, the MME shall remove resources associated with the N26 handover

Type / Range

Integer in the range of 0 to 10 in units of Second

Default

0

Name

lihsRemHeartbeat - LIHS REM Heartbeat

Syntax

```
--timerName lihsRemHeartbeat --timerValue <string> [ --timerUnit  
Millisecond ]
```

Description

Configure REM heartbeat interval for LIHS service. VNF: Default is 200, Range is 200 to 20000 CNF: Default is 600, Range is 600 to 20000

Type / Range

Integer in the range of 200 to 20,000 in units of Millisecond

Default

200

Name

mapM - Map m to HLR

Syntax

```
--timerName mapM --timerValue <string> [ --timerUnit Millisecond ]
```

Description

Defines the map m (medium) protocol when interfacing to an HLR.

Type / Range

Integer in the range of 15,000 to 30,000 in units of Millisecond

Default

20000

Name

mbmsResponseFromMce - MBMS response from MCE

Syntax

```
--timerName mbmsResponseFromMce --timerValue <string> [ --timerUnit  
Second ]
```

Description

MBMS response from MCE.

Type / Range

Integer in the range of 1 to 30 in units of Second

Default

5

Name

mBReachable - Timer beyond T3412

Syntax

```
--timerName mBReachable --timerValue <string> [ --timerUnit Minute ]
```

Description

Minutes beyond T3412 for taking actions when a UE does not send TAU. Timer stops when a NAS message is received.

Type / Range

Integer in the range of 1 to 60 in units of Minute

Default

4

Name

minTimeToMbmsDataTransfer - Min time to MBMS data transfer

Syntax

```
--timerName minTimeToMbmsDataTransfer --timerValue <string> [ --  
timerUnit Second ]
```

Description

Min time to MBMS data transfer.

Type / Range

Integer in the range of 1 to 60 in units of Second

Default

1

Name

mmeCnfgUpdate - MME config update

Syntax

```
--timerName mmeCnfgUpdate --timerValue <string> [ --timerUnit  
Second ]
```

Description

When the MME sends a configuration update message to the eNB, it expects to receive an update acknowledgment response message from the eNB. If the timer expires while waiting for this response, the MME considers that this class 1 procedure failed.

Type / Range

Integer in the range of 1 to 60 in units of Second

Default

8

Name

mmelInitDetach - MME Initiated Detach

Syntax

```
--timerName mmeInitDetach --timerValue <string> [ --timerUnit  
Minute ]
```

Description

Timer starts when 'Mobile Reachable' timer expires. Timer stops when a NAS message is received.

Type / Range

Integer in the range of 0 to 1,500 in units of Minute

Default

240

Name

mobileReachableLpa - Mobile reachable LPA

Syntax

```
--timerName mobileReachableLpa --timerValue <string> [ --timerUnit  
Minute ]
```

Description

Mobile reachable time for the LPA UE.

Type / Range

Integer in the range of 0 to 3,600 in units of Minute

Default

180

Name

moDataAnswer - MO data answer

Syntax

```
--timerName moDataAnswer --timerValue <string> [ --timerUnit  
Millisecond ]
```

Description

Time to wait for ODA after sending ODR (MO-Data-Request).

Type / Range

Integer in the range of 100 to 6,000 in units of Millisecond

Default

1000

Name

monitorArrivalDownlinkData - Monitor arrival downlink data

Syntax

```
--timerName monitorArrivalDownlinkData --timerValue <string> [ --  
timerUnit Millisecond ]
```

Description

Monitor arrival of downlink data if downlink data is expected.

Type / Range

Integer in the range of 200 to 10,000 in units of Millisecond

Default

2000

Name

mtDataAnswer - MT data answer

Syntax

```
--timerName mtDataAnswer --timerValue <string> [ --timerUnit
Millisecond ]
```

Description

This timer is used for responding to SCEF with TDA when SCEF sends TDR and does not include SCEF-Wait-Time AVP.

Type / Range

Integer in the range of 100 to 30,000 in units of Millisecond

Default

12000

Name

mtDataRequest - MT data request

Syntax

```
--timerName mtDataRequest --timerValue <string> [ --timerUnit
Millisecond ]
```

Description

This timer is started to wait for MT data request before releasing the S1 connection. this timer is started immediately after sending connection-management-request (CMR) with connection-action AVP set to CONNECTION-UPDATE.

Type / Range

Integer in the range of 0 to 10,000 in units of Millisecond

Default

1000

Name

n26rmUeDataAtSrcMme - N26 remove Ue Data at source MME

Syntax

```
--timerName n26rmUeDataAtSrcMme --timerValue <string> [ --timerUnit
Millisecond ]
```

Description

N26 remove Ue Data at source MME

Type / Range

Integer in the range of 500 to 5,000 in units of Millisecond

Default

2500

Name

nwdsRemHeartbeat - NWDS REM heartbeat

Syntax

```
--timerName nwdsRemHeartbeat --timerValue <string> [ --timerUnit  
Millisecond ]
```

Description

Configure REM heartbeat interval for NWDS service. Applicable only for CNF. Default is 600.
Range is 600 to 20000.

Type / Range

Integer in the range of 600 to 20000 in units of Millisecond

Default

600

Name

pagingGapTimer - Paging gap timer

Syntax

```
--timerName pagingGapTimer --timerValue <string> [ --timerUnit  
Minute ]
```

Description

This timer indicates the interval in which the MME will suppress paging for a UE after multiple consecutive page response failures have occurred for the UE. a value of 0 indicates that paging should not be suppressed due to previous page response failures.

Type / Range

Integer in the range of 0 to 1,440 in units of Minute

Default

0

Name

papsRemHeartbeat - PAPS REM heartbeat

Syntax

```
--timerName papsRemHeartbeat --timerValue <string> [ --timerUnit  
Millisecond ]
```

Description

Configure REM heartbeat interval for PAPS service.

Type / Range

Integer in the range of 1,000 to 20,000 in units of Millisecond

Default

1000

Name

pcmsRemHeartbeat - PCMS REM Heartbeat

Syntax

```
--timerName pcmsRemHeartbeat --timerValue <string> [ --timerUnit  
Millisecond ]
```

Description

Configure REM heartbeat interval for PCMS service. VNF: Default is 200, Range is 200 to 20000 CNF: Default is 600, Range is 600 to 20000

Type / Range

Integer in the range of 200 to 20,000 in units of Millisecond

Default

200

Name

pdnConnectAfterEcmIdle - PDN connect after ECM idle

Syntax

```
--timerName pdnConnectAfterEcmIdle --timerValue <string> [ --  
timerUnit Second ]
```

Description

Defines how long the subscriber needs to be in ECM-IDLE state before the PDN re-connection is initiated.

Type / Range

Integer in the range of 0 to 120 in units of Second

Default

2

Name

pgwIsolationDeclarationTimer - PGW isolation declaration timer

Syntax

```
--timerName pgwIsolationDeclarationTimer --timerValue <string> [ --  
timerUnit Second ]
```

Description

If the number of the P-GW faults (remote peer not responding cause received in the S11/S4 create session response) exceed the provisioned threshold in this timer, MME will isolate the S-GW/P-GW pair that reported this fault for new PDN connections for a configurable isolation duration. changes to the timer will take into effect whenever MME checks whether total faults exceeded the fault threshold in the timer that is either triggered by a new fault or some other event.

Type / Range

Integer in the range of 1 to 600 in units of Second

Default

3

Name

pgwIsolationDuration - PGW isolation duration

Syntax

```
--timerName pgwIsolationDuration --timerValue <string> [ --timerUnit  
Minute ]
```

Description

This command is used to provision the duration of PGW isolation once it is declared that the PGW is isolated for any new PDN connections. WMM will start selecting the PGW once the duration expires. This duration can be stopped and PGW selection can be resumed by using the sig-link CLI command

Type / Range

Integer in the range of 1 to 3,600 in units of Minute

Default

15

Name

pgwRestartRecovery - PGW restart recovery

Syntax

```
--timerName pgwRestartRecovery --timerValue <string> [ --timerUnit  
Minute ]
```

Description

It is used to provision a duration in which MME would attempt to re-establish PDN connections associated with a PGW indicated by the PGW restart notification message of the ECM-IDLE UE. MME would start the timer when it starts the recovery. once the timer expires, MME will stop the recovery and deletes the PDN session of the left over UEs.

Type / Range

Integer in the range of 30 to 300 in units of Minute

Default

60

Name

praDcConnectedIn - PRA Dual Connectivity Connected In

Syntax

```
--timerName praDcConnectedIn --timerValue <string> [ --timerUnit  
Millisecond ]
```

Description

Specifies the timer for Segment Based Dual Connectivity PRA reporting functionality, during which the MME suppresses the PRA status change report when the UE is in ECM-CONNECTED state and the last reported PRA status was 'inside'. The timer helps the MME to skip sequential back and forth status updates related to the segment based reporting. If MME receives new radio transport layer endpoint(s) for user plane, it waits for possible subsequential next update or UE context release before sending the PRA report towards the SGW/PGW.

Type / Range

Integer in the range of 0 to 60000 in units of Millisecond

Default

0

Name

praDcConnectedOut - PRA Dual Connectivity Connected Out

Syntax

```
--timerName praDcConnectedOut --timerValue <string> [ --timerUnit  
Millisecond ]
```

Description

Specifies the timer for Segment Based Dual Connectivity PRA reporting functionality, during which the MME suppresses the PRA status change report when the UE is in ECM-CONNECTED state and the last reported PRA status was 'outside'. The timer helps the MME to skip sequential back and forth status updates related to the segment based reporting. If MME receives new radio transport layer endpoint(s) for user plane, it waits for possible subsequential next update or UE context release before sending the PRA report towards the SGW/PGW.

Type / Range

Integer in the range of 0 to 60000 in units of Millisecond

Default

0

Name

praDcIdle - PRA Dual Connectivity Idle

Syntax

```
--timerName praDcIdle --timerValue <string> [ --timerUnit  
Millisecond ]
```

Description

Defines a timer for Presence Reporting Area (PRA) functionality for optimizing Dual Connectivity related reporting when the UE was previously ECM-IDLE. MME starts this timer when the UE was ECM-IDLE previously and the MME receives new RAN endpoints (receives Initial Context Setup Response during Service Request, Control Plane Service Request or Intra MME TAU). MME stops this timer when it receives either new RAN endpoints (Path Switch

Request, Handover Request Ack, Initial Context Setup Response or E-RAB modification indication) or UE context release complete. MME sends PRA Information towards the SGW/PGW when timer either expires or was stopped and reporting is required to be done i.e. status differs from previous reported and the UE is still ECM-CONNECTED.

Type / Range

Integer in the range of 0 to 10,000 in units of Millisecond

Default

0

Name

praDcSegmentOptServReq - PRA DC Segment Optimization Service Request

Syntax

```
--timerName praDcSegmentOptServReq --timerValue <string> [ --  
timerUnit Millisecond ]
```

Description

Specifies the timer for IPv6 Address Segment Based Dual Connectivity PRA reporting feature and the Service Request optimization functionality. The timer helps the MME to skip any sequential back and forth status updates related to the segment based reporting related to the idle to connected transferring and the possible subsequent gNB addition. When MME receives a Service Request message for a UE for which address segment based PRA reporting has previously been requested, the MME waits during this timer for a subsequent E-RAB modification indication before sending any PRA status update towards the SGW/PGW/PCRF, if such would still be needed due to the Service request. If the timer is running and the MME receives an E-RAB Modification Indication, the MME stops the timer. The MME reports the segment based status at either the receipt of the E-RAB modification indication, or the timer expiry (if status at that point is different from the previously sent status).

Type / Range

Integer in the range of 0 to 10,000 in units of Millisecond

Default

0

Name

praDcSingleTimer - PRA DC Single Timer

Syntax

```
--timerName praDcSingleTimer --timerValue <string> [ --timerUnit  
Millisecond ]
```

Description

Specifies the single optimisation timer for Segment Based Dual Connectivity PRA reporting functionality, during which the MME suppresses the PRA status change reports. The MME starts the timer when the timer is not yet running and the MME receives new RAN endpoints that would trigger status update for any PRA id that is reported for the UE. The timer is

stopped when the MME receives new RAN endpoints and the PRA status of all UE's PRA ids is back to the previously reported status, or when the UE context is released. The MME restarts the timer when the MME receives new RAN endpoints that cause the status of a different PRA id to be updated to a status that is not yet reported.

Type / Range

Integer in the range of 0 to 60000 in units of Millisecond

Default

0

Name

praStdSuppressionCancel - PRA Standard Suppression Cancel

Syntax

```
--timerName praStdSuppressionCancel --timerValue <string> [ --  
timerUnit Millisecond ]
```

Description

PRA Suppression cancel timer for 3GPP standard based Presence Area Reporting. Effective when PRA standard suppression is set to Yes. The functionality includes two time definitions- PRA suppression time and PRA suppression cancel time. MME suppresses a subsequent PRA report after a PRA report (PRA Information) has been sent out towards the SGW/PGW (during the time defined by the PRA suppression time), unless the PRA reporting status stays the same for a suppress cancel defined time period. When more time than the provisioned PRA suppression time has passed since the last delivered PRA report, the MME sends any PRA report to SGW/PGW and stores the timestamp of the report sending. If MME detects next PRA status change before the provisioned suppression time has passed since previous PRA report, MME (suppresses the report for a while and) starts the suppression cancelling timer to wait for another status change. If MME detects another status change before the suppression cancel timer expires, the MME discards the report since the status is back to the same as already reported. If the suppression cancel timer expires, MME sends the latest (suppressed) PRA report towards the SGW/PGW. The timer can be provisioned with 100ms granularity.

Type / Range

Integer in the range of 100 to 600,000 in units of Millisecond

Default

500

Name

praStdSuppressionPeriod - PRA Standard Suppression Period

Syntax

```
--timerName praStdSuppressionPeriod --timerValue <string> [ --  
timerUnit Millisecond ]
```

Description

Defines the time period during which the MME suppresses a subsequent PRA report after a PRA report (PRA Information) has been sent out towards the SGW/PGW, unless the PRA status stays the same during a time period defined by the suppression cancel time. The timer can be provisioned with 100ms granularity.

Type / Range

Integer in the range of 100 to 600,000 in units of Millisecond

Default

1000

Name

purgeTimer - Purge timer

Syntax

```
--timerName purgeTimer --timerValue <string> [ --timerUnit Hour ]
```

Description

This timer starts after the MME-initiated detach timer fires. If this timer fires before the UE contacts the MME again, the UE VLR data is purged.

Type / Range

Integer in the range of 1 to 120 in units of Hour

Default

48

Name

rcisPurgeTimer - RCIS Purge Timer

Syntax

```
--timerName rcisPurgeTimer --timerValue <string> [ --timerUnit Hour ]
```

Description

RCIS Purge Timer

Type / Range

Integer in the range of 1 to 720 in units of Hour

Default

120

Name

rcisRemHeartbeat - RCIS REM Heartbeat

Syntax

```
--timerName rcisRemHeartbeat --timerValue <string> [ --timerUnit  
Millisecond ]
```

Description

Configure REM heartbeat interval for RCIS service. VNF: Default is 200, Range is 200 to 20000
CNF: Default is 600, Range is 600 to 20000

Type / Range

Integer in the range of 200 to 20,000 in units of Millisecond

Default

200

Name

receiveNotificationReturnFromUe - Receive notification return from UE

Syntax

```
--timerName receiveNotificationReturnFromUe --timerValue <string>
[ --timerUnit Second ]
```

Description

Receive notification return from UE.

Type / Range

Integer in the range of 1 to 60 in units of Second

Default

9

Name

reserveUeSubscriptionIratMob - Reserve UE Subscription IRAT Mobility

Syntax

```
--timerName reserveUeSubscriptionIratMob --timerValue <string> [ --
timerUnit Minute ]
```

Description

This command is used to provision the duration of preserving UE subscription data. Timer shall be restarted upon UE transitioning back to MME. UE's subscription data shall be kept until the timer expires, however if UE comes back before timer expiration, NOR instead of ULR shall be sent to HSS in TAU procedure.

Type / Range

Integer in the range of 1 to 1,440 in units of Minute

Default

360

Name

s102tack - S102 tack

Syntax

```
--timerName s102tack --timerValue <string> [ --timerUnit
Millisecond ]
```

Description

S102 tack.

Type / Range

Integer in the range of 100 to 60,000 in units of Millisecond

Default

1000

Name

s10rmUeDataAtSrcMme - S10 remove UE data at source MME

Syntax

```
--timerName s10rmUeDataAtSrcMme --timerValue <string> [ --timerUnit  
Millisecond ]
```

Description

Used in S10 interactions to remove UE data at the source MME after a handover with MME relocation.

Type / Range

Integer in the range of 0 to 5,000 in units of Millisecond

Default

0

Name

s1hoComplete - S1 HO complete

Syntax

```
--timerName s1hoComplete --timerValue <string> [ --timerUnit Second ]
```

Description

Used to time the receipt of either a handover notify message from the target eNB or a forward relocation complete message from the target MME in the case of MME relocation. the handover is not successful if either of these messages is not received before the expiration of the timer.

Type / Range

Integer in the range of 1 to 10 in units of Second

Default

5

Name

s1hoCompleteExtended - Extended S1 HO complete

Syntax

```
--timerName s1hoCompleteExtended --timerValue <string> [ --timerUnit  
Second ]
```

Description

This timer is introduced to handle extra latency introduced by CIOT and CAT-M1 CE mode b devices in completing S1HO. for S1HO without MME relocation, the timer is used to monitor handover notify reception. for S1HO with MME relocation, this timer covers the extra latency to execute the handover, get the handover notify and receive forward relocation complete notification.

Type / Range

Integer in the range of 5 to 100 in units of Second

Default

5

Name

s1hoResourceRelease - S1 HO resource release

Syntax

```
--timerName s1hoResourceRelease --timerValue <string> [ --timerUnit  
Millisecond ]
```

Description

During a relocation request (SGW only or MME and SGW), the timer starts upon receipt of a forward relocation complete acknowledge. if the release does not occur before the timer expires, the target MME sends a delete indirect data forwarding message to the target SGW to delete it if the target MME has setup indirect forward paths on the target SGW. the source MME deletes any bearers on the source SGW (with SGW relocation) and deletes the tunnel by sending a delete indirect data forwarding message if the source MME has setup indirect forward paths on the source SGW. the source MME also releases S1 UE connections with the source eNB.

Type / Range

Integer in the range of 100 to 5,000 in units of Millisecond

Default

2000

Name

s1hoResourceReleaseWithNoMmeSgwRel - S1 Handover Resource Release With No MME SGW Relocation

Syntax

```
--timerName s1hoResourceReleaseWithNoMmeSgwRel --timerValue <string>  
[ --timerUnit Millisecond ]
```

Description

During intra-mme intra-sgw s1-based ho request, the timer starts after Handover Notify message and once the timer expires, MME shall send UE Context Release Command to the source eNB and the source eNodeB releases its resources related to the UE and responds with a UE Context Release Complete message. When the timer is set to 0, the S1 Handover Resource Release timer shall be used.

Type / Range

Integer value in the range of 0 or 200 to 3,000 in units of Millisecond

Default

0

Name

s1releaseOnCsgExpiration - S1 release on CSG expiration

Syntax

```
--timerName s1releaseOnCsgExpiration --timerValue <string> [ --  
timerUnit Millisecond ]
```

Description

This timer is to specify the time to wait to do an S1 release when CSG registration expires.

Type / Range

Integer in the range of 500 to 5,000 in units of Millisecond

Default

2000

Name

s1Reset - S1 reset

Syntax

```
--timerName s1Reset --timerValue <string> [ --timerUnit Second ]
```

Description

When the MME sends a S1 reset message to the eNB, it expects to receive a reset acknowledgment response message from the eNB. If the timer expires while waiting for this response, the MME considers that this class 1 procedure failed.

Type / Range

Integer in the range of 1 to 180 in units of Second

Default

45

Name

s1UeCapInfoIndForLtemWaitTime - s1UeCapInfoIndWaitTime

Syntax

```
--timerName s1UeCapInfoIndForLtemWaitTime --timerValue <string> [ --  
timerUnit Millisecond ]
```

Description

Specifies the timeout for the MME to receive the S1 UE Capability Information Indication message from the eNB. The timer applies if the MME needs to find out from the eNB whether the UE is capable of LTE-M. The timer is started when the MME sends the UE Capability Match Request to the eNB as part of an attach or TAU procedure.

Type / Range

Integer in the range of 100 to 9000 in units of Millisecond

Default

100

Name

s1ueLocationReport - S1 UE location report

Syntax

```
--timerName s1ueLocationReport --timerValue <string> [ --timerUnit  
Millisecond ]
```

Description

This timer specifies the length of time to wait for the receipt of a location report from the eNB.

Type / Range

Integer in the range of 100 to 8,000 in units of Millisecond

Default

2000

Name

s3gnHoComplete - S3 Gn HO complete

Syntax

```
--timerName s3gnHoComplete --timerValue <string> [ --timerUnit  
Millisecond ]
```

Description

Supports inter-rat handover procedures.

Type / Range

Integer in the range of 100 to 10,000 in units of Millisecond

Default

4000

Name

s3gnIndirectForwarding - S3 Gn indirect forwarding

Syntax

```
--timerName s3gnIndirectForwarding --timerValue <string> [ --  
timerUnit Millisecond ]
```

Description

Used to time for resource release for indirect forwarding of UE data. when the timer expires, the MME releases the resources that have been allocated for indirect forwarding.

Type / Range

Integer in the range of 100 to 5,000 in units of Millisecond

Default

4000

Name

scefCmrAnswer - SCEF CMR answer

Syntax

```
--timerName scefCmrAnswer --timerValue <string> [ --timerUnit  
Millisecond ]
```

Description

This timer is used for responding with connection management answer to SCEF for SCEF sent connection management request (CMR) for an update. the timer applies to SCEF CMR updates other than T6a connection release. CMR for release from SCEF answer uses connectionmanagementanwer timer.

Type / Range

Integer in the range of 100 to 30,000 in units of Millisecond

Default

12000

Name

scefExpiredTimeReject - scefExpiredTimeReject

Syntax

```
--timerName scefExpiredTimeReject --timerValue <string> [ --timerUnit  
Second ]
```

Description

If the MME receives a T6a (SCEF) MT Data Request that contains the Maximum-Retransmission-Time AVP and/or SCEF-Wait-Time AVP, this timer defines how much in the past each AVP value can be in order for the MME to consider it as a still valid AVP. The default is 30 seconds to align with the prior hard-coded value.

Type / Range

Integer in the range of 1 to 120 in units of Second

Default

30

Name

secondaryRatUsageReportingDelay - Secondary Rat Usage Reporting Delay during Handover

Syntax

```
--timerName secondaryRatUsageReportingDelay --timerValue <string>  
[ --timerUnit Second ]
```

Description

Timer to delay forwarding the Secondary RAT Usage report to the S/PGW during Handover

Type / Range

Integer in the range of 1 to 30 in units of Second

Default

10

Name

serviceGapTimerOverrideValue - Service Gap Timer Override Value

Syntax

```
--timerName serviceGapTimerOverrideValue --timerValue <string> [ --  
timerUnit Second ]
```

Description

Specifies the timer value to use for the UE's service gap timer

Type / Range

Integer in the range of 0 to 65,535 in units of Second

Default

0

Name

sessionOrientedLinkMoDeletionTimer - Session oriented link MO deletion timer

Syntax

```
--timerName sessionOrientedLinkMoDeletionTimer --timerValue <string>  
[ --timerUnit Hour ]
```

Description

Session oriented link MO deletion timer for GTP based interfaces. value of 0 means do not do inactivity deletion.

Type / Range

Integer in the range of 0 to 168 in units of Hour

Default

24

Name

sfdsRemHeartbeat - SFDS REM Heartbeat

Syntax

```
--timerName sfdsRemHeartbeat --timerValue <string> [ --timerUnit  
Millisecond ]
```

Description

Configure REM heartbeat interval for SCTP Flow Distributor Service. VNF: N/A CNF: Default is 600, Range is 600 to 20000

Type / Range

Integer in the range of 200 to 20,000 in units of Millisecond

Default

600

Name

sgsLiteDetachIndicationAck - SGs lite detach indication ack

Syntax

```
--timerName sgsLiteDetachIndicationAck --timerValue <string> [ --  
timerUnit Millisecond ]
```

Description

Configure SGsLite-IMSI-DETACH-ACK timeout in milliseconds.

Type / Range

Integer in the range of 100 to 60,000 in units of Millisecond

Default

1000

Name

sgsLiteLocationUpdateAck - SGs lite location update ack

Syntax

```
--timerName sgsLiteLocationUpdateAck --timerValue <string> [ --  
timerUnit Millisecond ]
```

Description

Configure timer for the reception of SGsLite-LOCATION-UPDATE-ACK timer.

Type / Range

Integer in the range of 100 to 60,000 in units of Millisecond

Default

1000

Name

sgsLiteUplinkDataAck - SGs lite uplink data ack

Syntax

```
--timerName sgsLiteUplinkDataAck --timerValue <string> [ --timerUnit  
Millisecond ]
```

Description

Configure SGsLite-UPLINK-ACK timeout.

Type / Range

Integer in the range of 100 to 60,000 in units of Millisecond

Default

1000

Name

sgsPaging - SGs paging

Syntax`--timerName sgsPaging --timerValue <string> [ --timerUnit Second ]`**Description**

Defines the value for receiving responses to a SG paging request. this timer should be set slightly lower than the paging timer value provisioned in the MSC/VLR.

Type / Range

Integer in the range of 1 to 25 in units of Second

Default

6

Name

sgwIsolationDeclarationTimer - SGW isolation declaration timer

Syntax`--timerName sgwIsolationDeclarationTimer --timerValue <string> [ --timerUnit Second ]`**Description**

This command is used to provision SGW isolation declaration timer. if the number of the SGW faults (remote peer not responding cause received in the S11/S4 create session response) exceed the provisioned threshold in this provisioned timer then WMM will isolate the SGW from the selection. a sliding window will be used in counting the total number faults for the isolation declaration duration.

Type / Range

Integer in the range of 1 to 600 in units of Second

Default

3

Name

sgwIsolationDuration - SGW isolation duration

Syntax`--timerName sgwIsolationDuration --timerValue <string> [ --timerUnit Minute ]`**Description**

This command is used to provision the duration of SGW isolation once it is declared that the SGW is isolated from selection. WMM will start selecting the SGW once the duration expires. This duration can be stopped and PGW selection can be resumed by using the sig-link CLI command

Type / Range

Integer in the range of 1 to 3,600 in units of Minute

Default

15

Name

sgwRestorationTimer - SGW restoration timer

Syntax

```
--timerName sgwRestorationTimer --timerValue <string> [ --timerUnit  
Minute ]
```

Description

This timer is used to guard the MME attempt to assign UE associated with a failed SGW or restarted SGW.

Type / Range

Integer in the range of 1 to 180 in units of Minute

Default

60

Name

srnsCompletion - SRNS completion

Syntax

```
--timerName srnsCompletion --timerValue <string> [ --timerUnit  
Millisecond ]
```

Description

Used to time for receipt of an SRNS completion message from the target SGSN.

Type / Range

Integer in the range of 100 to 10,000 in units of Millisecond

Default

4000

Name

srnsHoRauRequestWait - SRNS HO RAU request wait

Syntax

```
--timerName srnsHoRauRequestWait --timerValue <string> [ --timerUnit  
Millisecond ]
```

Description

Specify how long 3G-SGSN waits for a RAU request after SRNS relocation or 4G to 3G HO.

Type / Range

Integer in the range of 100 to 10,000 in units of Millisecond

Default

200

Name

srsDataPurge - SRS Data Purge

Syntax`--timerName srsDataPurge --timerValue <string> [ --timerUnit Minute ]`**Description**

SRS Data Purge time

Type / Range

Integer in the range of 30 to 7,200 in units of Minute

Default

2880

Name

srsResponse - SRS response

Syntax`--timerName srsResponse --timerValue <string> [ --timerUnit Second ]`**Description**

SRS response time.

Type / Range

Integer in the range of 1 to 30 in units of Second

Default

6

Name

srvccPsToCsComplete - SRVCC PS to CS complete

Syntax`--timerName srvccPsToCsComplete --timerValue <string> [ --timerUnit Millisecond ]`**Description**

Time to wait for the SRVCC PS to CS complete message from an MSC.

Type / Range

Integer in the range of 500 to 15,000 in units of Millisecond

Default

4000

Name

srvccTo1xHoComplete - SRVCC to 1x HO complete

Syntax

```
--timerName srvccTo1xHoComplete --timerValue <string> [ --timerUnit  
Millisecond ]
```

Description

This is guard timer that is started when S102 signaling with HO status IE (SUCCESS) is received and shall be stopped when S1 UE context release request with cause CIOT cell redirection is received.

Type / Range

Integer in the range of 1 to 17,407 in units of Millisecond

Default

12000

Name

srvccTo1xHoPreparation - SRVCC to 1x HO preparation

Syntax

```
--timerName srvccTo1xHoPreparation --timerValue <string> [ --  
timerUnit Millisecond ]
```

Description

This is a guard timer that is started when S1 UL CDMA2000 tunneling with HO required IE is received and stopped when S102 Signaling with HO status IE is received.

Type / Range

Integer in the range of 1 to 8,192 in units of Millisecond

Default

5000

Name

suspendReq - Suspend request

Syntax

```
--timerName suspendReq --timerValue <string> [ --timerUnit  
Millisecond ]
```

Description

Used in an EUTRAN to GERAN CS handover procedure to time for the receipt of the suspend request message from the SGSN in the network to which the UE has moved.

Type / Range

Integer in the range of 500 to 10,000 in units of Millisecond

Default

2000

Name

t3346attachRejectMaximum - T3346 attach reject maximum

Syntax

```
--timerName t3346attachRejectMaximum --timerValue <string> [ --  
timerUnit Second ]
```

Description

Specifies the maximum value to consider when randomly assigning the T3346 timer value to be used for an attach procedure rejection due to IPDS CPU overload, CPPS CPU overload, and CXN object overloads with NAS cause code #22 (Congestion).

Type / Range

Integer in the range of 0 to 600 in units of Second

Default

60

Name

t3346attachRejectMinimum - T3346 attach reject minimum

Syntax

```
--timerName t3346attachRejectMinimum --timerValue <string> [ --  
timerUnit Second ]
```

Description

Specifies the minimum value to consider when randomly assigning the T3346 timer value to be used for an attach procedure rejection due to IPDS CPU overload, CPPS CPU overload, and CXN object overloads with NAS cause code #22 (Congestion).

Type / Range

Integer in the range of 0 to 600 in units of Second

Default

15

Name

t3346gtpVolEsrMax - T3346 GTP VOL ESR max

Syntax

```
--timerName t3346gtpVolEsrMax --timerValue <string> [ --timerUnit  
Second ]
```

Description

The maximum value to consider when randomly assigning the T3346 timer value to be used for an ESR procedure rejection due to GTP overload.

Type / Range

Integer in the range of 0 to 600 in units of Second

Default

60

Name

t3346gtpVolEsrMin - T3346 GTP VOL ESR min

Syntax

```
--timerName t3346gtpVolEsrMin --timerValue <string> [ --timerUnit  
Second ]
```

Description

The minimum value to consider when randomly assigning the T3346 timer value to be used for an SR procedure rejection due to GTP overload.

Type / Range

Integer in the range of 0 to 600 in units of Second

Default

15

Name

t3346gtpVolSrMax - T3346 GTP VOL SR max

Syntax

```
--timerName t3346gtpVolSrMax --timerValue <string> [ --timerUnit  
Second ]
```

Description

The maximum value to consider when randomly assigning the T3346 timer value to be used for an SR procedure rejection due to GTP overload.

Type / Range

Integer in the range of 0 to 600 in units of Second

Default

60

Name

t3346gtpVolSrMin - T3346 GTP VOL SR min

Syntax

```
--timerName t3346gtpVolSrMin --timerValue <string> [ --timerUnit  
Second ]
```

Description

The minimum value to consider when randomly assigning the T3346 timer value to be used for an SR procedure rejection due to GTP overload.

Type / Range

Integer in the range of 0 to 600 in units of Second

Default

15

Name

t3346gtpVolTauMax - T3346 GTP VOL TAU max

Syntax

```
--timerName t3346gtpVolTauMax --timerValue <string> [ --timerUnit  
Second ]
```

Description

The maximum value to consider when randomly assigning the T3346 timer value to be used for a TAU procedure rejection due to GTP overload.

Type / Range

Integer in the range of 0 to 600 in units of Second

Default

60

Name

t3346gtpVolTauMin - T3346 GTP VOL TAU min

Syntax

```
--timerName t3346gtpVolTauMin --timerValue <string> [ --timerUnit  
Second ]
```

Description

The minimum value to consider when randomly assigning the T3346 timer value to be used for a TAU procedure rejection due to GTP overload.

