

CLI Reference Guide

Cloud Mobility Manager

Release 25.7 SP13

FINAL

DN09131852

Issue 25-0

Nokia is committed to diversity and inclusion. We are continuously reviewing our customer documentation and consulting with standards bodies to ensure that terminology is inclusive and aligned with the industry. Our future customer documentation will be updated accordingly.

This document includes Nokia proprietary and confidential information, which may not be distributed or disclosed to any third parties without the prior written consent of Nokia.

This document is intended for use by Nokia's customers ("You"/"Your") in connection with a product purchased or licensed from any company within Nokia Group of Companies. Use this document as agreed. You agree to notify Nokia of any errors you may find in this document; however, should you elect to use this document for any purpose(s) for which it is not intended, You understand and warrant that any determinations You may make or actions You may take will be based upon Your independent judgment and analysis of the content of this document.

Nokia reserves the right to make changes to this document without notice. At all times, the controlling version is the one available on Nokia's site.

No part of this document may be modified.

NO WARRANTY OF ANY KIND, EITHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO ANY WARRANTY OF AVAILABILITY, ACCURACY, RELIABILITY, TITLE, NON-INFRINGEMENT, MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE, IS MADE IN RELATION TO THE CONTENT OF THIS DOCUMENT. IN NO EVENT WILL NOKIA BE LIABLE FOR ANY DAMAGES, INCLUDING BUT NOT LIMITED TO SPECIAL, DIRECT, INDIRECT, INCIDENTAL OR CONSEQUENTIAL OR ANY LOSSES, SUCH AS BUT NOT LIMITED TO LOSS OF PROFIT, REVENUE, BUSINESS INTERRUPTION, BUSINESS OPPORTUNITY OR DATA THAT MAY ARISE FROM THE USE OF THIS DOCUMENT OR THE INFORMATION IN IT, EVEN IN THE CASE OF ERRORS IN OR OMISSIONS FROM THIS DOCUMENT OR ITS CONTENT.

Copyright and trademark: Nokia is a registered trademark of Nokia Corporation. Other product names mentioned in this document may be trademarks of their respective owners.

Table of Contents

List of Tables.....	20
Summary of changes.....	21
1 CMM command notes.....	32
2 Command line interface (CLI).....	33
2.1 Authentication, user accounts and user roles.....	33
2.2 Creating user accounts.....	37
2.3 Deleting user accounts.....	42
2.4 Unlocking a user account after failed login attempts.....	44
2.5 Logging in to NECC as the cmm_fallback user.....	44
2.6 CLI command structure.....	45
2.7 CLI command history.....	46
2.8 Executing CLI commands.....	47
3 CMM CLI commands: cmm aggregateService - cmm amfUePageFanoutControl.....	53
3.1 cmm aggregateService.....	53
3.2 cmm aiMI5gUeOffloadStatus.....	54
3.3 cmm aiMIAwsParms.....	57
3.4 cmm aiMIControl.....	59
3.5 cmm aiMIMultiLink.....	65
3.6 cmm aiMIPeer.....	67
3.7 cmm alarmActive.....	69
3.8 cmm alarmDefinition.....	71
3.9 cmm alarmHistory.....	71
3.10 cmm alarmIgnore.....	75
3.11 cmm allowedNfDomain.....	76
3.12 cmm allowedNfDomainList.....	77
3.13 cmm allowedNfType.....	78
3.14 cmm allowedNfTypeList.....	80
3.15 cmm allowedPlmn.....	81
3.16 cmm allowedPlmnList.....	82
3.17 cmm allowedSnssai.....	83
3.18 cmm allowedSnssaiList.....	85
3.19 cmm allowedSnssaiListItem.....	86
3.20 cmm amfAccessRestrictionNasMappingProfile.....	87
3.21 cmm amfAdjacentPlmn.....	100
3.22 cmm amfAdjacentPlmnList.....	101
3.23 cmm amfAliasDnnConversionProfile.....	102
3.24 cmm amfAmPolicyProfile.....	105

3.25	cmm amfAusfHttp2ToNasCcMapping.....	108
3.26	cmm amfAusfHttp2ToNasCcMappingList.....	112
3.27	cmm amfCapacityGParams.....	113
3.28	cmm amfCellId.....	118
3.29	cmm amfCipheringAlgorithm.....	119
3.30	cmm amfCmasGParams.....	122
3.31	cmm amfConsumerLocalEndPointConfig.....	126
3.32	cmm amfDeregistrationBehaviorMappingProfile.....	131
3.33	cmm amfDirectedUelb.....	142
3.34	cmm amfDirectedUelbProfile.....	143
3.35	cmm amfDirectedUelbStats.....	147
3.36	cmm amfDnnOverrideProfile.....	153
3.37	cmm amfEdrxMicoGParams.....	155
3.38	cmm amfEirGParams.....	164
3.39	cmm amfEirOverrideProfile.....	168
3.40	cmm amfEmergencyNum.....	173
3.41	cmm amfEmergencyNumList.....	177
3.42	cmm amfEmergencyProfile.....	178
3.43	cmm amfEplmn.....	185
3.44	cmm amfEplmnList.....	186
3.45	cmm amfEpsCipheringAlgorithm.....	187
3.46	cmm amfEpsIntegrityAlgorithm.....	190
3.47	cmm amfEquivalentPlmn.....	192
3.48	cmm amfEventExposureGParams.....	194
3.49	cmm amfEventProfile.....	196
3.50	cmm amfExtendedEmergencyNum.....	201
3.51	cmm amfExtendedEmergencyNumList.....	203
3.52	cmm amfFreqCountMonitoring.....	204
3.53	cmm amfFreqCountMonitoringProfile.....	206
3.54	cmm amfGParams.....	216
3.55	cmm amfGtpProfile.....	309
3.56	cmm amfGuamiStatusAdmin.....	317
3.57	cmm amfGuamiStatusAdminStats.....	318
3.58	cmm amfHoCellIdRestrictionList.....	322
3.59	cmm amfHoCellIdRestrictionListItem.....	324
3.60	cmm amfHttp2Ping.....	325
3.61	cmm amfInstance.....	329
3.62	cmm amfIntegrityAlgorithm.....	338
3.63	cmm amfIntfAdmin.....	341
3.64	cmm amfIntfQueryPath.....	343
3.65	cmm amfIntfSummary.....	346
3.66	cmm amfLadnMapping.....	349
3.67	cmm amfLadnTai.....	351
3.68	cmm amfLadnTaiList.....	352
3.69	cmm amfLcsGParams.....	353
3.70	cmm amfLinkAdmin.....	366
3.71	cmm amfLinkAlarmCfg.....	371

3.72	cmm amfLinkQueryByGnb.....	374
3.73	cmm amfLinkQueryByN3iwf.....	380
3.74	cmm amfLinkQueryDetail.....	386

Summary of changes

A list of changes between document issues. You can navigate through the respective changed topics.

Changes between issues 24-0 (CMM25.3) and 25-0 (CMM25.7)

Table 1: New and changed commands/parameters

Features	Commands/Parameters
CMM support for third party software updates in CMM25.7 (Feature f02570-70)	- cmm traceData Create Delete List - cmm traceDataStatus Show List
CMM support for CLI / PM changes in CMM25.7 (Feature f02570-80)	- cmm dnnToSnsai Create Show Modify Delete List --dataNetworkName <string> [Changed] - cmm dnnToSnsaiPerPlmn Create Show Modify Delete List --dataNetworkName <string> [Changed] - cmm cmpProc Create --caCertificateFile <string> [New]
AMF support for 3GPP standards Rel17 select Change Requests (CRs) - Phase 10 (Feature f10003-20)	- cmm amfGParms Show Modify List --amfGparmName sendSkipN2PduSessionResRelInd --amfGparmValue <string> [New] - cmm amfLcsGParms Show Modify List --amfGparmName posGpsi --amfGparmValue <string> [New] - cmm networkFunctionInstance Create Show Modify Delete List --pgwFqdnListName <string> [New] - cmm pgwFqdnList Create Show Delete List --name <string> [New] - cmm amfUePlmnServices Create Show Modify Delete List --staticSmf <list-item> [New] - cmm pgwFqdnItem Create Show Delete List --name <string> [New] --fqdn <string> [New]

Table 1: New and changed commands/parameters (continued)

Features	Commands/Parameters
	- cmm pgwFqdnListItem Create Show Delete List --pgwFqdnListName <string> [New] --pgwFqdnItemName <string> [New]
MME support for intelligent PGW selection based on requested PDN type enhancements (Feature f10102-07)	- cmm generalGParams Show Modify List --cmGparamName resendDnsQueryWithoutPdnTypeForTimeout - -cmGparamValue <string> [New]
CMM support for adjustable thresholds for UE paging fanout mitigations (Feature f10737-08)	- cmm mmeUePageFanoutControl Show Modify List --pagingFanoutThreshold <integer> [New] --pageFanoutToTotalMsgThreshold <integer> [New] --msgRateToSafetyNetThreshold <integer> [New] - cmm amfUePageFanoutControl Show Modify List --pagingFanoutThreshold <integer> [New] --pageFanoutToTotalMsgThreshold <integer> [New] --msgRateToSafetyNetThreshold <integer> [New]
MME support for attach rate message throttling for roamers (Feature f10742-01)	- cmm plmn Create Show Modify Delete List --includePlmnAttachRate <list-item> [New] - cmm generalGParams Show Modify List --cmGparamName roamerAttachRateLimitOverride --cmGparamValue <string> [New]
MME support for sending only IMEI portion of IMEISV towards gateways and EIR for all procedures (Feature f10810-01)	- cmm generalGParams Show Modify List --cmGparamName sendOnlyImeiToSgw --cmGparamValue <string> [New] --cmGparamName sendOnlyImeiToEir --cmGparamValue <string> [New]

Table 1: New and changed commands/parameters (continued)

Features	Commands/Parameters
CMM support for RAN serving PLMN in the S1/N2 setup response (Feature f10942-01)	• <code>cmm amfGParms Show Modify List</code> <code>--amfGparmName sendOnlyRanSupportedPlmnsInN2 --amfGparmValue <string> [New]</code> • <code>cmm generalGParms Show Modify List</code> <code>--cmGparmName sendOnlyRanSupportedPlmnsInS1 --cmGparmValue <string> [New]</code>
CMM support for Nokia stacks - SCTP stack enhancements - delivery (Feature f12130-03)	• <code>cmm sctpProfile Create Show Modify Delete List</code> <code>--mtuSize <integer> [Changed]</code> • <code>cmm m3uaProfile Create Show Modify Delete List</code> <code>--mtuSize <integer> [Changed]</code>
MME support for reporting HSS name instead of remote endpoint ID in PM measurement for remote endpoint (Feature f13045-01)	• <code>cmm generalGParms Show Modify List</code> <code>--cmGparmName pmReportHssByName --cmGparmValue <string> [New]</code>
CMM support for automated TLS certificate management - delivery (Feature f13237-03)	• <code>cmm tlsCAcert Create Delete List</code> • <code>cmm tlsCertificate Create Delete List</code> • <code>cmm tlsClientCert Create Delete List</code> • <code>cmm tlsRevocation Create Delete List</code> • <code>cmm oamTlsCAcert Create Delete List</code> <code>--signedCertFile <string> [New]</code> • <code>cmm oamTlsCertificate Create Delete List</code> <code>--privateKeyFile <string> [New]</code> <code>--signedCertFile <string> [New]</code> • <code>cmm oamTlsClientCert Create Delete List</code> <code>--privateKeyFile <string> [New]</code> <code>--signedCertFile <string> [New]</code> • <code>cmm oamTlsRevocation Create Delete List</code>

Table 1: New and changed commands/parameters (continued)

Features	Commands/Parameters
	--revocationListFile <string> [New]
MME support for directed UE move with non-zero relative capacity (Feature f13321-01)	- cmm ueLoadBalance Show Modify List --suppressRcZero <list-item> [New]
CMM support for offload subscribers gracefully when CLI not working (Feature f13322-01)	- cmm aggregateService Show Modify List --lockN2Intf <list-item> [New]
CMM support for NR10 optimization for high runner scenarios - Phase 1 (Feature f14109-15)	- cmm generalGParms Show Modify List --cmGparmName srsTrafficReduction --cmGparmValue <string> [New]
AMF support for OAuth2.0 enhancements phase 3 (Feature f20039-04)	- cmm oauthProfile Create Show Modify Delete List --supportMultiplePlmnsConsumer <list-item> [New] --supportMultiplePlmnsProducer <list-item> [New] --supportModelA <list-item> [New] - cmm consumerOAuthNfType Show Modify List --enable <list-item> [New]
CMM support for using RFSP as selection criterion for access restriction (Feature f20085-10)	- cmm amfGParms Show Modify List --amfGparmName rfspAccessRestriction --amfGparmValue <string> [New] - cmm imsiRangeServices Create Show Modify Delete List --rfspAccessRestrictionListName <string> [New] - cmm amfAccessRestrictionNasMappingProfile Create Show Modify Delete List --rfspAccessRestrictionCc <integer> [New] - cmm restNasMappingProfile Create Show Modify Delete List --rfspAccessRestrictionCc <integer> [New] - cmm amfSupiRangeServices Create Show Modify Delete List

Table 1: New and changed commands/parameters (continued)

Features	Commands/Parameters
	--amfRfspAccessRestrictionListName <string> [New] • cmm generalGParms Show Modify List --cmGparmName rfspAccessRestriction --cmGparmValue <string> [New] • cmm rfspAccessRestrictionList Create Show Delete List --name <string> [New] • cmm uePlmnServices Create Show Modify Delete List --rfspAccessRestrictionListName <string> [New] • cmm amfUePlmnServices Create Show Modify Delete List --amfRfspAccessRestrictionListName <string> [New] • cmm rfspAccessRestrictionListItem Create Show Delete List --rfspAccessRestrictionListName <string> [New] --rfspValue <integer> [New] • cmm amfRfspAccessRestrictionListItem Create Show Delete List --amfRfspAccessRestrictionListName <string> [New] --amfRfspValue <integer> [New] • cmm amfRfspAccessRestrictionList Create Show Delete List --name <string> [New]
AMF support for customer specific DNN conversion enhancement (Feature f20085-11)	• cmm amfAliasDnnConversionProfile Create Show Modify Delete List --replacementDnnListName <string> [New]
AMF support for SMP based priority paging and timer based temporary priority (Feature f20091-06)	• cmm amfGParms Show Modify List --amfGparmName smpBasedPriorityFromSmsf --amfGparm Value <string> [New] • cmm amfSupiRangeServices Create Show Modify Delete List --amfSmpToPagingPriorityProfileListName <string> [New]

Table 1: New and changed commands/parameters (continued)

Features	Commands/Parameters
	• <code>cmm amfSmpToPagingPriorityProfile Create Show Modify Delete List</code> <code>--sbiMessagePriority <integer> [New]</code> <code>--pagingPriLevel <list-item> [New]</code> <code>--amfSmpToPagingPriorityProfileListName <string> [New]</code> <code>--upliftTimer <integer> [New]</code> <code>--prioDuration <list-item> [New]</code> <code>--prioType <list-item> [New]</code> <code>--includePagingPriority <list-item> [New]</code> • <code>cmm amfSmpToPagingPriorityProfileList Create Show Delete List</code> <code>--name <string> [New]</code> • <code>cmm amfUePlmnServices Create Show Modify Delete List</code> <code>--amfSmpToPagingPriorityProfileListName <string> [New]</code> • <code>cmm amfMcsPagingPriProfile Create Show Modify Delete List</code> <code>--includePagingPriority <list-item> [New]</code> • <code>cmm amfPagingPriProfile Create Show Modify Delete List</code> <code>--includePagingPriority <list-item> [New]</code> • <code>cmm amfUePriorityProfile Create Show Modify Delete List</code> <code>--sendPagingForSubsequentPrioN1N2 <list-item> [New]</code>
AMF support for sending PEI with IMEI type towards SMF and EIR for all procedures (Feature f20113-01)	• <code>cmm amfGParms Show Modify List</code> <code>--amfGparmName sendPeiTypeImeiToSmf --amfGparmValue <string> [New]</code> <code>--amfGparmName sendPeiTypeImeiToEir --amfGparmValue <string> [New]</code>
AMF support for network slice specific authentication and authorization - phase 3 (Feature f20606-04)	• <code>cmm amfGParms Show Modify List</code> <code>--amfGparmName sendPendingSnssaiInAllowedNssaiOfIcsr --amfGparmValue <string> [New]</code> • <code>cmm networkFunctionInstance Create Show Modify Delete List</code>

Table 1: New and changed commands/parameters (continued)

Features	Commands/Parameters
	--supiRangeListName <string> [New] - cmm amfUePlmnServices Create Show Modify Delete List --nssaafSelection <list-item> [New] --nssaafStatusSubscribe <list-item> [New] --defaultNssaafSelection <list-item> [New] - cmm callTraceJob Create Show Delete List --n58 <list-item> [New] - cmm callTraceSetting Show Modify List --n58 <list-item> [New]
AMF support for UDM/HSS based P-CSCF restoration procedure - phase 2 (Feature f21302-02)	cmm amfGParms Show Modify List --amfGparmName pageForN1SmlnUpdRsp --amfGparmValue <string> [New]
AMF support for migration of SBI interfaces to HTTPS/TLS (Feature f21510-01)	cmm sbilndirectCommunicationGParms Show Modify List --amfGparmName prefSchemeForCallbacksInModelID --amfGparmValue <string> [New]
AMF support for HLCOM for MICO UEs (Feature f21701-01)	- cmm amfSvcAgreementProfile Create Show Modify Delete List --micoExtendedConnectSource <list-item> [New] --extendedConnectTime <integer> [New] --edrxExtendedConnectSource <list-item> [New] - cmm amfSupiRangeServices Create Show Modify Delete List --hlcomAllowedMico <list-item> [New] - cmm amfUePlmnServices Create Show Modify Delete List --hlcomAllowedMico <list-item> [New] - cmm amfEdrxMicoGParms Show Modify List --amfGparmName hlcomActiveMico --amfGparmValue <string> [New]

Table 1: New and changed commands/parameters (continued)

Features	Commands/Parameters
	--amfGparmName hlcomWaitTimeOffsetMico --amfGparmValue <string> [New]
CMM support for UE nodeB prediction - phase 3 (Feature f21901-05)	- cmm nbNbrGParms Show Modify List --cmGparmName gnbNeighborContUpdate --cmGparmValue <string> [New] --cmGparmName gnbMapLocalRestoration --cmGparmValue <string> [New] --cmGparmName prioritizedUeHistoryCount --cmGparmValue <string> [New] - cmm gnbNbrMapDump List --poolType <list-item> [New] --poolId <integer> [New] --macroGnbId <integer> [New] --gnbMapType <list-item> [New] --weight <integer> [New] --neighborGnbId <integer> [New] --information <string> [New]
MME support for selective RFSP overwrite (Feature f51024-07)	- cmm generalGParms Show Modify List --cmGparmName useLocalRfspHssRfspNotSub --cmGparmValue <string> [New] - cmm svcAgreementProfile Create Show Modify Delete List --useLocalRfspHssRfspNotSub <list-item> [New]
SGSN support for NITZ in PLMN level (Feature f51048-01)	- cmm amfNon3gppTai Create Show Modify Delete List --timeZoneName <list-item> [Changed] - cmm plmnParam Create Show Modify Delete List --timeZone <list-item> [New] --fullNetwName <string> [New] --shortNetwName <string> [New]

Table 1: New and changed commands/parameters (continued)

Features	Commands/Parameters
	• cmm amfPlmn Create Show Modify Delete List --timeZoneName <list-item> [Changed] • cmm enb Create Show Modify Delete List --timeZoneName <list-item> [Changed] • cmm plmn Create Show Modify Delete List --timeZoneName <list-item> [Changed] • cmm tai Create Show Modify Delete List --timeZoneName <list-item> [Changed] • cmm taiDiscoveryDefaults Show Modify List --timeZoneName <list-item> [Changed] • cmm taiRangeDiscoveryProfile Create Show Modify Delete List --timeZoneName <list-item> [Changed] • cmm sgsnGParms Show Modify List --sgsnGparmName networkNamePlmn --sgsnGparmValue <string> [New] • cmm personalize Show Modify List --timeZoneName <list-item> [Changed] • cmm amfMultiTacOperation Create Modify --timeZoneName <list-item> [Changed] • cmm multiTacOperation Modify --timeZoneName <list-item> [Changed] • cmm amfTaiRangeDiscoveryProfile Create Show Modify Delete List --timeZoneName <list-item> [Changed] • cmm amfTai Create Show Modify Delete List --timeZoneName <list-item> [Changed]
CMM support for AI/ML driven overload control and MLIS links	• cmm aiMLControl Show Modify List --aiMLDrivenCpuOverload <list-item> [New]

Table 1: New and changed commands/parameters (continued)

Features	Commands/Parameters
status CLI query - phase 1 (Feature f72013-19)	• cmm aimlMultiLink Show List --aimlLinkIndex <integer> [New] --linkOperationState <list-item> [New] --aimlLinkIndexType <list-item> [New] --localIp <string> [New] --peerNodeIp <string> [New] --peerNode <string> [New] • cmm aiMl5gUeOffloadStatus List --peerNodeIp <string> [New] --ueOffloadStatus <list-item> [New] --peerNode <string> [New] --ownName <string> [New] --localIp <string> [New] --statusStartTime <string> [New] • cmm localEndPtCfg Create Show Modify Delete List
CMM support for paging optimization using AI/ML forecasted UE location/trajectory - PoC phase 2 (Feature f72013-22)	• cmm amfPagingPolicy Create Show Modify Delete List --maxGnbsPaged <integer> [New] --amfMethod <list-item> [Changed] • cmm amfPagingMethodOverride Create Show Modify Delete List --maxGnbsPaged <integer> [New] --nearestNeighborMethod <list-item> [Changed]  NOTE: The parameters introduced in this feature are not supported in CMM25.7.

Table 2: Removed commands/parameters

Type	Command/ Parameter	Reason
Parameter	cmm gParms support5gslwk Flag	The gParm is redundant and does not have any impact on MME behavior with or without N26 in relation to 5GS interworking.

1 CMM command notes

Notes about Cloud Mobility Manager CLI.

Disclaimer notice

The CMM CLI json/yaml/plain output is a reflection of CMM format. This output does not reflect the raw data that is used to generate the output. This format is designed for human readability and not for scripting purposes.

2 Command line interface (CLI)

Run-time management operations can be carried out through the command line interface (CLI) provided by the Network Element Cluster Controller (NECC).

2.1 Authentication, user accounts and user roles

User authentication protects the system from unauthorized users. Preconfigured user accounts can be used when accessing the CMM for the first time. Pre-configured user `cmmsecurity` can be used to create user groups with different access rights.

Authentication

All the defined user accounts need to be found in the LDAP database in the NECC, otherwise, logging to CMM and use of the CLI commands fail.

User accounts and user roles

Table 3: Preconfigured user accounts in the system

Username	Password	Role
root	39pfMBw3W8ec	–
cmm	2pe1qIP4zjXt	sysadmin
cbamuser	KX6GQrNagFSw	sysadmin
sam5620	dipq2zIPLv36	sysadmin
cmm_fallback	–	–
diagnostic	psf45edIKp82	sysadmin
trainee	aple41OKsprq	monitor
rsp	dOje1586Dp78	sysadmin
cgw	pLk5390tGi09	A user for the charging GW, with access only to the data-charging folder in the

Table 3: Preconfigured user accounts in the system (continued)

Username	Password	Role
		NECC through the SFTP with the Bp service IP.
orchest	–	sysadmin This user is present when orchestrating with the CBAM.
dcae-dfc	8u53hgBS53gq	A user for the open network automation platform (ONAP) with access only to the /data-pm/gzip folder in the NECC through the SFTP.
ca4mn	7xrr99Sso05T	A user for the cognitive analytics for mobile networks (CA4MN), with access only to the /data-pcmd folder in the NECC through the SFTP.
cmmsecurity	akflt9nT/pBMdX+V	secadmin
 NOTE: Nokia strongly recommends changing the pre-configured user account password as soon as the application is deployed.		

Restrictions:

- A root user cannot log in through SSH. The only way to log in as root is to use the su command while logged in as cmm user or cmm_fallback user (or some other user in the admin group).
- The cmm_fallback account is not available in the CNF-based deployments.
- A cmm_fallback user can log in only through SSH from the controller node (this user does not have a password). The only thing that the cmm_fallback user can do is to change to root through the su root command. This is a backup user for certain situations, for example, when LDAP is down and prevents login for LDAP users, such as cmm user.
- The Password column is not applicable to CMM CNFs.

**NOTE:**

- Nokia strongly recommends changing the preconfigured user account password as soon as the application is deployed.
- The root account cannot be used when logging in to the NECC directly using its floating IP. Instead, use another account and use `su -` to become the root user.
- A healing/rebuild operation restores the NECC root password to default and password change is required.

User groups and user roles

Preconfigured user roles are:

monitor	The monitor user can only view configuration settings but, cannot change them.
manage	The manage user is an administrative user who can configure and view all settings.
sysadmin	The sysadmin user can view and modify all configurations. The sysadmin user has also superuser (sudo) rights. The superuser is a special user account used for system administration.
lioperator	The lioperator user can configure LIC and LIB network elements and read LI-related logs.
secadmin	The secadmin user can create other users and configure security settings.

Table 4: User group and user role mapping

LDAP group	User role	Tasks
admin	sysadmin	• access to system and security logs • access to almost all Linux administrative components

Table 4: User group and user role mapping (continued)

LDAP group	User role	Tasks
		• configure the CMM parameters through the CLI interface (excluding security-related parameters)
monitor	monitor	read the CMM parameters through the CLI interface (excluding the security-related parameters)
configure	manage	configure the CMM parameters through the CLI interface (excluding the security-related parameters)
li	lioperator	• configure the LI-related parameters through the LI CLI interface • access to LI logs
security	secadmin	• LDAP user provisioning • configure the security-related CMM parameters through the CLI interface

Restrictions:

- Only users in the security group can create, modify or delete the following commands:
 - authServer
 - certificate
 - oamSession
 - oauthAccessTokenKey, oauthAccessTokenKeyList
 - oauthProfile
 - passwdPolicy
 - radiusProxy
 - tacacsAuthRoleMapping
 - tlsCAcert, tlsCAcertList
 - tlsCertificate, tlsCertificateList

- tlsClientCert, tlsClientCertList
- tlsProfile
- tlsRevocation, tlsRevocationList
- secureCopySetup
- extLdapProfile
- oamTlsCAcert, oamTlsCAcertList
- ldapAuthRoleMapping
- oamTlsCertificate, oamTlsCertificateList
- oamTlsClientCert, oamTlsClientCertList
- oamTlsProfile
- oamTlsRevocation, oamTlsRevocationList
- amfMcsPagingPriProfile, amfMcsPagingPriProfileList
- amfPagingPriProfile, amfPagingPriProfileList
- amfUePriorityProfile

- Users in the admin and configuration group can use list and show in the following commands:

- oauthProfile
- oamTlsProfile
- secureCopySetup
- tlsProfile

2.2 Creating user accounts

To create user accounts, use the **fsuseradd** command.

Purpose

In addition to the preconfigured user accounts, a root user and a cmmsecurity user can add new user accounts with the desired user roles. This procedure describes how to create user accounts with command line interface to the internal configuration directory server.

Before you start

Ensure that you have the correct permissions.

Procedure

1. View existing users.

Sub-steps

- a) Log in to the NECC as a cmmsecurity user.
- b) Execute `fsdumpusers`.

Step example

```
[cmmsecurity@necc0 ~]$ fsdumpusers
dn = uid=cmm,ou=People,fsFragmentId=Security,fsClusterId=ClusterRoot
cn: cmm
uid: cmm
objectClass: FSSecAccount posixAccount shadowAccount extensibleObject
uidNumber: 1000
gidNumber: 30500
homeDirectory: /home/cmm
loginShell: /bin/bash
shadowMin: 0
shadowMax: 180
shadowWarning: 7
shadowLastChange: 17114

dn = uid=cbamuser,ou=People,fsFragmentId=Security,fsClusterId=ClusterRoot
cn: cbamuser
uid: cbamuser
objectClass: FSSecAccount posixAccount shadowAccount extensibleObject
uidNumber: 1001
gidNumber: 1001
homeDirectory: /home/cbamuser
loginShell: /bin/bash
shadowMin: 0
shadowMax: 180
shadowWarning: 7
shadowLastChange: 0
```

2. Add a user account.

Sub-steps

- a) Log in to the NECC as a cmmsecurity user.
- b) Create a hash for password using the `slappasswd` command.

NOTE:

A different hash string is used each time.

Step example

{SSHA}Uhy4I9+x7CDLaMQ2SFS8nhFk+IdWXbCP is a hash for Nokia_1234.

```
[cmmsecurity@necc0 ~]$ slappasswd -h {SSHA} -s Nokia_1234

{SSHA}Uhy4I9+x7CDLaMQ2SFS8nhFk+IdWXbCP
```

c) Execute the `fsuseradd` command with the target user group.

Add a new user account with the `fsuseradd` command. The full syntax of the command with all options is the following:

```
fsuseradd [-c cn] [-u uidNumber] [-d homeDirectory] [-p userPassword]
[-s loginShell] [-G group[,...]] [-e expire_date] [-f inactive_time]
[-n mindays] [-x maxdays] [-w warndays] [-l last_change] [--filter
filter_size] [-v] [-h] [--syssec] [-g gidNumber] uid
```

**NOTE:**

A primary group is created automatically with the same textual as that of the user account.

**NOTE:**

If the secondary group does not exist prior to creating the new user account, the secondary group must be created first. It is also possible to create a user account without any secondary groups, but such a user account cannot have any permissions as they are mapped to a user only through secondary groups.

Table 5: Parameters of the `fsuseradd` command

Parameter	Description	Value range
-c cn	Common name. This is the full name of the user.	The default value is an empty string.
-u uidNumber	UID number.	The value is a number in the range 10000 to 60000. The default value is the first available number in this range.

Table 5: Parameters of the `fsuseradd` command (continued)

Parameter	Description	Value range
<code>-d homeDirectory</code>	The home directory of the user.	The default value is <code>/home/<uid></code> .
<code>-e expire_date</code>	The date on which the user account will be disabled.	–
<code>-f inactive_days</code>	The number of days after a password expires until the account is permanently disabled.	The date is specified in the format <code>YYYY-MM-DD</code> or in the number of days from UNIX EPOCH.
<code>-p userPassword</code>	The encrypted password, as generated using SSHA.	The value is the string output of the <code>s1appasswd</code> command. The default value is <code>"*"</code> .
<code>-s loginShell</code>	The default login shell.	The default value is <code>fsclish</code> .
<code>-G group[, ...]</code>	List of secondary groups.	The default value is an empty string.
<code>-n mindays</code>	The number of days from the password change before which the password cannot be changed.	The default value is 0.
<code>-x maxdays</code>	The number of days from the password change after which the password must be changed.	The default value is 180. Recommended value is 90 days or less.
<code>-w warndays</code>	The number of days before the user is notified when the password expires.	The default value is 7.
<code>-l last_change</code>	The date of the last change of the password. The value <code>-l 0</code> forces the user to change the password after the first login.	The date is specified in the format <code>YYYY-MM-DD</code> or in the number of days from UNIX

Table 5: Parameters of the `fsuseradd` command (continued)

Parameter	Description	Value range
		EPOCH. The default value is 2014-12-05 (16409).
<code>--filter filter_size</code>	The initial filter size of the free uidNumber search.	Available range of values is 2 to 2048. The default value is 128.
<code>-v</code>	Verification is asked from user.	–
<code>-h</code>	Help. Prints command help page.	–
<code>--syssec</code>	Add the user under LDAP SystemSecurity fragment (ou=People, fsFragmentId=SystemSecurity, fsClusterId=ClusterRoot) syssec option cannot be combined with usertype option	–
<code>-g gidNumber</code>	Primary group number or name.	–
<code>uid</code>	User's login name.	–

Step example

```
fsuseradd [username] -G [group name] -p [password hash] -l [last_change]
```

```
[cmmsecurity@necc0 ~]$ fsuseradd test_monitor1 -G monitor -p um0D9BIE0Bb+uW+Idp2eg1HvSZaqEVoa -l 0
```

Command executed successfully.

Step example

To create the user account *testuser* with the following attributes:

- Assign the user to the group *testuser*.
- Assign the user to the pre-existing secondary group *admin*

- Set the home directory to /home/testuser.
- Set the inactive time to 14 days.
- Set the expiration date to 31.12.2016.
- Set the login shell to /bin/bash.
- Set the time when the password must be changed to 60 days.
- Set the time to notify the user about the password change to 14 days.
- Set the date of the last change of the password to zero to prompt the user to change the password after the first login.

Enter the following command:

```
fsuseradd testuser -G monitor -d /home/testuser -f 14 -e 2016-12-31 -s /bin/  
bash -x 60 -w 14 -l 0
```

After successful operation, the following message is displayed:

```
Command executed successfully.
```

Step result

Now the added user can log in to the NECC and further authenticate oneself using the created account.

NOTE:

Last login date and time is displayed after a successful login on all the login attempts.

2.3 Deleting user accounts

To delete user accounts, use the `fsuserdel` command. Optionally, the user's home directory can be preserved when the user account is removed.

Before you start

Ensure that you have the correct permissions.

Procedure

1. Log in to the NECC as a `cmmsecurity` user.
2. Delete a user account.

To delete a user account, use the following command:

```
fsuserdel [-v] [-h] [-f] [-p] uid
```

The parameters are described in the following table:

Table 6: Parameters for the `fsuserdel` command

Parameter	Description
-v	Verification is asked from the user.
-h	Print the command help page.
-f	Force to delete entries when the entry is found in both <i>Security</i> and <i>SystemSecurity</i> fragments.
-p	Preserve users home directory.
uid	Specify the username.

Step example

To delete the testuser user, delete also the user's home directory, and ask for verification, enter the following command:

```
fsuserdel -v testuser
```

The following output is displayed:

```
Deleting this from LDAP:

'uid'           = testuser
'uidNumber'     = 1002
'cn'            = testuser
'gidNumber'     = 30500
'groups'        = 1002
'homeDirectory' = /home/testuser
'loginShell'    = /bin/bash
Removing also home directory in the disk: /home/testuser

Delete? y/n
```

Enter y to confirm. The following output is displayed:

```
Command executed successfully.
```

Step example

To delete test_monitor1 user, but preserve the user's home directory (home directory's owner will be changed to root), enter the following command:

```
[cmmsecurity@necc0 ~]$ fsuserdel -p test_monitor1  
Command executed successfully.
```

2.4 Unlocking a user account after failed login attempts

A user is locked out after five unsuccessful login attempts. In addition, if a user fails to log in successfully before the maximum time for login attempts expires, the connection is closed.

Purpose

A locked-out user can attempt to log in after five minutes. Instead of waiting, you can reset (or clear) the number of failed login attempts.

Procedure

- Reset the number of failed attempts for a cmm user.

Enter the command in the NECC:

```
sudo /usr/sbin/faillock --user cmm --reset
```

2.5 Logging in to NECC as the cmm_fallback user

If you cannot log in as a cmm user (and root user login is disabled), you can always log in as the cmm_fallback user from the controller.

Purpose

NOTE:

The cmm_fallback account is not available in the CNF-based deployments.

If the LDAP is down, login as a cmm user does not work. Login as a cmm_fallback user still works because the controller has a public key for the cmm_fallback user and the cmm_fallback user is a normal Linux user and not in LDAP. After login, change to the root user and fix the LDAP issue.

NOTE:

Login banner is not configurable, HTTPs login does not display banner. CMM login using SSH will display banner.

Procedure

1. Log in as the cmm_fallback user from the controller.

```
[IPC-TCL-102@controller-1 ~]$ ssh cmm_fallback@[NECC VIP]
```

2. Change to the root user with the su command.

```
[cmm_fallback@necc0 ~]$ su root
```

2.6 CLI command structure

A CLI command consists of primary keyword (cmm), command group or table name, command, and parameters.

The command format is: cmm <group> <command> [--<parameter1> <value>] [--<parameter2> <value>] ...

cmm

primary keyword

group

parameter group or table name, for example, plmn

command

actions: create, modify, delete, show, list

parameter

parameter types (optional parameters, positional parameters or required named parameters)

Table 7: CLI parameter types

Notation	Description
<parameter value>	Mandatory positional argument. Example: cmm tai show -plmnName <plmnName> --tac <tac>
{value1, value2, value3...}	Mandatory positional argument with one of the values inside the brackets. Example: interfaceName allowed values {S1MME, S6A, S10, S11, GN, SV, SGS, X2, S13, ...}
--parameter <value>	Mandatory required named parameter. Example: cmm tai create --plmnName 310_012 --tac 9999

Table 7: CLI parameter types (continued)

Notation	Description
--parameter {value1, value2, value3...}	Mandatory required named parameter with one of the values inside the brackets. Example: cmm rmtEndPtCfg create --name remoteEndPt_1 --interfaceName {S6A,S13,SGS,SLG,SLS,SBC,S V,SGS_LITE} --ip1 2.2.2.2 --ip2 3.3.3.3
[--parameter <value>]	Optional required named parameter Example: [--multiHomed {true, false}]
[--parameter {value1, value2, value3...}]	Optional required named parameter with one of the values inside the brackets. Example: cmm localEndPtCfg create --interfaceName S1MME --multiHomed true

**NOTE:**

If <value> allows the '-' character in its allowed character set, it cannot be the first character of that string.

The configuration database contains pre-populated tables and defaults, for example, internal subnet, service IPs for internal communication, various profiles, and timers. If the value of a field is not specifically provisioned, the system populates the field with the default value. There are two types of default:

- An absolute value has no dependencies from other field(s) in the same or other tables.
- A relative value is a set of possible default values that are chosen based on the content of other field(s) in the same or other tables.

2.7 CLI command history

CMM supports a dedicated log file for the logging of CLI command history.

For each command entered, the log file captures:

- User ID
- Timestamp

- Command syntax, including all parameters provided on the command line
- Command outcome (for example, success, fail, return code)

There is a log file on each NECC (/var/log/cli_cmd.log).

The file has maximum size and retention policy managed by standard Linux log rotation.

2.8 Executing CLI commands

The command line interface (CLI) can be used in the active NECC.

Procedure

1. Log in to an active NECC VM (NECC-0 or NECC-1) using ssh with a valid user account and authenticate.

User **cmm** is authenticated to the CMM CLI automatically. All other users need to be authenticated before they can enter configuration commands.

The command is `cmm authenticate`.

Step example

```
[root@necc0 ~]# cmm authenticate
Enter Username: john
Enter Password:

Authentication successful.
[root@necc0 ~]#
```

2. Type `cmm -h` or `cmm --help` to see the available commands.

Commands `cmm -h` and `cmm --help` list all commands available for CMM.

3. Use the CLI help for detailed command information (`-h` / `--help`).

Help arguments are `-h` and `--help`.

Step example

```
cmm hssGrp create --help
```

4. Type the command with the required arguments in the command line and press **Enter**.

If you are unsure of the exact command to execute, use the auto-completion feature of CLI. This feature displays the choices allowed for a command or the commands themselves. To use auto-completion, type the command or part of it, and then press **TAB**.

NOTE:

When using the create command, all mandatory parameters must be given at the same time.

**NOTE:**

When the wildcard character is used in a CLI command, enter it in quotation marks (' * '). This will make sure the wildcard character will be expanded as a string instead of the list of files in current directory.

Enter parameter values with word spaces, for example "Home Network", in quotation marks.

Step example

```
cmm clusterMgmt test.ping --target '*'
cmm diamProfile create --name 1 --dwrFreqTimer 10000 -- dwrMsgTimer 2000 --
dwrRetransMax 3 --cerRetransMax 3 -- diamProductName "MME Diameter"
```

Step result

When the command is executed successfully, information is displayed. If no information is available, the command displays nothing or an empty table or a message indicating that there is no information to display.

5. Use output formatters to modify the command output.

All commands include Linux output formatter options:

```
[-f {json,plain,shell,table,value,yaml}]
[-c COLUMN]
[--max-width <integer>]
[--fit-width]
[--print-empty]
[--noindent]
[--prefix PREFIX]
```

Table 8: Output formatter options

Output formatter	Description
-c COLUMN --column COLUMN	Specify the column(s) to include, can be repeated.
-f {csv,json,plain,table,value,yaml} --format {csv,json,plain,table,value,yaml}	Output formatter for list operation, defaults to table.

Table 8: Output formatter options (continued)

Output formatter	Description
<code>-f {json,plain,shell,table,value,yaml}</code> <code>--format {json,plain,shell,table,value,yaml}</code>	Output formatter for show operation, defaults to table.
<code>--max-width <integer></code>	Table formatter. Maximum display width, <1 to disable. You can also use the CLIFF_MAX_TERM_WIDTH environment variable, but the parameter takes precedence.
<code>--fit-width</code>	Table formatter. Fit the table to the display width. Implied if <code>--max-width</code> is greater than 0. Set the environment variable CLIFF_FIT_WIDTH=1 to always enable.
<code>--print-empty</code>	Table formatter. Print empty table if there is no data to show.
<code>--noindent</code>	json formatter: Whether to disable indenting the JSON.
<code>--quote {all,minimal,none,nonnumeric}</code>	csv formatter: When to include quotes, defaults to nonnumeric.
<code>--prefix PREFIX</code>	Shell formatter, a format a UNIX shell can parse (variable="value"). Add a prefix to all variable names.

Step example

Show only the selected column (`-c/--column`):

```
cmm traceDataStatus list
```

```
+-----+-----+-----+-----+-----+-----+-----+
|SUBSCRIBER|MSISDN|TRACE|TRACE|HITS|FIRST|LAST|
|          |      |ID  |ORIGIN|    |    |    |
+-----+-----+-----+-----+-----+-----+-----+
|2622800000000001|918003779680|1|hss|6|2016-11-17|2016-11-17|
```

					T13:19:28.018	T13:19:28.209	
262280000000000001	918003779680		2 hss		15 2016-11-17	2016-11-17	
					T13:19:28.304	T13:19:29.101	
262280000000000002	918003779681		3 hss		20 2016-11-17	2016-11-17	
					T13:19:29.115	T13:19:29.873	
262280000000000002	918003779681		4 hss		20 2016-11-17	2016-11-17	
					T13:19:29.924	T13:19:30.535	
262280000000000002	918003779681		5 hss		20 2016-11-17	2016-11-17	
					T13:19:30.616	T13:19:31.307	
+-----+	+-----+	+-----+	+-----+	+-----+	+-----+	+-----+	+-----+

```
cmm traceDataStatus list --column HITS
```

```
+-----+
| HITS |
+-----+
| 5    |
| 6    |
+-----+
```

```
cmm traceDataStatus list -c HITS
```

```
+-----+
| HITS |
+-----+
| 5    |
| 6    |
+-----+
```

Step example

If the displayed information is too wide and difficult to read, adjust the width of the displayed information. Re-enter the command but use the `--max-width` argument to make the information easier to read.

```
cmm alarm active show 19 --max-width 50
```

6. For debugging, use the `-v` argument.

With the `-v` (`--verbose`) argument, CLI command logs, the REST Request, and the received Response are shown.

TIP:

If a CLI command fails, this may help you identify the cause of the failure.

Step example

```

cmm systemInfo show -v
initialize_app
found extension EntryPoint.parse('plain =
nokia.mmecli.api.plainformatter:PlainFormatter')
found extension EntryPoint.parse('table =
cliff.formatters.table:TableFormatter')
found extension EntryPoint.parse('json =
cliff.formatters.json_format:JSONFormatter')
found extension EntryPoint.parse('shell =
cliff.formatters.shell:ShellFormatter')
found extension EntryPoint.parse('value =
cliff.formatters.value:ValueFormatter')
found extension EntryPoint.parse('yaml =
cliff.formatters.yaml_format:YAMLFormatter')
prepare_to_run_command SysteminfoShow
request header: {'Accept': 'application/json'}
request URL = http://10.10.30.226:8080/api/cm/v1/systemInfos/config
REST server json response = 200, {'_embedded': {'releaseNum':
u'CMM17.0.0', u'application': u'MME',
u'buildNum': u'B1_C1982', u'hwType': u'ATE', u'_links': {'self':
{'href': u'/api/cm/v1/systemInfos/config'}},
u'switchName': u'ns17', u'timeZone': u'CST'}, u'_links': {'self':
{'href': u'/api/cm/v1/systemInfos/config'}}}}
+-----+-----+
| Field | Value |
+-----+-----+
| systemInfo | config |
| switchName | ns17 |
| timeZone | CST |
| application | MME |
| releaseNum | CMM17.0.0 |
| buildNum | B1_C1982 |
| hwType | ATE |
+-----+-----+
clean_up SysteminfoShow

```

7. If you get a timeout when displaying alarm or timer data, try the `--period` argument to select a shorter period.

When using CLI commands to display alarm history or counter data, timeout may occur. Without the `--period` argument, the default period for alarms is 1 d (day) and for counters 15 minutes. Re-enter the command with a shorter period.

Step example

```
cmm alarm history list --period 1h
```

8. If you get output “Command execution not possible yet – try again later” try again later.
CLI cannot send a command forward because the receiving side is not ready. Try again later.

3 CMM CLI commands: cmm aggregateService - cmm amfUePageFanoutControl

CMM CLI command descriptions: syntax, usage, parameters, and user roles.

3.1 cmm aggregateService

Aggregate services. Syntax, description, parameters, and roles for cmm aggregateService command.

Syntax

Description

Administer available services. For QA applications both adminState and amfAdminState must to specified and set to the same state. For AMF-only applications only amfAdminState is applicable. For MME-only and TA applications only adminState is applicable. For TA and QA applications, SGSN PAPSs must be locked (using cmm serviceState modify command with the 'force' option) before locking aggregate service.

Parameters

Name

adminState - Admin state

Syntax

```
--adminState <list-item>
```

Description

Admin state of the services.

Class

Optional.

List

- locked - Locked.
- unlocked - Unlocked.

Name

amfAdminState - AMF Admin state

Syntax

```
--amfAdminState <list-item>
```

Description

Admin state of the AMF services.

Class

Optional.

List

- locked - Locked.
- unlocked - Unlocked.

Name

lockN2Intf - Lock N2 Interface

Syntax

--lockN2Intf <list-item>

Description

Setting this parameter to true will cause the N2 Interface to be locked on application of Aggregate Service Lock for AMF or QA.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Roles**Show**

sysadmin, manage, monitor

Modify

sysadmin, manage

List

sysadmin, manage, monitor

3.2 cmm aiML5gUeOffloadStatus

AIML Driven 5G UE Offload Status. Syntax, description, parameters, and roles for cmm aiML5gUeOffloadStatus command.

Syntax**Description**

AIML Driven 5G UE Offload Status

Parameters**Name**

localIp - local Ip

Syntax

--localIp <string>

Description

Local MLIS external IP

Class

Read only.

Type / Range

Digit string of length 0 or 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

ownName - Own Name

Syntax

--ownName <string>

Description

Local CMM/AMF name

Class

Read only.

Type / Range

Digit string of length 1 to 40 with the allowed pattern of [0-9a-zA-Z\-*]

Name

peerNode - peer Node

Syntax

--peerNode <string>

Description

Remote CMM Name from cmm aiMIPeer table

Class

Read only.

Type / Range

Digit string of length 1 to 40 with the allowed pattern of [0-9a-zA-Z\-*]

Name

peerNodeIp - Peer Node Ip

Syntax

--peerNodeIp <string>

Description

Remote peer CMM MLIS external IP

Class

Read only.

Type / Range

Digit string of length 0 or 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

statusStartTime - offload status start time

Syntax

--statusStartTime <string>

Description

Offload Status Start Time

Class

Read only.

Type / Range

Date and Time Digit string of length 0 to 20 with the allowed pattern of '20[0-9][0-9]/[0-1][0-9]/[0-3][0-9] [0-2][0-9]:[0-5][0-9]:[0-5][0-9]'

Name

ueOffloadStatus - AIML driven UE offload status

Syntax

--ueOffloadStatus <list-item>

Description

AIML driven UE offload status

Class

Read only.

List

- unknown - Offload status unknown
- offloadPendingFromPeer - Offload Pending From Peer - Offload is Pending From Peer CMM
- offloadInProgressFromPeer - Offload is Progress From Peer CMM - Offload in progress from peer CMM
- offloadPendingToPeer - Offload Pending To Peer - Offload is Pending to Peer CMM
- offloadInProgressToPeer - Offload in Progress to Peer CMM - Offload in progress to peer CMM

Roles**List**

sysadmin, manage, monitor

3.3 cmm aiMlAwsParms

Artificial Intelligence and Machine Learning AWS Access Parameters. Syntax, description, parameters, and roles for cmm aiMlAwsParms command.

Syntax

Description

This command is used to provide parameters such as IP address, port, access keys etc in CMM to access AWS cloud to store artificial intelligence and machine learning data.

Parameters

Name

awsAccessKey - Access Key

Syntax

--awsAccessKey <string>

Description

Access Key

Class

Optional.

Type / Range

String of length 0, or 16 to 128, with a pattern of [a-zA-Z0-9]*

Default

"

Name

awsHttpSchema - HTTP schema

Syntax

--awsHttpSchema <list-item>

Description

HTTP schema

Class

Optional.

List

- http - Hypertext Transfer Protocol scheme

- https - Hypertext Transfer Protocol Secure scheme

Default

http

Name

awsIp - IP address

Syntax

--awsIp <string>

Description

IP address

Class

Optional.

Type / Range

Digit string of length 0 or 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Default

"

Name

awsPort - Port

Syntax

--awsPort <integer>

Description

Port

Class

Optional.

Type / Range

Integer in the range of 0 or 1,024 to 65,535

Default

8080

Name

awsRegion - Region

Syntax

--awsRegion <string>

Description

Region

Class

Optional.

Type / Range

String of length 0, or 1 to 50, with a pattern of [a-zA-Z0-9]*

Default

"

Name

awsSecretKey - Secret key

Syntax

--awsSecretKey <string>

Description

Secret key

Class

Optional.

Type / Range

Digit string of length 0 to 256 with the allowed pattern of [0-9a-zA-Z\.\-_:]*

Default

"

Roles**Show**

sysadmin, manage, monitor

Modify

sysadmin, manage

List

sysadmin, manage, monitor

3.4 cmm aiMLControl

Artificial Intelligence and Machine Learning Controls. Syntax, description, parameters, and roles for cmm aiMLControl command.

Syntax**Description**

This command is used to administer Artificial Intelligence and Machine Learning control fields/flags.

Parameters**Name**

aiMLDriven5gUeLocationForecasting - AIML Driven 5g Ue Location Forecasting

Syntax

--aiMLDriven5gUeLocationForecasting <list-item>

Description

Flag to enable or disable AIML driven 5G UE location forecasting.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

aiMLDriven5gUePagingFailureRca - AIML Driven 5g Ue Paging Failure RCA

Syntax

--aiMLDriven5gUePagingFailureRca <list-item>

Description

AIML Driven 5g Ue Paging Failure Root Cause Analysis

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

aiMLDriven5gUeRegistrationFailureRca - AIML Driven 5g Ue Registration Failure RCA

Syntax

--aiMLDriven5gUeRegistrationFailureRca <list-item>

Description

AIML Driven 5g Ue Registration Failure Root Cause Analysis

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

aiMLDriven5gUeServiceFailureRca - AIML Driven 5g Ue Service Failure RCA

Syntax

--aiMLDriven5gUeServiceFailureRca <list-item>

Description

AIML Driven 5g Ue Service Failure Root Cause Analysis

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

aiMLDrivenCpuOverload - AIML Driven CPU Overload detection

Syntax

--aiMLDrivenCpuOverload <list-item>

Description

AIML Driven CPU Overload detection and mitigation

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

aiMLDrivenMsgRateOverload - AIML Driven Message Rate Overload

Syntax

--aiMLDrivenMsgRateOverload <list-item>

Description

AIML Driven Message Rate Overload detection and mitigation

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

analyticsDrivenAmfSetMgmt - Analytics Driven AMF Set Management

Syntax

--analyticsDrivenAmfSetMgmt <list-item>

Description

Flag to enable or disable traffic management across CMM Set or Pool. For AMF, management is across AMF Set. For MME, management is across MME Pool.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

analyticsDrivenAmfSetRebalance - Analytics Driven AMF Set Rebalance

Syntax

--analyticsDrivenAmfSetRebalance <list-item>

Description

Flag to invoke UE rebalance between AMFs within a set based on AI/ML analytics.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

analyticsDrivenAmfSliceMgmt - Analytics Driven AMF Slice Management

Syntax

--analyticsDrivenAmfSliceMgmt <list-item>

Description

Flag to enable or disable AMF Slice management within and across AMF set.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

analyticsDrivenAmfSliceMitigation - Analytics Driven AMF Slice Mitigation

Syntax

--analyticsDrivenAmfSliceMitigation <list-item>

Description

Flag to enable/disable mitigation of AMF slice operations driven by AI/ML models.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

dataLakeType - Data Storage type

Syntax

--dataLakeType <list-item>

Description

Data storage mechanism used to store Artificial Intelligence and Machine Learning data

Class

Optional.

List

- aws - AWS storage - Storage of Artificial Intelligence and Machine Learning data in AWS S3 buckets
- azure - Azure Storage - Storage of Artificial Intelligence and Machine Learning data in MS Azure cloud
- gcp - GCP Storage - Storage of Artificial Intelligence and Machine Learning data in GCP cloud
- local - Local Storage - Local storage of data for Artificial Intelligence and Machine Learning modelling

Default

local

Name

pagingOverloadControl - Flag to control artificial intelligence model to perform paging overload control

Syntax

--pagingOverloadControl <list-item>

Description

Flag to control artificial intelligence model to perform paging overload control

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

trafficLoadForScaling - Flag to enable or disable traffic load modelling for automatic scaling

Syntax

--trafficLoadForScaling <list-item>

Description

Flag to enable or disable traffic load modelling to automatically scaling call processing pods

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Roles**Show**

sysadmin, manage, monitor

Modify

sysadmin, manage

List

sysadmin, manage, monitor

3.5 cmm aimlMultiLink

AIML Multilink Status Query. Syntax, description, parameters, and roles for cmm aimlMultiLink command.

Syntax**Description**

This command is used to query the status of each AIML_DATA_STREAM network interface type external link that the MLIS pod has with MLIS pods in other CMMs within a pool

Parameters**Name**

aimlLinkIndex - AIML Link Index

Syntax

--aimlLinkIndex <integer>

Description

AIML external link index

Class

Required key.

Type / Range

Integer in the range of 0 to 4,294,967,295

Name

aimlLinkIndexType - aiml Link Index Type

Syntax

--aimlLinkIndexType <list-item>

Description

Describes if link index is a client or server

Class

Read only.

List

- client - Client socket
- server - Server socket

Name

linkOperationState - AML peer MLIS external interface link status

Syntax

--linkOperationState <list-item>

Description

AML peer MLIS external interface link status

Class

Read only.

List

- disabled - Link down, not established.
- enabled - Link established and enabled.
- unknown - Link status unknown. Link not established.

Default

unknown

Name

localIp - Local MLIS external IP

Syntax

--localIp <string>

Description

Local MLIS external IP

Class

Read only.

Type / Range

Digit string of length 0 or 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

peerNode - Remote CMM Name

Syntax

--peerNode <string>

Description

Remote CMM name from cmm aiMIPeer table

Class

Read only.

Type / Range

Digit string of length 1 to 40 with the allowed pattern of [0-9a-zA-Z\-*]

Name

peerNodeIp - remote peer MLIS IP

Syntax

--peerNodeIp <string>

Description

remote peer MLIS IP

Class

Read only.

Type / Range

Digit string of length 0 or 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Roles**Show**

sysadmin, manage, monitor

List

sysadmin, manage, monitor

3.6 cmm aiMIPeer

Artificial Intelligence and Machine Learning Peer CMM Access Parameters. Syntax, description, parameters, and roles for cmm aiMIPeer command.

Syntax**Description**

This command is used to provide parameters such as IP address, port, access keys etc in CMM to peer CMMs share artificial intelligence and machine learning data.

Parameters

Name

peerNode - Peer CMM Name to Share AIML Data

Syntax

--peerNode <string>

Description

Parameter is used to provision peer CMM name

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

peerNodeIp - Remote Node IP address

Syntax

--peerNodeIp <string>

Description

Remote Node (CMM) IP address

Class

Required on create, not modifiable.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

enable - Enable

Syntax

--enable <list-item>

Description

The parameter is used to enable the use of the remote peer.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Roles

Create

sysadmin, manage

Show

sysadmin, manage, monitor

Modify

sysadmin, manage

Delete

sysadmin, manage

List

sysadmin, manage, monitor

3.7 cmm alarmActive

Alarm Active. Syntax, description, parameters, and roles for cmm alarmActive command.

Syntax

Description

This command has three operations: The cancel operation is used to cancel active alarms. The list operation is used to list active alarms. The show operation is used to show active alarms. Note: Before CMM195M2, the command is cmm alarm active instead of cmm alarmActive. For backward compatibility, both versions of the command are supported.

Parameters

Name

pid - Alarm PID

Syntax

--pid <integer>

Description

Alarm PID(e.g. 42004).

Class

Optional.

Type / Range

Integer in the range of 0 to 2,147,483,647

Name

sourceApp - Source appname

Syntax

--sourceApp <string>

Description

Source appname.

Class

Optional.

Type / Range

Digit string of length

Name

sourceHost - Source hostname

Syntax

--sourceHost <string>

Description

Source hostname.

Class

Optional.

Type / Range

Digit string of length

Name

sourceIp - Source hostip

Syntax

--sourceIp <string>

Description

Source hostip.

Class

Optional.

Type / Range

Digit string of length

Roles**Cancel**

sysadmin, manage

List

sysadmin, manage, monitor

Show

sysadmin, manage, monitor

3.8 cmm alarmDefinition

Alarm Definition. Syntax, description, parameters, and roles for cmm alarmDefinition command.

Syntax

Description

This command has two operations: The list operation is used to list alarm definitions. The show operation is used to show alarm definitions. Note: Before CMM195BR, the command was cmm alarm definition instead of cmm alarmDefinition. For backwards compatibility, both versions of the command are supported.

Parameters

N/A

Roles

List

sysadmin, manage, monitor

Show

sysadmin, manage, monitor

3.9 cmm alarmHistory

Alarm History. Syntax, description, parameters, and roles for cmm alarmHistory command.

Syntax

Description

This command has three operations: The list operation is used to list alarm history. The meta operation is used to provide alarm history meta information. The show operation is used to show alarm history. Note: Before CMM195BR, the command was cmm alarm history instead of cmm alarmHistory. For backwards compatibility, both versions of the command are supported.

Parameters

Name

category - Category

Syntax

--category <string>

Description

Category.

Class

Optional.

Type / Range

Digit string of length

Name

endTime - Ending time

Syntax

--endTime <string>

Description

Ending time('yyyy-mm-dd HH:MM:SS').

Class

Optional.

Type / Range

Digit string of length 19 to 19 with the allowed pattern of (\d{4}-\d{2}-\d{2} \d{2}:\d{2}:\d{2})

Name

limit - Amount limit in response

Syntax

--limit <string>

Description

Amount limit in response.

Class

Optional.

Type / Range

Digit string of length

Name

period - Time period

Syntax

--period <string>

Description

Time period(e.g. 30s,15m,2h,1d ...).

Class

Optional.

Type / Range

Digit string of length

Name

pid - Alarm PID

Syntax

--pid <integer>

Description

Alarm PID(e.g. 42004).

Class

Optional.

Type / Range

Integer in the range of 0 to 2,147,483,647

Name

problem - Problem

Syntax

--problem <string>

Description

Problem.

Class

Optional.

Type / Range

Digit string of length

Name

severity - Severity

Syntax

--severity <string>

Description

Severity(e.g. major,minor,info ...).

Class

Optional.

Type / Range

Digit string of length

Name

sourceApp - Source appname

Syntax

--sourceApp <string>

Description

Source appname.

Class

Optional.

Type / Range

Digit string of length

Name

sourceHost - Source hostname

Syntax

--sourceHost <string>

Description

Source hostname.

Class

Optional.

Type / Range

Digit string of length

Name

sourceIp - Source hostip

Syntax

--sourceIp <string>

Description

Source hostip.

Class

Optional.

Type / Range

Digit string of length

Name

startTime - Starting time

Syntax

--startTime <string>

Description

Starting time('yyyy-mm-dd HH:MM:SS').

Class

Optional.

Type / Range

Digit string of length 19 to 19 with the allowed pattern of `(\d{4}-\d{2}-\d{2} \d{2}:\d{2}:\d{2})`

Name

task - Task

Syntax

`--task <string>`

Description

Task(e.g. raise, cancel, update, expire).

Class

Optional.

Type / Range

Digit string of length

Roles**List**

sysadmin, manage, monitor

Meta

sysadmin, manage

Show

sysadmin, manage, monitor

3.10 cmm alarmIgnore

Alarms ignored. Syntax, description, parameters, and roles for `cmm alarmIgnore` command.

Syntax**Description**

Configure PIDs for alarms to be ignored.

Parameters**Name**

alarmId - Alarm PID

Syntax

`--alarmId <integer>`

Description

PID of the alarm to be ignored.

Class

Required key.

Type / Range

Integer in the range of 0 to 2,147,483,647

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

sysadmin, manage, monitor

3.11 cmm allowedNfDomain

Allowed NF Domain. Syntax, description, parameters, and roles for cmm allowedNfDomain command.

Syntax**Description**

Links a Domain to an allowedNfDomain list. A Domain may be added only once in a list.

Parameters**Name**

allowedNfDomainListName - Allowed NF Domain List Name

Syntax

--allowedNfDomainListName <string>

Description

Allowed NF Domain List Name

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

domain - NF Domain

Syntax

--domain <string>

Description

NF Domain

Class

Required key.

Type / Range

Digit string of length 1 to 128 with the allowed pattern of [0-9a-zA-Z\._:@]*

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

sysadmin, manage, monitor

3.12 cmm allowedNfDomainList

Allowed NF Domain List. Syntax, description, parameters, and roles for cmm allowedNfDomainList command.

Syntax**Description**

List of allowed NF domains. Up to 8 lists can be created. Each list can have up to 127 domains.

Parameters**Name**

name - Allowed NF Domains List Name

Syntax

--name <string>

Description

Allowed NF Domains List Name

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

sysadmin, manage, monitor

3.13 cmm allowedNfType

Allowed NF Type. Syntax, description, parameters, and roles for cmm allowedNfType command.

Syntax**Description**

Links a NF Type to an allowed NF Type list. Each NF Type may be added only once in a list.

Parameters**Name**

allowedNfTypeListName - Allowed NF Types List Name

Syntax

--allowedNfTypeListName <string>

Description

Allowed NF Types List Name

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

nfType - NF Type

Syntax

--nfType <list-item>

Description

NF Type

Class

Required key.

List

- 5GEIR - 5G EIR - The network function type of 5G-Equipment Identity Register.
- AMF - Access and Mobility Manager Function - The network function type of Access and Mobility Manager Function.
- AUSF - Authentication Server Function - The network function type of Authentication Server Function.
- CBCF - Cell Broadcast Centre Function - The network function type of Cell Broadcast Centre Function
- CHF - Charging Function - The network function type of Charging Function
- GMLC - Gateway Mobile Location Center - The network function type of Gateway Mobile Location Center.
- LMF - Location Management Function - The network function type of Location Management Function.
- NRF - Network Repository Function - The network function type of Network Repository Function.
- NSSAAF - Network Slice Specific Authentication and Authorization Function - The network function type of Network Slice Specific Authentication and Authorization Function
- NSSF - Network Slice Selection Function - The network function type of Network Slice Selection Function.
- NWDAF - Network Data Analytics Function - The network function type of NWDAF.
- PCF - Policy Control Function - The network function type of Policy Control Function.
- SMF - Session Management Function - The network function type of Session Management Function.
- SMSF - Short Message Service Function - The network function type of Short Message Service Function.

- UDM - Unified Data Manager - The network function type of Unified Data Manager.
- UDSF - Unstructured Data Storage Function - The network function type of Unstructured Data Storage Function.

3.14 cmm allowedNfTypeList

Allowed NF Type List. Syntax, description, parameters, and roles for cmm allowedNfTypeList command.

Syntax

Description

List of allowed NF types. Up to 8 lists can be created. Each list can have up to 15 NF Types.

Parameters

Name

name - Allowed NF Type List Name

Syntax

--name <string>

Description

Allowed NF Type List Name

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Roles

Create

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

sysadmin, manage, monitor

3.15 cmm allowedPlmn

Allowed PLMN. Syntax, description, parameters, and roles for `cmm allowedPlmn` command.

Syntax

Description

Links a PLMN to an allowed PLMN List. Each PLMN can be added only once to a list.

Parameters

Name

allowedPlmnListName - Allowed PLMNs List Name

Syntax

--allowedPlmnListName <string>

Description

Allowed PLMNs List Name

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

mcc - Mobile Country Code

Syntax

--mcc <digits>

Description

Mobile Country Code

Class

Required key.

Type / Range

Digit string of length 3 to 3 with the allowed pattern of [0-9]*

Name

mnc - Mobile Network Code

Syntax

--mnc <digits>

Description

Mobile Network Code

Class

Required key.

Type / Range

Digit string of length 2 to 3 with the allowed pattern of [0-9]*

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

sysadmin, manage, monitor

3.16 cmm allowedPlmnList

Allowed PLMN List. Syntax, description, parameters, and roles for cmm allowedPlmnList command.

Syntax**Description**

List of allowed PLMN. Up to 8 lists can be created. Each list can have 31 PLMNs.

Parameters**Name**

name - Allowed PLMNs List Name

Syntax

--name <string>

Description

Allowed PLMNs List Name

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

sysadmin, manage, monitor

3.17 cmm allowedSnssai

Allowed S-NSSAI. Syntax, description, parameters, and roles for cmm allowedSnssai command.

Syntax**Description**

Create an Allowed S-NSSAI with Name, Service Type and Service Differentiator.

Parameters**Name**

name - Allowed S-NSSAI Name

Syntax

--name <string>

Description

Allowed S-NSSAI Name

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Name

sliceServiceType - Slice Service Type

Syntax

--sliceServiceType <integer>

Description

The S-NSSAI consists of a Slice Service Type (SST) and a Slice Differentiator (SD). Each slice must have SST and SD is optional.

Class

Required on create.

Type / Range

5G Slice Service Type

Name

sliceDifferentiator - Slice Differentiator

Syntax

--sliceDifferentiator <string>

Description

The S-NSSAI consists of a Slice Service Type (SST) and a Slice Differentiator (SD). Each slice must have SST and SD is optional. A SST may have multiple SDs. If there is no Differentiator this value shall be set to 'FFFFFF'.

Class

Optional.

Type / Range

Identifies Slice Differentiator (SD)

Default

FFFFFF

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Modify

sysadmin, manage

Delete

sysadmin, manage

List

sysadmin, manage, monitor

3.18 cmm allowedSnssaiList

Allowed S-NSSAI List . Syntax, description, parameters, and roles for cmm allowedSnssaiList command.

Syntax

Description

List with allowed S-NSSAIs. Up to 8 lists can be created. Each list can have up to 255 S-NSSAIs.

Parameters

Name

name - Allowed S-NSSAI List Name

Syntax

--name <string>

Description

Allowed S-NSSAI List Name

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Roles

Create

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

sysadmin, manage, monitor

3.19 cmm allowedSnssaiListItem

Allowed SNSSAI List Item. Syntax, description, parameters, and roles for cmm allowedSnssaiListItem command.

Syntax

Description

Adds or removes an Allowed S-NSSAI to an Allowed S-NSSAI List. Each list can have up to 255 S-NSSAIs

Parameters

Name

allowedSnssaiListName - Allowed S-NSSAI List Name

Syntax

--allowedSnssaiListName <string>

Description

Allowed S-NSSAI List Name

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

allowedSnssaiName - Allowed S-NSSAI Name

Syntax

--allowedSnssaiName <string>

Description

Allowed S-NSSAI Name

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Roles

Create

sysadmin, manage

Show

3.20 cmm amfAccessRestrictionNasMappingProfile

Access Restriction To NAS Cause Mapping Profile. Syntax, description, parameters, and roles for cmm amfAccessRestrictionNasMappingProfile command.

Syntax

Description

Command is used to administer the Access Restriction to NAS Cause Mapping Profile. This profile is used to select the right cause code to send to the UE when a UE mobility management request is rejected due to an access restriction. The maximum number of profiles supported is 128. A default profile, named 'default', is provided.

Parameters

Name

name - Name of access restriction to NAS cause code profile name

Syntax

--name <string>

Description

Profile name for access restriction to NAS cause code mapping.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Name

ausfMsgDecodingFailure - AUSF Message Decoding Failure

Syntax

--ausfMsgDecodingFailure <integer>

Description

NAS cause code sent to the UE when AMF fails in decoding a message from AUSF.

Class

Optional.

Type / Range

5GMM Cause Code.

Default

10

Name

ausfResponseTimeOut - AUSF Response Time Out

Syntax

--ausfResponseTimeOut <integer>

Description

NAS cause code sent to the UE when AUSF times out with no response.

Class

Optional.

Type / Range

5GMM Cause Code.

Default

15

Name

ausfUnavailability - AUSF Unavailability

Syntax

--ausfUnavailability <integer>

Description

NAS cause code sent to the UE when AMF is not able to communicate with the AUSF.

Class

Optional.

Type / Range

5GMM Cause Code.

Default

111

Name

authenticationResponseTimeout - Authentication Response Timeout

Syntax

--authenticationResponseTimeout <integer>

Description

NAS cause code sent to the UE when AMF times out waiting for NAS Authentication Response from the UE.

Class

Optional.

Type / Range

5GMM Cause Code.

Default

10

Name

cagRestrictUeNotSuppCag - CAG Restriction for UE Not Supporting CAG

Syntax

--cagRestrictUeNotSuppCag <integer>

Description

NAS cause code sent when UE is not allowed to access network due to CAG restriction for UE not supporting CAG feature.

Class

Optional.

Type / Range

5GMM Cause Code.

Default

15

Name

cagRestrictUeSuppCag - CAG Restriction for UE Supporting CAG

Syntax

--cagRestrictUeSuppCag <integer>

Description

NAS cause code sent when UE is not allowed to access network due to CAG restriction for UE supporting CAG feature.

Class

Optional.

Type / Range

5GMM Cause Code.

Default

76

Name

coreNetworkTypeRestriction - Core Network Type Restriction

Syntax

--coreNetworkTypeRestriction <integer>

Description

NAS cause code sent when UE is not allowed in 5G Core Network.

Class

Optional.

Type / Range

5GMM Cause Code.

Default

15

Name

forbiddenTaiHplmn - UE is in a forbidden TAI in HPLMN

Syntax

--forbiddenTaiHplmn <integer>

Description

NAS cause code sent when UE is in a forbidden TA in HPLMN.

Class

Optional.

Type / Range

5GMM Cause Code.

Default

15

Name

interPlmnMobRegUpdtRej - Inter-PLMN Mobility Registration Update Reject

Syntax

--interPlmnMobRegUpdtRej <integer>

Description

NAS cause code sent to roamer UE when inter-plmn idle mode Mobility Registration Update is not allowed.