Type / Range

Integer in the range of 0 to 600 in units of Second

Default

15

Name

t3346NblotAttachRejectMaximum - T3346 NB-IOT Attach Reject Maximum

Syntax

```
--timerName t3346NbIotAttachRejectMaximum --timerValue <string> [ --  
timerUnit Second ]
```

Description

Specifies the maximum value to consider when randomly assigning the T3346 NB-IOT timer value to be used for an attach procedure rejection due to IPDS CPU overload, CPPS CPU overload, and CXN object overloads with NAS cause code #22 (Congestion).

Type / Range

Integer in the range of 0 to 11,160 in units of Second

Default

60

Name

t3346NbIotAttachRejectMinimum - T3346 NB-IOT Attach Reject Minimum**Syntax**

```
--timerName t3346NbIotAttachRejectMinimum --timerValue <string> [ --  
timerUnit Second ]
```

Description

Specifies the minimum value to consider when randomly assigning the T3346 NB-IOT timer value to be used for an attach procedure rejection due to IPDS CPU overload, CPPS CPU overload, and CXN object overloads with NAS cause code #22 (Congestion).

Type / Range

Integer in the range of 0 to 11,160 in units of Second

Default

15

Name

t3346NbIotCpsrRejectMaximum - T3346 NB-IOT Control Plane SR Reject Maximum

Syntax

```
--timerName t3346NbIotCpsrRejectMaximum --timerValue <string> [ --  
timerUnit Second ]
```

Description

Specifies the maximum value to consider when randomly assigning the T3346 NB-IOT timer value to be used for an Control Plane SR procedure rejection due to IPDS CPU overload, CPPS CPU overload, and CXN object overloads with NAS cause code #22 (Congestion).

Type / Range

Integer in the range of 0 to 11,160 in units of Second

Default

60

Name

t3346NbIotCpsrRejectMinimum - T3346 NB-IOT Control Plane SR Reject Minimum

Syntax

```
--timerName t3346NbIotCpsrRejectMinimum --timerValue <string> [ --  
timerUnit Second ]
```

Description

Specifies the minimum value to consider when randomly assigning the T3346 NB-IOT timer value to be used for an Control Plane SR procedure rejection due to IPDS CPU overload, CPPS CPU overload, and CXN object overloads with NAS cause code #22 (Congestion).

Type / Range

Integer in the range of 0 to 11,160 in units of Second

Default

15

Name

t3346NbIotOdbRejectMaximum - t3346 NB-IOT ODB Reject Maximum

Syntax

```
--timerName t3346NbIotOdbRejectMaximum --timerValue <string> [ --  
timerUnit Second ]
```

Description

Specifies the maximum value backoff timer value in Seconds randomly assigned to a NB-IoT UE with ODB trying to access the MME. This timer applies when the MME is provisioned to provide cause 22 to the UE (in the restNasMappingProfile).

Type / Range

Integer in the range of 0 to 11,160 in units of Second

Default

60

Name

t3346NbIotOdbRejectMinimum - t3346 NB-IOT ODB Reject Minimum

Syntax

```
--timerName t3346NbIotOdbRejectMinimum --timerValue <string> [ --  
timerUnit Second ]
```

Description

Specifies the minimum value backoff timer value in Seconds randomly assigned to a NB-IoT UE with ODB trying to access the MME. This timer applies when the MME is provisioned to provide cause 22 to the UE (in the restNasMappingProfile).

Type / Range

Integer in the range of 0 to 11,160 in units of Second

Default

15

Name

t3346NbIotSrRejectMaximum - T3346 NB-IOT SR Reject Maximum

Syntax

```
--timerName t3346NbIotSrRejectMaximum --timerValue <string> [ --  
timerUnit Second ]
```

Description

Specifies the maximum value to consider when randomly assigning the T3346 NB-IOT timer value to be used for an SR procedure rejection due to IPDS CPU overload, CPPS CPU overload, and CXN object overloads with NAS cause code #22 (Congestion).

Type / Range

Integer in the range of 0 to 11,160 in units of Second

Default

60

Name

t3346NbIotSrRejectMinimum - T3346 NB-IOT SR Reject Minimum

Syntax

```
--timerName t3346NbIotSrRejectMinimum --timerValue <string> [ --  
timerUnit Second ]
```

Description

Specifies the minimum value to consider when randomly assigning the T3346 NB-IOT timer value to be used for an SR procedure rejection due to IPDS CPU overload, CPPS CPU overload, and CXN object overloads with NAS cause code #22 (Congestion).

Type / Range

Integer in the range of 0 to 11,160 in units of Second

Default

15

Name

t3346NbIotTauRejectMaximum - T3346 NB-IOT TAU Reject Maximum

Syntax

```
--timerName t3346NbIotTauRejectMaximum --timerValue <string> [ --  
timerUnit Second ]
```

Description

Specifies the maximum value to consider when randomly assigning the T3346 NB-IOT timer value to be used for a TAU procedure rejection due to IPDS CPU overload, CPPS CPU overload, and CXN object overloads with NAS cause code #22 (Congestion).

Type / Range

Integer in the range of 0 to 11,160 in units of Second

Default

60

Name

t3346NbIotTauRejectMinimum - T3346 NB-IOT TAU Reject Minimum

Syntax

```
--timerName t3346NbIotTauRejectMinimum --timerValue <string> [ --  
timerUnit Second ]
```

Description

Specifies the minimum value to consider when randomly assigning the T3346 NB-IOT timer value to be used for a TAU procedure rejection due to IPDS CPU overload, CPPS CPU overload, and CXN object overloads with NAS cause code #22 (Congestion).

Type / Range

Integer in the range of 0 to 11,160 in units of Second

Default

15

Name

t3346srRejectMaximum - T3346 SR reject maximum

Syntax

```
--timerName t3346srRejectMaximum --timerValue <string> [ --timerUnit  
Second ]
```

Description

Specifies the maximum value to consider when randomly assigning the T3346 timer value to be used for an SR procedure rejection due to IPDS CPU overload, CPPS CPU overload, and CXN object overloads with NAS cause code #22 (Congestion).

Type / Range

Integer in the range of 0 to 600 in units of Second

Default

60

Name

t3346srRejectMinimum - T3346 SR reject minimum

Syntax

```
--timerName t3346srRejectMinimum --timerValue <string> [ --timerUnit  
Second ]
```

Description

Specifies the minimum value to consider when randomly assigning the T3346 timer value to be used for an SR procedure rejection due to IPDS CPU overload, CPPS CPU overload, and CXN object overloads with NAS cause code #22 (Congestion).

Type / Range

Integer in the range of 0 to 600 in units of Second

Default

15

Name

t3346tauRejectMaximum - T3346 TAU reject maximum

Syntax

```
--timerName t3346tauRejectMaximum --timerValue <string> [ --timerUnit  
Second ]
```

Description

Specifies the maximum value to consider when randomly assigning the T3346 timer value to be used for a TAU procedure rejection due to IPDS CPU overload, CPPS CPU overload, and CXN object overloads with NAS cause code #22 (Congestion).

Type / Range

Integer in the range of 0 to 600 in units of Second

Default

60

Name

t3346tauRejectMinimum - T3346 TAU reject minimum

Syntax

```
--timerName t3346tauRejectMinimum --timerValue <string> [ --timerUnit  
Second ]
```

Description

Specifies the minimum value to consider when randomly assigning the T3346 timer value to be used for a TAU procedure rejection due to IPDS CPU overload, CPPS CPU overload, and CXN object overloads with NAS cause code #22 (Congestion).

Type / Range

Integer in the range of 0 to 600 in units of Second

Default

15

Name

t3396genmax - T3396 gen max

Syntax

```
--timerName t3396genmax --timerValue <string> [ --timerUnit  
{Minute,Second} ]
```

Description

Parameter t3396genmax indicates maximum value to consider when assigning the T3396gen timer value to be used when MME rejects an IMS PDN Connectivity request (standalone or attach) When the timer has value > 0, then whenever the MME rejects an IMS PDN Connectivity Request (standalone or Attach) due to not subscribed IMS APN (or IMS APN is subscribed only via the wildcard APN and GPARM is enabled) then the T3396 IE shall be included in PDN Connectivity Reject message to force the UE re-attempt only after the back off timer expires,

Type / Range

Integer in the range of 0 to 360 in units of Minute,Second

Default

0

Name

t3396genmin - T3396 gen min

Syntax

```
--timerName t3396genmin --timerValue <string> [ --timerUnit  
{Minute,Second} ]
```

Description

Parameter t3396genmin indicates minimum value to consider when assigning the T3396gen timer value to be used when MME rejects an IMS PDN Connectivity request (standalone or attach)

Type / Range

Integer in the range of 0 to 360 in units of Minute,Second

Default

0

Name

t3396gtpVolMax - T3396 GTP VOL max

Syntax

```
--timerName t3396gtpVolMax --timerValue <string> [ --timerUnit  
Second ]
```

Description

The maximum value to consider when randomly assigning the T3396 timer value to be used for an SM request rejection due to GTP overload.

Type / Range

Integer in the range of 0 to 600 in units of Second

Default

60

Name

t3396gtpVolMin - T3396 GTP VOL min

Syntax

```
--timerName t3396gtpVolMin --timerValue <string> [ --timerUnit  
Second ]
```

Description

The minimum value to consider when randomly assigning the T3396 timer value to be used for an SM request rejection due to GTP overload.

Type / Range

Integer in the range of 0 to 600 in units of Second

Default

15

Name

t3396max - T3396 max

Syntax`--timerName t3396max --timerValue <string> [ --timerUnit Second ]`**Description**

The maximum value to consider when randomly assigning the T3396 timer value to be used for an SM request rejection due to overload.

Type / Range

Integer in the range of 0 to 600 in units of Second

Default

60

Name

t3396min - T3396 min

Syntax`--timerName t3396min --timerValue <string> [ --timerUnit Second ]`**Description**

The minimum value to consider when randomly assigning the T3396 timer value to be used for an SM request rejection due to overload.

Type / Range

Integer in the range of 0 to 599 in units of Second

Default

15

Name

t3402 - T3402 reattach request

Syntax`--timerName t3402 --timerValue <string> [ --timerUnit Minute ]`**Description**

Part of UE attach accept message. used by UE to initiate the next attach or TAU procedure in case of a failure of a previous attach or TAU procedure.

Type / Range

Integer in the range of 1 to 31 in units of Minute

Default

12

Name

t3402AttachReject - T3402 Attach Reject**Syntax**

```
--timerName t3402AttachReject --timerValue <string> [ --timerUnit  
{DeciHour,Minute} ]
```

Description

Specifies the wait time for another attach request if the UEs attach counter has reached 5 to the Attach Reject message.

Type / Range

Integer in the range of 0 to 31 in units of DeciHour,Minute

Default

0

Name

t3412 - T3412 periodic TAU

Syntax

```
--timerName t3412 --timerValue <string> [ --timerUnit  
{2Second,DeciHour,Minute} ]
```

Description

Part of UE attach accept message. used by the UE for periodic TAU. the MME starts this timer when the UE state is changed to the ECM-IDLE state.

Type / Range

Integer in the range of 1 to 31 in units of 2Second,DeciHour,Minute

Default

20

Name

t3412extendedForLpaUe - T3412 extended for LPA UE

Syntax

```
--timerName t3412extendedForLpaUe --timerValue <string> [ --timerUnit  
{10Hour,10Minute,2Second,30Second,320Hour,Hour,Minute} ]
```

Description

Periodic TAU timer that MME sends to UE in attach accept message to a UE configured for low priority access.

Type / Range

Integer in the range of 1 to 31 in units of
10Hour,10Minute,2Second,30Second,320Hour,Hour,Minute

Default

18

Name

t3412withTauSuppression - T3412 with TAU suppression

Syntax

```
--timerName t3412withTauSuppression --timerValue <string> [ --  
timerUnit {2Second,DeciHour,Minute} ]
```

Description

This timer is used instead of the standard T3412 timer when TAU suppression has been triggered by the MME. a value of 0 indicates that the standard T3412 timer should be used even when the MME has triggered TAU suppression.

Type / Range

Integer in the range of 0 to 31 in units of 2Second,DeciHour,Minute

Default

0

Name

t3422 - T3422 retransmit detach request

Syntax

```
--timerName t3422 --timerValue <string> [ --timerUnit Second ]
```

Description

Retransmit detach request.

Type / Range

Integer in the range of 1 to 60 in units of Second

Default

6

Name

t3422Wbs1CeMode - T3422 for WB-S1 CE mode

Syntax

```
--timerName t3422Wbs1CeMode --timerValue <string> [ --timerUnit  
Second ]
```

Description

T3422 timer value for the maximum interval MME waits after sending a detach request before retry for UE in WB-S1 coverage enhancement (CE) mode.

Type / Range

Integer in the range of 1 to 60 in units of Second

Default

24

Name

t3442rejectEsrNoSrvcc - T3442 reject ESR no SRVCC

Syntax

```
--timerName t3442rejectEsrNoSrvcc --timerValue <string> [ --timerUnit  
Second ]
```

Description

T3442 timer to be included in the service reject message when ESR is rejected due to UE with IMS voice bearer.

Type / Range

Integer in the range of 0 to 60 in units of Second

Default

0

Name

t3448Max - T3448 Maximum

Syntax

```
--timerName t3448Max --timerValue <string> [ --timerUnit Minute ]
```

Description

Specifies the maximum value of control plane data back-off timer. If the UE supports the control plane data back-off timer T3448, the UE shall set the CP backoff bit to back-off timer for transport of user data via the control plane supported in the UE network capability IE of the ATTACH REQUEST message.

Type / Range

Integer in the range of 15 to 30 in units of Minute

Default

30

Name

t3448Min - T3448 Minimum

Syntax

```
--timerName t3448Min --timerValue <string> [ --timerUnit Minute ]
```

Description

Specifies the minimum value of control plane data back-off timer. If the UE supports the control plane data back-off timer T3448, the UE shall set the CP backoff bit to back-off timer for transport of user data via the control plane supported in the UE network capability IE of the ATTACH REQUEST message.

Type / Range

Integer in the range of 15 to 30 in units of Minute

Default

15

Name

t3450 - T3450 retransmit attach and TAU accept or GUTI reallocation

Syntax

```
--timerName t3450 --timerValue <string> [ --timerUnit Second ]
```

Description

Retransmit attach accept, TAU accept, or GUTI reallocation command. timer starts if an attach request is accepted by the network and the MME sends an ATTACH ACCEPT message to the UE. timer stops after receiving an ATTACH COMPLETE message and considers the GUTI sent in the ATTACH ACCEPT message as valid.

Type / Range

Integer in the range of 1 to 60 in units of Second

Default

6

Name

t3450Wbs1CeMode - T3450 for WB-S1 CE mode

Syntax

```
--timerName t3450Wbs1CeMode --timerValue <string> [ --timerUnit  
Second ]
```

Description

T3450 timer which is used to supervise the retransmit of attach accept, TAU accept, or GUTI reallocation commands of UE in WB-S1 coverage enhancement (CE) mode.

Type / Range

Integer in the range of 1 to 60 in units of Second

Default

18

Name

t3460 - T3460 retransmit auth or sec mode command

Syntax

```
--timerName t3460 --timerValue <string> [ --timerUnit Second ]
```

Description

Retransmit auth request, or security mode command. timer starts when a security mode command is sent. normal stop occurs when security mode complete or security mode reject is received.

Type / Range

Integer in the range of 1 to 60 in units of Second

Default

6

Name

t3460Wbs1CeMode - T3460 for WB-S1 CE mode

Syntax

```
--timerName t3460Wbs1CeMode --timerValue <string> [ --timerUnit  
Second ]
```

Description

T3460 timer which is used to supervise the response to the transmission by the MME of the authentication request or security mode command for UE in WB-S1 coverage enhancement(ce) mode.

Type / Range

Integer in the range of 1 to 60 in units of Second

Default

24

Name

t3470 - T3470 retransmit identity command

Syntax

```
--timerName t3470 --timerValue <string> [ --timerUnit Second ]
```

Description

Retransmit identity command. timer starts when IDENTITY REQUEST is received. timer stops when IDENTITY REQUEST is received.

Type / Range

Integer in the range of 1 to 60 in units of Second

Default

6

Name

t3470Wbs1CeMode - T3470 for WB-S1 CE mode

Syntax

```
--timerName t3470Wbs1CeMode --timerValue <string> [ --timerUnit  
Second ]
```

Description

T3470 timer which is used to supervise the network initiated identification procedure for UE in WB-S1 coverage enhancement (CE) mode.

Type / Range

Integer in the range of 1 to 60 in units of Second

Default

24

Name

t3485 - T3485 retransmit activate def or ded bearer request

Syntax

```
--timerName t3485 --timerValue <string> [ --timerUnit Second ]
```

Description

Retransmit activate default bearer request, or activate dedicated bearer request. timer starts when an ACTIVATE DEFAULT/ DEDICATED EPS BEARER CONTEXT REQUEST is sent. timer stops when ACTIVATE DEFAULT EPS BEARER CONTEXT ACCEPT/REJECT or ACTIVATE DEDICATED EPS BEARER CONTEXT ACCEPT/REJECT is received.

Type / Range

Integer in the range of 1 to 60 in units of Second

Default

6

Name

t3485Wbs1CeMode - T3485 for WB-S1 CE mode

Syntax

```
--timerName t3485Wbs1CeMode --timerValue <string> [ --timerUnit  
Second ]
```

Description

T3485 timer which is used to supervise the response to the transmission by the MME of the activate default bearer request, or activate dedicated bearer request for UE in WB-S1 coverage enhancement (CE) mode.

Type / Range

Integer in the range of 1 to 60 in units of Second

Default

16

Name

t3486 - T3486 retransmit mod bearer request

Syntax

```
--timerName t3486 --timerValue <string> [ --timerUnit Second ]
```

Description

Retransmit modify bearer request.

Type / Range

Integer in the range of 1 to 60 in units of Second

Default

6

Name

t3486Wbs1CeMode - T3486 for WB-S1 CE mode

Syntax

```
--timerName t3486Wbs1CeMode --timerValue <string> [ --timerUnit
Second ]
```

Description

T3486 timer which is used to supervise the response to the transmission by the MME of the modify EPS bearer context request for UE in WB-S1 coverage enhancement (CE) mode.

Type / Range

Integer in the range of 1 to 60 in units of Second

Default

16

Name

t3489 - T3489 retransmit ESM info request timeout

Syntax

```
--timerName t3489 --timerValue <string> [ --timerUnit Second ]
```

Description

Timeout before retransmission of ESM information request.

Type / Range

Integer in the range of 1 to 60 in units of Second

Default

4

Name

t3489Wbs1CeMode - T3489 for WB-S1 CE mode

Syntax

```
--timerName t3489Wbs1CeMode --timerValue <string> [ --timerUnit
Second ]
```

Description

T3489 timer which is used to supervise the response to the transmission by the MME of the ESM information request for UE in WB-S1 coverage enhancement (CE) mode.

Type / Range

Integer in the range of 1 to 60 in units of Second

Default

12

Name

t3495 - T3495 retransmit deact bearer request

Syntax

```
--timerName t3495 --timerValue <string> [ --timerUnit Second ]
```

Description

Retransmit deactivate bearer request. timer starts when DEACTIVATE EPS BEARER CONTEXT REQUEST is sent. timer stops when DEACTIVATE EPS BEARER CONTEXT ACCEPT is received.

Type / Range

Integer in the range of 1 to 60 in units of Second

Default

6

Name

t3495Wbs1CeMode - T3495 for WB-S1 CE mode

Syntax

```
--timerName t3495Wbs1CeMode --timerValue <string> [ --timerUnit  
Second ]
```

Description

T3495 timer which is used to supervise the EPS bearer context deactivation procedure for UE in WB-S1 coverage enhancement (CE) mode.

Type / Range

Integer in the range of 1 to 60 in units of Second

Default

16

Name

t3x01 - T3X01 receive location response from E-SMLC via SIs timer

Syntax

```
--timerName t3x01 --timerValue <string> [ --timerUnit Second ]
```

Description

Timer to receive location response from the E-SMLC via SLs. (timer to transition from location state to LCS-IDLE state for a UE).

Type / Range

Integer in the range of 1 to 180 in units of Second

Default

8

Name

t3x02 - T3X02 receive reset ack after send reset to E-SMLC timer

Syntax

```
--timerName t3x02 --timerValue <string> [ --timerUnit Second ]
```

Description

Timer to receive reset ack after sending reset to the E-SMLC (SLs).

Type / Range

Integer in the range of 1 to 60 in units of Second

Default

3

Name

tauAfterHo - TAU after HO

Syntax

```
--timerName tauAfterHo --timerValue <string> [ --timerUnit Second ]
```

Description

This command is used to set the value of the tauAfterHo timer which supervises the exchange between the MME and UE after handover occurs from LTE S1, UTRAN or GERAN. The MME detaches the UE if the timer expires before the TAU Request is Received. This timer only applies when a TAU is expected, e.g. if the TAI changed in an LTE-to-LTE HO. Caution! this value should only be set to '0' for troubleshooting purposes. The '0' value is not recommended by Nokia for service operation. If this value is set to '0', the MME does not start the timer, does not detach the UE, and does not start a new AKA as part of the handover procedure. this can generate security vulnerabilities in the EPS that a UE can exploit.

Type / Range

Integer in the range of 0 to 10 in units of Second

Default

2

Name

tauAfterN26Ho - TAU after N26 HO

Syntax

```
--timerName tauAfterN26Ho --timerValue <string> [ --timerUnit  
Second ]
```

Description

This timer supervises the exchange between the MME and UE after handover occurs from NR. The MME detaches the UE if the timer expires before the TAU Request is Received. Caution! this value should only be set to '0' for troubleshooting purposes. The '0' value is not recommended by Nokia for service operation. If this value is set to '0', the MME does not start the timer, does not detach the UE, and does not start a new AKA as part of the handover procedure. This can generate security vulnerabilities in the EPS that a UE can exploit.

Type / Range

Integer in the range of 0 to 10 in units of Second

Default

2

Name

tauSuppressionThreshold - TAU suppression threshold

Syntax

```
--timerName tauSuppressionThreshold --timerValue <string> [ --  
timerUnit Second ]
```

Description

This timer indicates the maximum interval for cyclic movement between tracking areas that will trigger TAU suppression by MME. a value of 0 indicates that TAU suppression is performed without regard to the interval of the cyclic movement between tracking areas.

Type / Range

Integer in the range of 0 to 300 in units of Second

Default

0

Name

tDynMO - TdynMO

Syntax

```
--timerName tDynMO --timerValue <string> [ --timerUnit Hour ]
```

Description

Indicates the interval to wait for an interface to return an operational state, before deleting the interface. As of CMM23.2.0, tDynMO is used for the Link Disable timer which only applies to links in DISABLED operational state. S1mme, S11, S10, N26, NR10 and other dynamical MME links except for Gn, S3, and S16 are subject to the tDynMO. Statically provisioned links and administrative locked links are not subject to the Link Disable timer. Disabled N2 links are subject to the tDynMO disable timer. The MME N26 links are subject to the tDynMO timer or Transaction Oriented MO delete timer depending on the operational state of the links, either being enabled and disabled. Those are exclusive states.

Type / Range

Integer in the range of 1 to 24 in units of Hour

Default

1

Name

transactionOrientedLinkMoDeletionTimer - Transaction oriented link MO deletion timer

Syntax

```
--timerName transactionOrientedLinkMoDeletionTimer --timerValue  
<string> [ --timerUnit Minute ]
```

Description

Transaction oriented link MO deletion timer for GTP based interfaces. Value 0 means do not do inactivity deletion. Transaction Oriented Link MO Deletion Time is used for Link Inactivity timer and only applies to operational ENABLED links. Only SGSN Gn, S3, S16, S10 and N26 are subject to this time. GGSN is subjective to Session Oriented Link MO Deletion Time. Administrative locked links are not subject to the inactivity timer.

Type / Range

Integer in the range of 0 to 1,440 in units of Minute

Default

30

Name

tS10 - TS10 implicit IMSI detach from non-eps services procedure guard timer

Syntax

```
--timerName tS10 --timerValue <string> [ --timerUnit Second ]
```

Description

Guards implicit IMSI detach from non-eps services procedure.

Type / Range

Integer in the range of 1 to 30 in units of Second

Default

4

Name

tS12_1 - TS12-1 MME reset variable guard timer

Syntax

```
--timerName tS12_1 --timerValue <string> [ --timerUnit Second ]
```

Description

Controls the resetting of the 'MME-Reset' variable.

Type / Range

Integer in the range of 8 to 23,048 in units of Second

Default

11168

Name

tS12_2 - TS12-2 MME reset procedure guard timer

Syntax

```
--timerName tS12_2 --timerValue <string> [ --timerUnit Second ]
```

Description

Guards the MME reset procedure. there is one ts12-2 timer per MME SGs association with a VLR.

Type / Range

Integer in the range of 1 to 120 in units of Second

Default

4

Name

tS13 - T13 SGs MME implicit detach guard timer

Syntax

```
--timerName tS13 --timerValue <string> [ --timerUnit Second ]
```

Description

Configure SGs TS13 timer for MME implicit detach.

Type / Range

Integer in the range of 1 to 32 in units of Second

Default

4

Name

tS6_1 - T6-1 location update procedure guard timer

Syntax

```
--timerName tS6_1 --timerValue <string> [ --timerUnit Second ]
```

Description

Guards the location update procedure.

Type / Range

Integer in the range of 10 to 90 in units of Second

Default

41

Name

tS8 - TS8 explicit IMSI detach from EPS services procedure guard timer

Syntax

```
--timerName tS8 --timerValue <string> [ --timerUnit Second ]
```

Description

Guards explicit IMSI detach from the EPS services procedure.

Type / Range

Integer in the range of 1 to 30 in units of Second

Default

4

Name

ts9 - TS9 explicit IMSI detach from non-eps services procedure guard timer

Syntax

```
--timerName ts9 --timerValue <string> [ --timerUnit Second ]
```

Description

Guards explicit IMSI detach from non-eps services procedure.

Type / Range

Integer in the range of 1 to 30 in units of Second

Default

4

Name

tslrAckFromGmlc - TSLR ack from GMLC

Syntax

```
--timerName tslrAckFromGmlc --timerValue <string> [ --timerUnit  
Second ]
```

Description

TSLR ack from GMLC.

Type / Range

Integer in the range of 1 to 60 in units of Second

Default

10

Name

ucdsRemHeartbeat - UCDS REM Heartbeat

Syntax

```
--timerName ucdsRemHeartbeat --timerValue <string> [ --timerUnit  
Millisecond ]
```

Description

Configure REM heartbeat interval for the UCDS service. VNF: Default is 1400, Range is 1400 to 20000 CNF: Default is 1400, Range is 1400 to 20000

Type / Range

Integer in the range of 200 to 20,000 in units of Millisecond

Default

1400

Name

ueContextModify - UE context modify

Syntax

```
--timerName ueContextModify --timerValue <string> [ --timerUnit  
Second ]
```

Description

When the MME sends a context modification message to the eNB, it expects to receive a modification response message from the eNB. if the timer expires while waiting for this response, the MME considers that this class 1 procedure failed.

Type / Range

Integer in the range of 1 to 60 in units of Second

Default

8

Name

ueContextRelease - UE context release

Syntax

```
--timerName ueContextRelease --timerValue <string> [ --timerUnit  
Second ]
```

Description

When the MME sends a context release message to the eNB, it expects to receive a release complete response message from the eNB. if the timer expires while waiting for this response, the MME considers that this class 1 procedure failed.

Type / Range

Integer in the range of 1 to 60 in units of Second

Default

8

Name

ueCtxtEpsMovedTo5gPurgeTimer - 4G Purge Timer for UE Contexts Moved to 5GC

Syntax

```
--timerName ueCtxtEpsMovedTo5gPurgeTimer --timerValue <string> [ --  
timerUnit Minute ]
```

Description

Purge timer starts after the UE moves to 5GC. The UE gets purged either because of the global purge timer or current timer, whichever expires first.

Type / Range

Integer in the range of 5 to 7,200 in units of Minute

Default

30

Name

ueRadioCapabilityMatchRequest - UE radio capability match request

Syntax

```
--timerName ueRadioCapabilityMatchRequest --timerValue <string> [ --  
timerUnit Millisecond ]
```

Description

Specifies the time to wait for UE radio capability match request.

Type / Range

Integer in the range of 100 to 10,000 in units of Millisecond

Default

8000

Name

ufdsRemHeartbeat - UFDS REM Heartbeat

Syntax

```
--timerName ufdsRemHeartbeat --timerValue <string> [ --timerUnit  
Millisecond ]
```

Description

Configure REM heartbeat interval for UDP Flow Distributor Service. VNF: N/A CNF: Default is 600, Range is 600 to 20000

Type / Range

Integer in the range of 200 to 20,000 in units of Millisecond

Default

600

Name

vlrCleanupIratUeCtxt - VLR Cleanup IRAT UE Contexts

Syntax

```
--timerName vlrCleanupIratUeCtxt --timerValue <string> [ --timerUnit  
Minute ]
```

Description

This parameter specifies the time for deleting from the VLR the preserved UE Contexts of the deregistered UEs that have moved to 5GC.

Type / Range

Integer in the range of 5 to 120, allowed 0 value also. in units of Minute

Default

5

Recommended

5

Name

warningMessage - Warning message

Syntax

```
--timerName warningMessage --timerValue <string> [ --timerUnit  
Second ]
```

Description

This is the timer value that MME waits before re-transmitting the WRWR (Write Replace Warning Request) message to an eNB if the CMAS response is not received from the eNB.

Type / Range

Integer in the range of 1 to 60 in units of Second

Default

8

7.115 cmm tlsCAcert

TLS CA Certificate. Syntax, description, parameters, and roles for cmm tlsCAcert command.

Syntax**Description**

This command creates the CA certificate to be loaded into openssl. The Certificate is used to validate certificates received from other tls entities.

Parameters**Name**

name - TLS CA Certificate Name

Syntax

```
--name <string>
```

Description

TLS CA Certificate Name. This is the pem file for the CA authority.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

signedCertFile - Signed Certificate File Name

Syntax

--signedCertFile <string>

Description

Absolute path of the signed certificate file name. Example: /tmp/certificate

Class

Required on create.

Type / Range

Digit string of length 1 to 100 with the allowed pattern of [0-9a-zA-Z\._:@,()/*]*

Name

content - certificate content

Syntax

--content <string>

Description

certificate content

Class

Read only.

Type / Range

String of length 0 to 120

Name

lineNumber - content line number

Syntax

--lineNumber <integer>

Description

line number of the certificate content

Class

Read only.

Type / Range

Integer in the range of 0 to 65,535

Roles

Create

secadmin

Delete

secadmin

List

secadmin

7.116 cmm tlsCAcertList

TLS CA cert List. Syntax, description, parameters, and roles for `cmm tlsCAcertList` command.

Syntax

Description

This command is to create/delete TLS Certified Authority certificate name.

Parameters

Name

name - TLS CA Cert list

Syntax

--name <string>

Description

TLS Certified Authority Certificate

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of `[0-9a-zA-Z\.\-_:@]*`

Roles

Create

secadmin

7.117 cmm tlsCertificate

TLS Certificate. Syntax, description, parameters, and roles for cmm tlsCertificate command.

Syntax**Description**

Manage TLS Certificate. The file pair must be specified together for the create operation

Parameters**Name**

name - TLS Certificate Name

Syntax

--name <string>

Description

TLS Certificate Name. Not applicable for the list operation

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

privateKeyFile - Private key file name

Syntax

--privateKeyFile <string>

Description

Absolute path of the private key file name. Example: /tmp/privkey.pem

Class

Required on create.

Type / Range

Digit string of length 1 to 100 with the allowed pattern of [0-9a-zA-Z\._:@&(),/]*

Name

signedCertFile - Signed Certificate File Name

Syntax

--signedCertFile <string>

Description

Absolute path of the signed certificate file name. Example: /tmp/certificate

Class

Required on create.

Type / Range

Digit string of length 1 to 100 with the allowed pattern of [0-9a-zA-Z\._&,(/]*

Name

content - certificate content

Syntax

--content <string>

Description

certificate content

Class

Optional.

Type / Range

String of length 0 to 120

Name

lineNumber - content line number

Syntax

--lineNumber <integer>

Description

line number of the certificate content

Class

Optional.

Type / Range

Integer in the range of 0 to 65,535

Name

type - certificate type

Syntax

--type <string>

Description

certificate type

Class

Optional.

Type / Range

Digit string of length 0 to 20

7.118 cmm tlsCertificateList

TLS Certificate List. Syntax, description, parameters, and roles for cmm tlsCertificateList command.

Syntax**Description**

This command is to create/delete TLS server certificate name.