Class

Optional.

Type / Range

5GMM Cause Code.

Default

9

Name

noAllowedNssai - No Allowed NSSAI

Syntax

--noAllowedNssai <integer>

Description

NAS cause code sent to the UE when no allowed NSSAI for the UE.

Class

Optional.

Type / Range

5GMM Cause Code.

Default

10

Name

noCommonSecurityAlgorithm - No Common Security Algorithm

Syntax

--noCommonSecurityAlgorithm <integer>

Description

NAS cause code sent to the UE when there is no common security algorithm between the UE supported algorithms and the AMF configuration.

Class

Optional.

Type / Range

5GMM Cause Code.

Default

10

Name

nonEncryptedSuciRestriction - Non Encrypted SUCI Not Allowed

Syntax

--nonEncryptedSuciRestriction <integer>

Description

NAS cause code sent in Registration Reject message when nonEncryptedSuciNotAllowed is enabled but UE identity received is non-encrypted SUCI.

Class

Optional.

Type / Range

5GMM Cause Code.

Default

3

Name

noSlicesAvailableDueToNssaa - No Network Slices Available Due to NSSAA

Syntax`--noSlicesAvailableDueToNssaa <integer>`**Description**

NAS cause code sent to the UE when there is no Network Slices Available due to NSSAA function. The network shall set the 5GMM cause value to #62 'No network slices available'. If the UE had included requested NSSAI in the REGISTRATION REQUEST message, then the network shall include the rejected S-NSSAI(s) in the Rejected NSSAI IE of the REGISTRATION REJECT message. Otherwise, the network may include the rejected NSSAI

Class

Optional.

Type / Range

5GMM Cause Code.

Default

62

Name

nrPlmnNotAllowed - PLMN of SUPI not allowed in NR

Syntax`--nrPlmnNotAllowed <integer>`**Description**

NAS cause code sent by the AMF to inbound roamer(s) because PLMN of roaming SUPI(s) is not allowed in 5G NR.

Class

Optional.

Type / Range

5GMM Cause Code.

Default

27

Name

nrRatNotAllowedForRoamer - NR RAT restricted for roamer

Syntax`--nrRatNotAllowedForRoamer <integer>`**Description**

NAS cause code sent when a roamer UE is not allowed in the NR RAT based on receipt of RAT_NOT ALLOWED from UDM.

Restrictions

Applies to roamer UEs

Class

Optional.

Type / Range

5GMM Cause Code.

Default

15

Name

nssfMsgDecodingFailure - NSSF Message Decoding Failure

Syntax

--nssfMsgDecodingFailure <integer>

Description

NAS cause code sent to the UE when AMF fails in decoding a message from NSSF.

Class

Optional.

Type / Range

5GMM Cause Code.

Default

10

Name

nssfResponseTimeout - NSSF Response Timeout

Syntax

--nssfResponseTimeout <integer>

Description

NAS cause code sent to the UE when NSSF times out with no response.

Class

Optional.

Type / Range

5GMM Cause Code.

Default

10

Name

nssfUnavailability - NSSF Unavailability

Syntax

--nssfUnavailability <integer>

Description

NAS cause code sent to the UE when AMF is not able to communicate with the NSSF.

Class

Optional.

Type / Range

5GMM Cause Code.

Default

10

Name

ratNotAllowedHplmn - NR restricted in the UE's HPLMN

Syntax

--ratNotAllowedHplmn <integer>

Description

NAS cause code sent when UE is not allowed in the NR RAT.

Class

Optional.

Type / Range

5GMM Cause Code.

Default

15

Name

redcapRatNotAllowedForRoamer - RedCap RAT not allow for Roamer

Syntax

--redcapRatNotAllowedForRoamer <integer>

Description

Defines the cause code to be sent to the UE in case of access restriction for the NR RedCap RAT.

Class

Optional.

Type / Range

5GMM Cause Code.

Default

15

Name

redcapRatNotAllowedHplmn - RedCap RAT not allow for HPLMN

Syntax`--redcapRatNotAllowedHplmn <integer>`**Description**

Defines the cause code to be provided to a home UE that is not allowed to use the NR RedCap RAT.

Class

Optional.

Type / Range

5GMM Cause Code.

Default

15

Name

rfspAccessRestrictionCc - RFSP Access Restriction Cause Code

Syntax`--rfspAccessRestrictionCc <integer>`**Description**

The Cause Code to be sent to a UE if it is restricted access based on RFSP

Class

Optional.

Type / Range

5GMM Cause Code.

Default

15

Name

roam3gppAccessForbiddenTai - Roaming in 5G 3GPP Access in TA not allowed

Syntax`--roam3gppAccessForbiddenTai <integer>`**Description**

NAS cause code sent to roamer UE when roaming is not allowed in 5G 3GPP Access in this Tracking Area based on UDM forbidden TAIs or locally provisioned forbidden TAIs.

Restrictions

Applies to roamer UEs.

Class

Optional.

Type / Range

5GMM Cause Code.

Default

15

Name

roam3gppAccessNotAllowed - Roaming in 5G 3GPP Access not allowed

Syntax

--roam3gppAccessNotAllowed <integer>

Description

NAS cause code sent to roamer UE when roaming is not allowed in 5G 3GPP Access based on receipt of ACCESS_NOT_ALLOWED from UDM or due to local provisioning.

Restrictions

Applies to roamer UEs

Class

Optional.

Type / Range

5GMM Cause Code.

Default

15

Name

roamingSuciRestriction - Roaming UE SUCI Access Restriction

Syntax

--roamingSuciRestriction <integer>

Description

The NAS cause code sent to an inbound roaming UE when UE SUCI has no match in UE Scheme Output allowed list.

Class

Optional.

Type / Range

5GMM Cause Code.

Default

27

Name

securityModeCompleteTimeout - Security Mode Complete Timeout

Syntax

--securityModeCompleteTimeout <integer>

Description

NAS cause code sent to the UE when AMF times out waiting for NAS Security Mode Complete from the UE.

Class

Optional.

Type / Range

5GMM Cause Code.

Default

10

Name

serviceAreaRestriction - Service Area Restriction

Syntax

--serviceAreaRestriction <integer>

Description

NAS cause code sent when UE is not allowed in a Service Area.

Class

Optional.

Type / Range

5GMM Cause Code.

Default

28

Name

snpnNotAllowed - SNPN Not Allowed

Syntax

--snpnNotAllowed <integer>

Description

NAS cause code sent to UE when SNPN service not allowed.

Class

Optional.

Type / Range

5GMM Cause Code.

Default

74

Name

udmImmediateReportUnavailable - UDM Immediate Report Not Available

Syntax

--udmImmediateReportUnavailable <integer>

Description

NAS cause code sent to the UE when UDM indicates Immediate Report feature supported but associated report s not included in the UDM response to the AMF.

Class

Optional.

Type / Range

5GMM Cause Code.

Default

15

Name

udmMsgDecodingFailure - UDM Message Decoding Failure

Syntax

--udmMsgDecodingFailure <integer>

Description

NAS cause code sent to the UE when AMF fails in decoding a message from UDM.

Class

Optional.

Type / Range

5GMM Cause Code.

Default

10

Name

udmOdbAllPacket - UDM ODB All Packet Services

Syntax

--udmOdbAllPacket <integer>

Description

NAS cause code sent to the UE on Registration Reject when both UDM provides ODB All Packet Services restriction for the UE and AMF local provisioning has on service agreement level parameter Restrict Mobility on UDM ODB All Packet Barred set to true.

Class

Optional.

Type / Range

5GMM Cause Code.

Default

15

Name

udmResponseTimeOut - UDM Response Time Out

Syntax

--udmResponseTimeOut <integer>

Description

NAS cause code sent to the UE when UDM times out with no response.

Class

Optional.

Type / Range

5GMM Cause Code.

Default

15

Name

udmUnavailability - UDM Unavailability

Syntax

--udmUnavailability <integer>

Description

NAS cause code sent to the UE when AMF is not able to communicate with the UDM.

Class

Optional.

Type / Range

5GMM Cause Code.

Default

10

Name

wlanRatRestriction - WLAN RAT Restriction HPLMN

Syntax

--wlanRatRestriction <integer>

Description

NAS cause code sent when UE is not allowed in the WLAN RAT in HPLMN.

Class

Optional.

Type / Range

5GMM Cause Code.

Default

72

3.21 cmm amfAdjacentPlmn

Adjacent Plmn. Syntax, description, parameters, and roles for cmm amfAdjacentPlmn command.

Syntax**Description**

Configures an existing network as an adjacent plmn network and includes parameter attributes for adding the adjacent plmn network names.

Parameters**Name**

amfAdjacentPlmnListName - Adjacent Plmn List Name

Syntax`--amfAdjacentPlmnListName <string>`**Description**

Identifies the Adjacent PLMN list name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

amfAdjacentPlmnName - Adjacent Plmn Name

Syntax

--amfAdjacentPlmnName <string>

Description

Identifies the name of the Adjacent PLMN which can be Home, Shared or Other PLMN. There can be up to 5 Adjacent Plmns in the list and each have to exist in the EPLMN List sent to the gNB.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

3.22 cmm amfAdjacentPlmnList

Adjacent PLMN List. Syntax, description, parameters, and roles for cmm amfAdjacentPlmnList command.

Syntax**Description**

Adjacent PLMN List

Parameters**Name**

name - Adjacent PLMN List Name

Syntax

--name <string>

Description

Identifies the name of the Adjacent PLMN List

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

description - Description of Adjacent PLMN List

Syntax

--description <string>

Description

Describes the use of the Adjacent PLMN List

Class

Optional.

Type / Range

Digit string of length 0 to 160 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

3.23 cmm amfAliasDnnConversionProfile

AMF Alias DNN Conversion Profile. Syntax, description, parameters, and roles for cmm amfAliasDnnConversionProfile command.

Syntax

Description

This command is used to administer an alias DNN Conversion Profile.

Parameters

Name

name - Name

Syntax

--name <string>

Description

Name that identifies alias Dnn Conversion profile

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

aliasConversionDnnSupport - Alias Conversion DNN Support

Syntax

--aliasConversionDnnSupport <list-item>

Description

Parameter controls the feature activation flag. By default, the flag shall be disabled. When enabled AMF shall support alias Conversion DNN functionality.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

aliasDefaultConversionDnn - Alias Default Conversion DNN

Syntax

--aliasDefaultConversionDnn <string>

Description

Provisioned Alias Default Conversion DNN

Class

Optional.

Type / Range

Data Network Name with Null String.

Default

""

Name

replacementDnnListName - Replacement DNN List Name

Syntax

--replacementDnnListName <string>

Description

Contains list of allowed DNNs that are subjected to conversion. aliasConversionDnnSupport flag need to be enabled to have an entry in replacementDnnListName list.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Default

""

Name

sendAliasConvertedDnnToUe - Send Alias Converted DNN to UE

Syntax

--sendAliasConvertedDnnToUe <list-item>

Description

Parameter controls whether to send the corrected/overridden DNN or the UE requested DNN. When the parameter is false, UE requested DNN shall be sent to UE and SMF. When the parameter is true converted DNN shall be sent to SMF and back to the UE, If the UE did not send a requested DNN, then the AMF shall send the converted DNN to the UE and SMF.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

3.24 cmm amfAmPolicyProfile

AMF AM Policy Profile. Syntax, description, parameters, and roles for cmm amfAmPolicyProfile command.

Syntax

Description

This command is used to administer an AM Policy Profile. and includes following parameters: RFSP index ServiceAreaRestriction SUPI GPSI URSP location change change of ue presence area

Parameters

Name

name - AM Policy Profile Name

Syntax

--name <string>

Description

A name that identifies AM Policy profile.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

serviceAreaRestriction - Service Area Restriction

Syntax

--serviceAreaRestriction <list-item>

Description

Service Area Restriction specifies the list of allowed or non-allowed and maximum number of allowed TAs

Class

Required on create.

List

- 1 - allowedServiceAreaRestrictionListName - allowed Service Area Restriction List Name
- 2 - notAllowedServiceAreaRestrictionListName - not allowed Service Area Restriction List Name

Name

allowedServiceAreaRestrictionListName - Allowed Service Area Restriction List Name

Syntax

--allowedServiceAreaRestrictionListName <string>

Description

Allowed Service Area Restriction List Name

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

maxNumOfTAs - Maximum number of Tracking Areas

Syntax

--maxNumOfTAs <integer>

Description

Maximum number of Tracking Areas

Class

Optional.

Type / Range

Integer in the range of 1 to 65,535

Default

255

Name

notAllowedServiceAreaRestrictionListName - Not Allowed Service Area Restriction List Name

Syntax

--notAllowedServiceAreaRestrictionListName <string>

Description

Not Allowed Service Area Restriction List Name

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

rfspIndex - RFSP Index Value

Syntax

--rfspIndex <integer>

Description

Value of the RFSP Index

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

0

Name

v2xSupported - V2X Supported

Syntax

--v2xSupported <list-item>

Description

Specifies whether the PCF supports V2X.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

3.25 cmm amfAusfHttp2ToNasCcMapping

AMF AUSF HTTP2 To NAS CC mapping. Syntax, description, parameters, and roles for cmm amfAusfHttp2ToNasCcMapping command.

Syntax

Description

Defines AUSF HTTP2 Status Codes Mapping to AMF NAS Cause Codes. The maximum number of profiles supported is 128. A default profile, named 'default', is provided.

Parameters

Name

amfAusfHttp2ToNasCcMappingListName - AMF AUSF HTTP2 to NAS CC mapping list name

Syntax

--amfAusfHttp2ToNasCcMappingListName <string>

Description

The name of the HTTP2 to 5G NAS Cause Code mapping list

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

ausfHttp2StatusCode - AUSF HTTP2 Status Code

Syntax

--ausfHttp2StatusCode <list-item>

Description

Defines the AUSF HTTP2 Status Code to map to 5G NAS Cause Code

Class

Required key.

List

- 400_RESOURCE_CONTEXT_NOT_FOUND - 400 RESOURCE CONTEXT NOT FOUND - The notification request is rejected because the call back URI still exists in the receiver of the notification, but the specific resource context identified within the notification payload is not found in the NF service consumer.
- 400_UNKNOWN - 400 UNKNOWN - The 400_UNKNOWN is used when included problem details is not specified in 3GPP or it is not included.
- 403_CCA_VERIFICATION_FAILURE - 403 CCA VERIFICATION FAILURE - The request is rejected due to a failure to verify the CCA at the receiving entity (AUSF).
- 403_UNKNOWN - 403 UNKNOWN - The 403_UNKNOWN is used when included problem details is not specified in 3GPP or it is not included.
- 404_UNKNOWN - 404 UNKNOWN - The 404_UNKNOWN is used when included problem details is not specified in 3GPP or it is not included.
- 411_UNKNOWN - 411 UNKNOWN - The 411_UNKNOWN is used when included problem details is not specified in 3GPP or it is not included.
- 429_UNKNOWN - 429 UNKNOWN - The 429_UNKNOWN is used when included problem details is not specified in 3GPP or it is not included.
- 500_NF_FAILOVER - 500 NF FAILOVER - The request is rejected due to the unavailability of the NF (AUSF), and the requester may trigger an immediate re-selection of an alternative NF based on this information.
- 500_NF_SERVICE_FAILOVER - 500 NF SERVICE FAILOVER - The request is rejected due to the unavailability of the NF service, and the requester may trigger an immediate re-selection of an alternative NF service based on this information.
- 500_UNKNOWN - 500 UNKNOWN - The 500_UNKNOWN is used when included problem details is not specified in 3GPP or it is not included.
- 501_UNKNOWN - 501 UNKNOWN - The 501_UNKNOWN is used when included problem details is not specified in 3GPP or it is not included.
- 503_UNKNOWN - 503 UNKNOWN - The 503_UNKNOWN is used when included problem details is not specified in 3GPP or it is not included.

- 504_TARGET_NF_NOT_REACHABLE - 504 TARGET NF NOT REACHABLE - The request is not served as the target NF (AUSF) is not reachable.
- 504_TIMED_OUT_REQUEST - 504 TIMED OUT REQUEST - The request is rejected due a request that has timed out at the HTTP client based on origination time stamp
- 504_UNKNOWN - 504 UNKNOWN - The 504_UNKNOWN is used when included problem details is not specified in 3GPP or it is not included.
- 400_INVALID_API - 400 Bad Request Invalid API - The HTTP request contains an unsupported API name or API version in the URI.
- 400_INVALID_MSG_FORMAT - 400 Bad Request Invalid Msg Format - The HTTP request has an invalid format.
- 400_INVALID_QUERY_PARAM - 400 Bad Request Invalid Query Param - The HTTP request contains an unsupported query parameter in the URI.
- 400_MANDATORY_QUERY_PARAM_INCORRECT - 400 Bad Request Mandatory Query Param Incorrect - A mandatory query parameter, or a conditional query parameter but mandatory required, for an HTTP method was received in the URI with semantically incorrect value.
- 400_OPTIONAL_QUERY_PARAM_INCORRECT - 400 Bad Request Optional Query Param Incorrect - An optional query parameter for an HTTP method was received in the URI with a semantically incorrect value that prevents successful processing of the service request.
- 400_MANDATORY_QUERY_PARAM_MISSING - 400 Bad Request Mandatory Query Param Missing - Query parameter which is defined as mandatory, or as conditional but mandatory required, for an HTTP method is not included in the URI of the request.
- 400_MANDATORY_IE_INCORRECT - 400 Bad Request Mandatory IE Incorrect - A mandatory IE or conditional IE in data structure, but mandatory required, for an HTTP method was received with a semantically incorrect value.
- 400_OPTIONAL_IE_INCORRECT - 400 Bad Request Optional IE Incorrect - An optional IE in data structure for an HTTP method was received with a semantically incorrect value that prevents successful processing of the service request.
- 400_MANDATORY_IE_MISSING - 400 Bad Request Mandatory IE Missing - IE which is defined as mandatory or as conditional in data structure, but mandatory required, for an HTTP method is not included in the payload body of the request.
- 400_UNSPECIFIED_MSG_FAILURE - 400 Bad Request Unspecified Msg Failure - The request is rejected due to unspecified client error.
- 403_MODIFICATION_NOT_ALLOWED - 403 Forbidden Modification Not Allowed - The request is rejected because the contained modification instructions attempt to modify IE which is not allowed to be modified.
- 403_SERVING_NETWORK_NOT_AUTHORIZED - 403 Forbidden Serving Network Not Authorized - The serving network is not authorized, e.g. serving PLMN.

- 403_AUTHENTICATION_REJECTED - 403 Forbidden Authentication Rejected - The user is cannot be authenticated with this authentication method e.g. only SIM data available.
- 403_INVALID_HN_PUBLIC_KEY_IDENTIFIER - 403 Forbidden Invalid HN Public Key Identifier - Invalid HN public key identifier received
- 403_INVALID_SCHEME_OUTPUT - 403 Forbidden Invalid Scheme Output - SUCI cannot be decrypted with received data.
- 404_SUBSCRIPTION_NOT_FOUND - 404 Not Found Subscription Not Found - The request for modification or deletion of subscription is rejected because the subscription is not found in the NF.
- 404_CONTEXT_NOT_FOUND - 404 Not Found Context Not Found - The AUSF cannot found the resource corresponding to the URI provided by the NF Service Consumer.
- 404_RESOURCE_URI_STRUCTURE_NOT_FOUND - 404 Not Found Resource URI Structure Not Found - The request is rejected because a fixed part after the first variable part of an apiSpecificResourceUriPart is not found in the NF. This fixed part of the URI may represent a sub-resource collection (e.g. contexts, subscriptions, policies) or a custom operation.
- 404_USER_NOT_FOUND - 404 Not Found User Not Found - The user does not exist in the HPLMN.
- 411_INCORRECT_LENGTH - 411 Length Required Incorrect Length - The request is rejected due to incorrect value of a Content-length header field.
- 429_NF_CONGESTION_RISK - 429 Too Many Requests NF Congestion Risk - The request is rejected due to excessive traffic which, if continued over time, may lead to (or may increase) an overload situation.
- 500_INSUFFICIENT_RESOURCES - 500 Internal Server Error Insufficient Resources - The request is rejected due to insufficient resources.
- 500_UNSPECIFIED_NF_FAILURE - 500 Internal Server Error Unspecified NF Failure - The request is rejected due to unspecified reason at the NF.
- 500_SYSTEM_FAILURE - 500 Internal Server Error System Failure - The request is rejected due to generic error condition in the NF.
- 500_AV_GENERATION_PROBLEM - 500 Internal Server Error AV Generation Problem - The UDM has indicated that it was not able to generate AV.
- 501_UNSUPPORTED_PROTECTION_SCHEME - 501 Not implemented Unsupported Protection Scheme - The received protection scheme is not supported by HPLMN.
- 503_NF_CONGESTION - 503 Service Unavailable NF Congestion - The NF experiences congestion and performs overload control, which does not allow the request to be processed.
- 504_UPSTREAM_SERVER_ERROR - 504 Gateway Timeout Upstream Server Error - No response is received from a remote peer, e.g. from the UDM.

- 504_NETWORK_FAILURE - 504 Gateway Timeout Network Failure - The request is rejected due to a network problem.

Name

amf5gMmCc - 5GMM NAS Cause Code

Syntax

--amf5gMmCc <integer>

Description

Defines the 5GMM NAS cause code to use towards the UE based on the HTTP2 Status Code received from the AUSF

Class

Optional.

Type / Range

5GMM Cause Code.

Default

15

Roles**Show**

sysadmin, manage, monitor

Modify

sysadmin, manage

3.27 cmm amfCapacityGParms

AMF Capacity. Syntax, description, parameters, and roles for cmm amfCapacityGParms command.

Syntax**Description**

This command opens the context for configuring capacity related parameters for the AMF network.

Parameters**Name**

amfGparmName - Parameter name

Syntax

--amfGparmName <list-item>

Description

Name of parameter

Class

Required key.

List

- **amfRelativeCapacity** - AMF Relative Capacity - Assigns Relative AMF Capacity for use by the gNB when selecting an AMF from an AMF SET(pool). RAN uses Relative Capacity to load balance across AMFs within an AMF SET. This will only be used if Auto Adjust Capacity is set to false.
- **autoAdjustCap** - Auto Adjust Relative Capacity - Indicates whether or not the AMF automatically adjusts the value of the relative capacity according to an algorithm based upon: 1) The number of active CPPS in the enabled and unlocked states and the number of CPPS considered as 'Protected' (Number Protection CPPS) in an n+k protection or sparing scheme. 2) The number of active IPDS Pools in the enabled and unlocked states.
- **maxTrackingAreaRelativeCapacity** - Maximum Tracking Area Relative Capacity - Selects the maximum provisioned AMF TA relative capacity of the provisioned AMF relative capacities of TAs supported by the gNB when sent to gNB in NGAP SETUP RESPONSE or AMF CONFIGURATION UPDATE messages.
- **numProtCpps** - Total Number of Protection CPPS - This parameter is the number of the CPPS with the AMMS personality in the system that are protection CPPS. This is also considered the k value in the n+k sparing arrangement. This is only used when Auto Adjust Capacity is true. Total number of CPPS minus numProtCpps times relativeCapacityCpps should be less than or equal to 255.
- **relativeCapacityCpps** - Relative Capacity per CPPS - AMF Relative Capacity assigned to each N CPPS in a N + K protection or sparing scheme of CPPS with the AMMS personality. This value will only be used when Auto Adjust Capacity parameter is set to true. This value will be used to calculate the CPPS contribution to the total AMF Relative Capacity based upon the total number of CPPS and the value of K, Number Protection CPPS parameter, which contains the number of Protection CPPS. Total number of CPPS minus numProtCpps times relativeCapacityCpps should be less than or equal to 255.
- **relativeCapacityIPDS0** - Relative Capacity per IPDS Pool 0 - AMF Relative Capacity assigned to the IPDS Pool 0. This value will be used to calculate the IPDS contribution to the total nominal value for the AMF Relative Capacity. $\text{relativeCapacityIPDS0} + (\text{total number of available additional IPDS pools} * \text{relativeCapacityIPDSAdditional})$ should be less than or equal to 255.
- **relativeCapacityIPDSAdditional** - Relative Capacity per IPDS Additional - AMF Relative Capacity assigned per additional IPDS Pool. This value will be used to calculate the IPDS contribution to the total nominal value for the AMF Relative Capacity. $\text{relativeCapacityIPDS0} + (\text{total number of available additional IPDS pools} * \text{relativeCapacityIPDSAdditional})$ should be less than or equal to 255.
- **trackingAreaRelativeCapacity** - Tracking Area Relative Capacity - Sets AMF relative capacity per tracking area

Name

amfGparmValue - Parameter value

Syntax

--amfGparmValue <string>

Description

Value of parameter

Class

Required on create.

Type / Range

Digit string of length 0 to 64

The amfGparmValue string is based on the amfGparmName parameter:

Name

amfRelativeCapacity - AMF Relative Capacity

Syntax

--amfGparmName amfRelativeCapacity --amfGparmValue <string>

Description

Assigns Relative AMF Capacity for use by the gNB when selecting an AMF from an AMF SET(pool). RAN uses Relative Capacity to load balance across AMFs within an AMF SET. This will only be used if Auto Adjust Capacity is set to false.

Type / Range

Integer in the range of 0 to 255

Default

5

Name

autoAdjustCap - Auto Adjust Relative Capacity

Syntax

--amfGparmName autoAdjustCap --amfGparmValue <string>

Description

Indicates whether or not the AMF automatically adjusts the value of the relative capacity according to an algorithm based upon: 1) The number of active CPPS in the enabled and unlocked states and the number of CPPS considered as 'Protected' (Number Protection CPPS) in an n+k protection or sparing scheme. 2) The number of active IPDS Pools in the enabled and unlocked states.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

maxTrackingAreaRelativeCapacity - Maximum Tracking Area Relative Capacity

Syntax

```
--amfGparmName maxTrackingAreaRelativeCapacity --amfGparmValue  
<string>
```

Description

Selects the maximum provisioned AMF TA relative capacity of the provisioned AMF relative capacities of TAIs supported by the gNB when sent to gNB in NGAP SETUP RESPONSE or AMF CONFIGURATION UPDATE messages.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

numProtCpps - Total Number of Protection CPPS

Syntax

```
--amfGparmName numProtCpps --amfGparmValue <string>
```

Description

This parameter is the number of the CPPS with the AMMS personality in the system that are protection CPPS. This is also considered the k value in the n+k sparing arrangement. This is only used when Auto Adjust Capacity is true. Total number of CPPS minus numProtCpps times relativeCapacityCpps should be less than or equal to 255.

Type / Range

Integer in the range of 0 to 8

Default

0

Name

relativeCapacityCpps - Relative Capacity per CPPS

Syntax

```
--amfGparmName relativeCapacityCpps --amfGparmValue <string>
```

Description

AMF Relative Capacity assigned to each N CPPS in a N + K protection or sparing scheme of CPPS with the AMMS personality. This value will only be used when Auto Adjust Capacity parameter is set to true. This value will be used to calculate the CPPS contribution to the total AMF Relative Capacity based upon the total number of CPPS and the value of K, Number

Protection CPPS parameter, which contains the number of Protection CPPS. Total number of CPPS minus numProtCpps times relativeCapacityCpps should be less than or equal to 255.

Type / Range

Integer in the range of 0 to 255

Default

6

Name

relativeCapacityIPDS0 - Relative Capacity per IPDS Pool 0

Syntax

```
--amfGparmName relativeCapacityIPDS0 --amfGparmValue <string>
```

Description

AMF Relative Capacity assigned to the IPDS Pool 0. This value will be used to calculate the IPDS contribution to the total nominal value for the AMF Relative Capacity. $\text{relativeCapacityIPDS0} + (\text{total number of available additional IPDS pools} * \text{relativeCapacityIPDSAdditional})$ should be less than or equal to 255.

Type / Range

Integer in the range of 0 to 255

Default

20

Name

relativeCapacityIPDSAdditional - Relative Capacity per IPDS Additional

Syntax

```
--amfGparmName relativeCapacityIPDSAdditional --amfGparmValue  
<string>
```

Description

AMF Relative Capacity assigned per additional IPDS Pool. This value will be used to calculate the IPDS contribution to the total nominal value for the AMF Relative Capacity. $\text{relativeCapacityIPDS0} + (\text{total number of available additional IPDS pools} * \text{relativeCapacityIPDSAdditional})$ should be less than or equal to 255.

Type / Range

Integer in the range of 0 to 255

Default

20

Name

trackingAreaRelativeCapacity - Tracking Area Relative Capacity

Syntax

```
--amfGparmName trackingAreaRelativeCapacity --amfGparmValue <string>
```

Description

Sets AMF relative capacity per tracking area

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

3.28 cmm amfCellId

Cell Identifiers Subject to Handover. Syntax, description, parameters, and roles for `cmm amfCellId` command.

Syntax**Description**

Administer Cell Identifiers subject to Handover Restriction

Parameters**Name**

name - Name of Cell ID

Syntax

--name <string>

Description

Name of the cell identifier

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

cellIdentifier - Cell Identifier

Syntax

--cellIdentifier <integer>

Description

Identify the cell

Class

Required on create, not modifiable.

Type / Range

Integer in the range of 0..68719476735

Name

plmnName - Mobile network name

Syntax

--plmnName <string>

Description

A name that identifies mobile network

Class

Required on create, not modifiable.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

3.29 cmm amfCIPHERingAlgorithm

Preferred Ciphering Algorithm. Syntax, description, parameters, and roles for cmm amfCIPHERingAlgorithm command.

Syntax

Description

This command sets the algorithms, in priority order, AMF will use to negotiate encryption of NAS messages with the UE. At UE REGISTRATION, the UE provides, in the UE security capabilities, which encryption algorithms are supported. The AMF will use the algorithm both supported by the UE and highest in priority in the nea ciphering algorithm priority list. - An algorithm must be chosen for 'priority-1' and 'priority-2'. - An additional selection, 'none', can be selected for 'priority-3' and 'priority-4' - effectively truncating the list. - If any ciphering algorithm (including null) is selected for 'priority-4', then 'priority-3' must not be 'none'. - An algorithm cannot be used for more than one priority (except for 'none').

Parameters

Name

cipheringAlgPrio1 - Priority 1 ciphering algorithm

Syntax

--cipheringAlgPrio1 <list-item>

Description

Most preferred ciphering algorithm.

Class

Optional.

List

- aes - 128-NEA2 (AES)
- noCiphering - 128-NEA0 (No ciphering)
- none - No Algorithm Selected
- snow3G - 128-NEA1 (SNOW 3G)
- zuc - 128-NEA3 (ZUC)

Default

snow3G

Name

cipheringAlgPrio2 - Second most preferred ciphering algorithm

Syntax

--cipheringAlgPrio2 <list-item>

Description

Second most preferred ciphering algorithm; used if the user element does not support algorithm(s) of higher priority

Class

Optional.

List

- aes - 128-NEA2 (AES)
- noCiphering - 128-NEA0 (No ciphering)
- none - No Algorithm Selected
- snow3G - 128-NEA1 (SNOW 3G)
- zuc - 128-NEA3 (ZUC)

Default

aes

Name

cipheringAlgPrio3 - Third most preferred ciphering algorithm

Syntax

--cipheringAlgPrio3 <list-item>

Description

Third most preferred ciphering algorithm; used if the user element does not support algorithm(s) of higher priority.

Class

Optional.

List

- aes - 128-NEA2 (AES)
- noCiphering - 128-NEA0 (No ciphering)
- none - No Algorithm Selected
- snow3G - 128-NEA1 (SNOW 3G)
- zuc - 128-NEA3 (ZUC)

Default

none

Name

cipheringAlgPrio4 - Fourth most preferred ciphering algorithm

Syntax

--cipheringAlgPrio4 <list-item>

Description

Fourth most preferred ciphering algorithm; used if the user element does not support algorithm(s) of higher priority.

Class

Optional.

List

- aes - 128-NEA2 (AES)
- noCiphering - 128-NEA0 (No ciphering)
- none - No Algorithm Selected
- snow3G - 128-NEA1 (SNOW 3G)
- zuc - 128-NEA3 (ZUC)

Default

none

3.30 cmm amfCmasGParms

AMF CMAS. Syntax, description, parameters, and roles for `cmm amfCmasGParms` command.

Syntax

Description

This command is used to enter the context of CMAS to provision AMF global CMAS parameter

Parameters

Name

amfGparmName - Parameter name

Syntax

--amfGparmName <list-item>

Description

Name of parameter

Class

Required key.

List

- **alertMessageHoldingTime** - Alert Message Holding Time - Alert Message Holding Time timer indicates the time to wait (in seconds) that a N50 NonUeN2MessageTransfer request from the CBCF that will be queued while waiting for a previously received N50 NonUeN2MessageTransfer request completes its broadcast.
- **cmas5GWarningSystemLog** - CMAS 5G WarningSystemLog - 5G CMAS Warning System Log
- **messageReTransmission** - Message Retransmission - This command configures maximum number of times WRITE_REPLACE WARNING REQUEST message to re-transmit if no response is received from the gNB. By default the command sets the re-transmission value to 0.
- **queuingCbcfRequests** - Queuing CBCF Requests - Parameter controls queuing CBCF requests. By default, it is disabled. When enabled, AMF shall support queuing of up to 20 CBCF requests while processing on-going broadcast.
- **stopWarningIndication** - Stop Warning Indication - This command is used to enable sending of STOP WARNING MESSAGE TO the CBCF.
- **warningMessageDelivery** - Warning Message Delivery - This command enables/disables Commercial Mobile Alert System (aka warning message delivery) By default, the warning message delivery is disabled
- **writeReplaceWarningIndication** - Write Replace Warning Indication - This command is used to enable AMF sending of broadcast completed area list to the CBCF. By default this is disabled.

Name

amfGparmValue - Parameter value

Syntax

--amfGparmValue <string>

Description

Value of parameter

Class

Required on create.

Type / Range

Digit string of length 0 to 64

The amfGparmValue string is based on the amfGparmName parameter:

Name

alertMessageHoldingTime - Alert Message Holding Time

Syntax

```
--amfGparmName alertMessageHoldingTime --amfGparmValue <string>
```

Description

Alert Message Holding Time timer indicates the time to wait (in seconds) that a N50 NonUeN2MessageTransfer request from the CBCF that will be queued while waiting for a previously received N50 NonUeN2MessageTransfer request completes its broadcast.

Type / Range

Integer in the range of 0 to 180 in units of Second

Default

0

Name

cmas5GWarningSystemLog - CMAS 5G WarningSystemLog

Syntax

```
--amfGparmName cmas5GWarningSystemLog --amfGparmValue <string>
```

Description

5G CMAS Warning System Log

List

- all - Log both NGAP and CBCF CMAS messages in warnsys log.
- cbcfOnly - CBCF Only - Only log CBCF CMAS messages in warnsys log.
- ngapOnly - NGAP Only - Only log NGAP CMAS messages in warnsys log.
- none - Do not log 5G CMAS messages in warnsys log.

Default

all

Name

messageReTransmission - Message Retransmission

Syntax

```
--amfGparmName messageReTransmission --amfGparmValue <string>
```

Description

This command configures maximum number of times WRITE_REPLACE WARNING REQUEST message to re-transmit if no response is received from the gNB. By default the command sets the re-transmission value to 0.

Type / Range

Integer in the range of 0 to 10

Default

0

Name

queuingCbcfRequests - Queuing CBCF Requests

Syntax

--amfGparmName queuingCbcfRequests --amfGparmValue <string>

Description

Parameter controls queuing CBCF requests. By default, it is disabled. When enabled, AMF shall support queuing of up to 20 CBCF requests while processing on-going broadcast.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

stopWarningIndication - Stop Warning Indication

Syntax

--amfGparmName stopWarningIndication --amfGparmValue <string>

Description

This command is used to enable sending of STOP WARNING MESSAGE TO the CBCF.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

warningMessageDelivery - Warning Message Delivery

Syntax

--amfGparmName warningMessageDelivery --amfGparmValue <string>

Description

This command enables/disables Commercial Mobile Alert System (aka warning message delivery) By default, the warning message delivery is disabled

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

writeReplaceWarningIndication - Write Replace Warning Indication

Syntax

--amfGparmName writeReplaceWarningIndication --amfGparmValue <string>

Description

This command is used to enable AMF sending of broadcast completed area list to the CBCF.
By default this is disabled.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

3.31 cmm amfConsumerLocalEndPointConfig

Consumer AMF Local End Point Configuration. Syntax, description, parameters, and roles for cmm amfConsumerLocalEndPointConfig command.

Syntax**Description**

This command is used to create, modify and delete AMF local endpoint configuration for the AMF in the home network and AMFs in the shared network. An endpoint can be created for AMF supported services and endpoints used by an AMF as a client to setup connections to remote AMF and other NF. Separate endpoints can be configured using this command per a NF for the NF supported NSSAI.

Parameters**Name**

endPointName - AMF Local End Point Interface Name

Syntax

--endPointName <string>

Description

Command to create AMF local end point with parameters such as IPv4 address, IPv6 address, TCP well known port for HTTP and HTTPS, HTTP profile and TCP profile.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

amfServiceIpName - Service IP Name

Syntax

--amfServiceIpName <string>

Description

The parameter points to a set of parameters related with IP address configuration created using the 'serviceIp' command.

Class

Required on create.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

sbiEndpointType - SBI Endpoint Type

Syntax

--sbiEndpointType <list-item>

Description

Specifies endpoint configuration is applied to which SBI.

Class

Required on create, not modifiable.

List

- AUSF - AUSF consumer endpoint - N12 Interface - The endpoint configuration is for AMF as a consumer of AUSF services. The reference point N12 is used between AMF and AUSF.
- CHF - CHF consumer endpoint - N41 interface. - The endpoint configuration is for AMF as a consumer of CHF services. The reference point N41 is used between AMF and CHF

- EIR - EIR consumer endpoint - N17 interface - The endpoint configuration is for as a consumer of EIR services. The reference point N17 is used between AMF and PCF.
- GMLC - GMLC consumer endpoint - NLg interface - The endpoint configuration is for AMF as a consumer of GMLC services. The reference point NLg is used between AMF and GMLC.
- LMF - LMF consumer endpoint - NLs interface - The endpoint configuration is for AMF as a consumer of LMF services. The reference point NLs is used between AMF and LMF.
- NRF - NRF consumer endpoint - The endpoint configuration is for AMF as a consumer of NRF services.
- NSSAAF - NSSAAF consumer endpoint - N58 Interface - The endpoint configuration is for AMF as a consumer of NSSAAF services
- NSSF - NSSF consumer endpoint - N22 interface - The endpoint configuration is for AMF as a consumer of NSSF services. The reference point N22 is used between AMF and AUSF.
- NWDAF - NWDAF consumer endpoint - The endpoint configuration is for an AMF as a consumer of NWDAF services.
- PCF - PCF consumer endpoint - N15 interface - The endpoint configuration is for as a consumer of PCF services. The reference point N15 is used between AMF and PCF.
- RemoteAMF - Remote AMF consumer endpoint - The endpoint configuration is for AMF as a consumer of remote AMF services. The reference point N14 is used between two AMF.
- SMF - SMF consumer endpoint - N11 interface. - The endpoint configuration is for AMF as a consumer of SMF services. The reference point N11 is used between AMF and SMF.
- SMSF - SMSF consumer endpoint - N20 interface - The endpoint configuration is for AMF as a consumer of SMSF services. The reference point N20 is used between AMF and SMSF.
- UDM - UDM consumer endpoint - N13 interface. - The endpoint configuration is for AMF as a consumer of UDM services. The reference point N8 is used between AMF and UDM.
- UDSF - UDSF consumer endpoint - The endpoint configuration is for AMF as a consumer of UDSF services.

Name

dscpCode - DSCP Code

Syntax

--dscpCode <list-item>

Description

Parameter to set DSCP code to be used for an IP packet

Class

Optional.

List

- AF11 - Assured forwarding 11.
- AF12 - Assured forwarding 12.
- AF13 - Assured forwarding 13.
- AF21 - Assured forwarding 21.
- AF22 - Assured forwarding 22.
- AF23 - Assured forwarding 23.
- AF31 - Assured forwarding 31.
- AF32 - Assured forwarding 32.
- AF33 - Assured forwarding 33.
- AF41 - Assured forwarding 41.
- AF42 - Assured forwarding 42.
- AF43 - Assured forwarding 43.
- BE - BE.
- CS1 - Class selector 1.
- CS2 - Class selector 2.
- CS3 - Class selector 3.
- CS4 - Class selector 4.
- CS5 - Class selector 5.
- CS6 - Class selector 6.
- CS7 - Class selector 7.
- EF - Expedited forwarding.
- voiceAdmit - Voice Admit

Default

AF41

Name

httpProfileName - HTTP profile name

Syntax

--httpProfileName <string>

Description

Assign HTTP profile for the end point.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\- _:@]*

Default

default

Name

rmtNfSupportedSnssaiListName - Remote NF Supported S-NSSAI List

Syntax

--rmtNfSupportedSnssaiListName <string>

Description

This parameter only applies to other NF and remote AMF. The parameter specifies the NSSAI supported by the remote NF. This parameter enables AMF to setup separate TCP connection for a NSSAI and NF. This is an optional parameter. If the parameter is not set then the endpoint can be used to connect to any NF irrespective of their support of NSSAI. If the parameter is set then the endpoint is used to setup connection with the NF that supports the provisioned NSSAI.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\- _:@]*

Name

tcpProfileName - TCP Profile Name

Syntax

--tcpProfileName <string>

Description

Configure TCP profile to the endpoint.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\- _:@]*

Default

default

Name

tlsProfileName - Transport Layer Security Certificate

Syntax

```
--tlsProfileName <string>
```

Description

Configure TLS certificate used in establishing secure communication.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

3.32 cmm amfDeregistrationBehaviorMappingProfile

AMFDeregistration Behavior Mapping Profile. Syntax, description, parameters, and roles for cmm amfDeregistrationBehaviorMappingProfile command.

Syntax**Description**

Administers De-registration Behavior Mapping Profile for various scenarios related to UE de-registration. Profile includes parameters for defining cause codes, de-registration types and option to page UE. The maximum number of profiles supported is 128. A default profile, named 'default', is provided.

Parameters**Name**

name - De-registration behavior mapping profile name

Syntax

```
--name <string>
```

Description

Identifies, via name, a given de-registration behavior mapping.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Name

adminDeleteUeContextCc - Delete UE context cause code

Syntax

--adminDeleteUeContextCc <integer>

Description

NAS Cause code to include in Deregistration Request when UE context is deleted

Class

Optional.

Type / Range

5GMM Cause Code.

Default

10

Name

adminDeleteUeContextDeregistrationType - Delete UE context deregistration type

Syntax

--adminDeleteUeContextDeregistrationType <list-item>

Description

Deregistration type when UE context is deleted via administrative action e.g. cli command

Class

Optional.

List

- registrationNotRequired - Registration not required - Specifies registration type of registration not required
- registrationRequired - Registration required - Specifies registration type of registration required

Default

registrationNotRequired

Name

adminDeleteUeContextNotifyIdleUe - Delete UE context notify idle UE

Syntax

--adminDeleteUeContextNotifyIdleUe <list-item>

Description

Page UE if in the CM-idle when deleting UE context via administrative action e.g. cli command

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

adminDeleteUeContextSendCc - Delete UE context send cause code

Syntax

--adminDeleteUeContextSendCc <list-item>

Description

Include cause code in deregistration request when deregistration reason is due to deleting UE context

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

udmCoreNetworkTypeDeregistration - UDM Core Network Type Deregistration

Syntax

--udmCoreNetworkTypeDeregistration <list-item>

Description

Deregistration type sent to the UE when UDM Notification of UE subscription change is 5GC is not allowed.

Restrictions

Applies to home or roamer UEs.

Class

Optional.

List

- registrationNotRequired - Registration not required - Specifies registration type of registration not required
- registrationRequired - Registration required - Specifies registration type of registration required

Default

registrationNotRequired

Name

udmCoreNetworkTypeDeregistrationCc - UDM Core Network Type Deregistration cause code mapping

Syntax

--udmCoreNetworkTypeDeregistrationCc <integer>

Description

NAS Cause code to include in Deregistration Request when UDM Notification Change of UE subscription is Core Network Type 5GC not allowed.

Restrictions

Applies to home or roamer UEs.

Class

Optional.

Type / Range

5GMM Cause Code.

Default

27

Name

udmCoreNetworkTypeDeregistrationNotifyIdleUE - Core Network Type Deregistration Notify for idle UE

Syntax

--udmCoreNetworkTypeDeregistrationNotifyIdleUE <list-item>

Description

Page UE if in the CM-idle state when UDM Change Notification is 5GC restricted.

Restrictions

Applies to home to roamer UEs.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

udmCoreNetworkTypeDeregistrationSendCc - UDM Core Network Type Deregistration send cause code to UE

Syntax

--udmCoreNetworkTypeDeregistrationSendCc <list-item>

Description

Include cause code in Deregistration Request when UDM Change Notification is Core Network Type 5GC not allowed.

Restrictions

Applies to home or roamer UEs.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

udmForbiddenTacCc - UDM Forbidden TAC Cause Code

Syntax

--udmForbiddenTacCc <integer>

Description

UDM Forbidden TAC Cause Code

Class

Optional.

Type / Range

Integer in the range of 0 to 63

Default

15

Name

udmForbiddenTacDeregistrationType - UDM Forbidden TAC Deregistration Type

Syntax

--udmForbiddenTacDeregistrationType <list-item>

Description

UDM Forbidden TAC Deregistration Type

Class

Optional.

List

- registrationNotRequired - Registration not required - Specifies registration type of registration not required
- registrationRequired - Registration required - Specifies registration type of registration required

Default

registrationRequired

Name

udmForbiddenTacNotifyIdleUe - UDM Forbidden TAC Notify Idle UE

Syntax

--udmForbiddenTacNotifyIdleUe <list-item>

Description

UDM Forbidden TAC Notify Idle UE

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

udmForbiddenTacSendCc - UDM Forbidden TAC Send Cause Code

Syntax

--udmForbiddenTacSendCc <list-item>

Description

UDM Forbidden TAC Send Cause Code

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

udmNrRatRestrictionDeregistration - UDM NR RAT Restriction Deregistration

Syntax

--udmNrRatRestrictionDeregistration <list-item>

Description

Deregistration type sent to the UE when UDM Notification of UE RAT Restriction in NR is to restrict.

Restrictions

Applies to home or roamer UEs.

Class

Optional.

List

- registrationNotRequired - Registration not required - Specifies registration type of registration not required
- registrationRequired - Registration required - Specifies registration type of registration required

Default

registrationNotRequired

Name

udmNrRatRestrictionDeregistrationCc - UDM NR RAT Restriction Deregistration CC

Syntax

--udmNrRatRestrictionDeregistrationCc <integer>

Description

NAS Cause code to include in Deregistration Request when UDM Notification of UE RAT Restriction in NR is to restrict.

Class

Optional.

Type / Range

5GMM Cause Code.

Default

27

Name

udmNrRatRestrictionDeregistrationNotifyIdleUE - UDM NR RAT Restriction Deregistration Notify UE

Syntax

--udmNrRatRestrictionDeregistrationNotifyIdleUE <list-item>

Description

Page UE if in the CM-idle state when UDM Change Notification is NR RAT restricted.

Restrictions

Applies to home or roamer UEs.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

udmNrRatRestrictionDeregistrationSendCc - UDM NR RAT Restriction Deregistration Send Cause Code to UEC

Syntax

--udmNrRatRestrictionDeregistrationSendCc <list-item>

Description

Include cause code in Deregistration Request when UDM Change Notification NR RAT Restriction is to restrict.

Restrictions

Applies to home or roamer UEs.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

udmOdbAllPacketCc - UDM ODB All Packet Services Cause Code

Syntax

--udmOdbAllPacketCc <integer>

Description

NAS Cause code to include in Deregistration Request when both UDM provides ODB All Packet Services Barred and AMF local provisioning parameter on service agreement level for Restrict Mobility on UDM ODB All Packet Barred is set to true.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

10

Name

udmOdbAllPacketDeregistrationType - UDM ODB All Packet Services Deregistration Type

Syntax

--udmOdbAllPacketDeregistrationType <list-item>

Description

Deregistration type when both UDM provides ODB All Packet Services Barred and AMF local provisioning parameter on service agreement level for Restrict Mobility on UDM ODB All Packet Barred is set to true.

Class

Optional.

List

- registrationNotRequired - Registration not required - Specifies registration type of registration not required
- registrationRequired - Registration required - Specifies registration type of registration required

Default

registrationNotRequired

Name

udmOdbAllPacketNotifyIdleUe - UDM ODB All Packet Services Notify Idle UE

Syntax

--udmOdbAllPacketNotifyIdleUe <list-item>

Description

Defines whether to page the UE for deregistering when both UDM provides ODB All Packet Services Barred and AMF local provisioning parameter on service agreement level for Restrict Mobility on UDM ODB All Packet Barred is set to true.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

udmOdbAllPacketSendCc - UDM ODB All Packet Services Send CC

Syntax

--udmOdbAllPacketSendCc <list-item>

Description

Defines whether the AMF includes the cause code in Deregistration request when both UDM provides ODB All Packet Services Barred and AMF local provisioning parameter on service agreement level for Restrict Mobility on UDM ODB All Packet Barred is set to true.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

udmSubWithdrawnCc - Deregistration Notify with Subscription Withdrawn Cause Code

Syntax

--udmSubWithdrawnCc <integer>

Description

NAS Cause code to include in Deregistration Request when deregistration reason in DeregistrationNotify is subscription withdrawn.

Class

Optional.

Type / Range

5GMM Cause Code.

Default

10

Name

udmSubWithdrawnDeregistrationType - Deregistration Notify with reason subscription
withdrawn deregistration type

Syntax

--udmSubWithdrawnDeregistrationType <list-item>

Description

Deregistration type when UDM deregistration notify reason is subscription withdrawn

Class

Optional.

List

- registrationNotRequired - Registration not required - Specifies registration type of registration not required
- registrationRequired - Registration required - Specifies registration type of registration required

Default

registrationNotRequired

Name

udmSubWithdrawnNotifyIdleUe - Deregistration Notify with Subscription Withdrawn notify
idle UE

Syntax

--udmSubWithdrawnNotifyIdleUe <list-item>

Description

Page UE if in the CM-idle when deregistration reason in UDM deregistration notify is
subscription withdrawn.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

udmSubWithdrawnSendCc - deregistration notify subscription withdrawn send cause code to UE

Syntax

--udmSubWithdrawnSendCc <list-item>

Description

Include cause code in deregistration request when deregistration reason in deregistration notify is subscription withdrawn.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

3.33 cmm amfDirectedUelb

AMF UE Load Balancing. Syntax, description, parameters, and roles for cmm amfDirectedUelb command.

Syntax**Description**

UE loadbalancing for less than 100% is performed using this CLI command that enables the operator to move a percentage or an absolute number of 5G UEs. If maxOffLoadRate is not specified the If

maxOffLoadRate is not specified the off-load happens as fast as possible.. Source GUAMI defaults to ALL supported GUAMIs (Note: when multiple GUAMIs are supported then a subset may be specified). The radioType defaults to NG-3GPP, in future releases it can be non-3GPP, or ALL. The service lock is not required as this command is never used to empty a CMM. There is no concept of quarantine or filters, once the number of UEs are moved the command shutdowns automatically. The command can be stopped/started using the --action parameter

Parameters

Name

uelbAction - action

Syntax

--uelbAction <list-item>

Description

Allows the operator to turn on or off the UELB. when turning on the profile shall be specified.

Class

Required key.

List

- start - starts the UELB
- stop - Stops the UELB

Name

amfDirectedUelbProfileName - Profile Name

Syntax

--amfDirectedUelbProfileName <string>

Description

a profile created with cmm amfDirectedUeLBProfile

Restrictions

profile name shall be entered only when the action is start.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Roles

Modify

sysadmin, manage

3.34 cmm amfDirectedUelbProfile

Directed UELB Profile. Syntax, description, parameters, and roles for cmm amfDirectedUelbProfile command.

Syntax

Description

This sets the parameters that will be used in cmm amfDirectedUelb --amfDirectedUelbProfileName --action.

Parameters

Name

name - Profile Name

Syntax

--name <string>

Description

Profile name that was used to invoke the Directed UELB Command

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

targetGuamiPointer - Target GUAMI

Syntax

--targetGuamiPointer <integer>

Description

The GUAMI where the UEs will go.

Class

Required on create.

Type / Range

5G AMF Pointer

Name

endSupi - End of SUPI Range

Syntax

--endSupi <digits>

Description

The end of the SUPI range.

Class

Optional.

Type / Range

Digit string of length 0 or 9 to 15

Default

""

Name

lbAbsolute - Number of UEs

Syntax

--lbAbsolute <integer>

Description

Target number of UEs to redirect to the target GUAMI. If 0, it is not used, and lbPercentage is used

Restrictions

either --lbAbsolute or --lbPercentage are required but not both

Class

Optional.

Type / Range

Integer in the range of 0 to 4,000,000

Default

0

Name

lbPercentage - Percentage of UEs

Syntax

--lbPercentage <integer>

Description

This specifies a percentage of the Connected UEs. The number is translated into a number of UEs based on the number of connected UEs at the time the command is issued. If 0, it is not used, and lbAbsolute is used.

Class

Optional.

Type / Range

Integer in the range of 0 to 100

Default

100

Name

maxOffloadRate - Off-load Rate

Syntax

--maxOffloadRate <integer>

Description

Target Off-load Rate. The rate at which redirections occur.

Class

Optional.

Type / Range

Integer in the range of 10 to 500

Default

500

Name

offloadGuardTimer - Directed UELB Offload Guard Timer

Syntax

--offloadGuardTimer <integer>

Description

This guard timer is for Directed UELB. If the UE target users moved is not met, the offload will end after this time period.

Class

Optional.

Type / Range

Integer in the range of 1 to 24 in units of Hour

Default

1

Name

startSupi - Start SUPI Range

Syntax

--startSupi <digits>

Description

The start of SUPI range

Class

Optional.

Type / Range

Digit string of length 0 or 9 to 15

Default

""

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Modify

sysadmin, manage

Delete

sysadmin, manage

List

sysadmin, manage, monitor

3.35 cmm amfDirectedUelbStats

Directed UELB Statistics. Syntax, description, parameters, and roles for cmm amfDirectedUelbStats command.

Syntax**Description**

Displays the statistics of the directed UELB Command cmm amfDirectedUelb. This command shows one line for each of the previous 5 invocations of the command(only one amfUeLoadBalance command can be active at any time): The stats include: Target, Radio type Number of UEs moved and Target UE number (derived from percentage if needed), duration, offLoadRate achieved and offLoadRate specified.

Parameters**Name**

startDateTime - Start Date and Time

Syntax

--startDateTime <string>

Description

records the date and time at which the command was entered.

Class

Required key.

Type / Range

Date and Time Digit string of length 0 to 20 with the allowed pattern of '20[0-9][0-9]/[0-1][0-9]/[0-3][0-9] [0-2][0-9]:[0-5][0-9]:[0-5][0-9]'

Name

actualOffloadRate - Actual Off-Load Rate

Syntax

--actualOffloadRate <integer>

Description

the achieved rate of redirections.

Class

Read only.

Type / Range

Integer in the range of 0 to 1,000

Name

amfDirectedUelbProfileName - Profile Name

Syntax

--amfDirectedUelbProfileName <string>

Description

A name.

Class

Read only.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Name

endSupi - End of the SUPI Range

Syntax

--endSupi <digits>

Description

The end of the SUPI range.

Class

Read only.

Type / Range

Digit string of length 0 or 9 to 15

Default

""

Name

lbAbsolute - Number of UEs

Syntax

--lbAbsolute <integer>

Description

Target number of UEs to redirect to the targetGUAMI. If 0, it is not used, and lbPercentage is used

Restrictions

either --lbAbsolute will be computed from --lbPercentage if the latter is the input

Class

Read only.

Type / Range

Integer in the range of 0 to 4,000,000

Name

lbPercentage - Percentage of UEs

Syntax

--lbPercentage <integer>

Description

shows the percentage of UEs requested. If 0, it is not used, and lbAbsolute is used

Class

Read only.

Type / Range

Integer in the range of 0 to 100

Name

maxOffloadRate - Off-load Rate

Syntax

--maxOffloadRate <integer>

Description

Target Off-load Rate. The requested rate for redirections

Class

Read only.

Type / Range

Integer in the range of 10to 500

Default

500

Name

n1MsgRedirectedUes - N1 message Redirected UEs

Syntax

--n1MsgRedirectedUes <integer>

Description

Count of the number of redirected UEs to the target as a result of the UELB Command

Class

Read only.

Type / Range

Integer in the range of 0 to 268,435,455

Name

n2InfoRedirectedUes - N2InfoRedirectedUes

Syntax

--n2InfoRedirectedUes <integer>

Description

Count of the number of redirected UEs to the target as a result of the UELB Command

Class

Read only.

Type / Range

Integer in the range of 0 to 268,435,455

Name

offloadGuardTimer - Directed UELB Offload Guard Timer

Syntax

--offloadGuardTimer <integer>

Description

The requested guard timer is for Directed UELB.

Class

Read only.

Type / Range

Integer in the range of 1 to 24 in units of Hour

Default

1

Name

radioType5g - Radio Type 5G

Syntax

--radioType5g <list-item>

Description

Indicates the radio type that would be used to select UEs for redirection

Class

Read only.

List

- both - selects both NG-3GPP and non-3GPP radios
- ng3gpp - NG-3GPP - 5G NG RAN 3GPP
- non3gpp - non-3GPP - non-3GPP Radios (via N3IWF)
- unknown - The value is unknown

Default

ng3gpp

Name

redirect308UeCount - UEs 308 redirected during UELB Count

Syntax

--redirect308UeCount <integer>

Description

Count of UEs that have been 308 redirected during a UELB operation

Class

Read only.

Type / Range

Integer in the range of 0 to 268,435,455

Name

runTime - Run Time

Syntax

--runTime <string>

Description

Counts in hh:mm:ss the run time of the command

Class

Read only.

Type / Range

Digit string of length 0 to 8 with the allowed pattern of [0-9a-zA-Z\._:-]*

Name

startSupi - Start of the SUPI Range

Syntax

--startSupi <digits>

Description

The start of the SUPI range.

Class

Read only.

Type / Range

Digit string of length 0 or 9 to 15

Default

""

Name

targetGuamiPointer - Target GUAMI

Syntax

--targetGuamiPointer <integer>

Description

The GUAMI where the UEs are redirected

Class

Read only.

Type / Range

5G AMF Pointer

Name

uelbCommandStatus - UELB Command Status

Syntax

--uelbCommandStatus <list-item>

Description

indicates whether the command is stopped, running, completed

Class

Read only.

List

- completed - command completed the load balancing operation as requested
- errorGuardTimer - error guard timer - The requested guard timer expired without completing the task
- errorSetAmfFailure - error set AMF failure - The UELB was stopped due to a failure triggering restoration in the set

- errorTargetAmfFailure - error target AMF failure - the UELB terminated because the target AMF failed or was unreachable
- running - the UELB command is running
- stopped - The UELB command was stopped.

Roles

List

sysadmin, manage, monitor

3.36 cmm amfDnnOverrideProfile

DNN Override Profile. Syntax, description, parameters, and roles for cmm amfDnnOverrideProfile command.

Syntax

Description

This command is used to administer an DNN Override Profile.

Parameters

Name

name - Name

Syntax

--name <string>

Description

Name that identifies Dnn Override profile

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

defaultOverrideDnn - Default DNN

Syntax

--defaultOverrideDnn <string>

Description

Provisioned Default Override DNN

Class

Optional.

Type / Range

Data Network Name with Null String.

Default

""

Name

sendOverrideDnnToUe - Send Overridden DNN to UE

Syntax

--sendOverrideDnnToUe <list-item>

Description

Parameter controls whether to send the corrected/overridden DNN or the UE requested DNN. When the parameter is false, overridden DNN shall be sent to SMF and back to the UE. When the parameter is true, the UE requested DNN is sent to the UE and SMF. If the UE did not send a requested DNN, then the AMF shall send the overridden DNN to the UE and SMF.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

supportDnnOverride - Support DNN Override

Syntax

--supportDnnOverride <list-item>

Description

Parameter controls the feature activation flag. By default the flag shall be disabled. When enabled AMF shall support DNN Override functionality

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

supportDnnOverrideWithWildcardDnn - Support DNN Override with Wildcard DNN

Syntax

--supportDnnOverrideWithWildcardDnn <list-item>

Description

When this parameter is set to true and when the UE has wildcard DNN subscribed, the AMF uses the UE requested DNN to establish the PDU when the AMF is able to discover an SMF for the UE requested DNN. When the AMF is not able to discover an SMF for the UE requested DNN, the AMF applies DNN override functionality, when the DNN override is enabled. When this parameter is set to false, and the UE has wildcard DNN subscribed, the AMF attempts to discover an SMF for the UE requested DNN, but if the SMF discovery fails, the AMF fails the PDU setup procedure.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

3.37 cmm amfEdrxMicoGParms

AMF eDRX and MICO Global Parameters. Syntax, description, parameters, and roles for cmm amfEdrxMicoGParms command.

Syntax

Description

Global Parameters for eDRX and MICO.

Parameters

Name

amfGparmName - Parameter name

Syntax

--amfGparmName <list-item>

Description

Name of parameter

Class

Required key.

List

- dnnEdrxRegWithoutPduAllowed - DNN eDRX without PDU on Registration Allowed - For a UE NAS registration at the AMF where a DNN list is to be used for allowing eDRX and the UE has not yet set up PDU(s), this field determines whether the AMF is to allow eDRX.
- edrxActive - eDRX Active - Specifies whether eDRX is allowed to be used on all serving PLMNs within the AMF.
- edrxCarryOverPage - eDRX Carryover Page - In the case when a subsequent eDRX page is to be done and there is not sufficient time remaining the PTW, this parameter specifies whether the page attempt is to be carried over to the next PTW for the UE.
- edrxEpochLeapSeconds - eDRX Epoch Leap Seconds - Number of leap seconds since the eDRX epoch time.
- edrxEpochTime - eDRX Epoch Time - eDRX Epoch Time. Valid range is 1980-01-01 00:00:00 through 2037-12-31 23:59:59. The provisioned time must be older than the current system time.
- edrxNewLeapSecondTime - eDRX new leap second time - The data and time when an additional leap second will occur. Valid range is 1980-01-01 00:00:00 through 2037-12-31 23:59:59 or blank.
- edrxPageStartOfPtw - eDRX Page Start of PTW - For a UE using eDRX, this field specifies whether the first page attempt is to wait until the start of the next paging time window. It applies only for HLCOM (pending downlink data) and only if all potential page attempt timeouts would exceed the end of the UE's paging time window.
- edrxPtwEndOffset - eDRX PTW End Offset - Specifies offset (in milliseconds) that the AMF shall consider the UE PTW to end. This parameter is set to account for hyperframe

time synchronization differences between the AMF and RAN, and to account for transmission delays in paging messages sent to the RAN. This offset should be less than or equal to edrxPtwStartOffset.

- **edrxPtwHoldTime** - eDRX PTW Hold Time - Maximum time (in milliseconds) that the AMF will queue a page prior to the start of a UE's paging time window. If a page request is received prior to the hold time, the request is rejected.
- **edrxPtwStartOffset** - eDRX page start offset - Specifies offset (in milliseconds) that the AMF shall consider the UE PTW to begin. This parameter is set to account for hyperframe time synchronization differences between the AMF and RAN, and to account for transmission delays in paging messages sent to the RAN.
- **hlcomActive** - HLCOM Active - Specifies whether extended buffering (HLCOM) for eDRX UEs is active on the AMF for all serving PLMNs. The default is false.
- **hlcomActiveMico** - HLCOM Active MICO - Specifies whether extended buffering (HLCOM) for MICO UEs is active on the AMF for all serving PLMNs. The default is false.
- **hlcomWaitTimeOffset** - HLCOM Wait Time Offset - Specifies additional time to be added for 'Max Waiting Time' sent to an SMF during a requested eDRX UE page attempt.
- **hlcomWaitTimeOffsetMico** - HLCOM Wait Time Offset MICO - Specifies additional time to be added for 'Max Waiting Time' sent to an SMF supporting HLCOM during a requested MICO UE page attempt.
- **reachableEdrxOffset** - Reachable eDRX Offset - Specifies the amount of time in advance of a UE's Paging Time Window Start that the AMF shall send a notification to the UDM for 'Reachable For DL Traffic'. This applies only if Send Reachable for DL Traffic for eDRX is true.
- **sendReachableForDLTrafficForEdrx** - Send Reachable for DL Traffic for eDRX - Feature flag for the AMF to send a pending 'Reachable for DL Traffic' notification to the UDM if a UE using eDRX enters its paging time window.

Name

amfGparmValue - Parameter value

Syntax

--amfGparmValue <string>

Description

Value of parameter

Class

Optional.

Type / Range

Digit string of length 0 to 64

The amfGparmValue string is based on the amfGparmName parameter:

Name

dnnEdrxRegWithoutPduAllowed - DNN eDRX without PDU on Registration Allowed

Syntax

```
--amfGparmName dnnEdrxRegWithoutPduAllowed --amfGparmValue <string>
```

Description

For a UE NAS registration at the AMF where a DNN list is to be used for allowing eDRX and the UE has not yet set up PDU(s), this field determines whether the AMF is to allow eDRX.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

edrxActive - eDRX Active

Syntax

```
--amfGparmName edrxActive --amfGparmValue <string>
```

Description

Specifies whether eDRX is allowed to be used on all serving PLMNs within the AMF.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

edrxCarryOverPage - eDRX Carryover Page

Syntax

```
--amfGparmName edrxCarryOverPage --amfGparmValue <string>
```

Description

In the case when a subsequent eDRX page is to be done and there is not sufficient time remaining the PTW, this parameter specifies whether the page attempt is to be carried over to the next PTW for the UE.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

edrxEpochLeapSeconds - eDRX Epoch Leap Seconds

Syntax

--amfGparmName edrxEpochLeapSeconds --amfGparmValue <string>

Description

Number of leap seconds since the eDRX epoch time.

Type / Range

Integer in the range of 0 to 100

Default

18

Recommended

18

Name

edrxEpochTime - eDRX Epoch Time

Syntax

--amfGparmName edrxEpochTime --amfGparmValue <string>

Description

eDRX Epoch Time. Valid range is 1980-01-01 00:00:00 through 2037-12-31 23:59:59. The provisioned time must be older than the current system time.

Type / Range

Digit string of length 19 to 19 with the allowed pattern of (\d{4}-\d{2}-\d{2} \d{2}:\d{2}:\d{2})

Default

1980-01-06 00:00:00

Recommended

1980-01-06 00:00:00

Name

edrxNewLeapSecondTime - eDRX new leap second time

Syntax

--amfGparmName edrxNewLeapSecondTime --amfGparmValue <string>

Description

The data and time when an additional leap second will occur. Valid range is 1980-01-01 00:00:00 through 2037-12-31 23:59:59 or blank.

Type / Range

Digit string of length 0 or 19 to 19 with the allowed pattern of (\d{4}-\d{2}-\d{2} \d{2}:\d{2}:\d{2})*

Default

"

Recommended

"

Name

edrxPageStartOfPtw - eDRX Page Start of PTW

Syntax

--amfGparmName edrxPageStartOfPtw --amfGparmValue <string>

Description

For a UE using eDRX, this field specifies whether the first page attempt is to wait until the start of the next paging time window. It applies only for HLCOM (pending downlink data) and only if all potential page attempt timeouts would exceed the end of the UE's paging time window.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Recommended

false

Name

edrxPtwEndOffset - eDRX PTW End Offset

Syntax

--amfGparmName edrxPtwEndOffset --amfGparmValue <string>

Description

Specifies offset (in milliseconds) that the AMF shall consider the UE PTW to end. This parameter is set to account for hyperframe time synchronization differences between the AMF and RAN, and to account for transmission delays in paging messages sent to the RAN. This offset should be less than or equal to edrxPtwStartOffset.

Type / Range

Integer in the range of 100 to 5,000

Default

2000

Recommended

2000

Name

edrxPtwHoldTime - eDRX PTW Hold Time

Syntax

--amfGparmName edrxPtwHoldTime --amfGparmValue <string>

Description

Maximum time (in milliseconds) that the AMF will queue a page prior to the start of a UE's paging time window. if a page request is received prior to the hold time, the request is rejected.

Type / Range

Integer in the range of 3,000 to 15,000

Default

10000

Recommended

10000

Name

edrxPtwStartOffset - eDRX page start offset

Syntax

--amfGparmName edrxPtwStartOffset --amfGparmValue <string>

Description

Specifies offset (in milliseconds) that the AMF shall consider the UE PTW to begin. This parameter is set to account for hyperframe time synchronization differences between the AMF and RAN, and to account for transmission delays in paging messages sent to the RAN.

Type / Range

Integer in the range of 100 to 5,000

Default

2000

Recommended

2000

Name

hlcomActive - HLCOM Active

Syntax

--amfGparmName hlcomActive --amfGparmValue <string>

Description

Specifies whether extended buffering (HLCOM) for eDRX UEs is active on the AMF for all serving PLMNs. The default is false.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

hlcomActiveMico - HLCOM Active MICO

Syntax

```
--amfGparmName hlcomActiveMico --amfGparmValue <string>
```

Description

Specifies whether extended buffering (HLCOM) for MICO UEs is active on the AMF for all serving PLMNs. The default is false.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

hlcomWaitTimeOffset - HLCOM Wait Time Offset

Syntax

```
--amfGparmName hlcomWaitTimeOffset --amfGparmValue <string>
```

Description

Specifies additional time to be added for 'Max Waiting Time' sent to an SMF during a requested eDRX UE page attempt.

Type / Range

Integer in the range of 0 to 10,000 in units of Millisecond

Default

0

Recommended

0

Name

hlcomWaitTimeOffsetMico - HLCOM Wait Time Offset MICO

Syntax

```
--amfGparmName hlcomWaitTimeOffsetMico --amfGparmValue <string>
```

Description

Specifies additional time to be added for 'Max Waiting Time' sent to an SMF supporting HLCOM during a requested MICO UE page attempt.

Type / Range

Integer in the range of 0 to 5,000 in units of Millisecond

Default

0

Name

reachableEdrxOffset - Reachable eDRX Offset

Syntax

```
--amfGparmName reachableEdrxOffset --amfGparmValue <string>
```

Description

Specifies the amount of time in advance of a UE's Paging Time Window Start that the AMF shall send a notification to the UDM for 'Reachable For DL Traffic'. This applies only if Send Reachable for DL Traffic for eDRX is true.

Type / Range

Integer in the range of 0 to 5,000 in units of Millisecond

Default

0

Name

sendReachableForDLTrafficForEdrx - Send Reachable for DL Traffic for eDRX

Syntax

```
--amfGparmName sendReachableForDLTrafficForEdrx --amfGparmValue  
<string>
```

Description

Feature flag for the AMF to send a pending 'Reachable for DL Traffic' notification to the UDM if a UE using eDRX enters its paging time window.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

3.38 cmm amfEirGParms

Equipment Identity Register. Syntax, description, parameters, and roles for cmm amfEirGParms command.

Syntax

Description

This command opens the context for configuring equipment identity register (EIR) related parameters for the network.

Parameters

Name

amfGparmName - Parameter name

Syntax

--amfGparmName <list-item>

Description

Name of parameter

Class

Required key.

List

- allowAttachEirChkFail - Allow Attach EIR Check Fail - Parameter 'allowAttachEirChkFail' controls the registration/attach procedure to continue. By default, this flag shall be disabled. When the flag is enabled, Attach/Registration procedure shall be allowed even if the interaction with EIR fails.
- amfAcceptGreyListedUe - Accept Grey Listed UE - The accept greylisted UE command enables acceptance of UEs that are grey-listed in the EIR repository.
- eirCheckingForInitialRegistrationFromInterAmf - EIR Checking for Initial Registration from Inter AMF - This parameter controls whether the EIR checking is performed for Initial Registration from inter AMF for N14 case.. By default this shall be set to true.
- eirCheckingForInitialRegistrationFromIntraAmf - EIR Checking for Initial Registration from Intra AMF - This parameter controls whether the EIR checking is performed for Initial Registration from intra AMF for N14 case. By default this shall be set to true.

- **eirCheckingForInterAmfMobilityRegistration** - EIR Checking For Inter AMF Mobility Registration - This parameter controls whether the EIR checking is performed for inter AMF Mobility registration. By default this shall be set to true. When parameter is set to false, identity check towards EIR won't be performed by AMF.
- **eirCheckingForMobilityRegistrationFromMme** - EIR Checking For Mobility Registration From MME - This parameter controls whether the EIR checking is performed for registration upon mobility across N26 interface.. For emergency registration, the setting of the amfEsrvcBehavior in the emergency profile is used to control if emergency registration is allowed to continue.
- **eirCheckingForRegistrationWithSuci** - EIR Checking for Registration with SUCI - This parameter controls whether the EIR checking is performed for 5G Registration With SUCI. By default this shall be set to true.
- **rejectRegRequest** - Reject Registration Request - Provisioning control to reject registration request, when AMF initiates EIR checking with 5G-EIR during initial registration detects N17 link is disabled.

Name

amfGparmValue - Parameter value

Syntax`--amfGparmValue <string>`**Description**

Value of parameter

Class

Required on create.

Type / Range

Digit string of length 0 to 64

The amfGparmValue string is based on the amfGparmName parameter:

Name

allowAttachEirChkFail - Allow Attach EIR Check Fail

Syntax`--amfGparmName allowAttachEirChkFail --amfGparmValue <string>`**Description**

Parameter 'allowAttachEirChkFail' controls the registration/attach procedure to continue. By default, this flag shall be disabled. When the flag is enabled, Attach/Registration procedure shall be allowed even if the interaction with EIR fails.

List

- **false** - Boolean value of false.
- **true** - Boolean value of true.

Default

false

Name

amfAcceptGreyListedUe - Accept Grey Listed UE

Syntax

```
--amfGparmName amfAcceptGreyListedUe --amfGparmValue <string>
```

Description

The accept greylisted UE command enables acceptance of UEs that are grey-listed in the EIR repository.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

eirCheckingForInitialRegistrationFromInterAmf - EIR Checking for Initial Registration from Inter AMF

Syntax

```
--amfGparmName eirCheckingForInitialRegistrationFromInterAmf --  
amfGparmValue <string>
```

Description

This parameter controls whether the EIR checking is performed for Initial Registration from inter AMF for N14 case.. By default this shall be set to true.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

eirCheckingForInitialRegistrationFromIntraAmf - EIR Checking for Initial Registration from Intra AMF

Syntax

```
--amfGparmName eirCheckingForInitialRegistrationFromIntraAmf --  
amfGparmValue <string>
```

Description

This parameter controls whether the EIR checking is performed for Initial Registration from intra AMF for N14 case. By default this shall be set to true.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

eirCheckingForInterAmfMobilityRegistration - EIR Checking For Inter AMF Mobility Registration

Syntax

```
--amfGparmName eirCheckingForInterAmfMobilityRegistration --  
amfGparmValue <string>
```

Description

This parameter controls whether the EIR checking is performed for inter AMF Mobility registration. By default this shall be set to true. When parameter is set to false, identity check towards EIR won't be performed by AMF.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

eirCheckingForMobilityRegistrationFromMme - EIR Checking For Mobility Registration From MME

Syntax

```
--amfGparmName eirCheckingForMobilityRegistrationFromMme --  
amfGparmValue <string>
```

Description

This parameter controls whether the EIR checking is performed for registration upon mobility across N26 interface.. For emergency registration, the setting of the amfEsrvcBehavior in the emergency profile is used to control if emergency registration is allowed to continue.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

eirCheckingForRegistrationWithSuci - EIR Checking for Registration with SUCI

Syntax

```
--amfGparmName eirCheckingForRegistrationWithSuci --amfGparmValue  
<string>
```

Description

This parameter controls whether the EIR checking is performed for 5G Registration With SUCI. By default this shall be set to true.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

rejectRegRequest - Reject Registration Request

Syntax

```
--amfGparmName rejectRegRequest --amfGparmValue <string>
```

Description

Provisioning control to reject registration request, when AMF initiates EIR checking with 5G-EIR during initial registration detects N17 link is disabled.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

3.39 cmm amfEirOverrideProfile

AMF EIR Override Profile. Syntax, description, parameters, and roles for cmm amfEirOverrideProfile command.

Syntax

Description

This command opens the context for configuring Equipment Identity Register (EIR) related parameters profile to allow override of AMF EIR global parameters at the UE PLMN Services or SUPI range level.

Parameters

Name

name - EIR Override Profile Name

Syntax

--name <string>

Description

Identifies profile name

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

acceptTrackListedUe - Accept Tracklisted UE

Syntax

--acceptTrackListedUe <list-item>

Description

Enables acceptance of UE that are track-listed in the EIR repository.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

allowRegistrationEirCheckFail - Allow Registration EIR Check Failed

Syntax

--allowRegistrationEirCheckFail <list-item>

Description

This parameter controls whether the Registration procedure is allowed to continue if AMF receives a failure error from EIR during EIR check. For emergency registration, the setting of the amfEsrvcBehavior in the emergency profile is used to control if emergency registration is allowed to continue.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

eirCheckingForInitialRegistrationFromInterAmf - EIR Checking for Initial Registration from Inter AMF

Syntax

--eirCheckingForInitialRegistrationFromInterAmf <list-item>

Description

This parameter controls whether the EIR checking is performed for Initial Registration from inter AMF for N14 case. By default this shall be set to false.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

eirCheckingForInitialRegistrationFromMme - EIR Checking for Initial Registration from MME

Syntax

--eirCheckingForInitialRegistrationFromMme <list-item>

Description

This parameter controls whether the EIR checking is performed for Initial Registration from MME (N26) By default this shall be set to false.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

eirCheckingForInterAmfMobilityRegistration - EIR Checking for Inter AMF Mobility Registration

Syntax

```
--eirCheckingForInterAmfMobilityRegistration <list-item>
```

Description

This parameter controls whether the EIR checking is performed for Inter AMF Mobility Registration (N14 and N2). By default this shall be set to false

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

eirCheckingForMobilityRegistrationFromMme - EIR Checking for Mobility Registration from MME

Syntax

```
--eirCheckingForMobilityRegistrationFromMme <list-item>
```

Description

This parameter controls whether the EIR checking is performed for registration upon mobility across N26 interface.. For emergency registration, the setting of the amfEsrvBehavior in the emergency profile is used to control if emergency registration is allowed to continue.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

eirCheckingForRegistrationWithSuci - EIR Checking for Registration with SUCI

Syntax

--eirCheckingForRegistrationWithSuci <list-item>

Description

This parameter controls whether the EIR checking is performed for 5G Registration With SUCI. By default this shall be set to false.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

interAmfMobilityRegistrationPercentage - Inter AMF Mobility Registration Percentage

Syntax

--interAmfMobilityRegistrationPercentage <integer>

Description

Inter AMF Mobility Registration percentage to EIR.

Class

Optional.

Type / Range

Integer in the range of 0 to 100

Default

0

Name

mobilityRegistrationFromMmePercentage - Mobility Registration From MME Percentage

Syntax

--mobilityRegistrationFromMmePercentage <integer>

Description

Mobility Registration from MME Percentage to EIR

Class

Optional.

Type / Range

Integer in the range of 0 to 100

Default

0

Name

rejectRegistrationRequest - Reject Registration Reject

Syntax

--rejectRegistrationRequest <list-item>

Description

This parameter controls whether the Registration procedure is allowed to continue if AMF detects transport error such as N17 link(s) is disabled or EIR check attempts timeout. For emergency registration, the setting of the amfEsrvBehavior in the emergency profile is used to control if emergency registration is allowed to continue.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

3.40 cmm amfEmergencyNum

Emergency Number List. Syntax, description, parameters, and roles for cmm amfEmergencyNum command.

Syntax

Description

This command is used to administer an Emergency Number List and includes parameters for defining emergency numbers for ambulance, fire brigade, marine guard, mountain rescue and police. Maximum list of up to 6 Emergency Numbers shall be supported.

Parameters

Name

amfEmergencyNumListName - Name

Syntax

--amfEmergencyNumListName <string>

Description

Defines the name of amf emergency number list table

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

emergencyDigits - Emergency Digits

Syntax

--emergencyDigits <string>

Description

Emergency number. Only 6 unique amfEmergencyNum records can be associated with the same amfEmergencyNumList name.

Class

Required key.

Type / Range

Digit string of length 1 to 10 with the allowed pattern of [0-9][0-9A-Ca-c*#]*

Name

ambulance - Ambulance

Syntax

--ambulance <list-item>

Description

If emergency number digits apply to ambulance.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

fireBrigade - Fire brigade

Syntax

--fireBrigade <list-item>

Description

If emergency number digits apply to firebrigade.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

marineGuard - Marine guard

Syntax

--marineGuard <list-item>

Description

If emergency number digits apply to marineguard.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

mountainRescue - Mountain rescue

Syntax

--mountainRescue <list-item>

Description

If emergency number digits apply to mountainrescue.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

police - Police

Syntax

--police <list-item>

Description

If emergency number digits apply to police.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

3.41 cmm amfEmergencyNumList

Emergency Number List Table. Syntax, description, parameters, and roles for cmm amfEmergencyNumList command.

Syntax

Description

This command is used to administer an Emergency Number List Table.

Parameters

Name

name - Name

Syntax

--name <string>

Description

Defines the name of emergency number list table.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Roles

Create

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

3.42 cmm amfEmergencyProfile

AMF Emergency Profile. Syntax, description, parameters, and roles for cmm amfEmergencyProfile command.

Syntax

Description

This command is used to administer an Emergency Profile. AMF allows creation of up to 10 emergency profiles. An emergency profile can be assigned to an AMF home PLMN (for 3GPP access) and/or to a non-3GPP access TA.

Parameters

Name

name - amf Emergency Profile Name

Syntax

--name <string>

Description

Name that identifies amf emergency profile

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

sliceServiceType - Slice Service Type

Syntax

--sliceServiceType <integer>

Description

The S-NSSAI consists of a Slice Service Type (SST) and a Slice Differentiator (SD). Each slice must have SST and SD is optional. SST is mandatory for an sNssai, as such it shall be always provisioned in emergency profile.

Class

Required on create.

Type / Range

5G Slice Service Type

Name

ambrDl - AMBR downlink

Syntax

--ambrDl <integer>

Description

AMBR downlink bandwidth in bits per second

Class

Optional.

Type / Range

Integer in the range of 0 to 4,294,967,295

Default

4096000

Name

ambrUl - AMBR uplink

Syntax

--ambrUl <integer>

Description

AMBR uplink bandwidth in bits per second

Class

Optional.

Type / Range

Integer in the range of 0 to 4,294,967,295

Default

4096000

Name

amfEmerFallback - Emergency Fallback

Syntax

--amfEmerFallback <list-item>

Description

Emergency fall back services shall be provided to a UE to establish emergency call. Not applicable for non-3GPP access TA.

Class

Optional.

List

- false - Boolean value of false.

- true - Boolean value of true.

Default

false

Name

amfEmerFallbackNumListIncl - AMF Emergency Fallback Number List Inclusion

Syntax

--amfEmerFallbackNumListIncl <list-item>

Description

Defines whether the AMF includes the UE the Emergency Number List as part of (normal i.e. not emergency) Registration Accept, when the AMF indicates Emergency service support indicator for 3GPP access (EMC) flag as not supported, and Emergency services fallback indicator for 3GPP access (EMF) as supported. Not applicable for non-3GPP access TA.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

amfEmergencyNumListName - Amf Emergency number list table name

Syntax

--amfEmergencyNumListName <string>

Description

Defines the amf emergency number list table name

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

amfEsrvBehavior - Service behavior

Syntax

--amfEsrvBehavior <list-item>

Description

AMF behavior in providing emergency service session support.

Class

Optional.

List

- All UEs are allowed - Specifies AMF emergency support to all UEs are allowed.
- Only UEs that are authenticated are allowed - Specifies AMF emergency support to only UEs that are authenticated are allowed.
- UE SUPI required, authentication optional - Specifies AMF emergency support to UEs SUPI required, authentication optional.
- Valid UEs only - Specifies AMF emergency support to valid UEs only.

Default

All UEs are allowed

Name

amfEsrvcBlackListedUe - Service for black listed UE

Syntax

--amfEsrvcBlackListedUe <list-item>

Description

Emergency services shall be provided to a UE with an PEI that is black listed in the 5G-EIR.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

amfEsrvcT3512Timer - Emergency T3512 Timer In Minutes

Syntax

--amfEsrvcT3512Timer <integer>

Description

Emergency T3512 timer in minutes. If it is 0, this timer is disabled and t3512 timer from AMF NAS Timers table is used. Not applicable for non-3GPP access TA.

Class

Optional.

Type / Range

Integer in the range of 0 to 186

Default

0

Name

dnnNi - DNN (NI)

Syntax

--dnnNi <string>

Description

DNN is a reference to a data network.

Class

Optional.

Type / Range

Digit string of length 1 to 62 with the allowed pattern of [0-9a-zA-Z\.\-]*

Default

sos

Name

indicateEmergencyHandoverAfter5gSrvcc - Indicate Emergency Handover after 5G-SRVCC

Syntax

--indicateEmergencyHandoverAfter5gSrvcc <list-item>

Description

Defines whether the AMF indicates the emergency call handover towards the GMLC after an emergency call has been handed over to UTRAN by 5G-SRVCC, and additionally whether the AMF supports and includes the MSC server address on it. Not applicable for non-3GPP access TA.

Class

Optional.

List

- NoLocationContinuity - No Location Continuity - AMF does not trigger Namf_Location_EventNotify towards the GMLC after 5G-SRVCC handover. (Note: This value should be used when the MSC server is configured to update the GMLC after the 5G-SRVCC completion.
- WithMscServerAddr - With MSC Server Address - AMF triggers Namf_Location_EventNotify towards the GMLC to indicate the emergency call handover, whenever AMF has previously triggered the LCS procedure when the emergency session was started (according to LCS settings). AMF supports receiving the MSC

server address from MME_SRVCC over N26 and includes the MSC server address on Namf_Location_EventNotify towards the GMLC, if received from MME.

- WithoutMscServerAddr - Without MSC Server Address - AMF triggers Namf_Location_EventNotify towards the GMLC to indicate the emergency call handover, whenever AMF has previously triggered the LCS procedure when the emergency session was started (according to LCS settings). AMF does not support receiving the MSC server address from MME_SRVCC over N26 and does not include the MSC server address on Namf_Location_EventNotify towards the GMLC.

Default

WithoutMscServerAddr

Name

networkInducedLcsBehavior - NI-LR Behavior

Syntax

--networkInducedLcsBehavior <list-item>

Description

AMF NI-LR behaviors: E911 without NI-LR, E911 with NI-LR without LMF or E911 with NI-LR and LMF. Not supported on the current product release for non-3GPP access TAI.

Class

Optional.

List

- LMFNI-LR - NI-LR With LMF Contact - NI-LR with LMF contact
- NoLMFNI-LR - NI-LR Without LMF Contact - NI-LR without LMF contact
- NoNI-LR - Do Not Perform NI-LR - Do not perform NI-LR

Default

NoNI-LR

Name

sliceDifferentiator - Slice Differentiator

Syntax

--sliceDifferentiator <string>

Description

The S-NSSAI consists of a Slice Service Type (SST) and a Slice Differentiator (SD). Each slice must have SST and SD is optional. A SST may have multiple SDs.

Class

Optional.

Type / Range

Identifies Slice Differentiator (SD)

Default

FFFFFF

Name

smfEmergencySelection - SMF Emergency Selection

Syntax`--smfEmergencySelection <list-item>`**Description**

The parameter specifies the method of SMF selection used by the AMF for Emergency services. If populated it shall override smf selection in uePlmn services.

Class

Optional.

List

- LocalProvisioning - Local Provisioning - AMF will use locally provisioned NF for the selection of a NF.
- NRF - Network Repository Function - Make use of NRF to select NF.
- NRFLocalProvisioning - NRF with Local Provisioning Override - The AMF will check the locally provisioned selection rules and if there is a match then the AMF will select the NF matching the rule. If there is no matching then AMF will use the NRF. The selection rule by default is that AMF will select a NF supporting a provisioned criterion for the NF.
- NoProvisioning - No Provisioning - Use smfSelection from amfUePlmnServices

Default

NoProvisioning

Name

snssaiName - SNSSAI Name

Syntax`--snssaiName <string>`**Description**

SNSSAI Name

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

3.43 cmm amfEplmn

Equivalent PLMN . Syntax, description, parameters, and roles for `cmm amfEplmn` command.

Syntax

Description

Configures an existing network as an equivalent network and includes parameter attributes for defining the serving and equivalent network names.

Parameters

Name

amfEplmnListName - Equivalent PLMN List Name

Syntax

--amfEplmnListName <string>

Description

Identifies the Equivalent PLMN list name.

Restrictions

EPLMN List must not include the Served PLMN at list creation or modification.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of `[0-9a-zA-Z\.\-_\:@]*`

Name

amfEquivalentPlmnName - AMF Equivalent PLMN Name

Syntax

--amfEquivalentPlmnName <string>

Description

Identifies the name of the EPLMN which can be Home, Shared or Other PLMN. There can be up to 15 EPLMNs in the list.

Restrictions

EPLMN List must not include the Served PLMN at list creation or modification.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

3.44 cmm amfEplmnList

EPLMN List. Syntax, description, parameters, and roles for cmm amfEplmnList command.

Syntax**Description**

EPLMN List

Parameters**Name**

name - EPLMN List name

Syntax

--name <string>

Description

Identifies the name of the EPLMN List

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

description - Description of Eplmn List

Syntax

--description <string>

Description

Describes the use of the EPLMN list e.g. for UE or gNB.

Class

Optional.

Type / Range

Digit string of length 0 to 160 with the allowed pattern of [0-9a-zA-Z\._:@]*

3.45 cmm amfEpsCipheringAlgorithm

Preferred EPS Ciphering Algorithm in AMF . Syntax, description, parameters, and roles for cmm amfEpsCipheringAlgorithm command.

Syntax

Description

This command sets EPS algorithms, in priority order, AMF will use it to negotiate encryption of NAS messages with the UE. At UE REGISTRATION, the UE provides, in the UE security capabilities, which encryption algorithms in EPS are supported. The AMF will use the algorithm both supported by the UE and highest in priority in the eea ciphering algorithm priority list. - An algorithm must be chosen for 'priority-1' and 'priority-2'. - An additional selection, 'none', can be selected for 'priority-3' and 'priority-4' - effectively truncating the list. - If any ciphering algorithm (including null) is selected for 'priority-4', then 'priority-3' must not be 'none'. - An algorithm cannot be used for more than one priority (except for 'none')

Parameters

Name

epsCipheringAlgPrio1 - Priority 1 EPS ciphering algorithm

Syntax

--epsCipheringAlgPrio1 <list-item>

Description

Most preferred EPS ciphering algorithm

Class

Optional.

List

- aes - 128-EEA2 (AES) - Specify ciphering of 128-EEA2 (AES).
- noCiphering - 128-EEA0 (No ciphering) - Specify ciphering of 128-EEA0 (No ciphering).
- none - No algorithm selected - Specify ciphering of no algorithm selected.
- snow3G - 128-EEA1 (SNOW 3G) - Specify ciphering of 128-EEA1 (SNOW 3G).
- zuc - 128-EEA3 (ZUC) - Specify ciphering of 128-EEA3 (ZUC).

Default

snow3G

Name

epsCipheringAlgPrio2 - Second most preferred EPS ciphering algorithm

Syntax

--epsCipheringAlgPrio2 <list-item>

Description

Second most preferred EPS ciphering algorithm; used if the user element does not support algorithm(s) of higher priority

Class

Optional.

List

- aes - 128-EEA2 (AES) - Specify ciphering of 128-EEA2 (AES).
- noCiphering - 128-EEA0 (No ciphering) - Specify ciphering of 128-EEA0 (No ciphering).
- none - No algorithm selected - Specify ciphering of no algorithm selected.
- snow3G - 128-EEA1 (SNOW 3G) - Specify ciphering of 128-EEA1 (SNOW 3G).
- zuc - 128-EEA3 (ZUC) - Specify ciphering of 128-EEA3 (ZUC).

Default

aes

Name

epsCipheringAlgPrio3 - Third most preferred ciphering algorithm

Syntax

--epsCipheringAlgPrio3 <list-item>

Description

Third most preferred ciphering algorithm; used if the user element does not support algorithm(s) of higher priority

Class

Optional.

List

- aes - 128-EEA2 (AES) - Specify ciphering of 128-EEA2 (AES).
- noCiphering - 128-EEA0 (No ciphering) - Specify ciphering of 128-EEA0 (No ciphering).
- none - No algorithm selected - Specify ciphering of no algorithm selected.
- snow3G - 128-EEA1 (SNOW 3G) - Specify ciphering of 128-EEA1 (SNOW 3G).
- zuc - 128-EEA3 (ZUC) - Specify ciphering of 128-EEA3 (ZUC).

Default

zuc

Name

epsCipheringAlgPrio4 - Fourth most preferred ciphering algorithm

Syntax

--epsCipheringAlgPrio4 <list-item>

Description

Fourth most preferred ciphering algorithm; used if the user element does not support algorithm(s) of higher priority

Class

Optional.

List

- aes - 128-EEA2 (AES) - Specify ciphering of 128-EEA2 (AES).
- noCiphering - 128-EEA0 (No ciphering) - Specify ciphering of 128-EEA0 (No ciphering).
- none - No algorithm selected - Specify ciphering of no algorithm selected.
- snow3G - 128-EEA1 (SNOW 3G) - Specify ciphering of 128-EEA1 (SNOW 3G).
- zuc - 128-EEA3 (ZUC) - Specify ciphering of 128-EEA3 (ZUC).

Default

none

3.46 cmm amfEpsIntegrityAlgorithm

Preferred Integrity EPS Algorithm in AMF . Syntax, description, parameters, and roles for cmm amfEpsIntegrityAlgorithm command.

Syntax**Description**

This command sets the algorithms, in priority order, AMF will use to negotiate integrity of NAS messages with the UE. At REGISTRATION, the UE provides, in the UE security capabilities, which EPS integrity algorithms are supported. The AMF will use the algorithm both supported by the UE and highest in priority in the eia algorithm priority list. - An algorithm must be chosen for 'priority-1' and 'priority-2'. - An additional selection, 'none', can be selected for 'priority-3' and 'priority-4' - effectively truncating the list. - If any integrity algorithm (including null) is selected for 'priority-4', then 'priority-3' must not be 'none'. - An algorithm cannot be used for more than one priority (except for 'none').

Parameters**Name**

epsIntegrityAlgPrio1 - Priority 1 EPS Integrity algorithm

Syntax

--epsIntegrityAlgPrio1 <list-item>

Description

Most preferred EPS Integrity algorithm

Class

Optional.

List

- aes - 128-EIA2 (AES) - Specify integrity algorithm of 128-EIA2 (AES).
- none - No algorithm selected - Specify integrity algorithm of no algorithm selected.
- snow3G - 128-EIA1 (SNOW 3G) - Specify integrity algorithm of 128-EIA1 (SNOW 3G).
- zuc - 128-EIA3 (ZUC) - Specify integrity algorithm of 128-EIA3 (ZUC).

Default

snow3G

Name

epsIntegrityAlgPrio2 - Priority 2 EPS integrity algorithm

Syntax

--epsIntegrityAlgPrio2 <list-item>

Description

Second most preferred integrity algorithm; used if the user element does not support algorithm(s) of higher priority

Class

Optional.

List

- aes - 128-EIA2 (AES) - Specify integrity algorithm of 128-EIA2 (AES).
- none - No algorithm selected - Specify integrity algorithm of no algorithm selected.
- snow3G - 128-EIA1 (SNOW 3G) - Specify integrity algorithm of 128-EIA1 (SNOW 3G).
- zuc - 128-EIA3 (ZUC) - Specify integrity algorithm of 128-EIA3 (ZUC).

Default

aes

Name

epsIntegrityAlgPrio3 - Third most preferred EPS integrity algorithm

Syntax

--epsIntegrityAlgPrio3 <list-item>

Description

Third most preferred integrity algorithm; used if the user element does not support algorithm(s) of higher priority

Class

Optional.

List

- aes - 128-EIA2 (AES) - Specify integrity algorithm of 128-EIA2 (AES).
- none - No algorithm selected - Specify integrity algorithm of no algorithm selected.
- snow3G - 128-EIA1 (SNOW 3G) - Specify integrity algorithm of 128-EIA1 (SNOW 3G).
- zuc - 128-EIA3 (ZUC) - Specify integrity algorithm of 128-EIA3 (ZUC).

Default

zuc

Name

epsIntegrityAlgPrio4 - Priority 4 EPS integrity algorithm

Syntax

--epsIntegrityAlgPrio4 <list-item>

Description

Priority 4 EPS integrity algorithm

Class

Optional.

List

- aes - 128-EIA2 (AES) - Specify integrity algorithm of 128-EIA2 (AES).
- none - No algorithm selected - Specify integrity algorithm of no algorithm selected.
- snow3G - 128-EIA1 (SNOW 3G) - Specify integrity algorithm of 128-EIA1 (SNOW 3G).
- zuc - 128-EIA3 (ZUC) - Specify integrity algorithm of 128-EIA3 (ZUC).

3.47 cmm amfEquivalentPlmn

AMF Equivalent PLMN. Syntax, description, parameters, and roles for cmm amfEquivalentPlmn command.

Syntax

Description

Configures an Equivalent PLMN network, and includes parameters for defining the Equivalent PLMN network name(s) and the mapping to the Served PLMN(s) Home or Shared. This table allows the provisioning of AMF TAI List for Equivalent PLMN(s).

Parameters

Name

servedPlmnName - Served PLMN Name

Syntax

--servedPlmnName <string>

Description

Plmn Name that identifies the serving network Home or Shared.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

amfEquivalentPlmnName - Equivalent PLMN Name

Syntax

--amfEquivalentPlmnName <string>

Description

Identifies the Equivalent Plmn Name

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

3.48 cmm amfEventExposureGParms

AMF Event Exposure Global Parameters. Syntax, description, parameters, and roles for cmm amfEventExposureGParms command.

Syntax

Description

This command is used to enter AMF Event Exposure global parameters.

Parameters

Name

amfGparmName - Parameter name

Syntax

--amfGparmName <list-item>

Description

Name of parameter

Class

Required key.

List

- maxExpiry - Maximum Expiry - Specifies the Maximum Expiration time for a subscribed Event. If an event subscription request has an expiration timer greater than the maximum expiry, the AMF shall set the event expiry to the provisioned value.
- uesInAreaSubscriptionAllowed - UEs In Area Subscription Allowed - Specifies whether the AMF is allowed to accept a subscription to the UEs in Area Event

Name

amfGparmValue - Parameter value

Syntax

--amfGparmValue <string>

Description

Value of parameter

Class

Required on create.

Type / Range

Digit string of length 0 to 64

The amfGparmValue string is based on the amfGparmName parameter:

Name

maxExpiry - Maximum Expiry

Syntax

```
--amfGparmName maxExpiry --amfGparmValue <string>
```

Description

Specifies the Maximum Expiration time for a subscribed Event. If an event subscription request has an expiration timer greater than the maximum expiry, the AMF shall set the event expiry to the provisioned value.

Type / Range

Integer in the range of 10 to 90 in units of Hour

Default

10

Name

uesInAreaSubscriptionAllowed - UEs In Area Subscription Allowed

Syntax

```
--amfGparmName uesInAreaSubscriptionAllowed --amfGparmValue <string>
```

Description

Specifies whether the AMF is allowed to accept a subscription to the UEs in Area Event

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Roles

Show

sysadmin, manage, monitor

Modify

sysadmin, manage

List

sysadmin, manage, monitor

3.49 cmm amfEventProfile

AMF Event Profile. Syntax, description, parameters, and roles for `cmm amfEventProfile` command.

Syntax**Description**

Profile defines which AMF Event Exposure capabilities are activated at the AMF. A maximum of 16 profiles is supported. The 'default' profile always exists and cannot be deleted.

Parameters**Name**

name - name

Syntax

--name <string>

Description

profile name

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

communicationFailure - Communication Failure

Syntax

--communicationFailure <list-item>

Description

Communication Failure Event Feature

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

connectivityStatus - Connectivity Status

Syntax

--connectivityStatus <list-item>

Description

Connectivity Status Event Active

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

groupAllowed - Group Allowed

Syntax

--groupAllowed <list-item>

Description

Specifies whether groupID events are allowed on the AMF

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

location - Location

Syntax

--location <list-item>

Description

Location Reporting Event

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

lossOfConnectivity - Loss Of Connectivity

Syntax

--lossOfConnectivity <list-item>

Description

Loss of Connectivity for the profile

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

maxAvailTimeSupported - Max Avail Time Supported

Syntax

--maxAvailTimeSupported <list-item>

Description

Specifies whether the AMF can include Maximum Availability Time in a UE Reachability Notification for downlink data for a UE currently assigned eDRX active time.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Recommended

false

Name

pageIdleUeForCurrentLocation - Page IDLE UE for Current Location

Syntax

--pageIdleUeForCurrentLocation <list-item>

Description

Defines the AMF behavior for an CM-IDLE UE when the subscribed event type is LOCATION_REPORT and immediateFlag is false or absent. The parameter defines whether the AMF pages the UE to retrieve the current location or, if no paging is done, whether the AMF waits for the UE to establish the signalling connection and only after that the AMF reports the current location towards the service consumer. This setting applies for ONE_TIME reports and for CONTINUOUS reports the first report.

Class

Optional.

List

- AmfNoPaging - AMF No Paging - AMF does not page a CM-IDLE UE for current location.
- AmfPageAlways - AMF Page Always - AMF pages the CM-IDLE UE always no matter the requested location.
- AmfPageForCellOnly - AMF Page For Cell Only - AMF pages the CM-IDLE UE for the cell level only.

Default

AmfNoPaging

Name

presenceInAoI - Presence in Area of Interest

Syntax

--presenceInAoI <list-item>

Description

Presence in Area of Interest.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

reachability - Reachability

Syntax

--reachability <list-item>

Description

UE Reachability Event

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

registrationState - Registration State

Syntax

--registrationState <list-item>

Description

Registration State Event Active

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

typeAllocCode - Type Allocation Code

Syntax

--typeAllocCode <list-item>

Description

Specifies whether the AMF supports the Type Allocation Code Event

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

userState - User State

Syntax

--userState <list-item>

Description

User State Event Report Feature

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

3.50 cmm amfExtendedEmergencyNum

AMF Extended Emergency Number. Syntax, description, parameters, and roles for cmm amfExtendedEmergencyNum command.

Syntax

Description

This command is used to administer an Extended Emergency Number List Table Maximum of 25 Extended Emergency Number entries can be supported per Extended Emergency Number List.

Parameters

Name

extendedEmergencyNumListName - Extended Emergency Number List Name

Syntax

--extendedEmergencyNumListName <string>

Description

Defines the extended emergency number list table name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

extendedEmergencyDigits - Extended Emergency Digits

Syntax

--extendedEmergencyDigits <string>

Description

Maximum of 25 items can be in a list.

Class

Required key.

Type / Range

Digit string of length 1 to 10 with the allowed pattern of [0-9][0-9A-Ca-c*#]*

Name

subServiceUrn - Sub-service Unified Resource Name

Syntax

--subServiceUrn <string>

Description

Name of the emergency service. If the associated emergency service URN is 'urn:service:sos.gas', there is only one sub-service provided in the sub-services field which is 'gas'. Following are some of the examples of URN services: 'urn:service:sos.ambulance', 'urn:service:sos.police', 'urn:service:sos.fire', 'urn:service:sos.marine', 'urn:service:sos.mountain', 'urn:service:sos.ecall.manual', 'urn:service:sos.ecall.automatic'. If the UE can determine the type of emergency service, the

UE shall use an emergency service URN with a sub-service type corresponding to the type of emergency service. There is no need to enter the prefix: urn:service:

Class

3.51 cmm amfExtendedEmergencyNumList

AMF Extended Emergency Number List. Syntax, description, parameters, and roles for cmm amfExtendedEmergencyNumList command.

Syntax**Description**

This command is used to administer an Extended Emergency Number List. Maximum of 10 extended emergency number list shall be supported.

Parameters**Name**

name - Extended Emergency Number List Name

Syntax

--name <string>

Description

Defines the extended emergency number list table name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

extendedEmergencyNumberListValidity - Extended Emergency Number List Validity

Syntax

--extendedEmergencyNumberListValidity <list-item>

Description

Parameter specifies whether extended emergency number list validity is valid in the country or the PLMN from which this IE is received.

Class

Optional.

List

- country - Country Extended Emergency Number List Validity - Extended Local Emergency Numbers List is valid in the country of the PLMN from which this IE is received
- plmn - PLMN Extended Emergency Number List Validity - Extended Local Emergency Numbers List is valid only in the PLMN from which this IE is received.

Default

country

3.52 cmm amfFreqCountMonitoring

AMF Frequency Count Monitoring. Syntax, description, parameters, and roles for cmm amfFreqCountMonitoring command.

Syntax

Description

Manage AMF actions related to frequency count monitoring functionality. The command supports three tasks. A task is created for each action. The Create Deny-listed UE File task dumps/exports currently deny-listed UEs into created file. The Delete Behaviour Data task deletes/purges all behavior contexts i.e. clears any deny-listing related information from AMF internal storage. After performing this, deny-listed UEs can again access the AMF (normal subscriber data is maintained). The Deny-listed UE Count task outputs the number of deny-listed UEs.

Parameters

Name

frequencyMonitoringTask - Frequency Monitoring Task

Syntax

--frequencyMonitoringTask <list-item>

Description

Defines frequency count monitoring task to be executed.

Class

Required key.

List

- denyListedUeCount - Deny-listed UE Count - Request deny-listed UE count.
- createDenyListedUeFile - Create Deny-listed UE File - Request to create a file with deny-listed UEs.
- deleteBehaviourData - Delete Behaviour Data - Request to delete all AMF stored behaviour data (for the UEs that have previously attempted to access the AMF, deny-listed or not yet deny-listed).

Name

denyListedUeCount - Deny-listed UE Count

Syntax

--denyListedUeCount <integer>

Description

The number of deny-listed UEs.

Class

Read only.

Type / Range

Integer in the range of 0 to 4,294,967,295

Name

freqMonitoringStatus - Frequency Monitoring Status

Syntax

--freqMonitoringStatus <string>

Description

Shows current status of task.

Class

Read only.

Type / Range

Digit string of length 0 to 64

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

3.53 cmm amfFreqCountMonitoringProfile

AMF Frequency Count Monitoring Profile. Syntax, description, parameters, and roles for cmm amfFreqCountMonitoringProfile command.

Syntax**Description**

This profile defines parameters for frequency count analysis. AMF considers UE attempts for defined procedure(s) abnormally frequent if the number of attempts exceed the provisioned value during a provisioned time period. AMF supports max 128 profiles.

Parameters**Name**

name - Name

Syntax

--name <string>

Description

The name of the AMF frequency count monitoring profile.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

allowed3gppRegistrationAttempts - Allowed 3GPP Registration Attempts

Syntax

--allowed3gppRegistrationAttempts <integer>

Description

Defines the allowed number of NAS Registration attempts over 3GPP access for a single UE within the provisioned time interval before UE is deny-listed.

Class

Optional.

Type / Range

Integer in the range of 1 to 100

Default

5

Name

allowed3gppServiceRequestAttempts - Allowed 3GPP Service Request Attempts

Syntax

--allowed3gppServiceRequestAttempts <integer>

Description

Defines the allowed number of NAS Service Request attempts over 3GPP access for a single UE within the provisioned time interval before UE is deny-listed.

Class

Optional.

Type / Range

Integer in the range of 1 to 100

Default

5

Name

allowed3gppUINasSmAttempts - Allowed 3GPP UL NAS SM Attempts

Syntax

--allowed3gppUINasSmAttempts <integer>

Description

Defines the allowed number of NAS UL NAS Transport attempts over 3GPP access for a single UE, where the Payload Container Type indicates N1 SM information, within the provisioned time interval before UE is deny-listed.

Class

Optional.

Type / Range

Integer in the range of 1 to 100

Default

5

Name

allowed3gppUlNasSmsAttempts - Allowed 3GPP UL NAS SMS Attempts

Syntax

--allowed3gppUlNasSmsAttempts <integer>

Description

Defines the allowed number of NAS UL NAS Transport attempts over 3GPP access for a single UE, where the Payload Container Type indicates SMS, within the provisioned time interval before UE is deny-listed.

Class

Optional.

Type / Range

Integer in the range of 1 to 100

Default

10

Name

allowedNon3gppRegistrationAttempts - Allowed Non-3GPP Registration Attempts

Syntax

--allowedNon3gppRegistrationAttempts <integer>

Description

Defines the allowed number of NAS Registration attempts over non-3GPP access for a single UE within the provisioned time interval before UE is deny-listed.

Class

Optional.

Type / Range

Integer in the range of 1 to 100

Default

5

Name

allowedNon3gppServiceRequestAttempts - Allowed Non-3GPP Service Request Attempts

Syntax

--allowedNon3gppServiceRequestAttempts <integer>

Description

Defines the allowed number of NAS Service Request attempts over non-3GPP access for a single UE within the provisioned time interval before UE is deny-listed.

Class

Optional.

Type / Range

Integer in the range of 1 to 100

Default

5

Name

allowedNon3gppUINasSmAttempts - Allowed Non-3GPP UL NAS SM Attempts

Syntax

--allowedNon3gppUINasSmAttempts <integer>

Description

Defines the allowed number of NAS UL NAS Transport attempts over non-3GPP access for a single UE, where the Payload Container Type indicates N1 SM information, within the provisioned time interval before UE is deny-listed.

Class

Optional.

Type / Range

Integer in the range of 1 to 100

Default

5

Name

allowedNon3gppUINasSmsAttempts - Allowed Non-3GPP UL NAS SMS Attempts

Syntax

--allowedNon3gppUINasSmsAttempts <integer>

Description

Defines the allowed number of NAS UL NAS Transport attempts over non-3GPP access for a single UE, where the Payload Container Type indicates SMS, within the provisioned time interval before UE is deny-listed.

Class

Optional.

Type / Range

Integer in the range of 1 to 100

Default

10

Name

calculateTotalNumberOfAttempts - Calculate Total Number of Attempts

Syntax

--calculateTotalNumberOfAttempts <list-item>

Description

Defines whether the AMF calculates a total number of all monitored procedure attempts per the monitoring period. AMF only calculates into the total number of attempts for the procedures that are provisioned as monitored. When set to true, the AMF performs actions if the complete number of all monitored procedures exceeds the total number of allowed attempts per monitoring period. When set to false, only exceeding the procedure specific attempt(s) causes AMF action.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

initialRegistrationDeregistrationCause - Initial Registration and Deregistration cause

Syntax

--initialRegistrationDeregistrationCause <integer>

Description

Defines the 5GMM cause code to be used on Registration Rejects for Registration Type Initial Registration, and Deregistration Requests from the AMF, when triggered due to frequency count monitoring functionality.

Class

Optional.

Type / Range

5GMM Cause Code.

Default

7

Name

mobilityPeriodicRegistrationServiceRequestCause - Mobility and Periodic Registration Update and Service Request Cause

Syntax

--mobilityPeriodicRegistrationServiceRequestCause <integer>

Description

Defines the 5GMM cause code used on Mobility and periodic registration update procedures or Service request, when the AMF rejects the procedure due to UE procedure frequency count monitoring functionality.

Class

Optional.

Type / Range

5GMM Cause Code that leads on Mobility and Periodic Registration Update the UE into any 5GMM-DEREGISTERED state.

Default

7

Name

monitor3gppRegistrations - Monitor 3GPP Registrations

Syntax

--monitor3gppRegistrations <list-item>

Description

Defines whether the AMF monitors frequency of NAS Registration procedure attempts over 3GPP access.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

monitor3gppServiceRequests - Monitor 3GPP Service Requests

Syntax

--monitor3gppServiceRequests <list-item>

Description

Defines whether the AMF monitors the frequency of NAS Service requests over 3GPP access.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

monitor3gppUINasSm - Monitor 3GPP Uplink NAS SM

Syntax

--monitor3gppUINasSm <list-item>

Description

Defines whether the AMF monitors the frequency of NAS UL NAS transports with payload container type indicating N1 SM information over 3GPP access.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

monitor3gppUINasSms - Monitor 3GPP Uplink NAS SMS

Syntax

--monitor3gppUINasSms <list-item>

Description

Defines whether the AMF monitors the frequency of NAS UL NAS transports with payload container type indicating SMS over 3GPP access.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

monitorNon3gppRegistrations - Monitor Non-3GPP Registrations

Syntax

--monitorNon3gppRegistrations <list-item>

Description

Defines whether the AMF monitors the frequency of NAS Registrations over non-3GPP access.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

monitorNon3gppServiceRequests - Monitor Non-3GPP Service Requests

Syntax

--monitorNon3gppServiceRequests <list-item>

Description

Defines whether the AMF monitors NAS Service requests over non-3GPP access.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

monitorNon3gppULNasSm - Monitor Non-3GPP UL NAS SM

Syntax

--monitorNon3gppULNasSm <list-item>

Description

Defines whether the AMF monitors separately the frequency of NAS UL NAS transports with payload container type indicating N1 SM information over non-3GPP access.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

monitorNon3gppUlnasSms - Monitor Non-3GPP Uplink NAS SMS

Syntax

--monitorNon3gppUlnasSms <list-item>

Description

Defines whether the AMF monitors the frequency of NAS UL NAS transports with payload container type indicating SMS over non-3GPP access.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

timeInterval - Time Interval

Syntax

--timeInterval <integer>

Description

Defines the monitoring interval within which the AMF monitors the number of procedure attempts from a UE.

Class

Optional.

Type / Range

Integer in the range of 1 to 3,600 in units of Second

Default

60

Name

totalAllowedAttempts - Total Allowed Attempts

Syntax

--totalAllowedAttempts <integer>

Description

Defines the total allowed number of all monitored procedure attempts over any access type for a single UE within the provisioned time interval before UE is deny-listed. AMF only calculates into the total number of attempts the attempts for procedures that are provisioned as monitored. This parameter is applied when Calculate Total Number of Attempts is set to true.

Class

Optional.

Type / Range

Integer in the range of 1 to 100

Default

10

Name

ulNasCause - UL NAS Cause

Syntax

--ulNasCause <integer>

Description

Defines the 5GMM cause code used when a NAS UL NAS message is sent back to the UE.

Class

Optional.

Type / Range

5GMM Cause Code.

Default

90

3.54 cmm amfGParms

5G Global Parameters. Syntax, description, parameters, and roles for cmm amfGParms command.

Syntax

Description

AMF global parameters.

Parameters

Name

amfGparmName - Parameter name

Syntax

--amfGparmName <list-item>

Description

Name of parameter.

Class

Required key.

List

- 5g4gRetPrefPlmn - 5g4g Return Preferred PLMN - This parameter enables indicating to serving NG-RAN the last visited EPC PLMN as preferred indication to be used in future 5GS to EPS mobility.
- 5gRanTotalConfigIncompatibilityAlarm - 5G RAN Total Configuration Incompatibility Alarm - When this parameter is enabled, AMF will raise an Alarm when receiving RAN Configuration Update or there is local configuration change (that may or not lead to sending AMF Configuration Update) that results in total configuration incompatibility between the AMF and the RAN.
- acceptVoiceNoCheckResp - Accept Voice No Check Response - Controls whether the AMF allows indicating IMS voice over PS sessions supported towards the UE and the UDM, when UE Radio Capability Check procedure is provisioned to be run towards the NG-RAN from the AMF but the NG-RAN provides no response for NGAP UE Radio Capability Check Request message.

- **accessTypeChangePcfTrigger** - Access Type Change PCF Trigger - Enables the AMF support for Access Type changes triggered from PCF. By default, flag shall be disabled.
- **alwaysSendDnnWithOperatorIdentifier** - Always Send DNN with DNN Operator Identifier - Defines whether AMF will always include DNN-OI in DNNs sent as SBI JSON Body IEs and Query Parameters. When the value is true, the AMF will always include the DNN-OI in DNNs. When value is false, the DNN-OI may not be always present as the AMF transparently conveys the DNN in the non roaming scenarios.
- **amfEirSupport** - AMF EIR Support - Activation of the AMF EIR feature on the AMF. By default this shall be disabled
- **amfHomogeneousSupportTais** - AMF Homogeneous Support TAI - Defines the TAI the AMF considers for IMS voice over PS homogeneous support under the serving AMF. The other access TAI is considered to support all voice options when considered for the other access IMS voice over PS homogeneous support. (Non-3GPP TAI is considered to support VoPS with VoNR and VoLTE Handover and Redirect.)
- **amfN26DirectFwd** - Indicates whether direct data forwarding is enabled or disabled on n26 handover.
- **amfN26IndirectFwd** - Indicates whether indirect data forwarding is enabled or disabled on n26 handover.
- **amfNpli** - AMF NPLI - Enables the support for Network Provided Location Info (NPLI) i.e the Namf_Location_ProvideLocationInfo service for the AMF.
- **amfRanCombiningOption** - AMF RAN Combining Option - Controls how the AMF establishes the user plane sessions during Service Request or Mobility Registration Update for multiple PDU sessions. AMF may either combine/aggregate all SMF responses and formulate a single NGAP message, or formulate separate NGAP messages per each SMF request.
- **amfRequestPsCellInLrc** - AMF Request PS Cell in LRC - When location reporting control procedure is used in AMF, if AMF Request PS Cell in LRC is set, then AMF includes additional location information IE and set to Include PSCell. gNB will include the current PSCell in the report if Dual Connectivity is activated. If AMF Request PS Cell in LRC is not set, AMF will not request additional location information under location reporting procedure as existing function, then gNB will not report PSCell in location report.
- **amfSmsSubscrGet** - AMF SMS Subscription Get - Controls whether the AMF always attempts to get the SMS related subscription data from the UDM, or whether the AMF follows UE indication of support for SMS over NAS when retrieving the SMS related subscription data from the UDM (i.e. gets the subscription data on need only).
- **amfTaiDiscovery** - AMF TAI Discovery - Specifies whether the AMF TAI auto-discovery feature is active. Default is disable.
- **amfTriggeredRrcInactivePaging** - AMF Triggered RRC Inactive Paging - When set to true, the AMF triggers paging of UE(s) in RRC Inactive state but not reachable without network triggered messaging.

- **applProtocolFallbackN26ToS10** - Application Protocol Fallback from N26 to S10 - Current parameter enables fallback to search for 's10' candidate when DNS Query to find target MME during S10 handover using 'n26' fails. This parameter is expected to be used together with parameter Use N26 Service Parameter in 5GS to EPS Handover
- **apra** - Additional Presence Reporting Area - Enables the use of the Additional Presence Reporting Area (APRA) feature on the Namf_EventExposure service. When this parameter is set to true, and when also the service consumer indicates support for the APRA feature, and the Presence Reporting Area (PRA) set is internally provisioned in the AMF, and the service consumer requests reporting for the PRA set, the AMF reports the PRA set id in the 'prald' field and the individual PRA id(s) in the 'additionalPrald' field(s) on the presenceInfo of the areaList (an array of AmfEventAreas) of a reportList (an array of AmfEventReports).
- **asynchrTypeComm** - Asynchronous Type Communication - This parameter defines whether the AMF attempts to contact a CM-IDLE UE when AMF receives signalling message for the UE, e.g. SMF triggers N1/N2 message transfer for PDU session modification. When enabled, the AMF attempts to reach the UE via paging (if the UE is currently considered reachable and would be expected to respond to paging). When disabled, the AMF sends the signalling message to the UE when the UE makes the next contact towards the network.
- **autoAddTaiToTaiList** - Auto Add TAI to TAI List - Auto Add TAI to TAI list, with allowed values are: Off and Update Three.
- **cagSupport** - CAG Support - This parameter enables Closed Access Group feature at the AMF
- **checkTgtMmeN26StatusN26Ho** - Check Target MME N26 Status in N26 Handover - Current parameter enables checking the N26 link/interface status of local target MME node during N26 handover so that if it isn't available to use, then even if the local MME can serve the target RAN, source AMF will select an alternative node to complete the N26 handover.
- **checkUesUsageSetting** - Check UE's Usage Setting - Controls whether the AMF requires UE's Usage Setting IE to be included in NAS Registration Request to indicate IMS voice over PS sessions supported towards the UE and the UDM. If set to false, IMS voice over PS sessions support indication does not depend on whether the UE includes UE's Usage Setting IE. If set to true, AMF indicates IMS voice over PS sessions supported only if UE's Usage Setting IE is included in NAS Registration Request.
- **contactOverNon3gppFor3gpp** - Contact Over Non-3GPP for 3GPP - Defines whether the AMF contacts a UE over non-3GPP access, when the UE is CM-CONNECTED over non-3GPP access and CM-IDLE over 3GPP access, and the AMF gets a 3GPP access related trigger for the UE.
- **cr129ts29500ErrorToken** - CR 129 TS 29.500 Error Token - This parameter controls the activation of CR 0129 of TS29.500. When this parameter is set to true: Removes

condition the access without an OAuth2.0 access token failed for the realm attribute
Adds error code invalid_token

- **defaultHttpPort** - Default HTTP Port - Default port to be used for HTTP connections when it is not explicitly given as part of the the authority of a SBI URI. This parameter applies only to HTTP connections. HTTPS connections always use 443 as the default port (if not explicitly given otherwise in the URI)
- **defErrorCcSnpn** - Default Error Cause for SNPN network - This parameter defines the default error cause to send for UE request towards SNPN network when Access Restriction NAS Mapping profile isn't available to use
- **delayUdmDuringRegistration** - Delay UDM During Registration - When the same AMF still holds the UE data internally after previous N26 mobility to EPS, this parameter enables AMF to successfully complete the registration procedure and suppress the UDM dialogs (Nudm_UECM_Registration, Nudm_SDM_Get and/or Nudm_SDM_Subscribe, depending on other settings) for the enabled UEs. The UDM dialogs will be re-attempted automatically according to provisioning. Note: this functionality only is effective when the AMF global parameter Keep VLR Entry is set to true.
- **deletePduAfterFailedUpAttemptsInIndirectComm** - Delete PDU After Failed User Plane Attempts in Indirect Communication - Enables the possibility to delete a PDU from AMF after provisioned number of failed user plane re-establishment attempts when indirect communication is deployed. When this parameter is set to true, the AMF counts the number of times the AMF receives (after possible SCP reselection(s)) a 504 failure from SCP into the internal counter for failed user plane re-establishment attempts. Once the AMF detects 'nth' time the user plane re-establishment fails (for either direct or indirect attempt towards the SMF), the AMF internally deletes the PDU and indicates towards the UE that the PDU is inactive. The AMF applies the value of the AMF global parameter Failed User Plane Attempts to Delete PDU for the number 'n' above. This parameter is only effective when AMF global parameter Failed User Plane Attempts to Delete PDU is set to a non-zero value. When this parameter is set to false, the AMF does not count 504 response from SCP as SMF not reachable during user plane re-establishment attempts and does not delete PDU(s) due to those.
- **directNasMsgTransfer** - Direct NAS message transfer to the target AMF - If the parameters is set to 'True' then AMF forwards the NAS Registration message to the target AMF over N14 interface if the AMF can determine the target AMF. If the parameters is set to 'False' then AMF forwards the NAS Registration message via 5G RAN.
- **dualFailVnflpds** - Dual Fail IPDS - When enabled, a dual failure of a spread IPDS pool will trigger IPDS pool 0 to dual fail. This is specifically for the two large IPDS configuration in VNF or CNF. It applies to any application type. This dual failure of IPDS pool 0 will result in system outage of the system. When disabled, the propagation of the dual failure will not occur.
- **eaea** - EBI and ARP mapping update in EBI Assignment - Enables supporting EAEA feature

- **ebiAssignReqReject** - EBI Assignment Request Reject - When set to true, the AMF rejects SMF EBI assignment request with an http2 status code associated with the ongoing procedure at the time of the received request, TEMPORARY_REJECT_HANDOVER_ONGOING or TEMPORARY_REJECT_REGISTRATION_ONGOING
- **emcNon3gppN3iwf** - EMC Non-3GPP Access N3IWF - Enables the support for emergency services over untrusted non-3GPP access via N3IWF.
- **emergencyEpslwkWoN26** - Emergency EPS Interworking Without N26 - Enables the possibility to handover an emergency session from EPS to 5GS (3GPP access) without N26 interface on the AMF. Session continuity is ensured by getting the (EPS stored) emergency information from HSS+UDM as part of the subscription profile. Applied when EPS Interworking Without N26 is set to true.
- **emergencyNon3gppEpsPduHo** - Emergency Non-3GPP Access EPS PDU Handover - Enables the AMF support for UE triggered emergency PDU handovers between untrusted non-3GPP via N3IWF/5GS and E-UTRAN/EPS.
- **enhancedPcfSelection3gppAccess** - Enhanced PCF Selection 3GPP Access - When this parameter is enabled, AMF will support the following functionality for 3GPP access:
a) Reselect PCF upon change of Serving PLMN if required. b) Exclude PCFs that do not support both UE and AM Policy Control Services when an association for both Policies is required. c) Reselect PCF during inter-AMF UE mobility if the PCF Instance provided by the old AMF does not meet all the selection criterions. d) Fallback to selection of PCF without considering Slice support, when no valid candidate PCF that serves all slices in the Allowed NSSAI is discovered.
- **epdgEmergencyHo** - ePDG Emergency Handover - This parameter enables session continuity of an emergency session between ePDG/EPC and NG-RAN/5GC.
- **epdgHo** - ePDG Handover - Enables handover between non-3GPP access connected to EPC and 3GPP access (NG-RAN) connected to 5GC
- **epsFallbackNoPageUe** - Page UE during EPS Fallback - Enables suppression of UE paging when gNB releases UE context due to EPS Fallback and EpsFallbackNoPageTimer is running.
- **epslwkWithoutN26** - EPS Interworking Without N26 - Enables the EPS interworking without N26 interface support on the AMF.
- **epsTo5gsHoWithAmfReselect** - EPS To 5GS Handover With AMF Reselect - This parameter enables the capability of AMF reselection during EPS to 5GS handover. It is evaluated at both the initial AMF and target AMF of an EPS to 5GS Handover with AMF reselection procedure
- **epsUpip** - EPS UPIP - Current parameter enables support for the EPS-UPIP (User Plane Integrity Protection)

- **ethernetPduSupportN26** - Ethernet PDU Support N26 - Parameter controls AMF indicating in Context Request if Ethernet PDU is supported for EPS to 5GS idle mobility scenario. By default, the flag shall be disabled.
- **excludeRoutingIndWithSupi** - Exclude Routing Indicator with SUPI - When enabled, the AMF, when SUPI is available, will use SUPI and exclude routing indicator as selection criteria in the query to the NRF to select AUSF and UDM.
- **existingPduNoSmf** - Existing PDU No SMF - Controls whether the AMF sends the SM message back to the UE or drops it, if the AMF receives an SM message with Request Type 'existing PDU session', the AMF does not have a routing context for the PDU session and no SMF can be found on the UDM subscription data for the PDU session id or the DNN.
- **extendedEmergencyNumListAreaCode** - Extended Emergency Number List Area Code - Indicates provisioned extended emergency list area code. When feature activation gParm is enabled and upon receiving AreaCode in UE Subscription data from UDM, if received Area Code matches provisioned area code for this feature, AMF shall send Extended Emergency Numbers List in the REGISTRATION ACCEPT message.
- **failedUserPlaneAttemptsToDeletePdu** - Failed User Plane Attempts to Delete PDU - Defines how many failed UE triggered user plane re-establishment attempts, where the AMF fails to communicate with the SMF due to link issues, cause the AMF to internally delete the requested PDU and to indicate towards the UE that the corresponding requested PDU is inactive. The value 0 stands for the functionality to be disabled. When disabled, the AMF does not delete the PDU due to link related SMF communication failures during user plane re-establishment attempts.
- **freqCountMonitoring** - Frequency Count Monitoring - Defines whether the AMF monitors the UE attempts for different UE triggered procedures, and if too frequent attempts made by the UE during the provisioned monitoring period, treat the UE accordingly, e.g. drop subsequent procedure requests or deregister the UE.
- **getSmfSelSubDataEmptySnssaiInfo** - Get Smf Selection Subscription Data when having empty SnssaiInfo - Enable fetching SMF Selection Subscription Data during PDU Session Establishment (type = initial request) when local UE context indicates that the UE is supposed to have PDU session service subscribed but local subscription data for SMF selection is empty
- **gnbRerouteFallback** - GNB Reroute NAS Fallback - AMF re-routes NAS message to gNB when N14 is not available during UE inter-AMF re-location when source AMF can't service the UE slice.
- **iabEnabled** - IAB Enabled - This gParm enables Integrated Access and Backhauling (IAB) operation at the AMF
- **icsrAloneVoiceRadioCap** - ICSR Alone Voice Radio Capability - Controls whether AMF sends NGAP Initial Context Setup Request alone without NAS Registration Accept, when either -AMF does not hold UE radio capability but needs it for purposes listed further below, and/or -AMF needs to run NGAP UE radio capability check procedure to decide

IMS voice over PS support for the UE. If UE radio capabilities are needed on the AMF (Reject On VoNR Tracking Area and/or EMC Suppress No VoNR and/or IMS VoPS S1 Disabled is true under AMF Voice Profile for the UE on 5G UE PLMN Services), or UE radio capability check procedure result is required to decide for the IMS voice over PS result for the UE, the AMF needs to send NGAP Initial Context Setup Request alone first (without any NAS message) in order to let NG-RAN establish AS security before requesting radio capabilities from the UE. When set to true and when Reject On VoNR Tracking Area and/or EMC Suppress No VoNR and/or IMS VoPS S1 Disabled is true under AMF Voice Profile for the UE on 5G UE PLMN Services, AMF sends NGAP UE Radio Capability Check Request only after receiving Initial Context Setup Response.

- **ignoreAusfFailuresOptionalReAuthentications** - Ignore AUSF Failures on Optional Re-Authentications - This parameter, when set, enables AMF to ignore AUSF dialog related failures during optional re-authentications. The UEs to apply the functionality to are provisioned on the AMF. The functionality is applied when the AMF is locally provisioned to perform an optional re-authentication for a UE that is already registered on the AMF, but the re-authentication fails during the AUSF dialog and the AMF is able to continue serving the UE without the re-authentication.
- **imdRptThirdPartySub** - Immediate Report to Third Party Subscription - Controls whether the AMF supports the 'IERSR' feature negotiation when a client subscribes to an Event at the AMF and requests an immediate report as part of that subscription. When the gparm is set and the client subscription request an immediate report, the AMF optionally can send the first event report in the subscription response, depending on whether the first report is ready by the time the AMF must respond to the subscription. See TS 29.518 CR 0646.
- **imsVopsHomogeneousSupport** - IMS VoPS Homogeneous Support - This parameter controls whether or not the AMF includes the IMS VoPS attribute towards the UDM as part of the Amf3gppAccessRegistration attribute.
- **inhibitInterAmfN2HoSameTa** - Inhibit Inter AMF N2 Handover Source and Target gNBs in same TA - When enabled, source AMF inhibits N2 HO to target AMF if source AMF has no N2 link to target gNB and UE current location (TAC) and the target gNB TAC is the same. Source AMF responds back to source gNB with Handover Preparation Failure message.
- **initialContextSetupTrigger** - Send Initial Context - Controls when the AMF sends NGAP Initial Context Setup Request towards the NG-RAN.
- **interSystemAndEnDcConfTransferOverN26** - Inter-System and EN-DC SON Configuration Transfer Over N26 - Parameter controls feature activation GPARM flag. By default, flag shall be disabled. When enabled, AMF/MME shall transfer inter-system SON configuration information and EN-DC Configuration Transfer between a gNB and eNodeB.
- **intraAmfInterPlmnUdmModRegistration** - Intra AMF Inter PLMN UDM Registration Modification - When set to true and UE moves between Serving PLMNs within the same AMF, the AMF will modify GUAMI IE to the target Serving PLMN GUAMI, within the UE Context Management information in UDM, for given UE.

- **intraAmfInterPlmnUdmModSubscription** - Intra AMF Inter PLMN UDM Subscription Modification - When set to true and UE moves between Serving PLMN within the same AMF, the AMF will modify the PLMN ID to the target Serving PLMN for given UE.
- **ismf** - Intermediate SMF - Enables Support of deployments topologies with specific SMF Service Areas, i.e. the Intermediate SMF (I-SMF) support in the AMF. An Intermediate SMF may be inserted on the signalling path between AMF and the SMF, when the SMF is not able to control the UPF(s) because the UPF(s) belong to a different SMF Service Area. The I-SMF may also be changed or removed due to this during procedures. The I-SMF concept is introduced in 3GPP Release 16.
- **ismfSelectionFailureMaintain** - I-SMF Selection Failure Maintain - Defines whether the AMF maintains PDU session in a situation when 3GPP Support of deployments topologies with specific SMF Service Areas i.e. I-SMF is deployed, and AMF detects the need to select a new I-SMF, but no I-SMF supporting the current UE area is available. If set to 'false', AMF releases the PDU session (i.e. triggers Nsmf_PDUSession_UpdateSMContext with release indication towards the old SMF or I-SMF) if no new I-SMF is available for the current area of the UE.
- **keepUeContextAfterN26Ho** - Keep VLR Entry - When this parameter is set to true, keep VLR entry when UDM DeregistrationReason is 5GS_TO_EPS_MOBILITY
- **ladn** - Local Area Data Network - Local Area Data Network. This parameter activates the LADN functionality support in AMF. With the LADN functionality, access to a provisioned data network is only provided on a restricted service area. The LADN DNN and the associated LADN Service Area (the Tracking Area list) also need to be provisioned.
- **ladnNotifications** - LADN Notifications - Controls whether the AMF triggers Event Notifications on LADN state towards the service consumer.
- **linkAlarmCustomize** - AMF Link Alarm Customize - If the global parameter is set to true, customized severity levels in the AMF Link Alarm Config are used to set the alarm severity for links and interfaces. If the global parameter is set to false, customization of link alarm severity is not supported.
- **locationEvents** - Location Events - Enables the Namf_Event Exposure in the AMF for subscribing to UE location reporting events (direct or continuous location reporting).
- **maskedImeIsV** - Masked IMEISV - Include Masked IMEISV in NGAP messages
- **maxAmfUeRadioCapLength** - Maximum AMF Ue Radio Capability Length - Maximum Ue Radio Capability Length Supported on the AMF. Default is 9216. Setting this value to 24576 enables storage of Radio capability length between 9216 - 24576 bytes in the RCIS if RCIS is available
- **maxNumberOfForbiddenTacs** - Maximum Number of Forbidden TACs - AMF shall support maximum number of 600 forbidden TACs with the default value of 64.
- **mcs** - Mission Critical Services - Enables the support for Mission Critical Services (MCS) on the AMF.

- **memoryRestrictionForbiddenTac** - Memory Restriction Forbidden TAC - Parameter to control CPPS VLR memory allocation for feature f20430-02. **maxNumberOfForbiddenTacs** can be set to larger size (i.e 600) only when this gParm is 'true' A memory restricted gparm that can only be changed, with aggregate service lock. default value is false. **memoryRestrictionForbiddenTac** cannot be changed in CMM24.7 release. It will be deprecated in CMM24.11
- **mps** - Multimedia Priority Services - Enables the support for Multimedia Priority Services (MPS) on the AMF.
- **mrlDINasTransp** - Mobility Restriction List on DL NAS Transport - Controls whether the AMF will only include Mobility Restriction List on DL NAS transport if the list context has been changed, or include even if the content has not changed from previous content.
- **mrlSplmnOnlySending** - Mobility Restriction List Serving PLMN only sending - Controls whether the AMF includes Mobility Restriction List on NGAP messages (Initial Context Setup Request, Handover Request and DL NAS Transport) with Serving PLMN as the only content, or only if also restrictions are to be communicated to the NG-RAN. (Note: DL NAS transport with only serving PLMN included is only applicable if Mobility Restriction List is sent in every DL NAS Transport.
- **multiLevelMps** - Multi-Level MPS - Enables the use of 5 different MPS levels with dedicated SBI Message Priority value for each MPS level. Applies when AMF global parameter Multimedia Priority Services is set to true.
- **multiSimWithSameMsisdnSupport** - Multiple SIM with Same MSISDN Support - Parameter controls feature activation. By default, parameter shall be disabled. When enabled, AMF shall support and allow more than one SUPI to register to the AMF by using the same MSISDN. With the default value setting of false, the AMF shall work as it had before the introduction of this feature.
- **n26iwkSuppt** - N26 interworking Supported - Enables the support for EPS interworking with N26 interface in the AMF
- **n2HoWithAmfReselect** - N2 Handover with AMF Reselection - This parameter enables the capability of target AMF reselection during inter-AMF N2 handover. The reselection is performed by the initial target AMF when it is not able to serve all requested S-NSSAIs
- **n3gppInitialCtxtNas** - Non-3GPP NAS Response with Initial Context - Controls whether AMF sends NAS response on top of the NGAP Initial Context Setup Request for non-3GPP access. When set to false (default), AMF sends NAS response alone via DL NAS Transport after the Initial Context Setup has been completed. When set to true, AMF sends NAS response on top of the NGAP Initial Context Setup Request.
- **ngap3gppRelease** - NGAP asn.1 3GPP Release - Identifies supported NGAP ASN.1 3GPP Releases.
- **non3gppAccessImsVopsHomogeneous** - Non-3GPP Access N3IWF IMS VoPS Homogeneous - This parameter controls whether or not the AMF applies UECM Update service operation towards UDM due to imsVoPs homogeneous supports change for a UE that is registered over untrusted non-3GPP access via N3IWF

- **non3gppAccessN3iwf** - Non-3GPP access N3IWF - Controls the support of non-3GPP access and the Non-3GPP Access Interworking Function (N3IWF) in the AMF.
- **non3gppAccessN3iwfRatType** - AMF Non-3GPP Access N3IWF RAT Types - Defines the RAT type the AMF supports for UEs connected via untrusted non-3GPP access and N3IWF to the AMF.
- **non3gppAccessVoiceN3iwf** - Non-3GPP Access Voice N3IWF - Enables support for IMS Voice over PS sessions over untrusted non-3GPP access via N3IWF.
- **non3gppEpsPduHo** - Non-3GPP Access EPS PDU Handover - Enables the AMF support for UE triggered non-emergency PDU handovers between untrusted non-3GPP via N3IWF/5GS and E-UTRAN/EPS.
- **non3gppNpliN3iwf** - Non-3GPP NPLI N3IWF - Enables the AMF support for Network Provided Location Information (NPLI) for untrusted non-3GPP access via N3IWF.
- **nonIpPdnSupportN26** - Non IP PDN Support N26 - Parameter controls AMF indicating in Context Request if Non IP PDN is supported for EPS to 5GS idle mobility scenario. By default, the flag shall be enabled.
- **nrDualConnectivity** - NR Dual Connectivity - Enables NR Dual Connectivity NR-DC and Secondary RAT Usage Reporting. The NR Dual Connectivity profile, when configured, administers NR-DC support, Secondary RAT Usage Reporting restriction and UDM NR Secondary RAT Access restriction override per UE PLMN Services or SUPI Range Services.
- **nrfDefaultLoadValueForNfs** - Default Load Value for NFs - Determines default 'load' value to be assumed for a Service instance when the 'load' information is not received from NRF. Load is used by the AMF along with Locality, Priority and Capacity in order to select/load balance traffic among multiple NF Service Instances that meet the given criteria.
- **nrfHeartbeatFailures** - NRF Heartbeat Failures - This parameter is used to provision maximum number of consecutive heartbeat failures to NRF. If AMF does not receive responses to heartbeat messages consecutively specified by this parameter then, AMF stops heartbeat messages and tries to re-register to this NRF. If registration is successful, AMF again tries heartbeat messages. If registration is unsuccessful, AMF tries to register to another NRF.
- **nrfUseNFLoadInfo** - NRF Use Network Function Load Information - Determines whether 'load' will be taken into account when applying load balancing among candidate Network Functions / Service Instances. The 'load' indicates the current load percentage of the NF/Service Instance and is acquired from the NRF during NF Discovery and NF Profile Notification Update. Parameter values: - No (default): load is not taken into account - Yes: load is taken into account
- **nssaaEnable** - NSSAA - A control parameter to enable Network Slice-Specific Authentication and Authorization (NSSAA). If the parameter set to true, then AMF shall support NSSAA. Otherwise, AMF will not support it

- **nssfNsSelectionLoadBalancing** - NSSF NSSelection Load Balancing - This parameter controls whether load balancing will be applied among multiple Nssf_NSSelection service instances. When load balancing is enabled, load balancing will be applied among the highest priority available service instances based on their relative capacity.
- **nullSchemeSuciUseSupi** - Null-Scheme SUCI Use SUPI - When enabled, the AMF derives SUPI from Null-Scheme SUCI and include the SUPI: - in the query to the NRF to select AUSF - in the Authentication Request to the AUSF to authenticate the UE
- **nwdafEnable** - NWDAF Enable - A control parameter to enable AMF access to an NWDAF in the home PLMN. If set false, the AMF will not use the SBI towards the NWDAF.
- **oauthSupport** - OAuth Support - Parameter controls the feature activation. If parameter is enabled, OAuth based Authorization of Network Function Service Access shall be supported. By default this parameter shall be disabled.
- **pageForN1SmInUpdRsp** - Page for N1Sm in Update Response - Current parameter enables paging the UE when receive N1Sm in Update Sm Context Response and the UE is in CM-IDLE state.
- **pageOn3gppIfNon3gppFail** - Page UE on 3GPP if non-3GPP fail - Defines AMF action when UE is CM-CONNECTED for non-3GPP access and CM-IDLE on 3GPP access, and AMF has sent Notification on non-3GPP access to re-establish user plane or deliver signaling from SMF for 3GPP access, but AMF timer T3565 supervising the Notification Response, Service Request or Registration Request has expired. When set to 'false', AMF notifies the SMF that the UE is unreachable. When set to 'true', AMF pages the UE on 3GPP access.
- **pageRrcInactiveUe** - Page UE in RRC Inactive state - Enables paging UE in RRC Inactive state feature. When set to true, AMF invokes paging for UEs UE in RRC Inactive state if RAN paging fails.
- **pagingGapFailCountTrigger** - Paging Gap Fail Count Trigger - Parameter AMF Paging Gap Fail Count Trigger indicates the number of failed paging operations that start the AMF Paging Gap Timer.
- **pagingOverloadPrevention** - Paging Overload Prevention - Parameter controls feature activation related to monitoring AMF paging activity and taking action (when necessary) to avoid an overload condition. By default, flag shall be always enabled.
- **peips** - PEIPS Active - Specifies whether the PEIPS feature (Paging Early Indication with Paging Subgroups) is active on the AMF.
- **peiRetrievalMethod** - Query PEI method - Specify method to retrieve PEI from the UE. If the parameter is set to none, PEI is retrieved via identity request procedure if/when needed.
- **pmlInclude5qi** - Include 5QI PM Counters - This parameter controls whether the PM counters relevant to 5QI would be pegged from the system. When this parameter is set, the system is able to extract the 5QI information needed to peg the corresponding counters.