Parameters**Name**

name - TLS Certificate Name

Syntax

--name <string>

Description

TLS Certificate Name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

7.119 cmm tlsClientCert

TLS Client Certificate. Syntax, description, parameters, and roles for `cmm tlsClientCert` command.

Syntax

Description

Manage TLS Client Certificate. The file pair must be specified together for the create operation

Parameters

Name

name - TLS Client Certificate Name

Syntax

--name <string>

Description

TLS Client Certificate Name. Not applicable with the list operation

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of `[0-9a-zA-Z\.\_:@]*`

Name

privateKeyFile - Client private key file name

Syntax

--privateKeyFile <string>

Description

Absolute path of the client private key file name. Example: `/tmp/clientprivkey.pem`

Class

Required on create.

Type / Range

Digit string of length 1 to 100 with the allowed pattern of `[0-9a-zA-Z\.\_:@,()/*]*`

Name

signedCertFile - Signed Client Certificate File Name

Syntax

--signedCertFile <string>

Description

Absolute path of the signed client certificate file name. Example: /tmp/clientcert

Class

Required on create.

Type / Range

Digit string of length 1 to 100 with the allowed pattern of [0-9a-zA-Z\.\-_:&(),/]*

Name

content - client certificate content

Syntax

--content <string>

Description

client certificate content

Class

Optional.

Type / Range

String of length 0 to 120

Name

lineNumber - client certificate content line number

Syntax

--lineNumber <integer>

Description

line number of the client certificate content

Class

Optional.

Type / Range

Integer in the range of 0 to 65,535

Name

type - client certificate type

Syntax

--type <string>

Description

client certificate type

Class

Optional.

Type / Range

Digit string of length 0 to 20

7.120 cmm tlsClientCertList

TLS Client Certificate List. Syntax, description, parameters, and roles for `cmm tlsClientCertList` command.

Syntax**Description**

This command is to create/delete TLS client certificate name.

Parameters**Name**

name - TLS Client Certificate Name

Syntax

--name <string>

Description

TLS Client Certificate Name

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of `[0-9a-zA-Z\.\-_\:@]*`

7.121 cmm tlsProfile

TLS Profile. Syntax, description, parameters, and roles for `cmm tlsProfile` command.

Syntax

Description

Create , modify and delete a Transport Layer Security profile. A TLS profile will be provisioned to a SBI.

Parameters

Name

name - TLS Profile Name

Syntax

--name <string>

Description

TLS profile name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

mutualTlsAuth - Mutual TLS Authentication

Syntax

--mutualTlsAuth <list-item>

Description

This parameter indicates if the Producer Service should ask to Authenticate the Client through mutual Authentication. If the EndPoint associated with this Profile is a Client this parameter is ignored.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

sendSni - Send SNI

Syntax

```
--sendSni <list-item>
```

Description

When this parameter is set to true CMM will send the Server Name Indication (SNI) extension when setting up a TLS connection as a HTTP/2 client. The SNI is set to the FQDN of the Server that terminates the connection.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

tlsCertificateName - TLS Certificate Name for SBI

Syntax

```
--tlsCertificateName <string>
```

Description

Configure TLS certificate used in establishing secure communication.

Restrictions

This element is only applicable when interfaceName is a SBI interface.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

tlsEncrypted - TLS Encrypted for SBI

Syntax

--tlsEncrypted <list-item>

Description

If this parameter is set to 'True' then AMF uses https. If not AMF uses http.

Restrictions

This element is only applicable when interfaceName is a SBI interface.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

tlsVersion - TLS Version

Syntax

--tlsVersion <list-item>

Description

TLS version used to set up secure TCP connection for HTTPS.

Class

Optional.

List

- 1.2 - Version 1.2
- 1.3 - Version 1.3
- negotiation - Negotiation of TLS 1.3 OR 1.2

Default

1.2

Name

validateSni - Validate SNI

Syntax

--validateSni <list-item>

Description

When this parameter is set to true CMM will validate the Server Name Indication (SNI) extension when setting up a TLS connection as a HTTP/2 server. The SNI must be set to one of the FQDNs associated with the IP endpoint where the connection is terminated.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

7.122 cmm tlsRevocation

TLS Revocation CRL. Syntax, description, parameters, and roles for `cmm tlsRevocation` command.

Syntax

Description

TLS Revocation CRL - A file of Revoke Certificate Serial Numbers. This is a complete list of Revoked Certificates not a delta

Parameters

Name

name - TLS CA Certificate Name

Syntax

--name <string>

Description

TLS CA Certificate Name. This is the pem file for the CA authority.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

revocationListFile - Certificate Revocation List

Syntax

--revocationListFile <string>

Description

Absolute path of the CRL file

Class

Required on create.

Type / Range

Digit string of length 1 to 100 with the allowed pattern of [0-9a-zA-Z\._&(),/]*

Name

content - certificate content

Syntax

--content <string>

Description

certificate content

Class

Read only.

Type / Range

String of length 0 to 120

Name

lineNumber - content line number

Syntax

--lineNumber <integer>

Description

line number of the certificate content

Class

Read only.

Type / Range

Integer in the range of 0 to 65,535

Roles**Create**

7.123 cmm tlsRevocationList

TLS Revocation List. Syntax, description, parameters, and roles for cmm tlsRevocationList command.

Syntax**Description**

This command is to create/delete TLS Revocation List name.

Parameters**Name**

name - TLS Revocation List

Syntax

--name <string>

Description

TLS Revocation List Name

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Roles**Create**

secadmin

Show

secadmin

7.124 cmm tnlaProfile

TNLA Profile. Syntax, description, parameters, and roles for `cmm tnlaProfile` command.

Syntax

Description

Administer TNLA Profile.

Parameters

Name

name - TNLA Profile Name

Syntax

--name <string>

Description

TNLA profile name

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Name

numberTnlaPerGnb - Number of TNLAs to establish per gNB

Syntax

--numberTnlaPerGnb <integer>

Description

Parameter specifies the number of TNLAs to an AMF establishes with per gNB. The parameter can be set from 1 to N where N is the number of maximum number of AMF N2 local endpoints that can be provisioned.

Class

Optional.

Type / Range

Integer in the range of 1 to 16

Default

1

Name

tnlaDistributorEnable - TNLA Distributor Enable

Syntax

--tnlaDistributorEnable <list-item>

Description

Parameter enables and disables TNLA distributor functionality. When the parameter is set to 'true', the ability of the AMF to add and remove TNLAs for a gNB is enabled. When the parameter is set to 'false', the ability of the AMF to add and remove TNLAs for a gNB is disabled.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

tnlaWeightFactor - Weight factor of each TNLA of the AMF

Syntax

--tnlaWeightFactor <integer>

Description

Parameter specifies the weight factor of each TNLA of the AMF.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

255

7.125 cmm traceData

Tracedata. Syntax, description, parameters, and roles for cmm traceData command.

Syntax

Description

Create, delete, list and show traces.

Parameters

Name

end - End

Syntax

--end <string>

Description

End time of the trace, format <YYYY>--<MM>--<DD>T<HH>:<mm>:<ss>.<SSS>

Class

Optional.

Type / Range

Digit string of length

Name

file - File

Syntax

--file <string>

Description

File name of the trace.

Class

Optional.

Type / Range

Digit string of length

Name

fileFolder - File folder

Syntax

--fileFolder <string>

Description

Trace file folder.

Class

Optional.

Type / Range

Digit string of length

Name

fileLocation - File location

Syntax

--fileLocation <string>

Description

Trace file location.

Class

Optional.

Type / Range

Digit string of length

Name

fileName - File name

Syntax

--fileName <string>

Description

Trace file name.

Class

Optional.

Type / Range

Digit string of length

Name

imsi - IMSI

Syntax

--imsi <digits>

Description

IMSI.

Class

Optional.

Type / Range

Digit string of length 5 to 15

Name

limit - Limit

Syntax

--limit <list-item>

Description

Delete limit of the trace.

Class

Optional.

List

- all - The specified call trace job packets will be deleted from elasticsearch DB and CT *.pcap file(s) has been created (per CRAFT request) and stored at ACTIVE NECC /shared/restfm/traces.
- db - The specified call trace job packets stored in elasticsearch DB will be deleted.

Name

msisdn - MSISDN

Syntax

--msisdn <digits>

Description

MSISDN.

Class

Optional.

Type / Range

Digit string of length 5 to 18

Name

packetCount - Packet count

Syntax

--packetCount <string>

Description

Packet count.

Class

Optional.

Type / Range

Digit string of length

Name

start - Start

Syntax

--start <string>

Description

Start time of the trace, format <YYYY>--<MM>--<DD>T<HH>:<mm>:<ss>.<SSS>

Class

Optional.

Type / Range

Digit string of length

Name

status - Status

Syntax

--status <string>

Description

Status of the operation.

Class

Optional.

Type / Range

Digit string of length

Name

traceID - Trace id

Syntax

--traceID <integer>

Description

Id of the trace.

Class

Optional.

Type / Range

Integer in the range of 1 to 100

Name

traceOrigin - Trace origin

Syntax

--traceOrigin <list-item>

Description

Type of the trace.

Class

Optional.

List

- cli - cli
- hss - hss
- udm - udm

Roles**Create**

sysadmin, manage

Delete

sysadmin, manage

List

sysadmin, manage, monitor

7.126 cmm traceDataStatus

trace Data Status. Syntax, description, parameters, and roles for **cmm traceDataStatus** command.

Syntax**Description**

List and show available trace data.

Parameters**Name**

end - End

Syntax

--end <string>

Description

Stop date of the trace.

Class

Optional.

Type / Range

Digit string of length

Name

first - First

Syntax

--first <string>

Description

First trace.

Class

Optional.

Type / Range

Digit string of length

Name

for - For

Syntax

--for <string>

Description

Who the trace is for.

Class

Optional.

Type / Range

Digit string of length

Name

hits - Hits

Syntax

--hits <integer>

Description

How many trace hits.

Class

Optional.

Type / Range

Integer in the range of 1 to 65,535

Name

imsi - IMSI

Syntax

--imsi <digits>

Description

IMSI.

Class

Optional.

Type / Range

Digit string of length 5 to 15

Name

last - Last

Syntax

--last <string>

Description

Last trace.

Class

Optional.

Type / Range

Digit string of length

Name

msisdn - MSISDN

Syntax

--msisdn <digits>

Description

MSISDN.

Class

Optional.

Type / Range

Digit string of length 5 to 18

Name

start - Start

Syntax

--start <string>

Description

Start date of the trace.

Class

Optional.

Type / Range

Digit string of length

Name

traceID - Trace id

Syntax

--traceID <integer>

Description

Id of the trace.

Class

Optional.

Type / Range

Integer in the range of 1 to 100

Name

traceOrigin - Trace origin

Syntax

--traceOrigin <list-item>

Description

Type of the trace.

Class

Optional.

List

- cli - cli
- hss - hss
- udm - udm

Roles**Show**

sysadmin, manage, monitor

List

sysadmin, manage, monitor

7.127 cmm ueCounts

ueCounts. Syntax, description, parameters, and roles for cmm ueCounts command.

Syntax

Description

ueCounts from cppsId.

Parameters

Name

cppsId - Cpps identifier

Syntax

--cppsId <integer>

Description

Cpps identifier.

Class

Required key.

Type / Range

Integer in the range of 0 to 63

Name

countName - Count name

Syntax

--countName <string>

Description

Count name.

Class

Read only.

Type / Range

Digit string of length

Name

countValue - Count value

Syntax

--countValue <integer>

Description

Count value.

Class

Read only.

Type / Range

Integer in the range of 0 to 2,147,483,647

Roles**List**

sysadmin, manage, monitor

7.128 cmm ueFailopenProfile

UE Failopen Profile. Syntax, description, parameters, and roles for `cmm ueFailopenProfile` command.

Syntax**Description**

UE failopen profile for HSS unavailability. At maximum 50 UE failopen profiles can be created.

Parameters**Name**

name - UE Failopen Profile Name

Syntax

--name <string>

Description

The name of the UE failopen profile.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

chargingCharacteristics - Charging Characteristics

Syntax

--chargingCharacteristics <string>

Description

Charging characteristics.

Class

Required on create.

Type / Range

Digit string of length 1 to 4 with the allowed pattern of [0-9a-fA-F]*

Name

apnOverrideWithFailopen - APN Override with Failopen

Syntax

--apnOverrideWithFailopen <list-item>

Description

Controls whether the MME uses the UE failopen profile to to override UE requested APN, when the HSS default APN configuration is not available due to HSS unavailability, and the MME is provisioned to both use the UE failopen profile and override/correct/replace the requested APN based on HSS subscription. The parameter is applied with any of the below settings: 1) 'Support APN correction' global parameter is set to 'Yes' 2) Per UE PLMN/serving PLMN 'APN correction during attach' and/or 'APN correction during standalone PDN connect' is/are defined as 'Received from HSS', 3) Support IMSI IMEI APN conversion is set to 'IMEI priority' or 'IMSI priority', and on 'APN IMSI Range Services' command the 'Replacement action' for the IMSI/IMEI/APN defines 'Use default' 4) 'IMSI IMEI lookup fail' global parameter is set to 'Use Default' 5) 'Support IMS IIMEI APN enhancement' global parameter is set to 'Enable and use default APN context ID'

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

defaultApnNi - Default APN NI

Syntax

--defaultApnNi <string>

Description

The default Access Point Name Network Indicator.

Class

Optional.

Type / Range

Digit string of length 0 to 62 with the allowed pattern of ([0-9a-zA-Z\.\-]*|*)

Default

"

Name

failopenProfileApnListName - Failopen Profile APN List Name

Syntax

--failopenProfileApnListName <string>

Description

The name of the APN list associated with the UE failopen profile.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\- _:@]*

Default

"

Name

networkAccessMode - Network Access Mode

Syntax

--networkAccessMode <list-item>

Description

Network access mode.

Class

Optional.

List

- Packet and Circuit - Specifies network access mode of packet and circuit.
- Packet only - Specifies network access mode of packet only.

Default

Packet only

Name

pdnDeactivationCc - PDN Deactivation Cause Code

Syntax

--pdnDeactivationCc <integer>

Description

ESM cause that the MME sends if the failopen profile based PDN needs to be deactivated due to HSS unavailability recovery.

Class

Optional.

Type / Range

Integer in the range of 8, 26-39, 41-47, 49-60, 65-66, 81, 95-101, 111-113

Default

36

Name

restorationDeactNotifyIdleUe - Restoration Deactivation Notify Idle UE

Syntax

--restorationDeactNotifyIdleUe <list-item>

Description

Define whether an ECM-IDLE UE will be paged for PDN deactivation during manual HSS restoration process.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

rfspId - RFSP ID

Syntax

--rfspId <integer>

Description

RAT/frequency selection priority identification.

Class

Optional.

Type / Range

Integer in the range of 1 to 256

Default

256

Name

serviceRejectCode - Service Reject Code

Syntax

--serviceRejectCode <integer>

Description

The Service reject cause code when automatic HSS restoration is ongoing and the UE needs to reattach.

Class

Optional.

Type / Range

Integer in the range of 3,6-12,35,40,42

Default

10

Name

tauRejectCauseCode - TAU Reject Cause Code

Syntax

--tauRejectCauseCode <integer>

Description

The TAU reject cause code when automatic HSS restoration is ongoing and the UE needs to reattach.

Class

Optional.

Type / Range

Integer in the range of 3,6,7,9,10-12,14,15,35,40,42

Default

10

Name

ueAmbrDL - UE-AMBR DL

Syntax

--ueAmbrDL <integer>

Description

User equipment aggregate maximum bit rate downlink.

Class

Optional.

Type / Range

Integer in the range of 0, 1-63, 64- 568, 576-8640, 8700-16000, 17000-128000,
130000-4000000000

Default

128000

Recommended

The recommended value is 100000000.

Name

ueAmbrUI - UE-AMBR UL

Syntax

--ueAmbrUl <integer>

Description

User equipment aggregate maximum bit rate uplink.

Class

Optional.

Type / Range

Integer in the range of 0, 1-63, 64- 568, 576-8640, 8700-16000, 17000-128000, 130000-4000000000

Default

128000

Recommended

The recommended value is 100000000.

7.129 cmm ueLbStatistics

UE Load Balance Statistics. Syntax, description, parameters, and roles for cmm ueLbStatistics command.

Syntax

Description

This command shows the UE Load Balance Statistics.

Parameters

Name

imsiRangeFrom - IMSI range from

Syntax

--imsiRangeFrom <digits>

Description

IMSI range from.

Class

Optional.

Type / Range

Digit string of length 0 or 1 to 15

Name

imsiRangeTo - IMSI range to

Syntax

--imsiRangeTo <digits>

Description

IMSI range to.

Class

Optional.

Type / Range

Digit string of length 0 or 1 to 15

Name

lbAbsolute - Number of UEs to load balance

Syntax

--lbAbsolute <integer>

Description

This field specifies the absolute number of UEs to be load balanced. changing this setting can be done only when ue-load balancing is administratively shutdown.

Class

Optional.

Type / Range

Integer in the range of 1 to 5,000,000

Name

lbcmmLocked - Locked status

Syntax

```
--lbcmmLocked <list-item>
```

Description

Locked status.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Name

lbmmeQuarantine - MME quarantined

Syntax

```
--lbmmeQuarantine <list-item>
```

Description

MME quarantined.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Name

lbMoreStatus - More status

Syntax

```
--lbMoreStatus <string>
```

Description

Additional status.

Class

Optional.

Type / Range

Digit string of length

Name

lbNumConUesRelocated4G - Connected ues relocated in LTE

Syntax

```
--lbNumConUesRelocated4G <integer>
```

Description

Connected UEs relocated in LTE.

Class

Optional.

Type / Range

Integer in the range of 0 to 4,294,967,295

Name

lbNumConUesToReloc4G - Connected ues to relocate in LTE

Syntax

-- lbNumConUesToReloc4G <integer>

Description

Connected UEs to relocate in LTE.

Class

Optional.

Type / Range

Integer in the range of 0 to 4,294,967,295

Name

lbNumIdleUesRelocated4G - Idle ues relocated in LTE

Syntax

-- lbNumIdleUesRelocated4G <integer>

Description

Idle UEs relocated in LTE.

Class

Optional.

Type / Range

Integer in the range of 0 to 4,294,967,295

Name

lbNumIdleUesToReloc4G - Idle ues to relocate in LTE

Syntax

-- lbNumIdleUesToReloc4G <integer>

Description

Idle UEs to relocate in LTE.

Class

Optional.

Type / Range

Integer in the range of 0 to 4,294,967,295

Name

lbNumUesNotPaged4G - Number of UEs not paged

Syntax

--lbNumUesNotPaged4G <integer>

Description

UEs not paged in LTE.

Class

Optional.

Type / Range

Integer in the range of 0 to 4,294,967,295

Name

lbNumUesRelocated4G - Ues relocated in LTE

Syntax

--lbNumUesRelocated4G <integer>

Description

UEs relocated in LTE.

Class

Optional.

Type / Range

Integer in the range of 0 to 4,294,967,295

Name

lbNumUesToReloc4G - Ues to relocate in LTE

Syntax

--lbNumUesToReloc4G <integer>

Description

UEs to relocate in LTE.

Class

Optional.

Type / Range

Integer in the range of 0 to 4,294,967,295

Name

lbPercentage - Percentage of UEs to load balance

Syntax

--lbPercentage <integer>

Description

This field specifies the percentage of UEs to be load balanced. changing this setting can be done only when ue-load balancing is administratively shutdown.

Class

Optional.

Type / Range

Integer in the range of 1 to 100

Name

lbPhase - Phase

Syntax

--lbPhase <list-item>

Description

Phase of load balance.

Class

Optional.

List

- AGGR - AGGR phase - AGGR phase.
- Campon - Campon phase - Campon phase.
- Drain - Drain phase - Drain phase.
- FetchFromDbbs - FetchFromDbbs.
- NotRunning - Not running - Not running.
- WaitLock - Wait lock - Wait lock phase.

Name

lbStatus - Status

Syntax

--lbStatus <list-item>

Description

Load balance status.

Class

Optional.

List

- Aborted - Aborted state.
- CapReached - Completed capacity reached - Completed capacity reached state.
- CompleteLocked - Complete locked - Complete locked.
- CompleteTimeoutLocked - Complete timeout locked - Complete timeout locked.

- Completed - Completed state.
- DInterMME - Denied inter MME reloaction - Denied inter MME reloaction inprogress state.
- DIntraMME - Denied intra MME reloaction - Denied intra MME reloaction inprogress state.
- DMMEAGGR - Denied MME AGGR locked - Denied MME AGGR locked state.
- DNoActS10L - Denied noactive S10 link - Denied noactive S10 link state.
- DeniedMMENotConfigured - Denied MME not configured - Denied MME not configured.
- DeniedSgsnAggrLocked - Denied SGSN aggr locked - Denied SGSN aggr locked.
- DeniedSgsnNotConfigured - Denied SGSN not configured - Denied SGSN not configured.
- Failed - Failed state.
- Inprogress - Inprogress state.
- MMECompleteSgsnAbort - MME complete SGSN abort - MME complete SGSN abort.
- MMECompleteSgsnFailed - MME complete SGSN failed - MME complete SGSN failed.
- NotRunning - Not running - Not running state.
- OverLoad - Aborted over loaded - Aborted due to over loaded state.
- Requested - Requested state.
- SgsnCompleteMMEAbort - SGSN complete MME abort - SGSN complete MME abort.
- SgsnCompleteMMEFailed - SGSN complete MME failed - SGSN complete MME failed.
- Stop4GNoS10SgsnComplete - Stop 4G no S10 SGSN complete - Stop 4G no S10 SGSN complete.
- Stop4GNoS10SgsnFailed - Stop 4G no S10 SGSN failed - Stop 4G no S10 SGSN failed.
- TimeOut - Completed time out - Completed time out state.
- Unlocked - Unlocked state.

Name

lbTimeRemainInPhase - lbTimeRemainInPhase

Syntax

--lbTimeRemainInPhase <integer>

Description

Time remaining in phase.

Class

Optional.

Type / Range

Integer in the range of 0 to 4,294,967,295

Name

lbTotalTimeInterval - LBTotalTimeInterval

Syntax

--lbTotalTimeInterval <integer>

Description

Total time interval.

Class

Optional.

Type / Range

Integer in the range of 1 to 54,000

Name

maxDuration - MaxDuration requested

Syntax

--maxDuration <integer>

Description

Maximum duration requested.

Class

Optional.

Type / Range

Integer in the range of 900 to 54,000

Name

maxOffLoadRate - Maximum Off Load Rate

Syntax

--maxOffLoadRate <integer>

Description

The CMM shall limit the off-load rate to a --maxOffLoadRate per CPPS (UEs/sec). The rate is a function the VLR Scan rate and the impact of --SkipPostProcLb. If --maxOffLoadRate is not supplied the CMM instance off-loads at the default rate. The default value is 150 UEs/Sec per CPPS. --maxOffLoadRate range allowed is 1 to 600 UEs/sec.

Class

Optional.

Type / Range

Maximum offload rate for UE load balance.

Default

150

Name

mmeCode - MmeCode

Syntax

--mmeCode <digits>

Description

MME code.

Class

Optional.

Type / Range

Digit string of length 0 or 1 to 3

Name

msisdnRangeFrom - MSISDN range from

Syntax

--msisdnRangeFrom <digits>

Description

MSISDN range from.

Class

Optional.

Type / Range

Digit string of length 0 or 1 to 15

Name

msisdnRangeTo - MSISDN range to

Syntax

--msisdnRangeTo <digits>

Description

MSISDN range to.

Class

Optional.

Type / Range

Digit string of length 0 or 1 to 15

Name

nonBroadcastTac - NonBroadcast TAC

Syntax

--nonBroadcastTac <integer>

Description

NonBroadcast TAC.

Class

Optional.

Type / Range

Integer in the range of 0 to 65,535

Name

nonBroadcastTaMcc - NonBroadcast TAC MCC

Syntax

--nonBroadcastTaMcc <digits>

Description

NonBroadcast TAC MCC.

Class

Optional.

Type / Range

Digit string of length 3

Name

nonBroadcastTaMnc - NonBroadcast TAC MNC

Syntax

--nonBroadcastTaMnc <digits>

Description

NonBroadcast TAC MNC.

Class

Optional.

Type / Range

Digit string of length 2 to 3

Name

offloadRate - Offload Rate

Syntax

--offloadRate <integer>

Description

Calculated offload rate from $(lbNumUesRelocated4G)/(maxDuration-lbTimeRemainInPhase)$.

Class

Optional.

Type / Range

Rate of CPPS off-load for UELB show commands. Range is 0 to 1000 UEs/Sec.

Default

0

Name

offloadTaiAreaListName - Offload TAI Area List Name

Syntax

--offloadTaiAreaListName <string>

Description

This is the first list of TACs in a PLMN. When specified all users in the TACs specified will be moved by the UELB command.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

offloadTaiAreaListName2 - Offload TAI Area List Name 2

Syntax

--offloadTaiAreaListName2 <string>

Description

This is a second list of TACs in a PLMN. When specified all users in the TACs specified will be moved by the UELB command.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

offloadTaiAreaListName3 - Offload TAI Area List Name 3

Syntax

--offloadTaiAreaListName3 <string>

Description

This is the third list of TACs in a PLMN. When specified all users in the TACs specified will be moved by the UELB command.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

offloadTaiAreaListPlmnName - Offload TAI Area List Plmn Name

Syntax

--offloadTaiAreaListPlmnName <string>

Description

This specifies the PLMN name for the first TAI Area List.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

offloadTaiAreaListPlmnName2 - Offload TAI Area List Plmn Name 2

Syntax

--offloadTaiAreaListPlmnName2 <string>

Description

This specifies the PLMN name for the second TAI Area List.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

offloadTaiAreaListPlmnName3 - Offload TAI Area List Plmn Name 3

Syntax

--offloadTaiAreaListPlmnName3 <string>

Description

This specifies the PLMN name for the third TAI Area List.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

quarantineMode - QuarantineMode

Syntax

--quarantineMode <list-item>

Description

Quarantine mode.

Class

Optional.

List

- all - Specify quarantine mode of all.
- lte-only - LTE only - Specify quarantine mode of LTE only.
- not-used - Not used - Specify quarantine mode of not used.

Name

radioType - Radio type

Syntax

--radioType <list-item>

Description

Radio type.

Class

Optional.

List

- all - Specify radio type of all.
- lte - Specify radio type of LTE.

Name

serviceLock - ServiceLock

Syntax

--serviceLock <list-item>

Description

Service lock requested.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Name

shutdownFlag - ShutDown state requested

Syntax

--shutdownFlag <list-item>

Description

The load balancing process has to be explicitly started using no shutdown command. once started, none of the parameters can be changed. the shutdown command stops load balancing process. if this is done before the completion of the load balancing process the system will continue its normal operation. if the shutdown command has been issued after the job was completed and the system was in quarantine or service-lock mode, this action will effectively reset the corresponding mode and the system will continue its normal operation.

Class

Optional.

List

- noshutdown - Execute - Execute load balance on the WMM.
- shutdown - Abort-Stop - Aborted\t load balance on the WMM if one is in progress. if loadbalance\ \ is already completed, shutdown will let you to change the state to start\ \ a new one.

Name

skipPostProcLb - Skip Load Balancing after Procedure

Syntax

--skipPostProcLb <list-item>

Description

The GPARAM skipPostSrLbDuringUelb shall be deprecated and replaced by the - - skipPostProcLb option. skipPostSrLbDuringUelb shall not be used together with the -- soft option. Possible values are True/False. Default is True

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

soft - Soft UELB Option

Syntax

--soft <list-item>

Description

If the option 'soft' is set to true, the CMM makes two passes (Pass1, Pass2) in the CAMPON phase. The following actions take place during Pass1: For ECM-CONNECTED UEs (including emergency, Volte, high priority, non-emergency) the CMM shall issue a UE CONTEXT RELEASE

COMMAND with cause 'Loadbalancing TAU required' upon receiving a UE CONTEXT RELEASE REQUEST with cause 'User inactivity'. If the option soft is not set then the current behaviour applied. Soft off-load cannot be used with Directed loadbalancing as directed loadbalancing uses GUTI reallocation. For ECM-IDLE UEs(including emergency, Volte, high priority, non-emergency) the CMM shall page the UE. Once UE sends SR/CPSR and becomes ECM-CONNECTED then CMM shall use the procedure specified above for the ECM-CONNECTED UE to offload the UE

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

softSelectedProcs - Soft UELB for selected call processing procedures

Syntax

--softSelectedProcs <list-item>

Description

The -- softSelectedProcs option is introduced to enable soft handling of selected procedures with the current off-loading mechanism. If the softSelectedProcs option is set to True the CMM shall send UE CONTEXT RELEASE COMMAND with cause 'load balancing TAU required' when: CMM determines that it can initiate UE context release or a Volte UE releases its QCI1 bearer. Note1: softSelectedProcs cannot be used with the soft option because the treatment of Volte UEs would be inconsistent with the treatment of other UEs

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

srsUsed - SRS Used for UELB

Syntax

--srsUsed <list-item>

Description

When the CMM is configured to support in-instance session restoration (SRS) the -- sRsUsed option can be set to speed up the Database phase. The Database phase deals with unclaimed and aged-out UEs. During UELB Cache-Age is suspended for the UE types. The selected sRsUsed option value determines which UE types are to be moved with the help of the in-instance service restoration and therefore excluded from the Database phase.

Class

Optional.

List

- all - All UE Types - All UE Types are selected
- mbb - 4G Mobile Broadband UEs - 4G Mobile Broadband UEs Selection
- nbioT - NBioT UEs - NBioT UEs selection
- none - No UE Type is selected - No UE Type is selected. This is the default Value

Default

none

Name

ueType - Ue type

Syntax

--ueType <list-item>

Description

UE type.

Class

Optional.

List

- active - Specify active UEs.
- all - Specify all UEs.
- idle - Specify idle UEs.

Roles**Show**

sysadmin, manage, monitor

List

sysadmin, manage, monitor

7.130 cmm ueLoadBalance

UE Load Balance. Syntax, description, parameters, and roles for cmm ueLoadBalance command.

Syntax

Description

UE Load Balance. In case of TA/QA configuration, SGSN PAPSS should be drained (using the cmm maintenance command) and must be locked (using cmm serviceState modify command) before ueLoadBalance with serviceLock=true is entered.

Parameters

Name

dcnBasedOffload - Load balancing using DCN ID of the UE

Syntax

--dcnBasedOffload <list-item>

Description

Parameter is used to enable load balancing of UE supporting a DCN ID

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

dcnId - Dedicated Core Network Identifier

Syntax

--dcnId <integer>

Description

This parameter used to offload UEs supporting a DCN ID. MME determines DNC ID of UE by using the DNC ID to UE Usage Type provisioning

Class

Optional.

Type / Range

Integer in the range of 1 to 126 or 128 to 65,535

Default

65535

Name

directedMoveMode - Directed Move Mode

Syntax

--directedMoveMode <list-item>

Description

Parameter to select mode of UE move to a targeted MME in the same MME pool consisting of CMM and FNS. Two modes are supported: CMM - uses the CMM method of directive move method, FNS - uses the FNS method of directive move. Both the methods use GUTI reallocation to move to the target MME within the same pool. However, for FNS method, the target MME forces the UE to reattach to the network where as the CMM method gets UE context from the old MME thus eliminating need to force the UE to reattach.

Class

Optional.

List

- CMM - Mode 1 - CMM supported UE directed move.
- FNS - FNS supported UE directed move.

Default

CMM

Name

dynUeLbDrainIntv - Dynamic UELB drain interval

Syntax

--dynUeLbDrainIntv <list-item>

Description

Enables quick (dynamically calculated) UE-LB drain interval.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

imsiRangeFrom - IMSI range from

Syntax

--imsiRangeFrom <digits>

Description

Specifies which imsi-range start for UEs will be subject to load balancing process. there can be only single imsi-range specific data this command is mutually exclusive with mobilenetworkname, msisdn-range, location and ran data. imsirangefrom and imsirango must be specified together. changing this setting can be done only when ue-load balancing is administratively shutdown.

Class

Optional.

Type / Range

Digit string of length 0 or 1 to 15

Default

''

Name

imsiRangeTo - IMSI range to

Syntax

--imsiRangeTo <digits>

Description

Specifies which imsi-range end for UEs will be subject to load balancing process. there can be only single imsi-range specific data this command is mutually exclusive with mobilenetworkname, msisdn-range, location and ran data. imsirangefrom and imsirango must be specified together. changing this setting can be done only when ue-load balancing is administratively shutdown.

Class

Optional.

Type / Range

Digit string of length 0 or 1 to 15

Default

''

Name

lbAbsolute - Number of UEs to load balance

Syntax

--lbAbsolute <integer>

Description

This field specifies the absolute number of UEs to be load balanced. changing this setting can be done only when ue-load balancing is administratively shutdown.

Class

Optional.

Type / Range

Integer in the range of 1 to 5,000,000

Name

lbPercentage - Percentage of UEs to load balance

Syntax

--lbPercentage <integer>

Description

This field specifies the percentage of UEs to be load balanced. changing this setting can be done only when ue-load balancing is administratively shutdown.

Class

Optional.

Type / Range

Integer in the range of 1 to 100

Name

maxDuration - Maximum duration

Syntax

--maxDuration <integer>

Description

Specifies the maximum time in seconds load balancing process will be active. after reaching the maximum time before reaching target number of UEs the load balancing effort will stop and the system will behave in the same way as if the target number of UEs would have been reached. changing this setting can be done only when ue-load balancing is administratively shutdown.

Class

Optional.

Type / Range

Integer in the range of 900 to 54,000

Default

5400

Name

maxOffLoadRate - Maximum Off Load Rate

Syntax

--maxOffLoadRate <integer>

Description

The CMM shall limit the off-load rate to a --maxOffLoadRate per CPPS (UEs/sec). The rate is a function the VLR Scan rate and the impact of --SkipPostProcLb. If --maxOffLoadRate is not supplied the CMM instance off-loads at the default rate. The default value is 150 UEs/Sec per CPPS. --maxOffLoadRate range allowed is 1 to 600 UEs/sec.

Class

Optional.

Type / Range

Maximum offload rate for UE load balance.

Default

150

Name

mmeCode - MmeCode

Syntax

--mmeCode <digits>

Description

The target MME node in the pool the UEs should be moved to. the target MME is specified in the terms of mme-code. changing this setting can be done only when ue-load balancing is administratively shutdown.

Class

Optional.

Type / Range

Digit string of length 0 or 1 to 3

Name

msisdnRangeFrom - MSISDN range from

Syntax

--msisdnRangeFrom <digits>

Description

Specifies which msisdn-range start for UEs will be subject to load balancing process. there can be only single imsi-range specific data this command is mutually exclusive with mobilenetworkname, imsi-range, location and ran data. msisdnrangefrom and msisdnrangeto must be specified together. changing this setting can be done only when ue-load balancing is administratively shutdown.

Class

Optional.

Type / Range

Digit string of length 0 or 1 to 15

Default

''

Name

msisdnRangeTo - MSISDN range to

Syntax

--msisdnRangeTo <digits>

Description

Specifies which msisdn-range end for UEs will be subject to load balancing process. there can be only single imsi-range specific data this command is mutually exclusive with mobilenetworkname, imsi-range, location and ran data. msisdnrangefrom and msisdnrangeto must be specified together. changing this setting can be done only when ue-load balancing is administratively shutdown.

Class

Optional.

Type / Range

Digit string of length 0 or 1 to 15

Default

''

Name

nonBroadcastTac - NonBroadcastTAC

Syntax

--nonBroadcastTac <integer>

Description

Non broadcast TAC.

Class

Optional.

Type / Range

Integer in the range of 0 to 65,535

Default

0

Name

nonBroadcastTaMcc - NonBroadcastTaMCC

Syntax

--nonBroadcastTaMcc <digits>

Description

Non broadcast ta MCC.

Class

Optional.

Type / Range

Digit string of length 3

Default

000

Name

nonBroadcastTaMnc - NonBroadcastTaMNC

Syntax

--nonBroadcastTaMnc <digits>

Description

Non broadcast ta MNC.

Class

Optional.

Type / Range

Digit string of length 2 to 3

Default

000

Name

offloadTaiAreaListName - Offload TAI Area List Name

Syntax

--offloadTaiAreaListName <string>

Description

This is the first list of TACs in a PLMN. When specified all users in the TACs specified will be moved by the UELB command.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Default

"

Name

offloadTaiAreaListName2 - Offload TAI Area List Name 2

Syntax

--offloadTaiAreaListName2 <string>

Description

This is a second list of TACs in a PLMN. When specified all users in the TACs specified will be moved by the UELB command.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

"

Name

offloadTaiAreaListName3 - Offload TAI Area List Name 3

Syntax

--offloadTaiAreaListName3 <string>

Description

This is a third list of TACs in a PLMN. When specified all users in the TACs specified will be moved by the UELB command.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

"

Name

offloadTaiAreaListPlmnName - Offload TAI Area List Plmn Name

Syntax

--offloadTaiAreaListPlmnName <string>

Description

This specifies the PLMN name for the first TAI Area List.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

"

Name

offloadTaiAreaListPlmnName2 - Offload TAI Area List Plmn Name 2

Syntax

--offloadTaiAreaListPlmnName2 <string>

Description

This specifies the PLMN name for the second TAI Area List.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

"

Name

offloadTaiAreaListPlmnName3 - Offload TAI Area List Plmn Name 3

Syntax

--offloadTaiAreaListPlmnName3 <string>

Description

This specifies the PLMN name for the third TAI Area List.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

"

Name

quarantineMode - Quarantine mode

Syntax

--quarantineMode <list-item>

Description

Specifies the action the system will take after load balancing process is completed (or in other words the target number of moved UEs has been reached). this is mutually exclusive with service-lock command. quarantine-mode means that the system will not accept any new UEs after load balancing process completion and it will continue to serve all remaining UEs attached to the system. in combination with ue-filter criteria, the selection of 'non acceptance' of new UEs is the same as the selection of UEs to be moved. changing this setting can be done only when ue-load balancing is administratively shutdown.

Class

Optional.

List

- all - Specify quarantine mode of all.
- lte-only - LTE only - Specify quarantine mode of LTE only.
- not-used - Not used - Specify quarantine mode of not used.

Default

not-used

Name

radioType - Radio type

Syntax

--radioType <list-item>

Description

Specifies which radio-type connected UEs will be subject to load-balancing process. changing this setting can be done only when ue-load balancing is administratively shutdown.

Class

Optional.

List

- all - Specify radio type of all.
- lte - Specify radio type of LTE.

Default

all

Name

serviceLock - Service lock

Syntax

--serviceLock <list-item>

Description

Specifies the action the system will take after load balancing process is completed (or in other words the target number of moved UEs has been reached). this is mutually exclusive with quarantine-mode command. service-lock means that the system will block all its interfaces after load balancing process completion and it will not serve any UEs. this type of command is mainly meant to be used with moving all UEs from the system to allow system maintenance operation. the service-lock works regardless the UE-filter criteria, which means that after load balancing process no UEs will be served. using radio-type lte with service-lock flag allows to apply service-lock mode to MME changing this setting can be done only when ue-load balancing is administratively shutdown.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

shutDownFlag - ShutDown flag

Syntax

--shutDownFlag <list-item>

Description

The load balancing process has to be explicitly started using no shutdown command. once started, none of the parameters can be changed. the shutdown command stops load balancing process. if this is done before the completion of the load balancing process the system will continue its normal operation. if the shutdown command has been issued after the job was completed and the system was in quarantine or service-lock mode, this action will effectively reset the corresponding mode and the system will continue its normal operation. In Release 20.0BR the UELB command auto-shutdown if the --quarantine and --serviceLock options and False. All parameters are returned to their specified default values.

Class

Optional.

List

- noshutdown - Execute - Execute load balance on the WMM.
- shutdown - Abort-Stop - Aborted\t load balance on the WMM if one is in progress. if loadbalance\ \ is already completed, shutdown will let you to change the state to start\ \ a new one.

Default

shutdown

Name

skipPostProcLb - Skip Load Balancing after Procedure

Syntax

--skipPostProcLb <list-item>

Description

The GPARM skipPostSrLbDuringUelb shall be deprecated and replaced by the --skipPostProcLb option. skipPostSrLbDuringUelb shall not be used together with the --soft option. Possible values are True/False. Default is True

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

soft - Soft UELB Option

Syntax

--soft <list-item>

Description

If the option 'soft' is set to true, the CMM makes two passes (Pass1, Pass2) in the CAMPON phase. The following actions take place during Pass1: For ECM-CONNECTED UEs (including emergency, Volte, high priority, non-emergency) the CMM shall issue a UE CONTEXT RELEASE COMMAND with cause 'Loadbalancing TAU required' upon receiving a UE CONTEXT RELEASE REQUEST with cause 'User inactivity'. If the option soft is not set then the current behaviour applied. Soft off-load cannot be used with Directed loadbalancing as directed loadbalancing uses GUTI reallocation. For ECM-IDLE UEs(including emergency, Volte, high priority, non-emergency) the CMM shall page the UE. Once UE sends SR/CPSR and becomes ECM-CONNECTED then CMM shall use the procedure specified above for the ECM-CONNECTED UE to offload the UE

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

softSelectedProcs - Soft UELB for selected call processing procedures

Syntax

--softSelectedProcs <list-item>

Description

The -- softSelectedProcs option is introduced to enable soft handling of selected procedures with the current off-loading mechanism. If the softSelectedProcs option is set to True the CMM shall send UE CONTEXT RELEASE COMMAND with cause 'load balancing TAU required' when: CMM determines that it can initiate UE context release or a Volte UE releases its QCI1 bearer. Note1: softSelectedProcs cannot be used with the soft option because the treatment of Volte UEs would be inconsistent with the treatment of other UEs

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

srsUsed - SRS Used for UELB

Syntax

--srsUsed <list-item>

Description

When the CMM is configured to support in-instance session restoration (SRS) the -- sRsUsed option can be set to speed up the Database phase. The Database phase deals with unclaimed and aged-out UEs. During UELB Cache-Age is suspended for the UE types. The selected sRsUsed option value determines which UE types are to be moved with the help of the in-instance service restoration and therefore excluded from the Database phase.

Class

Optional.

List

- all - All UE Types - All UE Types are selected
- mbb - 4G Mobile Broadband UEs - 4G Mobile Broadband UEs Selection
- nbiot - NBloT UEs - NBloT UEs selection
- none - No UE Type is selected - No UE Type is selected. This is the default Value

Default

none

Name

suppressRcZero - Suppress RC Zero

Syntax

--suppressRcZero <list-item>

Description

When this parameter is disabled the MME updates the eNBs by setting the relative capacity to zero when the Directed ue-load balancing procedure is initiated and restores the value when the procedure is stopped. When this parameter is enabled the relative capacity is not updated. Changing this setting can be done only when ue-load balancing is administratively shutdown.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

ueType - Ue type

Syntax

--ueType <list-item>

Description

Specifies which UEs will be subject to load-balancing process. changing this setting can be done only when ue-load balancing is administratively shutdown.

Class

Optional.

List

- active - Specify active UEs.
- all - Specify all UEs.
- idle - Specify idle UEs.

Default

all

7.131 cmm ueMonitoringProfile

UE Monitoring Profile. Syntax, description, parameters, and roles for cmm ueMonitoringProfile command.

Syntax**Description**

Administer UE Monitoring Profile.

Parameters

Name

name - UE monitoring profile name

Syntax

--name <string>

Description

UE monitoring profile name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\.\-:@]*

Name

allowExtScefRefId - Allow Extended SCEF Reference ID

Syntax

--allowExtScefRefId <list-item>

Description

Specifies whether the MME is to allow negotiation of the use of extended SCEF reference IDs for monitoring Events. This field applies only for home/shared/TAHS UEs. The default is false.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Recommended

true

Name

allowExtScefRefIdRoamers - Allow Extended SCEF Reference ID for Roamers

Syntax

--allowExtScefRefIdRoamers <list-item>

Description

Specifies whether the MME is to allow negotiation of the use of extended SCEF reference IDs for monitoring Events. This field applies only for inbound roaming UEs. The default is false.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Recommended

true

Name

description - Description

Syntax

--description <string>

Description

UE monitoring profile description.

Class

Optional.

Type / Range

Digit string of length 0 to 160 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

"

Name

eventReportPreferIda - monitoring report via IDA

Syntax

--eventReportPreferIda <list-item>

Description

Current in MME, monitoring reports are with RIR only. With this parameter set, MME can report via IDA for any of the requested Monitoring events are available to be reported. Default is no set-> MME keep the same behavior as current.

Class

Optional.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

includeReportingTimeStamp - include Reporting Time Stamp

Syntax

--includeReportingTimeStamp <list-item>

Description

Specifies whether the Reporting Time Stamp shall included in Monitoring Event Reports generated by the MME. The report can appear in S6a:IDA or T6a:RIR messages, depending on the event scenario.

Class

Optional.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

minPerLocRptTimeOverS10 - Min Per Loc Rpt Time Over S10

Syntax

--minPerLocRptTimeOverS10 <list-item>

Description

Specifies whether the MME shall send and receive the Minimum Periodic Location Reporting Time in S10 messaging for inter-MME relocation.

Class

Optional.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

minPerLocTimer - minPerLocTimer

Syntax

--minPerLocTimer <integer>

Description

Specifies the minimum value of the Periodic Timer. This floor value applies if the periodic timer for Current Location Event Monitoring is received from the HSS over S6a. If the S6a value is lower than the provisioned value on the MME, the MME will use the provisioned value as the minimum reporting interval for current location event reporting.

Class

Optional.

Type / Range

Integer in the range of 3 to 50

Default

3

Name

monAvailAfterDdnFail - Monitor availability after DDN failure

Syntax

--monAvailAfterDdnFail <list-item>

Description

Allowability of UE monitoring type availability after DDN failure.

Class

Optional.

List

- none - No monitoring of availability after DDN failure.
- all - Allow monitoring of availability after DDN failure when UE moves to connected mode.
- allEdrx - Allow monitoring of availability after DDN failure to be reported at the beginning of an eDRX cycle in addition to the 'All' case.

Default

none

Name

monAvailAfterDdnFailWithIdleStatus - Mon Avail After DDN Fail With Idle Status

Syntax

--monAvailAfterDdnFailWithIdleStatus <list-item>

Description

Specifies whether the MME shall generate the Available After DDN Failure Monitoring Event for a UE if that UE is configured with the AVAILABILITY_AFTER_DDN_FAILURE_AND_IDLE_STATUS_INDICATION (9) monitoring event.

Class

Optional.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

monCommFailure - monCommFailure

Syntax

--monCommFailure <list-item>

Description

Communication Failure MONTE Event.

Class

Optional.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

monIdleStatusIndication - monitor idle status indication

Syntax

--monIdleStatusIndication <list-item>

Description

Allowability of UE monitoring type idle status indication

Class

Optional.

List

- all - support this event
- availAfterDdn - available After DDN failure - Support for monitor event available after DDN failure and idle states ind.
- none - not support this event
- ueReach - Ue Reachability - Support for monitor event UE reachability and idle states ind.

Default

none

Name

monIdleStatusRptAtIdr - monIdleStatusRptAtIdr

Syntax

--monIdleStatusRptAtIdr <list-item>

Description

Specifies whether the MME is to sent the Idle Status Monitoring Report if the UE is already idle when the event is configured via S6a:IDR message.

Class

Optional.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

monLocation - Monitor location

Syntax

--monLocation <list-item>

Description

Allowability of UE monitoring type location.

Class

Optional.

List

- all - Allow monitoring of location including ecgi, enodeb and TAI.
- enodeb/tai - Enodeb and TAI - Allow monitoring of location limiting to enodeb and TAI.
- none - No monitoring of location.

Default

none

Name

monLossOfConnectivity - Monitor loss of connectivity

Syntax

--monLossOfConnectivity <list-item>

Description

Allowability of UE monitoring type loss of connectivity.

Class

Optional.

List

- all - Allow monitoring of loss of connectivity including uedetach, maxtimedetach and uepurge.
- none - No monitoring of loss of connectivity.
- allPsm - Allow generation of loss of connectivity reporting event when UE enters PSM mode (after T3324 expiration) in addition to the 'All' cases.
- allEdrx - Allow generation of loss of connectivity reporting event when UE exits a paging time window within an eDRX cycle in addition to the 'All' case.
- allEdrxPsm - Allow generation of loss of connectivity reporting event for eDRX, PSM, and All cases.

Default

none

Name

monPdnConnectivityStatus - PDN Connectivity Status Event

Syntax

--monPdnConnectivityStatus <list-item>

Description

Defines whether the MME is to support the PDN Connectivity Status Event

Class

Optional.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

monReachability - Monitor reachability

Syntax

--monReachability <list-item>

Description

Allowability of UE monitoring type UE reachability.

Class

Optional.

List

- all - Allow monitoring of reachability including data and sms.
- none - No monitoring of reachability.

Default

none

Name

monReachabilityWithIdleStatus - Mon Reachability With Idle Status

Syntax

--monReachabilityWithIdleStatus <list-item>

Description

Specifies whether the MME shall generate the Reachability Monitoring Event for a UE if that UE is configured with the UE_REACHABILITY_AND_IDLE_STATUS_INDICATION (8) monitoring event.

Class

Optional.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

nsurNsuiOverS10 - NSUR NSUI Over S10

Syntax

--nsurNsuiOverS10 <list-item>

Description

Specifies whether the MME shall send and receive the NSUR (Notify SCEF when UE becomes Reachable) and NSUI (Notify SCEF when UE becomes Idle) flags in S10 messaging for inter-MME relocation.

Class

Optional.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

pageIdleUe4Location - page IdleUe For Location

Syntax

--pageIdleUe4Location <list-item>

Description

With this parameter set, MME will page UE in idle for Location info if IDR comes with current location for monitor type location. if paging failed, then last known location should be reported to SCEF. If this parameter does not set, MME keep the current behave, no RIR towards SCEF for current location request.

Restrictions

Note: pageIdleUe4Location parameter is only for idle UE which is not in eDRX sleep mode (i.e. unreachable windows) and not in PSM sleep mode.

Class

Optional.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

pageIdleUeForLocImmediateIda - Page Idle UE for Location Immediate IDA

Syntax

--pageIdleUeForLocImmediateIda <list-item>

Description

Specifies whether the MME, when receiving an S6a:IDR message that configures a current location monitoring event, will send the S6a:IDA response prior to paging for the location monitoring event. pageIdleUeForLocImmediateIda applies only if pageIdleUe4Location is also set true.

Class

Optional.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

pdnConnBearerIdentityIncluded - PDN Connectivity Bearer Identity Included

Syntax

--pdnConnBearerIdentityIncluded <list-item>

Description

Specifies whether to include the Bearer Identity as a non-standardized AVP in the PDN Connectivity Status Report

Class

Optional.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

pdnConnMip6AgentInfoIncluded - PDN Connectivity MIPv6AgentInfo Included

Syntax

--pdnConnMip6AgentInfoIncluded <list-item>

Description

Specifies whether to include the MIPv6AgentInfo AVP as a non-standardized parameter in the PDN Connectivity Status Report.

Class

Optional.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

pdnConnRatTypeAvpIncluded - PDN Connectivity RAT Type AVP Included

Syntax

--pdnConnRatTypeAvpIncluded <list-item>

Description

Specifies whether the RAT Type AVP is to be included as a non-standardized parameter in the PDN Connectivity Status Report.

Class

Optional.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

reportOldLastKnownLoc4Current - report Old LastKnown Location for Current location request

Syntax

--reportOldLastKnownLoc4Current <list-item>

Description

If current-location is not available, report last known location even if last-known-location is old (e.g. older than 1 minute).

Class

Optional.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

reportUeLocationInPsmEdrx - report Ue last known Location in PsmEdrx

Syntax

--reportUeLocationInPsmEdrx <list-item>

Description

with this parameter set, MME will report UE last known location towards SCEF when Ue is in either Psm or eDrx slepp mode if MME receives current location request via IDR. If the parameter does not set, then MME keeps current behave, no report towards SCEF if request is current location.

Restrictions

Note 1: When current location report is requested in IDR, in all cases (even for an existing continuous report update) and even if the location has not changed, always send the first report (one-time or continuous) for current-location. Note 2: For an eDRX UE, pagIdleUe4Location parameter is impacted during eDRX UE reachable window.

reportUeLocationInPsmEdrx parameter is impacted during eDRX sleep mode (i.e. unreachable window of eDRX cycle).

Class

Optional.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

supportPeriodicLocRpt - Support Periodic LocRpt

Syntax

--supportPeriodicLocRpt <list-item>

Description

Specifies whether the MME is to support a minimum reporting interval between successive MONTE Location Event Reports for the same UE.

Class

Optional.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

suppressAaddnfForSr - Suppress AADDNF Report for Service Request

Syntax

--suppressAaddnfForSr <list-item>

Description

Specifies whether the AADDNF (availability after DDN failure) report is to be suppressed for a UE that is not assigned eDRX and/or is not assigned PSM currently. The suppression applies only when the UE performs a Service Request. TAU and Attach continue to generate the reachability report. Events (6) and (9) from the UE subscription apply.

Class

Optional.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

suppressReachForSr - Suppress Reachability Report for Service Request

Syntax

--suppressReachForSr <list-item>

Description

Specifies whether the UE reachability Report is to be suppressed for a UE that is not assigned eDRX and/or is not assigned PSM currently. The suppression applies only when the UE performs a Service Request. TAU and Attach continue to generate the reachability report. Events (1) and (8) from the UE subscription apply.

Class

Optional.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

t6aExternalIdSupported - T6a External ID Supported

Syntax

--t6aExternalIdSupported <list-item>

Description

Specifies whether the External ID can be included in the T6a:RIR message.

Class

Optional.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

ueReachReportWithCauseCode - UE Reachability Report with Cause Code

Syntax

--ueReachReportWithCauseCode <list-item>

Description

Specifies whether the Reachability-Cause AVP is to be included in the UE Reachability Report.

Class

Optional.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

7.132 cmm uePlmnServices

Services based on UE Network and Served Network. Syntax, description, parameters, and roles for cmm uePlmnServices command.

Syntax**Description**

This command is used to administer services based on the UE Network and Served Network.

Parameters**Name**

name - Name of services based on UE network and served network

Syntax

--name <string>

Description

Name that identifies roaming agreement.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

servedPlmnName - Mobile network name

Syntax

--servedPlmnName <string>

Description

Name that identifies mobile network.

Class

Required on create, not modifiable.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

uePlmnName - UE mobile network

Syntax

--uePlmnName <string>

Description

Name that identifies roaming network.

Class

Required on create, not modifiable.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

acceptDab - Accept DAB

Syntax

--acceptDab <list-item>

Description

Indicates whether PLMN accepts DAB (Dual access bearer).

Restrictions

This element is not applicable when the serving and UE PLMNs are the same.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

allowEthernetPdnType - Allow Ethernet PDN Type

Syntax

--allowEthernetPdnType <list-item>

Description

Parameter controls MME support for allowing Ethernet PDN Type. By default this shall be set to false.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

allowNonIpOverS1u - allow non IP over S1

Syntax

--allowNonIpOverS1u <list-item>

Description

with allowNonIpOverS1u parameter under uePlmnServices set, MME will allow an UE has non IP connection (with other condition, HSS allow non IP APN etc) under this PLMN.

Restrictions

This element is applicable when the serving and UE PLMNs are same or when lteTreatAsHomeSubscriber set to true

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

apnCorrectionAttach - APN correction during attach

Syntax

--apnCorrectionAttach <list-item>

Description

APN correction that is done during attach.

Class

Optional.

List

- featureDisabled - Feature disabled - This feature is disabled.
- locallyConfigured - Locally configured - Locally configured.
- receivedFromHss - Received from HSS - Received from HSS.

Default

featureDisabled

Name

apnCorrectionStandalone - APN correction during standalone PDN connect

Syntax

--apnCorrectionStandalone <list-item>

Description

APN correction that is done during standalone PDN connectivity request.

Class

Optional.

List

- featureDisabled - Feature disabled - This feature is disabled.
- locallyConfigured - Locally configured - Locally configured.
- receivedFromHss - Received from HSS - Received from HSS.

Default

featureDisabled

Name

apnPriorityListName - APN priority list name

Syntax

--apnPriorityListName <string>

Description

APN priority list name.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

"

Name

apnWtLstLte - LTE APN white list

Syntax

--apnWtLstLte <string>

Description

It is used to assign a local breakout (LBO) APN white list to a roaming network partner for LBO PDN connections.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

apn-all

Name

applProtocolFallbackN26ToS10 - Application Protocol Fallback from N26 to S10

Syntax

--applProtocolFallbackN26ToS10 <list-item>

Description

Current parameter enables fallback to search for 's10' candidate when DNS Query to find target MME during S10 handover using 'n26' fails. This parameter is expected to be used together with parameter Use N26 Service Parameter in S10 Handover

Class

Optional.

List

- false - Boolean value of false.

- true - Boolean value of true.

Default

false

Name

applyApnWtLstLte - Apply LTE APN white list

Syntax

--applyApnWtLstLte <list-item>

Description

It is used to enable APN white list checks on the roamer UE in the LTE network.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

camelAllowed - CAMEL subscriber roaming allowed

Syntax

--camelAllowed <list-item>

Description

Indicates whether camel subscriber roaming in mobile network is allowed or not.

Restrictions

This element is not applicable when the serving and UE PLMNs are the same. This element only applies to 2G/3G.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

chargingCharAccessRestrictionProfileName - Charging Characteristics Access Restriction Profile Name

Syntax

--chargingCharAccessRestrictionProfileName <string>

Description

Defines the name of the charging characteristics access restriction profile.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

ciotEmmRegisterdWithoutPdn - Enable EMM-REGISTERED without PDN connection for C-IOT UE

Syntax

--ciotEmmRegisterdWithoutPdn <list-item>

Description

Enable EMM-REGISTERED without PDN connection for C-IOT UE.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

combinedAttachWithoutCsProfileName - Combined Attach without CS Profile Name

Syntax

--combinedAttachWithoutCsProfileName <string>

Description

The profile name to include parameters for combined attach without CS domain.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

..

Name

cpCIoT - CP CIOT

Syntax

--cpCIoT <list-item>

Description

Enable CP CIOT optimization.

Restrictions

This element is applicable when the serving and UE PLMNs are same or when lteTreatAsHomeSubscriber set to true.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

cpCIoTDeliveryMechanism - CP CIOT delivery mechanism

Syntax

--cpCIoTDeliveryMechanism <list-item>

Description

CP CIOT delivery mechanism.

Restrictions

This element is only applicable when plmn is home/shared.

Class

Optional.

List

- all - Delivery using both S11-u and T6a is supported.
- scef - Delivery using T6a interface.
- sgi - Delivery using S11-u interface.

Default

sgi

Name

csfbPagingPriProfileName - CSFB paging priority profile name

Syntax

--csfbPagingPriProfileName <string>

Description

Identifies the CSFB paging priority profile.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

custApn1QosprofileName - Custom APN QoS profile-1 for roamers

Syntax

--custApn1QosprofileName <string>

Description

Custom APN QoS profile-1 for roamers.

Restrictions

This element is not applicable when the serving and UE PLMNs are the same.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

"

Name

custApn1WpsQosprofileName - Custom APN WPS QoS profile for roamers - 1

Syntax

--custApn1WpsQosprofileName <string>

Description

Points to the first custom APN WPS QoS profile for roamers.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

"

Name

custApn2QosprofileName - Custom APN QoS profile 2 for roamers

Syntax

--custApn2QosprofileName <string>

Description

Custom APN QoS profile-2 for roamers.

Restrictions

This element is not applicable when the serving and UE PLMNs are the same.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

''

Name

custApn2WpsQosprofileName - Custom APN WPS QoS profile for roamers - 2

Syntax

--custApn2WpsQosprofileName <string>

Description

Points to the second custom APN WPS QoS profile for roamers.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

''

Name

custApn3QosprofileName - Custom APN QoS profile-3 for roamers

Syntax

--custApn3QosprofileName <string>

Description

Custom APN QoS profile-3 for roamers.

Restrictions

This element is not applicable when the serving and UE PLMNs are the same.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

"

Name

custApn3WpsQosprofileName - Custom APN WPS QoS profile for roamers - 3

Syntax

--custApn3WpsQosprofileName <string>

Description

Points to the third custom APN WPS QoS profile for roamers.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

"

Name

dedicatedCoreNetwork - Dedicated Core Network Support

Syntax

--dedicatedCoreNetwork <list-item>

Description

Parameter indicates whether DCN feature is activated. By default the parameter is set to 'False' indicating that the DCN feature is not activated.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

description - Description

Syntax

--description <string>

Description

Roaming agreement description.

Class

Optional.

Type / Range

Digit string of length 0 to 160 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

detachBehaviorMappingProfileName - Detach behavior profile name

Syntax

--detachBehaviorMappingProfileName <string>

Description

Identifies the detach behavior profile to use.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\.\-:@]*

Default

default

Name

diamApplProfileListName - Diameter Application Profile List Name

Syntax

--diamApplProfileListName <string>

Description

Diameter Application Profile List Name

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

""

Name

diamNasMappingProfileName - Diameter to NAS cause code profile name

Syntax

--diamNasMappingProfileName <string>

Description

Defines all MME diameter code to NAS cause code mapping.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Default

default

Name

dlRateLimit - Downlink Rate Limit

Syntax

--dlRateLimit <integer>

Description

The parameter defined maximum value MME allows an UE to transfer data over CPO

Class

Optional.

Type / Range

Integer in the range of 0 or 10 to 10000 in units of DeciHour

Default

20

Name

drmpCiotProfileName - DRMP CIOT profile name

Syntax

--drmpCiotProfileName <string>

Description

DRMP CIOT profile name.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Default

default

Name

drmpProfileName - DRMP profile name

Syntax

--drmpProfileName <string>

Description

DRMP profile name.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Default

default

Name

edrxApnListName - eDRX APN list name

Syntax

--edrxApnListName <string>

Description

eDRX APN list name.

Class

Optional.

Type / Range

Digit string of length 0 or 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Default

"

Name

edrxEnabled - eDRX enabled

Syntax

--edrxEnabled <list-item>

Description

eDRX enabled.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

edrxHssPtwProfileName - eDRX HSS PTW profile name

Syntax

--edrxHssPtwProfileName <string>

Description

eDRX HSS PTW profile name.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Default

default

Name

edrxModeWithPsm - eDRX mode with PSM

Syntax

--edrxModeWithPsm <list-item>

Description

eDRX mode with PSM.

Class

Optional.

List

- Both - Specifies both eDRX and PSM.
- PSM - Specifies PSM.
- eDRX - Specifies eDRX.

Default

eDRX

Name

edrxProfileName - eDRX profile name

Syntax

--edrxProfileName <string>

Description

eDRX profile name.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Default

default

Name

edrxSource - eDRX source

Syntax

--edrxSource <list-item>

Description

eDRX source.

Class

Optional.

List

- HSS - Specifies eDRX source as HSS.
- Local - Specifies eDRX source as local.

Default

Local

Name

emmInfoOverride - EMM info override

Syntax

--emmInfoOverride <list-item>

Description

Flag defining whether the emmInfo message should be overridden with profile information in the emmInfoOverrideTacSv table.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

emmInfoOverrideProfileName - EMM Info Override Profile Name

Syntax

--emmInfoOverrideProfileName <string>

Description

EMM Info Override Profile to be used for this PLMN

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Default

"

Name

enableRszcForbiddenPlmn - Enable RSZC forbidden PLMN

Syntax

--enableRszcForbiddenPlmn <list-item>

Description

Enable forbidden PLMN list using regional subscription zone code.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

enhancedDualConnectivity - 5G NSA Option 3X

Syntax

--enhancedDualConnectivity <list-item>

Description

This parameter enables 5G NSA Option 3x with enhanced capabilities which include higher bit rates, NR access restriction and S/PGW selection with NR capability

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

enhancedDualConnectivityProfileName - Enhanced Dual Connectivity Profile Name

Syntax

--enhancedDualConnectivityProfileName <string>

Description

Identifies the Enhanced Dual Connectivity Profile for NSA Option 3A/3X

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

ePcoSupport - Extended protocol configuration option support

Syntax

--ePcoSupport <list-item>

Description

Extended protocol configuration support.

Restrictions

This element is only applicable when plmn is home/shared.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

ePlmnListName - EPLMN list name

Syntax

--ePlmnListName <string>

Description

EPLMN list name

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

ePlmnListNameEnb - EPLMN List Name for eNB

Syntax

--ePlmnListNameEnb <string>

Description

Identifies Equivalent PLMN list name to be sent to eNB

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

"

Name

eps5gslwkWithoutN26 - EPS-5GS Interworking Without N26

Syntax

--eps5gsIwkWithoutN26 <list-item>

Description

Enables the EPS-5GS interworking without N26 interface support for the UE on MME side.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

epsUpip - EPS UPIP

Syntax

--epsUpip <list-item>

Description

Current parameter enables support for the EPS-UIPI (User Plane Integrity Protection)

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

extendedEmergencyNumListName - Extended Emergency Number List Name

Syntax

--extendedEmergencyNumListName <string>

Description

Extended Emergency Number List Name

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\- _:@]*

Default

"

Name

externalIdSupported - External ID Supported

Syntax

--externalIdSupported <list-item>

Description

Specifies whether the MME advertises support of the External ID to the HSS.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

freqCountMonitoringProfileName - Frequency Count Monitoring Profile

Syntax

--freqCountMonitoringProfileName <string>

Description

Defines the frequency count monitoring profile name applied for the UE.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

fullPgwApnGtpOvlControlSupport - Full PGW APN GTP Overload Control Support

Syntax

--fullPgwApnGtpOvlControlSupport <list-item>

Description

Defines whether the MME supports PGW indicated overload for the UE: -PGW Overload Control Information IE containing APN list on GTPv2 messages, when APN is congested on a PGW, -Back-off Time IE on Create Session Response when PGW rejects the request due to APN congestion.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

grpSvcId - Group service identification

Syntax

--grpSvcId <integer>

Description

Group service identification.