- **praPcfTrigger** - PRA PCF Trigger - Enables the AMF support for Presence Reporting Area changes triggered from PCF (for 3GPP access).
- **presenceInAol** - Presence in Area of Interest - Enables the Presence in Area of Interest in the AMF. The AMF provides this functionality via the Namf_EventExposure service. The service consumer may define an Area of Interest and the AMF reports back the presence of the UE on the area.
- **primaryHttpConnectionWeight** - Primary HTTP connection Weight - Defines how AMF will load balance traffic among 2 HTTP connections to the same SBI Server endpoint. Primary connection will have weight equal to primaryHttpConnectionWeight Secondary connection will have weight equal to 100 - primaryHttpConnectionWeight. Default is 50 which balances UE related traffic over the two connections on a per-UE basis and non-UE related traffic on a random basis.
- **prioritizeLinkStatesForCallbacks** - Prioritize Link States for Callbacks - When this parameter is set to true, when CMM is sending a Request to a callback URI (Subsequent Request or a Notification), it will prefer to use Endpoints with no link (Not Existing) or Endpoints that have links in Enabled and Unlocked state. Endpoints with links Under Creation (UNDEFINED) will be used only if no other valid Endpoint is available.
- **prioritizeLinkStatesForInitialRequests** - Prioritize Link States for Initial Requests - When this parameter is set to true, when CMM is sending an Initial Request in Direct communication, it will prefer to use Endpoints with no link (Not Existing) or Endpoints that have links in Enabled and Unlocked state. Endpoints with links Under Creation (UNDEFINED) will be used only if no other valid Endpoint is available.
- **prioritizeLinkStatesForScps** - Prioritize Link States for SCPs - When this parameter is set to true, when CMM is sending an Request in Indirect Direct communication, it will prefer to use Endpoints with no link (Not Existing) or Endpoints that have links in Enabled and Unlocked state. Endpoints with links Under Creation (UNDEFINED) will be used only if no other valid Endpoint is available.
- **radioCapInfoForPaging** - UE radio capability for paging - Enable/disable inclusion of radio capability for paging IE in the: - NGAP PAGING message - Initial UE Context Setup Request message when RRC Inactive feature is enabled
- **reattemptN26CtxReqCc92** - Reattempt N26 Context Request when receive CC92 - When current parameter is enabled and the AMF receives N26 Context Response with CC92, the AMF verifies UE identity, possibly by doing reauthentication, and attempts again N26 Context Request to source MME
- **reattemptN26CtxReqCc96** - Reattempt N26 Context Request when receive CC96 - When current parameter is enabled and the AMF receives N26 Context Response with CC96, the AMF verifies UE identity, possibly by doing reauthentication, and attempts again N26 Context Request to source MME
- **restrictBroadcastCmmHomePlmn** - Restrict Broadcasting CMM Home PLMN - Current parameter enables restrict sending CMM 'Home' PLMN in NG Setup and NRF Register procedures

- **reuseOldUeContextEpsTo5gs** - Reuse Old UE Context When UE Moves to 5GS - With this parameter, the AMF reuses the subscription data of the old UE Context that were locally preserved when UE moved to EPS and skips SDM GET and SDM Subscribe operations towards UDM
- **reuseRequestApiRootInLocationHeader** - Reuse Request apiRoot in Location Header - When this parameter is set to true and the Response includes a Location header, CMM will construct the apiRoot of the Location URI by reusing apiRoot included in the Request URI. When this parameter is false the apiRoot is deduced from the relevant service Instance provisioning.
- **rfspAccessRestriction** - RFSP Access Restriction - Feature control for RFSP Access Restriction for the AMF.
- **rimInformationTransfer** - RIM Information Transfer - Enables NGAP RIM Information Transfer Procedure. When set to false, AMF silently discards the NGAP Uplink RIM Information Transfer message.
- **rrcInactive** - RRC Inactive - Enables RRC Inactive feature. When enabled, AMF provides Core Network Assistance information to the RAN to assist gNB in moving UE(s) to RRC Inactive state
- **sbiHttp2PingKeepAlive** - SBI HTTP2 Ping Keep Alive - Enables or disables the impact of a received HTTP2 ping upon SBI link availability keep alive. When value is set to false a received HTTP2 ping will have no impact on SBI link availability. When value is set to true a received HTTP2 ping will reset SBI link keep alive, like other traffic messages.
- **sbiQueryConversions** - SBI Query Parameter Conversions - Enables or disables Query Conversion Rules. When value is set to false no Query conversion rule is applied. When value is set to true Query conversion rules are applied according to their Rule Status.
- **selectiveN15UsageControl** - Selective N15 Usage Control - Parameter controls feature activation flag. By default, the flag shall be disabled. When the flag is disabled, for homers AM and UE policy shall be created (old behavior) and for roamers, interPlmnPcfSupport shall be checked to decide if AM/UE policy need to be created or not (old behaviour). When gParm is enabled, for all users, pcfPolicyAssociation of amfSvcAgreement profile shall be checked to decide whether to establish AM and UE policy.
- **send3gppSbiCallbackInAllNotifications** - Send 3gpp-Sbi-Callback in all notifications - When this parameter is false the 3gpp-Sbi-Callback header is included only in Notifications sent via Indirect Communication. When the gParm is true the 3gpp-Sbi-Callback header is included in Notifications for both Direct and Indirect Communication.
- **send3gppSbiOriginatingNetworkId** - Send 3gpp-Sbi-Originating-Network-Id - When parameter is false, AMF does not include the 3gpp-Sbi-Originating-Network-Id header in Requests. When parameter is true, AMF includes 3gpp-Sbi-Originating-Network-Id header in Requests.
- **sendAmfConfigUpdTotalConfigMismatch** - Send AMF Configuration Update when Total Configuration Mismatch with gNB - When this parameter is enabled, AMF will send

AMF Configuration Update to a gNB with which there is total configuration mismatch, following a local configuration update.

- **sendAreaCodeBasedExtEmerNumberInRegistrationAccept** - Send Area Code Based Extended Emergency Number in Registration Accept - Parameter controls feature activation GPARM flag. By default, flag shall be disabled. When enabled, AMF shall send Extended Emergency Numbers List IE in the REGISTRATION ACCEPT messages if one is provisioned on the AMF.
- **sendCagPaging** - Send CAG Information List in Paging - When enabled, the AMF sends the CAG Information List in Paging message
- **sendEmeRegInd** - Send Emergency Registration Indication - The parameter enables sending the emergencyRegistrationInd IE in Amf3GppAccessRegistration data of UECM Registration to indicate emergency Registration to the UDM. This IE is sent in Nudm_UECM SBI v1.2.0-alpha.6 onwards
- **sendEmptyCagUe** - Send Empty CAG Information List to the UE - When enabled, the AMF sends empty CAG Information List in NAS Accept when no PLMN CAG is subscribed for CAG capable UE
- **sendEpslwkUpd** - When this parameter is enabled and the status of interworking with EPS for a PDU session changes due to change of UE 5GMM capability e.g. S1 mode supported, the AMF invokes Nsmf_PDUSession_UpdateSMContext to send updated EPS Interworking Indication to the SMF
- **sendExtEmerNumberInRegistrationAccept** - Send Extended Emergency Number in Registration Accept - Parameter controls feature activation GPARM flag. By default, flag shall be disabled. When enabled, AMF shall send Extended Emergency Numbers List IE in the REGISTRATION ACCEPT messages if one is provisioned on the AMF.
- **sendMappedGummei** - Current parameter enables sending in NGAP Setup Response the mapped GUAMI(s) pointing to the MME GUMMEI(s) for the associated PLMN(s) that coexist in both 4G and 5G at local CMM node
- **sendNsci** - Send NSCI IE - Current parameter enables sending 'New Security Context Indicator' NSCI IE in Handover Request, as part of EPS to 5GS handover
- **sendOnlyCommonlySupportedSlicesToAn** - Send Only Commonly Supported Slices to AN - When this parameter is true, the AMF will send only the intersection of the slices the AMF supports and the slices the gNB/ N3IWF supports for that PLMN (i.e. the union of all slices supported in all TAs the gNB/N3IWF supports per PLMN). Note: In the latter case the gNB/N3IWF will not be aware of all the slices the AMF supports, however it can resolve interworking issues when RAN cannot handle processing the all the slices included in the PLMN support list.
- **sendOnlyRanSupportedPlmnsInN2** - Send Only RAN Supported PLMNs in N2 - Current parameter enables sending in SETUP RSP and AMF Configuration Update only the PLMNs that are supported by the RAN even if additional PLMNs are configured at the AMF.

- **sendPc5ToNgran** - Send PC5 to NG RAN - Specifies whether the AMF is to send the UE PC5 QoS, if available, in applicable 38.413 messages
- **sendPeiTypeImeiToEir** - Send PEI Type IMEI to EIR - Parameter controls the option of sending PEI value type IMEI that indicates IMEI to EIR even though IMEISV is available. By default, flag shall be disabled.
- **sendPeiTypeImeiToSmf** - Send PEI Type IMEI to SMF - Parameter controls the option of sending PEI value type IMEI that indicates IMEI to SMF even though IMEISV is available. By default, flag shall be disabled.
- **sendPendingSnssaiInAllowedNssaiOfIcsr** - Send Pending SNSSAI in Allowed NSSAI of ICSR - Current parameter enables sending a pending SNSSAI (random selection) in Allowed NSSAI IE of the Initial Context Setup Request when latter needs be sent but there is not yet an allowed SNSSAI due to the NSSAA feature.
- **sendRlsSessionInfo** - Send Release Session Info - Current parameter enables sending the toReleaseSessionInfo attribute in Registration Status Update request.
- **sendSkipN2PduSessionResRelInd** - Send Skip N2 PDU Session Resource Release Indication - Current parameter enables sending Update SM Context Request carrying the skipN2PduSessionResRelInd parameter, instead of Release SM Context Request when a PDU Session needs to be released towards the UE at completion of handover e.g. because the associated S-NSSAI isn't supported at target TAI, but not towards the target gNB because a User Plane isn't established at the target gNB.
- **sendSnpnToUnsupportedNgRan** - Send SNPN Info to Unsupported NG-RAN - Current parameter enables sending the supported SNPNs in Setup Response and AMF Configuration Update towards NGRAN nodes that haven't indicated support of SNPN type of network in NG Setup or NG Configuration Update
- **sendTargetNfIdInRedirect** - Send 3gpp-sbi-Target-Nf-Id in Redirect - When this parameter is set to true the AMF adds the target AMF NF Instance and service instance Id in the relevant 3gpp-sbi-Target-Nf-Id HTTP header.
- **sharedPlmnSupport** - Shared PLMN support - Enables the support for Multiple Shared PLMN in the AMF. When the flag is set to TRUE, it shall be possible to set the multiple shared plmn for up to 8 PLMNs.
- **smContextStatusNotifyRequired** - SM Context Status Notify Required - This parameter defines whether the AMF requires an SM context status notify to be triggered from the SMF before the AMF deletes the PDU session. The parameter is applied during -UE/AMF/ SMF triggered PDU session release procedures, -PDU session setup procedures that have been rejected towards the UE after SM context create, and -PDU session setup procedures when the AMF already has a PDU session established for the requested PDU session id. Upon SBI timer pduSmCtxStatusNotify expiry, the AMF behavior is as follows: When set to true, the AMF only clears internal temporary data. AMF maintains the PDU session context. (AMF removes the PDU session only when it receives the SM context status notify with resourceStatusInfo set to 'RELEASED' on statusInfo inside SmContextStatusNotification.) When set to false, the AMF clears internal temporary

data, and also removes the PDU context (without waiting for the SM context status notify.)

- **smfAreaOfValidity** - SMF Area of Validity - Defines how the AMF applies the SMF optionally provided Area of Validity parameter on Namf_Communication_N1N2MessageTransfer request. AMF supports receiving up to 100 TAs.
- **smfRecoveryTime** - SMF Recovery Time - Enables the AMF to use the RecoveryTime attribute related to an SMF (service) instance to detect whether the SMF (service) instance has recently restarted and lost the resources created prior to the indicated recovery timestamp.
- **smpBasedPriorityFromSmsf** - SMP based Priority from SMSF - Enables AMF to apply priority handling for UEs receiving SBI message Priority value matching internal provisioning from SMSF.
- **smsfReselectionAfterUeProcedure** - SMSF Reselection After UE procedure - Enables the AMF to reselect SMSF for all impacted UEs, after AMF has detected an SMSF unavailable. The AMF reselects the SMSF for any impacted UEs after any next procedure for the impacted UEs.
- **smsfReselections** - SMSF Reselections - The number of attempted SMSF reselections per a single UE.
- **smsOverNas** - SMS Over NAS - Activates the SMS over NAS feature. The AMF supports the SMS delivery over NAS signalling and further via the N20 interface towards the SMSF.
- **smsRestrictionVoiceCentricUes** - SMS Restriction Voice Centric UEs - When this parameter is set to true, the AMF restricts the SMS over NAS service for UEs indicating 'voice centric' on UE's usage setting IE on NAS Registration request. Similar restriction also needs to be set per UE PLMN/serving PLMN combination. It is assumed that these UEs will get SMS service via IMS (and do not need SMS over NAS to be allowed). When this parameter is set to false, the SMS over NAS service is controlled in the AMF local provisioning by the AMF global parameter SMS Over NAS, the SMS Over NAS Allowed parameter per UE PLMN/serving PLMN combination and the SMS subscribed indication from UDM.
- **sorForTahs** - SoR for TAHS - Current parameter enables delivering the Steering of Roaming Information to TAHS subscriber during the Registration procedure, when Steering of Roaming subscription data is delivered to the AMF from the UDM.
- **srsInitialRegRelocation** - Initial UE Registration With SRS - Enables new AMF to retrieve UE Context from session restoration server during inter AMF UE initial registration with GUTI.
- **srvccPossibleNormallyRegisteredEmergency** - 5G-SRVCC Possible Normally Registered Emergency - Defines whether the AMF temporarily indicates on 5G-SRVCC Operation Possible indication the value 'Possible' when a normally registered UE supports 5G-SRVCC and establishes an emergency PDU session.

- **standaloneNonPublicNetworkSupport** - Standalone Non-Public Network Support - Parameter controls feature activation flag. By default, flag shall be disabled. When enabled, AMF shall support 3GPP specified Release 16 Stand alone Non Public Network functionality.
- **subscribedEmergencySnssai** - Subscribed Emergency S-NSSAI - Current parameter enables using the S-NSSAI from subscribed emergency DNN if such exists in subscription data
- **subscribedForbiddenTacChangeAction** - Subscribed Forbidden TAC Change Action - Parameter controls behavior invocation whether to release the N2 connection to put UE into idle mode or deregister the UE upon receipt of UDM Notification with updated list of subscribed forbidden Areas/TACs which includes the current UE TAC, and the UE is in connected mode. By default, parameter shall be set to none.
- **support5gAnSliceInconsistencyAlarm** - Support 5G-AN Slice inconsistency Alarm - When this parameter is enabled, AMF will raise a Alarm when multiple 5G-AN network elements (gNB, N3IWF) report different slices for the same Tracking Area.
- **support5gSrvcc** - Support 5G-SRVCC - Enables the AMF support for 5G-SRVCC to hand over regular voice calls from NG-RAN/5GS to 3GPP UTRAN/CS domain.
- **support5gSrvccEmergency** - Support 5G-SRVCC Emergency - Enables the AMF support for 5G-SRVCC to hand over emergency calls from NG-RAN/5GS to 3GPP UTRAN/CS domain.
- **supportAusfUdmGroupId** - Support AUSF UDM GroupId - When this parameter is set to true and the GroupId is included in the Profile of a AUSF or UDM selected for a UE, AMF will store it in the UE's context. The GroupId is accordingly used for subsequent AUSF/UDM selection and conveyed in case of inter AMF mobility.
- **suppressRetryWithNudmSdmSingleGet** - Suppress retry with SDM single Get - When set to true, the AMF will not retry with nudm-sdm single GET to the same UDM on receipt of an error response to a nudm-sdm multi dataset GET from the UDM with status code 404 DATA NOT FOUND or any other status code failure.
- **tappingActivated** - Status of AMF Tapping functionality - This parameter controls the activated/deactivated status of AMF Tapping
- **timeBasedAuthFrequency** - Time Based Authentication Frequency - Parameter controls feature activation global parameter flag. By default, the flag shall be disabled. When enabled, AMF shall support time-based authentication in accordance with new option(s) defined in AMF UE PLMN Services configuration.
- **timerSmfReselection** - Timer SMF Reselection - Enables the functionality to reselect SMF based on a timer during SM context creates. When timer based reselection is set to false, AMF only reselects SMF once per procedure on error cases (i.e. decision to reselect is attempt based). The used timer is deducted from SBI SMF response timer. Only when this parameter is set to 'true', the AMF applies the parameters errorSource, n1Included, reselectSmfVsmf, reselectOnlySmf and reselectRemote on cmm amfSmfNasMapping command.

- **trigUePolicyWhenNoUePolicyContainer** - Trigger UE Policy When No UE Policy Container - Parameter controls establishment of UE Policy Association based on received UE policy container from UE. By default, the flag shall be disabled. When enabled, if no UE Policy Container is received during UE Policy Association Establishment procedure the AMF will establish UE Policy Association.
- **udmBasedPscfRestoration** - UDM based PSCF Restoration - Parameter controls feature activation GPARM flag. By default, flag shall be disabled. When enabled, AMF upon receiving P-CSCF restoration indication from UDM shall initiate a network triggered PDU Session Release procedure of the IMS PDU session with Reactivation indication and accordingly UE shall request to re-establish IMS PDU session and shall discover P-CSCF during IMS PDU session establishment.
- **udmImmediateReport** - UDM Immediate Report - Immediate report indication to UDM
- **udmInitiatedCallTrace** - UDM Initiated Call Trace - Support UDM initiated call trace or not.
- **udmMdt** - UDM MDT - Activation/deactivation minimization of drive tests.
- **ueAmbrChangeFromPcf** - UE AMBR Change From PCF - Parameter controls whether to send UDM AMBR update to PCF in order for PCF to determine if AMBR update should occur. By default, flag shall be disabled. When enabled, AMF shall send UDM AMBR update to PCF.
- **ueRadioCapPagingN14** - Ue Radio Capability for Paging in N14 - Enable sending Ue Radio Capability for Paging IE in N14 interface
- **uniqueIdentifierSupportInSubscriptionId** - Unique Identifier Support In Subscription Id - Parameter controls feature activation flag. By default, flag shall be disabled. When enabled, support for unique identifier support in subscription is provided so the cell broadcast centre function can filter/sort which amf has provided subscription to it.
- **useAdditionalMemory** - Use Additional Memory - When the CPPS has been configured with additional memory, this parameter controls use of the additional memory for selected features. Use of additional memory for a feature must be indicated with this parameter before that feature can be activated.
- **useDnsForN26Ho** - Use Dns for N26 handover - Current parameter enables using DNS for selecting target node as part of N26 handover even when local MME of quad access node serves target RAN.
- **useFqdnAsAuthorityInAllSbiInterfaces** - Use FQDN as Authority in All SBI Interfaces - When this parameter is set to true, and FQDN of the target URI is available, CMM uses the FQDN as the authority in HTTP requests. If the parameter is set to true but there is no FQDN, the IP is used as the authority. When the parameter is set to false the IP is used as the authority in the SBI interfaces with exception of the NRF interface which always uses the FQDN as the preferred authority.
- **useLocationHeaderFromUdmRsp** - Use HTTP Location Header from UDM response - When this parameter is set to true, when CMM receives Response to a UDM Subscribe

the URI in the Location Header is used in subsequent Requests to update (PATCH/PUT) or Delete that Subscription. CMM also stores the Producer ID so as to be able to support OAuth in subsequent requests. Otherwise subsequent Requests are sent to a service instance discovered via NRF. Note: This parameter must be set to true when UDM communication is based on Model D (indirect communication with delegated discovery)

- **useN26SvcParam5gsToEpsHo** - Use N26 Service Parameter in 5GS to EPS Handover - Current parameter enables using N26 service parameter as part of DNS query for target MME selection during 5GS to EPS handover
- **useNssfAvailabilityService** - Use NSSF Availability Service - When this parameter is true, the AMF will use the NSSF Availability Services. When NSSF Availability Services are used, the AMF does not take in account the local provisioned info regarding Slice support per Tracking Area.
- **useNssfAvailabilityServiceSubscription** - Use NSSF Availability Service Subscription - When this parameter is true, the AMF will Subscribe the NSSF Availability Services in order to receive notification from NSSF regarding changes to the NSSAI availability information on a per TA basis. This parameter is applicable only when **amfGParams** **useNssfAvailabilityService** is set to true.
- **useNssfPerPlmnSliceRestrictions** - Use Per PLMN Slice Restrictions - When this parameter is set to true AMF evaluates the **restrictedNssaiList** when included in the **AuthorizedNssaiAvailabilityData** by the NSSF in a **Nnssf_NSSAIAvailability** operation. When set to false the restrictions are ignored.
- **useNssfSelectionServiceForAmf** - Use NSSF Selection Service for AMF - When this parameter is true the AMF uses the NSSF Selection Service to select AMF during UE Registration in case AMF decides that it is unable to serve all the Allowed Slices the UE.
- **useNssfSelectionServiceForSmf** - Use NSSF Selection Service for SMF - When this parameter is true the AMF uses the NSSF Selection Service to select SMF during PDU Session establishment
- **userLocationIgnoreNcgi** - User Location Ignore NCGI - Defines whether the AMF supports **ignoreNcgi** parameter inside the **nrLocation** and further on **userLocation**.
- **v2xAllowed** - V2X Allowed - Feature flag for the v2x feature. When set true, the AMF will request a PCF that supports v2x.
- **vlrCleanupBasedOnOccupancy** - VLR Cleanup Based on Occupancy - Current parameter enables doing VLR cleanup of the VLR Contexts of deregistered UEs based on VLR Occupancy
- **voiceEpsFallback** - Voice with EPS Fallback - This parameter activates the voice functionality using EPS fallback on the AMF.
- **voNR** - Voice over New Radio - Activation of the Voice over New Radio feature on the AMF.
- **vsmfChange** - VSMF Change - Enables VSMF change including selection of a new VSMF when new UE location is not supported by current VSMF.

Name

amfGparmValue - Parameter value

Syntax

--amfGparmValue <string>

Description

Value of parameter.

Class

Required on create.

Type / Range

Digit string of length 0 to 64

The amfGparmValue string is based on the amfGparmName parameter:

Name

5g4gRetPrefPlmn - 5g4g Return Preferred PLMN

Syntax

--amfGparmName 5g4gRetPrefPlmn --amfGparmValue <string>

Description

This parameter enables indicating to serving NG-RAN the last visited EPC PLMN as preferred indication to be used in future 5GS to EPS mobility.

List

- DISABLE - Disable
- ENABLE - Enable

Default

DISABLE

Name

5gRanTotalConfigIncompatibilityAlarm - 5G RAN Total Configuration Incompatibility Alarm

Syntax

--amfGparmName 5gRanTotalConfigIncompatibilityAlarm --amfGparmValue <string>

Description

When this parameter is enabled, AMF will raise an Alarm when receiving RAN Configuration Update or there is local configuration change (that may or not lead to sending AMF Configuration Update) that results in total configuration incompatibility between the AMF and the RAN.

List

- false - Boolean value of false.

- true - Boolean value of true.

Default

false

Recommended

true

Name

acceptVoiceNoCheckResp - Accept Voice No Check Response

Syntax

--amfGparmName acceptVoiceNoCheckResp --amfGparmValue <string>

Description

Controls whether the AMF allows indicating IMS voice over PS sessions supported towards the UE and the UDM, when UE Radio Capability Check procedure is provisioned to be run towards the NG-RAN from the AMF but the NG-RAN provides no response for NGAP UE Radio Capability Check Request message.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

accessTypeChangePcfTrigger - Access Type Change PCF Trigger

Syntax

--amfGparmName accessTypeChangePcfTrigger --amfGparmValue <string>

Description

Enables the AMF support for Access Type changes triggered from PCF. By default, flag shall be disabled.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

alwaysSendDnnWithOperatorIdentifier - Always Send DNN with DNN Operator Identifier

Syntax

```
--amfGparmName alwaysSendDnnWithOperatorIdentifier --amfGparmValue <string>
```

Description

Defines whether AMF will always include DNN-OI in DNNs sent as SBI JSON Body IEs and Query Parameters. When the value is true, the AMF will always include the DNN-OI in DNNs. When value is false, the DNN-OI may not be always present as the AMF transparently conveys the DNN in the non roaming scenarios.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

amfEirSupport - AMF EIR Support

Syntax

```
--amfGparmName amfEirSupport --amfGparmValue <string>
```

Description

Activation of the AMF EIR feature on the AMF. By default this shall be disabled

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

amfHomogeneousSupportTais - AMF Homogeneous Support TAIs

Syntax

```
--amfGparmName amfHomogeneousSupportTais --amfGparmValue <string>
```

Description

Defines the TAI the AMF considers for IMS voice over PS homogeneous support under the serving AMF. The other access TAI is considered to support all voice options when considered for the other access IMS voice over PS homogeneous support. (Non-3GPP TAI is considered to support VoPS with VoNR and VoLTE Handover and Redirect.)

List

- AmfHomogSuppAllPlmnsBothAccesses - AMF Homogeneous Support All PLMNs Both Accesses - AMF considers all Tracking Areas of all PLMNs provisioned for both access types when evaluating the IMS voice over PS homogeneous support for the UE.

- AmfHomogSuppAllPlmnsCurrentAccess - AMF Homogeneous Support All PLMNs Current Access - AMF considers all Tracking Areas of all PLMNs provisioned for the current access type when evaluating the IMS voice over PS homogeneous support for the UE.
- AmfHomogSuppServingPlmnBothAccesses - AMF Homogeneous Support Serving PLMN Both Accesses - AMF considers all Tracking Areas of the serving PLMN provisioned for both access types when evaluating the IMS voice over PS homogeneous support for the UE.
- AmfHomogSuppServingPlmnCurrentAccess - AMF Homogeneous Support Serving PLMN Current Access - AMF considers all Tracking Areas of the serving PLMN and the current access type when evaluating the IMS voice over PS homogeneous support for the UE.

Default

AmfHomogSuppAllPlmnsCurrentAccess

Recommended

The recommended value is AmfHomogSuppServingPlmnCurrentAccess.

Name

amfN26DirectFwd - amfN26DirectFwd

Syntax

--amfGparmName amfN26DirectFwd --amfGparmValue <string>

Description

Indicates whether direct data forwarding is enabled or disabled on n26 handover.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

amfN26IndirectFwd - amfN26IndirectFwd

Syntax

--amfGparmName amfN26IndirectFwd --amfGparmValue <string>

Description

Indicates whether indirect data forwarding is enabled or disabled on n26 handover.

List

- disabled - Indirect forwarding is disabled for n26 handover
- enabled - Indirect forwarding is enabled for n26 handover

Default

enabled

Name

amfNpli - AMF NPLI

Syntax

--amfGparmName amfNpli --amfGparmValue <string>

Description

Enables the support for Network Provided Location Info (NPLI) i.e the Namf_Location_ProvideLocationInfo service for the AMF.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

amfRanCombiningOption - AMF RAN Combining Option

Syntax

--amfGparmName amfRanCombiningOption --amfGparmValue <string>

Description

Controls how the AMF establishes the user plane sessions during Service Request or Mobility Registration Update for multiple PDU sessions. AMF may either combine/aggregate all SMF responses and formulate a single NGAP message, or formulate separate NGAP messages per each SMF request.

List

- AMF_COMBINE_RAN_MSGS - Combine RAN messages - The AMF waits for all the SMF responses related to all PDU sessions from all SMFs before sending any NGAP message towards the AN. On Service Request or Mobility Registration Update when user plane connection is established, the AMF formulates a single combined Initial Context Setup Request message on N2 interface with all the N2 resource setup containers included, together with the NAS Service Accept.
- AMF_SEPARATE_RAN_MSGS - Separate RAN Messages - The AMF forwards the SMF responses related to the separate PDU sessions from the SMFs one by one as they arrive at the AMF. On Service Request or Mobility Registration Update when user plane connection is established, the AMF formulates first an Initial Context Setup Request with the first SMF N2 interface container included, and after that formulates subsequent PDU Session Resource Setup Request(s), each request carrying a single N2 setup information container from the corresponding SMF. The last (of the possibly multiple) N2 message(s) contains the NAS Service Accept or Registration Accept message.

Default

AMF_COMBINE_RAN_MSGS

Name

amfRequestPsCellInLrc - AMF Request PS Cell in LRC

Syntax

--amfGparmName amfRequestPsCellInLrc --amfGparmValue <string>

Description

When location reporting control procedure is used in AMF, if AMF Request PS Cell in LRC is set, then AMF includes additional location information IE and set to Include PSCell. gNB will include the current PSCell in the report if Dual Connectivity is activated. If AMF Request PS Cell in LRC is not set, AMF will not request additional location information under location reporting procedure as existing function, then gNB will not report PSCell in location report.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

amfSmsSubscrGet - AMF SMS Subscription Get

Syntax

--amfGparmName amfSmsSubscrGet --amfGparmValue <string>

Description

Controls whether the AMF always attempts to get the SMS related subscription data from the UDM, or whether the AMF follows UE indication of support for SMS over NAS when retrieving the SMS related subscription data from the UDM (i.e. gets the subscription data on need only).

List

- amfSmsGetAlways - AMF SMS Get Always - AMF always attempts to get the SMS Subscription Data and the UE context in SMSF from the UDM during initial registration to the current AMF, if the SMS over NAS feature is enabled both AMF globally and for the UE on UE PLMN services. The AMF attempts to get the subscription data independently of the UE indicated support for SMS over NAS.
- amfSmsGetOnNeed - AMF SMS Get On Need - AMF follows the UE indicated support for SMS over NAS and only attempts to get the SMS Subscription Data and the UE context in SMSF from the UDM during initial registration to the current AMF, if the UE indicates it supports SMS over NAS. The AMF attempts to get the SMS Subscription Data and the UE context in SMSF from the UDM the during a subsequent (periodic or mobility) registration procedure if the UE support for SMS over NAS changes i.e. UE indicates support for SMS over NAS. Further, if AMF does not GET multiple data sets

simultaneously, AMF further does not GET the UE context in SMSF if SMS subscription data is not received.

Default

amfSmsGetAlways

Recommended

The recommended value is amfSmsGetOnNeed.

Name

amfTaiDiscovery - AMF TAI Discovery

Syntax

```
--amfGparmName amfTaiDiscovery --amfGparmValue <string>
```

Description

Specifies whether the AMF TAI auto-discovery feature is active. Default is disable.

List

- DISABLE - Disable
- ENABLE - Enable

Default

DISABLE

Name

amfTriggeredRrcInactivePaging - AMF Triggered RRC Inactive Paging

Syntax

```
--amfGparmName amfTriggeredRrcInactivePaging --amfGparmValue <string>
```

Description

When set to true, the AMF triggers paging of UE(s) in RRC Inactive state but not reachable without network triggered messaging.

Restrictions

This gParm is only taken into consideration if gParm pageRrcInactiveUe is set to true.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Recommended

false

Name

applProtocolFallbackN26ToS10 - Application Protocol Fallback from N26 to S10

Syntax

```
--amfGparmName applProtocolFallbackN26ToS10 --amfGparmValue <string>
```

Description

Current parameter enables fallback to search for 's10' candidate when DNS Query to find target MME during S10 handover using 'n26' fails. This parameter is expected to be used together with parameter Use N26 Service Parameter in 5GS to EPS Handover

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

apra - Additional Presence Reporting Area

Syntax

```
--amfGparmName apra --amfGparmValue <string>
```

Description

Enables the use of the Additional Presence Reporting Area (APRA) feature on the Namf_EventExposure service. When this parameter is set to true, and when also the service consumer indicates support for the APRA feature, and the Presence Reporting Area (PRA) set is internally provisioned in the AMF, and the service consumer requests reporting for the PRA set, the AMF reports the PRA set id in the 'prald' field and the individual PRA id(s) in the 'additionalPrald' field(s) on the presenceInfo of the areaList (an array of AmfEventAreas) of a reportList (an array of AmfEventReports).

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

asynchrTypeComm - Asynchronous Type Communication

Syntax

```
--amfGparmName asynchrTypeComm --amfGparmValue <string>
```

Description

This parameter defines whether the AMF attempts to contact a CM-IDLE UE when AMF receives signalling message for the UE, e.g. SMF triggers N1/N2 message transfer for PDU session modification. When enabled, the AMF attempts to reach the UE via paging (if the UE is currently considered reachable and would be expected to respond to paging). When

disabled, the AMF sends the signalling message to the UE when the UE makes the next contact towards the network.

List

- **ATC_Disabled** - Asynchronous Type Communication Disabled - When AMF receives terminating signalling for a UE that is CM-IDLE, the AMF attempts to reach a CM-IDLE UE via paging (if the UE is currently considered reachable and would be expected to respond to the paging).
- **ATC_Enabled** - Asynchronous Type Communication Enabled - For a CM-IDLE UE for which terminating signalling is received from another network element, the AMF stores the corresponding signalling message and delivers the message towards the UE when the UE makes the next contact towards the network.

Default

ATC_Disabled

Name

autoAddTaiToTaiList - Auto Add TAI to TAI List

Syntax

--amfGparmName autoAddTaiToTaiList --amfGparmValue <string>

Description

Auto Add TAI to TAI list, with allowed values are: Off and Update Three.

List

- **false** - Boolean value of false.
- **true** - Boolean value of true.

Default

false

Name

cagSupport - CAG Support

Syntax

--amfGparmName cagSupport --amfGparmValue <string>

Description

This parameter enables Closed Access Group feature at the AMF

List

- **false** - Boolean value of false.
- **true** - Boolean value of true.

Default

false

Name

checkTgtMmeN26StatusN26Ho - Check Target MME N26 Status in N26 Handover

Syntax

--amfGparmName checkTgtMmeN26StatusN26Ho --amfGparmValue <string>

Description

Current parameter enables checking the N26 link/interface status of local target MME node during N26 handover so that if it isn't available to use, then even if the local MME can serve the target RAN, source AMF will select an alternative node to complete the N26 handover.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Recommended

true

Name

checkUesUsageSetting - Check UE's Usage Setting

Syntax

--amfGparmName checkUesUsageSetting --amfGparmValue <string>

Description

Controls whether the AMF requires UE's Usage Setting IE to be included in NAS Registration Request to indicate IMS voice over PS sessions supported towards the UE and the UDM. If set to false, IMS voice over PS sessions support indication does not depend on whether the UE includes UE's Usage Setting IE. If set to true, AMF indicates IMS voice over PS sessions supported only if UE's Usage Setting IE is included in NAS Registration Request.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Recommended

The recommended value is TRUE.

Name

contactOverNon3gppFor3gpp - Contact Over Non-3GPP for 3GPP

Syntax

--amfGparmName contactOverNon3gppFor3gpp --amfGparmValue <string>

Description

Defines whether the AMF contacts a UE over non-3GPP access, when the UE is CM-CONNECTED over non-3GPP access and CM-IDLE over 3GPP access, and the AMF gets a 3GPP access related trigger for the UE.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

cr129ts29500ErrorToken - CR 129 TS 29.500 Error Token

Syntax

--amfGparmName cr129ts29500ErrorToken --amfGparmValue <string>

Description

This parameter controls the activation of CR 0129 of TS29.500. When this parameter is set to true: Removes condition the access without an OAuth2.0 access token failed for the realm attribute Adds error code invalid_token

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

defaultHttpPort - Default HTTP Port

Syntax

--amfGparmName defaultHttpPort --amfGparmValue <string>

Description

Default port to be used for HTTP connections when it is not explicitly given as part of the the authority of a SBI URI. This parameter applies only to HTTP connections. HTTPS connections always use 443 as the default port (if not explicitly given otherwise in the URI)

Type / Range

Integer in the range of 1 to 65,535

Default

80

Name

defErrorCcSnpn - Default Error Cause for SNPN network

Syntax

```
--amfGparmName defErrorCcSnpn --amfGparmValue <string>
```

Description

This parameter defines the default error cause to send for UE request towards SNPN network when Access Restriction NAS Mapping profile isn't available to use

Type / Range

5GMM Cause Code.

Default

74

Name

delayUdmDuringRegistration - Delay UDM During Registration

Syntax

```
--amfGparmName delayUdmDuringRegistration --amfGparmValue <string>
```

Description

When the same AMF still holds the UE data internally after previous N26 mobility to EPS, this parameter enables AMF to successfully complete the registration procedure and suppress the UDM dialogs (Nudm_UECM_Registration, Nudm_SDM_Get and/or Nudm_SDM_Subscribe, depending on other settings) for the enabled UEs. The UDM dialogs will be re-attempted automatically according to provisioning. Note: this functionality only is effective when the AMF global parameter Keep VLR Entry is set to true.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

deletePduAfterFailedUpAttemptsInIndirectComm - Delete PDU After Failed User Plane Attempts in Indirect Communication

Syntax

```
--amfGparmName deletePduAfterFailedUpAttemptsInIndirectComm --  
amfGparmValue <string>
```

Description

Enables the possibility to delete a PDU from AMF after provisioned number of failed user plane re-establishment attempts when indirect communication is deployed. When this parameter is set to true, the AMF counts the number of times the AMF receives (after possible SCP reselection(s)) a 504 failure from SCP into the internal counter for failed user plane re-establishment attempts. Once the AMF detects 'nth' time the user plane re-establishment fails (for either direct or indirect attempt towards the SMF), the AMF internally

deletes the PDU and indicates towards the UE that the PDU is inactive. The AMF applies the value of the AMF global parameter Failed User Plane Attempts to Delete PDU for the number 'n' above. This parameter is only effective when AMF global parameter Failed User Plane Attempts to Delete PDU is set to a non-zero value. When this parameter is set to false, the AMF does not count 504 response from SCP as SMF not reachable during user plane re-establishment attempts and does not delete PDU(s) due to those.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

directNasMsgTransfer - Direct NAS message transfer to the target AMF

Syntax

--amfGparmName directNasMsgTransfer --amfGparmValue <string>

Description

If the parameters is set to 'True' then AMF forwards the NAS Registration message to the target AMF over N14 interface if the AMF can determine the target AMF. If the parameters is set to 'False' then AMF forwards the NAS Registration message via 5G RAN.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

dualFailVnfIpds - Dual Fail IPDS

Syntax

--amfGparmName dualFailVnfIpds --amfGparmValue <string>

Description

When enabled, a dual failure of a spread IPDS pool will trigger IPDS pool 0 to dual fail. This is specifically for the two large IPDS configuration in VNF or CNF. It applies to any application type. This dual failure of IPDS pool 0 will result in system outage of the system. When disabled, the propagation of the dual failure will not occur.

List

- DISABLE - Disable
- ENABLE - Enable

Default

ENABLE

Name

eaea - EBI and ARP mapping update in EBI Assignment

Syntax

--amfGparmName eaea --amfGparmValue <string>

Description

Enables supporting EAEA feature

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

ebiAssignReqReject - EBI Assignment Request Reject

Syntax

--amfGparmName ebiAssignReqReject --amfGparmValue <string>

Description

When set to true, the AMF rejects SMF EBI assignment request with an http2 status code associated with the ongoing procedure at the time of the received request, TEMPORARY_REJECT_HANDOVER_ONGOING or TEMPORARY_REJECT_REGISTRATION_ONGOING

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

emcNon3gppN3iwf - EMC Non-3GPP Access N3IWF

Syntax

--amfGparmName emcNon3gppN3iwf --amfGparmValue <string>

Description

Enables the support for emergency services over untrusted non-3GPP access via N3IWF.

List

- false - Boolean value of false.

- true - Boolean value of true.

Default

false

Recommended

Should be set to true when non-3GPP access type is served on 5GS via N3IWF.

Name

emergencyEpsIwkWoN26 - Emergency EPS Interworking Without N26

Syntax

--amfGparmName emergencyEpsIwkWoN26 --amfGparmValue <string>

Description

Enables the possibility to handover an emergency session from EPS to 5GS (3GPP access) without N26 interface on the AMF. Session continuity is ensured by getting the (EPS stored) emergency information from HSS+UDM as part of the subscription profile. Applied when EPS Interworking Without N26 is set to true.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

emergencyNon3gppEpsPduHo - Emergency Non-3GPP Access EPS PDU Handover

Syntax

--amfGparmName emergencyNon3gppEpsPduHo --amfGparmValue <string>

Description

Enables the AMF support for UE triggered emergency PDU handovers between untrusted non-3GPP via N3IWF/5GS and E-UTRAN/EPS.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

enhancedPcfSelection3gppAccess - Enhanced PCF Selection 3GPP Access

Syntax

```
--amfGparmName enhancedPcfSelection3gppAccess --amfGparmValue  
<string>
```

Description

When this parameter is enabled, AMF will support the following functionality for 3GPP access: a) Reselect PCF upon change of Serving PLMN if required. b) Exclude PCFs that do not support both UE and AM Policy Control Services when an association for both Policies is required. c) Reselect PCF during inter-AMF UE mobility if the PCF Instance provided by the old AMF does not meet all the selection criterions. d) Fallback to selection of PCF without considering Slice support, when no valid candidate PCF that serves all slices in the Allowed NSSAI is discovered.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

epdgEmergencyHo - ePDG Emergency Handover

Syntax

```
--amfGparmName epdgEmergencyHo --amfGparmValue <string>
```

Description

This parameter enables session continuity of an emergency session between ePDG/EPC and NG-RAN/5GC.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

epdgHo - ePDG Handover

Syntax

```
--amfGparmName epdgHo --amfGparmValue <string>
```

Description

Enables handover between non-3GPP access connected to EPC and 3GPP access (NG-RAN) connected to 5GC

List

- DISABLE - Disable

- ENABLE - Enable

Default

DISABLE

Name

epsFallbackNoPageUe - Page UE during EPS Fallback

Syntax

--amfGparmName epsFallbackNoPageUe --amfGparmValue <string>

Description

Enables suppression of UE paging when gNB releases UE context due to EPS Fallback and EpsFallbackNoPageTimer is running.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

epsIwkWithoutN26 - EPS Interworking Without N26

Syntax

--amfGparmName epsIwkWithoutN26 --amfGparmValue <string>

Description

Enables the EPS interworking without N26 interface support on the AMF.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

epsTo5gsHoWithAmfReselect - EPS To 5GS Handover With AMF Reselect

Syntax

--amfGparmName epsTo5gsHoWithAmfReselect --amfGparmValue <string>

Description

This parameter enables the capability of AMF reselection during EPS to 5GS handover. It is evaluated at both the initial AMF and target AMF of an EPS to 5GS Handover with AMF reselection procedure

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

epsUpip - EPS UPIP

Syntax

--amfGparmName epsUpip --amfGparmValue <string>

Description

Current parameter enables support for the EPS-UIP (User Plane Integrity Protection)

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

ethernetPduSupportN26 - Ethernet PDU Support N26

Syntax

--amfGparmName ethernetPduSupportN26 --amfGparmValue <string>

Description

Parameter controls AMF indicating in Context Request if Ethernet PDU is supported for EPS to 5GS idle mobility scenario. By default, the flag shall be disabled.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

excludeRoutingIndWithSupi - Exclude Routing Indicator with SUPI

Syntax

--amfGparmName excludeRoutingIndWithSupi --amfGparmValue <string>

Description

When enabled, the AMF, when SUPI is available, will use SUPI and exclude routing indicator as selection criteria in the query to the NRF to select AUSF and UDM.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

existingPduNoSmf - Existing PDU No SMF

Syntax

--amfGparmName existingPduNoSmf --amfGparmValue <string>

Description

Controls whether the AMF sends the SM message back to the UE or drops it, if the AMF receives an SM message with Request Type 'existing PDU session', the AMF does not have a routing context for the PDU session and no SMF can be found on the UDM subscription data for the PDU session id or the DNN.

List

- AMF_EXISTING_PDU_NO_SMF_DROP - Existing PDU No SMF Drop - If the AMF receives an SM message with Request Type "existing PDU session", the AMF does not have a routing context for the PDU session and no SMF can be found on the UDM subscription data for the PDU session id or the DNN, the AMF drops the SM message.
- AMF_EXISTING_PDU_NO_SMF_SENDBACK - Existing PDU No SMF Send Back - If the AMF receives an SM message with Request Type "existing PDU session", the AMF does not have a routing context for the PDU session and no SMF can be found on the UDM subscription data for the PDU session id or the DNN, the AMF sends back the SM msg to the UE.

Default

AMF_EXISTING_PDU_NO_SMF_SENDBACK

Name

extendedEmergencyNumListAreaCode - Extended Emergency Number List Area Code

Syntax

--amfGparmName extendedEmergencyNumListAreaCode --amfGparmValue
<string>

Description

Indicates provisioned extended emergency list area code. When feature activation gParm is enabled and upon receiving AreaCode in UE Subscription data from UDM, if received Area Code matches provisioned area code for this feature, AMF shall send Extended Emergency Numbers List in the REGISTRATION ACCEPT message.

Type / Range

Integer in the range of 0 to 65,535

Default

0

Name

failedUserPlaneAttemptsToDeletePdu - Failed User Plane Attempts to Delete PDU

Syntax

```
--amfGparmName failedUserPlaneAttemptsToDeletePdu --amfGparmValue  
<string>
```

Description

Defines how many failed UE triggered user plane re-establishment attempts, where the AMF fails to communicate with the SMF due to link issues, cause the AMF to internally delete the requested PDU and to indicate towards the UE that the corresponding requested PDU is inactive. The value 0 stands for the functionality to be disabled. When disabled, the AMF does not delete the PDU due to link related SMF communication failures during user plane re-establishment attempts.

Type / Range

Integer in the range of 0 to 10

Default

0

Name

freqCountMonitoring - Frequency Count Monitoring

Syntax

```
--amfGparmName freqCountMonitoring --amfGparmValue <string>
```

Description

Defines whether the AMF monitors the UE attempts for different UE triggered procedures, and if too frequent attempts made by the UE during the provisioned monitoring period, treat the UE accordingly, e.g. drop subsequent procedure requests or deregister the UE.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

getSmfSelSubDataEmptySnssaiInfo - Get Smf Selection Subscription Data when having empty SnssaiInfo

Syntax

```
--amfGparmName getSmfSelSubDataEmptySnssaiInfo --amfGparmValue <string>
```

Description

Enable fetching SMF Selection Subscription Data during PDU Session Establishment (type = initial request) when local UE context indicates that the UE is supposed to have PDU session service subscribed but local subscription data for SMF selection is empty

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

gnbRerouteFallback - GNB Reroute NAS Fallback

Syntax

```
--amfGparmName gnbRerouteFallback --amfGparmValue <string>
```

Description

AMF re-routes NAS message to gNB when N14 is not available during UE inter-AMF re-location when source AMF can't service the UE slice.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

iabEnabled - IAB Enabled

Syntax

```
--amfGparmName iabEnabled --amfGparmValue <string>
```

Description

This gParm enables Integrated Access and Backhauling (IAB) operation at the AMF

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

icsrAloneVoiceRadioCap - ICSR Alone Voice Radio Capability

Syntax

```
--amfGparmName icsrAloneVoiceRadioCap --amfGparmValue <string>
```

Description

Controls whether AMF sends NGAP Initial Context Setup Request alone without NAS Registration Accept, when either -AMF does not hold UE radio capability but needs it for purposes listed further below, and/or -AMF needs to run NGAP UE radio capability check procedure to decide IMS voice over PS support for the UE. If UE radio capabilities are needed on the AMF (Reject On VoNR Tracking Area and/or EMC Suppress No VoNR and/or IMS VoPS S1 Disabled is true under AMF Voice Profile for the UE on 5G UE PLMN Services), or UE radio capability check procedure result is required to decide for the IMS voice over PS result for the UE, the AMF needs to send NGAP Initial Context Setup Request alone first (without any NAS message) in order to let NG-RAN establish AS security before requesting radio capabilities from the UE. When set to true and when Reject On VoNR Tracking Area and/or EMC Suppress No VoNR and/or IMS VoPS S1 Disabled is true under AMF Voice Profile for the UE on 5G UE PLMN Services, AMF sends NGAP UE Radio Capability Check Request only after receiving Initial Context Setup Response.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Recommended

The recommended value is TRUE.

Name

ignoreAusfFailuresOptionalReAuthentications - Ignore AUSF Failures on Optional Re-Authentications

Syntax

```
--amfGparmName ignoreAusfFailuresOptionalReAuthentications --  
amfGparmValue <string>
```

Description

This parameter, when set, enables AMF to ignore AUSF dialog related failures during optional re-authentications. The UEs to apply the functionality to are provisioned on the AMF. The functionality is applied when the AMF is locally provisioned to perform an optional re-authentication for a UE that is already registered on the AMF, but the re-authentication fails during the AUSF dialog and the AMF is able to continue serving the UE without the re-authentication.

List

- false - Boolean value of false.

- true - Boolean value of true.

Default

false

Name

imdRptThirdPartySub - Immediate Report to Third Party Subscription

Syntax

--amfGparmName imdRptThirdPartySub --amfGparmValue <string>

Description

Controls whether the AMF supports the 'IERSR' feature negotiation when a client subscribes to an Event at the AMF and requests an immediate report as part of that subscription. When the gparm is set and the client subscription request an immediate report, the AMF optionally can send the first event report in the subscription response, depending on whether the first report is ready by the time the AMF must respond to the subscription. See TS 29.518 CR 0646.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

imsVopsHomogeneousSupport - IMS VoPS Homogeneous Support

Syntax

--amfGparmName imsVopsHomogeneousSupport --amfGparmValue <string>

Description

This parameter controls whether or not the AMF includes the IMS VoPS attribute towards the UDM as part of the Amf3gppAccessRegistration attribute.

List

- DISABLE - Disable
- ENABLE - Enable

Default

DISABLE

Name

inhibitInterAmfN2HoSameTa - Inhibit Inter AMF N2 Handover Source and Target gNBs in same TA

Syntax

--amfGparmName inhibitInterAmfN2HoSameTa --amfGparmValue <string>

Description

When enabled, source AMF inhibits N2 HO to target AMF if source AMF has no N2 link to target gNB and UE current location (TAC) and the target gNB TAC is the same. Source AMF responds back to source gNB with Handover Preparation Failure message.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

initialContextSetupTrigger - Send Initial Context

Syntax

--amfGparmName initialContextSetupTrigger --amfGparmValue <string>

Description

Controls when the AMF sends NGAP Initial Context Setup Request towards the NG-RAN.

List

- normal - AMF sends NGAP Initial Context Setup Request when: - The RAN includes the UE Context Request IE in the NGAP Initial UE Message - Mobility Registration Update or Service Request with UL data status IE is set - Session Management procedure is triggered and Initial Context has not yet been established
- registrationAndServiceRequests - Registration and Service Requests - In addition to the "normal" setting triggers, AMF sends Initial Context Setup Request for initial UE Registration or Service Requests.
- serviceRequests - Service Requests - In addition to the "normal" setting triggers, AMF sends NGAP Initial Context Setup Request for initial UE Service Requests (UE in ECM-IDLE or ECM-CONNECTED state).

Default

normal

Recommended

The recommended value is registrationAndServiceRequests.

Name

interSystemAndEnDcConfTransferOverN26 - Inter-System and EN-DC SON Configuration Transfer Over N26

Syntax

--amfGparmName interSystemAndEnDcConfTransferOverN26 --amfGparmValue <string>

Description

Parameter controls feature activation GPARM flag. By default, flag shall be disabled. When enabled, AMF/MME shall transfer inter-system SON configuration information and EN-DC Configuration Transfer between a gNB and eNodeB.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

intraAmfInterPlmnUdmModRegistration - Intra AMF Inter PLMN UDM Registration Modification

Syntax

```
--amfGparmName intraAmfInterPlmnUdmModRegistration --amfGparmValue  
<string>
```

Description

When set to true and UE moves between Serving PLMNs within the same AMF, the AMF will modify GUAMI IE to the target Serving PLMN GUAMI, within the UE Context Management information in UDM, for given UE.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

intraAmfInterPlmnUdmModSubscription - Intra AMF Inter PLMN UDM Subscription Modification

Syntax

```
--amfGparmName intraAmfInterPlmnUdmModSubscription --amfGparmValue  
<string>
```

Description

When set to true and UE moves between Serving PLMN within the same AMF, the AMF will modify the PLMN ID to the target Serving PLMN for given UE.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

ismf - Intermediate SMF

Syntax

--amfGparmName ismf --amfGparmValue <string>

Description

Enables Support of deployments topologies with specific SMF Service Areas, i.e. the Intermediate SMF (I-SMF) support in the AMF. An Intermediate SMF may be inserted on the signalling path between AMF and the SMF, when the SMF is not able to control the UPF(s) because the UPF(s) belong to a different SMF Service Area. The I-SMF may also be changed or removed due to this during procedures. The I-SMF concept is introduced in 3GPP Release 16.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

ismfSelectionFailureMaintain - I-SMF Selection Failure Maintain

Syntax

--amfGparmName ismfSelectionFailureMaintain --amfGparmValue <string>

Description

Defines whether the AMF maintains PDU session in a situation when 3GPP Support of deployments topologies with specific SMF Service Areas i.e. I-SMF is deployed, and AMF detects the need to select a new I-SMF, but no I-SMF supporting the current UE area is available. If set to 'false', AMF releases the PDU session (i.e. triggers Nsmf_PDUSession_UpdateSMContext with release indication towards the old SMF or I-SMF) if no new I-SMF is available for the current area of the UE.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

keepUeContextAfterN26Ho - Keep VLR Entry

Syntax

--amfGparmName keepUeContextAfterN26Ho --amfGparmValue <string>

Description

When this parameter is set to true, keep VLR entry when UDM DeregistrationReason is 5GS_TO_EPS_MOBILITY

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

ladn - Local Area Data Network

Syntax

```
--amfGparmName ladm --amfGparmValue <string>
```

Description

Local Area Data Network. This parameter activates the LADN functionality support in AMF. With the LADN functionality, access to a provisioned data network is only provided on a restricted service area. The LADN DNN and the associated LADN Service Area (the Tracking Area list) also need to be provisioned.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

ladnNotifications - LADN Notifications

Syntax

```
--amfGparmName ladmNotifications --amfGparmValue <string>
```

Description

Controls whether the AMF triggers Event Notifications on LADN state towards the service consumer.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

linkAlarmCustomize - AMF Link Alarm Customize

Syntax

```
--amfGparmName linkAlarmCustomize --amfGparmValue <string>
```

Description

If the global parameter is set to true, customized severity levels in the AMF Link Alarm Config are used to set the alarm severity for links and interfaces. If the global parameter is set to false, customization of link alarm severity is not supported.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

locationEvents - Location Events

Syntax

```
--amfGparmName locationEvents --amfGparmValue <string>
```

Description

Enables the Namf_Event Exposure in the AMF for subscribing to UE location reporting events (direct or continuous location reporting).

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

maskedImeIsV - Masked IMEISV

Syntax

```
--amfGparmName maskedImeIsV --amfGparmValue <string>
```

Description

Include Masked IMEISV in NGAP messages

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

maxAmfUeRadioCapLength - Maximum AMF Ue Radio Capability Length

Syntax

--amfGparmName maxAmfUeRadioCapLength --amfGparmValue <string>

Description

Maximum Ue Radio Capability Length Supported on the AMF. Default is 9216. Setting this value to 24576 enables storage of Radio capability length between 9216 - 24576 bytes in the RCIS if RCIS is available

Type / Range

Integer in the range of 9,216 or 24,576

Default

9216

Name

maxNumberOfForbiddenTacs - Maximum Number of Forbidden TACs

Syntax

--amfGparmName maxNumberOfForbiddenTacs --amfGparmValue <string>

Description

AMF shall support maximum number of 600 forbidden TACs with the default value of 64.

Type / Range

Integer in the range of 64 or 255 or 600

Default

64

Name

mcs - Mission Critical Services

Syntax

--amfGparmName mcs --amfGparmValue <string>

Description

Enables the support for Mission Critical Services (MCS) on the AMF.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

memoryRestrictionForbiddenTac - Memory Restriction Forbidden TAC

Syntax

```
--amfGparmName memoryRestrictionForbiddenTac --amfGparmValue <string>
```

Description

Parameter to control CPPS VLR memory allocation for feature f20430-02. maxNumberOfForbiddenTacs can be set to larger size (i.e 600) only when this gParm is 'true' A memory restricted gparm that can only be changed, with aggregate service lock. default value is false. memoryRestrictionForbiddenTac cannot be changed in CMM24.7 release. It will be deprecated in CMM24.11

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

mps - Multimedia Priority Services

Syntax

```
--amfGparmName mps --amfGparmValue <string>
```

Description

Enables the support for Multimedia Priority Services (MPS) on the AMF.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

mrldINasTransp - Mobility Restriction List on DL NAS Transport

Syntax

```
--amfGparmName mrldINasTransp --amfGparmValue <string>
```

Description

Controls whether the AMF will only include Mobility Restriction List on DL NAS transport if the list context has been changed, or include even if the content has not changed from previous content.

List

- **AMF_MRL_ON_DL_NAS_TRANSP_CHANGES_ONLY** - Mobility Restriction List on DL NAS Transport changes only - AMF will include Mobility Restriction List on DL NAS Transport only if the Mobility Restriction List content has changed.
- **AMF_MRL_ON_DL_NAS_TRANSP_NO_CHANGE** - Mobility Restriction List on DL NAS Transport no changes - AMF will include Mobility Restriction List on DL NAS Transport even if the Mobility Restriction List content has not changed.

Default

AMF_MRL_ON_DL_NAS_TRANSP_CHANGES_ONLY

Name

mrlSplmnOnlySending - Mobility Restriction List Serving PLMN only sending

Syntax

--amfGparmName mrlSplmnOnlySending --amfGparmValue <string>

Description

Controls whether the AMF includes Mobility Restriction List on NGAP messages (Initial Context Setup Request, Handover Request and DL NAS Transport) with Serving PLMN as the only content, or only if also restrictions are to be communicated to the NG-RAN. (Note: DL NAS transport with only serving PLMN included is only applicable if Mobility Restriction List is sent in every DL NAS Transport.

List

- **AMF_MRL_SPLMN_NOT_ALONE** - Mobility Restriction List Serving PLMN not sent alone - AMF includes Mobility Restriction List on NGAP messages Initial Context Setup Request, Handover Request and DL NAS Transport only if also restrictions are to be communicated to the NG-RAN.
- **AMF_MRL_SPLMN_ONLY_SENT** - Mobility Restriction List Serving PLMN only sent - AMF includes Mobility Restriction List on NGAP messages Initial Context Setup Request, Handover Request and DL NAS Transport, even if the Serving PLMN would be the only content included in the list, i.e. no restrictions are to be communicated to the NG-RAN.

Default

AMF_MRL_SPLMN_ONLY_SENT

Name

multiLevelMps - Multi-Level MPS

Syntax

--amfGparmName multiLevelMps --amfGparmValue <string>

Description

Enables the use of 5 different MPS levels with dedicated SBI Message Priority value for each MPS level. Applies when AMF global parameter Multimedia Priority Services is set to true.

List

- **false** - Boolean value of false.

- true - Boolean value of true.

Default

false

Name

multiSimWithSameMsisdnSupport - Multiple SIM with Same MSISDN Support

Syntax

```
--amfGparmName multiSimWithSameMsisdnSupport --amfGparmValue <string>
```

Description

Parameter controls feature activation. By default, parameter shall be disabled. When enabled, AMF shall support and allow more than one SUPI to register to the AMF by using the same MSISDN. With the default value setting of false, the AMF shall work as it had before the introduction of this feature.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

n26iwkSuppt - N26 interworking Supported

Syntax

```
--amfGparmName n26iwkSuppt --amfGparmValue <string>
```

Description

Enables the support for EPS interworking with N26 interface in the AMF

List

- DISABLE - Disable
- ENABLE - Enable

Default

DISABLE

Recommended

Recommended value is ENABLE

Name

n2HoWithAmfReselect - N2 Handover with AMF Reselection

Syntax

```
--amfGparmName n2HoWithAmfReselect --amfGparmValue <string>
```

Description

This parameter enables the capability of target AMF reselection during inter-AMF N2 handover. The reselection is performed by the initial target AMF when it is not able to serve all requested S-NSSAIs

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

n3gppInitialCtxtNas - Non-3GPP NAS Response with Initial Context

Syntax

--amfGparmName n3gppInitialCtxtNas --amfGparmValue <string>

Description

Controls whether AMF sends NAS response on top of the NGAP Initial Context Setup Request for non-3GPP access. When set to false (default), AMF sends NAS response alone via DL NAS Transport after the Initial Context Setup has been completed. When set to true, AMF sends NAS response on top of the NGAP Initial Context Setup Request.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

ngap3gppRelease - NGAP asn.1 3GPP Release

Syntax

--amfGparmName ngap3gppRelease --amfGparmValue <string>

Description

Identifies supported NGAP ASN.1 3GPP Releases.

List

- rel16 - 3GPP R16 NGAP asn.1 - Identifies NGAP asn.1 3GPP Release
- rel17 - 3GPP R17 NGAP asn.1 - Identifies NGAP asn.1 3GPP Release
- mar20 - NGAP asn.1 3GPP March 2020 Release - Identifies NGAP asn.1 3GPP Release

Default

mar20

Name

non3gppAccessImsVopsHomogeneous - Non-3GPP Access N3IWF IMS VoPS Homogeneous

Syntax

```
--amfGparmName non3gppAccessImsVopsHomogeneous --amfGparmValue <string>
```

Description

This parameter controls whether or not the AMF applies UECM Update service operation towards UDM due to imsVoPs homogeneous supports change for a UE that is registered over untrusted non-3GPP access via N3IWF

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

non3gppAccessN3iwf - Non-3GPP access N3IWF

Syntax

```
--amfGparmName non3gppAccessN3iwf --amfGparmValue <string>
```

Description

Controls the support of non-3GPP access and the Non-3GPP Access Interworking Function (N3IWF) in the AMF.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

non3gppAccessN3iwfRatType - AMF Non-3GPP Access N3IWF RAT Types

Syntax

```
--amfGparmName non3gppAccessN3iwfRatType --amfGparmValue <string>
```

Description

Defines the RAT type the AMF supports for UEs connected via untrusted non-3GPP access and N3IWF to the AMF.

List

- AmfN3iwfRatTypeVirtual - AMF N3IWF RAT Type VIRTUAL - AMF supports RAT type VIRTUAL for untrusted non-3GPP access for UEs connected via N3IWF to AMF.

- AmfN3iwfRatTypeWlan - AMF N3IWF RAT Type WLAN - AMF supports RAT type WLAN for untrusted non-3GPP access for UEs connected via N3IWF to AMF.

Default

AmfN3iwfRatTypeWlan

Name

non3gppAccessVoiceN3iwf - Non-3GPP Access Voice N3IWF

Syntax

--amfGparmName non3gppAccessVoiceN3iwf --amfGparmValue <string>

Description

Enables support for IMS Voice over PS sessions over untrusted non-3GPP access via N3IWF.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

non3gppEpsPduHo - Non-3GPP Access EPS PDU Handover

Syntax

--amfGparmName non3gppEpsPduHo --amfGparmValue <string>

Description

Enables the AMF support for UE triggered non-emergency PDU handovers between untrusted non-3GPP via N3IWF/5GS and E-UTRAN/EPS.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

non3gppNpliN3iwf - Non-3GPP NPLI N3IWF

Syntax

--amfGparmName non3gppNpliN3iwf --amfGparmValue <string>

Description

Enables the AMF support for Network Provided Location Information (NPLI) for untrusted non-3GPP access via N3IWF.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

nonIpPdnSupportN26 - Non IP PDN Support N26

Syntax

--amfGparmName nonIpPdnSupportN26 --amfGparmValue <string>

Description

Parameter controls AMF indicating in Context Request if Non IP PDN is supported for EPS to 5GS idle mobility scenario. By default, the flag shall be enabled.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

nrDualConnectivity - NR Dual Connectivity

Syntax

--amfGparmName nrDualConnectivity --amfGparmValue <string>

Description

Enables NR Dual Connectivity NR-DC and Secondary RAT Usage Reporting. The NR Dual Connectivity profile, when configured, administers NR-DC support, Secondary RAT Usage Reporting restriction and UDM NR Secondary RAT Access restriction override per UE PLMN Services or SUPI Range Services.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

nrfDefaultLoadValueForNfs - Default Load Value for NFs

Syntax

--amfGparmName nrfDefaultLoadValueForNfs --amfGparmValue <string>

Description

Determines default 'load' value to be assumed for a Service instance when the 'load' information is not received from NRF. Load is used by the AMF along with Locality, Priority and Capacity in order to select/load balance traffic among multiple NF Service Instances that meet the given criteria.

Type / Range

Integer in the range of 0 to 100

Default

0

Name

nrfHeartbeatFailures - NRF Heartbeat Failures

Syntax

--amfGparmName nrfHeartbeatFailures --amfGparmValue <string>

Description

This parameter is used to provision maximum number of consecutive heartbeat failures to NRF. If AMF does not receive responses to heartbeat messages consecutively specified by this parameter then, AMF stops heartbeat messages and tries to re-register to this NRF. If registration is successful, AMF again tries heartbeat messages. If registration is unsuccessful, AMF tries to register to another NRF.

Type / Range

Integer in the range of 1 to 10

Default

3

Name

nrfUseNFLoadInfo - NRF Use Network Function Load Information

Syntax

--amfGparmName nrfUseNFLoadInfo --amfGparmValue <string>

Description

Determines whether 'load' will be taken into account when applying load balancing among candidate Network Functions / Service Instances. The 'load' indicates the current load percentage of the NF/Service Instance and is acquired from the NRF during NF Discovery and NF Profile Notification Update. Parameter values: - No (default): load is not taken into account - Yes: load is taken into account

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

nssaaEnable - NSSAA

Syntax

--amfGparmName nssaaEnable --amfGparmValue <string>

Description

A control parameter to enable Network Slice-Specific Authentication and Authorization (NSSAA). If the parameter set to true, then AMF shall support NSSAA. Otherwise, AMF will not support it

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

nssfNsSelectionLoadBalancing - NSSF NSSelection Load Balancing

Syntax

--amfGparmName nssfNsSelectionLoadBalancing --amfGparmValue <string>

Description

This parameter controls whether load balancing will be applied among multiple Nnssf_NSSelection service instances. When load balancing is enabled, load balancing will be applied among the highest priority available service instances based on their relative capacity.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

nullSchemeSuciUseSupi - Null-Scheme SUCI Use SUPI

Syntax

--amfGparmName nullSchemeSuciUseSupi --amfGparmValue <string>

Description

When enabled, the AMF derives SUPI from Null-Scheme SUCI and include the SUPI: - in the query to the NRF to select AUSF - in the Authentication Request to the AUSF to authenticate the UE

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

nwdafEnable - NWDAF Enable

Syntax

```
--amfGparmName nwdafEnable --amfGparmValue <string>
```

Description

A control parameter to enable AMF access to an NWDAF in the home PLMN. If set false, the AMF will not use the SBI towards the NWDAF.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

oauthSupport - OAuth Support

Syntax

```
--amfGparmName oauthSupport --amfGparmValue <string>
```

Description

Parameter controls the feature activation. If parameter is enabled, OAuth based Authorization of Network Function Service Access shall be supported. By default this parameter shall be disabled.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

pageForN1SmInUpdRsp - Page for N1Sm in Update Response

Syntax

```
--amfGparmName pageForN1SmInUpdRsp --amfGparmValue <string>
```

Description

Current parameter enables paging the UE when receive N1Sm in Update Sm Context Response and the UE is in CM-IDLE state.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

pageOn3gppIfNon3gppFail - Page UE on 3GPP if non-3GPP fail

Syntax

--amfGparmName pageOn3gppIfNon3gppFail --amfGparmValue <string>

Description

Defines AMF action when UE is CM-CONNECTED for non-3GPP access and CM-IDLE on 3GPP access, and AMF has sent Notification on non-3GPP access to re-establish user plane or deliver signaling from SMF for 3GPP access, but AMF timer T3565 supervising the Notification Response, Service Request or Registration Request has expired. When set to 'false', AMF notifies the SMF that the UE is unreachable. When set to 'true', AMF pages the UE on 3GPP access.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

pageRrcInactiveUe - Page UE in RRC Inactive state

Syntax

--amfGparmName pageRrcInactiveUe --amfGparmValue <string>

Description

Enables paging UE in RRC Inactive state feature. When set to true, AMF invokes paging for UEs UE in RRC Inactive state if RAN paging fails.

Restrictions

This gParm can only be set to true if gParm rrcInactive is set to true.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Recommended

false

Name

pagingGapFailCountTrigger - Paging Gap Fail Count Trigger

Syntax

```
--amfGparmName pagingGapFailCountTrigger --amfGparmValue <string>
```

Description

Parameter AMF Paging Gap Fail Count Trigger indicates the number of failed paging operations that start the AMF Paging Gap Timer.

Type / Range

Integer in the range of 1 to 5

Default

3

Name

pagingOverloadPrevention - Paging Overload Prevention

Syntax

```
--amfGparmName pagingOverloadPrevention --amfGparmValue <string>
```

Description

Parameter controls feature activation related to monitoring AMF paging activity and taking action (when necessary) to avoid an overload condition. By default, flag shall be always enabled.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

peips - PEIPS Active

Syntax

```
--amfGparmName peips --amfGparmValue <string>
```

Description

Specifies whether the PEIPS feature (Paging Early Indication with Paging Subgroups) is active on the AMF.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

peiRetrievalMethod - Query PEI method

Syntax

--amfGparmName peiRetrievalMethod --amfGparmValue <string>

Description

Specify method to retrieve PEI from the UE. If the parameter is set to none, PEI is retrieved via identity request procedure if/when needed.