Restrictions

This element can not be Zero if supportGrpSvcProvision is true.

Class

Optional.

Type / Range

Integer in the range of 0 or 1,001 to 4,294,967,295

Default

0

Name

gtpProfileName - GTP profile name

Syntax

--gtpProfileName <string>

Description

GTP profile to be assigned for the roamers.

Restrictions

1. When not empty string, refers valid gtpProfile.name 2. This element is not applicable when the Served and UE PLMNs are the same.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

"

Name

hlcomDdnAckWithDlBuffering - HLCOM ddn ack with downlink dl buffering

Syntax

--hlcomDdnAckWithDlBuffering <list-item>

Description

DDN ACK with downlink buffering for HLCOM.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

hlcomEnabled - HLCOM enabled

Syntax

--hlcomEnabled <list-item>

Description

HLCOM enabled.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

hlcomPsmDlBufferingPacketCount - HLCOM/PSM downlink buffering packet count

Syntax

--hlcomPsmDlBufferingPacketCount <integer>

Description

PSM downlink buffering packet count for HLCOM and PSM.

Class

Optional.

Type / Range

Integer in the range of 1 to 65,535

Default

1

Name

hlcomUseLocalDlBufferingPacketCount - HLCOM use local downlink buffering packet count

Syntax

--hlcomUseLocalDlBufferingPacketCount <list-item>

Description

Use local downlink buffering packet count for HLCOM.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

hoCellIdRestrictionListNameN26 - NR Cells List for Handover Restriction over N26

Syntax

--hoCellIdRestrictionListNameN26 <string>

Description

Identifies the list of source NR Cells that the UE is either allowed or restricted from being handover over from 5G to EPS. The MME uses the list to either receive or reject the Forward Relocation Request from the AMF.

Class

Optional.

Type / Range

Digit string of length 0 or 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Default

""

Name

homerUeTzInCreateAndUpdateBearerResp - Homer UE Time Zone in Create And Update Bearer Response

Syntax

--homerUeTzInCreateAndUpdateBearerResp <list-item>

Description

Parameter controls inclusion and sending of UE time zone IE in Update and Create Bearer Response for Homers. By default, flag shall be set to false. When enabled, MME will include and send UE time zone IE in Update and Create Bearer Response messages towards SGW. Definition of homers is subscribers that are using operator EPC network. In other words, this means UEs with IMSIs PLMN ID same as Serving PLMN ID, UEs with IMSIs PLMN ID different from Serving PLMN ID but treat as home subscriber, and multiple Home PLMN UEs.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

hoRestrictAreaListName - Handover restrict area list name

Syntax

--hoRestrictAreaListName <string>

Description

Defines the UE roaming restrict profile to be used for the service in 4G.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

imeiTacSvRejectionProfileName - IMEI TAC SV Rejection Profile Name

Syntax

```
--imeiTacSvRejectionProfileName <string>
```

Description

The name of the IMEI-TAC SV rejection profile.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

default

Name

imsApnQosprofileName - Default IMS APN QoS profile for roamers

Syntax

```
--imsApnQosprofileName <string>
```

Description

Default IMS APN QoS profile for roamers. IMS APN QoS profile name is not used when served PLMN and UE PLMN are the same. Otherwise, the default is Def-Roam-IMS-APN-QoS-Prfl.

Restrictions

This element is not applicable when the serving and UE PLMNs are the same.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

imsApnRoamingControl - IMS APN roaming control allowed

Syntax

```
--imsApnRoamingControl <list-item>
```

Description

IMS APN roaming control allowed.

Restrictions

This element is only applicable when plmn is roamer.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

imsApnWpsQosprofileName - Default IMS APN WPS QoS profile for roamers

Syntax

--imsApnWpsQosprofileName <string>

Description

Points to the roaming WPS QoS profile for IMS APNs. IMS APN WPS QoS profile name is not used when Serving PLMN equals UE PLMN or when Treat As Home Subscriber is true.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

imsLboProfileName - IMS LBO Profile Name

Syntax

--imsLboProfileName <string>

Description

The name of the IMS LBO profile.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

imsRegistrationFailureStnSr - IMS Registration Failure STN-SR

Syntax

--imsRegistrationFailureStnSr <digits>

Description

The STN-SR value indicating IMS registration failure. HSS indicates the MME the IMS registration success of a UE with special STN-SR parameter values. When IMS registration for a UE has failed, the HSS indicates the MME the IMS registration failure STN-SR as the subscribed STN-SR of the UE.

Class

Optional.

Type / Range

Digit string of length 9 to 15

Default

11111111111

Name

imsRegistrationSuccessStnSr - IMS Registration Success STN-SR

Syntax

--imsRegistrationSuccessStnSr <digits>

Description

The STN-SR value indicating IMS registration success. HSS indicates the MME the IMS registration success of a UE with special STN-SR parameter values. When IMS registration for a UE has succeeded, the HSS indicates the MME the IMS registration success STN-SR (or the real STN-SR of the UE) as the subscribed STN-SR of the UE.

Class

Optional.

Type / Range

Digit string of length 9 to 15

Default

22222222222

Name

includeNwPolicyInAttachAndTauAccept - Include Network Policy in Attach and TAU Accept

Syntax

--includeNwPolicyInAttachAndTauAccept <list-item>

Description

Parameter controls inclusion of Network Policy IE in Attach Accept and TAU Accept messages. By default, it shall be disabled. When enabled, MME shall include Network Policy IE in Attach Accept and TAU accept messages sent to the UE.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

initialGutiAttachEirPercentage - Initial GUTI Attach EIR Percentage

Syntax

--initialGutiAttachEirPercentage <integer>

Description

Parameter controls percentage EIR checking for Initial GUTI Attach Procedure. Default value of 0 indicates no EIR checking. This field is valid when the Attach EIR Percentage Checking General Global Parameter is enabled.

Class

Optional.

Type / Range

Integer in the range of 0 to 100

Default

0

Name

initialImsiAttachEirPercentage - Initial IMSI Attach ECR Percentage

Syntax

--initialImsiAttachEirPercentage <integer>

Description

Parameter controls percentage EIR checking for Initial IMSI Attach Procedure. Default value of 0 indicates no EIR checking. This field is valid when the Attach EIR Percentage Checking General Global Parameter is enabled.

Class

Optional.

Type / Range

Integer in the range of 0 to 100

Default

0

Name

interPlmn5gsToEpsAttach - Inter PLMN 5GS to EPS Attach

Syntax`--interPlmn5gsToEpsAttach <list-item>`**Description**

Allows or restricts inbound inter-plmn Attach from 5G to 4G based on UE GUTI PLMN ID. When restricted, MME invokes NAS Identity Request to retrieve IMSI and proceed with the Attach Request.

Class

Optional.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

interPlmn5gsToEpsTau - Inter PLMN Tracking Area Update

Syntax`--interPlmn5gsToEpsTau <list-item>`**Description**

Allows or restricts inbound inter-plmn idle mode Tracking Area Update from 5G to 4G based on UE GUTI PLMN ID. When restricted, MME rejects the TAU with NAS cause code #9, which triggers UE to initiate Attach with IMSI.

Class

Optional.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

interPlmnHandoverEpsTo5gs - Inter PLMN EPS to 5GS Handover

Syntax

```
--interPlmnHandoverEpsTo5gs <list-item>
```

Description

Allows or restricts eNB initiated EPS to 5GS Handover at the source MME.

Class

Optional.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

interPlmnHandoverTargetNodeBehavior - Inter PLMN Handover Target Node Behavior

Syntax

```
--interPlmnHandoverTargetNodeBehavior <list-item>
```

Description

Sets target MME behaviour over S10 or N26 during inter-plmn Handover.

Class

Optional.

List

- both - S10 and N26 Interfaces - The target MME allows inter-plmn Forward Relocation Request procedure from source MME or from source AMF to proceed.
- n26 - N26 Interface - The target MME allows inter-plmn Forward Relocation Request procedure from source AMF to proceed.
- none - The target MME rejects inter-plmn Forward Relocation Request procedure from source MME or from source AMF due to Handover not allowed.
- s10 - S10 Interface - The target MME allows inter-plmn Forward Relocation Request procedure from source MME to proceed.

Default

both

Name

interPlmnIdleModeMobSrcNodeBehavior - Inter PLMN Idle Mode Mobility Source Node Behavior

Syntax

```
--interPlmnIdleModeMobSrcNodeBehavior <list-item>
```

Description

Sets source or old MME behaviour over S10 or N26 during inter-plmn UE Idle Mode Mobility.

Class

Optional.

List

- both - Both S10 and N26 - Source or old MME allows Context Request procedure from new or target MME or UE Context Transfer procedure from new or target AMF to proceed based on Serving-Target PLMN ID combination during inter-plmn UE Idle Mode Mobility.
- n26 - N26 Interface - Source or old MME allows Context Request procedure from new or target AMF to proceed based on Serving-Target PLMN ID combination during inter-plmn UE Mobility Registration Update.
- none - Source or old MME rejects Context Request procedure from new or target MME or UE Context Transfer procedure from new or target AMF based on Serving-Target PLMN ID combination during inter-plmn UE Idle Mode Mobility.
- s10 - S10 Interface - Source or old MME allows Context Request procedure from new or target MME to proceed based on Serving-Target PLMN ID combination during inter-plmn UE Tracking Area Update.

Default

both

Name

interPlmnInitAttachRegSrcNodeBehavior - Inter PLMN Initial Attach or Registration Source Node Behavior

Syntax

--interPlmnInitAttachRegSrcNodeBehavior <list-item>

Description

Sets source or old MME behaviour over S10 or N26 during inter-plmn UE Initial Attach or Registration.

Class

Optional.

List

- both - Both S10 and N26 Interfaces - Source or old MME allows UE Identification Request procedure from new or target MME or Identification Request procedure from new or target AMF to proceed based on Serving-Target PLMN ID combination during inter-plmn UE Initial Attach or Initial Registration procedure.
- none - Source or old MME rejects UE Identification Request procedure from new or target MME or Identification Request procedure from new or target AMF based on Serving-Target PLMN ID combination during inter-plmn UE Initial Attach or Initial Registration procedure.

Default

both

Name

interPlmnN26EmergencyHoSourceNode - Inter Plmn N26 Emergency Call Handover Source Node

Syntax

--interPlmnN26EmergencyHoSourceNode <list-item>

Description

Identifies MME source node behaviour (allow or reject) for inter plmn 4G to 5G handover of emergency calls triggered by the source eNB.

Class

Optional.

List

- both - Both LBO and Home Routed emergency calls are allowed by the source node to be handed over.
- hrt - Home Routed Traffic - when UE originates emergency call in UE H-PLMN, the call is allowed by source node to be handed over to V-PLMN as home routed call.
- lbo - Local Break Out - When roaming UE originates LBO emergency call in V-PLMN, the call is allowed by source node to be handed over to another PLMN (another V-PLMN or UE H-PLMN).
- none - Neither LBO nor Home Routed emergency calls are allowed by the source node to be handed over.

Default

both

Name

interPlmnN26EmergencyHoTargetNode - Inter PLMN N26 Emergency Call Handover Target Node

Syntax

--interPlmnN26EmergencyHoTargetNode <list-item>

Description

Identifies MME target node behaviour (allow or reject) for inter plmn 5G to 4G handover of emergency calls from AMF source node.

Class

Optional.

List

- both - LBO and HRT - Both LBO and Home Routed emergency calls are allowed by the target node to be handed in.

- hrt - Home Routed Traffic - When UE originates emergency call in UE H-PLMN, the call is allowed by V-PLMN target node to be handed in.
- lbo - Local Break Out - When roaming UE originates emergency call in V-PLMN, the call is allowed by target node in another Plmn (V-PLMN or H-PLMN) to be handed in.
- none - Neither LBO nor Home Routed emergency calls are allowed by the target node to be handed in.

Default

both

Name

interPlmnS10EmergencyHoSourceNode - Inter Plmn S10 Emergency Call Handover Source Node

Syntax

--interPlmnS10EmergencyHoSourceNode <list-item>

Description

Identifies MME source node behaviour (allow or reject) for inter plmn 4G to 4G handover of emergency calls triggered by the source eNB.

Class

Optional.

List

- both - Both LBO and Home Routed emergency calls are allowed by the source node to be handed over.
- hrt - Home Routed Traffic - when UE originates emergency call in UE H-PLMN, the call is allowed by source node to be handed over to V-PLMN as home routed call.
- lbo - Local Break Out - When roaming UE originates LBO emergency call in V-PLMN, the call is allowed by source node to be handed over to another PLMN (another V-PLMN or UE H-PLMN).
- none - Neither LBO nor Home Routed emergency calls are allowed by the source node to be handed over.

Default

both

Name

interPlmnS10EmergencyHoTargetNode - Inter PLMN S10 Emergency Call Handover Target Node

Syntax

--interPlmnS10EmergencyHoTargetNode <list-item>

Description

Identifies MME target node behaviour (allow or reject) for inter plmn 4G to 4G handover of emergency calls from MME source node.

Class

Optional.

List

- both - LBO and HRT - Both LBO and Home Routed emergency calls are allowed by the target node to be handed in.
- hrt - Home Routed Traffic - When UE originates emergency call in UE H-PLMN, the call is allowed by V-PLMN target node to be handed in.
- lbo - Local Break Out - When roaming UE originates emergency call in V-PLMN, the call is allowed by target node in another PLMN (V-PLMN or H-PLMN) to be handed in.
- none - Neither LBO nor Home Routed emergency calls are allowed by the target node to be handed in.

Default

both

Name

interPlmnTauAttachEnable - Inter PLMN TAU attach enable

Syntax

--interPlmnTauAttachEnable <list-item>

Description

This field when set to yes, enables serving network on MME to send S10/S3/Gn messages to the old node for TAU request and attach request with a foreign GUTI. this enable is based on the global parameter inter PLMN TAU attach. if global parameter inter PLMN TAU attach is disabled, this field is ignored. this field when set to yes enables inter-plmn S10/S3/Gn messages to be sent to the old MME/SGSN by the new MME in case of TAU request and attach request with foreign GUTI to get UE context from the old MME/SGSN in a different network.

Restrictions

1. This element is not applicable when the serving and UE PLMNs are the same. 2. This element applies only to 4G.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

ipV6SupportForNoDab - IPv6 PDN type used when DAB is not supported

Syntax

--ipV6SupportForNoDab <list-item>

Description

Indicates whether IPv6 PDN type is used when PLMN does not support DAB (Dual access bearer) otherwise IPv4 PDN type is used.

Restrictions

This element is not applicable when the serving and UE PLMNs are the same.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

lapPagingPriProfileName - LAP paging priority profile name

Syntax

--lapPagingPriProfileName <string>

Description

Identifies the LAP paging priority profile.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

lcsOptionsProfileName - Location services options profile name

Syntax

--lcsOptionsProfileName <string>

Description

Defines location services options.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Default

default

Name

locationBasedGatewaySelection - Location Based Gateway Selection.

Syntax

--locationBasedGatewaySelection <list-item>

Description

Specifies whether location based gateway selection is allowed under UePlmnServices.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

ltePgwDomainMccOverride - LTE PGW domain name MCC override

Syntax

--ltePgwDomainMccOverride <digits>

Description

Override of normal PGW DNS domain derivation by using this mobility country code and the mobility network code represented by ltepgwdomainmncoveride.

Restrictions

1. This element is not applicable when the serving and UE PLMNs are the same. 2. If this element is present so must be ltePgwDomainMncOverride

Class

Optional.

Type / Range

Digit string of length 0 or 3

Name

ltePgwDomainMncOverride - LTE PGW domain name MNC override

Syntax

--ltePgwDomainMncOverride <digits>

Description

Override of normal PGW DNS domain derivation by using this mobility network code and the mobility country code represented by ltepgwdomainmccoverride.

Restrictions

1. This element is not applicable when the serving and UE PLMNs are the same. 2. If this element is present so must be ltePgwDomainMccOverride

Class

Optional.

Type / Range

Digit string of length 0 or 2 to 3

Name

lteRoamingAllowed - LTE roaming allowed

Syntax

--lteRoamingAllowed <list-item>

Description

Flag indicating if LTE roaming is allowed.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

lteTo2G3GQoSMappingName - LTE to 2G3G QoS mapping profile name

Syntax

--lteTo2G3GQoSMappingName <string>

Description

Name that identifies the LTE-2G3G QoS mapping profile, whose parameters are used during handover between 2G/3G and 4G networks.

Restrictions

This element is not applicable when the serving and UE PLMNs are the same.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

default

Name

lteTreatAsHomeSubscriber - Treat roamer as home subscriber

Syntax

--lteTreatAsHomeSubscriber <list-item>

Description

When set, treat a roaming UE as if it were a home subscriber of the serving PLMN. If LTE Treat As Home Subscriber is true for a roaming UE, the IMS APN QoS Profile and Non-IMS APN QoS Profile fields do not take effect even if populated.

Restrictions

This element is not applicable when the serving and UE PLMNs are the same.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

lteUeAmbrUseHssValue - LTE UE AMBR use HSS value

Syntax

--lteUeAmbrUseHssValue <list-item>

Description

Indicates for LTE to enable/disable use of HSS subscribed UL UE-AMBR and DL UE-AMBR values at roaming PLMN level.

Restrictions

1. This element applies only to 4G. 2. This element is not applicable when the serving and UE PLMNs are the same.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

maxUeAllowedInAllTa - Maximum UE Allowed in All TA

Syntax

--maxUeAllowedInAllTa <integer>

Description

Maximum number of UE allowed in all the TA of the serving PLMN. This maximum number of allowed UE for TA list overrides this provisioning

Class

Optional.

Type / Range

Integer in the range of 0 to 4,294,967,294

Default

0

Name

maxWildcardApns - Maximum APNs allowed for wildcard APN

Syntax

--maxWildcardApns <integer>

Description

Maximum number of APNs allowed for a wildcard APN in UE subscription data. a UE subscription data may contain a wild card APN if the HPLMN operator allows subscriber to access any network. if MME has received such a wild card APN, MME can allow an APN NI received from the UE even if the APN is not in the UE subscription. the wild card APN is coded as an APN with "*" as its single label, (i.e. a length octet with value one, followed by the ASCII code for the asterisk) in UE subscription.

Class

Optional.

Type / Range

Integer in the range of 0 to 8

Default

1

Name

mccLteHmRtPgWdnsDmOvrd - MCC LTE home routed PGW DNS domain override

Syntax

--mccLteHmRtPgWdnsDmOvrd <digits>

Description

Override the normal PGW domain derivation by using the given MCC and MNC values for a home routed APN.

Class

Optional.

Type / Range

Digit string of length 0 or 3

Name

mmeNbIotCptoUpSwitch - Enable MME triggered control plane bearers to user plane bearers switch for CIOT UE

Syntax

--mmeNbIotCptoUpSwitch <list-item>

Description

This parameters enables MME triggered control plane (CP) bearers to use user plane (UP) i.e. S1-U bearers for CIOT UE. if this parameter is set then MME triggers CP bearers to UP. By default the parameter is not set.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

mmeWbEutranCpToUpSwitch - Enable MME triggered control plane bearers to user plane bearers switch for WB-EUTRAN UE

Syntax

--mmeWbEutranCpToUpSwitch <list-item>

Description

This parameters enables MME triggered control plane (CP) bearers to use user plane (UP) i.e. S1-U bearers for WB-EUTRAN UE. if this parameter is set then MME triggers CP bearers to UP. By default the parameter is not set.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

mncLteHmRtPgWdnsDmOvrd - MNC LTE home routed PGW DNS domain override

Syntax

--mncLteHmRtPgWdnsDmOvrd <digits>

Description

Override the normal PGW domain derivation by using the given MCC and MNC values for a home routed APN.

Class

Optional.

Type / Range

Digit string of length 0 or 2 to 3

Default

"

Name

moEdtCp - moEdtCp

Syntax

--moEdtCp <list-item>

Description

Mobile Originated Early Data Transfer for Control Plane for S11u and T6a

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

mpdnconn - Multiple PDN connection to same APN

Syntax

--mpdnconn <list-item>

Description

If true, MME shall allow and accept multiple PDN connection to the same APN with the same PDN type.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

mtEdtCp - mtEdtCp

Syntax

--mtEdtCp <list-item>

Description

Mobile-Terminated Early Data Transfer over Control Plan

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

mtEdtT6a - mtEdtT6a

Syntax

--mtEdtT6a <list-item>

Description

Mobile Terminated Early Data Transfer over T6a

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

mtEdtUp - mtEdtUp

Syntax

--mtEdtUp <list-item>

Description

Mobile Terminated Early Data Transfer User Plane

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

mtSmsOpt2ForUeInPowerSavings - MT SMS option 2 deployment for UE in power savings

Syntax

--mtSmsOpt2ForUeInPowerSavings <list-item>

Description

Use deployment option 2 specified in TS 23.272 for handling mobile terminated SMS for UE in power savings (idle mode DRX and power savings mode). if this parameter is false then MME uses the option 1 specified in TS 23.272.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

n26IwkMme - n26 interworking on MME

Syntax

--n26IwkMme <list-item>

Description

Controlling enable of N26 interworking on MME

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

n26IwkMmeRestrictionTaiListName - MME N26 IWK Restriction TAI List

Syntax

--n26IwkMmeRestrictionTaiListName <string>

Description

N26 interworking restriction TAI list used by MME to restrict 4G service when UE(s) move from 5G into the respective TACs in the TAI list.

Class

Optional.

Type / Range

Digit string of length 0 or 1 to 31 with the allowed pattern of [0-9a-zA-Z_\.\\-:@]*

Default

""

Name

nblotDlDataSizeForCpToUpSwitch - Downlink data packet size threshold for CP bearers to UP bearers switch

Syntax

--nbIotDlDataSizeForCpToUpSwitch <integer>

Description

Provision the size of CIOT UE downlink control plane data packet size threshold in octets for MME to trigger control plane bearers to switch to use user plane bearers i.e. S1-U bearers. By default the data packet size is set to 120 octets. the range of allowed values are 20 to 1024 octets.

Class

Optional.

Type / Range

Integer in the range of 20 to 1,024

Default

120

Name

nbiotSmsWithoutCombinedAttach - Enable SMS without combined Attach For NB-IOT UE

Syntax

--nbiotSmsWithoutCombinedAttach <list-item>

Description

Enable SMS without combined Attach For NB-IOT UE

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

nBlotUeCpToUpSwitch - CIOT UE control plane bearer to user plane bearer switching

Syntax

--nBIotUeCpToUpSwitch <list-item>

Description

Parameter to allow/not allow CIOT UE control plane traffic to user plane i.e. setup radio bearers and transport user data over S1-U.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

nblotUlDataSizeForCpToUpSwitch - Upnlk data packet size threshold for CP bearers to UP bearers switch

Syntax

--nBIotUlDataSizeForCpToUpSwitch <integer>

Description

Provision the size of CIOT UE uplink control plane data packet size threshold in octets for MME to trigger control plane bearers to switch to use user plane bearers i.e. S1-U bearers. By default the data packet size is set to 120 octets. the range of allowed values are 20 to 1024 octets.

Class

Optional.

Type / Range

Integer in the range of 20 to 1,024

Default

120

Name

nonImsApnQosprofileName - Default non-ims APN QoS profile for roamers

Syntax

--nonImsApnQosprofileName <string>

Description

Default non-IMS APN QoS profile for roamers. Non IMS APN QoS profile name is not used when served PLMN and UE PLMN are the same. Otherwise, the default is Def-Roam-NonIMS-APN-QoS-Prfl.

Restrictions

This element is not applicable when the serving and UE PLMNs are the same.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

"

Name

nonImsApnWpsQosprofileName - Default non-ims APN WPS QoS profile for roamers

Syntax

--nonImsApnWpsQosprofileName <string>

Description

Points to the roaming QoS profile for non IMS APNs. Non IMS APN WPS QoS profile name is not used when Serving PLMN equals UE PLMN or when Treat As Home Subscriber is true.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

"

Name

nonIpDataTrans - Non-IP data transport

Syntax

--nonIpDataTrans <list-item>

Description

Enable/disable non-ip data transport.

Restrictions

This element is applicable when the serving and UE PLMNs are same or when lteTreatAsHomeSubscriber set to true.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

numberOfAvRequested - Number of Authentication Vectors Requested

Syntax

--numberOfAvRequested <integer>

Description

Defines the number of authentication vectors requested. This parameter, when defined to be used, takes precedence over the Local endpoint parameter. Value 0 for this parameter stands for 'not used', and when that is set, the Local endpoint parameter is applied.

Class

Optional.

Type / Range

Integer in the range of 0 to 5

Default

0

Name

pagingPriProfileListName - Paging priority profile name

Syntax

--pagingPriProfileListName <string>

Description

Identifies the paging priority profile.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Name

pdnReactivateN1Enable - PDN Reactivation when N1 mode gets enabled

Syntax

--pdnReactivateN1Enable <list-item>

Description

Current parameter enables the MME performing PDN deactivation (reactivation requested) for the non-emergency PDNs after TAU completes for which the UE re-enabled N1 mode for those PDN sessions that are established with standalone PGWs but the associated APNs allow 5GS IWK and UE is not 5G Restricted.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

pdnTypeIpv6Restriction - PDN Type IPv6 Restriction

Syntax

--pdnTypeIpv6Restriction <list-item>

Description

Restricts the use of PDN Type IPv6 or IPv4v6 for the UE.

Class

Optional.

List

- pdnTypeIpv6RestrictionDisabled - PDN Type IPv6 Restriction Disabled - MME functionality to restrict PDN Connectivity procedure attempts with PDN Type IPv6 or IPv4v6 is disabled.
- pdnTypeIpv6RestrictionModify - PDN Type IPv6 Restriction Modify - MME restricts any PDN Connectivity procedure attempts with PDN Type IPv6 or IPv4v6 that the UE performs by continuing the PDN connectivity request procedure using the IPv4 PDN Type.

- pdnTypeIpv6RestrictionReject - PDN Type IPv6 Restriction Reject - MME restricts any PDN Connectivity procedure attempts with PDN Type IPv6 or IPv4v6 that the UE performs by directly rejecting the UE request.

Default

pdnTypeIpv6RestrictionDisabled

Name

pdnTypeIpv6RestrictionPdnRejectionCause - PDN Type IPv6 Restriction PDN Rejection Cause

Syntax

--pdnTypeIpv6RestrictionPdnRejectionCause <integer>

Description

Defines the ESM cause value when MME rejects the PDN connectivity request of the UE due to PDN Type IPv6 being restricted.

Class

Optional.

Type / Range

Integer in the range of 8, 26-39, 41-47, 49-60, 65-66, 81, 95-101, 111-113

Default

50

Name

pgwSelectionCcApnName - P-GW selection by charging characteristics APN name

Syntax

--pgwSelectionCcApnName <string>

Description

Identifies the table to be used for P-Gateway selection by charging characteristics using APN.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

provisionedDefaultApn - Provisioned default APN

Syntax

--provisionedDefaultApn <string>

Description

Access point name, the corrected value.

Class

Optional.

Type / Range

Digit string of length 0 to 62 with the allowed pattern of [0-9a-zA-Z\.\-]*

Name

psmApnListName - PSM APN list name

Syntax

--psmApnListName <string>

Description

PSM APN list name.

Class

Optional.

Type / Range

Digit string of length 0 or 1 to 31 with the allowed pattern of [0-9a-zA-Z_\.\-:@]*

Default

"

Name

psmEnabled - PSM enabled

Syntax

--psmEnabled <list-item>

Description

PSM enabled.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

reAuthTimePeriod - Reauthentication Time Period

Syntax

--reAuthTimePeriod <integer>

Description

This field defines the time period between successive UE authentications forced by the MME.
When value equals zero then the feature is disabled

Class

Optional.

Type / Range

Integer in the range of 60 to 1440 including value zero in units of Minute

Default

0

Name

registeredUePerTaListName - Registered UE per TA List Name

Syntax

--registeredUePerTaListName <string>

Description

This list consists of TA and maximum number of registered UE allowed for each TA in the list. The list is created using the following commands: cmm registeredUePerTa create --name <string> cmm registeredUePerTaList create --registeredUePerTaListName <string> --servingPlmnName <integer> --tac <integer> [--maxUeAllowedPerTac <integer>

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

rejectGrpSrvAttachPdnRestricted - Reject group service attach PDN restricted

Syntax

--rejectGrpSrvAttachPdnRestricted <list-item>

Description

Selection of option to reject or accept a UE attach request if UE does not support ERw/oPDN and bit 2 of local-group-id is set to indicate attach without PDN connection restricted.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

rejectUeTauMaxUeExceed - Reject UE TAU request if Maximum Number Exceeded

Syntax

--rejectUeTauMaxUeExceed <list-item>

Description

If the parameter is set then MME rejects the UE TAU request if the allowed UEs exceed the max provisioned for the tracking area.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

restNasMappingProfileName - Access restriction to NAS cause code profile name

Syntax

--restNasMappingProfileName <string>

Description

Defines all MME access restriction to NAS cause code mapping.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\.\-:@]*

Default

default

Name

rfspAccessRestrictionListName - Access Restriction for RFSP List Name

Syntax

--rfspAccessRestrictionListName <string>

Description

A reference to a list of RFSP values for which access is to be restricted for the UE.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z_\.\-:@]*

Default

""

Name

roamerUeTzInCreateAndUpdateBearerResp - Roamer UE Time Zone in Create And Update Bearer Response

Syntax

--roamerUeTzInCreateAndUpdateBearerResp <list-item>

Description

Parameter controls inclusion and sending of UE time zone IE in Update and Create Bearer Response for Roamers. By default, flag shall be set to false. When enabled, MME will include and send UE time zone IE in Update and Create Bearer Response messages towards SGW. Definition of Roamers for eg: is subscriber roaming into 'Operator A' network but using their own PGW, PLMN not owned by 'Operator A'. In other words, HRT, meaning the roamer is using PGW of the roamer network (e.g., 'Operator B' UE roaming in 'Operator A' network but using 'Operator B' PGW. However LBO case doesn't apply for this feature.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

rohc - ROHC

Syntax

--rohc <list-item>

Description

ROHC.

Restrictions

This element is applicable when the serving and UE PLMNs are same or when lteTreatAsHomeSubscriber set to true.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

rszcForbiddenNasCauseCode - NAS cause code for RSZC PLMN

Syntax

--rszcForbiddenNasCauseCode <integer>

Description

NAS cause to be sent to UE if UE MM request is rejected due to regional subscription zone code PLMN checks.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

11

Name

s102PagingPriProfileName - S102 paging priority profile name

Syntax

--s102PagingPriProfileName <string>

Description

Identifies the S102 paging priority profile.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

s1uDataTrans - S1U data transfer

Syntax

--s1uDataTrans <list-item>

Description

Enable S1-U data transfer.

Restrictions

This element is applicable when the serving and UE PLMNs are same or when lteTreatAsHomeSubscriber set to true.

Class

Optional.

List

- false - Boolean value of false.

- true - Boolean value of true.

Default

false

Name

sendDcnrRestrictionsIndToUe - Send DC-NR Restriction Indication to UE

Syntax

--sendDcnrRestrictionsIndToUe <list-item>

Description

This parameter applies when the 'useNrSecondaryArdAsDcnrIndication' parameter is set and the UE does not provide a DC-NR indication to the MME. In this case, the setting of sendDcnrRestrictionsIndToUe defines whether the MME is to send DC-NR restrictions to the UE in NAS messaging.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

sendLtemRatToPgw - Send LTE-M RAT to PGW

Syntax

--sendLtemRatToPgw <list-item>

Description

Specifies whether the MME should send an indication to the PGW (via S11 messaging to the SGW) when the UE is using the LTE-M RAT Type. The PGWs would then include this in subsequent charging records.

Class

Optional.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

separateEplmnListNasS1ap - Separate EPLMN List on NAS and S1AP

Syntax

--separateEplmnListNasS1ap <list-item>

Description

Enable sending separate Equivalent PLMN Lists to NAS and S1AP. The EPLMN Lists applied to NAS and S1AP are copied from EPLMN List Name and EPLMN List Name for eNB, respectively.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

serviceGapControlActive - Service Gap Control Active

Syntax

--serviceGapControlActive <list-item>

Description

Service Gap Control is active for UEs from the PLMN

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

serviceGapTimerSource - Service Gap Timer Source

Syntax

--serviceGapTimerSource <list-item>

Description

Specifies whether to use Service Gap Timer from HSS or Local provisioning

Class

Optional.