List

- idr - Identity Request - Retrieve PEI via Identity Request
- none - No PEI retrieval
- smc - Security Mode Command - Retrieve PEI via Security Mode Command

Default

smc

Name

pmInclude5qi - Include 5QI PM Counters

Syntax

--amfGparmName pmInclude5qi --amfGparmValue <string>

Description

This parameter controls whether the PM counters relevant to 5QI would be pegged from the system. When this parameter is set, the system is able to extract the 5QI information needed to peg the corresponding counters.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

praPcfTrigger - PRA PCF Trigger

Syntax

--amfGparmName praPcfTrigger --amfGparmValue <string>

Description

Enables the AMF support for Presence Reporting Area changes triggered from PCF (for 3GPP access).

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

presenceInAoI - Presence in Area of Interest

Syntax

--amfGparmName presenceInAoI --amfGparmValue <string>

Description

Enables the Presence in Area of Interest in the AMF. The AMF provides this functionality via the Namf_EventExposure service. The service consumer may define an Area of Interest and the AMF reports back the presence of the UE on the area.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

primaryHttpConnectionWeight - Primary HTTP connection Weight

Syntax

--amfGparmName primaryHttpConnectionWeight --amfGparmValue <string>

Description

Defines how AMF will load balance traffic among 2 HTTP connections to the same SBI Server endpoint. Primary connection will have weight equal to primaryHttpConnectionWeight. Secondary connection will have weight equal to 100 - primaryHttpConnectionWeight. Default is 50 which balances UE related traffic over the two connections on a per-UE basis and non-UE related traffic on a random basis.

Type / Range

Integer in the range of 50 to 100

Default

50

Name

prioritizeLinkStatesForCallbacks - Prioritize Link States for Callbacks

Syntax

```
--amfGparmName prioritizeLinkStatesForCallbacks --amfGparmValue  
<string>
```

Description

When this parameter is set to true, when CMM is sending a Request to a callback URI (Subsequent Request or a Notification), it will prefer to use Endpoints with no link (Not Existing) or Endpoints that have links in Enabled and Unlocked state. Endpoints with links Under Creation (UNDEFINED) will be used only if no other valid Endpoint is available.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

prioritizeLinkStatesForInitialRequests - Prioritize Link States for Initial Requests

Syntax

```
--amfGparmName prioritizeLinkStatesForInitialRequests --amfGparmValue  
<string>
```

Description

When this parameter is set to true, when CMM is sending an Initial Request in Direct communication, it will prefer to use Endpoints with no link (Not Existing) or Endpoints that have links in Enabled and Unlocked state. Endpoints with links Under Creation (UNDEFINED) will be used only if no other valid Endpoint is available.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

prioritizeLinkStatesForScps - Prioritize Link States for SCPs

Syntax

```
--amfGparmName prioritizeLinkStatesForScps --amfGparmValue <string>
```

Description

When this parameter is set to true, when CMM is sending an Request in Indirect Direct communication, it will prefer to use Endpoints with no link (Not Existing) or Endpoints that have links in Enabled and Unlocked state. Endpoints with links Under Creation (UNDEFINED) will be used only if no other valid Endpoint is available.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

radioCapInfoForPaging - UE radio capability for paging

Syntax

--amfGparmName radioCapInfoForPaging --amfGparmValue <string>

Description

Enable/disable inclusion of radio capability for paging IE in the: - NGAP PAGING message - Initial UE Context Setup Request message when RRC Inactive feature is enabled

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

reattemptN26CtxReqCc92 - Reattempt N26 Context Request when receive CC92

Syntax

--amfGparmName reattemptN26CtxReqCc92 --amfGparmValue <string>

Description

When current parameter is enabled and the AMF receives N26 Context Response with CC92, the AMF verifies UE identity, possibly by doing reauthentication, and attempts again N26 Context Request to source MME

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

reattemptN26CtxReqCc96 - Reattempt N26 Context Request when receive CC96

Syntax

--amfGparmName reattemptN26CtxReqCc96 --amfGparmValue <string>

Description

When current parameter is enabled and the AMF receives N26 Context Response with CC96, the AMF verifies UE identity, possibly by doing reauthentication, and attempts again N26 Context Request to source MME

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

restrictBroadcastCmmHomePlmn - Restrict Broadcasting CMM Home PLMN

Syntax

--amfGparmName restrictBroadcastCmmHomePlmn --amfGparmValue <string>

Description

Current parameter enables restrict sending CMM 'Home' PLMN in NG Setup and NRF Register procedures

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

reuseOldUeContextEpsTo5gs - Reuse Old UE Context When UE Moves to 5GS

Syntax

--amfGparmName reuseOldUeContextEpsTo5gs --amfGparmValue <string>

Description

With this parameter, the AMF reuses the subscription data of the old UE Context that were locally preserved when UE moved to EPS and skips SDM GET and SDM Subscribe operations towards UDM

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

reuseRequestApiRootInLocationHeader - Reuse Request apiRoot in Location Header

Syntax

```
--amfGparmName reuseRequestApiRootInLocationHeader --amfGparmValue  
<string>
```

Description

When this parameter is set to true and the Response includes a Location header, CMM will construct the apiRoot of the Location URI by reusing apiRoot included in the Request URI. When this parameter is false the apiRoot is deduced from the relevant service Instance provisioning.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

rfspAccessRestriction - RFSP Access Restriction

Syntax

```
--amfGparmName rfspAccessRestriction --amfGparmValue <string>
```

Description

Feature control for RFSP Access Restriction for the AMF.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

rimInformationTransfer - RIM Information Transfer

Syntax

```
--amfGparmName rimInformationTransfer --amfGparmValue <string>
```

Description

Enables NGAP RIM Information Transfer Procedure. When set to false, AMF silently discards the NGAP Uplink RIM Information Transfer message.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

rrcInactive - RRC Inactive

Syntax

--amfGparmName rrcInactive --amfGparmValue <string>

Description

Enables RRC Inactive feature. When enabled, AMF provides Core Network Assistance information to the RAN to assist gNB in moving UE(s) to RRC Inactive state

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

sbiHttp2PingKeepAlive - SBI HTTP2 Ping Keep Alive

Syntax

--amfGparmName sbiHttp2PingKeepAlive --amfGparmValue <string>

Description

Enables or disables the impact of a received HTTP2 ping upon SBI link availability keep alive. When value is set to false a received HTTP2 ping will have no impact on SBI link availability. When value is set to true a received HTTP2 ping will reset SBI link keep alive, like other traffic messages.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

sbiQueryConversions - SBI Query Parameter Conversions

Syntax

--amfGparmName sbiQueryConversions --amfGparmValue <string>

Description

Enables or disables Query Conversion Rules. When value is set to false no Query conversion rule is applied. When value is set to true Query conversion rules are applied according to their Rule Status.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

selectiveN15UsageControl - Selective N15 Usage Control

Syntax

```
--amfGparmName selectiveN15UsageControl --amfGparmValue <string>
```

Description

Parameter controls feature activation flag. By default, the flag shall be disabled. When the flag is disabled, for homers AM and UE policy shall be created (old behavior) and for roamers, interPlmnPcfSupport shall be checked to decide if AM/UE policy need to be created or not (old behaviour). When gParm is enabled, for all users, pcfPolicyAssociation of amfSvcAgreement profile shall be checked to decide whether to establish AM and UE policy.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

send3gppSbiCallbackInAllNotifications - Send 3gpp-Sbi-Callback in all notifications

Syntax

```
--amfGparmName send3gppSbiCallbackInAllNotifications --amfGparmValue  
<string>
```

Description

When this parameter is false the 3gpp-Sbi-Callback header is included only in Notifications sent via Indirect Communication. When the gParm is true the 3gpp-Sbi-Callback header is included Notifications for both Direct and Indirect Communication.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Recommended

true

Name

send3gppSbiOriginatingNetworkId - Send 3gpp-Sbi-Originating-Network-Id

Syntax

```
--amfGparmName send3gppSbiOriginatingNetworkId --amfGparmValue  
<string>
```

Description

When parameter is false, AMF does not include the 3gpp-Sbi-Originating-Network-Id header in Requests. When parameter is true, AMF includes 3gpp-Sbi-Originating-Network-Id header in Requests.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

sendAmfConfigUpdTotalConfigMismatch - Send AMF Configuration Update when Total Configuration Mismatch with gNB

Syntax

```
--amfGparmName sendAmfConfigUpdTotalConfigMismatch --amfGparmValue  
<string>
```

Description

When this parameter is enabled, AMF will send AMF Configuration Update to a gNB with which there is total configuration mismatch, following a local configuration update.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

sendAreaCodeBasedExtEmerNumberInRegistrationAccept - Send Area Code Based Extended Emergency Number in Registration Accept

Syntax

```
--amfGparmName sendAreaCodeBasedExtEmerNumberInRegistrationAccept --  
amfGparmValue <string>
```

Description

Parameter controls feature activation GPARM flag. By default, flag shall be disabled. When enabled, AMF shall send Extended Emergency Numbers List IE in the REGISTRATION ACCEPT messages if one is provisioned on the AMF.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

sendCagPaging - Send CAG Information List in Paging

Syntax

```
--amfGparmName sendCagPaging --amfGparmValue <string>
```

Description

When enabled, the AMF sends the CAG Information List in Paging message

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

sendEmeRegInd - Send Emergency Registration Indication

Syntax

```
--amfGparmName sendEmeRegInd --amfGparmValue <string>
```

Description

The parameter enables sending the emergencyRegistrationInd IE in Amf3GppAccessRegistration data of UECM Registration to indicate emergency Registration to the UDM. This IE is sent in Nudm_UECM SBI v1.2.0-alpha.6 onwards

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Recommended

true

Name

sendEmptyCagUe - Send Empty CAG Information List to the UE

Syntax

```
--amfGparmName sendEmptyCagUe --amfGparmValue <string>
```

Description

When enabled, the AMF sends empty CAG Information List in NAS Accept when no PLMN CAG is subscribed for CAG capable UE

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

sendEpsIwkUpd - sendEpsIwkUpd

Syntax

```
--amfGparmName sendEpsIwkUpd --amfGparmValue <string>
```

Description

When this parameter is enabled and the status of interworking with EPS for a PDU session changes due to change of UE 5GMM capability e.g. S1 mode supported, the AMF invokes Nsmf_PDUSession_UpdateSMContext to send updated EPS Interworking Indication to the SMF

List

- neverSend - If status of interworking with EPS for a PDU session changes due to change of UE 5GMM capability e.g. S1 mode supported, the AMF doesn't invoke Nsmf_PDUSession_UpdateSMContext to send updated EPS Interworking Indication to SMF.
- sendAlways - If status of interworking with EPS for a PDU session changes due to change of UE 5GMM capability e.g. S1 mode supported, the AMF always invokes Nsmf_PDUSession_UpdateSMContext to send updated EPS Interworking Indication to SMF no matter if it is combo SMF or standalone SMF.

Default

neverSend

Name

sendExtEmerNumberInRegistrationAccept - Send Extended Emergency Number in Registration Accept

Syntax

```
--amfGparmName sendExtEmerNumberInRegistrationAccept --amfGparmValue <string>
```

Description

Parameter controls feature activation GPARM flag. By default, flag shall be disabled. When enabled, AMF shall send Extended Emergency Numbers List IE in the REGISTRATION ACCEPT messages if one is provisioned on the AMF.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

sendMappedGummei - sendMappedGummei

Syntax

```
--amfGparmName sendMappedGummei --amfGparmValue <string>
```

Description

Current parameter enables sending in NGAP Setup Response the mapped GUAMI(s) pointing to the MME GUMMEI(s) for the associated PLMN(s) that coexist in both 4G and 5G at local CMM node

List

- DISABLE - Disable
- ENABLE - Enable

Default

DISABLE

Name

sendNsci - Send NSCI IE

Syntax

```
--amfGparmName sendNsci --amfGparmValue <string>
```

Description

Current parameter enables sending 'New Security Context Indicator' NSCI IE in Handover Request, as part of EPS to 5GS handover

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

sendOnlyCommonlySupportedSlicesToAn - Send Only Commonly Supported Slices to AN

Syntax

```
--amfGparmName sendOnlyCommonlySupportedSlicesToAn --amfGparmValue <string>
```

Description

When this parameter is true, the AMF will send only the intersection of the slices the AMF supports and the slices the gNB/ N3IWF supports for that PLMN (i.e. the union of all slices supported in all TAs the gNB/N3IWF supports per PLMN). Note: In the latter case the gNB/N3IWF will not be aware of all the slices the AMF supports, however it can resolve interworking issues when RAN cannot handle processing the all the slices included in the PLMN support list.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

sendOnlyRanSupportedPlmnsInN2 - Send Only RAN Supported PLMNs in N2

Syntax

```
--amfGparmName sendOnlyRanSupportedPlmnsInN2 --amfGparmValue <string>
```

Description

Current parameter enables sending in SETUP RSP and AMF Configuration Update only the PLMNs that are supported by the RAN even if additional PLMNs are configured at the AMF.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

sendPc5ToNgran - Send PC5 to NG RAN

Syntax

```
--amfGparmName sendPc5ToNgran --amfGparmValue <string>
```

Description

Specifies whether the AMF is to send the UE PC5 QoS, if available, in applicable 38.413 messages

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

sendPeiTypeImeiToEir - Send PEI Type IMEI to EIR

Syntax

```
--amfGparmName sendPeiTypeImeiToEir --amfGparmValue <string>
```

Description

Parameter controls the option of sending PEI value type IMEI that indicates IMEI to EIR even though IMEISV is available. By default, flag shall be disabled.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

sendPeiTypeImeiToSmf - Send PEI Type IMEI to SMF

Syntax

```
--amfGparmName sendPeiTypeImeiToSmf --amfGparmValue <string>
```

Description

Parameter controls the option of sending PEI value type IMEI that indicates IMEI to SMF even though IMEISV is available. By default, flag shall be disabled.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

sendPendingSnssaiInAllowedNssaiOfIcsr - Send Pending SNSSAI in Allowed NSSAI of ICSR

Syntax

```
--amfGparmName sendPendingSnssaiInAllowedNssaiOfIcsr --amfGparmValue  
<string>
```

Description

Current parameter enables sending a pending SNSSAI (random selection) in Allowed NSSAI IE of the Initial Context Setup Request when latter needs be sent but there is not yet an allowed SNSSAI due to the NSSAA feature.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Recommended

true

Name

sendRlsSessionInfo - Send Release Session Info

Syntax

```
--amfGparmName sendRlsSessionInfo --amfGparmValue <string>
```

Description

Current parameter enables sending the toReleaseSessionInfo attribute in Registration Status Update request.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Recommended

true

Name

sendSkipN2PduSessionResRelInd - Send Skip N2 PDU Session Resource Release Indication

Syntax

```
--amfGparmName sendSkipN2PduSessionResRelInd --amfGparmValue <string>
```

Description

Current parameter enables sending Update SM Context Request carrying the skipN2PduSessionResRelInd parameter, instead of Release SM Context Request when a PDU Session needs to be released towards the UE at completion of handover e.g. because the associated S-NSSAI isn't supported at target TAI, but not towards the target gNB because a User Plane isn't established at the target gNB.

List

- false - Boolean value of false.

- true - Boolean value of true.

Default

false

Name

sendSnpnToUnsupportedNgRan - Send SNPN Info to Unsupported NG-RAN

Syntax

--amfGparmName sendSnpnToUnsupportedNgRan --amfGparmValue <string>

Description

Current parameter enables sending the supported SNPNs in Setup Response and AMF Configuration Update towards NGRAN nodes that haven't indicated support of SNPN type of network in NG Setup or NG Configuration Update

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

sendTargetNfIdInRedirect - Send 3gpp-sbi-Target-Nf-Id in Redirect

Syntax

--amfGparmName sendTargetNfIdInRedirect --amfGparmValue <string>

Description

When this parameter is set to true the AMF adds the target AMF NF Instance and service instance Id in the relevant 3gpp-sbi-Target-Nf-Id HTTP header.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

sharedPlmnSupport - Shared PLMN support

Syntax

--amfGparmName sharedPlmnSupport --amfGparmValue <string>

Description

Enables the support for Multiple Shared PLMN in the AMF. When the flag is set to TRUE, it shall be possible to set the multiple shared plmn for up to 8 PLMNs.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

smContextStatusNotifyRequired - SM Context Status Notify Required

Syntax

--amfGparmName smContextStatusNotifyRequired --amfGparmValue <string>

Description

This parameter defines whether the AMF requires an SM context status notify to be triggered from the SMF before the AMF deletes the PDU session. The parameter is applied during -UE/AMF/SMF triggered PDU session release procedures, -PDU session setup procedures that have been rejected towards the UE after SM context create, and -PDU session setup procedures when the AMF already has a PDU session established for the requested PDU session id. Upon SBI timer pduSmCtxStatusNotify expiry, the AMF behavior is as follows: When set to true, the AMF only clears internal temporary data. AMF maintains the PDU session context. (AMF removes the PDU session only when it receives the SM context status notify with resourceStatusInfo set to 'RELEASED' on statusInfo inside SmContextStatusNotification.) When set to false, the AMF clears internal temporary data, and also removes the PDU context (without waiting for the SM context status notify.)

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

smfAreaOfValidity - SMF Area of Validity

Syntax

--amfGparmName smfAreaOfValidity --amfGparmValue <string>

Description

Defines how the AMF applies the SMF optionally provided Area of Validity parameter on Namf_Communication_N1N2MessageTransfer request. AMF supports receiving up to 100 TAs.

List

- SmCtxtUpdateOptimization - SM Context Update Optimization - The AMF does not trigger i.e. skips the SM context update when the Service request is triggered by Paging

or NAS Notification indicating 3GPP access and the UE does not include Uplink data Status (despite of the Area of validity being included or not). Also if the UE was in CM-CONNECTED state on the access related to the PDU session id, the AMF does not trigger SM context update. This solution assumes that the N2 container is always valid and Area of validity is not required to be present on the SMF request.

- **ValidateTheArea** - Validate the Area - When the UE does not include the Uplink Data Status IE on the Service Request that was triggered by Paging or NAS Notification indicating 3GPP access, the AMF triggers the SM Context Update when the Area of Validity is either missing or the UE is outside the SMF provided Area of Validity. Also if the UE was in CM-CONNECTED state on the access related to the PDU session id, the AMF triggers SM context update if the UE either is outside the area of validity or the area of validity is not provided. This solution requires that the SMF includes the Area of validity parameter.

Default

SmCtxtUpdateOptimization

Name

smfRecoveryTime - SMF Recovery Time

Syntax

```
--amfGparmName smfRecoveryTime --amfGparmValue <string>
```

Description

Enables the AMF to use the RecoveryTime attribute related to an SMF (service) instance to detect whether the SMF (service) instance has recently restarted and lost the resources created prior to the indicated recovery timestamp.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

smpBasedPriorityFromSmsf - SMP based Priority from SMSF

Syntax

```
--amfGparmName smpBasedPriorityFromSmsf --amfGparmValue <string>
```

Description

Enables AMF to apply priority handling for UEs receiving SBI message Priority value matching internal provisioning from SMSF.

List

- false - Boolean value of false.

- true - Boolean value of true.

Default

false

Name

smsfReselectionAfterUeProcedure - SMSF Reselection After UE procedure

Syntax

```
--amfGparmName smsfReselectionAfterUeProcedure --amfGparmValue  
<string>
```

Description

Enables the AMF to reselect SMSF for all impacted UEs, after AMF has detected an SMSF unavailable. The AMF reselects the SMSF for any impacted UEs after any next procedure for the impacted UEs.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

smsfReselections - SMSF Reselections

Syntax

```
--amfGparmName smsfReselections --amfGparmValue <string>
```

Description

The number of attempted SMSF reselections per a single UE.

Type / Range

Integer in the range of 0 to 5

Default

1

Name

smsOverNas - SMS Over NAS

Syntax

```
--amfGparmName smsOverNas --amfGparmValue <string>
```

Description

Activates the SMS over NAS feature. The AMF supports the SMS delivery over NAS signalling and further via the N20 interface towards the SMSF.

List

- DISABLE - Disable
- ENABLE - Enable

Default

DISABLE

Name

smsRestrictionVoiceCentricUes - SMS Restriction Voice Centric UEs

Syntax`--amfGparmName smsRestrictionVoiceCentricUes --amfGparmValue <string>`**Description**

When this parameter is set to true, the AMF restricts the SMS over NAS service for UEs indicating 'voice centric' on UE's usage setting IE on NAS Registration request. Similar restriction also needs to be set per UE PLMN/serving PLMN combination. It is assumed that these UEs will get SMS service via IMS (and do not need SMS over NAS to be allowed). When this parameter is set to false, the SMS over NAS service is controlled in the AMF local provisioning by the AMF global parameter SMS Over NAS, the SMS Over NAS Allowed parameter per UE PLMN/serving PLMN combination and the SMS subscribed indication from UDM.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

sorForTahs - SoR for TAHS

Syntax`--amfGparmName sorForTahs --amfGparmValue <string>`**Description**

Current parameter enables delivering the Steering of Roaming Information to TAHS subscriber during the Registration procedure, when Steering of Roaming subscription data is delivered to the AMF from the UDM.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

srsInitialRegRelocation - Initial UE Registration With SRS

Syntax

```
--amfGparmName srsInitialRegRelocation --amfGparmValue <string>
```

Description

Enables new AMF to retrieve UE Context from session restoration server during inter AMF UE initial registration with GUTI.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

srvccPossibleNormallyRegisteredEmergency - 5G-SRVCC Possible Normally Registered Emergency

Syntax

```
--amfGparmName srvccPossibleNormallyRegisteredEmergency --  
amfGparmValue <string>
```

Description

Defines whether the AMF temporarily indicates on 5G-SRVCC Operation Possible indication the value 'Possible' when a normally registered UE supports 5G-SRVCC and establishes an emergency PDU session.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

standaloneNonPublicNetworkSupport - Standalone Non-Public Network Support

Syntax

```
--amfGparmName standaloneNonPublicNetworkSupport --amfGparmValue  
<string>
```

Description

Parameter controls feature activation flag. By default, flag shall be disabled. When enabled, AMF shall support 3GPP specified Release 16 Stand alone Non Public Network functionality.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

subscribedEmergencySnssai - Subscribed Emergency S-NSSAI

Syntax

```
--amfGparmName subscribedEmergencySnssai --amfGparmValue <string>
```

Description

Current parameter enables using the S-NSSAI from subscribed emergency DNN if such exists in subscription data

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

subscribedForbiddenTacChangeAction - Subscribed Forbidden TAC Change Action

Syntax

```
--amfGparmName subscribedForbiddenTacChangeAction --amfGparmValue  
<string>
```

Description

Parameter controls behavior invocation whether to release the N2 connection to put UE into idle mode or deregister the UE upon receipt of UDM Notification with updated list of subscribed forbidden Areas/TACs which includes the current UE TAC, and the UE is in connected mode. By default, parameter shall be set to none.

List

- deregister - Deregister the UE
- n2Release - N2 release - Release of N2
- none - None

Default

none

Name

support5gAnSliceInconsistencyAlarm - Support 5G-AN Slice inconsistency Alarm

Syntax

```
--amfGparmName support5gAnSliceInconsistencyAlarm --amfGparmValue  
<string>
```

Description

When this parameter is enabled, AMF will raise a Alarm when multiple 5G-AN network elements (gNB, N3IWF) report different slices for the same Tracking Area.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

support5gSrvcc - Support 5G-SRVCC

Syntax

```
--amfGparmName support5gSrvcc --amfGparmValue <string>
```

Description

Enables the AMF support for 5G-SRVCC to hand over regular voice calls from NG-RAN/5GS to 3GPP UTRAN/CS domain.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

support5gSrvccEmergency - Support 5G-SRVCC Emergency

Syntax

```
--amfGparmName support5gSrvccEmergency --amfGparmValue <string>
```

Description

Enables the AMF support for 5G-SRVCC to hand over emergency calls from NG-RAN/5GS to 3GPP UTRAN/CS domain.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

supportAusfUdmGroupId - Support AUSF UDM GroupId

Syntax

```
--amfGparmName supportAusfUdmGroupId --amfGparmValue <string>
```

Description

When this parameter is set to true and the GroupId is included in the Profile of a AUSF or UDM selected for a UE, AMF will store it in the UE's context. The GroupId is accordingly used for subsequent AUSF/UDM selection and conveyed in case of inter AMF mobility.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

suppressRetryWithNudmSdmSingleGet - Suppress retry with SDM single Get

Syntax

```
--amfGparmName suppressRetryWithNudmSdmSingleGet --amfGparmValue  
<string>
```

Description

When set to true, the AMF will not retry with nudm-sdm single GET to the same UDM on receipt of an error response to a nudm-sdm multi dataset GET from the UDM with status code 404 DATA NOT FOUND or any other status code failure.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Recommended

The value should be set to true if the UDM doesn't respond with error response with 404 DATA NOT FOUND to a nudm-sdm multi-data GET request if one of the requested datasets is not available.

Name

tappingActivated - Status of AMF Tapping functionality

Syntax

```
--amfGparmName tappingActivated --amfGparmValue <string>
```

Description

This parameter controls the activated/deactivated status of AMF Tapping

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

timeBasedAuthFrequency - Time Based Authentication Frequency

Syntax

--amfGparmName timeBasedAuthFrequency --amfGparmValue <string>

Description

Parameter controls feature activation global parameter flag. By default, the flag shall be disabled. When enabled, AMF shall support time-based authentication in accordance with new option(s) defined in AMF UE PLMN Services configuration.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

timerSmfReselection - Timer SMF Reselection

Syntax

--amfGparmName timerSmfReselection --amfGparmValue <string>

Description

Enables the functionality to reselect SMF based on a timer during SM context creates. When timer based reselection is set to false, AMF only reselects SMF once per procedure on error cases (i.e. decision to reselect is attempt based). The used timer is deducted from SBI SMF response timer. Only when this parameter is set to 'true', the AMF applies the parameters errorSource, n1Included, reselectIsmfVsmf, reselectOnlySmf and reselectRemote on cmm amfSmfNasMapping command.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

trigUePolicyWhenNoUePolicyContainer - Trigger UE Policy When No UE Policy Container

Syntax

```
--amfGparmName trigUePolicyWhenNoUePolicyContainer --amfGparmValue <string>
```

Description

Parameter controls establishment of UE Policy Association based on received UE policy container from UE. By default, the flag shall be disabled. When enabled, if no UE Policy Container is received during UE Policy Association Establishment procedure the AMF will establish UE Policy Association.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

udmBasedPscfRestoration - UDM based PSCF Restoration

Syntax

```
--amfGparmName udmBasedPscfRestoration --amfGparmValue <string>
```

Description

Parameter controls feature activation GPARM flag. By default, flag shall be disabled. When enabled, AMF upon receiving P-CSCF restoration indication from UDM shall initiate a network triggered PDU Session Release procedure of the IMS PDU session with Reactivation indication and accordingly UE shall request to re-establish IMS PDU session and shall discover P-CSCF during IMS PDU session establishment.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

udmImmediateReport - UDM Immediate Report

Syntax

```
--amfGparmName udmImmediateReport --amfGparmValue <string>
```

Description

Immediate report indication to UDM

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

udmInitiatedCallTrace - UDM Initiated Call Trace

Syntax

--amfGparmName udmInitiatedCallTrace --amfGparmValue <string>

Description

Support UDM initiated call trace or not.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

udmMdt - UDM MDT

Syntax

--amfGparmName udmMdt --amfGparmValue <string>

Description

Activation/deactivation minimization of drive tests.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

ueAmbrChangeFromPcf - UE AMBR Change From PCF

Syntax

--amfGparmName ueAmbrChangeFromPcf --amfGparmValue <string>

Description

Parameter controls whether to send UDM AMBR update to PCF in order for PCF to determine if AMBR update should occur. By default, flag shall be disabled. When enabled, AMF shall send UDM AMBR update to PCF.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

ueRadioCapPagingN14 - Ue Radio Capability for Paging in N14

Syntax

--amfGparmName ueRadioCapPagingN14 --amfGparmValue <string>

Description

Enable sending Ue Radio Capability for Paging IE in N14 interface

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

uniqueIdentifierSupportInSubscriptionId - Unique Identifier Support In Subscription Id

Syntax

--amfGparmName uniqueIdentifierSupportInSubscriptionId --
amfGparmValue <string>

Description

Parameter controls feature activation flag. By default, flag shall be disabled. When enabled, support for unique identifier support in subscription is provided so the cell broadcast centre function can filter/sort which amf has provided subscription to it.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

useAdditionalMemory - Use Additional Memory

Syntax

--amfGparmName useAdditionalMemory --amfGparmValue <string>

Description

When the CPPS has been configured with additional memory, this parameter controls use of the additional memory for selected features. Use of additional memory for a feature must be indicated with this parameter before that feature can be activated.

List

- frbtac - Forbidden Tac - Use additional memory for Forbidden TAC on CPPS.
- none - No additional memory needed for any features.

Default

none

Name

useDnsForN26Ho - Use Dns for N26 handover

Syntax

```
--amfGparmName useDnsForN26Ho --amfGparmValue <string>
```

Description

Current parameter enables using DNS for selecting target node as part of N26 handover even when local MME of quad access node serves target RAN.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

useFqdnAsAuthorityInAllSbiInterfaces - Use FQDN as Authoruty in All SBI Interfaces

Syntax

```
--amfGparmName useFqdnAsAuthorityInAllSbiInterfaces --amfGparmValue  
<string>
```

Description

When this parameter is set to true, and FQDN of the target URI is available, CMM uses the FQDN as the authority in HTTP requests. If the parameter is set to true but there is no FQDN, the IP is used as the authority. When the parameter is set to false the IP is used as the authority in the SBI interfaces with exception of the NRF interface which always uses the FQDN as the preferred authority.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

useLocationHeaderFromUdmRsp - Use HTTP Location Header from UDM response

Syntax

--amfGparmName useLocationHeaderFromUdmRsp --amfGparmValue <string>

Description

When this parameter is set to true, when CMM receives Response to a UDM Subscribe the URI in the Location Header is used in subsequent Requests to update (PATCH/PUT) or Delete that Subscription. CMM also stores the Producer ID so as to be able to support OAuth in subsequent requests. Otherwise subsequent Requests are sent to a service instance discovered via NRF. Note: This parameter must be set to true when UDM communication is based on Model D (indirect communication with delegated discovery)

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

useN26SvcParam5gsToEpsHo - Use N26 Service Parameter in 5GS to EPS Handover

Syntax

--amfGparmName useN26SvcParam5gsToEpsHo --amfGparmValue <string>

Description

Current parameter enables using N26 service parameter as part of DNS query for target MME selection during 5GS to EPS handover

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

useNssfAvailabilityService - Use NSSF Availability Service

Syntax

--amfGparmName useNssfAvailabilityService --amfGparmValue <string>

Description

When this parameter is true, the AMF will use the NSSF Availability Services. When NSSF Availability Services are used, the AMF does not take in account the local provisioned info regarding Slice support per Tracking Area.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

useNssfAvailabilityServiceSubscription - Use NSSF Availability Service Subscription

Syntax

```
--amfGparmName useNssfAvailabilityServiceSubscription --amfGparmValue  
<string>
```

Description

When this parameter is true, the AMF will Subscribe the NSSF Availability Services in order to receive notification from NSSF regarding changes to the NSSAI availability information on a per TA basis. This parameter is applicable only when amfGParms useNssfAvailabilityService is set to true.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

useNssfPerPlmnSliceRestrictions - Use Per PLMN Slice Restrictions

Syntax

```
--amfGparmName useNssfPerPlmnSliceRestrictions --amfGparmValue  
<string>
```

Description

When this parameter is set to true AMF evaluates the restrictedSnssaiList when included in the AuthorizedNssaiAvailabilityData by the NSSF in a Nnssf_NSSAIAvailability operation. When set to false the restrictions are ignored.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

useNssfSelectionServiceForAmf - Use NSSF Selection Service for AMF

Syntax

```
--amfGparmName useNssfSelectionServiceForAmf --amfGparmValue <string>
```

Description

When this parameter is true the AMF uses the NSSF Selection Service to select AMF during UE Registration in case AMF decides that it is unable to serve all the Allowed Slices the UE.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

useNssfSelectionServiceForSmf - Use NSSF Selection Service for SMF

Syntax

```
--amfGparmName useNssfSelectionServiceForSmf --amfGparmValue <string>
```

Description

When this parameter is true the AMF uses the NSSF Selection Service to select SMF during PDU Session establishment

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

userLocationIgnoreNcgi - User Location Ignore NCGI

Syntax

```
--amfGparmName userLocationIgnoreNcgi --amfGparmValue <string>
```

Description

Defines whether the AMF supports ignoreNcgi parameter inside the nrLocation and further on userLocation.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

v2xAllowed - V2X Allowed

Syntax

--amfGparmName v2xAllowed --amfGparmValue <string>

Description

Feature flag for the v2x feature. When set true, the AMF will request a PCF that supports v2x.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

vlrCleanupBasedOnOccupancy - VLR Cleanup Based on Occupancy

Syntax

--amfGparmName vlrCleanupBasedOnOccupancy --amfGparmValue <string>

Description

Current parameter enables doing VLR cleanup of the VLR Contexts of deregistered UEs based on VLR Occupancy

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Recommended

true

Name

voiceEpsFallback - Voice with EPS Fallback

Syntax

--amfGparmName voiceEpsFallback --amfGparmValue <string>

Description

This parameter activates the voice functionality using EPS fallback on the AMF.

List

- DISABLE - Disable

- ENABLE - Enable

Default

DISABLE

Name

voNR - Voice over New Radio

Syntax

```
--amfGparmName voNR --amfGparmValue <string>
```

Description

Activation of the Voice over New Radio feature on the AMF.

List

- DISABLE - Disable
- ENABLE - Enable

Default

DISABLE

Name

vsmfChange - VSMF Change

Syntax

```
--amfGparmName vsmfChange --amfGparmValue <string>
```

Description

Enables VSMF change including selection of a new VSMF when new UE location is not supported by current VSMF.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

3.55 cmm amfGtpProfile

amf GTP profile. Syntax, description, parameters, and roles for cmm amfGtpProfile command.

Syntax

Description

Administer amf gtp profile

Parameters

Name

name - Amf GTP Profile Name

Syntax

--name <string>

Description

Unique name for this GTP profile

Restrictions

GTP profile with label = default always exists, it cannot be deleted, but can be update.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Name

contextReqT3 - Context request timeout T3 waiting for response

Syntax

--contextReqT3 <integer>

Description

Max wait time for a response of a context request message

Class

Optional.

Type / Range

Integer in the range of 100 to 60,000 in units of Millisecond

Default

3000

Name

contextRspT3 - Context response timeout T3 waiting for ack

Syntax

--contextRspT3 <integer>

Description

Max wait time for a response to a context response message

Class

Optional.

Type / Range

Integer in the range of 100 to 60,000 in units of Millisecond

Default

3000

Name

echoRequests - Echo requests

Syntax

--echoRequests <integer>

Description

(N3-REQUESTS) the total number of echo request messages to be transmitted without receiving a corresponding echo response message after receiving at least one echo response from an endpoint.

Class

Optional.

Type / Range

Integer in the range of 5 to 20

Default

9

Name

identificationT3 - Identification response timeout T3

Syntax

--identificationT3 <integer>

Description

Max wait time for a response of an identification request message

Class

Optional.

Type / Range

Integer 100...60000, step 100 in units of Millisecond

Default

3000

Name

n3ContextReq - N3 context request attempts

Syntax

--n3ContextReq <integer>

Description

Max number of attempts to send a context request message

Class

Optional.

Type / Range

Integer in the range of 1 to 5

Default

3

Name

n3ContextRsp - N3 context response attempts

Syntax

--n3ContextRsp <integer>

Description

Max number of attempts to send a context response message

Class

Optional.

Type / Range

Integer in the range of 1 to 5

Default

3

Name

n3Identification - N3 identification request attempts

Syntax

--n3Identification <integer>

Description

Max number of attempts to send an identification request message.

Class

Optional.

Type / Range

Integer in the range of 1 to 5

Default

3

Name

n3RelocationCancel - N3 relocation cancel attempts

Syntax`--n3RelocationCancel <integer>`**Description**

Max number of attempts to send a relocation cancel message

Class

Optional.

Type / Range

Integer in the range of 1 to 5

Default

3

Name

n3RelocationCmpl - N3 forward relocation complete attempts

Syntax`--n3RelocationCmpl <integer>`**Description**

Max number of attempts to send a relocation complete message

Class

Optional.

Type / Range

Integer in the range of 1 to 5

Default

3

Name

n3RelocationReq - N3 forward relocation request attempts

Syntax`--n3RelocationReq <integer>`**Description**

Max number of attempts to send relocation request message

Class

Optional.

Type / Range

Integer in the range of 1 to 5

Default

3

Name

relocationCancelT3 - Relocation cancel response timeout T3

Syntax

--relocationCancelT3 <integer>

Description

Max wait time for a response of a relocation cancel message

Class

Optional.

Type / Range

Integer in the range of 100 to 60,000 in units of Millisecond

Default

3000

Name

relocationCmplT3 - Relocation complete ack timeout T3

Syntax

--relocationCmplT3 <integer>

Description

Max wait time for a response to a relocation complete message

Class

Optional.

Type / Range

Integer in the range of 100 to 60,000 in units of Millisecond

Default

3000

Name

relocationReqT3 - Relocation request timeout T3 waiting for response

Syntax

--relocationReqT3 <integer>

Description

Max wait time for a response of a relocation request message

Class

Optional.

Type / Range

Integer in the range of 100 to 60,000 in units of Millisecond

Default

3000

Name

sendEchoOnFailure - Send echo requests on failure

Syntax

--sendEchoOnFailure <list-item>

Description

Controls sending echo requests when no GTP-C non-echo response messages are received for a period of time.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

sendEchoTimerT3 - Send echo request timer T3

Syntax

--sendEchoTimerT3 <integer>

Description

The periodic interval for sending echo requests on interfaces that support GTP communications.

Class

Optional.

Type / Range

Integer value of 60000...10800000, step 100 in units of Millisecond

Default

60000

Name

sendPeriodicEcho - sendPeriodicEcho

Syntax

--sendPeriodicEcho <list-item>

Description

Controls sending of periodic echo requests on enabled links

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

waitEchoTimerT3 - Wait for echo response timer T3

Syntax

--waitEchoTimerT3 <integer>

Description

Specifies the time to wait for an echo response to be received before retransmitting the echo request message. the total time to wait for an echo response (N3-REQUESTS * T3-RESPONSE) should be less than the periodic time (Send echo request timer) used to send the echo request message.

Class

Optional.

Type / Range

Integer 1000...600000, step 100 in units of Millisecond

Default

6000

3.56 cmm amfGuamiStatusAdmin

Update GUAMI Status. Syntax, description, parameters, and roles for cmm amfGuamiStatusAdmin command.

Syntax

Description

cmm amfUpdateGuamiStatus is used to initiate the 100% non-directed off-load. The GUAMI to be moved to either MAINTENANCE STATUS or SUPPORTED STATUS shall be specified in this command. An internalStatus with values shuttingDown, locked and unlocked indicate the following: shuttingDown applies if the GUAMI is in the maintenanceTimer window, locked applies if the GUAMI has entered MAINTENANCE STATUS, this means that is not available and the NRF has been updated that the AMF does not support the GUAMI, unlocked is used when the GUAMI is in service and has been updated in the NRF as SUPPORTED. GUAMIs shall not be removed from the CMM configuration unless they are in internalState == locked. GUAMIs with SUPPORTED STATUS are in Service.To Backout of a Maintenance operation the operator shall move the GUAMI to SUPPORTED STATUS. If the aggregate service lock is applied to the CMM the AMF shall deregister from the NRF. When the aggregate service lock is removed the AMF shall register in the NRF with all GUAMIs that are in SUPPORTED STATUS. The list form of the command displays all the GUAMIs configured in the AMF Instance, requested status (MAINTENANCE or SUPPORTED), maintenanceTimer used and internalStatus. If the RAN supports the 'Timer Approach' the maintenanceTimer shall be set to the RAN configured Timer plus 5 seconds. Note: when a GUAMI is configured with cmm amfInstance, it is created with internalState == unlocked

Parameters

Name

guamiName - GUAMI Name

Syntax

--guamiName <string>

Description

It is the GUAMI name for which the status is going to change.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

guamiStatus - Guami Status

Syntax

--guamiStatus <list-item>

Description

GUAMI Status can be maintenance or supported

Class

Optional.

List

- maintenance - The GUAMI is not available due to maintenance actions.
- supported - The GUAMI is available.

Default

supported

Name

maintenanceTimer - Maintenance Timer

Syntax

--maintenanceTimer <integer>

Description

Specifies the length of the Timer Approach window. This timer shall be set to the timer value configured in the RAN (if supported) + 5 seconds. If the command is run during high traffic time, the value suggested is 0.

Restrictions

May only be provided if the status parameter is set to maintenance

Class

Optional.

Type / Range

Integer in the range of 0 to 100 in units of Second

Default

0

Roles**Show**

sysadmin, manage, monitor

Modify

sysadmin, manage

List

sysadmin, manage, monitor

3.57 cmm amfGuamiStatusAdminStats

GUAMI Status Administrative Statistics. Syntax, description, parameters, and roles for cmm amfGuamiStatusAdminStats command.

Syntax

Description

This command provides statistics when a GUAMI Status is changed by the operator to 'maintenance'. Changing the status of a GUAMI to 'maintenance' causes the CMM to initiate non-directed off-load for a time interval (--maintenanceTimer) controlled by the operator in the amfGuamiStatusAdmin command. For instance, during the non-directed off-load UEs release and rebind their TNLA Bindings.

Parameters

Name

guamiName - GUAMI Name

Syntax

--guamiName <string>

Description

GUAMI name for which the statistics are provided

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

startDateTime - Starting Date and Time

Syntax

--startDateTime <string>

Description

Date and Time at which the operator issued the status change with the amfGuamiStatusAdmin command

Class

Required key.

Type / Range

Date and Time Digit string of length 0 to 20 with the allowed pattern of '20[0-9][0-9]/[0-1][0-9]/[0-3][0-9] [0-2][0-9]:[0-5][0-9]:[0-5][0-9]'

Name

guamiInternalStatus - GUAMI Internal Status

Syntax

--guamiInternalStatus <list-item>

Description

An internalStatus with values shuttingDown, locked and unlocked indicate the following: shuttingDown applies if the GUAMI is in the maintenanceTimer window, locked applies if the GUAMI has entered MAINTENANCE STATUS, this means that is not available and the NRF has been updated that the AMF does not support the GUAMI, unlocked is used when the GUAMI is in service and has been updated in the NRF as SUPPORTED. GUAMIs shall not be removed from the CMM configuration unless they are in internalState == locked.

Class

Read only.

List

- locked - The GUAMI has entered Maintenance State (i.e., if applicable the maintenanceTimer has run out, the RAN, NRF and (when supported) notifications have been issued.
- shuttingDown - the GUAMI requested status is Maintenance and the maintenanceTimer has not run out
- unlocked - The GUAMI is Supported by the AMF, it is registered as Supported in the NRF, the RAN has been updated too

Default

unlocked

Name

guamiStatus - GUAMI Status

Syntax

--guamiStatus <list-item>

Description

GUAMI external status. GUAMIs with SUPPORTED STATUS are in Service.To Backout of a Maintenance operation the operator shall move the GUAMI to SUPPORTED STATUS. If the aggregate service lock is applied to the CMM the AMF shall deregister from the NRF. When the aggregate service lock is removed the AMF shall register in the NRF with all GUAMIs that are in SUPPORTED STATUS.

Class

Read only.

List

- maintenance - The GUAMI is not available due to maintenance actions.
- supported - The GUAMI is available.

Default

supported

Name

maintenanceTimer - Maintenance Timer

Syntax

--maintenanceTimer <integer>

Description

The maintenance timer value specified in the amfGuamiStatusAdmin command

Class

Read only.

Type / Range

Integer in the range of 0 to 100 in units of Second

Default

0

Name

numUeCpnfProcRedirected - Number of UE Network Procedures Redirected

Syntax

--numUeCpnfProcRedirected <integer>

Description

Provides the number of network initiated procedures that were redirected during the GUAMI status change

Class

Read only.

Type / Range

Integer in the range of 0 to 4,294,967,295

Default

0

Name

numUeTnlaBindingRelease - Number of UE TNLA Binding Releases

Syntax

--numUeTnlaBindingRelease <integer>

Description

Reports the number of UE TNLA Bindings released during the GUAMI status change

Class

Read only.

Type / Range

Integer in the range of 0 to 4,294,967,295

Default

0

Name

numUeTnlaRebinding - Number of UE TNLA Rebindings

Syntax

--numUeTnlaRebinding <integer>

Description

Provides the number of UE TNLA Bindings that resulted in a Rebinding during the GUAMI status change

Class

Read only.

Type / Range

Integer in the range of 0 to 4,294,967,295

Default

0

Roles**List**

sysadmin, manage, monitor

3.58 cmm amfHoCellIdRestrictionList

Handover Cell Identity Restriction List for AMF . Syntax, description, parameters, and roles for cmm amfHoCellIdRestrictionList command.

Syntax**Description**

Administer Handover Cell Identity Restriction List.

Parameters**Name**

name - Cell Identity Restriction List Name

Syntax

--name <string>

Description

Identifies the name of the Cell Identity Restriction List.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

listInterface - List of Interfaces

Syntax

--listInterface <list-item>

Description

Identify the interface used for cell id based handover.

Class

Required on create, not modifiable.

List

- n14 - n14 Interface between AMFs - Cell identifier based handover over N14 interface between AMFs.

Name

listType - List Type

Syntax

--listType <list-item>

Description

Identify if the Cell Identity restriction list is of type allow or deny list.

Class

Optional.

List

- allow - Allow Handover Cell Ids list - Identify the list of Cell Ids from which handover is allowed
- deny - Deny Handover Cell Ids list - Identify the list of Cell Ids from which handover is denied

Default

allow

3.59 cmm amfHoCellIdRestrictionListItem

Handover Cell ID Restriction List. Syntax, description, parameters, and roles for cmm amfHoCellIdRestrictionListItem command.

Syntax

Description

Administers addition (or deletion) of cell id to the handover cell id restriction list. AMF supports up to 16 cell id restriction lists with a maximum number of 10k cell ids. A list can have up to 10k cell ids resulting in one possible list since maximum numbers of cell ids allowed is used.

Parameters

Name

hoCellIdRestrictionListName - Handover Cell ID Restriction List Name

Syntax

--hoCellIdRestrictionListName <string>

Description

Name of the handover cell id restriction list.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

cellIdName - Cell Identifier Name

Syntax

--cellIdName <string>

Description

Name of the cell id.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

3.60 cmm amfHttp2Ping

AMF Interface HTTP2 Ping. Syntax, description, parameters, and roles for cmm amfHttp2Ping command.

Syntax**Description**

This command is used to determine the status of a TCP/HTTP2 connection in the 5G network

Parameters**Name**

amfClientIntf - Amf Client Interface Ping

Syntax

--amfClientIntf <list-item>

Description

Client Interfaces that can initiate a HTTP2 ping

Class

Required key.

List

- N11 - N11 Interface between AMF and SMF
- N12 - N12 Interface between AMF and AUSF
- N14 - N14 Interface between AMF and AMF
- N15 - N15 Interface between AMF and PCF
- N17 - N17 Interface between AMF and 5G-EIR
- N18 - Nudsf - Nudsf Interface between AMF and UDSF
- N20 - N20 Interface between AMF and SMSF
- N22 - N22 Interface between AMF and NSSF
- N58 - N58 interface between AMF and the NSSAAF
- N8 - N8 Interface between AMF and SDM/UECM
- NLg - NLg Interface between AMF and GMLC
- NLs - NLs Interface between AMF and LMF
- NR10 - Private Interface for Session Restoration
- NamfCommNotification - Namf Communication Notiifcation - Namf Communication Service Notification Interface
- NamfEeNotification - Namf Event Exposure Notiifcation - Namf Event Exposure Service Notification Interface
- NamfLocNotification - Namf Location Notification - Namf Location Notification Interface
- Nnef - Nnef Interface between AMF and NEF
- Nnrf - Nnrf Interface between AMF and NRF
- Nnwdaf - Nnwdaf interface between AMF and NWDAF

Name

amfIntfInstance - 5G Interface Instance

Syntax

--amfIntfInstance <integer>

Description

5G Interface Instance for ping

Class

Required key.

Type / Range

Integer in the range of 1 to 16

Name

amfRmtEndIp - AMF Remote Endpoint IP address

Syntax

--amfRmtEndIp <string>

Description

AMF Remote Endpoint IP address for ping

Class

Required key.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

amfRmtEndIpPort - AMF Remote Endpoint IP Port

Syntax

--amfRmtEndIpPort <integer>

Description

AMF Remote Endpoint IP Port.

Class

Required key.

Type / Range

Integer in the range of 1,024 to 65,535

Name

idx - Index

Syntax

--idx <integer>

Description

Index number for output

Class

Required key.

Type / Range

Integer in the range of 0 to 255

Name

http2PingStatus - HTTP2 Ping Status

Syntax

--http2PingStatus <list-item>

Description

HTTP2 Ping Return Status

Class

Read only.

List

- failure - TCP/HTTP - TCP/HTTP setup failure - The TCP/HTTP2 link establishment failed
- failure - internal error - Ping failure Internal System Error - Internal system error
- failure - time out - Ping Failure Time out - No HTTP2 Ping response received in time interval
- failure - unknown - Ping failure for unknown reason - Ping was unsuccessful - unknown reason
- success - Ping Success - The HTTP2 Ping was successful

Name

http2PingTimeOut - Time out for Ping Operation

Syntax

--http2PingTimeOut <integer>

Description

Time before the Ping will timeout

Class

Optional.

Type / Range

Integer in the range of 1 to 10

Default

5

Name

numHttp2Ping - Number of Pings to Send

Syntax

--numHttp2Ping <integer>

Description

This is the number of Pings that will be send during the operation

Class

Optional.

Type / Range

Integer in the range of 1 to 5

Default

5

Name

roundTripTimeSec - Ping Round Trip Time In Seconds

Syntax

--roundTripTimeSec <integer>

Description

This is the ping round trip time in seconds

Class

Read only.

Type / Range

Integer in the range of 0 to 100 in units of Second

Name

roundTripTimeUsec - Ping Round Trip Time In NSeconds

Syntax

--roundTripTimeUsec <integer>

Description

This is the ping round trip time in nseconds

Class

Read only.

Type / Range

Integer in the range of 0 to 65,535

Roles**List**

sysadmin, manage, monitor

3.61 cmm amfInstance

AMF Instance. Syntax, description, parameters, and roles for cmm amfInstance command.

Syntax**Description**

This command is used to create a new AMF instance and modify and delete an existing AMF instance. An AMF instance is identified by its Instance ID.

Parameters**Name**

servedPlmnName - Mobile Country Code

Syntax

--servedPlmnName <string>

Description

Set Mobile Country Code of the AMF

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

amfRegionId - AMF Region ID

Syntax

--amfRegionId <integer>

Description

AMF Region Identifier is used to identify an AMF group serving a region. 5G AMF are organized into an AMF region, AMF set and AMF pointer. An AMF is uniquely identified by PLMN ID, AMF Region ID, AMF Set and AMF pointer.

Class

Required key.

Type / Range

Integer in the range of 0 to 255

Name

amfSetId - AMF Set Identifier

Syntax

--amfSetId <integer>

Description

AMF Set Identifier is used to identify a set of AMF within an AMF region. An AMF is uniquely identified by PLMN ID, AMF Region ID, AMF Set and AMF pointer.

Class

Required key.

Type / Range

5G AMF Set ID

Name

amfPointer - AMF Pointer

Syntax

--amfPointer <integer>

Description

The AMF Pointer identifies an AMF in an AMF set. An AMF is uniquely identified by PLMN ID, AMF Region ID, AMF Set and AMF pointer.

Class

Required key.

Type / Range

5G AMF Pointer

Name

amfIdLabels - AMF Identifier labels for AMF name FQDN

Syntax

--amfIdLabels <string>

Description

This parameter is used to construct AMF name FQDN The amfLabel should not include the PLMN. For example, if the amfIdLabel is set to 'amf1.region1' then the AMF Name FQDN for MCC 345 and MNC 12 is 'amf1.region1.amf.5gc.mnc012.mcc345.3gppnetwork.org'. The provisioned part is 'amf1.region1' and the AMF derives the '.amf.5gc.mnc012.mcc345.3gppnetwork.org' part.

Class

Required on create.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Name

guamiName - GUAMI Name

Syntax

--guamiName <string>

Description

User-provided name for this GUAMI

Class

Required on create, not modifiable.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Name

nfServicesListName - NF Services List Name

Syntax

--nfServicesListName <string>

Description

Provision services supported by the AMF.

Class

Required on create.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

allowedNfDomainListName - Allowed NF Domain List Name

Syntax

--allowedNfDomainListName <string>

Description

The list with the NF domains the AMF is accessible to. When a list is provisioned, the AMF will add the NF domains included in the list in the the allowedNfDomains IE in the NF Profile Registered to the NRF.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

allowedNfTypeListName - Allowed NF Type List Name

Syntax

--allowedNfTypeListName <string>

Description

The list with the NF types the AMF is accessible to. When a list is provisioned, the AMF will add the NF types included in the list in the the allowedNfTypes IE in the NF Profile Registered to the NRF.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

allowedPlmnListName - Allowed PLMN List Name

Syntax

```
--allowedPlmnListName <string>
```

Description

The list with the PLMNs the AMF is accessible to. When a list is provisioned, the AMF will add the PLMNs included in the list in the the allowedPlmns IE in the NF Profile Registered to the NRF.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

""

Name

allowedSnssaiListName - Allowed S-NSSAI List Name

Syntax

```
--allowedSnssaiListName <string>
```

Description

The list with the S-NSSAIs the AMF is accessible to. When a list is provisioned, the AMF will add the S-NSSAIs included in the list in the the allowedNssais IE in the NF Profile Registered to the NRF.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

""

Name

capacity - AMF Relative Capacity

Syntax

```
--capacity <integer>
```

Description

AMF Relative Capacity. The relative capacity is only used in the other NF in the 5GC. There is a separate parameter for the relative capacity sent to the NG-RAN.

Class

Optional.

Type / Range

Integer in the range of 0 to 65,535

Default

65535

Name

enable - Enable AMF

Syntax`--enable <list-item>`**Description**

The parameter is used to enable use of the provisioned instance of the AMF. If the parameter is set to 'false', the AMF instance will not be used. Once an instance is enabled, the instance can be disabled only under certain TBD conditions.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

instanceId - Instance Identifier

Syntax`--instanceId <string>`**Description**

The AMF Instance ID is a Universally Unique Identifier (UUID) as a Universal Resource Name (URN). The AMF configuration generates the UUID version 4, as described in IETF RFC 4122 [xx].

Class

Read only.

Type / Range

Digit string of length 36 to 36 with the allowed pattern of `[0-9a-fA-F]{8}\-[0-9a-fA-F]{4}\-[0-9a-fA-F]{4}\-[0-9a-fA-F]{4}\-[0-9a-fA-F]{12}`

Name

interPlmnAmfLabel - Identifier labels for AMF Inter PLMN name FQDN

Syntax`--interPlmnAmfLabel <string>`**Description**

This parameter is used to construct AMF Inter PLMN name FQDN. The AMF Label should not include the PLMN ID. For example, if the Label is set to 'amf1.region1' then the AMF Inter PLMN Name FQDN for MCC 345 and MNC 12 is 'amf1.region1.amf.5gc.mnc012.mcc345.3gppnetwork.org'. The provisioned part is 'amf1.region1' and the AMF derives the '.amf.5gc.mnc012.mcc345.3gppnetwork.org' part. If this parameter is null, the AMF uses amfidLabels for the AMF Inter PLMN label.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

locality - Location of the AMF

Syntax

--locality <string>

Description

This parameter is used to configure AMF location like geographical location or data center name.

Class

Optional.

Type / Range

Digit string of length 0 to 64

Default

""

Name

nsiIdListName - NSI ID List Name

Syntax

--nsiIdListName <string>

Description

Provision NSI ID list name. The NSI ID list provisioning is optional. If provisioned AMF will include the list in the profile when the AMF registers with the NRF.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

oauthProfileName - OAuth Access Token Key Name

Syntax

--oauthProfileName <string>

Description

Configure OAuth Access Token Key used for validating OAuth access token received by AMF producer services.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

priority - AMF Priority

Syntax

--priority <integer>

Description

Indicates priority value of the AMF relative to the other AMF within the same AMF set. Lower value indicates higher priority. The capacity and priority parameters, if present, are used for NF selection and load balancing. NFs with a lower priority value is selected before NFs with a higher priority value; for NFs with equal priority value, the selection uses the relative capacity (weight) value of the NFs.

Class

Optional.

Type / Range

Integer in the range of 0 to 65,535

Default

1

Name

restorationEndPtListName - Restoration End Point List Name

Syntax

--restorationEndPtListName <string>

Description

The end point List that is to be used for backing up and restoring this GUAMI

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Name

scpDomainListName - SCP Domain List Name

Syntax

--scpDomainListName <string>

Description

Name of the list including the SCP Domains CMM belongs to. When a list is provisioned, the AMF will add the NF domains included in the list in the the scpDomains IE in the NF Profile Registered to the NRF.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Default

""

Name

tnlaProfileName - TNLA Profile Name

Syntax

--tnlaProfileName <string>

Description

Provision TNLA profile.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Default

default

Name

userAgentSuffix - User Agent Suffix

Syntax

--userAgentSuffix <string>

Description

The parameter is used to configure the text to be suffixed to User-Agent HTTP header. If the text 'Chicago' is provisioned then the User-Agent HTTP header will be set to 'amf-Chicago'.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

3.62 cmm amfIntegrityAlgorithm

Preferred Integrity Algorithm. Syntax, description, parameters, and roles for cmm amfIntegrityAlgorithm command.

Syntax**Description**

This command sets the algorithms, in priority order, AMF will use to negotiate integrity of NAS messages with the UE. At REGISTRATION, the UE provides, in the UE security capabilities, which integrity algorithms are supported. The AMF will use the algorithm both supported by the UE and highest in priority in the nia algorithm priority list. - An algorithm must be chosen for 'priority-1' and 'priority-2'. - An additional selection, 'none', can be selected for 'priority-3' and 'priority-4' - effectively truncating the list. - If any integrity algorithm (including null) is selected for 'priority-4', then 'priority-3' must not be 'none'. - An algorithm cannot be used for more than one priority (except for 'none').

Parameters

Name

integrityAlgPrio1 - Most preferred integrity algorithm

Syntax

```
--integrityAlgPrio1 <list-item>
```

Description

The most priority algorithm for integrity of NAS messages with the UE.

Class

Optional.

List

- aes - 128-NIA2 (AES)
- none - No Algorithm Selected
- nullIntegrity - 128-NIA0 (Null integrity)
- snow3G - 128-NIA1 (SNOW 3G)
- zuc - 128-NIA3 (ZUC)

Default

snow3G

Name

integrityAlgPrio2 - Priority 2 integrity algorithm

Syntax

```
--integrityAlgPrio2 <list-item>
```

Description

Second most preferred integrity algorithm; used if the user element does not support algorithm(s) of higher priority

Class

Optional.

List

- aes - 128-NIA2 (AES)
- none - No Algorithm Selected
- nullIntegrity - 128-NIA0 (Null integrity)
- snow3G - 128-NIA1 (SNOW 3G)
- zuc - 128-NIA3 (ZUC)

Default

aes

Name

integrityAlgPrio3 - Priority 3 integrity algorithm

Syntax

--integrityAlgPrio3 <list-item>

Description

Priority 3 integrity algorithm

Class

Optional.

List

- aes - 128-NIA2 (AES)
- none - No Algorithm Selected
- nullIntegrity - 128-NIA0 (Null integrity)
- snow3G - 128-NIA1 (SNOW 3G)
- zuc - 128-NIA3 (ZUC)

Default

none

Name

integrityAlgPrio4 - Priority 4 integrity algorithm

Syntax

--integrityAlgPrio4 <list-item>

Description

Priority 4 integrity algorithm

Class

Optional.

List

- aes - 128-NIA2 (AES)
- none - No Algorithm Selected
- nullIntegrity - 128-NIA0 (Null integrity)
- snow3G - 128-NIA1 (SNOW 3G)
- zuc - 128-NIA3 (ZUC)

Default

none

3.63 cmm amfIntfAdmin

AMF Signalling Interface Administration. Syntax, description, parameters, and roles for cmm amfIntfAdmin command.

Syntax

Description

AMF Signaling Interface Administration - Lock an Interface Locked indicates that no new sessions will be established (Client). UnLocked indicates that the interface is available for use. Blocked indicates that no new HTTP/TCP connections will be allowed into the Interface (Server). When the AMF has multiple Service Instances the command applies to all the Service instances of the Service type.

Parameters

Name

amfIntfType - AMF Interface type

Syntax

--amfIntfType <list-item>

Description

AMF Interface type.

Class

Required key.

List

- N11 - N11 Interface - N11 Interface between AMF and SMF
- N12 - N12 Interface - N12 Interface between AMF and AUSF
- N14 - N14 Interface - N14 Interface between AMF and AMF
- N15 - N15 Interface - N15 Interface between AMF and PCF
- N17 - N17 Interface - N17 Interface between AMF and 5G EIR

- N18 - N18 interface between AMF and UDSF
- N2 - N2 Interface - N2 Interface between AMF and 5gNB
- N20 - N20 Interface - N20 Interface between AMF and SMSF
- N22 - N22 Interface - N22 Interface between AMF and NSSF
- N26 - N26 Interface - N26 Interface between AMF and MME
- N41 - N41 interface - N41 interface between AMF and CHF
- N58 - N58 Interface - N58 interface between AMF and NSSAAF
- N8 - N8 Interface - N8 Interface between AMF and UDM
- NLg - NLg Interface - NLg Interface between AMF and GMLC
- NLs - NLs Interface - NLs Interface between AMF and LMF
- Nnef - Nnef Interface - Nnef Interface between AMF and Network Event Function
- Nnrf - Nnrf Interface - Nnrf Interface between AMF and NRF
- Nnwdaf - Nnwdaf Interface - Nnwdaf interface between AMF and NWDAF
- namf_Communications - AMF Communications Service
- namf_EventExposure - AMF Event Exposure Service
- namf_Location - AMF Location Service
- namf_MT - AMF Mobile Terminated Service
- notification_AMF - AMF Notification - AMF Notification Function
- notification_NRF - NRF Notification - NRF Notification Function
- notification_NSSAAF - NSSAAF Notification - NSSAAF Notification Function
- notification_NSSF - NSSF Notification - NSSF Notification Function
- notification_NWDAF - NWDAF Notification - NWDAF Notification Function
- notification_PCF - PCF Notification - PCF Notification Function
- notification_SMF - SMF Notification - SMF Notification Function
- notification_UDM - UDM Notification - UDM Notification Function

Name

endPointName - AMF Local End Point Interface Name

Syntax

--endPointName <string>

Description

AMF Local End Point Interface Name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Name

amfIntfAdminState - AMF Interface admin state

Syntax

--amfIntfAdminState <list-item>

Description

AMF Interface admin state.

Class

Required on create.

List

- blocked - Blocked State - only used for SBI_Server Interface types
- blockedDisabled - Blocked (disabled) - Blocked State - only used for SBI_Server Interface types when aggregate service is locked.
- locked - Locked State - only used for SBI_Client, N2 and N26 Interface types
- lockedDisabled - Locked (disabled) - Locked State - only used for SBI_Client, N2 and N26 Interface types when aggregate service is locked.
- unlocked - Unlocked State
- unlockedDisabled - Unlocked (disabled) - Unlocked State when aggregate service is locked.

3.64 cmm amfIntfQueryPath

Query sctp path information. Syntax, description, parameters, and roles for cmm amfIntfQueryPath command.

Syntax

Description

Query path information for SCTP link/interface in 5G.

Parameters

Name

amfIntfType - Link interface type

Syntax

--amfIntfType <list-item>

Description

Link interface type. only SCTP interfaces are supported.

Class

Required key.

List

- N2 - N2 Interface - List of (N2, ...)

Name

endLinkIndex - End Link Index

Syntax

--endLinkIndex <integer>

Description

End link index

Class

Optional.

Type / Range

Integer in the range of 0 to 4,294,967,295

Name

linkIndex - Link Index

Syntax

--linkIndex <integer>

Description

Link index

Class

Read only.

Type / Range

Integer in the range of 0 to 4,294,967,295

Name

maxResponseSize - Max record count

Syntax

--maxResponseSize <integer>

Description

Max number of records to be returned.

Class

Optional.

Type / Range

Integer in the range of 1 to 100

Name

path1Status - Path 1 Status

Syntax

--path1Status <list-item>

Description

Path 1 status

Class

Read only.

List

- not-used - Path status of not used.
- reachable - Path status of reachable.
- unknown - Path status of unknown.
- unreachable - Path status of unreachable.

Name

path2Status - Path 2 Status

Syntax

--path2Status <list-item>

Description

Path 2 status

Class

Read only.

List

- not-used - Path status of not used.
- reachable - Path status of reachable.
- unknown - Path status of unknown.

- unreachable - Path status of unreachable.

Name

startLinkIndex - Start Link Index

Syntax

--startLinkIndex <integer>

Description

Start link index

Class

Optional.

Type / Range

Integer in the range of 0 to 4,294,967,295

Roles**List**

sysadmin, manage, monitor

3.65 cmm amfIntfSummary

AMF Signalling Interface Link Summary. Syntax, description, parameters, and roles for cmm amfIntfSummary command.

Syntax**Description**

AMF Signalling Interface Link Summary Request

Parameters**Name**

amfIntfType - AMF Interface Type

Syntax

--amfIntfType <list-item>

Description

AMF Interface type. Default to N8.

Class

Required key.

List

- N11 - N11 Interface - N11 Interface between AMF and SMF
- N12 - N12 Interface - N12 Interface between AMF and AUSF
- N14 - N14 Interface - N14 Interface between AMF and AMF
- N15 - N15 Interface - N15 Interface between AMF and PCF
- N17 - N17 Interface - N17 Interface between AMF and 5G EIR
- N18 - N18 interface between AMF and UDSF
- N2 - N2 Interface - N2 Interface between AMF and 5gNB
- N20 - N20 Interface - N20 Interface between AMF and SMSF
- N22 - N22 Interface - N22 Interface between AMF and NSSF
- N26 - N26 Interface - N26 Interface between AMF and MME
- N41 - N41 interface - N41 interface between AMF and CHF
- N58 - N58 Interface - N58 interface between AMF and NSSAAF
- N8 - N8 Interface - N8 Interface between AMF and UDM
- NLg - NLg Interface - NLg Interface between AMF and GMLC
- NLs - NLs Interface - NLs Interface between AMF and LMF
- Nnef - Nnef Interface - Nnef Interface between AMF and Network Event Function
- Nnrf - Nnrf Interface - Nnrf Interface between AMF and NRF
- Nnwdaf - Nnwdaf Interface - Nnwdaf interface between AMF and NWDAF
- namf_Communications - AMF Communications Service
- namf_EventExposure - AMF Event Exposure Service
- namf_Location - AMF Location Service
- namf_MT - AMF Mobile Terminated Service
- notification_AMF - AMF Notification - AMF Notification Function
- notification_NRF - NRF Notification - NRF Notification Function
- notification_NSSAAF - NSSAAF Notification - NSSAAF Notification Function
- notification_NSSF - NSSF Notification - NSSF Notification Function
- notification_NWDAF - NWDAF Notification - NWDAF Notification Function
- notification_PCF - PCF Notification - PCF Notification Function
- notification_SMF - SMF Notification - SMF Notification Function
- notification_UDM - UDM Notification - UDM Notification Function

Default

N8

Name

amfLinkAdminState - AMF Link Admin State

Syntax

--amfLinkAdminState <list-item>

Description

AMF Link Admin State

Class

Read only.

List

- blocked - Blocked State - only used for SBI_Server link types
- locked - Locked State - only used for SBI_Client, N2 and N26 links types
- unlocked - Unlocked State

Name

endPointName - AMF Local End Point Interface Name

Syntax

--endPointName <string>

Description

AMF Local End Point Interface Name

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

linkCount - Link count

Syntax

--linkCount <integer>

Description

Link count.

Class

Read only.

Type / Range

Integer in the range of 0 to 4,294,967,295

Name

linkOperationState - Link operation state

Syntax

--linkOperationState <list-item>

Description

Link operation state.

Class

Read only.

List

- disabled - Disabled state of the link.
- enabled - Enabled state of the link.
- suspended - Suspended state of the link.
- unknown - Unknown state of the link. this can not be used during query.

Name

poolId - poolId

Syntax

--poolId <integer>

Description

IPDS Pool ID - If chosen only the count of interface links on the specified IPDS will be output. This parameter is only applicable for Multi-IPDS instantiations and requires linkInterfaceType option to display results on any Pool Id greater than 0

Class

Read only.

Type / Range

Integer in the range of 0 to 31

Roles**List**

sysadmin, manage, monitor

3.66 cmm amfLadnMapping

AMF LADN Information. Syntax, description, parameters, and roles for cmm amfLadnMapping command.

Syntax

Description

AMF Local Area Data Network (LADN) mapping. This command provides mapping between LADN service area (Tracking Area list) and the related Data Network Name (DNN). With the LADN functionality, access to a provisioned data network is only provided on a restricted service area. A single DNN can only have a single associated LADN TAI list in the same PLMN. The same LADN TAI list related to a single PLMN may be associated with multiple DNNs. AMF supports up to 200 LADN TAI list-DNN associations for a PLMN.

Parameters

Name

amfLadnTailistName - AMF LADN TAI List Name

Syntax

--amfLadnTailistName <string>

Description

The AMF Tracking Area list associated with a LADN DNN.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Name

dataNetworkName - Data Network Name

Syntax

--dataNetworkName <string>

Description

The Data Network Name (DNN) associated with the DNN service area (Tracking Area list) which is used for Local Area Data Network (LADN) functionality.

Class

Required key.

Type / Range

Data Network Name is basically APN Ni.

Name

plmnName - Mobile network name

Syntax

--plmnName <string>

Description

A name that identifies mobile network.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

3.67 cmm amfLadnTai

AMF Local Area Data Network TAI. Syntax, description, parameters, and roles for cmm amfLadnTai command.

Syntax**Description**

Administer Tracking Area (TA) associated with a Local Area Data Network (LADN). A UE can only access a Local Area Data Network when camping inside a specific service area defined by a list of Tracking Area Identifiers. AMF supports 300 TAIs on a single LADN TAI list.

Parameters**Name**

amfLadnTaiListName - AMF Local Area Data Network TAI List Name

Syntax

--amfLadnTaiListName <string>

Description

Name of Local Area Data Network (LADN) associated Tracking Area list.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

servedPlmn - Served PLMN

Syntax

--servedPlmn <string>

Description

Served mobile network name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

amfTac - AMF TAC

Syntax

--amfTac <integer>

Description

The Tracking Area Code in the AMF.

Class

Required key.

Type / Range

Integer in the range of 0 to 16,777,215

Roles**Create**

sysadmin, manage

3.68 cmm amfLadnTailList

AMF Local Area Data Network TAI List. Syntax, description, parameters, and roles for cmm amfLadnTailList command.

Syntax

Description

Administer AMF Local Area Data Network (LADN) TAI List. A UE can only access a Local Area Data Network when camping inside a specific service area defined by a list of Tracking Area Identifiers. AMF supports 200 LADN TAI lists per PLMN.

Parameters

Name

name - AMF Local Area Data Network TAI List Name

Syntax

--name <string>

Description

The name of the AMF Local Area Data Network TAI List.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

3.69 cmm amfLcsGParms

Location Service GParms. Syntax, description, parameters, and roles for cmm amfLcsGParms command.

Syntax

Description

This command opens the context for configuring location Service (LCS) related parameters for the network.

Parameters

Name

amfGparmName - Parameter name

Syntax

--amfGparmName <list-item>

Description

Name of parameter

Class

Required key.

List

- activateLcs - Activate LCS - Activate LCS in AMF
- activateLcsClientEmergencyServices - Activate LCS Client Type For Emergency Services - Activate LCS with Client Type is Emergency Services
- activateLcsClientVasService - Activate LCS Client Type For VAS Services - Activated Lcs MT_LR with ClientType= Value added Service. When parameter is set, AMF will accept MT-LR with client type= VAS. If the parameter is false, then AMF will not accept client type= VAS for MT-LR
- clientTypeLmfGmlcSelect - Client Type Based LMF/GMLC Selection - With this parameter set, Client type based GMLC/LMF selection shall be used so that dedicated GMLC/LMF will be selected and used for different client types. If the parameter is not set, existing function will be used -> AMF does NRF query of LMF and GMLC for MT-LR without client type.
- emerMtLrNoLmf - E911 LCS MT LR Without Query LMF - When the parameter is enabled, AMF supports MT-LR during emergency call for clientType emergency without contacting LMF. Instead, AMF reports the current NRCGI to GMLC when UE registers to the 5GC for emergency services
- ePdgEmergencyHoNotificationGmlc - ePDG emergency HO notification to GMLC - Defines the type of procedure the AMF triggers to GMLC when then UE requests an emergency session to be handed over from ePDG/EPC to NG-RAN/5GS. When set to true, the AMF will send Handover notification to GMLC. When set to false, AMF will send LRR with emergency origination. By default, the parameter is set to true.
- includeNrCgiMtlrFailure - Include last seen NR-CGI and timestamp in the ProblemDetails portion of a failed MT-LR - Include last seen NR-CGI and timestamp in the ProblemDetails portion of a failed MT-LR (Provide Position Response) if AMF not able to retrieve latitude/longitude information for UE.
- lawfulInterceptMtLrNoLmf - Lawful Intercept MT_LR No LMF - This is for MT_LR client type lawful Intercept service do not contact LMF for UE location information. If yes, when AMF receives mobile terminated location request with client

type=lawfulInterceptService, and activateLcsClientTypeLawfulInterceptServices is set, the AMF contacts the gNB for UE current cell information. This information is sent back to the GMLC. The AMF does not contact the LMF to obtain any UE location information. If gParms is no, nothing changes and keep existing function (i.e. AMF contacts LMF to obtain UE location)

- lcsClientTypeLawfulInterceptServices - Activate LCS Client Type Lawful Intercept Services
- lcsClientTypePlmnOperatorServices - Activate LCS Client Type PLMN Operator Services
- lcsRetrieveCurrentCellInfo - Retrieve Cell Id of UE - If a UE is 5GMM-CONNECTED, the AMF uses the setting of the lcsRetrieveCurrentCellInfo parameter to determine whether to send NGAP Location Reporting Control to retrieve current cell ID for the UE. If parameter setting is Yes, Location Reporting Control /Location Report exchange with the gNB occurs prior to the AMF contacting the LMF for geographic information
- lengthByteForNrppa - Length Byte For NRPPa - Normally, AMF transparent send NRPPa PDUs received from LMF to gNB without any change. With this parameter set to true, AMF will encode Octet String (with length Byte) towards gNB. If the parameter set to false, then existing function i.e. AMF transparent passes the PDU unchanged. The default value is false.
- lmfgmlcSelectForNiLr - LMF/GMLC Selection For NI-LR - Client type based GMLC/LMF selection has been introduced by 3GPP and Will be used in AMF. However, if Dedicated GMLC/LMF are used for E911 and selection of LMF/GMLC for NI-LR needs to follow the same rule. Thus, with this parameter is set, AMF shall do NRF query of LMF and GMLC for NI-LR. If this parameter is not set, existing function will keep-> AMF does NRF query of LMF and GMLC for NI-LR without client type.
- maxNrCgiAgeEmerMtlrNoLmf - Maximum time interval in seconds for requesting nrCGI for emergency MT-LR - If the parameter is set to 0 with the amfLcsGParms parameter emerMtlrNoLmf sets to yes, AMF page 5GMM-IDLE UE and send nrCGI information or send location-reporting control information for CM. If the parameter is set to a non-zero value, when AMF gets MT-LR request, AMF will check the difference between AMF stored nrCGI timestamp of the UE and time received MT-LR. If the time difference is less than provisioned value, then the AMF reports stored nrCGI information to GMLC. If time difference is greater than the provisioned value, then AMF will request current nrCGI either via paging or location report control depends UE status
- maxNrCgiAgeLawfulInterceptMtlrNoLmf - Maximum Time Interval In Seconds For Requesting nrCGI Lawful Intercept MT-LR - If the parameter is set to 0 with the amfLcsGParms parameter LawfulInterceptMtlrNoLmf sets to yes, AMF page 5GMM-IDLE UE and send nrCGI information or send location-reporting control information for CM. If the parameter is set to a non-zero value, when AMF gets MT-LR request, AMF will check the difference between AMF stored nrCGI timestamp of the UE and time received MT-LR. If the time difference is less than provisioned value, then the AMF reports stored nrCGI information to GMLC. If time difference is greater than the provisioned value (or equal

provisioned value), AMF will request current nrCGI either via paging or location report control depends UE status

- **maxNrCgiAgePlmnOperMtLrNoLmf** - Max nrCGI Age PLMN Operator MT-LR - Maximum time interval in seconds for requesting nrCGI PLMN operator MT-LR. If the parameter is set to 0 with the amfLcsGParms parameter plmnOperMtLrNoLmf sets to yes, AMF page 5GMM-IDLE UE and send nrCGI information or send location-reporting control information. If the parameter is set to a non-zero value, when AMF gets MT-LR request, AMF will check the difference between AMF stored nrCGI timestamp of the UE and time received MT-LR. If the time difference is less than provisioned value, then the AMF reports stored nrCGI information to GMLC. If time difference is greater than the provisioned value (or equal provisioned value), AMF will request current nrCGI either via paging or location report control depends UE status
- **maxNrCgiAgeValueAddedMtLrNoLmf** - Max NrCgi Age Value Added MT-LR - Maximum time interval in seconds for requesting nrCGI for value added MT-LR. If the parameter is set to 0 with the amfLcsGParms parameter valueAddedMtLrNoLmf sets to yes, AMF page 5GMM-IDLE UE and send nrCGI information or send location-reporting control information. If the parameter is set to a non-zero value, when AMF gets MT-LR request, AMF will check the difference between AMF stored nrCGI timestamp of the UE and time received MT-LR. If the time difference is less than provisioned value, then the AMF reports stored nrCGI information to GMLC. If time difference is greater than the provisioned value (or equal provisioned value), AMF will request current nrCGI either via paging or location report control depends UE status
- **nonUeAssociatedNrppa** - Non UE Associated NRPPa - With the parameter set, AMF supports non UE Associated NRPPa transfer between LMF and NG-RAN. If the parameter is not set, AMF will not support non UE Associated NRPPa transfer between LMF and NG-RAN.
- **plmnOperMtLrNoLmf** - PLMN Operator MT_LR No LMF - MT_LR client type PLMN Operator Service do not contact LMF for UE location information. If gParms is 'yes', when AMF receives mobile terminated location request with client type=plmnOperatorServices, and activateLcsClientTypePlmnOperatorServices is set, the AMF contacts the gNB for UE current cell information. This information is sent back to the GMLC. The AMF does not contact the LMF to obtain any UE location information. If gParms is 'no', nothing changes and keep existing function (i.e. AMF contacts LMF to obtain UE location for this MT-LR type) .
- **posGpsi** - POS GPSI - If the control parameter is set, it means that AMF supports the 'POSGPSI' feature, the ueContextId identifies the individual ueContext resource may also be composed by UE's GPSI.
- **valueAddedMtLrNoLmf** - Value Added MT_LR No LMF - MT_LR client type value-added do not contact lmf for UE location information. If gParms is 'yes', when AMF receives mobile terminated location request with client type=valueAdded, and activateLcsClientTypeValueAddedServices is set, the AMF contacts the gNB for UE current cell information. This information is sent back to the GMLC. The AMF does not

contact the LMF to obtain any UE location information. If gParms is 'no', nothing change and keep existing function (i.e. AMF contacts LMF to obtain UE location for this MT-LR type

Name

amfGparmValue - Parameter value

Syntax

```
--amfGparmValue <string>
```

Description

Value of parameter

Class

Required on create.

Type / Range

Digit string of length 0 to 64

The amfGparmValue string is based on the amfGparmName parameter:

Name

activateLcs - Activate LCS

Syntax

```
--amfGparmName activateLcs --amfGparmValue <string>
```

Description

Activate LCS in AMF

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

activateLcsClientEmergencyServices - Activate LCS Client Type For Emergency Services

Syntax

```
--amfGparmName activateLcsClientEmergencyServices --amfGparmValue <string>
```

Description

Activate LCS with Client Type is Emergency Services

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

activateLcsClientVasService - Activate LCS Client Type For VAS Services

Syntax

--amfGparmName activateLcsClientVasService --amfGparmValue <string>

Description

Activated Lcs MT_LR with ClientType= Value added Service. When parameter is set, AMF will accept MT-LR with client type= VAS. If the parameter is false, then AMF will not accept client type= VAS for MT-LR

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

clientTypeLmfGmlcSelect - Client Type Based LMF/GMLC Selection

Syntax

--amfGparmName clientTypeLmfGmlcSelect --amfGparmValue <string>

Description

With this parameter set, Client type based GMLC/LMF selection shall be used so that dedicated GMLC/LMF will be selected and used for different client types. If the parameter is not set, existing function will be used -> AMF does NRF query of LMF and GMLC for MT-LR without client type.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

emerMtLrNoLmf - E911 LCS MT LR Without Query LMF

Syntax

--amfGparmName emerMtLrNoLmf --amfGparmValue <string>

Description

When the parameter is enabled, AMF supports MT-LR during emergency call for clientType emergency without contacting LMF. Instead, AMF reports the current NRCGI to GMLC when UE registers to the 5GC for emergency services

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

ePdgEmergencyHoNotificationGmlc - ePDG emergency HO notification to GMLC

Syntax

```
--amfGparmName ePdgEmergencyHoNotificationGmlc --amfGparmValue  
<string>
```

Description

Defines the type of procedure the AMF triggers to GMLC when then UE requests an emergency session to be handed over from ePDG/EPC to NG-RAN/5GS. When set to true, the AMF will send Handover notification to GMLC. When set to false, AMF will send LRR with emergency origination. By default, the parameter is set to true.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

includeNrCgiMtlrFailure - Include last seen NR-CGI and timestamp in the ProblemDetails portion of a failed MT-LR

Syntax

```
--amfGparmName includeNrCgiMtlrFailure --amfGparmValue <string>
```

Description

Include last seen NR-CGI and timestamp in the ProblemDetails portion of a failed MT-LR (Provide Position Response) if AMF not able to retrieve latitude/longitude information for UE.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

lawfulInterceptMtLrNoLmf - Lawful Intercept MT_LR No LMF

Syntax

--amfGparamName lawfulInterceptMtLrNoLmf --amfGparamValue <string>

Description

This is for MT_LR client type lawful Intercept service do not contact LMF for UE location information. If yes, when AMF receives mobile terminated location request with client type=lawfulInterceptService, and activateLcsClientTypeLawfulInterceptServices is set, the AMF contacts the gNB for UE current cell information. This information is sent back to the GMLC. The AMF does not contact the LMF to obtain any UE location information. If gParms is no, nothing changes and keep existing function (i.e. AMF contacts LMF to obtain UE location)

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

lcsClientTypeLawfulInterceptServices - Activate LCS Client Type Lawful Intercept Services

Syntax

--amfGparamName lcsClientTypeLawfulInterceptServices --amfGparamValue <string>

Description

Activate LCS Client Type Lawful Intercept Services

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

lcsClientTypePlmnOperatorServices - Activate LCS Client Type PLMN Operator Services

Syntax

--amfGparamName lcsClientTypePlmnOperatorServices --amfGparamValue <string>

Description

Activate LCS Client Type PLMN Operator Services

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

lcsRetrieveCurrentCellInfo - Retrieve Cell Id of UE

Syntax

```
--amfGparmName lcsRetrieveCurrentCellInfo --amfGparmValue <string>
```

Description

If a UE is 5GMM-CONNECTED, the AMF uses the setting of the lcsRetrieveCurrentCellInfo parameter to determine whether to send NGAP Location Reporting Control to retrieve current cell ID for the UE. If parameter setting is Yes, Location Reporting Control /Location Report exchange with the gNB occurs prior to the AMF contacting the LMF for geographic information

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

lengthByteForNrppa - Length Byte For NRPPa

Syntax

```
--amfGparmName lengthByteForNrppa --amfGparmValue <string>
```

Description

Normally, AMF transparent send NRPPa PDUs received from LMF to gNB without any change. With this parameter set to true, AMF will encode Octet String (with length Byte) towards gNB. If the parameter set to false, then existing function i.e. AMF transparent passes the PDU unchanged. The default value is false.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

lmfGmlcSelectForNiLr - LMF/GMLC Selection For NI-LR

Syntax

```
--amfGparmName lmfGmlcSelectForNiLr --amfGparmValue <string>
```

Description

Client type based GMLC/LMF selection has been introduced by 3GPP and Will be used in AMF. However, if Dedicated GMLC/LMF are used for E911 and selection of LMF/GMLC for NI-LR needs to follow the same rule. Thus, with this parameter is set, AMF shall do NRF query of LMF and GMLC for NI-LR. If this parameter is not set, existing function will keep-> AMF does NRF query of LMF and GMLC for NI-LR without client type.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

maxNrCgiAgeEmerMtLrNoLmf - Maximum time interval in seconds for requesting nrCGI for emergency MT-LR

Syntax

```
--amfGparmName maxNrCgiAgeEmerMtLrNoLmf --amfGparmValue <string>
```

Description

If the parameter is set to 0 with the amfLcsGParms parameter emerMtLrNoLmf sets to yes, AMF page 5GMM-IDLE UE and send nrCGI information or send location-reporting control information for CM. If the parameter is set to a non-zero value, when AMF gets MT-LR request, AMF will check the difference between AMF stored nrCGI timestamp of the UE and time received MT-LR. If the time difference is less than provisioned value, then the AMF reports stored nrCGI information to GMLC. If time difference is greater than the provisioned value, then AMF will request current nrCGI either via paging or location report control depends UE status

Type / Range

Integer in the range of 0 to 180

Default

0

Name

maxNrCgiAgeLawfulInterceptMtLrNoLmf - Maximum Time Interval In Seconds For Requesting nrCGI Lawful Intercept MT-LR

Syntax

```
--amfGparmName maxNrCgiAgeLawfulInterceptMtLrNoLmf --amfGparmValue  
<string>
```

Description

If the parameter is set to 0 with the amfLcsGParms parameter LawfullInterceptMtLrNoLmf sets to yes, AMF page 5GMM-IDLE UE and send nrCGI information or send location-reporting control information for CM. If the parameter is set to a non-zero value, when AMF gets MT-LR request, AMF will check the difference between AMF stored nrCGI timestamp of the UE and time received MT-LR. If the time difference is less than provisioned value, then the AMF reports stored nrCGI information to GMLC. If time difference is greater than the provisioned value (or equal provisioned value), AMF will request current nrCGI either via paging or location report control depends UE status

Type / Range

Integer in the range of 0 to 180 in units of Second

Default

0

Name

maxNrCgiAgePlmnOperMtLrNoLmf - Max nrCGI Age PLMN Operator MT-LR

Syntax

--amfGparmName maxNrCgiAgePlmnOperMtLrNoLmf --amfGparmValue <string>

Description

Maximum time interval in seconds for requesting nrCGI PLMN operator MT-LR. If the parameter is set to 0 with the amfLcsGParms parameter plmnOperMtLrNoLmf sets to yes, AMF page 5GMM-IDLE UE and send nrCGI information or send location-reporting control information. If the parameter is set to a non-zero value, when AMF gets MT-LR request, AMF will check the difference between AMF stored nrCGI timestamp of the UE and time received MT-LR. If the time difference is less than provisioned value, then the AMF reports stored nrCGI information to GMLC. If time difference is greater than the provisioned value (or equal provisioned value), AMF will request current nrCGI either via paging or location report control depends UE status

Type / Range

Integer in the range of 0 to 180 in units of Second

Default

0

Name

maxNrCgiAgeValueAddedMtLrNoLmf - Max NrCgi Age Value Added MT-LR

Syntax

--amfGparmName maxNrCgiAgeValueAddedMtLrNoLmf --amfGparmValue <string>

Description

Maximum time interval in seconds for requesting nrCGI for value added MT-LR. If the parameter is set to 0 with the amfLcsGParms parameter valueAddedMtLrNoLmf sets to yes, AMF page 5GMM-IDLE UE and send nrCGI information or send location-reporting control

information. If the parameter is set to a non-zero value, when AMF gets MT-LR request, AMF will check the difference between AMF stored nrCGI timestamp of the UE and time received MT-LR. If the time difference is less than provisioned value, then the AMF reports stored nrCGI information to GMLC. If time difference is greater than the provisioned value (or equal provisioned value), AMF will request current nrCGI either via paging or location report control depends UE status

Type / Range

Integer in the range of 0 to 180 in units of Second

Default

0

Name

nonUeAssociatedNrppa - Non UE Associated NRPPa

Syntax

--amfGparmName nonUeAssociatedNrppa --amfGparmValue <string>

Description

With the parameter set, AMF supports non UE Associated NRPPa transfer between LMF and NG-RAN. If the parameter is not set, AMF will not support non UE Associated NRPPa transfer between LMF and NG-RAN.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

plmnOperMtLrNoLmf - PLMN Operator MT_LR No LMF

Syntax

--amfGparmName plmnOperMtLrNoLmf --amfGparmValue <string>

Description

MT_LR client type PLMN Operator Service do not contact LMF for UE location information. If gParms is 'yes', when AMF receives mobile terminated location request with client type=plmnOperatorServices, and activateLcsClientTypePlmnOperatorServices is set, the AMF contacts the gNB for UE current cell information. This information is sent back to the GMLC. The AMF does not contact the LMF to obtain any UE location information. If gParms is 'no', nothing changes and keep existing function (i.e. AMF contacts LMF to obtain UE location for this MT-LR type) .

List

- false - Boolean value of false.

- true - Boolean value of true.

Default

false

Name

posGpsi - POS GPSI

Syntax

--amfGparmName posGpsi --amfGparmValue <string>

Description

If the control parameter is set, it means that AMF supports the 'POSGPSI' feature, the ueContextId identifies the individual ueContext resource may also be composed by UE's GPSI.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

valueAddedMtLrNoLmf - Value Added MT_LR No LMF

Syntax

--amfGparmName valueAddedMtLrNoLmf --amfGparmValue <string>

Description

MT_LR client type value-added do not contact lmf for UE location information. If gParms is 'yes', when AMF receives mobile terminated location request with client type=valueAdded, and activateLcsClientTypeValueAddedServices is set, the AMF contacts the gNB for UE current cell information. This information is sent back to the GMLC. The AMF does not contact the LMF to obtain any UE location information. If gParms is 'no', nothing change and keep existing function (i.e. AMF contacts LMF to obtain UE location for this MT-LR type

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

3.70 cmm amfLinkAdmin

AMF Link Administration. Syntax, description, parameters, and roles for cmm amfLinkAdmin command.

Syntax

Description

AMF link administration - Modify/Show the administrative state of a 5G link

Parameters

Name

amfLinkType - AMF Link Type

Syntax

--amfLinkType <list-item>

Description

AMF link type

Class

Required key.

List

- N2 - N2 link - N2 link between AMF and gNB
- N26 - N26 link - N26 link between AMF and MME
- SBI_Client - 5G Client SBI - 5G Client Service Based link
- SBI_Server - 5G Server SBI - 5G Server Service Based link

Name

linkIndex - AMF Link Index

Syntax

--linkIndex <integer>

Description

AMF link index

Class

Required key.

Type / Range

Integer in the range of 0 to 4,294,967,295

Name

amfLinkAdminState - AMF Link Admin State

Syntax

--amfLinkAdminState <list-item>

Description

AMF link admin state

Class

Required on create.

List

- blocked - Blocked State - only used for SBI_Server link types
- locked - Locked State - only used for SBI_Client, N2 and N26 links types
- unlocked - Unlocked State

Name

alarmState - Alarm State

Syntax

--alarmState <list-item>

Description

Alarm state

Class

Read only.

List

- critical - Critical alarm.
- major - Major alarm.
- minor - Minor alarm.
- none - No alarm.
- unknown - Unknown.

Name

linkIdentifier - Link identifier

Syntax

--linkIdentifier <string>

Description

Link information.

Class

Read only.

Type / Range

Digit string of length 0 or 1 to 255

Name

linkOperationState - Link Operation State

Syntax

--linkOperationState <list-item>

Description

Link operation state

Class

Read only.

List

- disabled - Disabled state of the link.
- enabled - Enabled state of the link.
- suspended - Suspended state of the link.
- unknown - Unknown state of the link. this can not be used during query.

Name

localIp1 - Local IP1

Syntax

--localIp1 <string>

Description

Local IP1.

Class

Read only.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

localIp2 - Local IP2

Syntax

--localIp2 <string>

Description

Local IP2.

Class

Read only.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

localPort1 - Local Port 1

Syntax

--localPort1 <integer>

Description

Local Port associated with the local IP address 1

Class

Read only.

Type / Range

Integer in the range of 0 to 65,534

Name

localPort2 - Local Port 2

Syntax

--localPort2 <integer>

Description

Local Port associated with the local IP address 2

Class

Read only.

Type / Range

Integer in the range of 0 to 65,534

Name

poolId - poolId

Syntax

--poolId <integer>

Description

IPDS Pool ID - ID will only be 0 for non Multi-IPDS instantiations.

Class

Read only.

Type / Range

Integer in the range of 0 to 31

Name

remotelp1 - Remote IP1

Syntax

--remoteIp1 <string>

Description

Remote IP1.

Class

Read only.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

remotelp2 - Remote IP2

Syntax

--remoteIp2 <string>

Description

Remote IP2.

Class

Read only.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

remotePort1 - Remote Port 1

Syntax

--remotePort1 <integer>

Description

Remote Port associated with the remote IP address 1

Class

Read only.

Type / Range

Integer in the range of 0 to 65,534

Name

remotePort2 - Remote Port 2

Syntax

--remotePort2 <integer>

Description

Remote Port associated with the remote IP address 2

Class

Read only.

Type / Range

Integer in the range of 0 to 65,534

3.71 cmm amfLinkAlarmCfg

AMF Link Alarm Config. Syntax, description, parameters, and roles for cmm amfLinkAlarmCfg command.

Syntax**Description**

Administer Link Alarm Severity for AMF.

Parameters**Name**

amfIntfType - AMF Interface Type

Syntax

--amfIntfType <list-item>

Description

AMF interface type.

Class

Required key.

List

- N11 - N11 Interface - N11 Interface between AMF and SMF
- N12 - N12 Interface - N12 Interface between AMF and AUSF
- N14 - N14 Interface - N14 Interface between AMF and AMF
- N15 - N15 Interface - N15 Interface between AMF and PCF
- N17 - N17 Interface - N17 Interface between AMF and 5G EIR

- N18 - N18 interface between AMF and UDSF
- N2 - N2 Interface - N2 Interface between AMF and 5gNB
- N20 - N20 Interface - N20 Interface between AMF and SMSF
- N22 - N22 Interface - N22 Interface between AMF and NSSF
- N26 - N26 Interface - N26 Interface between AMF and MME
- N41 - N41 interface - N41 interface between AMF and CHF
- N58 - N58 Interface - N58 interface between AMF and NSSAAF
- N8 - N8 Interface - N8 Interface between AMF and UDM
- NLg - NLg Interface - NLg Interface between AMF and GMLC
- NLs - NLs Interface - NLs Interface between AMF and LMF
- Nnef - Nnef Interface - Nnef Interface between AMF and Network Event Function
- Nnrf - Nnrf Interface - Nnrf Interface between AMF and NRF
- Nnwdaf - Nnwdaf Interface - Nnwdaf interface between AMF and NWDAF
- namf_Communications - AMF Communications Service
- namf_EventExposure - AMF Event Exposure Service
- namf_Location - AMF Location Service
- namf_MT - AMF Mobile Terminated Service
- notification_AMF - AMF Notification - AMF Notification Function
- notification_NRF - NRF Notification - NRF Notification Function
- notification_NSSAAF - NSSAAF Notification - NSSAAF Notification Function
- notification_NSSF - NSSF Notification - NSSF Notification Function
- notification_NWDAF - NWDAF Notification - NWDAF Notification Function
- notification_PCF - PCF Notification - PCF Notification Function
- notification_SMF - SMF Notification - SMF Notification Function
- notification_UDM - UDM Notification - UDM Notification Function

Name

absoluteLinkLossExcessiveAlarm - Absolute Link Loss Excessive Alarm

Syntax

--absoluteLinkLossExcessiveAlarm <integer>

Description

This parameter indicates the absolute number of unavailable Links necessary to trigger the Excessive Links Lost Alarm. This parameter applies to N2 and N11 only.

Class

Optional.

Type / Range

Integer in the range of 5 to 100

Default

100

Name

aggrSeverity - Aggregate severity

Syntax

--aggrSeverity <list-item>

Description

Aggregate severity.

Class

Optional.

List

- critical - Critical alarm.
- major - Major alarm.
- minor - Minor alarm.
- none - No alarm.

Default

critical

Name

individualSeverity - Individual severity

Syntax

--individualSeverity <list-item>

Description

Individual severity.

Class

Optional.

List

- critical - Critical alarm.
- major - Major alarm.
- minor - Minor alarm.
- none - No alarm.

Default

major

Name

percentLinkLossAlarm - Percentage of Link Loss Alarm

Syntax

--percentLinkLossAlarm <integer>

Description

This parameter specifies the percentage of unavailable links at which to raise a critical interface alarm. This parameter applies to N2 and N11 only.

Class

Optional.

Type / Range

Integer in the range of 5 to 100 in units of %

Default

20

3.72 cmm amfLinkQueryByGnb

5G Link query by gnb. Syntax, description, parameters, and roles for cmm amfLinkQueryByGnb command.

Syntax

Description

5G Link query by gNB ID. When multiple TNLAs exist for a gNB, one is designated the primary TNLA for the purposes of performing non-UE-associated signaling procedures. amfLinkQueryByGnb prints information for the primary gNB TNLA. Use ngRanTnlaQuery for listing gNB information for each TNLA of a gNB.

Parameters

Name

mcc - Mobile Country Code

Syntax

--mcc <digits>

Description

3-digit number used to represent the Mobile Country Code

Class

Required key.

Type / Range

Digit string of length 0 or 3

Name

mnc - Mobile Network Code

Syntax

--mnc <digits>

Description

Digits used to represent Mobile Network Code.

Class

Required key.

Type / Range

Digit string of length 0 or 2 to 3

Name

macroGnbId - Macro gNB ID

Syntax

--macroGnbId <integer>

Description

Macro gNB ID

Class

Required key.

Type / Range

Integer in the range of 0 to 4,294,967,295

Name

alarmState - Alarm state

Syntax

--alarmState <list-item>

Description

Alarm state.

Class

Read only.

List

- critical - Critical alarm.
- major - Major alarm.
- minor - Minor alarm.
- none - No alarm.
- unknown - Unknown.

Name

amfLinkAdminState - 5G link admin state

Syntax

--amfLinkAdminState <list-item>

Description

Link admin state.

Class

Read only.

List

- blocked - Blocked State - only used for SBI_Server link types
- locked - Locked State - only used for SBI_Client, N2 and N26 links types
- unlocked - Unlocked State

Name

amfLinkType - 5G Link type

Syntax

--amfLinkType <list-item>

Description

5G Link type.

Class

Read only.

List

- N2 - N2 link - N2 link between AMF and gNB
- N26 - N26 link - N26 link between AMF and MME
- SBI_Client - 5G Client SBI - 5G Client Service Based link
- SBI_Server - 5G Server SBI - 5G Server Service Based link

Name

linkIdentifier - Link identifier

Syntax

--linkIdentifier <string>

Description

Link information.

Class

Read only.

Type / Range

Digit string of length 0 or 1 to 255

Name

linkIndex - Link index

Syntax

--linkIndex <integer>

Description

Link index.

Class

Read only.

Type / Range

Integer in the range of 0 to 4,294,967,295

Name

linkOperationState - Link operation state

Syntax

--linkOperationState <list-item>

Description

Link operation state

Class

Read only.

List

- disabled - Disabled state of the link.
- enabled - Enable state of the link.
- unknown - Unknown state of the link. this can not be used during query.

Name

localIp1 - Local IP1

Syntax

--localIp1 <string>

Description

Local IP1.

Class

Read only.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

localIp2 - Local IP2

Syntax

--localIp2 <string>

Description

Local IP2.

Class

Read only.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

localPort1 - Local Port 1

Syntax

--localPort1 <integer>

Description

Local Port associated with the local IP address 1

Class

Read only.

Type / Range

Integer in the range of 0 to 65,534

Name

localPort2 - Local Port 2

Syntax

--localPort2 <integer>

Description

Local Port associated with the local IP address 2

Class

Read only.

Type / Range

Integer in the range of 0 to 65,534

Name

poolId - poolId

Syntax

--poolId <integer>

Description

IPDS Pool ID - ID will only be 0 for non Multi-IPDS instantiations.

Class

Read only.

Type / Range

Integer in the range of 0 to 31

Name

remotep1 - Remote IP1

Syntax

--remoteIp1 <string>

Description

Remote IP1.

Class

Read only.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

remotep2 - Remote IP2

Syntax

--remoteIp2 <string>

Description

Remote IP2.

Class

Read only.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

remotePort1 - Remote Port 1

Syntax

--remotePort1 <integer>

Description

Remote Port associated with the remote IP address 1

Class

Read only.

Type / Range

Integer in the range of 0 to 65,534

Name

remotePort2 - Remote Port 2

Syntax

--remotePort2 <integer>

Description

Remote Port associated with the remote IP address 2

Class

Read only.

Type / Range

Integer in the range of 0 to 65,534

Roles**Show**

sysadmin, manage, monitor

3.73 cmm amfLinkQueryByN3iwf

5G Link query by n3iwf. Syntax, description, parameters, and roles for cmm amfLinkQueryByN3iwf command.

Syntax

Description

5G Link query by N3IWF ID. When multiple TNLAs exist for a N3IWF, one is designated the primary TNLA for the purposes of performing non-UE-associated signaling procedures. amfLinkQueryByN3iwf prints information for the primary N3IWF TNLA. Use ngRanTnlaQuery for listing n3iwf information for each TNLA of a N3IWF.

Parameters

Name

mcc - Mobile Country Code

Syntax

--mcc <digits>

Description

3-digit number used to represent the Mobile Country Code

Class

Required key.

Type / Range

Digit string of length 0 or 3

Name

mnc - Mobile Network Code

Syntax

--mnc <digits>

Description

Digits used to represent Mobile Network Code.

Class

Required key.

Type / Range

Digit string of length 0 or 2 to 3

Name

n3iwfId - N3IWF ID

Syntax

--n3iwfId <integer>

Description

N3IWF ID

Class

Required key.

Type / Range

Integer in the range of 0 to 4,294,967,295

Name

alarmState - Alarm state

Syntax

--alarmState <list-item>

Description

Alarm state

Class

Read only.

List

- critical - Critical alarm.
- major - Major alarm.
- minor - Minor alarm.
- none - No alarm.
- unknown - Unknown.

Name

amfLinkAdminState - 5G link admin state

Syntax

--amfLinkAdminState <list-item>

Description

Link admin state.

Class

Read only.

List

- blocked - Blocked State - only used for SBI_Server link types
- locked - Locked State - only used for SBI_Client, N2 and N26 links types
- unlocked - Unlocked State

Name

amfLinkType - 5G Link type

Syntax

--amfLinkType <list-item>

Description

5G Link type.

Class

Read only.

List

- N2 - N2 link - N2 link between AMF and gNB
- N26 - N26 link - N26 link between AMF and MME
- SBI_Client - 5G Client SBI - 5G Client Service Based link
- SBI_Server - 5G Server SBI - 5G Server Service Based link

Name

linkIdentifier - Link identifier

Syntax

--linkIdentifier <string>

Description

Link information

Class

Read only.

Type / Range

Digit string of length 0 or 1 to 255

Name

linkIndex - Link index

Syntax

--linkIndex <integer>

Description

Link index.

Class

Read only.

Type / Range

Integer in the range of 0 to 4,294,967,295

Name

linkOperationState - Link operation state

Syntax

--linkOperationState <list-item>

Description

Link operation state

Class

Read only.

List

- disabled - Disabled state of the link.
- enabled - Enable state of the link.
- unknown - Unknown state of the link. this can not be used during query.

Name

localIp1 - Local IP1

Syntax

--localIp1 <string>

Description

Local IP1.

Class

Read only.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

localIp2 - Local IP2

Syntax

--localIp2 <string>

Description

Local IP2

Class

Read only.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

localPort1 - Local Port 1

Syntax

--localPort1 <integer>

Description

Local Port associated with the local IP address 1

Class

Read only.

Type / Range

Integer in the range of 0 to 65,534

Name

localPort2 - Local Port 2

Syntax

--localPort2 <integer>

Description

Local Port associated with the local IP address 2

Class

Read only.

Type / Range

Integer in the range of 0 to 65,534

Name

poolId - poolId

Syntax

--poolId <integer>

Description

IPDS Pool ID - ID will only be 0 for non Multi-IPDS instantiations.

Class

Read only.

Type / Range

Integer in the range of 0 to 31

Name

remotep1 - Remote IP1

Syntax

--remoteIp1 <string>

Description

Remote IP1

Class

Read only.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

remotep2 - Remote IP2

Syntax

--remoteIp2 <string>

Description

Remote IP2

Class

Read only.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

remotePort1 - Remote Port 1

Syntax

--remotePort1 <integer>

Description

Remote Port associated with the remote IP address 1

Class

Read only.

Type / Range

Integer in the range of 0 to 65,534

Name

remotePort2 - Remote Port 2

Syntax

--remotePort2 <integer>

Description

Remote Port associated with the remote IP address 2

Class

Read only.

Type / Range

Integer in the range of 0 to 65,534

Roles**Show**

sysadmin, manage, monitor

3.74 cmm amfLinkQueryDetail

AMF Signalling Link Query Detail. Syntax, description, parameters, and roles for cmm amfLinkQueryDetail command.

Syntax

Description

AMF Signalling Link Show query link detail

Parameters

Name

amfLinkType - AMF Link Type

Syntax

--amfLinkType <list-item>

Description

AMF link type

Class

Required key.

List

- N2 - N2 link - N2 link between AMF and gNB
- N26 - N26 link - N26 link between AMF and MME
- SBI_Client - 5G Client SBI - 5G Client Service Based link
- SBI_Server - 5G Server SBI - 5G Server Service Based link

Name

linkIndex - Link Index

Syntax

--linkIndex <integer>

Description

Link index

Class

Required key.

Type / Range

Integer in the range of 0 to 4,294,967,295

Name

linkDetailCode - Link Detail Code

Syntax

--linkDetailCode <integer>

Description

Link detail code. Code 1 has been allocated

Class

Required key.

Type / Range

Integer in the range of 0 to 65,535

Name

detailOutput - Link details

Syntax

--detailOutput <string>

Description

Link details.

Class

Read only.

Type / Range

Digit string of length

Roles**Show**

sysadmin, manage, monitor

3.75 cmm amfLinkQueryPath

Query sctp Path. Syntax, description, parameters, and roles for cmm amfLinkQueryPath command.

Syntax**Description**

Query path information for SCTP links in 5G.

Parameters**Name**

amfIntfType - Link interface type

Syntax

--amfIntfType <list-item>

Description

Link interface type. Only SCTP interfaces are supported. Default to N2

Class

Required key.

List

- N2 - N2 Interface - List of (N2, ...)

Name

linkIndex - Link index

Syntax

--linkIndex <integer>

Description

Link index to read

Class

Required key.

Type / Range

Integer in the range of 0 to 4,294,967,295

Name

path1LocalIp - Path 1 Local IP

Syntax

--path1LocalIp <string>

Description

Path 1 Local IP

Class

Read only.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

path1LocalPort - Path 1 Local Port

Syntax

--path1LocalPort <integer>

Description

Path 1 Local Port

Class

Read only.

Type / Range

Integer in the range of 0 to 65,535

Name

path1Remotelp - Path 1 Remote IP

Syntax

--path1RemoteIp <string>

Description

Path 1 Remote IP

Class

Read only.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

path1RemotePort - Path 1 Remote Port

Syntax

--path1RemotePort <integer>

Description

Path 1 Remote Port

Class

Read only.

Type / Range

Integer in the range of 0 to 65,535

Name

path1Status - path 1 status

Syntax

--path1Status <list-item>

Description

Path 1 status

Class

Read only.

List

- not-used - Path status of not used.
- reachable - Path status of reachable.
- unknown - Path status of unknown.
- unreachable - Path status of unreachable.

Name

path2LocalIp - Path 2 Local IP

Syntax

--path2LocalIp <string>

Description

Path 2 Local IP

Class

Read only.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

path2LocalPort - Path 2 Local Port

Syntax

--path2LocalPort <integer>

Description

Path 2 Local Port

Class

Read only.

Type / Range

Integer in the range of 0 to 65,535

Name

path2RemoteIp - Path 2 Remote IP

Syntax

--path2RemoteIp <string>

Description

Path 2 Remote IP

Class

Read only.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

path2RemotePort - Path 2 Remote Port

Syntax

--path2RemotePort <integer>

Description

Path 2 Remote Port

Class

Read only.

Type / Range

Integer in the range of 0 to 65,535

Name

path2Status - Path 2 status

Syntax

--path2Status <list-item>

Description

Path 2 status

Class

Read only.

List

- not-used - Path status of not used.
- reachable - Path status of reachable.
- unknown - Path status of unknown.
- unreachable - Path status of unreachable.

Roles**Show**

sysadmin, manage, monitor

3.76 cmm amfMcsPagingPriProfile

AMF MCS Paging Priority Profile. Syntax, description, parameters, and roles for cmm amfMcsPagingPriProfile command.

Syntax**Description**

This command is used to administer Paging Priority Profiles for Mission Critical Services (MCS/MCX). The profile includes parameters for defining e.g. the ARP Priority level and paging priority levels.

Parameters**Name**

amfMcsPagingPriProfileListName - AMF MCS Paging Priority Profile List Name

Syntax

--amfMcsPagingPriProfileListName <string>

Description

Name that identifies the AMF MCS Paging Priority Profile List.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

arpLevel - Allocation Retention Priority Level

Syntax

--arpLevel <integer>

Description

Allocation Retention Priority (ARP) Priority Level related to MCS specific paging priority profile on AMF. Defines the relative importance of a resource request. Values are ordered in decreasing order of priority, i.e., with 1 as the highest priority and 15 as the lowest priority.

Class

Required key.

Type / Range

Integer in the range of 1 to 15

Name

includePagingPriority - Include Paging Priority

Syntax

--includePagingPriority <list-item>

Description

Defines whether the AMF includes the provisioned Paging Priority on the NGAP Paging message (when set to true) or suppresses it (when set to false).

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

pagingPriorityLevel - Paging Priority Level

Syntax

--pagingPriorityLevel <list-item>

Description

The Priority Level to be used for the paging.

Class

Optional.

List

- PrioLevel0 - Priority level 0 - Priority level 0. No paging priority is set.
- PrioLevel1 - Priority level 1 - Priority level 1. Highest Paging priority.
- PrioLevel2 - Priority level 2 - Priority level 2.
- PrioLevel3 - Priority level 3 - Priority level 3.
- PrioLevel4 - Priority level 4 - Priority level 4.
- PrioLevel5 - Priority level 5 - Priority level 5.
- PrioLevel6 - Priority level 6 - Priority level 6.
- PrioLevel7 - Priority level 7 - Priority level 7.
- PrioLevel8 - Priority level 8 - Priority level 8. Lowest Paging Priority.

Default

PrioLevel0

3.77 cmm amfMcsPagingPriProfileList

AMF MCS Paging Priority Profile List. Syntax, description, parameters, and roles for cmm amfMcsPagingPriProfileList command.

Syntax

Description

This command is used to administer a Paging Priority Profile List for Mission Critical Services (MCS/MCX).

Parameters

Name

name - AMF MCS Paging Priority Profile Name

Syntax

--name <digits>

Description

Defines the paging priority profile name for Mission Critical Services (MCS/MSX).

Class

Required key.

Type / Range

Digit string of length 1 to 1 with the allowed pattern of [1-8]*

3.78 cmm amfMobilityTimers

AMF Mobility Timers. Syntax, description, parameters, and roles for cmm amfMobilityTimers command.

Syntax

Description

Define AMF Mobility Timers

Parameters

Name

amfTimerName - Timer Name

Syntax

--amfTimerName <list-item>

Description

Name of timer.

Class

Required key.

List

- amfInitDeregistration - AMF initiated de-registration timer - Timer starts when 'Mobile reachable' timer expires and stops when a NAS message is received. UE is implicitly de-registered when timer expires.
- connGutiReallocation - GUTI Reallocation timer - AMF re-allocates a new GUTI, while in CM Connected mode, on timer expiry. AMF restarts the timer when running if AMF reallocates a new GUTI during a NAS procedure (e.g. Service Request in connected mode).
- hoMobilityRegistrationUpdateWait - HO Mobility Registration Update Wait - Configure how long to wait for Mobility Registration Update after Xn HO or N2 HO
- mobilityReachable - Mobility Reachable timer beyond T3512 - Minutes beyond T3512 for taking actions when a UE does not send Periodic Mobility Registration Update. T3512 timer starts when UE enters idle state and stops when a NAS message is received from the UE.
- n14RmIsmfVsmfAtSrcAmf - N14 remove I-SMF or V-SMF at source AMF - Used in N14 interactions to remove SM context from old I-SMF or old V-SMF at the source AMF after UE has moved to a new AMF and new AMF has indicated I-SMF or V-SMF is going to be changed or removed. This timer supersedes timer n14RmUeDataAtSrcAmf, when I-SMF/ V-SMF is to be removed or changed.
- n14RmUeDataAtSrcAmf - N14 remove UE data at source AMF - Used in N14 interactions to remove UE data at the source AMF after UE mobility with AMF relocation.
- n26RmUeDataAtSrcAmf - N26 remove UE data at source AMF - Used in N26 interactions to remove UE data at the source AMF after UE mobility towards MME
- n2HoRanStatusN1N2Transfer - N2 Handover RAN Status N1N2 Transfer - Defines the time the source AMF waits for Namf_N1N2MessageTransfer Response from the target AMF during inter AMF N2 Handover procedure, when the source AMF has received NGAP Uplink RAN Status Transfer from the source NG-RAN and forwards the RAN status to the target AMF.
- purgeTimer - 5G Purge timer - Purge timer starts after the AMF initiated de-registration timer fires. AMF purges UE context data and deletes AMF association with the UDM for this UE after timer expiry.

- rcisAmfPurgeTimer - RCIS AMF Purge Timer - RCIS Purge Timer for AMF UEs
- registrationStatusUpdate - Registration Status Update timer - Supervises UE Context Transfer result during UE inter-AMF Registration or UE Registration with AMF re-allocation.
- secondaryRatUsageReportingDelay - Secondary Rat Usage Reporting Delay during Handover - AMF delays forwarding the Secondary RAT Usage report to the SMF during Handover
- smfAggregate - SMF aggregate timer - Time AMF waits for SMF(s) to respond before aggregating a response back to the RAN during Xn HO. AMF doesn't have to wait for the timer expiry if all expected responses are received before the timer expires.
- srvcc5gRemovePdus - 5G-SRVCC Remove PDUs - Defines the timer on the source AMF to trigger removal of all 3GPP access related PDU sessions of the UE after the 5G-SRVCC handover for the voice call component is complete.
- ueCtxMovedToEpsPurgeTimer - 5G Purge Timer for UE Contexts Moved to EPS - Purge timer starts after the UE moves to EPS. AMF purges UE context data that were preserved when UE moved to EPS and deletes AMF association with the UDM for this UE after timer expiry.
- ueSorAck - UE SoR Acknowledge Timer - Time to wait for receiving SoR Acknowledge from the UE.

Name

amfTimerUnit - Timer Unit

Syntax

--amfTimerUnit <list-item>

Description

Unit of measurement

Class

Required on create, not modifiable.

List

- Millisecond - Specify timer unit of 1 millisecond
- Second - Specify timer unit of 1 second
- 2Second - 2 Second - Specify timer unit of 2 seconds
- 30Second - 30 Second - Specify timer unit of 30 seconds.
- Minute - Specify timer unit of 1 minute
- DeciHour - Specify timer unit of 1 decihour (6 minutes).
- 10Minute - 10 Minute - Specify timer unit of 10 minutes
- Hour - Specify timer unit of 1 hour

- 10Hour - 10 Hour - Specify timer unit of 10 hours.

Name

amfTimerValue - Timer value

Syntax

--amfTimerValue <integer>

Description

Numeric value of timer

Class

Required on create.

Type / Range

Integer in the range of 0 to 65,535

The amfTimerValue string is based on the amfTimerName parameter:

Name

amfInitDeregistration - AMF initiated de-registration timer

Syntax

--amfTimerName amfInitDeregistration --amfTimerValue <string> [--
amfTimerUnit Minute]

Description

Timer starts when 'Mobile reachable' timer expires and stops when a NAS message is received. UE is implicitly de-registered when timer expires.

Type / Range

Integer in the range of 0 to 1,500 in units of Minute

Default

240

Name

connGutiReallocation - GUTI Reallocation timer

Syntax

--amfTimerName connGutiReallocation --amfTimerValue <string> [--
amfTimerUnit 10Minute]

Description

AMF re-allocates a new GUTI, while in CM Connected mode, on timer expiry. AMF restarts the timer when running if AMF reallocates a new GUTI during a NAS procedure (e.g. Service Request in connected mode).

Type / Range

Integer in the range of 0 to 1,000 in units of 10Minute

Default

0

Name

hoMobilityRegistrationUpdateWait - HO Mobility Registration Update Wait

Syntax

```
--amfTimerName hoMobilityRegistrationUpdateWait --amfTimerValue  
<string> [ --amfTimerUnit Millisecond ]
```

Description

Configure how long to wait for Mobility Registration Update after Xn HO or N2 HO

Type / Range

Integer in the range of 100 to 10,000 in units of Millisecond

Default

1000

Name

mobilityReachable - Mobility Reachable timer beyond T3512

Syntax

```
--amfTimerName mobilityReachable --amfTimerValue <string> [ --  
amfTimerUnit Minute ]
```

Description

Minutes beyond T3512 for taking actions when a UE does not send Periodic Mobility Registration Update. T3512 timer starts when UE enters idle state and stops when a NAS message is received from the UE.

Type / Range

Integer in the range of 1 to 60 in units of Minute

Default

4

Name

n14RmIsmfVsmfAtSrcAmf - N14 remove I-SMF or V-SMF at source AMF

Syntax

```
--amfTimerName n14RmIsmfVsmfAtSrcAmf --amfTimerValue <string> [ --  
amfTimerUnit Second ]
```

Description

Used in N14 interactions to remove SM context from old I-SMF or old V-SMF at the source AMF after UE has moved to a new AMF and new AMF has indicated I-SMF or V-SMF is going to be changed or removed. This timer supersedes timer n14RmUeDataAtSrcAmf, when I-SMF/V-SMF is to be removed or changed.

Type / Range

Integer in the range of 0 to 10 in units of Second

Default

2

Name

n14RmUeDataAtSrcAmf - N14 remove UE data at source AMF

Syntax

```
--amfTimerName n14RmUeDataAtSrcAmf --amfTimerValue <string> [ --  
amfTimerUnit Millisecond ]
```

Description

Used in N14 interactions to remove UE data at the source AMF after UE mobility with AMF relocation.

Type / Range

Integer in the range of 0 to 5,000 in units of Millisecond

Default

0

Name

n26RmUeDataAtSrcAmf - N26 remove UE data at source AMF

Syntax

```
--amfTimerName n26RmUeDataAtSrcAmf --amfTimerValue <string> [ --  
amfTimerUnit Millisecond ]
```

Description

Used in N26 interactions to remove UE data at the source AMF after UE mobility towards MME

Type / Range

Integer in the range of 0 to 5,000 in units of Millisecond

Default

0

Name

n2HoRanStatusN1N2Transfer - N2 Handover RAN Status N1N2 Transfer

Syntax

```
--amfTimerName n2HoRanStatusN1N2Transfer --amfTimerValue <string>  
[ --amfTimerUnit Millisecond ]
```

Description

Defines the time the source AMF waits for Namf_N1N2MessageTransfer Response from the target AMF during inter AMF N2 Handover procedure, when the source AMF has received NGAP Uplink RAN Status Transfer from the source NG-RAN and forwards the RAN status to the target AMF.

Type / Range

Integer in the range of 100 to 30,000 in units of Millisecond

Default

5000

Name

purgeTimer - 5G Purge timer

Syntax

```
--amfTimerName purgeTimer --amfTimerValue <string> [ --amfTimerUnit  
Hour ]
```

Description

Purge timer starts after the AMF initiated de-registration timer fires. AMF purges UE context data and deletes AMF association with the UDM for this UE after timer expiry.

Type / Range

Integer in the range of 1 to 120 in units of Hour

Default

48

Name

rcisAmfPurgeTimer - RCIS AMF Purge Timer

Syntax

```
--amfTimerName rcisAmfPurgeTimer --amfTimerValue <string> [ --  
amfTimerUnit Hour ]
```

Description

RCIS Purge Timer for AMF UEs

Type / Range

Integer in the range of 1 to 120 in units of Hour

Default

48

Name

registrationStatusUpdate - Registration Status Update timer

Syntax

```
--amfTimerName registrationStatusUpdate --amfTimerValue <string> [ --  
amfTimerUnit Millisecond ]
```

Description

Supervises UE Context Transfer result during UE inter-AMF Registration or UE Registration with AMF re-allocation.

Type / Range

Integer in the range of 10 to 10,000 in units of Millisecond

Default

8000

Name

secondaryRatUsageReportingDelay - Secondary Rat Usage Reporting Delay during Handover

Syntax

```
--amfTimerName secondaryRatUsageReportingDelay --amfTimerValue  
<string> [ --amfTimerUnit Second ]
```

Description

AMF delays forwarding the Secondary RAT Usage report to the SMF during Handover

Type / Range

Integer in the range of 1 to 30 in units of Second

Default

10

Name

smfAggregate - SMF aggregate timer

Syntax

```
--amfTimerName smfAggregate --amfTimerValue <string> [ --amfTimerUnit  
Millisecond ]
```

Description

Time AMF waits for SMF(s) to respond before aggregating a response back to the RAN during Xn HO. AMF doesn't have to wait for the timer expiry if all expected responses are received before the timer expires.

Type / Range

Integer in the range of 100 to 10,000 in units of Millisecond

Default

500

Name

srvcc5gRemovePdu - 5G-SRVCC Remove PDUs

Syntax

```
--amfTimerName srvcc5gRemovePdu --amfTimerValue <string> [ --  
amfTimerUnit Second ]
```

Description

Defines the timer on the source AMF to trigger removal of all 3GPP access related PDU sessions of the UE after the 5G-SRVCC handover for the voice call component is complete.

Type / Range

Integer in the range of 1 to 10 in units of Second

Default

2

Name

ueCtxMovedToEpsPurgeTimer - 5G Purge Timer for UE Contexts Moved to EPS

Syntax

```
--amfTimerName ueCtxMovedToEpsPurgeTimer --amfTimerValue <string>  
[ --amfTimerUnit Hour ]
```

Description

Purge timer starts after the UE moves to EPS. AMF purges UE context data that were preserved when UE moved to EPS and deletes AMF association with the UDM for this UE after timer expiry.

Type / Range

Integer in the range of 0 to 120 in units of Hour

Default

0

Name

ueSorAck - UE SoR Acknowledge Timer

Syntax

```
--amfTimerName ueSorAck --amfTimerValue <string> [ --amfTimerUnit  
Millisecond ]
```

Description

Time to wait for receiving SoR Acknowledge from the UE.

Type / Range

Integer in the range of 100 to 10,000 in units of Millisecond

Default

5000

3.79 cmm amfMpsLevels

AMF MPS Levels. Syntax, description, parameters, and roles for cmm amfMpsLevels command.

Syntax

Description

Defines MPS priority (sub)levels AMF globally. 5 MPS sublevels with specific SBI Message Priority (SMP) value ranges are defined. Applies when global parameter Multilevel MPS is set to true. Default MPS levels are as follows: Level (SMP values): 0 (0..0), 1 (1..4), 2 (5..10), 3 (11..16), 4 (17..23). When MPS level provisioning is modified, all value limits are required to be provided. The SMP value ranges are not allowed to overlap, and all MPS SMP ranges must have higher priority (i.e. lower SMP value) than the 'default' SMP value 24: 0 <= MPS Level 0 SBI Message Priority Max < MPS Level 1 SBI Message Priority Max < MPS Level 2 SBI Message Priority Max < MPS Level 3 SBI Message Priority Max < MPS Level 4 SBI Message Priority Max < 24.

Parameters

Name

mpsLevel0SmpMax - MPS Level 0 SBI Message Priority Max

Syntax

--mpsLevel0SmpMax <integer>

Description

Defines the SBI Message Priority (SMP) max value (lowest priority, highest numerical value) that still is included in the MPS level 0. MPS Level 0 consists of SMP values spanning between SMP values 0 and (MPS Level 0 SBI Message Priority Max).

Class

Optional.

Type / Range

Integer in the range of 0 to 19

Default

0

Name

mpsLevel1SmpMax - MPS Level 1 SBI Message Priority Max

Syntax

--mpsLevel1SmpMax <integer>

Description

Defines the SBI Message Priority (SMP) max value (lowest priority, highest numerical value) that still is included in the MPS level 1. MPS Level 1 consists of SMP values spanning between

SMP values (MPS Level 0 SBI Message Priority Max + 1) and (MPS Level 1 SBI Message Priority Max).

Class

Optional.

Type / Range

Integer in the range of 1 to 20

Default

4

Name

mpsLevel2SmpMax - MPS Level 2 SBI Message Priority Max

Syntax

--mpsLevel2SmpMax <integer>

Description

Defines the SBI Message Priority (SMP) max value (lowest priority, highest numerical value) that still is included in the MPS level 2. MPS Level 2 consists of SMP values spanning between SMP values (MPS Level 1 SBI Message Priority Max + 1) and (MPS Level 2 SBI Message Priority Max).

Class

Optional.

Type / Range

Integer in the range of 2 to 21

Default

10

Name

mpsLevel3SmpMax - MPS Level 3 SBI Message Priority Max

Syntax

--mpsLevel3SmpMax <integer>

Description

Defines the SBI Message Priority (SMP) max value (lowest priority, highest numerical value) that still is included in the MPS level 3. MPS Level 3 consists of SMP values spanning between SMP values (MPS Level 2 SBI Message Priority Max + 1) and (MPS Level 3 SBI Message Priority Max).

Class

Optional.

Type / Range

Integer in the range of 3 to 22

Default

16

Name

mpsLevel4SmpMax - MPS SBI Message Priority Level 4 Max

Syntax`--mpsLevel4SmpMax <integer>`**Description**

Defines the SBI Message Priority (SMP) max value (lowest priority, highest numerical value) that still is included in the MPS level 4. MPS Level 4 consists of SMP values spanning between SMP values (MPS Level 3 SBI Message Priority Max + 1) and (MPS Level 4 SBI Message Priority Max).

Class

Optional.

Type / Range

Integer in the range of 4 to 23

Default

23

3.80 cmm amfMultiLink

AMF Signalling Multilink List. Syntax, description, parameters, and roles for `cmm amfMultiLink` command.

Syntax**Description**

AMF signalling multiple link show

Parameters**Name**

amfIntfType - AMF Interface Type

Syntax

--amfIntfType <list-item>

Description

AMF interface type. Default to N8

Class

Required key.

List

- N11 - N11 Interface - N11 Interface between AMF and SMF
- N12 - N12 Interface - N12 Interface between AMF and AUSF
- N14 - N14 Interface - N14 Interface between AMF and AMF
- N15 - N15 Interface - N15 Interface between AMF and PCF
- N17 - N17 Interface - N17 Interface between AMF and 5G EIR
- N18 - N18 interface between AMF and UDSF
- N2 - N2 Interface - N2 Interface between AMF and 5gNB
- N20 - N20 Interface - N20 Interface between AMF and SMSF
- N22 - N22 Interface - N22 Interface between AMF and NSSF
- N26 - N26 Interface - N26 Interface between AMF and MME
- N41 - N41 interface - N41 interface between AMF and CHF
- N58 - N58 Interface - N58 interface between AMF and NSSAAF
- N8 - N8 Interface - N8 Interface between AMF and UDM
- NLg - NLg Interface - NLg Interface between AMF and GMLC
- NLs - NLs Interface - NLs Interface between AMF and LMF
- Nnef - Nnef Interface - Nnef Interface between AMF and Network Event Function
- Nnrf - Nnrf Interface - Nnrf Interface between AMF and NRF
- Nnwdaf - Nnwdaf Interface - Nnwdaf interface between AMF and NWDAF
- namf_Communications - AMF Communications Service
- namf_EventExposure - AMF Event Exposure Service
- namf_Location - AMF Location Service
- namf_MT - AMF Mobile Terminated Service
- notification_AMF - AMF Notification - AMF Notification Function
- notification_NRF - NRF Notification - NRF Notification Function

- notification_NSSAAF - NSSAAF Notification - NSSAAF Notification Function
- notification_NSSF - NSSF Notification - NSSF Notification Function
- notification_NWDAF - NWDAF Notification - NWDAF Notification Function
- notification_PCF - PCF Notification - PCF Notification Function
- notification_SMF - SMF Notification - SMF Notification Function
- notification_UDM - UDM Notification - UDM Notification Function

Default

N8

Name

alarmState - Alarm State

Syntax

--alarmState <list-item>

Description

Alarm state

Class

Read only.

List

- critical - Critical alarm.
- major - Major alarm.
- minor - Minor alarm.
- none - No alarm.
- unknown - Unknown.

Name

amfLinkAdminState - AMF Admin State

Syntax

--amfLinkAdminState <list-item>

Description

AMF admin state

Class

Optional.

List

- blocked - Blocked State - only used for SBI_Server link types
- locked - Locked State - only used for SBI_Client, N2 and N26 links types

- unlocked - Unlocked State

Name

amfLinkType - AMF Link Type

Syntax

--amfLinkType <list-item>

Description

AMF link type

Class

Read only.

List

- N2 - N2 link - N2 link between AMF and gNB
- N26 - N26 link - N26 link between AMF and MME
- SBI_Client - 5G Client SBI - 5G Client Service Based link
- SBI_Server - 5G Server SBI - 5G Server Service Based link

Name

endLinkIndex - End link index

Syntax

--endLinkIndex <integer>

Description

End link index from the read command.

Class

Optional.

Type / Range

Integer in the range of 0 to 4,294,967,295

Name

endPointName - AMF Local End Point Interface Name

Syntax

--endPointName <string>

Description

AMF local end point interface name

Class

Read only.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

linkAlarm - Link Alarmed

Syntax

--linkAlarm <list-item>

Description

If true query returns only alarmed links else return all links

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

linkIdentifier - Link identifier

Syntax

--linkIdentifier <string>

Description

Link information.

Class

Read only.

Type / Range

Digit string of length 0 or 1 to 255

Name

linkIndex - Link Index

Syntax

--linkIndex <integer>

Description

Link index

Class

Read only.

Type / Range

Integer in the range of 0 to 4,294,967,295

Name

linkOperationState - Link operation state

Syntax

```
--linkOperationState <list-item>
```

Description

Link operation state.

Class

Optional.

List

- disabled - Disabled state of the link.
- enabled - Enabled state of the link.
- suspended - Suspended state of the link.
- unknown - Unknown state of the link. this can not be used during query.

Name

localIp1 - Local IP1

Syntax

```
--localIp1 <string>
```

Description

Local IP1.

Class

Read only.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

localIp2 - Local IP2

Syntax

```
--localIp2 <string>
```

Description

Local IP2.

Class

Read only.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

localPort1 - Local Port 1

Syntax

--localPort1 <integer>

Description

Local Port associated with the local IP address 1

Class

Read only.

Type / Range

Integer in the range of 0 to 65,534

Name

localPort2 - Local Port 2

Syntax

--localPort2 <integer>

Description

Local Port associated with the local IP address 2

Class

Read only.

Type / Range

Integer in the range of 0 to 65,534

Name

maxResponseSize - Max record count

Syntax

--maxResponseSize <integer>

Description

Max number of records to be returned.

Class

Optional.

Type / Range

Integer in the range of 1 to 100

Name

poolId - poolId

Syntax

--poolId <integer>

Description

IPDS Pool ID - If chosen only the links on the specified IPDS will be output. The IPDS Pool ID will only be 0 for non Multi-IPDS instantiations. The default is ALL IPDS pools

Class

Read only.

Type / Range

Integer in the range of 0 to 31

Default

31

Name

previousIndex - Previous index

Syntax

--previousIndex <integer>

Description

Previous index when specified next available index will be returned.

Class

Optional.

Type / Range

Integer in the range of -1 or 0 to 2,147,483,647

Name

queryRmtIp - Query Remote IP address

Syntax

--queryRmtIp <string>

Description

IP address used to query for a link whose remote IP address matches the specified IP.

Class

Optional.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

remotelp1 - Remote IP1

Syntax

--remoteIp1 <string>

Description

Remote IP1.

Class

Read only.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

remoteIp2 - Remote IP2

Syntax

--remoteIp2 <string>

Description

Remote IP2.

Class

Read only.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

remotePort1 - Remote Port 1

Syntax

--remotePort1 <integer>

Description

Remote Port associated with the remote IP address 1

Class

Read only.

Type / Range

Integer in the range of 0 to 65,534

Name

remotePort2 - Remote Port 2

Syntax

--remotePort2 <integer>

Description

Remote Port associated with the remote IP address 2

Class

Read only.

Type / Range

Integer in the range of 0 to 65,534

Name

startLinkIndex - Start Link Index

Syntax

--startLinkIndex <integer>

Description

Start link index

Class

Optional.

Type / Range

Integer in the range of 0 to 4,294,967,295

Roles**List**

sysadmin, manage, monitor

3.81 cmm amfMultipleHomePlmn

Multiple Home Plmn. Syntax, description, parameters, and roles for cmm amfMultipleHomePlmn command.

Syntax**Description**

This command is used to configure an existing network as an multiple home plmn network and includes parameters for defining the serving and multiple home network names

Parameters**Name**

servedPlmnName - Serving Mobile Network

Syntax

--servedPlmnName <string>

Description

Name that identifies serving network.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Name

multipleHomePlmnName - Multiple Home Plmn Network name

Syntax

--multipleHomePlmnName <string>

Description

Name that identifies equivalent network.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

3.82 cmm amfMultiTacOperation

Tracking Area ID. Syntax, description, parameters, and roles for cmm amfMultiTacOperation command.

Syntax**Description**

Provision multiple TACs for a serving PLMN. A serving PLMN may be AMF home PLMN or shared PLMN. Maximum number of TACs supported in one operation shall be 100.

Parameters**Name**

plmnName - Serving PLMN Name

Syntax

--plmnName <string>

Description

The serving PLMN name may be the name of the AMF home PLMN or shared PLMN.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

maxTac - Max tracking area code

Syntax

--maxTac <integer>

Description

Maximum TAC value in defining set of TACs to create or update, used with mintac.

Class

Required on create.

Type / Range

Integer in the range of 0 to 16777215

Name

minTac - Min tracking area code

Syntax

--minTac <integer>

Description

Minimum TAC value in defining set of TACs to update or create, used with maxtac.

Class

Required on create.

Type / Range

Integer in the range of 0 to 16777215

Name

allTac - All Tracking Area

Syntax

--allTac <list-item>

Description

Define set of TACs to update to be all TACs in a given mobile network.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

amfRelativeCapacity - AMF Relative Capacity

Syntax

--amfRelativeCapacity <integer>

Description

Configures AMF relative capacity for the tracking area

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

5

Name

emergencyFallback - Emergency Fallback

Syntax

--emergencyFallback <list-item>

Description

Enables Emergency Fallback support in the tracking area. AMF indicates to the UE that emergency fallback is supported by the network if the emergency fallback is enabled in the tracking areas sent to the UE in the tracking area list. By default, the emergency fallback is not supported.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

emergencyServiceTai - Emergency Service TAI

Syntax

--emergencyServiceTai <list-item>

Description

This command is used to enable/disable Emergency service in the tracking area. AMF indicates to the UE that emergency service is supported by the network if the emergency service is enabled in the current tracking area and all other tracking areas sent to the UE in the tracking area neighbor list. By default, the emergency service is disabled.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

imsVopsSupport - IMS VoPS Support

Syntax

--imsVopsSupport <list-item>

Description

This parameter indicates whether IMS VoPS is supported on the Tracking Areas of the AMF. Voice over PS can be supported either via Voice over New Radio connected to 5G Core, or via VoLTE connected to EPS with the NG-RAN supporting handover or redirection to EPS for the UE at QoS Flow establishment for IMS voice.

Class

Optional.

List

- amfVopsNotSupported - AMF VoPS Not Supported - Voice over PS sessions is not supported on this Tracking Area of the AMF.
- amfVopsSupportedOverNrConnectedTo5gc - AMF VoPS Support Over New Radio Connected to 5GC - Voice over PS sessions is supported on this Tracking Area of the AMF by Voice over New Radio connected to 5G Core. Note: this value is only effective when gParm voNR is enabled.
- amfVopsSupportedVoNrVolteHoRe - AMF VoPS Supported VoNR and VoLTE Handover and Redirect - Voice over PS sessions on this Tracking Area of the AMF is supported by - Voice over New Radio connected to 5G Core, -Voice over LTE connected to EPS, and the NG-RAN supports both handover and redirection to EPS at QoS Flow establishment for IMS voice. Note: this value is only effective when gParms voiceEpsFallback and VoNR are enabled.
- amfVopsSupportedVolteHo - AMF VoPS Supported VoLTE Handover - Voice over PS sessions is supported on this Tracking Area of the AMF by Voice over LTE connected to EPS, and the NG-RAN supports handover to EPS at QoS Flow establishment for IMS voice. Note: this value is only effective when gParm voiceEpsFallback is enabled.
- amfVopsSupportedVolteHoRe - AMF VoPS Supported VoLTE Handover and Redirect - Voice over PS sessions on this Tracking Area of the AMF is supported by Voice over LTE connected to EPS, and the NG-RAN supports both handover and redirection to EPS at

QoS Flow establishment for IMS voice. Note: this value is only effective when gParm voiceEpsFallback is enabled.

- amfVopsSupportedVolteRedirect - AMF VoPS Supported VoLTE Redirect - Voice over PS sessions on this Tracking Area of the AMF is supported by Voice over LTE connected to EPS, and the NG-RAN supports redirection to EPS at QoS Flow establishment for IMS voice. Note: this value is only effective when gParm voiceEpsFallback is enabled.
- amfVopsSupportedVonnrVolteHo - AMF VoPS Supported VoNR and VoLTE Handover - Voice over PS sessions on this Tracking Area of the AMF is supported by -Voice over New Radio connected to 5G Core, -Voice over LTE connected to EPS, and the NG-RAN supports handover to EPS at QoS Flow establishment for IMS voice. Note: this value is only effective when gParms voiceEpsFallback and VoNR are enabled.
- amfVopsSupportedVonnrVolteRe - AMF VoPS Supported VoNR and VoLTE Redirect - Voice over PS sessions on this Tracking Area of the AMF is supported by -Voice over New Radio connected to 5G Core, -Voice over LTE connected to EPS, and the NG-RAN supports redirection to EPS at QoS Flow establishment for IMS voice. Note: this value is only effective when gParms voiceEpsFallback and VoNR are enabled.

Default

amfVopsNotSupported

Name

overwriteExistingTaiOnCreate - Overwrite Existing TAIs on Create

Syntax

--overwriteExistingTaiOnCreate <list-item>

Description

When this parameter is set to false (default value) and the given TAC range overlaps with already existing TAIs, the existing TAIs parameter values will be retained (i.e. create command will not overwrite parameter values of an existing amfTai). When this parameter is set to true, and the given TAC range overlaps with already created TAIs, the existing TAIs parameter values will be overwritten. This parameter is not applicable for the amfMultiTacOperation modify operation

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

snssaiListName - SNSSAI List Name

Syntax

```
--snssaiListName <string>
```

Description

This parameter is a pointer to a list of S-NSSAI. The S_NSSAI in the list are supported in all the TACs specified by the amfMultiTacOperation command. If a TAC is not provisioned with SNSSAI list then it is assumed that all SNSSAI are supported in the TAC.

Restrictions

The S_NSSAI lists only apply to NRF and SMF

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

timeZoneName - Time Zone Name

Syntax

```
--timeZoneName <list-item>
```

Description

Provision time zone of the TACs

Class

Optional.

List

- Africa/Abidjan - Timezone for africa/abidjan UTC offset of +00:00.
- Africa/Accra - Timezone for africa/accra UTC offset of +00:00.
- Africa/Addis_Ababa - Timezone for africa/addis_ababa UTC offset of +03:00.
- Africa/Algiers - Timezone for africa/algiers UTC offset of +01:00.
- Africa/Asmara - Timezone for africa/asmara UTC offset of +03:00.
- Africa/Asmera - Timezone for africa/asmera UTC offset of +03:00.
- Africa/Bamako - Timezone for africa/bamako UTC offset of +00:00.
- Africa/Bangui - Timezone for africa/bangui UTC offset of +01:00.
- Africa/Banjul - Timezone for africa/banjul UTC offset of +00:00.
- Africa/Bissau - Timezone for africa/bissau UTC offset of +00:00.
- Africa/Blantyre - Timezone for africa/blantyre UTC offset of +02:00.