List

- Local - Use locally-provisioned Service Gap Timer
- HSS - Use HSS-provided Service Gap Timer

Default

HSS

Name

sGdDiamRpMappingProfileName - SGd Diameter RP Mapping Profile Name

Syntax

--sGdDiamRpMappingProfileName <string>

Description

Defines all SGd interface Diameter code to SMS Relay Protocol (RP) cause code mapping.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\.\\-:@]*

Default

default

Name

sgwRelocationAllow - SGW Relocation Allow

Syntax

--sgwRelocationAllow <list-item>

Description

Parameter 'sgwRelocationAllow' will override the existing 'sgwRelocationRestriction' global gparm 'on per UEPLMN/serving PLMN combination. If the flag is set to true, SGW will be relocated at TAU procedure where the current SGW is not in the candidate list of the new TAI. This applies to gateway selection mode 2. By default this flag is disabled.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

smsProfileName - SMS profile name

Syntax

--smsProfileName <string>

Description

The profile containing the SMS delivery related parameters for the SMS in MME feature.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\.\-:@]*

Default

default

Name

smsS102PagingPriProfileName - S102 SMS paging priority profile name

Syntax

--smsS102PagingPriProfileName <string>

Description

Identifies the S102 SMS paging priority profile.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z_\.\-:@]*

Name

srvcc5gMscServerAddrToAmf - 5G-SRVCC MSC Server Address to AMF

Syntax

--srvcc5gMscServerAddrToAmf <list-item>

Description

Enables MME (acting as the MME_SRVCC) to deliver the MSC server address to the AMF over N26 interface.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

support5gSrvcc - Support 5G-SRVCC

Syntax

--support5gSrvcc <list-item>

Description

Enables the intermediary role of the MME_SRVCC (MME supporting 5G-SRVCC) for the UE for regular voice calls. The MME_SRVCC passes messages between the AMF and MSC server during 5G-SRVCC handover of voice calls from NG-RAN/5GS to 3GPP UTRAN/CS domain.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

supportGrpSvcProvision - Support group service provision

Syntax

--supportGrpSvcProvision <list-item>

Description

Support group service provision.

Restrictions

This element is only applicable when plmn is home/shared.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

svcAgreementProfileName - Service agreement profile name

Syntax

--svcAgreementProfileName <string>

Description

Defines the MME PLMN service agreement profile to be used for service.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Default

default

Name

t6aDiamToNasProfileName - T6A diam to NAS profile name

Syntax

--t6aDiamToNasProfileName <string>

Description

Configure T6a diameter error to NAS cause code profile.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Default

default

Name

taiZoneMappingListName - TAI Zone Mapping List Name

Syntax

--taiZoneMappingListName <string>

Description

TAI Zone Mapping List Name

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Default

""

Name

tauDataForwarding - TAU data forwarding

Syntax

--tauDataForwarding <list-item>

Description

TAU data forwarding.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

ueAmbrDownLink - UE AMBR downlink bitrate

Syntax

--ueAmbrDownLink <integer>

Description

LTE UE aggregate maximum downlink bitrate.

Restrictions

This element applies only to LTE. This element is not applicable when the serving and UE PLMNs are the same. The granularity is 8 when the value is between 64 and 568. The granularity is 64 when the value is between 576 and 8640. The granularity is 100 when the value is between 8700 and 16000. The granularity is 1000 when the value is between 17000 and 128000. The granularity is 2000 when the value is between 130000 and 256000.

Class

Optional.

Type / Range

Integer in the range of 0, 1-63, 64- 568, 576-8640, 8700-16000, 17000-128000, 130000-4000000000 in units of kbps

Default

0

Name

ueAmbrUpLink - UE AMBR uplink bitrate

Syntax

--ueAmbrUpLink <integer>

Description

LTE UE aggregate maximum uplink bitrate.

Restrictions

This element applies only to LTE. This element is not applicable when the serving and UE PLMNs are the same. The granularity is 8 when the value is between 64 and 568. The granularity is 64 when the value is between 576 and 8640. The granularity is 100 when the value is between 8700 and 16000. The granularity is 1000 when the value is between 17000 and 128000. The granularity is 2000 when the value is between 130000 and 256000.

Class

Optional.

Type / Range

Integer in the range of 0, 1-63, 64- 568, 576-8640, 8700-16000, 17000-128000, 130000-4000000000 in units of kbps

Default

0

Name

ueFailopenProfileName - MME Failopen Profile Name

Syntax

--ueFailopenProfileName <string>

Description

The name of the failopen profile. A failopen profile as part of uePlmnServices is only applied if an APN configuration profile list is defined as part of it.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

""

Name

ueMonitoringEnabled - UE monitoring enabled

Syntax

--ueMonitoringEnabled <list-item>

Description

Indicate if UE monitoring is enabled.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

ueMonitoringProfileName - UE monitoring profile name

Syntax

--ueMonitoringProfileName <string>

Description

Reference to a UE monitoring profile in uemonitoringprofile.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Default

default

Name

ueUsagePgwFallbackSelection - UE Usage PGW Fallback Selection

Syntax

--ueUsagePgwFallbackSelection <list-item>

Description

If the parameter is set to 'True' then MME attempts to select a PGW that does not support the UE Usage Type if MME failed to select a PGW supporting the UE Usage Type.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

ueUsagePgwRelocation - PGW Relocation on UE Usage Type change

Syntax

--ueUsagePgwRelocation <list-item>

Description

This parameter is used by a new MME for TAU with MME relocation. The new MME checks whether the UE usage Type is supported by the PGW associated with the active PDN

connection. If the PGW does not support the UE Usage Type and if the parameter is set then the new MME will deactivate the PDN connection so that a PGW supporting the UE Usage Type can be selected. If the PDN connection is the last PDN connection then the UE is detached. if the parameter is set to false then the MME will not take check UE Usage Type of the PGW.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

ueUsagePgwSelection - PGW Selection using UE Usage Type

Syntax

--ueUsagePgwSelection <list-item>

Description

Parameter enables the use of UE Usage Type to select a PGW if the FID f11601-01 is enabled.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

ueUsageSgwFallbackSelection - UE Usage SGW Fallback Selection

Syntax

--ueUsageSgwFallbackSelection <list-item>

Description

If the parameter is set to 'True' then MME will select a SGW that does not support the UE Usage Type if MME fails to select a SGW supporting the UE Usage Type.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

ueUsageSgwRelocation - UE Usage SGW Relocation

Syntax

--ueUsageSgwRelocation <list-item>

Description

This parameter applies to target MME when there is MME relocation. In the case of MME relocation with SGW relocation then the target MME will select a SGW supporting the UE Usage Type. If SGW relocation is not required, then the target MME checks to see whether the SGW supports the UE Usage Type. If the SGW does not support the UE Usage type and if this parameters is set to 'Yes' then MME initiates SGW relocation to select a SGW supporting the UE Usage Type.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

ueUsageSgwSelection - UE Usage SGW Selection

Syntax

--ueUsageSgwSelection <list-item>

Description

If this parameter is set to to 'True', then MME selects SGW supporting the UE Usage Type.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

ueUsageSourceImsiRange - ueUsageSourceImsiRange

Syntax

--ueUsageSourceImsiRange <list-item>

Description

if ueUsageSourceImsiRange is true and if the UE matches an imsiRangeServices record, the CMM will assign the ueUsageType from the imsiRangeServices to the UE (or blank if no UUT is defined for that IMSI Range). Otherwise, the CMM will assign to the UE the ueUsageType from the HSS (or blank if not present).

Restrictions

This element is applicable when the serving and UE PLMNs are same or when lteTreatAsHomeSubscriber set to true.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

ulRateLimit - uplink rate limit

Syntax

--ulRateLimit <integer>

Description

MME allows an UE to transfer up to the maximum data over CPO with the parameter limited value for uplink data.

Class

Optional.

Type / Range

Integer in the range of 0 or 10 to 10000 in units of DeciHour

Default

20

Name

upCloT - UP CloT

Syntax

--upCIoT <list-item>

Description

Enable CP CIOT optimization.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

useApnOiToDetermineHrt - Use APN-OI to Determine HRT

Syntax

--useApnOiToDetermineHrt <list-item>

Description

Current parameter enables using the APN-OI instead of the PGW FQDN to determine if a PDN Session is HRT for a roaming subscriber when applying QoS modification for a PDN session in accordance to local configuration and when sending the UE Time Zone IE in UBR and CBR Response messages. The parameter is effective only when the gParm useApnOiToDetermineHrt is also enabled.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

useLocallyProvQoS - Use Locally Provisioned QoS

Syntax

--useLocallyProvQoS <list-item>

Description

Parameter controls whether to use locally configured QoS values all the time. By default this shall be disabled, when enabled MME shall always use the locally configured QoS values, HSS QoS subscription values shall be ignored.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

useLocallyProvQoSForHomers - Use Locally Provisioned QoS for Homers

Syntax

--useLocallyProvQoSForHomers <list-item>

Description

Parameter controls whether to use locally configured QoS values all the time. By default this shall be disabled, when enabled MME shall always use the locally configured QoS values for homers. HSS QoS subscription values shall be ignored.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

useN26SvcParamS10Ho - Use N26 Service Parameter in S10 Handover

Syntax

--useN26SvcParamS10Ho <list-item>

Description

Current parameter enables using N26 service parameter as part of DNS query for target MME selection during S10 handover

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

useNrSecondaryArdAsDcnrIndication - Use NR Secondary ARD As DC-NR Indication

Syntax

--useNrSecondaryArdAsDcnrIndication <list-item>

Description

MME preferentially selects an S/PGW with 'nc-nr' in the app-protocol name of the DNS record based solely on the Access-Restriction-Data (NR as secondary RAT in E-UTRAN not allowed bit).

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

uutOverrideProfileName - UE Usage Type Override Profile Name

Syntax

--uutOverrideProfileName <string>

Description

Specifies profile name for assigning local UE Usage Type override

Class

Optional.

Type / Range

Digit string of length 0 or 1 to 31 with the allowed pattern of [0-9a-zA-Z_\.\\-:@]*

Default

"

Name

wbEutranDlDataSizeForCpToUpSwitch - Downlink data packet size threshold for CP bearers to UP bearers switch

Syntax

--wbEutranDlDataSizeForCpToUpSwitch <integer>

Description

Provision the size of WB-EUTRAN UE downlink control plane data packet size threshold in octets for MME to trigger control plane bearers to switch to use user plane bearers i.e. S1-U bearers. By default the data packet size is set to 120 octets. The range of allowed values are 20 to 1024 octets.

Class

Optional.

Type / Range

Integer in the range of 20 to 1,024

Default

120

Name

wbEutranUeCpToUpSwitch - WB-EUTRAN UE control plane bearers to user plane switching

Syntax

--wbEutranUeCpToUpSwitch <list-item>

Description

Parameter to allow WB-EUTRAN UE control plane bearers switching to user plane i.e. set up radio bearers and transport user data over S1-U.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

wbEutranUlDataSizeForCpToUpSwitch - Upnlink data packet size threshold for CP bearers to UP bearers switch

Syntax

--wbEutranUlDataSizeForCpToUpSwitch <integer>

Description

Provision the size of WB-EUTRAN UE uplink control plane data packet size threshold in octets for MME to trigger control plane bearers to switch to use user plane bearers i.e. S1-U bearers. By default the data packet size is set to 120 octets. The range of allowed values are 20 to 1024 octets.

Class

Optional.

Type / Range

Integer in the range of 20 to 1,024

Default

120

Name

wusProfileName - Wake Up Signal Profile Name

Syntax

--wusProfileName <string>

Description

Specifies the applicable profile for Wake Up Signaling for UEs from this PLMN

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

zoneCodeExtendedEmergencyNumListName - Zone Code Extended Emergency Number List Name

Syntax

--zoneCodeExtendedEmergencyNumListName <string>

Description

Zone Code Extended Emergency Number List Name

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

7.133 cmm ueRoamRestrictProfile

UE Roaming TAI and LAI Restriction Profile. Syntax, description, parameters, and roles for cmm ueRoamRestrictProfile command.

Syntax

Description

This command is used to administer the UE Roaming TAI and LAI Restriction Profile and includes parameters for defining the list type, serving or equivalent network name, LAI or TAI network name, and Location Area Code or Tracking Area Code.

Parameters

Name

areaListName - TAI and LAI area list name

Syntax

--areaListName <string>

Description

Name that identifies roaming restriction profile.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

servedPlmnName - Mobile network name

Syntax

--servedPlmnName <string>

Description

Name that identifies the serving or equivalent network containing the restricted TAI or LAI.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

listType - List type

Syntax

--listType <list-item>

Description

Indicates the type of list being provisioned.

Class

Required key.

List

- LAI List - Specify location area identifier list.
- TAI List - Specify tracking area identifier list.

Name

taiLaiPlmnName - LAI/TAI mobile network name

Syntax

--taiLaiPlmnName <string>

Description

Name that identifies LAI/TAI network.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

tacLac - Restricted TAC or restricted LAC

Syntax

--tacLac <integer>

Description

Restricted tracking area code or location area code.

Class

Required key.

Type / Range

Integer in the range of 1 to 65,535

Name

ueRoamRestrictProfileId - UE roaming restrict profile ID

Syntax

--ueRoamRestrictProfileId <integer>

Description

Defines the UE roaming restrict profile to be used for the service.

Class

Read only.

Type / Range

Integer in the range of 1 to 5,000

7.134 cmm uutOverrideProfile

UUT Override Profile. Syntax, description, parameters, and roles for cmm uutOverrideProfile command.

Syntax**Description**

Specifies conditions under which the MME is to assign a local value for UE Usage Type. This local value is then used to determine whether to reroute or keep the UE on the MME. If the UE is kept, the value is used for SGW and PGW DNS selection.

Parameters**Name**

name - UE Usage Type Override Profile Name

Syntax

--name <string>

Description

Name of the override profile

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Name

dcnrPrioritizedOverN1 - DCNR Prioritized

Syntax

--dcnrPrioritizedOverN1 <list-item>

Description

Specifies the relative priority of local UUT assignment. For this priority field to be used, the DC-NR and N1 overrides (UUTs) must be provisioned in the profile. Otherwise, this field is ignored. If this field is set to true, DC-NR has priority over N1. Otherwise, N1 has priority. The default is false (N1 priority).

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

ignoreArdDcnrDisallowed - UE DC NR Ignore ARD

Syntax

--ignoreArdDcnrDisallowed <list-item>

Description

Specifies whether to ignore ARD from HSS that restricts UE the use of DC-NR. If ignore is false, the MME will not assign a local UUT override for DC-NR regardless of UE capability. The default is false.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

ue5gcRestricted - UE 5G Core Restricted

Syntax

--ue5gcRestricted <integer>

Description

UUT Override value to apply to UEs whose HSS restricts 5G core use as indicated in subscription profile in S6a:ULA and S6a:IDR messaging. If a value of 0 is specified, there is no UUT override assigned.

Class

Optional.

Type / Range

UE Usage type in the range of 1 to 126 or 128 to 255, or 0 if not used.

Default

0

Name

ue5gNasNotSupported - UE 5G NAS Not Supported

Syntax

--ue5gNasNotSupported <integer>

Description

UUT Override value to apply to UEs not capable of 5G NAS operation as indicated by the 'N1 mode' bit in the UE network capability IE that the UE provides in Attach and TAU messaging. If a value of 0 is specified, there is no UUT override assigned.

Class

Optional.

Type / Range

UE Usage type in the range of 1 to 126 or 128 to 255, or 0 if not used.

Default

0

Name

ue5gNasSupported - UE 5G NAS Supported

Syntax

--ue5gNasSupported <integer>

Description

UUT Override value to apply to UEs capable of 5G NAS operation as indicated by the 'N1 mode' bit in the UE network capability IE that the UE provides in Attach and TAU messaging. If a value of 0 is specified, there is no UUT override assigned.

Class

Optional.

Type / Range

UE Usage type in the range of 1 to 126 or 128 to 255, or 0 if not used.

Default

0

Name

ueDcnrNotSupportedUut - UE DC-NR Not Supported

Syntax

--ueDcnrNotSupportedUut <integer>

Description

UUT Override value to assign to UEs that do not indicate support of DC-NR operation via the 'DCNR' bit (octet 9, bit 5) in the UE network capability IE that the UE provides in Attach and TAU messaging. If an override value of 0 is specified, there is no UUT override to be assigned to the UE.

Class

Optional.

Type / Range

UE Usage type in the range of 1 to 126 or 128 to 255, or 0 if not used.

Default

0

Name

ueDcnrSupportedUut - UE DC-NR Supported

Syntax

--ueDcnrSupportedUut <integer>

Description

UUT Override value to assign to UEs that indicate support of DC-NR operation via the 'DCNR' bit (octet 9, bit 5) in the UE network capability IE that the UE provides in Attach and TAU messaging. If an override value of 0 is specified, there is no UUT override to be assigned to the UE.

Class

Optional.

Type / Range

UE Usage type in the range of 1 to 126 or 128 to 255, or 0 if not used.

Default

0

7.135 cmm vdpProfile

VDP profile. Syntax, description, parameters, and roles for `cmm vdpProfile` command.

Syntax

Description

Voice Domain Preference profile.

Parameters

Name

plmnName - Mobile network name

Syntax`--plmnName <string>`**Description**

Name that identifies serving network.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of `[0-9a-zA-Z\.\-_:@]*`

Name

name - VDP profile name

Syntax`--name <string>`**Description**

Voice domain preference profile name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Name

dCsOnlyCombAttachTreatment - Data centric CS only combined Attach treatment

Syntax

--dCsOnlyCombAttachTreatment <list-item>

Description

Data centric circuit switched only treatment for combined attach scenarios. If DEFAULT, the behavior will be to use the value from dCsOnlyTreatment. If not DEFAULT, override dCsOnlyTreatment for Combined Attach scenarios with the specified value.

Class

Optional.

List

- ALW - Allow - NonEps procedure (i.e. combined-attach or combined-ta) and Eps procedures are allowed.
- CS_D_NOT_AVAIL - CS domain not available - NonEps procedure (i.e. combined-attach or combined-ta) is not allowed. in attach accept/tau accept emmcause portion send cause "CS domain not available" for the noneps part.
- CSFB_NOT_PREF - CSFB not preferred - Anytype of noneps procedure (i.e. combined-attach or combined-ta) is allowed. in the attach accept/tau accept message we will indicate to the UE that "CSFB is not preferred".
- NAS - NonEps procedure (i.e. combined-attach or combined-ta) and Eps procedures are not allowed. use the provisioned NAS cause code in the attach accept/tau accept emmcause portion to indicate the failure.
- SMS_ONLY - SMS only - NonEps procedure allowed however indicate to the UE in attach accept/tau accept that they are only allowed to have SMS service.
- EPS_ONLY_NAS - EPS only NAS - NonEps procedure (i.e. combined-attach or combined-ta) is not allowed. Use the provisioned NAS cause code in the attach accept/tau accept emmcause portion to indicate the failure for the noneps part.
- DEFAULT - Use the treatment provisioned commonly for all Attach and TAU procedures.

Default

DEFAULT

Name

dCsOnlyCombTauTreatment - Data centric CS only combined TAU treatment

Syntax

--dCsOnlyCombTauTreatment <list-item>

Description

Data centric circuit switched only treatment for combined TAU scenarios. If DEFAULT, the behavior will be to use the value from dCsOnlyTreatment. If not DEFAULT, override dCsOnlyTreatment for Combined TAU scenarios with the specified value.

Class

Optional.

List

- ALW - Allow - NonEps procedure (i.e. combined-attach or combined-ta) and Eps procedures are allowed.
- CS_D_NOT_AVAIL - CS domain not available - NonEps procedure (i.e. combined-attach or combined-ta) is not allowed. in attach accept/tau accept emmcause portion send cause "CS domain not available" for the noneps part.
- CSFB_NOT_PREF - CSFB not preferred - Anytype of noneps procedure (i.e. combined-attach or combined-ta) is allowed. in the attach accept/tau accept message we will indicate to the UE that "CSFB is not preferred".
- NAS - NonEps procedure (i.e. combined-attach or combined-ta) and Eps procedures are not allowed. use the provisioned NAS cause code in the attach accept/tau accept emmcause portion to indicate the failure.
- SMS_ONLY - SMS only - NonEps procedure allowed however indicate to the UE in attach accept/tau accept that they are only allowed to have SMS service.
- EPS_ONLY_NAS - EPS only NAS - NonEps procedure (i.e. combined-attach or combined-ta) is not allowed. Use the provisioned NAS cause code in the attach accept/tau accept emmcause portion to indicate the failure for the noneps part.
- DEFAULT - Use the treatment provisioned commonly for all Attach and TAU procedures.

Default

DEFAULT

Name

dCsOnlyImsSupervision - Data centric CS only IMS supervision

Syntax

--dCsOnlyImsSupervision <list-item>

Description

Data centric circuit switched only IMS supervision flag. The IMS supervision functionality of the MME checks that the UE activates the IMS PDN connection and performs successful IMS registration. Otherwise the MME detaches the UE.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

dCsOnlyNasCause - Data centric CS only NAS cause code

Syntax

--dCsOnlyNasCause <integer>

Description

Data centric circuit switched only cause code.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

15

Name

dCsOnlyNonEpsNasCause - Data centric CS only Non EPS NAS cause

Syntax

--dCsOnlyNonEpsNasCause <integer>

Description

The NAS cause used when non-EPS procedure is not allowed for Data centric CS only UE.

Class

Optional.

Type / Range

Non EPS rejection NAS cause

Default

18

Name

dCsOnlySendForbiddenTaiList - Data Centric CS Voice Only Send Forbidden TAI List

Syntax

--dCsOnlySendForbiddenTaiList <list-item>

Description

Controls whether the forbidden TAI list is sent for Data centric, CS voice only UEs. Applied when global parameter VDP Forbidden TAI List on VDP Profile is set to true.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

dCsOnlyTreatment - Data centric CS only treatment

Syntax

--dCsOnlyTreatment <list-item>

Description

Data centric circuit switched only treatment.

Class

Optional.

List

- ALW - Allow - NonEps procedure (i.e. combined-attach or combined-ta) and Eps procedures are allowed.
- CSFB_NOT_PREF - CSFB not preferred - Anytype of noneps procedure (i.e. combined-attach or combined-ta) is allowed. in the attach accept/tau accept message we will indicate to the UE that "CSFB is not preferred".
- CS_D_NOT_AVAIL - CS domain not available - NonEps procedure (i.e. combined-attach or combined-ta) is not allowed. in attach accept/tau accept emmcause portion send cause "CS domain not available" for the noneps part.
- EPS_ONLY_NAS - EPS only NAS - NonEps procedure (i.e. combined-attach or combined-ta) is not allowed. Use the provisioned NAS cause code in the attach accept/tau accept emmcause portion to indicate the failure for the noneps part.
- NAS - NonEps procedure (i.e. combined-attach or combined-ta) and Eps procedures are not allowed. use the provisioned NAS cause code in the attach accept/tau accept emmcause portion to indicate the failure.
- SMS_ONLY - SMS only - NonEps procedure allowed however indicate to the UE in attach accept/tau accept that they are only allowed to have SMS service.

Default

ALW

Name

dCsPreferCombAttachTreatment - Data centric CS preferred Combined Attach treatment

Syntax

--dCsPreferCombAttachTreatment <list-item>

Description

Data centric circuit switched preferred, IMS secondary treatment for combined attach scenarios. If DEFAULT, the behavior will be to use the value from dCsPreferTreatment. If not DEFAULT, override dCsPreferTreatment for Combined Attach scenarios with the specified value.

Class

Optional.

List

- ALW - Allow - NonEps procedure (i.e. combined-attach or combined-ta) and Eps procedures are allowed.
- CS_D_NOT_AVAIL - CS domain not available - NonEps procedure (i.e. combined-attach or combined-ta) is not allowed. in attach accept/tau accept emmcause portion send cause "CS domain not available" for the noneps part.
- CSFB_NOT_PREF - CSFB not preferred - Anytype of noneps procedure (i.e. combined-attach or combined-ta) is allowed. in the attach accept/tau accept message we will indicate to the UE that "CSFB is not preferred".
- NAS - NonEps procedure (i.e. combined-attach or combined-ta) and Eps procedures are not allowed. use the provisioned NAS cause code in the attach accept/tau accept emmcause portion to indicate the failure.
- SMS_ONLY - SMS only - NonEps procedure allowed however indicate to the UE in attach accept/tau accept that they are only allowed to have SMS service.
- EPS_ONLY_NAS - EPS only NAS - NonEps procedure (i.e. combined-attach or combined-ta) is not allowed. Use the provisioned NAS cause code in the attach accept/tau accept emmcause portion to indicate the failure for the noneps part.
- DEFAULT - Use the treatment provisioned commonly for all Attach and TAU procedures.

Default

DEFAULT

Name

dCsPreferCombTauTreatment - Data centric CS preferred combined TAU treatment

Syntax

--dCsPreferCombTauTreatment <list-item>

Description

Data centric circuit switched preferred, IMS secondary treatment for combined TAU scenarios. If DEFAULT, the behavior will be to use the value from dCsPreferTreatment. If not DEFAULT, override dCsPreferTreatment for Combined TAU scenarios with the specified value.

Class

Optional.

List

- ALW - Allow - NonEps procedure (i.e. combined-attach or combined-ta) and Eps procedures are allowed.
- CS_D_NOT_AVAIL - CS domain not available - NonEps procedure (i.e. combined-attach or combined-ta) is not allowed. in attach accept/tau accept emmcause portion send cause "CS domain not available" for the noneps part.
- CSFB_NOT_PREF - CSFB not preferred - Anytype of noneps procedure (i.e. combined-attach or combined-ta) is allowed. in the attach accept/tau accept message we will indicate to the UE that "CSFB is not preferred".
- NAS - NonEps procedure (i.e. combined-attach or combined-ta) and Eps procedures are not allowed. use the provisioned NAS cause code in the attach accept/tau accept emmcause portion to indicate the failure.
- SMS_ONLY - SMS only - NonEps procedure allowed however indicate to the UE in attach accept/tau accept that they are only allowed to have SMS service.
- EPS_ONLY_NAS - EPS only NAS - NonEps procedure (i.e. combined-attach or combined-ta) is not allowed. Use the provisioned NAS cause code in the attach accept/tau accept emmcause portion to indicate the failure for the noneps part.
- DEFAULT - Use the treatment provisioned commonly for all Attach and TAU procedures.

Default

DEFAULT

Name

dCsPreferImsSupervision - Data centric CS preferred IMS supervision

Syntax

--dCsPreferImsSupervision <list-item>

Description

Data centric CS preferred IMS secondary IMS supervision flag. The IMS supervision functionality of the MME checks that the UE activates the IMS PDN connection and performs successful IMS registration. Otherwise the MME detaches the UE.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

dCsPreferNasCause - Data centric CS preferred NAS cause code

Syntax

--dCsPreferNasCause <integer>

Description

Data centric circuit switched preferred IMS secondary cause code.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

15

Name

dCsPreferNonEpsNasCause - Data centric CS preferred Non EPS NAS cause

Syntax

--dCsPreferNonEpsNasCause <integer>

Description

The NAS cause used when non-EPS procedure is not allowed for Data centric circuit switched preferred, IMS secondary UE.

Class

Optional.

Type / Range

Non EPS rejection NAS cause

Default

18

Name

dCsPreferSendForbiddenTaiList - Data Centric CS Voice Preferred Send Forbidden TAI List

Syntax

--dCsPreferSendForbiddenTaiList <list-item>

Description

Controls whether the forbidden TAI list is sent for Data centric, CS voice preferred UEs.
Applied when global parameter VDP Forbidden TAI List on VDP Profile is set to true.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

dCsPreferTreatment - Data centric CS preferred treatment

Syntax

--dCsPreferTreatment <list-item>

Description

Data centric circuit switched preferred IMS secondary treatment.

Class

Optional.

List

- ALW - Allow - NonEps procedure (i.e. combined-attach or combined-ta) and Eps procedures are allowed.
- CSFB_NOT_PREF - CSFB not preferred - Anytype of noneps procedure (i.e. combined-attach or combined-ta) is allowed. in the attach accept/tau accept message we will indicate to the UE that "CSFB is not preferred".
- CS_D_NOT_AVAIL - CS domain not available - NonEps procedure (i.e. combined-attach or combined-ta) is not allowed. in attach accept/tau accept emmcause portion send cause "CS domain not available" for the noneps part.
- EPS_ONLY_NAS - EPS only NAS - NonEps procedure (i.e. combined-attach or combined-ta) is not allowed. Use the provisioned NAS cause code in the attach accept/tau accept emmcause portion to indicate the failure for the noneps part.
- NAS - NonEps procedure (i.e. combined-attach or combined-ta) and Eps procedures are not allowed. use the provisioned NAS cause code in the attach accept/tau accept emmcause portion to indicate the failure.
- SMS_ONLY - SMS only - NonEps procedure allowed however indicate to the UE in attach accept/tau accept that they are only allowed to have SMS service.

Default

ALW

Name

description - Description

Syntax

--description <string>

Description

Profile description.

Class

Optional.

Type / Range

Digit string of length 0 to 160 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

"

Name

dlmsOnlyCombAttachTreatment - Data centric IMS only Combined Attach treatment

Syntax

-dImsOnlyCombAttachTreatment <list-item>

Description

Data centric IMS only treatment for combined attach scenarios. If DEFAULT, the behavior will be to use the value from dlmsOnlyTreatment. If not DEFAULT, override dlmsOnlyTreatment for Combined Attach scenarios with the specified value.

Class

Optional.

List

- ALW - Allow - NonEps procedure (i.e. combined-attach or combined-ta) and Eps procedures are allowed.
- CS_D_NOT_AVAIL - CS domain not available - NonEps procedure (i.e. combined-attach or combined-ta) is not allowed. in attach accept/tau accept emmcause portion send cause "CS domain not available" for the noneps part.
- CSFB_NOT_PREF - CSFB not preferred - Anytype of noneps procedure (i.e. combined-attach or combined-ta) is allowed. in the attach accept/tau accept message we will indicate to the UE that "CSFB is not preferred".
- NAS - NonEps procedure (i.e. combined-attach or combined-ta) and Eps procedures are not allowed. use the provisioned NAS cause code in the attach accept/tau accept emmcause portion to indicate the failure.
- SMS_ONLY - SMS only - NonEps procedure allowed however indicate to the UE in attach accept/tau accept that they are only allowed to have SMS service.
- EPS_ONLY_NAS - EPS only NAS - NonEps procedure (i.e. combined-attach or combined-ta) is not allowed. Use the provisioned NAS cause code in the attach accept/tau accept emmcause portion to indicate the failure for the noneps part.
- DEFAULT - Use the treatment provisioned commonly for all Attach and TAU procedures.

Default

DEFAULT

Name

dlmsOnlyCombTauTreatment - Data centric IMS only Combined TAU treatment

Syntax

--dlmsOnlyCombTauTreatment <list-item>

Description

Data centric IMS only treatment for combined TAU scenarios. If DEFAULT, the behavior will be to use the value from dlmsOnlyTreatment. If not DEFAULT, override dlmsOnlyTreatment for Combined TAU scenarios with the specified value.

Class

Optional.

List

- ALW - Allow - NonEps procedure (i.e. combined-attach or combined-ta) and Eps procedures are allowed.
- CS_D_NOT_AVAIL - CS domain not available - NonEps procedure (i.e. combined-attach or combined-ta) is not allowed. in attach accept/tau accept emmcause portion send cause "CS domain not available" for the noneps part.
- CSFB_NOT_PREF - CSFB not preferred - Anytype of noneps procedure (i.e. combined-attach or combined-ta) is allowed. in the attach accept/tau accept message we will indicate to the UE that "CSFB is not preferred".
- NAS - NonEps procedure (i.e. combined-attach or combined-ta) and Eps procedures are not allowed. use the provisioned NAS cause code in the attach accept/tau accept emmcause portion to indicate the failure.
- SMS_ONLY - SMS only - NonEps procedure allowed however indicate to the UE in attach accept/tau accept that they are only allowed to have SMS service.
- EPS_ONLY_NAS - EPS only NAS - NonEps procedure (i.e. combined-attach or combined-ta) is not allowed. Use the provisioned NAS cause code in the attach accept/tau accept emmcause portion to indicate the failure for the noneps part.
- DEFAULT - Use the treatment provisioned commonly for all Attach and TAU procedures.