- Africa/Brazzaville - Timezone for africa/brazzaville UTC offset of +01:00.
- Africa/Bujumbura - Timezone for africa/bujumbura UTC offset of +02:00.
- Africa/Cairo - Timezone for africa/cairo UTC offset of +02:00.
- Africa/Casablanca - Timezone for africa/casablanca UTC offset of +00:00.
- Africa/Ceuta - Timezone for africa/ceuta UTC offset of +01:00.
- Africa/Conakry - Timezone for africa/conakry UTC offset of +00:00.
- Africa/Dakar - Timezone for africa/dakar UTC offset of +00:00.
- Africa/Dar_es_Salaam - Timezone for africa/dar_es_salaam UTC offset of +03:00.
- Africa/Djibouti - Timezone for africa/djibouti UTC offset of +03:00.
- Africa/Douala - Timezone for africa/douala UTC offset of +01:00.
- Africa/El_Aaiun - Timezone for africa/el_aaiun UTC offset of +00:00.
- Africa/Freetown - Timezone for africa/freetown UTC offset of +00:00.
- Africa/Gaborone - Timezone for africa/gaborone UTC offset of +02:00.
- Africa/Harare - Timezone for africa/harare UTC offset of +02:00.
- Africa/Johannesburg - Timezone for africa/johannesburg UTC offset of +02:00.
- Africa/Juba - Timezone for africa/juba UTC offset of +03:00.
- Africa/Kampala - Timezone for africa/kampala UTC offset of +03:00.
- Africa/Khartoum - Timezone for africa/khartoum UTC offset of +03:00.
- Africa/Kigali - Timezone for africa/kigali UTC offset of +02:00.
- Africa/Kinshasa - Timezone for africa/kinshasa UTC offset of +01:00.
- Africa/Lagos - Timezone for africa/lagos UTC offset of +01:00.
- Africa/Libreville - Timezone for africa/libreville UTC offset of +01:00.
- Africa/Lome - Timezone for africa/lome UTC offset of +00:00.
- Africa/Luanda - Timezone for africa/luanda UTC offset of +01:00.
- Africa/Lubumbashi - Timezone for africa/lubumbashi UTC offset of +02:00.
- Africa/Lusaka - Timezone for africa/lusaka UTC offset of +02:00.
- Africa/Malabo - Timezone for africa/malabo UTC offset of +01:00.
- Africa/Maputo - Timezone for africa/maputo UTC offset of +02:00.
- Africa/Maseru - Timezone for africa/maseru UTC offset of +02:00.
- Africa/Mbabane - Timezone for africa/mbabane UTC offset of +02:00.
- Africa/Mogadishu - Timezone for africa/mogadishu UTC offset of +03:00.

- Africa/Monrovia - Timezone for africa/monrovia UTC offset of +00:00.
- Africa/Nairobi - Timezone for africa/nairobi UTC offset of +03:00.
- Africa/Ndjamena - Timezone for africa/ndjamena UTC offset of +01:00.
- Africa/Niamey - Timezone for africa/niamey UTC offset of +01:00.
- Africa/Nouakchott - Timezone for africa/nouakchott UTC offset of +00:00.
- Africa/Ouagadougou - Timezone for africa/ouagadougou UTC offset of +00:00.
- Africa/Porto-Novo - Timezone for africa/porto-novo UTC offset of +01:00.
- Africa/Sao_Tome - Timezone for africa/sao_tome UTC offset of +00:00.
- Africa/Timbuktu - Timezone for africa/timbuktu UTC offset of +00:00.
- Africa/Tripoli - Timezone for africa/tripoli UTC offset of +02:00.
- Africa/Tunis - Timezone for africa/tunis UTC offset of +01:00.
- Africa/Windhoek - Timezone for africa/windhoek UTC offset of +02:00.
- America/Adak - Timezone for america/adak UTC offset of -10:00.
- America/Anchorage - Timezone for america/anchorage UTC offset of -09:00.
- America/Anguilla - Timezone for america/anguilla UTC offset of -04:00.
- America/Antigua - Timezone for america/antigua UTC offset of -04:00.
- America/Araguaina - Timezone for america/araguaina UTC offset of -03:00.
- America/Argentina/Buenos_Aires - Timezone for america/argentina/buenos_aires UTC offset of -03:00.
- America/Argentina/Catamarca - Timezone for america/argentina/catamarca UTC offset of -03:00.
- America/Argentina/ComodRivadavia - Timezone for america/argentina/comodrivadavia UTC offset of -03:00.
- America/Argentina/Cordoba - Timezone for america/argentina/cordoba UTC offset of -03:00.
- America/Argentina/Jujuy - Timezone for america/argentina/jujuy UTC offset of -03:00.
- America/Argentina/La_Rioja - Timezone for america/argentina/la_rioja UTC offset of -03:00.
- America/Argentina/Mendoza - Timezone for america/argentina/mendoza UTC offset of -03:00.
- America/Argentina/Rio_Gallegos - Timezone for america/argentina/rio_gallegos UTC offset of -03:00.
- America/Argentina/Salta - Timezone for america/argentina/salta UTC offset of -03:00.

- America/Argentina/San_Juan - Timezone for america/argentina/san_juan UTC offset of -03:00.
- America/Argentina/San_Luis - Timezone for america/argentina/san_luis UTC offset of -03:00.
- America/Argentina/Tucuman - Timezone for america/argentina/tucuman UTC offset of -03:00.
- America/Argentina/Ushuaia - Timezone for america/argentina/ushuaia UTC offset of -03:00.
- America/Aruba - Timezone for america/aruba UTC offset of -04:00.
- America/Asuncion - Timezone for america/asuncion UTC offset of -03:00.
- America/Atikokan - Timezone for america/atikokan UTC offset of -05:00.
- America/Atka - Timezone for america/atka UTC offset of -10:00.
- America/Bahia - Timezone for america/bahia UTC offset of -03:00.
- America/Bahia_Banderas - Timezone for america/bahia_banderas UTC offset of -06:00.
- America/Barbados - Timezone for america/barbados UTC offset of -04:00.
- America/Belem - Timezone for america/belem UTC offset of -03:00.
- America/Belize - Timezone for america/belize UTC offset of -06:00.
- America/Blanc-Sablon - Timezone for america/blanc-sablon UTC offset of -04:00.
- America/Boa_Vista - Timezone for america/boa_vista UTC offset of -04:00.
- America/Bogota - Timezone for america/bogota UTC offset of -05:00.

3.83 cmm amfN26LocalEndPointConfig

N26 AMF Local End Point Configuration. Syntax, description, parameters, and roles for cmm amfN26LocalEndPointConfig command.

Syntax

Description

This command is used to create, modify and delete AMF local endpoint configuration for the N26 interface.

Parameters

Name

endPointName - End Point Interface Name

Syntax

--endPointName <string>

Description

End Point Interface Name

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

amfServiceIpName - Service IP Name

Syntax

--amfServiceIpName <string>

Description

The parameter points to a set of parameters related to IP address configuration created using the 'amfServiceIp' command

Class

Required on create.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

enable - Enable

Syntax

--enable <list-item>

Description

The parameter is used to enable use of the provisioned instance of the N26 interface. If the parameter is set to 'false', the N26 instance will not be used. Once an instance is enabled, the instance can be disabled only under certain TBD conditions.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

protocolProfileName - Interface profile name

Syntax

--protocolProfileName <string>

Description

Interface profile name

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

default

3.84 cmm amfNasMsgAttempts

AMF NAS Message Attempts. Syntax, description, parameters, and roles for cmm amfNasMsgAttempts command.

Syntax

Description

This command assigns number of re-transmission attempts for NAS procedure messages

Parameters

Name

msgName - 5G NAS message attempts

Syntax

--msgName <list-item>

Description

This command is used to assign the number of retransmission attempts used for NAS procedure messages

Class

Required key.

List

- authenticationRequest - Authentication Request - Number of AUTHENTICATION REQUEST messages without receiving a corresponding AUTHENTICATION RESPONSE
- identityRequest - Identity Request - Number of IDENTITY REQUEST messages without receiving a corresponding IDENTITY RESPONSE
- netInitDeregistration - Network Initiated Deregistration - Number of network initiated deregistration requests transmitted without receiving a corresponding deregistration accept response
- networkSliceSpecificAuthCommand - Network Slice Specific Authentication Command - Number of NETWORK SLICE-SPECIFIC AUTHENTICATION COMMAND without receiving a corresponding NETWORK SLICE-SPECIFIC AUTHENTICATION COMPLETE
- notification - Number of Notification messages without receiving a corresponding Notification Response, Service Request or Registration Request.
- registrationAccept - Registration Accept - Number of "initial registration" accept messages with assigned GUTI transmitted without receiving a corresponding registration complete response.
- registrationUpdateAccept - Registration Update Accept - Number of registration accept messages with assigned GUTI transmitted, when registration type is mobility or periodic updating, without receiving a corresponding registration complete response.
- securityModeCommand - Security Mode Command - Number of security mode command messages without receiving a corresponding SECURITY MODE COMPLETE

- ueConfigurationUpdate - UE COntfiguration Update - Number of UE configuration update command messages without receiving a corresponding UE configuration update complete response.

Name

msgAttempts - Message retransmission attempts

Syntax

--msgAttempts <integer>

Description

specify number of NAS message retransmission attempts

Class

Optional.

Type / Range

Integer in the range of 0 to 5

Default

3

3.85 cmm amfNasTimers

AMF NAS Timers. Syntax, description, parameters, and roles for cmm amfNasTimers command.

Syntax**Description**

This command is to add AMF NAS Timers

Parameters**Name**

amfTimerName - Timer name

Syntax

--amfTimerName <list-item>

Description

Name of timer.

Class

Required key.

List

- dlNasTransportBackoffTimerMaximum - DL NAS Transport Backoff Timer Maximum - Specifies the maximum value to consider when assigning this timer value to be used for a Downlink Nas Transport procedure rejection due to IPDS CPU overload, CPPS CPU overload, and CXN object overloads with NAS cause code #22 (Congestion).
- dlNasTransportBackoffTimerMinimum - DL NAS Transport Backoff Timer Minimum - Specifies the minimum value to consider when assigning this timer value to be used for a Downlink Nas Transport procedure rejection due to IPDS CPU overload, CPPS CPU overload, and CXN object overloads with NAS cause code #22 (Congestion).
- micoT3324 - MICO T3324 - Value of the T3324 Active Timer to be assigned to a MICO UE. Default is 5 minutes.
- micoT3512 - MICO T3512 - Value of the T3512 Timer to be assigned to a MICO UE. Default is 30 minutes. Maximum supported unit is 'Hours'. Maximum supported timer is 31 Hours.
- non3gppAccessDeregistrationTimer - Non-3GPP Access Deregistration Timer - AMF provides this timer to the UE on Registration Accept when the UE registers over non-3GPP access. Specifies the time after which the UE deregisters after moving to CM-IDLE for non-3GPP access. Maximum value for the timer is 186 Minutes. Default is 9 DeciHour (54 Minutes).
- t3346registerRejectMaximum - T3346 register reject maximum - Specifies the maximum value to consider when randomly assigning the T3346 timer value to be used for an register procedure rejection due to IPDS CPU overload, CPPS CPU overload, and CXN object overloads with NAS cause code #22 (Congestion).
- t3346registerRejectMinimum - T3346 register reject minimum - Specifies the minimum value to consider when randomly assigning the T3346 timer value to be used for an register procedure rejection due to IPDS CPU overload, CPPS CPU overload, and CXN object overloads with NAS cause code #22 (Congestion).
- t3346srRejectMaximum - T3346 SR reject maximum - Specifies the maximum value to consider when randomly assigning the T3346 timer value to be used for an SR procedure rejection due to IPDS CPU overload, CPPS CPU overload, and CXN object overloads with NAS cause code #22 (Congestion).
- t3346srRejectMinimum - T3346 SR reject minimum - Specifies the minimum value to consider when randomly assigning the T3346 timer value to be used for an SR

procedure rejection due to IPDS CPU overload, CPPS CPU overload, and CXN object overloads with NAS cause code #22 (Congestion).

- **t3502** - Used in UE Registration Accept and Registration Reject messages. Used by UE to initiate the next registration (initial registration, mobility registration update or periodic registration in case of a registration failure when the registration attempt counter is reached. Default is 12 minutes. Maximum is 186 minutes. (31*DeciHour)
- **t3512** - Supervise the UE registration status when UE is in CM-IDLE and has no other mobility procedure to use. At Expiry of timer T3512, UE sends Mobility Registration Request with 'Periodic Updating' to notify the network it is still registered. If no request is received, AMF starts mobile reachable timer. Default is 12 Minutes. Maximum value is 310 Hours.
- **t3522** - Supervise the re-transmission of the De-Registration Request. At Expiry of timer T3522, AMF retries the associated message and repeats 'n' configured times. On the nth expiry of the timer, AMF considers the UE as 'non-De-Registered'.
- **t3550** - Timer supervising Registration Complete - Supervise the re-transmission of the Registration Accept when the Registration Complete is expected. At Expiry of timer T3550, AMF retries the associated command and repeats 'n' configured times. On the nth expiry of the timer, AMF aborts the associated procedure.
- **t3555** - Supervise the re-transmission of the UE Configuration Update Request when Configuration Update Complete is expected. At Expiry of timer T3555, AMF retries the associated message and repeats 'n' configured times. On the nth expiry of the timer, AMF aborts the procedure.
- **t3560** - Supervise the re-transmission of the Authentication Request/Security mode command. At Expiry of timer T3560, AMF retries the associated command and repeats 'n' configured times. On the nth expiry of the timer, AMF rejects the associated procedure.
- **t3565** - Supervise the re-transmission of the Notification when either Notification Response, Service Request or Registration Request is expected. At expiry of timer T3565, AMF retries the associated message and repeats 'n' configured times. On the nth expiry of the timer, AMF aborts the procedure.
- **t3570** - Supervise the re-transmission of the Identity Request. At Expiry of timer t3570, AMF retries the associated command and repeats 'n' configured times. On the nth expiry of the timer, AMF either continues with the procedure if requesting IMEISV or aborts the associated procedure.
- **t3575** - Supervise transmission of NETWORK SLICE-SPECIFIC AUTHENTICATION COMMAND is expected. At Expiry of timer T3575, AMF retries the associated command and repeats 'n' configured times. On the nth expiry of the timer, AMF aborts the associated procedure.

Name

amfTimerUnit - Timer unit

Syntax

```
--amfTimerUnit <list-item>
```

Description

Unit of measurement. Timer unit is modifiable. Timer unit allowed values are per timer.

Class

Optional.

List

- Millisecond - Specify timer unit of 1 millisecond
- Second - Specify timer unit of 1 second
- 2Second - 2 Second - Specify timer unit of 2 seconds
- 30Second - 30 Second - Specify timer unit of 30 seconds.
- Minute - Specify timer unit of 1 minute
- DeciHour - Specify timer unit of 1 decihour (6 minutes).
- 10Minute - 10 Minute - Specify timer unit of 10 minutes
- Hour - Specify timer unit of 1 hour
- 10Hour - 10 Hour - Specify timer unit of 10 hours.

Name

amfTimerValue - Timer value

Syntax

```
--amfTimerValue <integer>
```

Description

Numeric value of timer.

Class

Optional.

Type / Range

Integer in the range of 0 to 65,535

The amfTimerValue string is based on the amfTimerName parameter:

Name

dlNasTransportBackoffTimerMaximum - DL NAS Transport Backoff Timer Maximum

Syntax

```
--amfTimerName dlNasTransportBackoffTimerMaximum --amfTimerValue  
<string> [ --amfTimerUnit Second ]
```

Description

Specifies the maximum value to consider when assigning this timer value to be used for a Downlink Nas Transport procedure rejection due to IPDS CPU overload, CPPS CPU overload, and CXN object overloads with NAS cause code #22 (Congestion).

Type / Range

Integer in the range of 0 to 600 in units of Second

Default

60

Name

dlNasTransportBackoffTimerMinimum - DL NAS Transport Backoff Timer Minimum

Syntax

```
--amfTimerName dlNasTransportBackoffTimerMinimum --amfTimerValue  
<string> [ --amfTimerUnit Second ]
```

Description

Specifies the minimum value to consider when assigning this timer value to be used for a Downlink Nas Transport procedure rejection due to IPDS CPU overload, CPPS CPU overload, and CXN object overloads with NAS cause code #22 (Congestion).

Type / Range

Integer in the range of 0 to 600 in units of Second

Default

15

Name

micoT3324 - MICO T3324

Syntax

```
--amfTimerName micoT3324 --amfTimerValue <string> [ --amfTimerUnit  
{10Minute,2Second,30Second,Hour,Minute} ]
```

Description

Value of the T3324 Active Timer to be assigned to a MICO UE. Default is 5 minutes.

Type / Range

Integer in the range of 1 to 31 in units of 10Minute,2Second,30Second,Hour,Minute

Default

5

Name

micoT3512 - MICO T3512

Syntax

```
--amfTimerName micoT3512 --amfTimerValue <string> [ --amfTimerUnit  
{10Minute,2Second,30Second,Hour,Minute} ]
```

Description

Value of the T3512 Timer to be assigned to a MICO UE. Default is 30 minutes. Maximum supported unit is 'Hours'. Maximum supported timer is 31 Hours.

Type / Range

Integer in the range of 1 to 31 in units of 10Minute,2Second,30Second,Hour,Minute

Default

30

Name

non3gppAccessDeregistrationTimer - Non-3GPP Access Deregistration Timer

Syntax

```
--amfTimerName non3gppAccessDeregistrationTimer --amfTimerValue  
<string> [ --amfTimerUnit {2Second,DeciHour,Minute} ]
```

Description

AMF provides this timer to the UE on Registration Accept when the UE registers over non-3GPP access. Specifies the time after which the UE deregisters after moving to CM-IDLE for non-3GPP access. Maximum value for the timer is 186 Minutes. Default is 9 DeciHour (54 Minutes).

Type / Range

Integer in the range of 0 to 31 in units of 2Second,DeciHour,Minute

Default

9

Name

t3346registerRejectMaximum - T3346 register reject maximum

Syntax

```
--amfTimerName t3346registerRejectMaximum --amfTimerValue <string>  
[ --amfTimerUnit Second ]
```

Description

Specifies the maximum value to consider when randomly assigning the T3346 timer value to be used for an register procedure rejection due to IPDS CPU overload, CPPS CPU overload, and CXN object overloads with NAS cause code #22 (Congestion).

Type / Range

Integer in the range of 0 to 1800 in units of Second

Default

60

Name

t3346registerRejectMinimum - T3346 register reject minimum

Syntax

```
--amfTimerName t3346registerRejectMinimum --amfTimerValue <string>  
[ --amfTimerUnit Second ]
```

Description

Specifies the minimum value to consider when randomly assigning the T3346 timer value to be used for an register procedure rejection due to IPDS CPU overload, CPPS CPU overload, and CXN object overloads with NAS cause code #22 (Congestion).

Type / Range

Integer in the range of 0 to 1800 in units of Second

Default

15

Name

t3346srRejectMaximum - T3346 SR reject maximum

Syntax

```
--amfTimerName t3346srRejectMaximum --amfTimerValue <string> [ --  
amfTimerUnit Second ]
```

Description

Specifies the maximum value to consider when randomly assigning the T3346 timer value to be used for an SR procedure rejection due to IPDS CPU overload, CPPS CPU overload, and CXN object overloads with NAS cause code #22 (Congestion).

Type / Range

Integer in the range of 0 to 1800 in units of Second

Default

60

Name

t3346srRejectMinimum - T3346 SR reject minimum

Syntax

```
--amfTimerName t3346srRejectMinimum --amfTimerValue <string> [ --  
amfTimerUnit Second ]
```

Description

Specifies the minimum value to consider when randomly assigning the T3346 timer value to be used for an SR procedure rejection due to IPDS CPU overload, CPPS CPU overload, and CXN object overloads with NAS cause code #22 (Congestion).

Type / Range

Integer in the range of 1 to 1800 in units of Second

Default

15

Name

t3502 - t3502

Syntax

```
--amfTimerName t3502 --amfTimerValue <string> [ --amfTimerUnit  
{2Second,DeciHour,Minute} ]
```

Description

Used in UE Registration Accept and Registration Reject messages. Used by UE to initiate the next registration (initial registration, mobility registration update or periodic registration in case of a registration failure when the registration attempt counter is reached. Default is 12 minutes. Maximum is 186 minutes. (31*DeciHour)

Type / Range

Integer in the range of 1 to 31 in units of 2Second,DeciHour,Minute

Default

12

Name

t3512 - t3512

Syntax

```
--amfTimerName t3512 --amfTimerValue <string> [ --amfTimerUnit  
{10Hour,10Minute,2Second,30Second,Hour,Minute} ]
```

Description

Supervise the UE registration status when UE is in CM-IDLE and has no other mobility procedure to use. At Expiry of timer T3512, UE sends Mobility Registration Request with 'Periodic Updating' to notify the network it is still registered. If no request is received, AMF starts mobile reachable timer. Default is 12 Minutes. Maximum value is 310 Hours.

Type / Range

Integer in the range of 0 to 31 in units of 10Hour,10Minute,2Second,30Second,Hour,Minute

Default

12

Name

t3522 - t3522

Syntax

```
--amfTimerName t3522 --amfTimerValue <string> [ --amfTimerUnit  
Second ]
```

Description

Supervise the re-transmission of the De-Registration Request. At Expiry of timer T3522, AMF retries the associated message and repeats 'n' configured times. On the nth expiry of the timer, AMF considers the UE as 'non-De-Registered'.

Type / Range

Integer in the range of 1 to 60 in units of Second

Default

6

Name

t3550 - Timer supervising Registration Complete

Syntax

```
--amfTimerName t3550 --amfTimerValue <string> [ --amfTimerUnit  
Second ]
```

Description

Suprvice the re-transmission of the Registration Accept when the Registration Complete is expected. At Expiry of timer T3550, AMF retries the associated command and repeats 'n' configured times. On the nth expiry of the timer, AMF aborts the associated procedure.

Type / Range

Integer in the range of 1 to 60 in units of Second

Default

6

Name

t3555 - t3555

Syntax

```
--amfTimerName t3555 --amfTimerValue <string> [ --amfTimerUnit  
Second ]
```

Description

Supervise the re-transmission of the UE Configuration Update Request when Configuration Update Complete is expected. At Expiry of timer T3555, AMF retries the associated message and repeats 'n' configured times. On the nth expiry of the timer, AMF aborts the procedure.

Type / Range

Integer in the range of 1 to 60 in units of Second

Default

6

Name

t3560 - t3560

Syntax

```
--amfTimerName t3560 --amfTimerValue <string> [ --amfTimerUnit  
Second ]
```

Description

Supervise the re-transmission of the Authentication Request/Security mode command.
At Expiry of timer T3560, AMF retries the associated command and repeats 'n' configured times. On the nth expiry of the timer, AMF rejects the associated procedure.

Type / Range

Integer in the range of 1 to 60 in units of Second

Default

6

Name

t3565 - t3565

Syntax

```
--amfTimerName t3565 --amfTimerValue <string> [ --amfTimerUnit  
Second ]
```

Description

Supervise the re-transmission of the Notification when either Notification Response, Service Request or Registration Request is expected. At expiry of timer T3565, AMF retries the associated message and repeats 'n' configured times. On the nth expiry of the timer, AMF aborts the procedure.

Type / Range

Integer in the range of 1 to 60 in units of Second

Default

6

Name

t3570 - t3570

Syntax

```
--amfTimerName t3570 --amfTimerValue <string> [ --amfTimerUnit  
Second ]
```

Description

Supervise the re-transmission of the Identity Request. At Expiry of timer t3570, AMF retries the associated command and repeats 'n' configured times. On the nth expiry of the timer, AMF either continues with the procedure if requesting IMEISV or aborts the associated procedure.

Type / Range

Integer in the range of 1 to 60 in units of Second

Default

6

Name

t3575 - t3575

Syntax

```
--amfTimerName t3575 --amfTimerValue <string> [ --amfTimerUnit  
Second ]
```

Description

Supervise transmission of NETWORK SLICE-SPECIFIC AUTHENTICATION COMMAND is expected. At Expiry of timer T3575, AMF retries the associated command and repeats 'n' configured times. On the nth expiry of the timer, AMF aborts the associated procedure.

Type / Range

Integer in the range of 1 to 60 in units of Second

Default

15

3.86 cmm amfNgRanLocalEndPointConfig

NG Ran Local End Point Configuration. Syntax, description, parameters, and roles for cmm amfNgRanLocalEndPointConfig command.

Syntax**Description**

This command is used to create, modify and delete AMF local endpoint configuration for the NG-RAN N2 interface. The NG-RAN could be gNB, ng-eNB or N3IWF.

Parameters**Name**

endPointName - End Point Interface Name

Syntax

```
--endPointName <string>
```

Description

End Point Interface Name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

amfServiceIpName - Service IP Name

Syntax

--amfServiceIpName <string>

Description

The parameter points to a set of parameters related with IP address configuration created using the 'servicelp' command.

Class

Required on create.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

interfaceType - Interface name

Syntax

--interfaceType <list-item>

Description

Interface name.

Class

Required on create, not modifiable.

List

- N2 - N2 Interface - List of (N2, ...)

Name

amfServiceIpName1 - Service IP Name 1

Syntax

--amfServiceIpName1 <string>

Description

The parameter points to a set of parameters related with IP address configuration created using the 'servicelp' command. When configured, it specifies the second IP Address for N2 SCTP multi-homing.

Class

Optional.

Type / Range

Digit string of length 0 or 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

""

Name

dscpCode - DSCP code

Syntax

--dscpCode <list-item>

Description

Parameter to set DSCP code to be used for an IP packet

Class

Optional.

List

- AF11 - Assured forwarding 11.
- AF12 - Assured forwarding 12.
- AF13 - Assured forwarding 13.
- AF21 - Assured forwarding 21.
- AF22 - Assured forwarding 22.
- AF23 - Assured forwarding 23.
- AF31 - Assured forwarding 31.
- AF32 - Assured forwarding 32.
- AF33 - Assured forwarding 33.
- AF41 - Assured forwarding 41.
- AF42 - Assured forwarding 42.
- AF43 - Assured forwarding 43.
- BE - BE.
- CS1 - Class selector 1.
- CS2 - Class selector 2.
- CS3 - Class selector 3.
- CS4 - Class selector 4.
- CS5 - Class selector 5.
- CS6 - Class selector 6.

- CS7 - Class selector 7.
- EF - Expedited forwarding.
- voiceAdmit - Voice Admit

Default

AF41

Name

enable - Enable

Syntax`--enable <list-item>`**Description**

The parameter is used to enable use of the provisioned instance of the N2 interface. If the parameter is set to 'false', the N2 instance will not be used. Once an instance is enabled, the instance can be disabled only under certain TBD conditions.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

interfacePort - Interface port

Syntax`--interfacePort <integer>`**Description**

This parameter assigns local sctp port number.

Class

Optional.

Type / Range

Integer in the range of 0 or 1,024 to 65,535

Default

0

Name

multiHomed - Multi home

Syntax

--multiHomed <list-item>

Description

This enables/disables sctp multihomed at the given sctp local termination.

Restrictions

multiHomed is only applicable when interfaceName is N2. multiHomed can be modified only when enable is set to false.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

protocolProfileName - Interface profile name

Syntax

--protocolProfileName <string>

Description

Interface profile name.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

default

Name

tlsProfileName - TLS Profile

Syntax

--tlsProfileName <string>

Description

TLS Profile Name for N1/N2 endpoint

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

..

3.87 cmm amfNon3gppTai

Non-3GPP Tracking Area Identifier. Syntax, description, parameters, and roles for cmm amfNon3gppTai command.

Syntax

Description

Defines the non-3GPP access specific Tracking Area on the AMF. A single TAI dedicated to Non-3GPP access, is defined in a PLMN and applies within the PLMN. When a UE registers with the network over the Non-3GPP access, the AMF allocates a registration area that only includes the Non-3GPP TAI to the UE.

Parameters

Name

plmnName - Serving PLMN Name

Syntax

--plmnName <string>

Description

The serving PLMN name may be the name of the AMF home PLMN or shared PLMN.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

amfTac - AMF Tracking Area Code

Syntax

--amfTac <integer>

Description

Provision 5G TAC for non-3GPP access. 5G TAC is 3 octets long.

Class

Required key.

Type / Range

Integer in the range of 0 to 16777215

Name

amfEmergencyProfileName - AMF Emergency Profile Name

Syntax

--amfEmergencyProfileName <string>

Description

The name of the AMF Emergency profile that applies for the non-3GPP TAI.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

emergencyServiceSupported - Emergency Service Supported

Syntax

--emergencyServiceSupported <list-item>

Description

Defines whether Emergency service is supported in the non-3GPP access tracking area.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

imsVops - IMS Voice Over PS Support

Syntax

--imsVops <list-item>

Description

Indicates whether IMS VoPS is supported on the Non-3GPP Tracking Area of the AMF.

Class

Optional.

List

- AmflmsVopsNon3gppNotSupported - IMS Voice Over PS Non-3GPP Access Not Supported - IMS Voice over PS not supported over Non-3GPP access.
- AmflmsVopsNon3gppSupported - IMS Voice Over PS Non-3GPP Access Supported - IMS Voice over PS supported over Non-3GPP access.

Default

AmflmsVopsNon3gppNotSupported

Name

snssaiListName - SNSSAI List Name

Syntax

--snssaiListName <string>

Description

This parameter is a pointer to the S-NSSAI list. The S-NSSAI in the list are authorized in the TAI. If the TAI is not provisioned with a list then it is assumed that all S-NSSAIs that are supported by AMF and 5G-AN are authorized in the TAI. This parameter is not used if AMF is provisioned to use the NSSF Availability Service as in this case the Slices that are authorized in the TAI are provided by the NSSF.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

""

Name

timeZoneName - Time Zone Name

Syntax

--timeZoneName <list-item>

Description

Time Zone of the Tracking Area.

Class

Optional.

List

- Africa/Abidjan - Timezone for africa/abidjan UTC offset of +00:00.
- Africa/Accra - Timezone for africa/accra UTC offset of +00:00.
- Africa/Addis_Ababa - Timezone for africa/addis_ababa UTC offset of +03:00.
- Africa/Algiers - Timezone for africa/algiers UTC offset of +01:00.

3.88 cmm amfNotificationEndPointConfig

AMF Notification End Point Configuration. Syntax, description, parameters, and roles for cmm amfNotificationEndPointConfig command.

Syntax**Description**

This command is used to create, modify and delete AMF local endpoint configuration for receiving and sending notifications. AMF as a consumer/client of other NF (producer/server) may include callback URI in a request if the AMF expects to receive a notification from the producer NF. The callback URI will be constructed using the parameters of this command and other data such as UE SUPI. The producer will act as a consumer/client when it sends a notification to the AMF and sets up TCP connection to the IP address provisioned to this endpoint. AMF acts as a producer/server to receive the notification.

Parameters**Name**

endPointName - Notification Endpoint Name

Syntax

--endPointName <string>

Description

The name that identifies the Notification Endpoint.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

amfServiceIpName - Service IP

Syntax

--amfServiceIpName <string>

Description

The parameter points to a set of parameters related with IP address configuration created using the 'serviceIp' command.

Class

Required on create.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

nfType - Network Function Type

Syntax

--nfType <list-item>

Description

The endpoint will be used for constructing the callback URI to a NF identified by this parameter. For example, if AMF includes callback URI in a request to SMF then the AMF will construct the callback URI using the parameters of the endpoint for the NF type SMF.

Class

Required on create, not modifiable.

List

- 5GEIR - 5G EIR - The network function type of 5G-Equipment Identity Register.
- AMF - Access and Mobility Manager Function - The network function type of Access and Mobility Manager Function.
- AUSF - Authentication Server Function - The network function type of Authentication Server Function.

- CBCF - Cell Broadcast Centre Function - The network function type of Cell Broadcast Centre Function
- CHF - Charging Function - The network function type of Charging Function
- GMLC - Gateway Mobile Location Center - The network function type of Gateway Mobile Location Center.
- LMF - Location Management Function - The network function type of Location Management Function.
- NRF - Network Repository Function - The network function type of Network Repository Function.
- NSSAAF - Network Slice Specific Authentication and Authorization Function - The network function type of Network Slice Specific Authentication and Authorization Function
- NSSF - Network Slice Selection Function - The network function type of Network Slice Selection Function.
- NWDAF - Network Data Analytics Function - The network function type of NWDAF.
- PCF - Policy Control Function - The network function type of Policy Control Function.
- SMF - Session Management Function - The network function type of Session Management Function.
- SMSF - Short Message Service Function - The network function type of Short Message Service Function.
- UDM - Unified Data Manager - The network function type of Unified Data Manager.
- UDSF - Unstructured Data Storage Function - The network function type of Unstructured Data Storage Function.

Name

callbackUriAuthorityType - Callback URI Authority Type

Syntax

--callbackUriAuthorityType <list-item>

Description

Defines the format of the authority when the Notification Endpoint is provided to a remote NF. -DEFAULT_IP (default): The authority part of the Endpoint is given as an IP. IP Version aligns to the IP version of the interface via which the Request/Response is received/sent (if available) otherwise whatever version is available. -FQDN: The authority part of the Endpoint given as a FQDN. If --fqdn is not provisioned then authority is given as an IP address. IP Version aligns to the IP version of the interface via which the Request/Response is received/sent (if available) otherwise whatever version is available

Class

Optional.

List

- **DEFAULT_IP_VERSION** - Default IP Version - The authority part of the Endpoint is given as an IP. IP Version aligns to the IP version of the interface via which the Request/Response is received/sent (if available) otherwise whatever version is available.
- **FQDN** - The authority part of the Endpoint given as a FQDN. If FQDN is not provisioned then authority is given as an IP address. IP Version aligns to the IP version of the interface via which the Request/Response is received/sent (if available) otherwise whatever version is available.

Default

DEFAULT_IP_VERSION

Name

dscpCode - DSCP Code

Syntax

--dscpCode <list-item>

Description

Parameter used for selecting DSCP code to use for the IP packet.

Class

Optional.

List

- AF11 - Assured forwarding 11.
- AF12 - Assured forwarding 12.
- AF13 - Assured forwarding 13.
- AF21 - Assured forwarding 21.
- AF22 - Assured forwarding 22.
- AF23 - Assured forwarding 23.
- AF31 - Assured forwarding 31.
- AF32 - Assured forwarding 32.
- AF33 - Assured forwarding 33.
- AF41 - Assured forwarding 41.
- AF42 - Assured forwarding 42.
- AF43 - Assured forwarding 43.
- BE - BE.
- CS1 - Class selector 1.
- CS2 - Class selector 2.

- CS3 - Class selector 3.
- CS4 - Class selector 4.
- CS5 - Class selector 5.
- CS6 - Class selector 6.
- CS7 - Class selector 7.
- EF - Expedited forwarding.
- voiceAdmit - Voice Admit

Default

AF41

Name

fqdn - FQDN

Syntax

--fqdn <string>

Description

The FQDN of the endpoint

Class

Optional.

Type / Range

Digit string of length 0 to 96 with the allowed pattern of [0-9a-zA-Z\._:]*

Default

""

Name

httpProfileName - HTTP profile name

Syntax

--httpProfileName <string>

Description

Assign HTTP profile for the end point.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

default

Name

interPlmnFqdn - Inter PLMN FQDN

Syntax

--interPlmnFqdn <string>

Description

The FQDN of the endpoint used in inter PLMN scenarios

Class

Optional.

Type / Range

Digit string of length 0 to 96 with the allowed pattern of [0-9a-zA-Z\._:]*

Default

""

Name

port - TCP Port

Syntax

--port <integer>

Description

TCP Port.

Class

Optional.

Type / Range

TCP ports 0, 443 and 1024 - 65535

Default

8080

Name

tcpProfileName - TCP Profile Name

Syntax

--tcpProfileName <string>

Description

Configure TCP profile to the endpoint.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

default

Name

tlsProfileName - Transport Layer Security Certificate

Syntax

--tlsProfileName <string>

Description

Configure TLS certificate used in establishing secure communication.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

3.89 cmm amfNrDualConnectivityProfile

AMF NR Dual Connectivity Profile. Syntax, description, parameters, and roles for cmm amfNrDualConnectivityProfile command.

Syntax**Description**

Command used to administer NR Dual Connectivity profile and NR access restrictions per UE PLMN Services or SUPI Range Services when such a profile is configured.

Parameters**Name**

name - Profile Name

Syntax

--name <string>

Description

Name of the NR Dual Connectivity Profile.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

accessRestrictNrSecRat - Access Restriction for NR Secondary RAT

Syntax

--accessRestrictNrSecRat <list-item>

Description

AMF overrides UE subscription access to NR Secondary RAT.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

accessRestrictSubscribedNrSecRatAbsent - Access Restriction for Subscribed NR Secondary RAT Absent

Syntax

--accessRestrictSubscribedNrSecRatAbsent <list-item>

Description

AMF restricts NR Secondary RAT if Subscribed Secondary RAT Restriction IE is absent.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

includeNrsrna - Include NRSRNA over N26

Syntax

--includeNrsrna <list-item>

Description

AMF includes subscribed UDM NR Access Restriction indication in UE Context over N26 during 5GC to EPC Handover.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

nrDc - NR Dual Connectivity

Syntax

--nrDc <list-item>

Description

Enables or disables NR Dual Connectivity at UE PLMN Services or SUPI Range Services if AMF NR-DC support is enabled and NR Dual Connectivity profile is configured.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

secondaryRatUsageReporting - Secondary RAT Usage Reporting

Syntax

--secondaryRatUsageReporting <list-item>

Description

Enables or disables NR Secondary RAT Usage Reporting at UE PLMN Services or SUPI Range Services if AMF NR-DC support is enabled and NR Dual Connectivity profile is configured.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

3.90 cmm amfNrfGParms

NRF Global Parameters. Syntax, description, parameters, and roles for cmm amfNrfGParms command.

Syntax**Description**

This command opens the context for configuring NRF related parameters for the network.

Parameters**Name**

amfGparmName - Name of parameter

Syntax

--amfGparmName <list-item>

Description

Name of parameter

Class

Required key.

List

- **alwaysAddPlmnInNfDisc** - Always Include Target Plmn In NF Discoveries - When this parameter is enabled AMF will always include the target-plmn-list Query parameter in NF Discoveries for all non-roaming scenarios
- **amfDiscoveryLimit** - AMF Discovery Limit - Value to be used as the 'limit' Query Parameter in the NFDISCOVERY GET Requests for AMFs to the NRF. This parameter limits the Maximum number of NFProfiles to be returned in the response. When value is 0 (default), the AMF will not include the limit Query Parameter in the Request.
- **ausfDiscoveryLimit** - AUSF Discovery Limit - Value to be used as the 'limit' Query Parameter in the NFDISCOVERY GET Requests for AUSFs to the NRF. This parameter limits the Maximum number of NFProfiles to be returned in the response. When value is 0 (default), the AMF will not include the limit Query Parameter in the Request.
- **cbcfDiscoveryLimit** - CBCF Discovery Limit - Value to be used as the 'limit' Query Parameter in the NFDISCOVERY GET Requests for CBCFs to the NRF. This parameter limits the Maximum number of NFProfiles to be returned in the response. When value is 0 (default), the AMF will not include the limit Query Parameter in the Request.
- **checkPgwFqdnMatchInAnySmfInfo** - Check pgwFqdn match in any smfInfo - When this parameter is set to false, all relevant query parameters for SMF discovery must be matched in the same smfInfo IE within the SMF Profile so as to consider the SMF a valid candidate for selection (as per 3GPP specifications). When this parameter is set to true, SMF is considered as a valid candidate even when the pgwFqdn is placed in a different smfInfo IE than the smfInfo which matches all the remaining query parameters.
- **discoveryRateLimit** - Rate Limit for NRF Discoveries - This parameter defines the rate (per second) above which Discovery Messages will be rate limited. When Discovery Requests are load balanced towards multiple NRF (Service) instances the rate is counted separately for each NFDISCOVERY service instance. When this parameter is set to 0 rate limiting is not applied.
- **discoveryRedirectLimit** - Discovery Redirect Limit - When this parameter is set to greater than 0, CMM will perform Redirects.
- **discoveryRetry4xx** - Discovery Retry 4xx - This parameter defines whether NRF Discovery Retry is triggered for 4xx status class Responses.
- **discoveryRetry5xx** - Discovery Retry 5xx - This parameter defines whether NRF Discovery Retry is triggered for 5xx status class Responses.

- **discoveryRetryLimit** - Discovery Retry Limit - When this parameter is set to greater than 0, CMM will perform Retries in case of NRF Discovery errors or timeouts when CMM is provisioned to perform Retry for that type of error.
- **discoveryRetryTimeout** - Discovery Retry Timeout - This parameter defines whether NRF Discovery Retry is triggered for Timeouts.
- **eirDiscoveryLimit** - 5G EIR Discovery Limit - Value to be used as the 'limit' Query Parameter in the NFDISCOVERY GET Requests for 5G-EIRs to the NRF. This parameter limits the Maximum number of NFProfiles to be returned in the response. When value is 0 (default), the AMF will not include the limit Query Parameter in the Request.
- **gmlcDiscoveryLimit** - GMLC Discovery Limit - Value to be used as the 'limit' Query Parameter in the NFDISCOVERY GET Requests for GMLCs to the NRF. This parameter limits the Maximum number of NFProfiles to be returned in the response. When value is 0 (default), the AMF will not include the limit Query Parameter in the Request.
- **includeOauth2RequiredInNfProfile** - Include oauth2required in NfProfile - When this parameter is enabled AMF includes in the NFProfile it registers to NRF information regarding which of its service instances require OAuth2.0. The information is conveyed in the oauth2Required and perPlmnOauth2ReqList attributes of each NFService.
- **interPlmnFqdnNfProfile** - Inter-PLMN FQDN in NF Profile and Service - Support receiving intra-PLMN notification of changes in the NFProfile/NFService containing the interPlmnFqdn attribute
- **lmfDiscoveryLimit** - LMF Discovery Limit - Value to be used as the 'limit' Query Parameter in the NFDISCOVERY GET Requests for LMFs to the NRF. This parameter limits the Maximum number of NFProfiles to be returned in the response. When value is 0 (default), the AMF will not include the limit Query Parameter in the Request.
- **maxPayload** - Max Payload - Defines the Maximum payload size (before compression, if any) of the response, expressed in kiloBytes. When set to value other than zero the relevant Query Parameter will be sent to the NRF which will limit the number of NF profiles returned in the response such as to not exceed the maximum payload size indicated in the request.
- **pcfDiscoveryLimit** - PCF Discovery Limit - Value to be used as the 'limit' Query Parameter in the NFDISCOVERY GET Requests for PCFs to the NRF. This parameter limits the Maximum number of NFProfiles to be returned in the response. When value is 0 (default), the AMF will not include the limit Query Parameter in the Request.
- **prefetchTimerFixedValue** - Prefetch Timer Fixed Value - Prefetch timer fixed value (in sec). Relevant when the NRF NF Profile Prefetch Timer Mode is set to fixed.
- **prefetchTimerMode** - Prefetch Timer Mode - The NRF NFProfile Prefetch timer mode. In the fixed mode, the prefetch timer is set to the value given in the Prefetch Timer Fixed Value parameter and is common for all NFs. In the percent mode, the prefetch timer is calculated per NF as a percent of the Validity timer received in the NF Discovery Response from NRF (Prefetch Timer Percent Value * Validity).

- **prefetchTimerPercentValue** - Prefetch Timer Percent Value - Prefetch timer percent value. Relevant when NRF NF Profile Prefetch Timer Mode is set to percent.
- **sendN2InterfaceAmfInfo** - Send n2InterfaceAmfInfo - When this parameter is set to true AMF will include n2InterfaceAmfInfo in the AmfInfo of the NFProfile it Registers to NRF.
- **sendNfSetIdListToNrf** - Send NfSetIdList to NRF - When this parameter is set to true, AMF includes the NF Sets it belongs to in the nfSetIdList IE of the NFProfile it Registers in NRF.
- **sendOnlyEndpointFqdnInRegistration** - Send Only Endpoint Fqdn In Registration - When this parameter is set to True, the AMF omits the IPs and includes only the FQDN in the Endpoints of the NFServices and defaultNotificationSubscriptions in the Profile Registered to NRF.
- **sendRequesterExtendedSnssais** - Send Requester Extended S-NSSAIS - When this parameter is set to true, the AMF supports populating the supported S-NSSAIs in Discovery Queries and Subscriptions Requests issued to NRF as Extended S-NSSAIs that (may) include SD Ranges (ExtSnssai)
- **sendRequesterNfInstanceId** - Send Requester NF Instance ID - When this parameter is set to true CMM includes its own NF Instance ID when sending a Discovery Query or Subscribing to a NRF
- **sendRequesterPlmnInSubscriptions** - Send Requester PLMN in Subscriptions - When this parameter is set to true, CMM includes all Home and Shared PLMNs in the reqPlmnList IE when subscribing to a NRF for a NF Instance in a remote PLMN
- **sendRequesterSpecificSnssaiList** - Send Requester Specific S-NSSAI List - When this parameter is set to true, the AMF will populate the list of supported S-NSSAIs per Serving PLMN in Discovery Queries issued to NRF when the Home PLMN or Serving PLMNs do not all share the same slice list. Additionally when this parameter is set to true, AMF will send the Requester Specific S-NSSAI List in Subscription Requests when the relevant IE is supported by the NRF API version and when the Home PLMN or Serving PLMNs do not all share the same slice list.
- **sendSubscriptionsToQueryNrf** - Send Subscriptions to Query NRF - Controls the selection of the NRF where the NFStatusSubscribe requests are sent for newly discovered NFs. When the value is false the AMF sends the NFStatusSubscribe to the NRF where the AMF is currently Registered When the value is true the AMF sends the NFStatusSubscribe to the NRF used to discover the NF. Default value is false.
- **smfDiscoveryLimit** - SMF Discovery Limit - Value to be used as the 'limit' Query Parameter in the NFDISCOVERY GET Requests for SMFs to the NRF. This parameter limits the Maximum number of NFProfiles to be returned in the response. When value is 0 (default), the AMF will not include the limit Query Parameter in the Request.
- **smsfDiscoveryLimit** - SMSF Discovery Limit - Value to be used as the 'limit' Query Parameter in the NFDISCOVERY GET Requests for SMSFs to the NRF. This parameter limits the Maximum number of NFProfiles to be returned in the response. When value is 0 (default), the AMF will not include the limit Query Parameter in the Request.

- **subscriptionRateLimit** - Rate Limit for NRF Subscriptions - This parameter defines the rate (per second) above which NRF Subscriptions will be rate limited. Heartbeats and Registrations of the NRF Management API will never be rate limited. When this parameter is set to 0 rate limiting is not applied for Subscription Requests.
- **supportPerPlmnSnssaiListInNfProfiles** - Support per PLMN S-NSSAI List in NF Profiles - When this parameter is set to true, CMM will evaluate the per PLMN S-NSSAI List IE in NF Profile received from NRF during NF Discovery operations. Setting this parameter to false does not block CMM from populating per PLMN S-NSSAI List in its own NF Profile sent to NRF during Registration.
- **supportPerPlmnSnssaiListInSmfServices** - Support per PLMN S-NSSAI List in SMF Services - When this parameter is set to true, CMM will evaluate the per PLMN S-NSSAI List IE in NF Services received from NRF during NF Discovery operations for SMF. This parameter can be activated only when Supporting per PLMN S-NSSAI List on Profile level is activated.
- **suppressIdenticalDiscRequests** - Suppress Identical Discovery Requests - When this parameter is enabled AMF will avoid sending the exact same Discovery Request to NRF multiple times if one is issued and response has not yet been received.
- **udmDiscoveryLimit** - UDM Discovery Limit - Value to be used as the 'limit' Query Parameter in the NFDISCOVERY GET Requests for UDM to the NRF. This parameter limits the Maximum number of NFProfiles to be returned in the response. When value is 0 (default), the AMF will not include the limit Query Parameter in the Request.
- **useExpiredNfProfiles** - Use Expired NF Profiles - When this parameter is set to true, in case CMM failed to find a matching NF profile from the local cache and the NRF Discovery failed, will search whether an expired cached NF Profile matches the Discovery criterions prior to falling back to locally provisioned NFs.
- **useL1L2NrfCache** - Use L1L2 Nrf Cache - This parameter activates the use of the L1L2 Discovery Result Cache for NF selection.
- **useQueryCache** - Use Query Cache - When this parameter is enabled CMM caches the discovery Queries that have been performed towards the NRF and avoids repeating the exact same query (i.e. GET with all query parameters/values exactly the same) to the NRF multiple times. The entry with all the query parameters is maintained in the cache for the period indicated validityPeriod IE in the NRF response. This parameter should be enabled when CMM is provisioned to not use cached NF profiles in certain scenarios (via f20104-01). It may be enabled otherwise.
- **useServiceMaps** - Use Service Maps - When this parameter is enabled CMM will indicate to the NRF that it supports identifying the list of NF Service Instances as a map in Discovery and Subscription Requests, and will Register to NRF its own NF Profile populating its services as a map of NF Service Instances.

Name

amfGparmValue - Value of parameter

Syntax`--amfGparmValue <string>`**Description**

Value of parameter

Class

Required on create.

Type / Range

Digit string of length 0 to 64

The amfGparmValue string is based on the amfGparmName parameter:

Name

alwaysAddPlmnInNfDisc - Always Include Target Plmn In NF Discoveries

Syntax`--amfGparmName alwaysAddPlmnInNfDisc --amfGparmValue <string>`**Description**

When this parameter is enabled AMF will always include the target-plmn-list Query parameter in NF Discoveries for all non-roaming scenarios

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

amfDiscoveryLimit - AMF Discovery Limit

Syntax`--amfGparmName amfDiscoveryLimit --amfGparmValue <string>`**Description**

Value to be used as the 'limit' Query Parameter in the NFDISCOVERY GET Requests for AMFs to the NRF. This parameter limits the Maximum number of NFProfiles to be returned in the response. When value is 0 (default), the AMF will not include the limit Query Parameter in the Request.

Type / Range

Integer in the range of 0 to 255

Default

0

Name

ausfDiscoveryLimit - AUSF Discovery Limit

Syntax

```
--amfGparmName ausfDiscoveryLimit --amfGparmValue <string>
```

Description

Value to be used as the 'limit' Query Parameter in the NFDISCOVERY GET Requests for AUSFs to the NRF. This parameter limits the Maximum number of NFProfiles to be returned in the response. When value is 0 (default), the AMF will not include the limit Query Parameter in the Request.

Type / Range

Integer in the range of 0 to 255

Default

0

Name

cbcfDiscoveryLimit - CBCF Discovery Limit

Syntax

```
--amfGparmName cbcfDiscoveryLimit --amfGparmValue <string>
```

Description

Value to be used as the 'limit' Query Parameter in the NFDISCOVERY GET Requests for CBCFs to the NRF. This parameter limits the Maximum number of NFProfiles to be returned in the response. When value is 0 (default), the AMF will not include the limit Query Parameter in the Request.

Type / Range

Integer in the range of 0 to 255

Default

0

Name

checkPgwfQdnMatchInAnySmfInfo - Check pgwfQdn match in any smfInfo

Syntax

```
--amfGparmName checkPgwfQdnMatchInAnySmfInfo --amfGparmValue <string>
```

Description

When this parameter is set to false, all relevant query parameters for SMF discovery must be matched in the same smfInfo IE within the SMF Profile so as to consider the SMF a valid candidate for selection (as per 3GPP specifications). When this parameter is set to true, SMF is considered as a valid candidate even when the pgwfQdn is placed in a different smfInfo IE than the smfInfo which matches all the remaining query parameters.

List

- false - Boolean value of false.

- true - Boolean value of true.

Default

false

Name

discoveryRateLimit - Rate Limit for NRF Discoveries

Syntax

```
--amfGparmName discoveryRateLimit --amfGparmValue <string>
```

Description

This parameter defines the rate (per second) above which Discovery Messages will be rate limited. When Discovery Requests are load balanced towards multiple NRF (Service) instances the rate is counted separately for each NFDISCOVERY service instance. When this parameter is set to 0 rate limiting is not applied.

Type / Range

Limit above which requests will be rate limited in units of Second

Default

0

Name

discoveryRedirectLimit - Discovery Redirect Limit

Syntax

```
--amfGparmName discoveryRedirectLimit --amfGparmValue <string>
```

Description

When this parameter is set to greater than 0, CMM will perform Redirects.

Type / Range

Integer in the range of 0 to 1

Default

0

Name

discoveryRetry4xx - Discovery Retry 4xx

Syntax

```
--amfGparmName discoveryRetry4xx --amfGparmValue <string>
```

Description

This parameter defines whether NRF Discovery Retry is triggered for 4xx status class Responses.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

discoveryRetry5xx - Discovery Retry 5xx

Syntax

--amfGparmName discoveryRetry5xx --amfGparmValue <string>

Description

This parameter defines whether NRF Discovery Retry is triggered for 5xx status class Responses.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

discoveryRetryLimit - Discovery Retry Limit

Syntax

--amfGparmName discoveryRetryLimit --amfGparmValue <string>

Description

When this parameter is set to greater than 0, CMM will perform Retries in case of NRF Discovery errors or timeouts when CMM is provisioned to perform Retry for that type of error.

Type / Range

Integer in the range of 0 to 2

Default

0

Name

discoveryRetryTimeout - Discovery Retry Timeout

Syntax

--amfGparmName discoveryRetryTimeout --amfGparmValue <string>

Description

This parameter defines whether NRF Discovery Retry is triggered for Timeouts.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

eirDiscoveryLimit - 5G EIR Discovery Limit

Syntax

--amfGparmName eirDiscoveryLimit --amfGparmValue <string>

Description

Value to be used as the 'limit' Query Parameter in the NFDISCOVERY GET Requests for 5G-EIRs to the NRF. This parameter limits the Maximum number of NFProfiles to be returned in the response. When value is 0 (default), the AMF will not include the limit Query Parameter in the Request.

Type / Range

Integer in the range of 0 to 255

Default

0

Name

gmlcDiscoveryLimit - GMLC Discovery Limit

Syntax

--amfGparmName gmlcDiscoveryLimit --amfGparmValue <string>

Description

Value to be used as the 'limit' Query Parameter in the NFDISCOVERY GET Requests for GMLCsto the NRF. This parameter limits the Maximum number of NFProfiles to be returned in the response. When value is 0 (default), the AMF will not include the limit Query Parameter in the Request.

Type / Range

Integer in the range of 0 to 255

Default

0

Name

includeOauth2RequiredInNfProfile - Include oauth2required in NfProfile

Syntax

--amfGparmName includeOauth2RequiredInNfProfile --amfGparmValue
<string>

Description

When this parameter is enabled AMF includes in the NFProfile it registers to NRF information regarding which of its service instances require OAuth2.0. The information is conveyed in the oauth2Required and perPlmnOauth2ReqList attributes of each NFService.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Recommended

Should be set to true if OAuth2.0 is enforced in CMM as a Producer.

Name

interPlmnFqdnNfProfile - Inter-PLMN FQDN in NF Profile and Service

Syntax

```
--amfGparmName interPlmnFqdnNfProfile --amfGparmValue <string>
```

Description

Support receiving intra-PLMN notification of changes in the NFProfile/NFService containing the interPlmnFqdn attribute

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Recommended

true

Name

lmfDiscoveryLimit - LMF Discovery Limit

Syntax

```
--amfGparmName lmfDiscoveryLimit --amfGparmValue <string>
```

Description

Value to be used as the 'limit' Query Parameter in the NFDISCOVERY GET Requests for LMFs to the NRF. This parameter limits the Maximum number of NFProfiles to be returned in the response. When value is 0 (default), the AMF will not include the limit Query Parameter in the Request.

Type / Range

Integer in the range of 0 to 255

Default

0

Name

maxPayload - Max Payload

Syntax

```
--amfGparmName maxPayload --amfGparmValue <string>
```

Description

Defines the Maximum payload size (before compression, if any) of the response, expressed in kiloBytes. When set to value other than zero the relevant Query Parameter will be sent to the NRF which will limit the number of NF profiles returned in the response such as to not exceed the maximum payload size indicated in the request.

Type / Range

Integer in the range of 0 or 64 to 2,000

Default

0

Name

pcfDiscoveryLimit - PCF Discovery Limit

Syntax

```
--amfGparmName pcfDiscoveryLimit --amfGparmValue <string>
```

Description

Value to be used as the 'limit' Query Parameter in the NFDISCOVERY GET Requests for PCFs to the NRF. This parameter limits the Maximum number of NFProfiles to be returned in the response. When value is 0 (default), the AMF will not include the limit Query Parameter in the Request.

Type / Range

Integer in the range of 0 to 255

Default

0

Name

prefetchTimerFixedValue - Prefetch Timer Fixed Value

Syntax

```
--amfGparmName prefetchTimerFixedValue --amfGparmValue <string>
```

Description

Prefetch timer fixed value (in sec). Relevant when the NRF NF Profile Prefetch Timer Mode is set to fixed.

Type / Range

Integer in the range of 0 to 300

Default

16

Name

prefetchTimerMode - Prefetch Timer Mode

Syntax

--amfGparmName prefetchTimerMode --amfGparmValue <string>

Description

The NRF NFProfile Prefetch timer mode. In the fixed mode, the prefetch timer is set to the value given in the Prefetch Timer Fixed Value parameter and is common for all NFs. In the percent mode, the prefetch timer is calculated per NF as a percent of the Validity timer received in the NF Discovery Response from NRF (Prefetch Timer Percent Value * Validity).

List

- fixed - Prefetch timer is Fixed and common for all NFs.
- percent - Prefetch timer is calculated per NF as a percent of the validity timer received in the discovery response.

Default

fixed

Name

prefetchTimerPercentValue - Prefetch Timer Percent Value

Syntax

--amfGparmName prefetchTimerPercentValue --amfGparmValue <string>

Description

Prefetch timer percent value. Relevant when NRF NF Profile Prefetch Timer Mode is set to percent.

Type / Range

Integer in the range of 0 to 50

Default

10

Name

sendN2InterfaceAmfInfo - Send n2InterfaceAmfInfo

Syntax

--amfGparmName sendN2InterfaceAmfInfo --amfGparmValue <string>

Description

When this parameter is set to true AMF will include n2InterfaceAmfInfo in the AmfInfo of the NFProfile it Registers to NRF.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

sendNfSetIdListToNrf - Send NfSetIdList to NRF

Syntax

--amfGparamName sendNfSetIdListToNrf --amfGparamValue <string>

Description

When this parameter is set to true, AMF includes the NF Sets it belongs to in the nfSetIdList IE of the NFProfile it Registers in NRF.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

sendOnlyEndpointFqdnInRegistration - Send Only Endpoint Fqdn In Registration

Syntax

--amfGparamName sendOnlyEndpointFqdnInRegistration --amfGparamValue <string>

Description

When this parameter is set to True, the AMF omits the IPs and includes only the FQDN in the Endpoints of the NFServices and defaultNotificationSubscriptions in the Profile Registered to NRF.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

sendRequesterExtendedSnssais - Send Requester Extended S-NSSAIS

Syntax

--amfGparamName sendRequesterExtendedSnssais --amfGparamValue <string>

Description

When this parameter is set to true, the AMF supports populating the supported S-NSSAIs in Discovery Queries and Subscriptions Requests issued to NRF as Extended S-NSSAIs that (may) include SD Ranges (ExtSnssai)

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

sendRequesterNfInstanceId - Send Requester NF Instance ID

Syntax

--amfGparmName sendRequesterNfInstanceId --amfGparmValue <string>

Description

When this parameter is set to true CMM includes its own NF Instance ID when sending a Discovery Query or Subscribing to a NRF

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

sendRequesterPlmnInSubscriptions - Send Requester PLMN in Subscriptions

Syntax

--amfGparmName sendRequesterPlmnInSubscriptions --amfGparmValue
<string>

Description

When this parameter is set to true, CMM includes all Home and Shared PLMNs in the reqPlmnList IE when subscribing to a NRF for a NF Instance in a remote PLMN

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

sendRequesterSpecificSnssaiList - Send Requester Specific S-NSSAI List

Syntax

--amfGparmName sendRequesterSpecificSnssaiList --amfGparmValue
<string>

Description

When this parameter is set to true, the AMF will populate the list of supported S-NSSAIs per Serving PLMN in Discovery Queries issued to NRF when the Home PLMN or Serving PLMNs do not all share the same slice list. Additionally when this parameter is set to true, AMF will send the Requester Specific S-NSSAI List in Subscription Requests when the relevant IE is supported by the NRF API version and when the Home PLMN or Serving PLMNs do not all share the same slice list.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

sendSubscriptionsToQueryNrf - Send Subscriptions to Query NRF

Syntax

```
--amfGparamName sendSubscriptionsToQueryNrf --amfGparamValue <string>
```

Description

Controls the selection of the NRF where the NFStatusSubscribe requests are sent for newly discovered NFs. When the value is false the AMF sends the NFStatusSubscribe to the NRF where the AMF is currently Registered When the value is true the AMF sends the NFStatusSubscribe to the NRF used to discover the NF. Default value is false.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

smfDiscoveryLimit - SMF Discovery Limit

Syntax

```
--amfGparamName smfDiscoveryLimit --amfGparamValue <string>
```

Description

Value to be used as the 'limit' Query Parameter in the NFDISCOVERY GET Requests for SMFs to the NRF. This parameter limits the Maximum number of NFProfiles to be returned in the response. When value is 0 (default), the AMF will not include the limit Query Parameter in the Request.

Type / Range

Integer in the range of 0 to 255

Default

0

Name

smsfDiscoveryLimit - SMSF Discovery Limit

Syntax`--amfGparmName smsfDiscoveryLimit --amfGparmValue <string>`**Description**

Value to be used as the 'limit' Query Parameter in the NFDISCOVERY GET Requests for SMSFs to the NRF. This parameter limits the Maximum number of NFProfiles to be returned in the response. When value is 0 (default), the AMF will not include the limit Query Parameter in the Request.

Type / Range

Integer in the range of 0 to 255

Default

0

Name

subscriptionRateLimit - Rate Limit for NRF Subscriptions

Syntax`--amfGparmName subscriptionRateLimit --amfGparmValue <string>`**Description**

This parameter defines the rate (per second) above which NRF Subscriptions will be rate limited. Heartbeats and Registrations of the NRF Management API will never be rate limited. When this parameter is set to 0 rate limiting is not applied for Subscription Requests.

Type / Range

Limit above which requests will be rate limited in units of Second

Default

0

Name

supportPerPlmnSnssaiListInNfProfiles - Support per PLMN S-NSSAI List in NF Profiles

Syntax`--amfGparmName supportPerPlmnSnssaiListInNfProfiles --amfGparmValue <string>`**Description**

When this parameter is set to true, CMM will evaluate the per PLMN S-NSSAI List IE in NF Profile received from NRF during NF Discovery operations. Setting this this parameter to false does not block CMM from populating per PLMN S-NSSAI List in its own NF Profile sent to NRF during Registration.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

supportPerPlmnSnssaiListInSmfServices - Support per PLMN S-NSSAI List in SMF Services

Syntax

```
--amfGparmName supportPerPlmnSnssaiListInSmfServices --amfGparmValue <string>
```

Description

When this parameter is set to true, CMM will evaluate the per PLMN S-NSSAI List IE in NF Services received from NRF during NF Discovery operations for SMF. This parameter can be activated only when Supporting per PLMN S-NSSAI List on Profile level is activated.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

suppressIdenticalDiscRequests - Suppress Identical Discovery Requests

Syntax

```
--amfGparmName suppressIdenticalDiscRequests --amfGparmValue <string>
```

Description

When this parameter is enabled AMF will avoid sending the exact same Discovery Request to NRF multiple times if one is issued and response has not yet been received.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

udmDiscoveryLimit - UDM Discovery Limit

Syntax

```
--amfGparmName udmDiscoveryLimit --amfGparmValue <string>
```

Description

Value to be used as the 'limit' Query Parameter in the NFDISCOVERY GET Requests for UDM to the NRF. This parameter limits the Maximum number of NFProfiles to be returned in the response. When value is 0 (default), the AMF will not include the limit Query Parameter in the Request.

Type / Range

Integer in the range of 0 to 255

Default

0

Name

useExpiredNfProfiles - Use Expired NF Profiles

Syntax

```
--amfGparmName useExpiredNfProfiles --amfGparmValue <string>
```

Description

When this parameter is set to true, in case CMM failed to find a matching NF profile from the local cache and the NRF Discovery failed, will search whether an expired cached NF Profile matches the Discovery criterions prior to falling back to locally provisioned NFs.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

useL1L2NrfCache - Use L1L2 Nrf Cache

Syntax

```
--amfGparmName useL1L2NrfCache --amfGparmValue <string>
```

Description

This parameter activates the use of the L1L2 Discovery Result Cache for NF selection.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

useServiceMaps - Use Service Maps

Syntax

```
--amfGparmName useServiceMaps --amfGparmValue <string>
```

Description

When this parameter is enabled CMM will indicate to the NRF that it supports identifying the list of NF Service Instances as a map in Discovery and Subscription Requests, and will Register to NRF its own NF Profile populating its services as a map of NF Service Instances.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

3.91 cmm amfNrfHttp2ToNasCcMapping

NRF HTTP2 to NAS Cause Codes Mapping. Syntax, description, parameters, and roles for cmm amfNrfHttp2ToNasCcMapping command.

Syntax**Description**

Defines NRF HTTP2 Status Codes Mapping to AMF NAS Cause Codes. The maximum number of profiles supported is 128. A default profile, named 'default', is provided.

Parameters**Name**

amfNrfHttp2ToNasCcMappingListName - NRF HTTP2 to NAS CC mapping list name

Syntax

```
--amfNrfHttp2ToNasCcMappingListName <string>
```

Description

The name of the HTTP2 to 5G NAS Cause Code mapping list to be used for NRF

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

nrfHttp2StatusCode - NRF HTTP2 Status Code

Syntax

--nrfHttp2StatusCode <list-item>

Description

Defines the NRF HTTP2 Status Code to map to 5G NAS Cause Code

Class

Required key.

List

- 200_OK - 200 OK - The NFDDiscover Query is successfully processed by NRF but SearchResult contains no matching NF Profiles.
- 4XX_CLIENT_ERROR - 4xx Client Error - The NFDDiscover Query was rejected by the NRF due to an error in the request
- 5XX_SERVER_ERROR - 5xx Server Error - The NFDDiscover Query was rejected by the NRF as it was unable to process the request due to a Server Error
- DECODING_FAILURE - Decoding Failure - The AMF faces an error when decoding the NRF response.
- LINK_DOWN - Link Down - All TCP connections for the NFDDiscovery Service are unavailable (TCP unable to be setup or Link disabled via link management CLI).
- TIMEOUT - AMF times out when waiting for a response from the NRF.

Name

nfType - NF Type

Syntax

--nfType <list-item>

Description

NF Type that for which the NFDDiscovery Query was sent to the NRF. The Cause code assigned to the NF type 'DEFAULT' is used when no Cause Code is defined for the specific NF Type.

Class

Required key.

List

- 5GEIR - 5G EIR - The network function type of 5G-Equipment Identity Register.
- AMF - Access and Mobility Manager Function - The network function type of Access and Mobility Manager Function.
- AUSF - Authentication Server Function - The network function type of Authentication Server Function.
- NSSF - Network Slice Selection Function - The network function type of Network Slice Selection Function
- SMF - Session Management Function - The network function type of Session Management Function.
- SMSF - Short Message Service Function - The network function type of Short Message Service Function.
- UDM - Unified Data Manager - The network function type of Unified Data Manager.

Name

procedure - Procedure

Syntax

--procedure <list-item>

Description

Defines the procedure to apply the NRF error code into 5GMM cause code mapping.

Class

Required key.

List

- DEFAULT - Default Procedure

Name

amf5gMmCc - 5GMM NAS Cause Code

Syntax

--amf5gMmCc <integer>

Description

Defines the 5GMM NAS cause code to use towards the UE based on either the HTTP2 Status Code received from the NRF, or other error (e.g. timeout). The default value depends on peer NF and nature of the error. For 5G EIR timeout, link down or decoding error, NAS cause code 5 is used by default. For UDM or AUSF timeout, link down or decoding error, NAS cause code 10 is used by default. For SMF 200 OK, NAS cause code 91 is used by default.

Class

Optional.

Type / Range

5GMM Cause Code.

Default

90

Name

useSystemDefaultCC - Use System Default Cause code

Syntax`--useSystemDefaultCC <list-item>`**Description**

This Parameter controls if AMF will use System's default Cause code or the 5GMM Cause Code defined in the amf5gMmCc parameter for the specific combination of Procedure, NfType and HTTP Status Code. Default value is true which means that System's default Cause code will be sent back to the UE.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

3.93 cmm amfNrfPreferredParameterOrderProfile

NRF Preferred Parameter Order Profile. Syntax, description, parameters, and roles for cmm amfNrfPreferredParameterOrderProfile command.

Syntax

Description

This command parameter defines the relative order of precedence of the preferred-xxx query parameter when multiple preferred-xxx query parameters are included in the NF discovery and selection. Smaller order value indicates higher precedence. It is not allowed to have multiple preferred-XXX parameters with the same order. A default profile named 'default' always exists and can be modified but not deleted.

Parameters

Name

name - Name

Syntax

--name <string>

Description

Name of the profile

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

preferredFullPlmnOrder - Preferred Full PLMN

Syntax

--preferredFullPlmnOrder <integer>

Description

This parameter defines the order of precedence of the preferred-full-plmn query parameter when multiple preferred-xxx query parameters are included in the NF discovery and selection. Smaller order value indicates higher precedence. It is not allowed to have multiple preferred-XXX parameters with the same order.

Class

Optional.

Type / Range

Precedence order a preferred-xxx query parameter should be evaluated when multiple such query parameters are included for the NF discovery and selection (smaller order value indicates higher precedence).

Default

30

Name

preferredLocalityOrder - Preferred Locality Order

Syntax

--preferredLocalityOrder <integer>

Description

This parameter defines the order of precedence of the preferred-locality query parameter when multiple preferred-xxx query parameters are included in the NF discovery and selection. Smaller order value indicates higher precedence. It is not allowed to have multiple preferred-XXX parameters with the same order.

Class

Optional.

Type / Range

Precedence order a preferred-xxx query parameter should be evaluated when multiple such query parameters are included for the NF discovery and selection (smaller order value indicates higher precedence).

Default

100

Name

preferredNfInstancesOrder - Preferred NF Instances Order

Syntax

--preferredNfInstancesOrder <integer>

Description

This parameter defines the order of precedence the preferred-nf-instances query parameter when multiple preferred-xxx query parameters are included in the NF discovery and selection. Smaller order value indicates higher precedence. It is not allowed to have multiple preferred-XXX parameters with the same order.

Class

Optional.

Type / Range

Precedence order a preferred-xxx query parameter should be evaluated when multiple such query parameters are included for the NF discovery and selection (smaller order value indicates higher precedence).

Default

10

Name

preferredSupiOrder - Preferred SUPI Order

Syntax

--preferredSupiOrder <integer>

Description

This parameter defines the order of precedence of the preferred-supi query parameter when multiple preferred-xxx query parameters are included in the NF discovery and selection. Smaller order value indicates higher precedence. It is not allowed to have multiple preferred-XXX parameters with the same order.

Class

Optional.

Type / Range

Precedence order a preferred-xxx query parameter should be evaluated when multiple such query parameters are included for the NF discovery and selection (smaller order value indicates higher precedence).