Default

DEFAULT

Name

dlmsOnlyImsSupervision - Data centric IMS only IMS supervision

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

dlmsOnlyNasCause - Data centric IMS only NAS cause code

Syntax

--dlmsOnlyNasCause <integer>

Description

Data centric IMS only cause code.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

15

Name

dlmsOnlyNonEpsNasCause - Data centric IMS only Non EPS NAS cause

Syntax

--dlmsOnlyNonEpsNasCause <integer>

Description

The NAS cause used when non-EPS procedure is not allowed for Data centric IMS only UE.

Class

Optional.

Type / Range

Non EPS rejection NAS cause

Default

18

Name

dlmsOnlySendForbiddenTailList - Data Centric IMS PS voice only Send Forbidden TAI List

Syntax

--dlmsOnlySendForbiddenTailList <list-item>

Description

Controls whether the forbidden TAI list is sent for Data centric, IMS PS voice only UEs.
Applied when global parameter VDP Forbidden TAI List on VDP Profile is set to true.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

dlmsOnlyTreatment - Data centric IMS only treatment

Syntax

--dlmsOnlyTreatment <list-item>

Description

Data centric IMS only treatment.

Class

Optional.

List

- ALW - Allow - NonEps procedure (i.e. combined-attach or combined-ta) and Eps procedures are allowed.
- CSFB_NOT_PREF - CSFB not preferred - Anytype of noneps procedure (i.e. combined-attach or combined-ta) is allowed. in the attach accept/tau accept message we will indicate to the UE that "CSFB is not preferred".
- CS_D_NOT_AVAIL - CS domain not available - NonEps procedure (i.e. combined-attach or combined-ta) is not allowed. in attach accept/tau accept emmcause portion send cause "CS domain not available" for the noneps part.
- EPS_ONLY_NAS - EPS only NAS - NonEps procedure (i.e. combined-attach or combined-ta) is not allowed. Use the provisioned NAS cause code in the attach accept/tau accept emmcause portion to indicate the failure for the noneps part.
- NAS - NonEps procedure (i.e. combined-attach or combined-ta) and Eps procedures are not allowed. use the provisioned NAS cause code in the attach accept/tau accept emmcause portion to indicate the failure.

- SMS_ONLY - SMS only - NonEps procedure allowed however indicate to the UE in attach accept/tau accept that they are only allowed to have SMS service.

Default

ALW

Name

dlmsPreferCombAttachTreatment - Data centric IMS preferred Combined Attach treatment

Syntax

- -dlmsPreferCombAttachTreatment <list-item>

Description

Data centric IMS preferred, circuit switched secondary treatment for combined attach scenarios. If DEFAULT, the behavior will be to use the value from dlmsPreferTreatment. If not DEFAULT, override dlmsPreferTreatment for Combined Attach scenarios with the specified value.

Class

Optional.

List

- ALW - Allow - NonEps procedure (i.e. combined-attach or combined-ta) and Eps procedures are allowed.
- CS_D_NOT_AVAIL - CS domain not available - NonEps procedure (i.e. combined-attach or combined-ta) is not allowed. in attach accept/tau accept emmcause portion send cause "CS domain not available" for the noneps part.
- CSFB_NOT_PREF - CSFB not preferred - Anytype of noneps procedure (i.e. combined-attach or combined-ta) is allowed. in the attach accept/tau accept message we will indicate to the UE that "CSFB is not preferred".
- NAS - NonEps procedure (i.e. combined-attach or combined-ta) and Eps procedures are not allowed. use the provisioned NAS cause code in the attach accept/tau accept emmcause portion to indicate the failure.
- SMS_ONLY - SMS only - NonEps procedure allowed however indicate to the UE in attach accept/tau accept that they are only allowed to have SMS service.
- EPS_ONLY_NAS - EPS only NAS - NonEps procedure (i.e. combined-attach or combined-ta) is not allowed. Use the provisioned NAS cause code in the attach accept/tau accept emmcause portion to indicate the failure for the noneps part.
- DEFAULT - Use the treatment provisioned commonly for all Attach and TAU procedures.

Default

DEFAULT

Name

dlmsPreferCombTauTreatment - Data centric IMS preferred Combined TAU treatment

Syntax

--dIm PreferCombTauTreatment <list-item>

Description

Data centric IMS preferred, circuit switched secondary treatment for combined TAU scenarios. If DEFAULT, the behavior will be to use the value from dlmsPreferTreatment. If not DEFAULT, override dlmsPreferTreatment for Combined TAU scenarios with the specified value.

Class

Optional.

List

- ALW - Allow - NonEps procedure (i.e. combined-attach or combined-ta) and Eps procedures are allowed.
- CS_D_NOT_AVAIL - CS domain not available - NonEps procedure (i.e. combined-attach or combined-ta) is not allowed. in attach accept/tau accept emmcause portion send cause "CS domain not available" for the noneps part.
- CSFB_NOT_PREF - CSFB not preferred - Anytype of noneps procedure (i.e. combined-attach or combined-ta) is allowed. in the attach accept/tau accept message we will indicate to the UE that "CSFB is not preferred".
- NAS - NonEps procedure (i.e. combined-attach or combined-ta) and Eps procedures are not allowed. use the provisioned NAS cause code in the attach accept/tau accept emmcause portion to indicate the failure.
- SMS_ONLY - SMS only - NonEps procedure allowed however indicate to the UE in attach accept/tau accept that they are only allowed to have SMS service.
- EPS_ONLY_NAS - EPS only NAS - NonEps procedure (i.e. combined-attach or combined-ta) is not allowed. Use the provisioned NAS cause code in the attach accept/tau accept emmcause portion to indicate the failure for the noneps part.
- DEFAULT - Use the treatment provisioned commonly for all Attach and TAU procedures.

Default

DEFAULT

Name

dlmsPreferImSupervision - Data centric IMS preferred IMS supervision

Syntax

--dIm PreferImSupervision <list-item>

Description

Data centric IMS preferred IMS supervision flag. The IMS supervision functionality of the MME checks that the UE activates the IMS PDN connection and performs successful IMS registration. Otherwise the MME detaches the UE.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

dlmsPreferNasCause - Data centric IMS preferred NAS cause code

Syntax

--dlmsPreferNasCause <integer>

Description

Data centric IMS preferred circuit switched secondary cause code.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

15

Name

dlmsPreferNonEpsNasCause - Data centric IMS preferred Non EPS NAS cause

Syntax

--dlmsPreferNonEpsNasCause <integer>

Description

The NAS cause used when non-EPS procedure is not allowed for Data centric IMS preferred, circuit switched secondary UE.

Class

Optional.

Type / Range

Non EPS rejection NAS cause

Default

18

Name

dlmsPreferSendForbiddenTailList - Data Centric IMS PS Voice Preferred Send Forbidden TAI List

Syntax

--dImsPreferSendForbiddenTaiList <list-item>

Description

Controls whether the forbidden TAI list is sent for Data centric, IMS PS voice preferred UEs. Applied when global parameter VDP Forbidden TAI List on VDP Profile is set to true.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

dlImsPreferTreatment - Data centric IMS preferred treatment

Syntax

--dImsPreferTreatment <list-item>

Description

Data centric IMS preferred circuit switched secondary treatment.

Class

Optional.

List

- ALW - Allow - NonEps procedure (i.e. combined-attach or combined-ta) and Eps procedures are allowed.
- CSFB_NOT_PREF - CSFB not preferred - Anytype of noneps procedure (i.e. combined-attach or combined-ta) is allowed. in the attach accept/tau accept message we will indicate to the UE that "CSFB is not preferred".
- CS_D_NOT_AVAIL - CS domain not available - NonEps procedure (i.e. combined-attach or combined-ta) is not allowed. in attach accept/tau accept emmcause portion send cause "CS domain not available" for the noneps part.
- EPS_ONLY_NAS - EPS only NAS - NonEps procedure (i.e. combined-attach or combined-ta) is not allowed. Use the provisioned NAS cause code in the attach accept/tau accept emmcause portion to indicate the failure for the noneps part.
- NAS - NonEps procedure (i.e. combined-attach or combined-ta) and Eps procedures are not allowed. use the provisioned NAS cause code in the attach accept/tau accept emmcause portion to indicate the failure.

- SMS_ONLY - SMS only - NonEps procedure allowed however indicate to the UE in attach accept/tau accept that they are only allowed to have SMS service.

Default

ALW

Name

noneCombAttachTreatment - None Combined Attach treatment

Syntax

--noneCombAttachTreatment <list-item>

Description

Combined Attach procedure treatment when UE usage or VDP is not given. If DEFAULT, the behavior will be to use the value from noneTreatment. If not DEFAULT, override noneTreatment for Combined Attach scenarios with the specified value.

Class

Optional.

List

- ALW - Allow - NonEps procedure (i.e. combined-attach or combined-ta) and Eps procedures are allowed.
- CS_D_NOT_AVAIL - CS domain not available - NonEps procedure (i.e. combined-attach or combined-ta) is not allowed. in attach accept/tau accept emmcause portion send cause "CS domain not available" for the noneps part.
- CSFB_NOT_PREF - CSFB not preferred - Anytype of noneps procedure (i.e. combined-attach or combined-ta) is allowed. in the attach accept/tau accept message we will indicate to the UE that "CSFB is not preferred".
- NAS - NonEps procedure (i.e. combined-attach or combined-ta) and Eps procedures are not allowed. use the provisioned NAS cause code in the attach accept/tau accept emmcause portion to indicate the failure.
- SMS_ONLY - SMS only - NonEps procedure allowed however indicate to the UE in attach accept/tau accept that they are only allowed to have SMS service.
- EPS_ONLY_NAS - EPS only NAS - NonEps procedure (i.e. combined-attach or combined-ta) is not allowed. Use the provisioned NAS cause code in the attach accept/tau accept emmcause portion to indicate the failure for the noneps part.
- DEFAULT - Use the treatment provisioned commonly for all Attach and TAU procedures.

Default

DEFAULT

Name

noneCombTauTreatment - None Combined TAU treatment

Syntax

--noneCombTauTreatment <list-item>

Description

Combined TAU procedure treatment when UE usage or VDP is not given. If DEFAULT, the behavior will be to use the value from noneTreatment. If not DEFAULT, override noneTreatment for Combined TAU scenarios with the specified value.

Class

Optional.

List

- ALW - Allow - NonEps procedure (i.e. combined-attach or combined-ta) and Eps procedures are allowed.
- CS_D_NOT_AVAIL - CS domain not available - NonEps procedure (i.e. combined-attach or combined-ta) is not allowed. in attach accept/tau accept emmcause portion send cause "CS domain not available" for the noneps part.
- CSFB_NOT_PREF - CSFB not preferred - Anytype of noneps procedure (i.e. combined-attach or combined-ta) is allowed. in the attach accept/tau accept message we will indicate to the UE that "CSFB is not preferred".
- NAS - NonEps procedure (i.e. combined-attach or combined-ta) and Eps procedures are not allowed. use the provisioned NAS cause code in the attach accept/tau accept emmcause portion to indicate the failure.
- SMS_ONLY - SMS only - NonEps procedure allowed however indicate to the UE in attach accept/tau accept that they are only allowed to have SMS service.
- EPS_ONLY_NAS - EPS only NAS - NonEps procedure (i.e. combined-attach or combined-ta) is not allowed. Use the provisioned NAS cause code in the attach accept/tau accept emmcause portion to indicate the failure for the noneps part.
- DEFAULT - Use the treatment provisioned commonly for all Attach and TAU procedures.

Default

DEFAULT

Name

noneImsSupervision - None IMS supervision

Syntax

--noneImsSupervision <list-item>

Description

IMS supervision flag when UE usage or VDP is not given. The IMS supervision functionality of the MME checks that the UE activates the IMS PDN connection and performs successful IMS registration. Otherwise the MME detaches the UE.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

noneNasCause - None NAS cause code

Syntax

--noneNasCause <integer>

Description

Cause code when UE usage or VDP is not given.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

15

Name

noneNonEpsNasCause - None Non EPS NAS cause

Syntax

--noneNonEpsNasCause <integer>

Description

The NAS cause used when non-EPS procedure is not allowed for UE that does not provide any UE usage type or VDP.

Class

Optional.

Type / Range

Non EPS rejection NAS cause

Default

18

Name

noneSendForbiddenTaiList - None Send Forbidden TAI List

Syntax

--noneSendForbiddenTaiList <list-item>

Description

Controls whether the forbidden TAI list is sent for UEs not indicating UE's usage setting and voice domain preference. Applied when global parameter VDP Forbidden TAI List on VDP Profile is set to true.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

noneTreatment - None treatment

Syntax

--noneTreatment <list-item>

Description

Treatment when UE usage or VDP is not given.

Class

Optional.

List

- ALW - Allow - NonEps procedure (i.e. combined-attach or combined-ta) and Eps procedures are allowed.
- CSFB_NOT_PREF - CSFB not preferred - Anytype of noneps procedure (i.e. combined-attach or combined-ta) is allowed. in the attach accept/tau accept message we will indicate to the UE that "CSFB is not preferred".
- CS_D_NOT_AVAIL - CS domain not available - NonEps procedure (i.e. combined-attach or combined-ta) is not allowed. in attach accept/tau accept emmcause portion send cause "CS domain not available" for the noneps part.
- EPS_ONLY_NAS - EPS only NAS - NonEps procedure (i.e. combined-attach or combined-ta) is not allowed. Use the provisioned NAS cause code in the attach accept/tau accept emmcause portion to indicate the failure for the noneps part.
- NAS - NonEps procedure (i.e. combined-attach or combined-ta) and Eps procedures are not allowed. use the provisioned NAS cause code in the attach accept/tau accept emmcause portion to indicate the failure.
- SMS_ONLY - SMS only - NonEps procedure allowed however indicate to the UE in attach accept/tau accept that they are only allowed to have SMS service.

Default

ALW

Name

vCsOnlyCombAttachTreatment - Voice centric CS only Combined Attach treatment

Syntax`--vCsOnlyCombAttachTreatment <list-item>`**Description**

Voice centric circuit switched only treatment for combined attach scenarios. If DEFAULT, the behavior will be to use the value from vCsOnlyTreatment. If not DEFAULT, override vCsOnlyTreatment for Combined Attach scenarios with the specified value.

Class

Optional.

List

- ALW - Allow - NonEps procedure (i.e. combined-attach or combined-ta) and Eps procedures are allowed.
- CS_D_NOT_AVAIL - CS domain not available - NonEps procedure (i.e. combined-attach or combined-ta) is not allowed. in attach accept/tau accept emmcause portion send cause "CS domain not available" for the noneps part.
- CSFB_NOT_PREF - CSFB not preferred - Anytype of noneps procedure (i.e. combined-attach or combined-ta) is allowed. in the attach accept/tau accept message we will indicate to the UE that "CSFB is not preferred".
- NAS - NonEps procedure (i.e. combined-attach or combined-ta) and Eps procedures are not allowed. use the provisioned NAS cause code in the attach accept/tau accept emmcause portion to indicate the failure.
- SMS_ONLY - SMS only - NonEps procedure allowed however indicate to the UE in attach accept/tau accept that they are only allowed to have SMS service.
- EPS_ONLY_NAS - EPS only NAS - NonEps procedure (i.e. combined-attach or combined-ta) is not allowed. Use the provisioned NAS cause code in the attach accept/tau accept emmcause portion to indicate the failure for the noneps part.
- DEFAULT - Use the treatment provisioned commonly for all Attach and TAU procedures.

Default

DEFAULT

Name

vCsOnlyCombTauTreatment - Voice Centric CS only Combined TAU treatment

Syntax`--vCsOnlyCombTauTreatment <list-item>`**Description**

Voice Centric Circuit Switched only Combined TAU procedure treatment. Voice centric circuit switched only treatment for combined TAU scenarios. If DEFAULT, the behavior will be to use the value from vCsOnlyTreatment. If not DEFAULT, override vCsOnlyTreatment for Combined TAU scenarios with the specified value.

Class

Optional.

List

- ALW - Allow - NonEps procedure (i.e. combined-attach or combined-ta) and Eps procedures are allowed.
- CS_D_NOT_AVAIL - CS domain not available - NonEps procedure (i.e. combined-attach or combined-ta) is not allowed. in attach accept/tau accept emmcause portion send cause "CS domain not available" for the noneps part.
- CSFB_NOT_PREF - CSFB not preferred - Anytype of noneps procedure (i.e. combined-attach or combined-ta) is allowed. in the attach accept/tau accept message we will indicate to the UE that "CSFB is not preferred".
- NAS - NonEps procedure (i.e. combined-attach or combined-ta) and Eps procedures are not allowed. use the provisioned NAS cause code in the attach accept/tau accept emmcause portion to indicate the failure.
- SMS_ONLY - SMS only - NonEps procedure allowed however indicate to the UE in attach accept/tau accept that they are only allowed to have SMS service.
- EPS_ONLY_NAS - EPS only NAS - NonEps procedure (i.e. combined-attach or combined-ta) is not allowed. Use the provisioned NAS cause code in the attach accept/tau accept emmcause portion to indicate the failure for the noneps part.
- DEFAULT - Use the treatment provisioned commonly for all Attach and TAU procedures.

Default

DEFAULT

Name

vCsOnlyImsSupervision - Voice centric CS only IMS supervision

Syntax

--vCsOnlyImsSupervision <list-item>

Description

Voice centric Circuit Switched only IMS supervision flag. The IMS supervision functionality of the MME checks that the UE activates the IMS PDN connection and performs successful IMS registration. Otherwise the MME detaches the UE.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

vCsOnlyNasCause - Voice centric CS only NAS cause code

Syntax

--vCsOnlyNasCause <integer>

Description

Voice centric circuit switched only cause code.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

15

Name

vCsOnlyNonEpsNasCause - Voice centric CS only Non EPS NAS cause

Syntax

--vCsOnlyNonEpsNasCause <integer>

Description

The NAS cause used when non-EPS procedure is not allowed for voice centric CS only UE.

Class

Optional.

Type / Range

Non EPS rejection NAS cause

Default

18

Name

vCsOnlySendForbiddenTaiList - Voice Centric CS Voice Only Send Forbidden TAI List

Syntax

--vCsOnlySendForbiddenTaiList <list-item>

Description

Controls whether the forbidden TAI list is sent for Voice centric, CS voice only UEs. Applied when global parameter VDP Forbidden TAI List on VDP Profile is set to true.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

vCsOnlyTreatment - Voice centric CS only treatment

Syntax

-vCsOnlyTreatment <list-item>

Description

Voice centric circuit switched only treatment.

Class

Optional.

List

- ALW - Allow - NonEps procedure (i.e. combined-attach or combined-ta) and Eps procedures are allowed.
- CSFB_NOT_PREF - CSFB not preferred - Anytype of noneps procedure (i.e. combined-attach or combined-ta) is allowed. in the attach accept/tau accept message we will indicate to the UE that "CSFB is not preferred".
- CS_D_NOT_AVAIL - CS domain not available - NonEps procedure (i.e. combined-attach or combined-ta) is not allowed. in attach accept/tau accept emmcause portion send cause "CS domain not available" for the noneps part.
- EPS_ONLY_NAS - EPS only NAS - NonEps procedure (i.e. combined-attach or combined-ta) is not allowed. Use the provisioned NAS cause code in the attach accept/tau accept emmcause portion to indicate the failure for the noneps part.
- NAS - NonEps procedure (i.e. combined-attach or combined-ta) and Eps procedures are not allowed. use the provisioned NAS cause code in the attach accept/tau accept emmcause portion to indicate the failure.
- SMS_ONLY - SMS only - NonEps procedure allowed however indicate to the UE in attach accept/tau accept that they are only allowed to have SMS service.

Default

ALW

Name

vCsPreferCombAttachTreatment - Voice centric CS preferred Combined Attach treatment

Syntax

--vCsPreferCombAttachTreatment <list-item>

Description

Voice centric circuit switched preferred, IMS secondary treatment for combined attach scenarios. If DEFAULT, the behavior will be to use the value from vCsPreferTreatment. If not DEFAULT, override vCsPreferTreatment for Combined Attach scenarios with the specified value.

Class

Optional.

List

- ALW - Allow - NonEps procedure (i.e. combined-attach or combined-ta) and Eps procedures are allowed.
- CS_D_NOT_AVAIL - CS domain not available - NonEps procedure (i.e. combined-attach or combined-ta) is not allowed. in attach accept/tau accept emmcause portion send cause "CS domain not available" for the noneps part.
- CSFB_NOT_PREF - CSFB not preferred - Anytype of noneps procedure (i.e. combined-attach or combined-ta) is allowed. in the attach accept/tau accept message we will indicate to the UE that "CSFB is not preferred".
- NAS - NonEps procedure (i.e. combined-attach or combined-ta) and Eps procedures are not allowed. use the provisioned NAS cause code in the attach accept/tau accept emmcause portion to indicate the failure.
- SMS_ONLY - SMS only - NonEps procedure allowed however indicate to the UE in attach accept/tau accept that they are only allowed to have SMS service.
- EPS_ONLY_NAS - EPS only NAS - NonEps procedure (i.e. combined-attach or combined-ta) is not allowed. Use the provisioned NAS cause code in the attach accept/tau accept emmcause portion to indicate the failure for the noneps part.
- DEFAULT - Use the treatment provisioned commonly for all Attach and TAU procedures.

Default

DEFAULT

Name

vCsPreferCombTauTreatment - Voice centric CS preferred Combined TAU treatment

Syntax

--vCsPreferCombTauTreatment <list-item>

Description

Voice centric circuit switched preferred, IMS secondary treatment for combined TAU scenarios. If DEFAULT, the behavior will be to use the value from vCsPreferTreatment. If not DEFAULT, override vCsPreferTreatment for Combined TAU scenarios with the specified value.

Class

Optional.

List

- ALW - Allow - NonEps procedure (i.e. combined-attach or combined-ta) and Eps procedures are allowed.
- CS_D_NOT_AVAIL - CS domain not available - NonEps procedure (i.e. combined-attach or combined-ta) is not allowed. in attach accept/tau accept emmcause portion send cause "CS domain not available" for the noneps part.
- CSFB_NOT_PREF - CSFB not preferred - Anytype of noneps procedure (i.e. combined-attach or combined-ta) is allowed. in the attach accept/tau accept message we will indicate to the UE that "CSFB is not preferred".
- NAS - NonEps procedure (i.e. combined-attach or combined-ta) and Eps procedures are not allowed. use the provisioned NAS cause code in the attach accept/tau accept emmcause portion to indicate the failure.
- SMS_ONLY - SMS only - NonEps procedure allowed however indicate to the UE in attach accept/tau accept that they are only allowed to have SMS service.
- EPS_ONLY_NAS - EPS only NAS - NonEps procedure (i.e. combined-attach or combined-ta) is not allowed. Use the provisioned NAS cause code in the attach accept/tau accept emmcause portion to indicate the failure for the noneps part.
- DEFAULT - Use the treatment provisioned commonly for all Attach and TAU procedures.

Default

DEFAULT

Name

vCsPreferImsSupervision - Voice centric CS preferred IMS supervision

Syntax

--vCsPreferImsSupervision <list-item>

Description

Voice centric Circuit Switched preferred IMS secondary IMS supervision flag. The IMS supervision functionality of the MME checks that the UE activates the IMS PDN connection and performs successful IMS registration. Otherwise the MME detaches the UE.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

vCsPreferNasCause - Voice centric CS preferred NAS cause code

Syntax

--vCsPreferNasCause <integer>

Description

Voice centric circuit switched preferred IMS secondary cause code.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

15

Name

vCsPreferNonEpsNasCause - Voice centric CS preferred Non EPS NAS cause

Syntax

--vCsPreferNonEpsNasCause <integer>

Description

The NAS cause used when non-EPS procedure is not allowed for voice centric CS preferred, IMS secondary UE.

Class

Optional.

Type / Range

Non EPS rejection NAS cause

Default

18

Name

vCsPreferSendForbiddenTaiList - Voice Centric CS Voice Preferred Send Forbidden TAI List

Syntax

--vCsPreferSendForbiddenTaiList <list-item>

Description

Controls whether the forbidden TAI list is sent for Voice centric, CS voice preferred UEs. Applied when global parameter VDP Forbidden TAI List on VDP Profile is set to true.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

vCsPreferTreatment - Voice centric CS preferred treatment

Syntax

--vCsPreferTreatment <list-item>

Description

Voice centric circuit switched preferred IMS secondary treatment.

Class

Optional.

List

- ALW - Allow - NonEps procedure (i.e. combined-attach or combined-ta) and Eps procedures are allowed.
- CSFB_NOT_PREF - CSFB not preferred - Anytype of noneps procedure (i.e. combined-attach or combined-ta) is allowed. in the attach accept/tau accept message we will indicate to the UE that "CSFB is not preferred".
- CS_D_NOT_AVAIL - CS domain not available - NonEps procedure (i.e. combined-attach or combined-ta) is not allowed. in attach accept/tau accept emmcause portion send cause "CS domain not available" for the noneps part.
- EPS_ONLY_NAS - EPS only NAS - NonEps procedure (i.e. combined-attach or combined-ta) is not allowed. Use the provisioned NAS cause code in the attach accept/tau accept emmcause portion to indicate the failure for the noneps part.
- NAS - NonEps procedure (i.e. combined-attach or combined-ta) and Eps procedures are not allowed. use the provisioned NAS cause code in the attach accept/tau accept emmcause portion to indicate the failure.
- SMS_ONLY - SMS only - NonEps procedure allowed however indicate to the UE in attach accept/tau accept that they are only allowed to have SMS service.

Default

ALW

Name

vlmsOnlyCombAttachTreatment - Voice centric IMS only Combined Attach treatment

Syntax

--vImsOnlyCombAttachTreatment <list-item>

Description

Voice centric IMS only treatment for combined attach scenarios. If DEFAULT, the behavior will be to use the value from vlmsOnlyTreatment. If not DEFAULT, override vlmsOnlyTreatment for Combined Attach scenarios with the specified value.

Class

Optional.

List

- ALW - Allow - NonEps procedure (i.e. combined-attach or combined-ta) and Eps procedures are allowed.
- CS_D_NOT_AVAIL - CS domain not available - NonEps procedure (i.e. combined-attach or combined-ta) is not allowed. in attach accept/tau accept emmcause portion send cause "CS domain not available" for the noneps part.
- CSFB_NOT_PREF - CSFB not preferred - Anytype of noneps procedure (i.e. combined-attach or combined-ta) is allowed. in the attach accept/tau accept message we will indicate to the UE that "CSFB is not preferred".
- NAS - NonEps procedure (i.e. combined-attach or combined-ta) and Eps procedures are not allowed. use the provisioned NAS cause code in the attach accept/tau accept emmcause portion to indicate the failure.
- SMS_ONLY - SMS only - NonEps procedure allowed however indicate to the UE in attach accept/tau accept that they are only allowed to have SMS service.
- EPS_ONLY_NAS - EPS only NAS - NonEps procedure (i.e. combined-attach or combined-ta) is not allowed. Use the provisioned NAS cause code in the attach accept/tau accept emmcause portion to indicate the failure for the noneps part.
- DEFAULT - Use the treatment provisioned commonly for all Attach and TAU procedures.

Default

DEFAULT

Name

vlmsOnlyCombTauTreatment - Voice centric IMS only Combined TAU treatment

Syntax

--vImOnlyCombTauTreatment <list-item>

Description

Voice centric IMS only treatment for combined TAU scenarios. If DEFAULT, the behavior will be to use the value from vlmsOnlyTreatment. If not DEFAULT, override vlmsOnlyTreatment for Combined TAU scenarios with the specified value.

Class

Optional.

List

- ALW - Allow - NonEps procedure (i.e. combined-attach or combined-ta) and Eps procedures are allowed.
- CS_D_NOT_AVAIL - CS domain not available - NonEps procedure (i.e. combined-attach or combined-ta) is not allowed. in attach accept/tau accept emmcause portion send cause “CS domain not available” for the noneps part.
- CSFB_NOT_PREF - CSFB not preferred - Anytype of noneps procedure (i.e. combined-attach or combined-ta) is allowed. in the attach accept/tau accept message we will indicate to the UE that “CSFB is not preferred”.
- NAS - NonEps procedure (i.e. combined-attach or combined-ta) and Eps procedures are not allowed. use the provisioned NAS cause code in the attach accept/tau accept emmcause portion to indicate the failure.
- SMS_ONLY - SMS only - NonEps procedure allowed however indicate to the UE in attach accept/tau accept that they are only allowed to have SMS service.
- EPS_ONLY_NAS - EPS only NAS - NonEps procedure (i.e. combined-attach or combined-ta) is not allowed. Use the provisioned NAS cause code in the attach accept/tau accept emmcause portion to indicate the failure for the noneps part.
- DEFAULT - Use the treatment provisioned commonly for all Attach and TAU procedures.

Default

DEFAULT

Name

vlmsOnlyImsSupervision - Voice centric IMS only IMS supervision

Syntax

--vImsOnlyImsSupervision <list-item>

Description

Voice centric IMS only IMS supervision flag. The IMS supervision functionality of the MME checks that the UE activates the IMS PDN connection and performs successful IMS registration. Otherwise the MME detaches the UE.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

vlmsOnlyNasCause - Voice centric IMS only NAS cause code

Syntax

--vImsOnlyNasCause <integer>

Description

Voice centric IMS only cause code.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

15

Name

vlmsOnlyNonEpsNasCause - Voice centric IMS only Non EPS NAS cause

Syntax

--vImsOnlyNonEpsNasCause <integer>

Description

The NAS cause used when non-EPS procedure is not allowed for Voice centric IMS only UE.

Class

Optional.

Type / Range

Non EPS rejection NAS cause

Default

18

Name

vlmsOnlySendForbiddenTailList - Voice Centric IMS PS Voice Only Send Forbidden TAI List

Syntax

--vImsOnlySendForbiddenTailList <list-item>

Description

Controls whether the forbidden TAI list is sent for Voice centric, IMS PS voice only UEs.
Applied when global parameter VDP Forbidden TAI List on VDP Profile is set to true.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

vlmsOnlyTreatment - Voice centric IMS only treatment

Syntax

--vImOnlyTreatment <list-item>

Description

Voice centric IMS only treatment.

Class

Optional.

List

- ALW - Allow - NonEps procedure (i.e. combined-attach or combined-ta) and Eps procedures are allowed.
- CSFB_NOT_PREF - CSFB not preferred - Anytype of noneps procedure (i.e. combined-attach or combined-ta) is allowed. in the attach accept/tau accept message we will indicate to the UE that "CSFB is not preferred".
- CS_D_NOT_AVAIL - CS domain not available - NonEps procedure (i.e. combined-attach or combined-ta) is not allowed. in attach accept/tau accept emmcause portion send cause "CS domain not available" for the noneps part.
- EPS_ONLY_NAS - EPS only NAS - NonEps procedure (i.e. combined-attach or combined-ta) is not allowed. Use the provisioned NAS cause code in the attach accept/tau accept emmcause portion to indicate the failure for the noneps part.
- NAS - NonEps procedure (i.e. combined-attach or combined-ta) and Eps procedures are not allowed. use the provisioned NAS cause code in the attach accept/tau accept emmcause portion to indicate the failure.
- SMS_ONLY - SMS only - NonEps procedure allowed however indicate to the UE in attach accept/tau accept that they are only allowed to have SMS service.

Default

ALW

Name

vlmsPreferCombAttachTreatment - Voice centric IMS preferred Combined Attach treatment

Syntax

--vImPreferCombAttachTreatment <list-item>

Description

Voice centric IMS preferred, circuit switched secondary treatment for combined attach scenarios. If DEFAULT, the behavior will be to use the value from vlmsPreferTreatment. If not DEFAULT, override vlmsPreferTreatment for Combined Attach scenarios with the specified value.

Class

Optional.

List

- ALW - Allow - NonEps procedure (i.e. combined-attach or combined-ta) and Eps procedures are allowed.
- CS_D_NOT_AVAIL - CS domain not available - NonEps procedure (i.e. combined-attach or combined-ta) is not allowed. in attach accept/tau accept emmcause portion send cause "CS domain not available" for the noneps part.
- CSFB_NOT_PREF - CSFB not preferred - Anytype of noneps procedure (i.e. combined-attach or combined-ta) is allowed. in the attach accept/tau accept message we will indicate to the UE that "CSFB is not preferred".
- NAS - NonEps procedure (i.e. combined-attach or combined-ta) and Eps procedures are not allowed. use the provisioned NAS cause code in the attach accept/tau accept emmcause portion to indicate the failure.
- SMS_ONLY - SMS only - NonEps procedure allowed however indicate to the UE in attach accept/tau accept that they are only allowed to have SMS service.
- EPS_ONLY_NAS - EPS only NAS - NonEps procedure (i.e. combined-attach or combined-ta) is not allowed. Use the provisioned NAS cause code in the attach accept/tau accept emmcause portion to indicate the failure for the noneps part.
- DEFAULT - Use the treatment provisioned commonly for all Attach and TAU procedures.

Default

DEFAULT

Name

vlmsPreferCombTauTreatment - Voice centric IMS preferred Combined TAU treatment

Syntax

--vlmsPreferCombTauTreatment <list-item>

Description

Voice centric IMS preferred, circuit switched secondary treatment for combined TAU scenarios. If DEFAULT, the behavior will be to use the value from vlmsPreferTreatment. If not DEFAULT, override vlmsPreferTreatment for Combined TAU scenarios with the specified value.

Class

Optional.

List

- ALW - Allow - NonEps procedure (i.e. combined-attach or combined-ta) and Eps procedures are allowed.

- CS_D_NOT_AVAIL - CS domain not available - NonEps procedure (i.e. combined-attach or combined-ta) is not allowed. in attach accept/tau accept emmcause portion send cause “CS domain not available” for the noneps part.
- CSFB_NOT_PREF - CSFB not preferred - Anytype of noneps procedure (i.e. combined-attach or combined-ta) is allowed. in the attach accept/tau accept message we will indicate to the UE that “CSFB is not preferred”.
- NAS - NonEps procedure (i.e. combined-attach or combined-ta) and Eps procedures are not allowed. use the provisioned NAS cause code in the attach accept/tau accept emmcause portion to indicate the failure.
- SMS_ONLY - SMS only - NonEps procedure allowed however indicate to the UE in attach accept/tau accept that they are only allowed to have SMS service.
- EPS_ONLY_NAS - EPS only NAS - NonEps procedure (i.e. combined-attach or combined-ta) is not allowed. Use the provisioned NAS cause code in the attach accept/tau accept emmcause portion to indicate the failure for the noneps part.
- DEFAULT - Use the treatment provisioned commonly for all Attach and TAU procedures.

Default

DEFAULT

Name

vlmsPreferImsSupervision - Voice centric IMS preferred IMS supervision

Syntax

--vlmsPreferImsSupervision <list-item>

Description

Voice centric IMS preferred Circuit Switched secondary IMS supervision flag. The IMS supervision functionality of the MME checks that the UE activates the IMS PDN connection and performs successful IMS registration. Otherwise the MME detaches the UE.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

vlmsPreferNasCause - Voice centric IMS preferred NAS cause code

Syntax

--vlmsPreferNasCause <integer>

Description

Voice centric IMS preferred circuit switched secondary cause code.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

15

Name

vImsPreferNonEpsNasCause - Voice centric IMS preferred Non EPS NAS cause

Syntax

--vImsPreferNonEpsNasCause <integer>

Description

The NAS cause used when non-EPS procedure is not allowed for voice centric IMS preferred, circuit switched secondary UE.

Class

Optional.

Type / Range

Non EPS rejection NAS cause

Default

18

Name

vImsPreferSendForbiddenTaiList - Voice Centric IMS PS Voice Preferred Send Forbidden TAI List

Syntax

--vImsPreferSendForbiddenTaiList <list-item>

Description

Controls whether the forbidden TAI list is sent for Voice centric, IMS PS voice preferred UEs. Applied when global parameter VDP Forbidden TAI List on VDP Profile is set to true.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

vImSPreferTreatment - Voice centric IMS preferred treatment

Syntax

--vImSPreferTreatment <list-item>

Description

Voice centric IMS preferred circuit switched secondary treatment.

Class

Optional.

List

- ALW - Allow - NonEps procedure (i.e. combined-attach or combined-ta) and Eps procedures are allowed.
- CSFB_NOT_PREF - CSFB not preferred - Anytype of noneps procedure (i.e. combined-attach or combined-ta) is allowed. in the attach accept/tau accept message we will indicate to the UE that "CSFB is not preferred".
- CS_D_NOT_AVAIL - CS domain not available - NonEps procedure (i.e. combined-attach or combined-ta) is not allowed. in attach accept/tau accept emmcause portion send cause "CS domain not available" for the noneps part.
- EPS_ONLY_NAS - EPS only NAS - NonEps procedure (i.e. combined-attach or combined-ta) is not allowed. Use the provisioned NAS cause code in the attach accept/tau accept emmcause portion to indicate the failure for the noneps part.
- NAS - NonEps procedure (i.e. combined-attach or combined-ta) and Eps procedures are not allowed. use the provisioned NAS cause code in the attach accept/tau accept emmcause portion to indicate the failure.
- SMS_ONLY - SMS only - NonEps procedure allowed however indicate to the UE in attach accept/tau accept that they are only allowed to have SMS service.

7.136 cmm vdpRangeServices

VDP Range Services. Syntax, description, parameters, and roles for **cmm vdpRangeServices** command.

Syntax

Description

Administer Voice Domain Preference based upon IMSI, IMEI, and TAC. If imeiTacSvListName is defined, the IMEI range parameters (minImeiTac/ maxImeiTac/ minImeiSv/ maxImeiSv/ inclusive) are not used when finding a match for the IMEI.

Parameters

Name

uePlmnServicesName - Name of Services based on UE Network and Served Network

Syntax

--uePlmnServicesName <string>

Description

Name that identifies roaming agreement

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

entryId - Entry ID

Syntax

--entryId <integer>

Description

Entry ID.

Class

Required key.

Type / Range

Integer in the range of 1 to 10,000

Name

description - Entry description

Syntax

--description <string>

Description

Description for VDP range services entry.

Class

Optional.

Type / Range

Digit string of length 0 to 160 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

"

Name

fakedFullCombSmsSgd - Faked Full Combined SMS SGd

Syntax

--fakedFullCombSmsSgd <list-item>

Description

Defines whether faked full combined attach shall be granted for the UE with SMS service provided over SGd. MME locally restricts the service to SMS only but accepts full combined attach towards the UE. The MME provides SMS service via SGd interface, but rejects any Extended Service Request from the UE with provisioned EMM cause code. This parameter applies only when SMS in MME is enabled for the UE.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

fakedFullCombSmsSgdSrvRejCause - Faked Full Combined SMS SGd Service Reject Cause

Syntax

--fakedFullCombSmsSgdSrvRejCause <integer>

Description

Defines the EMM cause code used to reject Extended Service Request CSFB call attempts when faked combined attach is enabled with SMS over SGd.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

39

Name

forbiddenListPref - Forbidden List Preference

Syntax

--forbiddenListPref <list-item>

Description

Specifies which ForbiddenTAI list to use for the VPD Range Services record

Class

Optional.

List

- TAI List - TAI List.
- TAI Range List - TAI Range List

Default

TAI List

Name

forbiddenTailistName - Forbidden TAI List Name

Syntax

--forbiddenTailistName <string>

Description

Forbidden TAI List Name

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

"

Name

forbiddenTaiRangeListName - Forbidden TAI Range List Name

Syntax

--forbiddenTaiRangeListName <string>

Description

Reference to a Forbidden TAI Range List (as created in the taiRangeList translation).

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

imeiTacSvListName - imeiTacSvListName

Syntax

--imeiTacSvListName <string>

Description

Defines IMEI TAC SV list for which the rule applies.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

imsApnSubscrOverride - IMS APN Subscription Override

Syntax

--imsApnSubscrOverride <list-item>

Description

Controls override functionality related to whether IMS APN is subscribed. If enabled, and the UE does NOT have IMS APN subscribed, the MME -accepts any Combined Attach/TAU attempt from the UE (i.e. does NOT apply Combined Attach Attach/TAU restriction for this UE, if such would be resulted based on other parameters of the restriction profile) -sets IMS voice over PS session indicator (IMS VoPS) to IMS voice over PS session in S1 mode not supported on every Attach Accept/TAU Accept for the UE. If disabled, any restriction otherwise resulted as part of the restriction profile is applicable.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

inclusive - Inclusive IMEI

Syntax

--inclusive <list-item>

Description

Specify if the IMEI range is inclusive or exclusive.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

maxImeiSv - Maximum IMEI SV

Syntax

--maxImeiSv <digits>

Description

The maximum IMEI SV in range.

Class

Optional.

Type / Range

Digit string of length 2 to 2

Default

99

Name

maxImeiTac - Maximum IMEI TAC

Syntax

--maxImeiTac <digits>

Description

The maximum IMEI TAC in range.

Class

Optional.

Type / Range

Digit string of length 8 to 8

Default

99999999

Name

maxMsin - Maximum MSIN

Syntax

--maxMsin <digits>

Description

The maximum IMSI MSIN value.

Class

Optional.

Type / Range

Digit string of length 8 to 10

Default

999999999

Name

minImeiSv - Minimum IMEI SV

Syntax

--minImeiSv <digits>

Description

The minimum IMEI SV in range.

Class

Optional.

Type / Range

Digit string of length 2 to 2

Default

00

Name

minImeiTac - Minimum IMEI TAC

Syntax

--minImeiTac <digits>

Description

The minimum IMEI TAC in range.

Class

Optional.

Type / Range

Digit string of length 8 to 8

Default

00000000

Name

minMsin - Minimum MSIN

Syntax

--minMsin <digits>

Description

The minimum IMSI MSIN value.

Class

Optional.

Type / Range

Digit string of length 8 to 10

Default

000000000

Name

shutdown - Shutdown

Syntax

--shutdown <list-item>

Description

When shutdown is true, the rule is not active.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

taiAreaListName - TAI Area List Name

Syntax

--taiAreaListName <string>

Description

Defines TAI restrictions

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

all

Name

taiListPref - TAI List Preference

Syntax

--taiListPref <list-item>

Description

Specifies which TAI list to use for the imsi Range Services record match

Class

Optional.

List

- TAI List - TAI List.
- TAI Range List - TAI Range List

Default

TAI List

Name

taiRangeListName - TAI Range List Name

Syntax

--taiRangeListName <string>

Description

Reference to a TAI Range List

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

""

Name

vdpProfileName - VDP profile name

Syntax

--vdpProfileName <string>

Description

Voice domain preference profile name

Class

Optional.

Type / Range

Digit string of length 0 or 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Default

""

7.137 cmm virtualSgsnAddress

virtualSgsnAddress. Syntax, description, parameters, and roles for cmm virtualSgsnAddress command.

Syntax**Description**

Configure, list and show virtual SGSN address.

Parameters**Name**

mcc - Mobile country code for radio network PLMN

Syntax

--mcc <digits>

Description

Mobile country code for radio network PLMN. in the SGSN/MME, the value of this parameter is in sync with the value of the parameter MCC of the supported PLMN in index 0 in the MME.

Class

Optional, not filterable on list.

Type / Range

Digit string of length 0 or 3

Default

""

Name

mnc - Mobile network code for radio network PLMN

Syntax

--mnc <digits>

Description

Mobile network code for radio network PLMN. in the SGSN/MME, the value of this parameter is in sync with the value of the parameter MCC of the supported PLMN in index 0 in the MME.

Class

Optional, not filterable on list.

Type / Range

Digit string of length 0 or 2 to 3

Default

""

Name

np - Numbering plan indicator E164

Syntax

--np <list-item>

Description

Numbering plan indicator E164. allowed values are E164, E212 and E214.

Class

Optional, not filterable on list.

List

- E164 - E.164 - Specify numbering plan of E.164.
- E212 - E.212 - Specify numbering plan of E.212.
- E214 - E.214 - Specify numbering plan of E.214.

Default

E212

Name

ton - Nature of address indicator

Syntax

--ton <list-item>

Description

Nature of address indicator. allowed values are INT (international) and NAT (national).

Class

Optional, not filterable on list.

List

- INT - International - Specify address format as international.
- NAT - National - Specify address format as national.

Default

INT

Name

vsa - Virtual SGSN address for radio network PLMN

Syntax

--vsa <digits>

Description

This parameter is a virtual SGSN address number. the maximum length of the number is 18 digits.

Class

Optional, not filterable on list.

Type / Range

Digit string of length 0 or 1 to 18

Default

""

Name

id - Id of virtual SGSN address

Syntax

<integer>

Description

Id of virtual SGSN address.

Class

Required value.

Type / Range

Integer in the range of 1 to 10

7.138 cmm visitingSubscriberGroup

visiting subscriber group. Syntax, description, parameters, and roles for cmm visitingSubscriberGroup command.

Syntax**Description**

Configure, list and show SGSN visiting subscribers.

Parameters**Name**

visitingSubscriberGroupId - Visiting subs group id

Syntax

--visitingSubscriberGroupId <integer>

Description

Visiting subscriber group identifier.

Class

Required key.

Type / Range

Integer in the range of 1 to 5,000

Name

visitorAccessListId - Visitor access list id

Syntax

--visitorAccessListId <integer>

Description

Visitor access list identifier. this parameter should match parameter visitoraccesslistid of table visitoraccesslist.

Class

Required on create, not modifiable.

Type / Range

Integer in the range of 1 to 1000

Name

accessRights - Access rights

Syntax

--accessRights <list-item>

Description

Access rights of subscriber group. possible values, norights ... no rights
2groamgeranandutran ... 2G roaming allowed with GERAN and UTRAN
3groamgeranandutran ... 3G roaming allowed with GERAN and UTRAN
2gand3groamgeranandutran ... 2G and 3G roaming allowed with GERAN and UTRAN
2groamgeran ... 2G roaming allowed with GERAN 3groamgeran ... 3G roaming allowed with GERAN

2gand3groamgeran ... 2G and 3G roaming allowed with GERAN
2gand3groamutran ... 2G and 3G roaming allowed with UTRAN.

Class

Optional.

List

- 2gAnd3gRoamGeran - 2G and 3G roaming allowed with GERAN - 2G and 3G roaming allowed with GERAN.
- 2gAnd3gRoamGeranAndUtran - 2G and 3G roaming allowed with GERAN and UTRAN - 2G and 3G roaming allowed with GERAN and UTRAN.
- 2gAnd3gRoamUtran - 2G and 3G roaming allowed with UTRAN - 2G and 3G roaming allowed with UTRAN.
- 2gRoamGeran - 2G roaming allowed with GERAN - 2G roaming allowed with GERAN.
- 2gRoamGeranAndUtran - 2G roaming allowed with GERAN and UTRAN - 2G roaming allowed with GERAN and UTRAN.
- 2gRoamUtran - 2G roaming allowed with UTRAN - 2G roaming allowed with UTRAN.
- 3gRoamGeran - 3G roaming allowed with GERAN - 3G roaming allowed with GERAN.

- 3gRoamGeranAndUtran - 3G roaming allowed with GERAN and UTRAN - 3G roaming allowed with GERAN and UTRAN.
- 3gRoamUtran - 3G roaming allowed with UTRAN - 3G roaming allowed with UTRAN.
- noRights - No rights - No rights.

Default

noRights

Name

imsi - IMSI

Syntax

--imsi <digits>

Description

Imsi.

Class

Optional.

Type / Range

Digit string of length 0 to 15

7.139 cmm visitorAccessList

visitor access list. Syntax, description, parameters, and roles for cmm visitorAccessList command.

Syntax

Description

Configure, list and show visitor access list.

Parameters

Name

visitorAccessListId - Visitor access list id

Syntax

--visitorAccessListId <integer>

Description

Visitor access list identifier.

Class

Required key.

Type / Range

Integer in the range of 1 to 1000

Name

alName - AI name

Syntax

--alName <string>

Description

Access list name.

Class

Optional.

Type / Range

Digit string of length 0 to 15 with the allowed pattern of [0-9a-zA-Z\.\-:]*

Default

""

7.140 cmm vlr

VLR. Syntax, description, parameters, and roles for cmm vlr command.

Syntax

Description

VLR.

Parameters

Name

vlrId - VlrId

Syntax

--vlrId <integer>

Description

VLR index.

Class

Required key.

Type / Range

Integer in the range of 0 to 199

Name

toa - Type of VLR address

Syntax

--toa <list-item>

Description

Identify type of VLR address. allowed values. GT ... global title address. SPC ... destination point code (ni + spc) if GT is given, the dig parameter should be given. if SPC is given, the ni and the spc parameters should be given.

Class

Required on create.

List

- GT - Global title address.

- SPC - Destination point code (ni + spc).

Name

vlrDigits - VLR address

Syntax

--vlrDigits <digits>

Description

Use this parameter to specify the virtual VLR address in E164 format.

Class

Required on create.

Type / Range

Digit string of length 1 to 18

Name

ni - Network indicator

Syntax

--ni <list-item>

Description

Network indicator. this parameter defines the value that represents the type of network where the VLR is located. allowed values, IN0 ... international network IN1 ... reserved for international use NA0 ... national network NA1 ... reserved for national use.

Class

Optional.

List

- IN0 - International network number 0.
- IN1 - International network number 1.
- NA0 - National network number 0.
- NA1 - National network number 1.

Default

NA0

Name

spc - Spc

Syntax

--spc <integer>

Description

Signalling point code.

Class

Optional.

Type / Range

Integer in the range of 0 to 16,777,215

Default

0

Name

tom - Tunneling of messages

Syntax

--tom <list-item>

Description

Tunneling of messages.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

vlrTon - Type of VLR address

Syntax

--vlrTon <list-item>

Description

Use this parameter to specify the country format of virtual VLR address.

Class

Optional.

List

- INT - International - Specify address format as international.
- NAT - National - Specify address format as national.

Default

INT

7.141 cmm voiceTrafficList

Voice Traffic List. Syntax, description, parameters, and roles for cmm voiceTrafficList command.

Syntax

Description

This command is used to administer a Voice Traffic List.

Parameters

Name

name - Voice traffic list name

Syntax

--name <string>

Description

Voice traffic list name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Roles

7.142 cmm voiceTrafficListNi

Voice Traffic List NI. Syntax, description, parameters, and roles for cmm voiceTrafficListNi command.

Syntax**Description**

This command is used to administer a Voice Traffic List Access Point Name Network Indicator.

Parameters**Name**

voiceTrafficListName - Voice traffic list name

Syntax

--voiceTrafficListName <string>

Description

Voice traffic list name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

apnNi - Access point name network indicator

Syntax

--apnNi <string>

Description

Access point name - network indicator.

Class

Required key.

Type / Range

Digit string of length 1 to 62 with the allowed pattern of [0-9a-zA-Z\._]*

Roles

7.143 cmm wpsQosProfile

WPS QoS Profile. Syntax, description, parameters, and roles for `cmm wpsQosProfile` command.

Syntax

Description

This command is used to administer an Wireless Priority Services QoS Profile for Roaming Subscribers and includes parameters for defining the APN-NI, APN AMBR bitrates, default bearer ARP, QCI, PCI and PVI values, and guaranteed and non-guaranteed dedicated bearer ARP, bitrate, QCI, PCI and PVI values.

Parameters

Name

name - WPS Roaming QoS Profile

Syntax

--name <string>

Description

A name that identifies this roaming QoS profile.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Name

profileType - WPS roaming QoS profile type

Syntax

--profileType <list-item>

Description

Profile Type. Uniquely identifies the various types of profiles we support: IMS, Non-IMS, Custom APN 1, 2 or 3

Class

Required on create, not modifiable.

List

- CustomAPNWpsPrfl1 - Custom APN Wps profile - 1 - Roaming WPS QoS profile for custom APN WPS 1.
- CustomAPNWpsPrfl2 - Custom APN Wps profile - 2 - Roaming WPS QoS profile for custom APN WPS 2.
- CustomAPNWpsPrfl3 - Custom APN Wps profile - 3 - Roaming WPS QoS profile for custom APN WPS 3
- IMSAPNWpsPrfl - IMS APN WPS profile - Roaming WPS QoS profile for IMS APNs.
- NonIMSAPNWpsPrfl - Non-IMS APN WPS profile - Roaming WPS QoS profile for non-ims APNs

Name

apnAmbrDownLink - APN AMBR downlink for default bearer

Syntax

--apnAmbrDownLink <integer>

Description

APN aggregated maximum bitrate downlink for default bearer.

Class

Optional.

Type / Range

Integer in the range of 0, 1-63, 64- 568, 576-8640, 8700-16000, 17000-128000, 130000-4000000000 in units of Kbps

Default

128000

Name

apnAmbrUpLink - APN AMBR uplink for default bearer

Syntax

--apnAmbrUpLink <integer>

Description

APN aggregated maximum bitrate uplink for default bearer.

Class

Optional.

Type / Range

Integer in the range of 0, 1-63, 64- 568, 576-8640, 8700-16000, 17000-128000, 130000-4000000000 in units of Kbps

Default

128000

Name

apnNi - Access point name - network indicator

Syntax

--apnNi <string>

Description

APN NI for this roaming WPS QoS profile.

Class

Optional.

Type / Range

Digit string of length 0 to 62 with the allowed pattern of [0-9a-zA-Z\.\-]*

Default

""

Name

defaultBrrArp - Default bearer ARP

Syntax

--defaultBrrArp <integer>

Description

Default bearer allocation and retention priority.

Class

Optional.

Type / Range

Integer in the range of 1 to 15

Default

15

Name

defaultBrrQci - Default bearer QCI

Syntax

--defaultBrrQci <integer>

Description

QoS class identifier for default bearer.

Class

Optional.

Type / Range

Integer in the range of 5 to 9

Default

9

Name

defBrrPci - Default bearer PCI

Syntax

--defBrrPci <list-item>

Description

Default bearer pre-emption capability indicator.

Class

Optional.

List

- Disabled - PCI disabled - Pre-emption capability disabled.
- Enabled - PCI enabled - Pre-emption capability enabled.

Default

Enabled

Name

defBrrPvi - Default bearer PVI

Syntax

--defBrrPvi <list-item>

Description

Default bearer pre-emption vulnerability indicator.

Class

Optional.

List

- Disabled - PVI disabled - Pre-emption vulnerability disabled.
- Enabled - PVI enabled - Pre-emption vulnerability enabled.

Default

Enabled

Name

description - Description

Syntax

--description <string>

Description

Profile description.

Class

Optional.

Type / Range

Digit string of length 0 to 160 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

gbrDedBrrArp - Guaranteed dedicated bearer ARP

Syntax

--gbrDedBrrArp <integer>

Description

Guaranteed dedicated bearer allocation and retention priority.

Class

Optional.

Type / Range

Integer in the range of 0 to 15

Default

15

Name

gbrDedBrrBitrateDownlink - Guaranteed dedicated bearer downlink bitrate

Syntax

--gbrDedBrrBitrateDownlink <integer>

Description

Guaranteed dedicated bearer downlink bitrate.

Class

Optional.

Type / Range

Integer in the range of 0, 1-63, 64-568, 576-8640, 8700-16000, 17000-128000, 130000-256000, 260000-500000, 510000-1500000, 1600000-4000000000 in units of Kbps

Default

128000

Name

gbrDedBrrBitrateUplink - Guaranteed dedicated bearer uplink bitrate

Syntax

--gbrDedBrrBitrateUplink <integer>

Description

Guaranteed dedicated bearer uplink bitrate.

Class

Optional.

Type / Range

Integer in the range of 0, 1-63, 64-568, 576-8640, 8700-16000, 17000-128000, 130000-256000, 260000-500000, 510000-1500000, 1600000-4000000000 in units of Kbps

Default

128000

Name

gbrDedBrrMaxBitrateDownlink - Guaranteed dedicated bearer maximum downlink bitrate

Syntax

--gbrDedBrrMaxBitrateDownlink <integer>

Description

Guaranteed dedicated bearer maximum downlink bitrate.

Class

Optional.

Type / Range

Integer in the range of 0, 1-63, 64-568, 576-8640, 8700-16000, 17000-128000, 130000-256000, 260000-500000, 510000-1500000, 1600000-4000000000 in units of Kbps

Default

128000

Name

gbrDedBrrMaxBitrateUplink - Guaranteed dedicated bearer maximum uplink bitrate

Syntax

--gbrDedBrrMaxBitrateUplink <integer>

Description

Guaranteed dedicated bearer maximum uplink bitrate.

Class

Optional.

Type / Range

Integer in the range of 0, 1-63, 64-568, 576-8640, 8700-16000, 17000-128000, 130000-256000, 260000-500000, 510000-1500000, 1600000-4000000000 in units of Kbps

Default

128000

Name

gbrDedBrrPci - Guaranteed dedicated bearer PCI

Syntax

--gbrDedBrrPci <list-item>

Description

Guaranteed dedicated bearer pre-emption capability indicator.

Class

Optional.

List

- Disabled - PCI disabled - Pre-emption capability disabled.
- Enabled - PCI enabled - Pre-emption capability enabled.

Default

Disabled

Name

gbrDedBrrPvi - Guaranteed dedicated bearer PVI

Syntax

--gbrDedBrrPvi <list-item>

Description

Guaranteed dedicated bearer pre-emption vulnerability indicator.

Class

Optional.

List

- Disabled - PVI disabled - Pre-emption vulnerability disabled.
- Enabled - PVI enabled - Pre-emption vulnerability enabled.

Default

Disabled

Name

gbrDedBrrQci - Guaranteed dedicated bearer QCI

Syntax

--gbrDedBrrQci <integer>

Description

Guaranteed dedicated bearer QCI

Class

Optional.

Type / Range

Integer in the range of 0 to 4

Default

4

Name

nonGbrDedBrrArp - Non guaranteed dedicated bearer ARP

Syntax

--nonGbrDedBrrArp <integer>

Description

Non guaranteed dedicated bearer allocation and retention priority.

Class

Optional.

Type / Range

Integer in the range of 0 to 15

Default

15

Name

nonGbrDedBrrPci - Non guaranteed dedicated bearer PCI

Syntax

--nonGbrDedBrrPci <list-item>

Description

Non guaranteed dedicated bearer pre-emption capability indicator.

Class

Optional.

List

- Disabled - PCI disabled - Pre-emption capability disabled.
- Enabled - PCI enabled - Pre-emption capability enabled.

Default

Disabled

Name

nonGbrDedBrrPvi - Non guaranteed dedicated bearer PVI

Syntax

--nonGbrDedBrrPvi <list-item>

Description

Non guaranteed dedicated bearer pre-emption vulnerability indicator.

Class

Optional.

List

- Disabled - PVI disabled - Pre-emption vulnerability disabled.
- Enabled - PVI enabled - Pre-emption vulnerability enabled.

Default

Disabled

Name

nonGbrDedBrrQci - Non guaranteed dedicated bearer QCI

Syntax

--nonGbrDedBrrQci <integer>

Description

Non guaranteed dedicated bearer QoS class identifier.

Class

Optional.

Type / Range

Integer in the range of 0 or 6 to 9

Default

9

7.144 cmm wusProfile

Wake Up Signal Profile. Syntax, description, parameters, and roles for `cmm wusProfile` command.

Syntax

Description

This profile specifies the wake up signal configuration to be used for the uePlmnServices and imsiRangeServices.

Parameters

Name

name - Wake Up Signal Profile Name

Syntax

--name <string>

Description

Name of the WUS profile.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

localWusAiValue - Local Wake Up Signal Assistance Information Value

Syntax

--localWusAiValue <list-item>

Description

This field specifies the paging probability Assistance Information value that is to be assigned to a UE that supports Group WUS functionality. This value will override any recommended value from the UE.

Class

Optional.

List

- p00 - 0% paging probability value
- p05 - 5% paging probability value
- p10 - 10% paging probability value
- p15 - 15% paging probability value

- p20 - 20% paging probability value
- p25 - 25% paging probability value
- p30 - 30% paging probability value
- p35 - 35% paging probability value
- p40 - 40% paging probability value
- p45 - 45% paging probability value
- p50 - 50% paging probability value
- p55 - 55% paging probability value
- p60 - 60% paging probability value
- p65 - 65% paging probability value
- p70 - 70% paging probability value
- p75 - 75% paging probability value
- p80 - 80% paging probability value
- p85 - 85% paging probability value
- p90 - 90% paging probability value
- p95 - 95% paging probability value
- p100 - 100% paging probability value

Default

p100

Name

ueWusAiAdjustment - UE Wake Up Signal Assistance Information Adjustment

Syntax

- ueWusAiAdjustment <integer>

Description

This field specifies the adjustment to be applied to the UE recommended value for Assistance information used for Group WUS. The specified value is an integer in the range [-20, 20] and defines the adjustment in 5% increments or decrements. If the adjustment takes the value to over 100%, the adjustment is changed to 100%. If the adjustment takes the value to less than 0%, the adjustment is changed to 0%. As an example, assume the field is provisioned to 10 (i.e. 50%). If the UE recommended value is 30%, the MME will adjust to 80%. If the UE recommended value is 75%, the MME will adjust to 100%.

Class

Optional.

Type / Range

Integer in the range of [-20, 20].

Default

0

Name

useLocalIfNoRecommendedAi - Use Local if No Recommended Assistance Information

Syntax

--useLocalIfNoRecommendedAi <list-item>

Description

Specifies whether the MME is to negotiate the use of Group WUS if the UE indicates support of Group WUS (WUSA bit in UE capabilities) but the UE does not provide a recommended assistance value. If the value is true, the MME will negotiate using the local provisioned value.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

wusSource - Wake Up Signal Source

Syntax

--wusSource <list-item>

Description

Specifies whether the MME is to use the UE recommended value or the MME local value for the negotiation of Group WUS with the UE.

Class

Optional.

List

- UE - Specifies to use the UE provided recommended assistance information for Group WUS negotiation. if the UE does not provide a recommended value, the local value will be used.
- Local - Specifies to use the locally provisioned value for assistance information for Group WUS negotiation.

Default

UE

7.145 cmm zone

Zone Name. Syntax, description, parameters, and roles for cmm zone command.

Syntax

Description

This command intends to map zone name with a given RAC and LAC. It is used to compare with current location of UEs. if current location of UE (RAC+LAC) is matching with a zone's name, then the zone name will be used as a Tag to the DNS query.

Parameters

Name

lac - LAC

Syntax

--lac <integer>

Description

Location area code.

Restrictions

configuration should be in Hexadecimal format no matter if there a prefix 0x is added.

Class

Required key.

Type / Range

Integer in the range of 1 to 65,533

Name

rac - RAC

Syntax

--rac <integer>

Description

Routing area code

Restrictions

configuration should be in Hexadecimal format no matter if there a prefix 0x is added.

Class

Required key.

Type / Range

Integer in the range of 0 to 255

Name

name - Zone Table Name

Syntax

--name <string>

Description

Name that identifies a Zone

Restrictions

configuration should not allow case like below: rac1 + lac1 --> zone name1 rac2 + lac2 --> zone name1

Class

Required on create.

Type / Range

Digit string of length 1 to 32 with the allowed pattern of [A-Za-z0-9.-]* A Zone name can not start or end with hyphen (-) or period (.).

Name

racRange - Rac Range

Syntax

--racRange <integer>

Description

This parameter indicates range of RAC. The value of the parameter must be greater or equal to RAC parameter. If this is not configured, then single RAC will be used.

Restrictions

configuration should be in Hexadecimal format no matter if there a prefix 0x is added

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

0

7.146 cmm zoneCode

Zone Code. Syntax, description, parameters, and roles for cmm zoneCode command.

Syntax

Description

This command is used to administer a Zone Code in support of regional subscription and includes parameters for defining the mobile network name, technology type, zone code list type, and zone code. The 'shutdown' parameter is used to enable/shutdown the zone code.

Parameters

Name

name - Zone code name

Syntax

--name <string>

Description

Zone code name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Name

plmnName - Mobile network name

Syntax

--plmnName <string>

Description

Name that identifies mobile network (alternate key).

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Name

techType - Network technology type

Syntax

--techType <list-item>

Description

Network technology type.

Class

Required on create, not modifiable.

List

- 2g3g - Zone code for 2G/3G (SGSN).
- 4g - Zone code for 4G (MME).

Name

zcId - Zone code

Syntax

--zcId <integer>

Description

Indicates one, of up to 128, unique zone codes.

Class

Required on create, not modifiable.

Type / Range

Integer in the range of 0 to 65,535

Name

limitedList - Limited list name

Syntax

--limitedList <string>

Description

Name of the LA list or TA list for a zone code.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

"

Name

rszListPref - Regional Zone List Preference

Syntax

--rszListPref <list-item>

Description

Specifies the list to use for zone code decision

Class

Optional.

List

- Limited List - The Limited List
- TAI Range List - The TAI Range List

Default

Limited List

Name

shutdown - Shutdown

Syntax

--shutdown <list-item>

Description

When it is true, indicates that zone code is shutdown.

Class

Optional.

List

- false - Boolean value of false.

- true - Boolean value of true.

Default

true

Name

taiRangeListName - TAI Range List Name

Syntax

--taiRangeListName <string>

Description

Reference to a TAI Range List

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

wmmZcType - Zone code type

Syntax

--wmmZcType <list-item>

Description

Indicates zone code list type of LAs or TAs.

Class

Optional.

List

- all - Regional subscription allowed in all LAs or all TAs.
- exclusiveLimited - Exclusive limited - Regional subscription not allowed in LAs or TAs in the list.
- inclusiveLimited - Inclusive limited - Regional subscription allowed in LAs or TAs in the list.
- no - Regional subscription not allowed in all LAs or all TAs.

Default

all