Default

20

Name

preferredTaiOrder - Preferred TAI Order

Syntax`--preferredTaiOrder <integer>`**Description**

This parameter defines the order of precedence of the preferred-tai query parameter when multiple preferred-xxx query parameters are included in the NF discovery and selection. Smaller order value indicates higher precedence. It is not allowed to have multiple preferred-XXX parameters with the same order.

Class

Optional.

Type / Range

Precedence order a preferred-xxx query parameter should be evaluated when multiple such query parameters are included for the NF discovery and selection (smaller order value indicates higher precedence).

Default

50

3.94 cmm amfNrRedcapGParms

AMF NR RedCap Global Parameters. Syntax, description, parameters, and roles for cmm amfNrRedcapGParms command.

Syntax

Description

Administer global parameters for NR RedCap.

Parameters

Name

amfGparmName - Parameter name

Syntax

--amfGparmName <list-item>

Description

Name of parameter

Class

Required key.

List

- redcapAsAmfProducer - RedCap As AMF Producer - Defines whether the AMF is to include a redcap RAT, if applicable to a given UE, in communicating as a producer to another core network element when the SBI is R16. Note that RedCap RAT is always included if the SBI version is R17 or greater, regardless of this parameter setting.
- redcapToAmf - RedCap To AMF - Defines whether the AMF is to include a redcap indication, if applicable to a given UE, in communicating to another AMF when the SBI is less than R17. Note that RedCap RAT is always included if the SBI version is R17, regardless of this parameter setting.
- redcapToPcf - RedCap to PCF - Specifies whether the RedCap RAT, if applicable to a given UE, shall be sent to the PCF if an R16 SBI version is used. The default is no. Note that RedCap RAT is always included if the SBI version is R17, regardless of this parameter setting.
- redcapToSmf - RedCap to SMF - Specifies whether the RedCap indication, if applicable to a given UE, is to be sent to an SMF when the SBI is not R17. The default is no. Note that RedCap RAT is always included if the SBI version is R17, regardless of this parameter setting.
- redcapToSmsf - RedCap to SMSF - Defines whether the AMF is to include a RedCap indication, if applicable to a given UE, to the SMSF if the SBI is prior to R17. Note that RedCap RAT is always included if the SBI version is R17, regardless of this parameter setting.
- redcapToUdm - RedCap to UDM - Defines whether the MME is to include a RedCap indication, if applicable to a given UE, to the UDM if the SBI is prior to R17. Note that RedCap RAT is always included if the SBI version is R17, regardless of this parameter setting.

Name

amfGparmValue - Parameter value

Syntax

--amfGparmValue <string>

Description

Value of parameter

Class

Required on create.

Type / Range

Digit string of length 0 to 64

The amfGparmValue string is based on the amfGparmName parameter:

Name

redcapAsAmfProducer - RedCap As AMF Producer

Syntax

--amfGparmName redcapAsAmfProducer --amfGparmValue <string>

Description

Defines whether the AMF is to include a redcap RAT, if applicable to a given UE, in communicating as a producer to another core network element when the SBI is R16. Note that RedCap RAT is always included if the SBI version is R17 or greater, regardless of this parameter setting.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

redcapToAmf - RedCap To AMF

Syntax

--amfGparmName redcapToAmf --amfGparmValue <string>

Description

Defines whether the AMF is to include a redcap indication, if applicable to a given UE, in communicating to another AMF when the SBI is less than R17. Note that RedCap RAT is always included if the SBI version is R17, regardless of this parameter setting.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

redcapToPcf - RedCap to PCF

Syntax

--amfGparmName redcapToPcf --amfGparmValue <string>

Description

Specifies whether the RedCap RAT, if applicable to a given UE, shall be sent to the PCF if an R16 SBI version is used. The default is no. Note that RedCap RAT is always included if the SBI version is R17, regardless of this parameter setting.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

redcapToSmf - RedCap to SMF

Syntax

--amfGparmName redcapToSmf --amfGparmValue <string>

Description

Specifies whether the RedCap indication, if applicable to a given UE, is to be sent to an SMF when the SBI is not R17. The default is no. Note that RedCap RAT is always included if the SBI version is R17, regardless of this parameter setting.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

redcapToSmsf - RedCap to SMSF

Syntax

--amfGparmName redcapToSmsf --amfGparmValue <string>

Description

Defines whether the AMF is to include a RedCap indication, if applicable to a given UE, to the SMSF if the SBI is prior to R17. Note that RedCap RAT is always included if the SBI version is R17, regardless of this parameter setting.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

redcapToUdm - RedCap to UDM

Syntax

--amfGparmName redcapToUdm --amfGparmValue <string>

Description

Defines whether the MME is to include a RedCap indication, if applicable to a given UE, to the UDM if the SBI is prior to R17. Note that RedCap RAT is always included if the SBI version is R17, regardless of this parameter setting.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

3.95 cmm amfNssfHttp2ToNasCcMapping

NSSF HTTP2 To NAS CC mapping. Syntax, description, parameters, and roles for cmm amfNssfHttp2ToNasCcMapping command.

Syntax**Description**

Defines NSSF HTTP2 Status Codes Mapping to AMF NAS Cause Codes.

Parameters

Name

amfNssfHttp2ToNasCcMappingListName - NSSF HTTP2 to NAS CC mapping list name

Syntax

--amfNssfHttp2ToNasCcMappingListName <string>

Description

The name of the NSSF HTTP2 to 5G NAS Cause Code mapping list

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

nssfHttp2StatusCode - NSSF HTTP2 Status Code

Syntax

--nssfHttp2StatusCode <list-item>

Description

NSSF HTTP2 Status Code

Class

Required key.

List

- 403_SNSSAI_NOT_SUPPORTED - 403 SNSSAI NOT SUPPORTED
- OTHER - Used for Status Codes for which mapping for exact Status and Application error is not defined.

Name

procedure - Procedure

Syntax

--procedure <list-item>

Description

Procedure for which the mapping is relevant

Class

Required key.

List

- pduSessionEstablishment - PDU Session Establishment
- ueMobility - UE Mobility

Name

amf5gMmCc - 5GMM NAS Cause Code

Syntax

--amf5gMmCc <integer>

Description

Defines the 5GMM NAS cause code to use towards the UE based on the HTTP2 Status Code received from the NSSF

Class

Optional.

Type / Range

5GMM Cause Code.

Default

62

Roles**Show**

3.97 cmm amfOlcGParms

AMF OLC. Syntax, description, parameters, and roles for cmm amfOlcGParms command.

Syntax**Description**

This command is used to provision AMF global Overload related parameters

Parameters**Name**

amfGparmName - Parameter Name

Syntax

--amfGparmName <list-item>

Description

Name of parameter

Class

Required key.

List

- **amfOverloadMmRejectionNasCc** - AMF Overload MM Rejection NAS CC - AMM 5GMM Cause Code to be sent in the mobility management reject messages (Registration Reject and Service Reject) due to any AMF overload or throttling of AMM procedures. Valid values are 3,5...7,9...13,15,20...24,26...28,43,65,67,69,71...73,90...92,95...101,111
- **apcmdSheddingDuringOverload** - APCMD Shedding During Overload
- **enableAmfOverloadBackoffTimer** - Enable AMF Overload Backoff Timer - This flag is used to enable the capability of AMF to include a randomly-selected T3346 timer value whenever an initial registration or a service request procedure is rejected due to IPDS CPU overload, CPPS CPU overload, or CXN object overload. no (default) - set the T3346 back-off timer to 0. yes - set the T3346 back-off timer to a randomly-selected value between provisioned minimum and maximum values.
- **memoryAlarmForRestrictedPaging** - Memory Overload Alarm for AMF Restricted Paging - Memory Overload Alarm at which CMM starts AMF Restricted Paging
- **ngapOverloadAction** - NGAP Overload Action - This is the action signaled over NGAP when AMF gets into overload (according to 3GPP 38.413)
- **ocSendOverloadStartAndStopToGnbs** - Overload Control Send Overload Start and Stop Messages to gNBs - A value of true indicates the AMF will send Overload Start and Overload Stop messages to gNBs as part of Overload Control. A value of false indicates the AMF will not send Overload Start and Overload Stop messages.
- **restrictPagingDuringOverload** - Restrict Paging During Overload - Restrict paging during overload.

Name

amfGparmValue - Parameter Value

Syntax

--amfGparmValue <string>

Description

The value of the global parameter

Class

Required on create.

Type / Range

Digit string of length 0 to 64

The amfGparmValue string is based on the amfGparmName parameter:

Name

amfOverloadMmRejectionNasCc - AMF Overload MM Rejection NAS CC

Syntax

--amfGparmName amfOverloadMmRejectionNasCc --amfGparmValue <string>

Description

AMM 5GMM Cause Code to be sent in the mobility management reject messages (Registration Reject and Service Reject) due to any AMF overload or throttling of AMM procedures. Valid values are 3,5...7,9...13,15,20...24,26...28,43,65,67,69,71...73,90...92,95...101,111

Type / Range

5GMM Cause Code.

Default

22

Name

apcmdSheddingDuringOverload - APCMD Shedding During Overload

Syntax

--amfGparmName apcmdSheddingDuringOverload --amfGparmValue <string>

Description

APCMD Shedding During Overload

List

- doNotDropApcmdDuringOverload - Do not drop APCMD during overload
- dropApcmdToNeccDuringMajorOverload - Drop APCMD to NECC during major overload

Default

doNotDropApcmdDuringOverload

Name

enableAmfOverloadBackoffTimer - Enable AMF Overload Backoff Timer

Syntax

--amfGparmName enableAmfOverloadBackoffTimer --amfGparmValue <string>

Description

This flag is used to enable the capability of AMF to include a randomly-selected T3346 timer value whenever an initial registration or a service request procedure is rejected due to IPDS CPU overload, CPPS CPU overload, or CXN object overload. no (default) - set the T3346 back-off timer to 0. yes - set the T3346 back-off timer to a randomly-selected value between provisioned minimum and maximum values.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

memoryAlarmForRestrictedPaging - Memory Overload Alarm for AMF Restricted Paging

Syntax

```
--amfGparmName memoryAlarmForRestrictedPaging --amfGparmValue  
<string>
```

Description

Memory Overload Alarm at which CMM starts AMF Restricted Paging

List

- minor - Minor Memory Alarm
- major - Major Memory Alarm
- critical - Critical Memory Alarm

Default

minor

Name

ngapOverloadAction - NGAP Overload Action

Syntax

```
--amfGparmName ngapOverloadAction --amfGparmValue <string>
```

Description

This is the action signaled over NGAP when AMF gets into overload (according to 3GPP 38.413)

List

- rejRrcForNonEmergMoDt - Reject RRC connection establishments for non-emergency MO DT - Reject RRC connection establishments for non-emergency MO DT (3GPP 38.413)
- rejRrcForSignaling - Reject RRC connection establishments for Signaling - Reject RRC connection establishments for Signaling (3GPP 38.413)
- permitEmergSessAndMtServicesOnly - Permit Emergency Sessions and mobile terminated services only - Permit Emergency Sessions and mobile terminated services only (3GPP 38.413)
- permitHighPrioSessAndMtServicesOnly - Permit High Priority Sessions and mobile terminated services only - Permit High Priority Sessions and mobile terminated services only (3GPP 38.413)

Default

rejRrcForNonEmergMoDt

Name

ocSendOverloadStartAndStopToGnbs - Overload Control Send Overload Start and Stop Messages to gNBs

Syntax

```
--amfGparmName ocSendOverloadStartAndStopToGnbs --amfGparmValue <string>
```

Description

A value of true indicates the AMF will send Overload Start and Overload Stop messages to gNBs as part of Overload Control. A value of false indicates the AMF will not send Overload Start and Overload Stop messages.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

restrictPagingDuringOverload - Restrict Paging During Overload

Syntax

```
--amfGparmName restrictPagingDuringOverload --amfGparmValue <string>
```

Description

Restrict paging during overload.

List

- DISABLE - Disable
- ENABLE - Enable

Default

ENABLE

3.98 cmm amfOlcTimersProfile

AMF Overload Control Timers. Syntax, description, parameters, and roles for cmm amfOlcTimersProfile command.

Syntax

Description

This command is used to provision AMF Overload Control related timers

Parameters

Name

name - AMF OLC Timers Profile Name

Syntax

--name <string>

Description

Name of the profile. Identifies AMF OLC Timers Profile to be used instead of the timer values in amfNasTimers.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Name

dlNasTransportBackoffTimerMaximum - DL NAS Transport Backoff Timer Maximum

Syntax

--dlNasTransportBackoffTimerMaximum <integer>

Description

Specifies the maximum value to consider when assigning this timer value to be used for a Downlink Nas Transport procedure rejection due to IPDS CPU overload, CPPS CPU overload, and CXN object overloads with NAS cause code #22 (Congestion).

Class

Optional.

Type / Range

Integer in the range of 1 to 600

Default

60

Name

dlNasTransportBackoffTimerMinimum - DL NAS Transport Backoff Timer Minimum

Syntax

--dlNasTransportBackoffTimerMinimum <integer>

Description

Specifies the minimum value to consider when assigning this timer value to be used for a Downlink Nas Transport procedure rejection due to IPDS CPU overload, CPPS CPU overload, and CXN object overloads with NAS cause code #22 (Congestion).

Class

Optional.

Type / Range

Integer in the range of 1 to 600

Default

15

Name

t3346registerRejectMaximum - T3346 Register Reject Maximum

Syntax

--t3346registerRejectMaximum <integer>

Description

Specifies the maximum value to consider when randomly assigning the T3346 timer value to be used for an register procedure rejection due to IPDS CPU overload, CPPS CPU overload, and CXN object overloads with NAS cause code #22 (Congestion)

Class

Optional.

Type / Range

Integer in the range of 1 to 1800 in units of Second

Default

60

Name

t3346registerRejectMinimum - T3346 Register Reject Minimum

Syntax

--t3346registerRejectMinimum <integer>

Description

Specifies the minimum value to consider when randomly assigning the T3346 timer value to be used for an register procedure rejection due to IPDS CPU overload, CPPS CPU overload, and CXN object overloads with NAS cause code #22 (Congestion)

Class

Optional.

Type / Range

Integer in the range of 1 to 1800 in units of Second

Default

15

Name

t3346srRejectMaximum - T3346 SR Reject Maximum

Syntax

--t3346srRejectMaximum <integer>

Description

Specifies the maximum value to consider when randomly assigning the T3346 timer value to be used for an SR procedure rejection due to IPDS CPU overload, CPPS CPU overload, and CXN object overloads with NAS cause code #22 (Congestion).

Class

Optional.

Type / Range

Integer in the range of 1 to 1800 in units of Second

Default

60

Name

t3346srRejectMinimum - T3346 SR Reject Minimum

Syntax

--t3346srRejectMinimum <integer>

Description

Specifies the minimum value to consider when randomly assigning the T3346 timer value to be used for an SR procedure rejection due to IPDS CPU overload, CPPS CPU overload, and CXN object overloads with NAS cause code #22 (Congestion).

Class

Optional.

Type / Range

Integer in the range of 1 to 1800 in units of Second

Default

15

3.99 cmm amfPagingMethodOverride

AMF Paging Policy Map. Syntax, description, parameters, and roles for cmm amfPagingMethodOverride command.

Syntax**Description**

Maps an existing paging policy to an override policy based on 5GPaging Type and UE plmn or supi range.

Parameters**Name**

nearestNeighborMethod - Nearest Neighbor Method

Syntax

--nearestNeighborMethod <list-item>

Description

The nearest neighbor paging method that is to be mapped to another paging method at a certain percentage.

Class

Required key.

List

- Level1NearestNeighbor - Level 1 Nearest Neighbor - The set of gNBs immediately adjacent to the UE's last confirmed location.
- Level2NearestNeighbor - Level 2 Nearest Neighbor - The set of gNBs up to two hops away from the UE's last confirmed location.
- Level3NearestNeighbor - Level 3 Nearest Neighbor - The set of gNBs up to three hops away from the UE's last confirmed location.
- AiMIDrivenGnbList - AIML Driven Gnb List - Set of GNBs forecast to be the nearest neighbors of UE's last confirmed location

Name

overridePagingMethod - Override Paging Method

Syntax

--overridePagingMethod <list-item>

Description

The paging method to be used. It is selected at a rate of 100% - percentage.

Class

Required on create.

List

- LastSeenGnb - Last Seen Gnb - The last seen Gnb
- LastSeenGnbList - Last Seen Gnb List
- LastSeenTai - Last Seen TAI - The last seen Tracking Area Identity
- LastSeenTailist - Last Seen TAI List - Last seen tracking area identity neighbor TAI

Name

maxGnbsPaged - Maximum number of gNBs paged

Syntax

--maxGnbsPaged <integer>

Description

Defines the maximum number of gNBs that may be paged for this page attempt. A value of 0 indicates that the default limit of gNBs to be paged applies.

Class

Optional.

Type / Range

Integer in the range of 0 to 30

Default

0

Recommended

10

Name

pctAsHundredths - Percent As Hundredths

Syntax

--pctAsHundredths <list-item>

Description

If set true, the AMF is to interpret the percentage field as hundredths of one percent. The default is false.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Recommended

false

Name

percentage - Percentage

Syntax

--percentage <integer>

Description

The percentage of paging attempts that are to use the specified nearest neighbor paging method. The other paging attempts outside of this percentage will use the specified override paging method.

Class

Optional.

Type / Range

Integer in the range of 0 to 100

Default

0

Recommended

0

3.100 cmm amfPagingPolicy

CMM AMF Paging Policy. Syntax, description, parameters, and roles for cmm amfPagingPolicy command.

Syntax

Description

This command is used to administer a cmm AMF Paging Policy and includes parameters for defining the number of paging attempts, the maximum number of Gnbs paged, paging method, paging type, and paging response timer.

Parameters

Name

plmnName - Mobile network name

Syntax

--plmnName <string>

Description

Name that identifies mobile network.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

amf5GpagingType - AMF 5G Paging type

Syntax

--amf5GpagingType <list-item>

Description

Defines the type of paging to be done, basic, at least one tuple must exist for each paging type.

Class

Required key.

List

- 5QI1 - 5QI-1 - Defines the type of 5QI-1 paging to be done.
- 5QI2 - 5QI-2 - Defines the type of 5QI-2 paging to be done.
- 5QI3 - 5QI-3 - Defines the type of 5QI-3 paging to be done.

- 5QI4 - 5QI-4 - Defines the type of 5QI-1 paging to be done.
- 5QI5 - 5QI-5 - Defines the type of 5QI-1 paging to be done.
- 5QI6 - 5QI-6 - Defines the type of 5QI-1 paging to be done.
- 5QI7 - 5QI-7 - Defines the type of 5QI-7 paging to be done.
- 5QI8 - 5QI-8 - Defines the type of 5QI-8 paging to be done.
- 5QI9 - 5QI-9 - Defines the type of 5QI-9 paging to be done.
- ARP1 - Defines the type of ARP1 paging to be done.
- ARP10 - Defines the type of ARP10 paging to be done.
- ARP11 - Defines the type of ARP11 paging to be done.
- ARP12 - Defines the type of ARP12 paging to be done.
- ARP13 - Defines the type of ARP13 paging to be done.
- ARP14 - Defines the type of ARP14 paging to be done.
- ARP15 - Defines the type of ARP15 paging to be done.
- ARP2 - Defines the type of ARP2 paging to be done.
- ARP3 - Defines the type of ARP3 paging to be done.
- ARP4 - Defines the type of ARP4 paging to be done.
- ARP5 - Defines the type of ARP5 paging to be done.
- ARP6 - Defines the type of ARP6 paging to be done.
- ARP7 - Defines the type of ARP7 paging to be done.
- ARP8 - Defines the type of ARP8 paging to be done.
- ARP9 - Defines the type of ARP9 paging to be done.
- Basic - Defines the type of paging to be done, basic, at least one tuple must exist for each paging type.
- PPI0 - Paging Policy Indication 0 - Paging policy differentiation using Paging Policy Indication value 0.
- PPI1 - Paging Policy Indication 1 - Paging policy differentiation using Paging Policy Indication value 1.
- PPI2 - Paging Policy Indication 2 - Paging policy differentiation using Paging Policy Indication value 2.
- PPI3 - Paging Policy Indication 3 - Paging policy differentiation using Paging Policy Indication value 3.
- PPI4 - Paging Policy Indication 4 - Paging policy differentiation using Paging Policy Indication value 4.

- PPI5 - Paging Policy Indication 5 - Paging policy differentiation using Paging Policy Indication value 5.
- PPI6 - Paging Policy Indication 6 - Paging policy differentiation using Paging Policy Indication value 6.
- PPI7 - Paging Policy Indication 7 - Paging policy differentiation using Paging Policy Indication value 7.
- PtOverride1 - Paging Type Override 1 - The PEIPS feature can map a given paging type (e.g. 5QI5) to this override paging type. If mapped, this paging type can then be used to specify different paging treatment from the mapped (e.g. 5QI5) paging type.
- PtOverride2 - Paging Type Override 2 - The PEIPS feature can map a given paging type (e.g. 5QI5) to this override paging type. If mapped, this paging type can then be used to specify different paging treatment from the mapped (e.g. 5QI5) paging type.
- PtOverride3 - Paging Type Override 3 - The PEIPS feature can map a given paging type (e.g. 5QI5) to this override paging type. If mapped, this paging type can then be used to specify different paging treatment from the mapped (e.g. 5QI5) paging type.
- PtOverride4 - Paging Type Override 4 - The PEIPS feature can map a given paging type (e.g. 5QI5) to this override paging type. If mapped, this paging type can then be used to specify different paging treatment from the mapped (e.g. 5QI5) paging type.
- PtOverride5 - Paging Type Override 5 - The PEIPS feature can map a given paging type (e.g. 5QI5) to this override paging type. If mapped, this paging type can then be used to specify different paging treatment from the mapped (e.g. 5QI5) paging type.
- PtOverride6 - Paging Type Override 6 - The PEIPS feature can map a given paging type (e.g. 5QI5) to this override paging type. If mapped, this paging type can then be used to specify different paging treatment from the mapped (e.g. 5QI5) paging type.
- PtOverride7 - Paging Type Override 7 - The PEIPS feature can map a given paging type (e.g. 5QI5) to this override paging type. If mapped, this paging type can then be used to specify different paging treatment from the mapped (e.g. 5QI5) paging type.
- PtOverride8 - Paging Type Override 8 - The PEIPS feature can map a given paging type (e.g. 5QI5) to this override paging type. If mapped, this paging type can then be used to specify different paging treatment from the mapped (e.g. 5QI5) paging type.
- PtOverride9 - Paging Type Override 9 - The PEIPS feature can map a given paging type (e.g. 5QI5) to this override paging type. If mapped, this paging type can then be used to specify different paging treatment from the mapped (e.g. 5QI5) paging type.
- Restricted - Restricted paging is triggered when OLC determines the CMM is in overload. the restricted paging type is used instead of the normal paging types during an overload condition. the restricted paging type normally has only a single page attempt. The only methods allowed for restricted are LastSeenGnb nad LastSeenGnbList.
- SxnRestoration - Session Restoration Paging - This paging policy is limited to Session Restoration - 1 time only, no second page attempt.

- **currentLocation** - Current Location - The paging is triggered due to consumer NF request for the current location of a CM-IDLE UE: Namf_EventExposure for LOCATION_REPORT or Namf_Location_ProvideLocationInfo.
- **hf1** - For UEs assigned eDRX cycle of one hyperframe (10.24 seconds)
- **hf1024** - Hyperframe 1024 - For UEs assigned eDRX cycle of 1024 hyperframes (10485.76 seconds)
- **hf128** - Hyperframe 128 - For UEs assigned eDRX cycle of 128 hyperframes (1310.72 seconds)
- **hf16** - Hyperframe 16 - For UEs assigned eDRX cycle of 16 hyperframes (163.84 seconds)
- **hf2** - Hyperframe 2 - For UEs assigned eDRX cycle of two hyperframes (20.48 seconds)
- **hf256** - Hyperframe 256 - For UEs assigned eDRX cycle of 256 hyperframes (2621.44 seconds)
- **hf32** - Hyperframe 32 - For UEs assigned eDRX cycle of 32 hyperframes (327.68 seconds)
- **hf4** - Hyperframe 4 - For UEs assigned eDRX cycle of four hyperframes (40.96 seconds)
- **hf512** - Hyperframe 512 - For UEs assigned eDRX cycle of 512 hyperframes (5242.88 seconds)
- **hf64** - Hyperframe 64 - For UEs assigned eDRX cycle of 64 hyperframes (655.36 seconds)
- **hf8** - Hyperframe 8 - For UEs assigned eDRX cycle of 8 hyperframes (81.92 seconds)
- **hfhalf** - Hyperframe Half - For UEs assigned eDRX cycle of a half hyperframe (5.12 seconds)
- **hfquarter** - Hyperframe Quarter - For UEs assigned eDRX cycle of a quarter hyperframe (2.56 seconds)
- **non3gppAccess** - Non-3GPP access - The paging over 3GPP access is triggered by non-3GPP access related signaling.
- **ueReachability** - UE Reachability Request - The paging trigger is Namf_EnableUERachability to make the UE reachable for e.g. MT SMS sending.

Default

Basic

Name

amfAttempt - Attempt

Syntax

--amfAttempt <list-item>

Description

Defines the attempt (1 of 4 possible). attempt numbers must start at 1 and be consecutive (1st attempt, 2nd attempt, and so on).

Class

Required key.

List

- Attempt1 - Attempt 1 - First attempt.
- Attempt2 - Attempt 2 - Second attempt.
- Attempt3 - Attempt 3 - Third attempt.
- Attempt4 - Attempt 4 - 4th attempt.

Name

amf5Gt3513Timer - 5G Paging T3513 timer

Syntax

--amf5Gt3513Timer <integer>

Description

Defines the value for the T3513 timer used for receiving responses to a paging request. When this timer expires, it triggers the AMF to proceed with the next paging attempt as provisioned in the AMF paging policy table. This timer value should be set according to the maximum time it takes a UE to respond to a paging message under normal operating conditions. The T3513 timer interval is in msec. The default timer value varies per the eDRX cycle: Hfquarter 3s; Hfhalf 6s; Hf1 11s; and for all eDRX cycles greater than one hyperframe 2.56s. Timer interval will only have a precision of +/- 100 milliseconds. The CMM timer wheel does not have an accuracy down to the millisecond. This timer also applies for eDRX paging timeout.

Class

Optional.

Type / Range

Integer in the range of 1 to 12,000 in units of Millisecond

Default

6000

Name

amfMethod - Method

Syntax

--amfMethod <list-item>

Description

Method that the designated attempt (1 - 4) should use.

Class

Optional.

List

- LastSeenGnb - Last Seen Gnb - The last seen Gnb
- LastSeenGnbList - Last Seen Gnb List - Last seen Gnb List
- LastSeenTai - Last Seen TAI - The last seen Tracking Area Identity
- LastSeenTaiList - Last Seen TAI List - Last seen tracking area identity neighbor TAI
- Level1NearestNeighbor - Level 1 Nearest Neighbor - The set of gNBs immediately adjacent to the UE's last confirmed location.
- Level2NearestNeighbor - Level 2 Nearest Neighbor - The set of gNBs up to two hops away from the UE's last confirmed location.
- Level3NearestNeighbor - Level 3 Nearest Neighbor - The set of gNBs up to three hops away from the UE's last confirmed location.
- AiMIDrivenGnbList - AIML Driven Gnb List - Set of GNBs forecast to be the nearest neighbors of UE's last confirmed location

Default

LastSeenGnb

Name

maxGnbsPaged - Maximum number of gNBs paged

Syntax

--maxGnbsPaged <integer>

Description

Defines the maximum number of gNBs that may be paged for this page attempt. A value of 0 indicates that the default limit of gNBs to be paged applies. This parameter applies only to the following paging methods: LastSeenGnbList, Level 1 Nearest Neighbor, Level 2 Nearest Neighbor, Level 3 Nearest Neighbor and AiMIDrivenGnbList. For the LastSeenGnbList paging method, a value larger than 5 will be treated as 5.

Class

Optional.

Type / Range

Integer in the range of 0 to 30

Default

0

Name

suppressPagingGap - Suppress Paging Gap

Syntax

--suppressPagingGap <list-item>

Description

Parameter allows the service provider to suppress the AMF Paging Gap functionality.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

3.101 cmm amfPagingPolicyPeipsMap

AMF Paging Policy PEIPS Map. Syntax, description, parameters, and roles for cmm amfPagingPolicyPeipsMap command.

Syntax**Description**

Applicable when a UE is assigned a paging subgroup per the PEIPS feature, this command allows the AMF to override a Paging Policy with another Policy based on the PEIPS value.

Parameters**Name**

servedPlmnName - PLMN Name

Syntax

--servedPlmnName <string>

Description

Serving PLMN

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

peiSubgroup - PEI Subgroup

Syntax

--peiSubgroup <integer>

Description

The subgroup assigned to a UE per the PEIPS feature.

Class

Required key.

Type / Range

Integer in the range of 0 to 7

Name

pagingTypeMapped - AMF 5G Paging Type

Syntax

--pagingTypeMapped <list-item>

Description

The AMF 5G Paging Type to map. A Paging Override Type is not allowed.

Class

Required key.

List

- 5QI1 - 5QI-1 - Defines the type of 5QI-1 paging to be done.
- 5QI2 - 5QI-2 - Defines the type of 5QI-2 paging to be done.
- 5QI3 - 5QI-3 - Defines the type of 5QI-3 paging to be done.
- 5QI4 - 5QI-4 - Defines the type of 5QI-1 paging to be done.
- 5QI5 - 5QI-5 - Defines the type of 5QI-1 paging to be done.
- 5QI6 - 5QI-6 - Defines the type of 5QI-1 paging to be done.
- 5QI7 - 5QI-7 - Defines the type of 5QI-7 paging to be done.
- 5QI8 - 5QI-8 - Defines the type of 5QI-8 paging to be done.

- 5QI9 - 5QI-9 - Defines the type of 5QI-9 paging to be done.
- ARP1 - Defines the type of ARP1 paging to be done.
- ARP10 - Defines the type of ARP10 paging to be done.
- ARP11 - Defines the type of ARP11 paging to be done.
- ARP12 - Defines the type of ARP12 paging to be done.
- ARP13 - Defines the type of ARP13 paging to be done.
- ARP14 - Defines the type of ARP14 paging to be done.
- ARP15 - Defines the type of ARP15 paging to be done.
- ARP2 - Defines the type of ARP2 paging to be done.
- ARP3 - Defines the type of ARP3 paging to be done.
- ARP4 - Defines the type of ARP4 paging to be done.
- ARP5 - Defines the type of ARP5 paging to be done.
- ARP6 - Defines the type of ARP6 paging to be done.
- ARP7 - Defines the type of ARP7 paging to be done.
- ARP8 - Defines the type of ARP8 paging to be done.
- ARP9 - Defines the type of ARP9 paging to be done.
- Basic - Defines the type of paging to be done, basic, at least one tuple must exist for each paging type.
- PPI0 - Paging Policy Indication 0 - Paging policy differentiation using Paging Policy Indication value 0.
- PPI1 - Paging Policy Indication 1 - Paging policy differentiation using Paging Policy Indication value 1.
- PPI2 - Paging Policy Indication 2 - Paging policy differentiation using Paging Policy Indication value 2.
- PPI3 - Paging Policy Indication 3 - Paging policy differentiation using Paging Policy Indication value 3.
- PPI4 - Paging Policy Indication 4 - Paging policy differentiation using Paging Policy Indication value 4.
- PPI5 - Paging Policy Indication 5 - Paging policy differentiation using Paging Policy Indication value 5.
- PPI6 - Paging Policy Indication 6 - Paging policy differentiation using Paging Policy Indication value 6.
- PPI7 - Paging Policy Indication 7 - Paging policy differentiation using Paging Policy Indication value 7.

- **Restricted** - Restricted paging is triggered when OLC determines the CMM is in overload. the restricted paging type is used instead of the normal paging types during an overload condition. the restricted paging type normally has only a single page attempt. The only methods allowed for restricted are LastSeenGnb nad LastSeenGnbList.
- **SxnRestoration** - Session Restoration Paging - This paging policy is limited to Session Restoration - 1 time only, no second page attempt.
- **currentLocation** - Current Location - The paging is triggered due to consumer NF request for the current location of a CM-IDLE UE: Namf_EventExposure for LOCATION_REPORT or Namf_Location_ProvideLocationInfo.
- **hf1** - For UEs assigned eDRX cycle of one hyperframe (10.24 seconds)
- **hf1024** - Hyperframe 1024 - For UEs assigned eDRX cycle of 1024 hyperframes (10485.76 seconds)
- **hf128** - Hyperframe 128 - For UEs assigned eDRX cycle of 128 hyperframes (1310.72 seconds)
- **hf16** - Hyperframe 16 - For UEs assigned eDRX cycle of 16 hyperframes (163.84 seconds)
- **hf2** - Hyperframe 2 - For UEs assigned eDRX cycle of two hyperframes (20.48 seconds)
- **hf256** - Hyperframe 256 - For UEs assigned eDRX cycle of 256 hyperframes (2621.44 seconds)
- **hf32** - Hyperframe 32 - For UEs assigned eDRX cycle of 32 hyperframes (327.68 seconds)
- **hf4** - Hyperframe 4 - For UEs assigned eDRX cycle of four hyperframes (40.96 seconds)
- **hf512** - Hyperframe 512 - For UEs assigned eDRX cycle of 512 hyperframes (5242.88 seconds)
- **hf64** - Hyperframe 64 - For UEs assigned eDRX cycle of 64 hyperframes (655.36 seconds)
- **hf8** - Hyperframe 8 - For UEs assigned eDRX cycle of 8 hyperframes (81.92 seconds)
- **hfhalf** - Hyperframe Half - For UEs assigned eDRX cycle of a half hyperframe (5.12 seconds)
- **hfquarter** - Hyperframe Quarter - For UEs assigned eDRX cycle of a quarter hyperframe (2.56 seconds)
- **non3gppAccess** - Non-3GPP access - The paging over 3GPP access is triggered by non-3GPP access related signaling.
- **ueReachability** - UE Reachability Request - The paging trigger is Namf_EnableUERachability to make the UE reachable for e.g. MT SMS sending.

Name

peipsPagingType - PEIPS Paging Type

Syntax

--peipsPagingType <list-item>

Description

The override paging type to be used

Class

Required on create.

List

- PtOverride1 - Pagine Type Override 1 - The PEIPS feature can map a given paging type (e.g. 5QI5) to this override paging type. If mapped, this paging type can then be used to specify different paging treatment from the mapped (e.g. 5QI5) paging type.
- PtOverride2 - Pagine Type Override 2 - The PEIPS feature can map a given paging type (e.g. 5QI5) to this override paging type. If mapped, this paging type can then be used to specify different paging treatment from the mapped (e.g. 5QI5) paging type.
- PtOverride3 - Pagine Type Override 3 - The PEIPS feature can map a given paging type (e.g. 5QI5) to this override paging type. If mapped, this paging type can then be used to specify different paging treatment from the mapped (e.g. 5QI5) paging type.
- PtOverride4 - Pagine Type Override 4 - The PEIPS feature can map a given paging type (e.g. 5QI5) to this override paging type. If mapped, this paging type can then be used to specify different paging treatment from the mapped (e.g. 5QI5) paging type.
- PtOverride5 - Pagine Type Override 5 - The PEIPS feature can map a given paging type (e.g. 5QI5) to this override paging type. If mapped, this paging type can then be used to specify different paging treatment from the mapped (e.g. 5QI5) paging type.
- PtOverride6 - Pagine Type Override 6 - The PEIPS feature can map a given paging type (e.g. 5QI5) to this override paging type. If mapped, this paging type can then be used to specify different paging treatment from the mapped (e.g. 5QI5) paging type.
- PtOverride7 - Pagine Type Override 7 - The PEIPS feature can map a given paging type (e.g. 5QI5) to this override paging type. If mapped, this paging type can then be used to specify different paging treatment from the mapped (e.g. 5QI5) paging type.
- PtOverride8 - Pagine Type Override 8 - The PEIPS feature can map a given paging type (e.g. 5QI5) to this override paging type. If mapped, this paging type can then be used to specify different paging treatment from the mapped (e.g. 5QI5) paging type.
- PtOverride9 - Pagine Type Override 9 - The PEIPS feature can map a given paging type (e.g. 5QI5) to this override paging type. If mapped, this paging type can then be used to specify different paging treatment from the mapped (e.g. 5QI5) paging type.

3.102 cmm amfPagingPriProfile

AMF Paging Priority Profile. Syntax, description, parameters, and roles for cmm amfPagingPriProfile command.

Syntax

Description

This command is used to administer a Paging Priority Profile and includes parameters for defining the ARP and paging priority levels

Parameters

Name

pagingPriProfileListName - Paging priority profile name

Syntax

--pagingPriProfileListName <string>

Description

Name that identifies paging priority profile table (alternate key).

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

arpLevel - Allocation Retention Priority level

Syntax

--arpLevel <integer>

Description

Allocation Retention Priority (ARP) priority level related to paging priority profile on AMF. Defines the relative importance of a resource request. Values are ordered in decreasing order of priority, i.e., with 1 as the highest priority and 15 as the lowest priority.

Class

Required key.

Type / Range

Integer in the range of 1 to 15

Name

includePagingPriority - Include Paging Priority

Syntax

```
--includePagingPriority <list-item>
```

Description

Defines whether the AMF includes the provisioned Paging Priority on the NGAP Paging message (when set to true) or suppresses it (when set to false).

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

pagingPriLevel - Paging priority level

Syntax

```
--pagingPriLevel <list-item>
```

Description

Paging priority level

Class

Optional.

List

- PrioLevel0 - Priority level 0 - Priority level 0. No paging priority is set.
- PrioLevel1 - Priority level 1 - Priority level 1. Highest Paging priority.
- PrioLevel2 - Priority level 2 - Priority level 2.
- PrioLevel3 - Priority level 3 - Priority level 3.
- PrioLevel4 - Priority level 4 - Priority level 4.

- PrioLevel5 - Priority level 5 - Priority level 5.
- PrioLevel6 - Priority level 6 - Priority level 6.
- PrioLevel7 - Priority level 7 - Priority level 7.
- PrioLevel8 - Priority level 8 - Priority level 8. Lowest Paging Priority.

Default

PrioLevel0

Name

sbiMessagePriorityForArpPl - SBI Message Priority for ARP PL

Syntax

--sbiMessagePriorityForArpPl <integer>

Description

Defines the SMP value that is used with the related ARP PL. Applies when global parameter Multilevel MPS is set to true and multiple MPS priorities are applied on AMF.

Class

Optional.

Type / Range

Integer in the range of 0 to 23

Default

23

Roles**Create**

3.103 cmm amfPagingPriProfileList

Paging Priority Profile List. Syntax, description, parameters, and roles for cmm amfPagingPriProfileList command.

Syntax

Description

This command is used to administer a Paging Priority Profile List.

Parameters

Name

name - Paging priority profile name

Syntax

--name <digits>

Description

Defines the paging priority profile name

Class

Required key.

Type / Range

Digit string of length 1 to 1 with the allowed pattern of [1-8]*

Roles

Create

secadmin

Show

sysadmin, manage, secadmin

Delete

secadmin

List

sysadmin, manage, secadmin

3.104 cmm amfPcfTriggerProfile

AMF PCF Policy Trigger Profile. Syntax, description, parameters, and roles for cmm amfPcfTriggerProfile command.

Syntax

Description

The profile to enable AM and UE policy triggers from PCF. A maximum of 16 profiles is supported. The 'default' profile always exists and cannot be deleted.

Parameters

Name

name - Profile Name

Syntax

--name <string>

Description

Profile name

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

amPolicyAccessTypeChange - AM Policy Access Type Change

Syntax

--amPolicyAccessTypeChange <list-item>

Description

Defines whether the PCF can trigger AM policy for Access Type Change towards the AMF

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

amPolicyImmediateReport - AM Policy Immediate Report

Syntax

--amPolicyImmediateReport <list-item>

Description

Enables the AMF support for the immediateReport feature for policy update notification for AM policy.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

amPolicyMultipleAccessTypes - AM Policy Multiple Access Types

Syntax

--amPolicyMultipleAccessTypes <list-item>

Description

Enables the AMF support for the 'multipleAccessTypes' feature for policy update notification for AM policy.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

amPolicyPra - AM Policy Change of UE presence in PRA

Syntax

--amPolicyPra <list-item>

Description

Defines whether the PCF can trigger AM policy for Change of UE presence in PRA towards the AMF.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

pageUeOnPraPolicyNotification - Page UE on PRA Policy Notification

Syntax

```
--pageUeOnPraPolicyNotification <list-item>
```

Description

Indicates whether the AMF triggers paging when it receives UE/AM policy notification with PRA(s). When set to false, AMF waits for next UE activity to analyse whether the UE is in or out of the requested presence reporting area(s).

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

uePolicyPlmnChange - UE Policy PLMN Change

Syntax

```
--uePolicyPlmnChange <list-item>
```

Description

Defines whether the PCF can trigger UE policy for PLMN Change towards the AMF

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

uePolicyPra - UE Policy Change of UE presence in PRA

Syntax

```
--uePolicyPra <list-item>
```

Description

Defines whether the PCF can trigger UE policy for Change of UE presence in PRA towards the AMF.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

3.105 cmm amfPcmdConfig

AMF PCMD Configuration. Syntax, description, parameters, and roles for cmm amfPcmdConfig command.

Syntax**Description**

This command is used to administer the AMF PCMD configuration.

Parameters**Name**

enableHttpProxyDetails - Enable HTTP Proxy Details

Syntax

--enableHttpProxyDetails <list-item>

Description

Defines whether or not HTTP Proxy Details are included in the PCMD records

Class

Optional.

List

- never - Never store HTTP Proxy details in PCMD data.
- onError - On error - Store HTTP Proxy details in PCMD data only in case of errors.

Default

never

Name

enableSmsReport - Enable SMS Report

Syntax

--enableSmsReport <list-item>

Description

Defines whether or not SMSF interactions are included in the PCMD record

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

enableSubscribeReport - Enable Subscribe Report

Syntax

--enableSubscribeReport <list-item>

Description

Defines whether or not Subscribe/Unsubscribe interactions are included in the PCMD record

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

include5qi - Include 5QI

Syntax

```
--include5qi <list-item>
```

Description

When this is set, the 5QI SM parameter shall be included within the AMF PCMD record.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

includeRequestedDnn - Include Requested DNN

Syntax

```
--includeRequestedDnn <list-item>
```

Description

This parameter controls when to include Requested DNN at AMF PCMD record

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

3.106 cmm amfPduDeletionProfile

AMF PDU Deletion Profile. Syntax, description, parameters, and roles for cmm amfPduDeletionProfile command.

Syntax

Description

Defines options for AMF triggered signalling when PDU session deletion of an existing PDU session needs to be triggered by the AMF. The maximum number of profiles supported is 128. A default profile, named 'default', is provided.

Parameters

Name

name - Name

Syntax

--name <string>

Description

The name of the AMF PDU Deletion Profile.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Name

causeToSmfDuplicatePdu - Cause to SMF Duplicate PDU

Syntax

--causeToSmfDuplicatePdu <list-item>

Description

The cause on SM context update with release indication to release a PDU session due to duplicate PDU Session.

Class

Optional.

List

- relDueToHo - Release Due to HO
- epsFallback - EPS Fallback
- relDueToUpSec - Release Due to User Plane Security
- dnnCongestion - DNN Congestion
- snssaiCongestion - S-NSSAI Congestion
- relDueToReactivation - Release Due to Reactivation

- 5gAnNotResponding - 5G AN Not Responding
- relDueToSliceNotAvailable - Release Due to Slice Not Available
- relDueToDuplicateSessionId - Release Due to Duplicate Session Id
- pduSessionStatusMismatch - PDU Session Status Mismatch
- hoFailure - HO Failure
- insufficientUpResources - Insufficient UP Resources
- pduSessionHandedOver - PDU Session Handed Over
- pduSessionResumed - PDU Session Resumed
- cnAssistedRanParameterTuning - CN Assisted RAN Parameter Tuning
- ismfContextTransfer - I-SMF Context Transfer
- smfContextTransfer - SMF Context Transfer
- relDueToPsToCsHo - Release Due to PS to CS HO
- relDueToSubscriptionChange - Release Due to Subscription Change
- hoCancel - HO Cancel
- relDueToSliceNotAuthorized - Release Due to Slice Not Authorized
- pduSessionHandoverFailure - PDU Session Handover Failure
- ddnFailureStatus - DDN Failure Status
- relDueToCpOnlyNotApplicable - Release Due to CP Only Not Applicable
- notSupportedWithIsmf - Not supported with I-SMF
- changedAnchorSmf - Changed Anchor SMF
- changedIntermediateSmf - Changed Intermediate SMF
- noCause - No Cause - No cause provided to SMF.

Default

relDueToDuplicateSessionId

Name

causeToSmfHoToCs - Cause to SMF HO To CS

Syntax

--causeToSmfHoToCs <list-item>

Description

The cause on SM context release after 5G-SRVCC Handover to CS domain has been completed.

Class

Optional.

List

- relDueToHo - Release Due to HO
- epsFallback - EPS Fallback
- relDueToUpSec - Release Due to User Plane Security
- dnnCongestion - DNN Congestion
- snssaiCongestion - S-NSSAI Congestion
- relDueToReactivation - Release Due to Reactivation
- 5gAnNotResponding - 5G AN Not Responding
- relDueToSliceNotAvailable - Release Due to Slice Not Available
- relDueToDuplicateSessionId - Release Due to Duplicate Session Id
- pduSessionStatusMismatch - PDU Session Status Mismatch
- hoFailure - HO Failure
- insufficientUpResources - Insufficient UP Resources
- pduSessionHandedOver - PDU Session Handed Over
- pduSessionResumed - PDU Session Resumed
- cnAssistedRanParameterTuning - CN Assisted RAN Parameter Tuning
- ismfContextTransfer - I-SMF Context Transfer
- smfContextTransfer - SMF Context Transfer
- relDueToPsToCsHo - Release Due to PS to CS HO
- relDueToSubscriptionChange - Release Due to Subscription Change
- hoCancel - HO Cancel
- relDueToSliceNotAuthorized - Release Due to Slice Not Authorized
- pduSessionHandoverFailure - PDU Session Handover Failure
- ddnFailureStatus - DDN Failure Status
- relDueToCpOnlyNotApplicable - Release Due to CP Only Not Applicable
- notSupportedWithIsmf - Not supported with I-SMF
- changedAnchorSmf - Changed Anchor SMF
- changedIntermediateSmf - Changed Intermediate SMF
- noCause - No Cause - No cause provided to SMF.

Default

relDueToPsToCsHo

Name

causeToSmfLbo - Cause to SMF LBO

Syntax

--causeToSmfLbo <list-item>

Description

The cause on SM context update with release indication to release a PDU session due to LBO restriction.

Class

Optional.

List

- relDueToHo - Release Due to HO
- epsFallback - EPS Fallback
- relDueToUpSec - Release Due to User Plane Security
- dnnCongestion - DNN Congestion
- snssaiCongestion - S-NSSAI Congestion
- relDueToReactivation - Release Due to Reactivation
- 5gAnNotResponding - 5G AN Not Responding
- relDueToSliceNotAvailable - Release Due to Slice Not Available
- relDueToDuplicateSessionId - Release Due to Duplicate Session Id
- pduSessionStatusMismatch - PDU Session Status Mismatch
- hoFailure - HO Failure
- insufficientUpResources - Insufficient UP Resources
- pduSessionHandedOver - PDU Session Handed Over
- pduSessionResumed - PDU Session Resumed
- cnAssistedRanParameterTuning - CN Assisted RAN Parameter Tuning
- ismfContextTransfer - I-SMF Context Transfer
- smfContextTransfer - SMF Context Transfer
- relDueToPsToCsHo - Release Due to PS to CS HO
- relDueToSubscriptionChange - Release Due to Subscription Change
- hoCancel - HO Cancel
- relDueToSliceNotAuthorized - Release Due to Slice Not Authorized

- pduSessionHandoverFailure - PDU Session Handover Failure
- ddnFailureStatus - DDN Failure Status
- relDueToCpOnlyNotApplicable - Release Due to CP Only Not Applicable
- notSupportedWithIsmf - Not supported with I-SMF
- changedAnchorSmf - Changed Anchor SMF
- changedIntermediateSmf - Changed Intermediate SMF
- noCause - No Cause - No cause provided to SMF.

Default

relDueToSubscriptionChange

Name

causeToSmfOdb - cause to SMF ODB

Syntax

--causeToSmfOdb <list-item>

Description

The cause on SM context update with release indication to release a PDU session due to ODB restriction.

Class

Optional.

List

- relDueToHo - Release Due to HO
- epsFallback - EPS Fallback
- relDueToUpSec - Release Due to User Plane Security
- dnnCongestion - DNN Congestion
- snssaiCongestion - S-NSSAI Congestion
- relDueToReactivation - Release Due to Reactivation
- 5gAnNotResponding - 5G AN Not Responding
- relDueToSliceNotAvailable - Release Due to Slice Not Available
- relDueToDuplicateSessionId - Release Due to Duplicate Session Id
- pduSessionStatusMismatch - PDU Session Status Mismatch
- hoFailure - HO Failure
- insufficientUpResources - Insufficient UP Resources
- pduSessionHandedOver - PDU Session Handed Over

- pduSessionResumed - PDU Session Resumed
- cnAssistedRanParameterTuning - CN Assisted RAN Parameter Tuning
- ismfContextTransfer - I-SMF Context Transfer
- smfContextTransfer - SMF Context Transfer
- relDueToPsToCsHo - Release Due to PS to CS HO
- relDueToSubscriptionChange - Release Due to Subscription Change
- hoCancel - HO Cancel
- relDueToSliceNotAuthorized - Release Due to Slice Not Authorized
- pduSessionHandoverFailure - PDU Session Handover Failure
- ddnFailureStatus - DDN Failure Status
- relDueToCpOnlyNotApplicable - Release Due to CP Only Not Applicable
- notSupportedWithIsmf - Not supported with I-SMF
- changedAnchorSmf - Changed Anchor SMF
- changedIntermediateSmf - Changed Intermediate SMF
- noCause - No Cause - No cause provided to SMF.

Default

relDueToSubscriptionChange

Name

causeToSmfSliceNotAuthorized - Cause to SMF Slice Not Authorized

Syntax

--causeToSmfSliceNotAuthorized <list-item>

Description

The cause on SM context update with release indication to release a PDU session due to slice not authorized.

Class

Optional.

List

- relDueToHo - Release Due to HO
- epsFallback - EPS Fallback
- relDueToUpSec - Release Due to User Plane Security
- dnnCongestion - DNN Congestion
- snssaiCongestion - S-NSSAI Congestion

- relDueToReactivation - Release Due to Reactivation
- 5gAnNotResponding - 5G AN Not Responding
- relDueToSliceNotAvailable - Release Due to Slice Not Available
- relDueToDuplicateSessionId - Release Due to Duplicate Session Id
- pduSessionStatusMismatch - PDU Session Status Mismatch
- hoFailure - HO Failure
- insufficientUpResources - Insufficient UP Resources
- pduSessionHandedOver - PDU Session Handed Over
- pduSessionResumed - PDU Session Resumed
- cnAssistedRanParameterTuning - CN Assisted RAN Parameter Tuning
- ismfContextTransfer - I-SMF Context Transfer
- smfContextTransfer - SMF Context Transfer
- relDueToPsToCsHo - Release Due to PS to CS HO
- relDueToSubscriptionChange - Release Due to Subscription Change
- hoCancel - HO Cancel
- relDueToSliceNotAuthorized - Release Due to Slice Not Authorized
- pduSessionHandoverFailure - PDU Session Handover Failure
- ddnFailureStatus - DDN Failure Status
- relDueToCpOnlyNotApplicable - Release Due to CP Only Not Applicable
- notSupportedWithIsmf - Not supported with I-SMF
- changedAnchorSmf - Changed Anchor SMF
- changedIntermediateSmf - Changed Intermediate SMF
- noCause - No Cause - No cause provided to SMF.

Default

relDueToSliceNotAuthorized

Name

causeToSmfSliceNotAvailable - Cause to SMF Slice Not Available

Syntax

--causeToSmfSliceNotAvailable <list-item>

Description

The cause on SM context update with release indication to release a PDU session due to slice not available.

Class

Optional.

List

- relDueToHo - Release Due to HO
- epsFallback - EPS Fallback
- relDueToUpSec - Release Due to User Plane Security
- dnnCongestion - DNN Congestion
- snssaiCongestion - S-NSSAI Congestion
- relDueToReactivation - Release Due to Reactivation
- 5gAnNotResponding - 5G AN Not Responding
- relDueToSliceNotAvailable - Release Due to Slice Not Available
- relDueToDuplicateSessionId - Release Due to Duplicate Session Id
- pduSessionStatusMismatch - PDU Session Status Mismatch
- hoFailure - HO Failure
- insufficientUpResources - Insufficient UP Resources
- pduSessionHandedOver - PDU Session Handed Over
- pduSessionResumed - PDU Session Resumed
- cnAssistedRanParameterTuning - CN Assisted RAN Parameter Tuning
- ismfContextTransfer - I-SMF Context Transfer
- smfContextTransfer - SMF Context Transfer
- relDueToPsToCsHo - Release Due to PS to CS HO
- relDueToSubscriptionChange - Release Due to Subscription Change
- hoCancel - HO Cancel
- relDueToSliceNotAuthorized - Release Due to Slice Not Authorized
- pduSessionHandoverFailure - PDU Session Handover Failure
- ddnFailureStatus - DDN Failure Status
- relDueToCpOnlyNotApplicable - Release Due to CP Only Not Applicable
- notSupportedWithIsmf - Not supported with I-SMF
- changedAnchorSmf - Changed Anchor SMF
- changedIntermediateSmf - Changed Intermediate SMF
- noCause - No Cause - No cause provided to SMF.

Default

relDueToSliceNotAvailable

Name

causeToSmfStatusMismatch - Cause to SMF Status Mismatch

Syntax

--causeToSmfStatusMismatch <list-item>

Description

The cause on SM context release when releasing a PDU session due to PDU session status mismatch with the UE.

Class

Optional.

List

- relDueToHo - Release Due to HO
- epsFallback - EPS Fallback
- relDueToUpSec - Release Due to User Plane Security
- dnnCongestion - DNN Congestion
- snssaiCongestion - S-NSSAI Congestion
- relDueToReactivation - Release Due to Reactivation
- 5gAnNotResponding - 5G AN Not Responding
- relDueToSliceNotAvailable - Release Due to Slice Not Available
- relDueToDuplicateSessionId - Release Due to Duplicate Session Id
- pduSessionStatusMismatch - PDU Session Status Mismatch
- hoFailure - HO Failure
- insufficientUpResources - Insufficient UP Resources
- pduSessionHandedOver - PDU Session Handed Over
- pduSessionResumed - PDU Session Resumed
- cnAssistedRanParameterTuning - CN Assisted RAN Parameter Tuning
- ismfContextTransfer - I-SMF Context Transfer
- smfContextTransfer - SMF Context Transfer
- relDueToPsToCsHo - Release Due to PS to CS HO
- relDueToSubscriptionChange - Release Due to Subscription Change
- hoCancel - HO Cancel

- relDueToSliceNotAuthorized - Release Due to Slice Not Authorized
- pduSessionHandoverFailure - PDU Session Handover Failure
- ddnFailureStatus - DDN Failure Status
- relDueToCpOnlyNotApplicable - Release Due to CP Only Not Applicable
- notSupportedWithIsmf - Not supported with I-SMF
- changedAnchorSmf - Changed Anchor SMF
- changedIntermediateSmf - Changed Intermediate SMF
- noCause - No Cause - No cause provided to SMF.

3.107 cmm amfPeipsProfile

AMF PEIPS Profile. Syntax, description, parameters, and roles for `cmm amfPeipsProfile` command.

Syntax**Description**

Mapping of UE characteristics to a paging subgroup to be used with the PEIPS feature.

Parameters**Name**

entryId - Entry ID

Syntax

--entryId <integer>

Description

Numeric identification of the profile. A lower number profile has higher read priority over a higher number profile.

Class

Required key.

Type / Range

Integer in the range of 1 to 1,024

Name

assignedPagingSubgroup - Assigned Paging Subgroup

Syntax

--assignedPagingSubgroup <integer>

Description

The paging subgroup, used with the PEIPS feature, to which a UE matching this profile is to be assigned.

Class

Required on create.

Type / Range

Integer in the range of 0 to 7

Name

amfRat - AMF RAT

Syntax

--amfRat <list-item>

Description

5G RAT

Class

Optional.

List

- any - Any of the supported 5G RATs (NR, NR REDCAP)
- nr - NR
- nrRedcap - NR REDCAP

Default

any

Name

amfTaiListName - TAI List Name

Syntax

--amfTaiListName <string>

Description

Name of a TAI List

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

"

Name

dnnListName - DNN List Name

Syntax

--dnnListName <string>

Description

The name of a DNN List. If this is populated, the UE must have at least one active DNN matching an entry in the list.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

"

Name

edrxCycleLength - f20206-01

Syntax

--edrxCycleLength <list-item>

Description

The 5G eDRX cycle length assigned to the UE.

Class

Optional.

List

- hfquarter - HF Quarter - Quarter of a Hyperframe (2.56 seconds).
- hfhalf - HF Half - Half of a Hyperframe (5.12 seconds)

- hf1 - HF 1 - One Hyperframe (10.24 seconds)
- hf2 - HF 2 - Two Hyperframes (20.48 seconds)
- hf4 - HF 4 - Four Hyperframes (40.96 seconds)
- hf8 - HF 8 - Eight Hyperframes (81.92 seconds)
- hf16 - HF 16 - Sixteen Hyperframes (163.84 seconds)
- hf32 - HF 32 - 32 Hyperframes (327.68 seconds)
- hf64 - HF 64 - 64 Hyperframes (655.36 seconds)
- hf128 - HF 258 - 256 Hyperframes (2621.44 seconds)
- hf256 - HF 258 - 256 Hyperframes (2621.44 seconds)
- hf512 - HF 512 - 512 Hyperframes (5242.88 seconds)
- hf1024 - HF 1024 - 1024 Hyperframes (10485.76 seconds)
- any - Any eDRX Cycle
- none - No eDRX cycle.

Default

none

Name

pagingProbability - Paging Probability

Syntax

--pagingProbability <list-item>

Description

The paging probability provided by the UE during registration

Class

Optional.

List

- any - Any paging probability value from the UE
- none - UE does not provide a paging probability value
- p00 - 0% paging probability value
- p05 - 5% paging probability value
- p10 - 10% paging probability value
- p100 - 100% paging probability value
- p15 - 15% paging probability value
- p20 - 20% paging probability value

- p25 - 25% paging probability value
- p30 - 30% paging probability value
- p35 - 35% paging probability value
- p40 - 40% paging probability value
- p45 - 45% paging probability value
- p50 - 50% paging probability value

- p95 - 95% paging probability value

Default

none

Name

servedPlmnName - Served PLMN Name

Syntax

--servedPlmnName <string>

Description

The serving PLMN where a UE is registered.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

"

Name

stationaryInd - Stationary Indication

Syntax

--stationaryInd <list-item>

Description

Whether the UDM profile indicates that the UE is stationary.

Class

Optional.

List

- absentOrAny - Absent or Any - The UE is identified as either MOBILE or STATIONARY in the UDM subscription, or the subscription does not include the indication.
- mobile - The UDM identifies the UE as mobile.
- stationary - The UDM identifies the UE as stationary.

Default

absentOrAny

Name

uePlmnName - UE PLMN

Syntax

--uePlmnName <string>

Description

The UE home PLMN

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

3.108 cmm amfPlmn

Public Land Mobile Networks. Syntax, description, parameters, and roles for cmm amfPlmn command.

Syntax

Description

This command is used to administer a Public Land Mobile Network and includes parameters for defining the network's MCC and MNC, PLMN type, roaming agreements, etc. For amfPlmn record of plmnType='Multiple Home Network' all attributes other than name, mcc, mnc, and plmnType are ignored; the AMF instead applies the attribute values from the amfPlmn record associated with plmnType='Home Network'.

Parameters

Name

name - PLMN name

Syntax

--name <string>

Description

PLMN name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Name

mcc - Mobile Country Code

Syntax

--mcc <digits>

Description

Mobile Country Code.

Class

Required on create, not modifiable.

Type / Range

Digit string of length 3 to 3 with the allowed pattern of [0-9]*

Name

mnc - Mobile Network Code

Syntax

--mnc <digits>

Description

Mobile Network Code.

Class

Required on create, not modifiable.

Type / Range

Digit string of length 2 to 3 with the allowed pattern of [0-9]*

Name

plmnType - PLMN Type

Syntax

--plmnType <list-item>

Description

Indicates which type of network this is

Class

Required on create, not modifiable.

List

- Home Network - Specify network type of home network.
- Other Network - Specify network type of Other for roaming partner(s)
- Shared Network - Specify network type of Shared Network
- Standalone Non-Public Network - standalone-non-public-network - Specify network type of SNPN

Name

amfEmergencyProfileName - AMF Emergency Profile Name

Syntax

--amfEmergencyProfileName <string>

Description

AMF Emergency profile name

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

assignMode - Assignment Mode

Syntax

--assignMode <integer>

Description

This fields defines the assignment mode for the SNPN

Class

Not modifiable.

Type / Range

Integer in the range of 0 to 2

Default

0

Name

checkImsDnnSubscription - Check IMS DNN subscription

Syntax

--checkImsDnnSubscription <list-item>

Description

Check IMS DNN subscription in determining network IMS voice over PS support.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

cmassEnable - cmass enable

Syntax

--cmassEnable <list-item>

Description

Parameter controls cmass enable with values true or false

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

defaultRacFor5gSrvcc - Default RAC for 5G-SRVCC

Syntax

--defaultRacFor5gSrvcc <integer>

Description

Defines the value for the default RAC used in N26 Forward Relocation Request for 5G-SRVCC from NG-RAN to UTRAN CS. The AMF uses this parameter to fill in the RAC of the Target Identification IE on the N26 Forward Relocation Request. The NGAP Handover Required message with a Target ID of type Target RNC-ID does not contain any RAC.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

255

Name

mncDigits - Number of MNC digits

Syntax

--mncDigits <list-item>

Description

Number of digits used to represent the mobile network code

Class

Not modifiable.

List

- 2/3Digits - 2 or 3 digits - 2 or 3 digits.
- 2Digits - 2 digits - 2 digits.
- 3Digits - 3 digits - 3 digits.

Default

3Digits

Name

nidValue - Nid value

Syntax

--nidValue <integer>

Description

By this field the assigned SNPN Nid is defined

Class

Not modifiable.

Type / Range

Integer in the Range 0 to 1099511627775

Default

0

Name

rerunRadioCapabilityCheck - Rerun Radio Capability Check

Syntax

--rerunRadioCapabilityCheck <list-item>

Description

When the NGAP UE Radio Capability Check is to be run as part of the AMF analysis for IMS voice over PS session support (as controlled by an other parameter), this parameter further controls whether the AMF only runs the NGAP UE Radio Capability Check Request procedure on the initial Registration or handover procedure (when the UE enters the current AMF), or whether the AMF reruns the Radio Capability Check on (each) Mobility Registration procedure, if there is no homogeneous support/homogeneous non-support for voice on the Tracking Areas of the network (the serving PLMN). Note: if there is homogeneous support/non-support for voice, the AMF anyway does not rerun UE Radio Capability Check.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

timeZoneName - Time Zone Name

Syntax

--timeZoneName <list-item>

Description

Provides time zone names that correspond to the Region selected

Class

Optional.

List

- Africa/Abidjan - Timezone for africa/abidjan UTC offset of +00:00.

- Africa/Accra - Timezone for africa/accra UTC offset of +00:00.
- Africa/Addis_Ababa - Timezone for africa/addis_ababa UTC offset of +03:00.
- Africa/Algiers - Timezone for africa/algiers UTC offset of +01:00.
- Africa/Asmara - Timezone for africa/asmara UTC offset of +03:00.
- Africa/Asmera - Timezone for africa/asmera UTC offset of +03:00.
- Africa/Bamako - Timezone for africa/bamako UTC offset of +00:00.
- Africa/Bangui - Timezone for africa/bangui UTC offset of +01:00.
- Africa/Banjul - Timezone for africa/banjul UTC offset of +00:00.
- Africa/Bissau - Timezone for africa/bissau UTC offset of +00:00.
- Africa/Blantyre - Timezone for africa/blantyre UTC offset of +02:00.
- Africa/Brazzaville - Timezone for africa/brazzaville UTC offset of +01:00.
- Africa/Bujumbura - Timezone for africa/bujumbura UTC offset of +02:00.
- Africa/Cairo - Timezone for africa/cairo UTC offset of +02:00.
- Africa/Casablanca - Timezone for africa/casablanca UTC offset of +00:00.
- Africa/Ceuta - Timezone for africa/ceuta UTC offset of +01:00.
- Africa/Conakry - Timezone for africa/conakry UTC offset of +00:00.
- Africa/Dakar - Timezone for africa/dakar UTC offset of +00:00.
- Africa/Dar_es_Salaam - Timezone for africa/dar_es_salaam UTC offset of +03:00.
- Africa/Djibouti - Timezone for africa/djibouti UTC offset of +03:00.
- Africa/Douala - Timezone for africa/douala UTC offset of +01:00.
- Africa/El_Aaiun - Timezone for africa/el_aaiun UTC offset of +00:00.
- Africa/Freetown - Timezone for africa/freetown UTC offset of +00:00.
- Africa/Gaborone - Timezone for africa/gaborone UTC offset of +02:00.
- Africa/Harare - Timezone for africa/harare UTC offset of +02:00.
- Africa/Johannesburg - Timezone for africa/johannesburg UTC offset of +02:00.
- Africa/Juba - Timezone for africa/juba UTC offset of +03:00.
- Africa/Kampala - Timezone for africa/kampala UTC offset of +03:00.
- Africa/Khartoum - Timezone for africa/khartoum UTC offset of +03:00.
- Africa/Kigali - Timezone for africa/kigali UTC offset of +02:00.
- Africa/Kinshasa - Timezone for africa/kinshasa UTC offset of +01:00.
- Africa/Lagos - Timezone for africa/lagos UTC offset of +01:00.

- Africa/Libreville - Timezone for africa/libreville UTC offset of +01:00.
- Africa/Lome - Timezone for africa/lome UTC offset of +00:00.
- Africa/Luanda - Timezone for africa/luanda UTC offset of +01:00.
- Africa/Lubumbashi - Timezone for africa/lubumbashi UTC offset of +02:00.
- Africa/Lusaka - Timezone for africa/lusaka UTC offset of +02:00.
- Africa/Malabo - Timezone for africa/malabo UTC offset of +01:00.
- Africa/Maputo - Timezone for africa/maputo UTC offset of +02:00.
- Africa/Maseru - Timezone for africa/maseru UTC offset of +02:00.
- Africa/Mbabane - Timezone for africa/mbabane UTC offset of +02:00.
- Africa/Mogadishu - Timezone for africa/mogadishu UTC offset of +03:00.
- Africa/Monrovia - Timezone for africa/monrovia UTC offset of +00:00.
- Africa/Nairobi - Timezone for africa/nairobi UTC offset of +03:00.
- Africa/Ndjamena - Timezone for africa/ndjamena UTC offset of +01:00.
- Africa/Niamey - Timezone for africa/niamey UTC offset of +01:00.
- Africa/Nouakchott - Timezone for africa/nouakchott UTC offset of +00:00.
- Africa/Ouagadougou - Timezone for africa/ouagadougou UTC offset of +00:00.
- Africa/Porto-Novo - Timezone for africa/porto-novo UTC offset of +01:00.
- Africa/Sao_Tome - Timezone for africa/sao_tome UTC offset of +00:00.
- Africa/Timbuktu - Timezone for africa/timbuktu UTC offset of +00:00.
- Africa/Tripoli - Timezone for africa/tripoli UTC offset of +02:00.
- Africa/Tunis - Timezone for africa/tunis UTC offset of +01:00.
- Africa/Windhoek - Timezone for africa/windhoek UTC offset of +02:00.
- America/Adak - Timezone for america/adak UTC offset of -10:00.
- America/Anchorage - Timezone for america/anchorage UTC offset of -09:00.
- America/Anguilla - Timezone for america/anguilla UTC offset of -04:00.
- America/Antigua - Timezone for america/antigua UTC offset of -04:00.
- America/Araguaina - Timezone for america/araguaina UTC offset of -03:00.
- America/Argentina/Buenos_Aires - Timezone for america/argentina/buenos_aires UTC offset of -03:00.
- America/Argentina/Catamarca - Timezone for america/argentina/catamarca UTC offset of -03:00.

- America/Argentina/ComodRivadavia - Timezone for america/argentina/comodrivadavia UTC offset of -03:00.
- America/Argentina/Cordoba - Timezone for america/argentina/cordoba UTC offset of -03:00.
- America/Argentina/Jujuy - Timezone for america/argentina/jujuy UTC offset of -03:00.
- America/Argentina/La_Rioja - Timezone for america/argentina/la_rioja UTC offset of -03:00.
- America/Argentina/Mendoza - Timezone for america/argentina/mendoza UTC offset of -03:00.
- America/Argentina/Rio_Gallegos - Timezone for america/argentina/rio_gallegos UTC offset of -03:00.
- America/Argentina/Salta - Timezone for america/argentina/salta UTC offset of -03:00.
- America/Argentina/San_Juan - Timezone for america/argentina/san_juan UTC offset of -03:00.
- America/Argentina/San_Luis - Timezone for america/argentina/san_luis UTC offset of -03:00.
- America/Argentina/Tucuman - Timezone for america/argentina/tucuman UTC offset of -03:00.
- America/Argentina/Ushuaia - Timezone for america/argentina/ushuaia UTC offset of -03:00.
- America/Aruba - Timezone for america/aruba UTC offset of -04:00.
- America/Asuncion - Timezone for america/asuncion UTC offset of -03:00.
- America/Atikokan - Timezone for america/atikokan UTC offset of -05:00.
- America/Atka - Timezone for america/atka UTC offset of -10:00.
- America/Bahia - Timezone for america/bahia UTC offset of -03:00.
- America/Bahia_Banderas - Timezone for america/bahia_banderas UTC offset of -06:00.
- America/Barbados - Timezone for america/barbados UTC offset of -04:00.
- America/Belem - Timezone for america/belem UTC offset of -03:00.
- America/Belize - Timezone for america/belize UTC offset of -06:00.
- America/Blanc-Sablon - Timezone for america/blanc-sablon UTC offset of -04:00.
- America/Boa_Vista - Timezone for america/boa_vista UTC offset of -04:00.
- America/Bogota - Timezone for america/bogota UTC offset of -05:00.
- America/Boise - Timezone for america/boise UTC offset of -07:00.
- America/Buenos_Aires - Timezone for america/buenos_aires UTC offset of -03:00.

- America/Cambridge_Bay - Timezone for america/cambridge_bay UTC offset of -07:00.

Default

Default

Name

ueRadioCapabilityCheck - UE Radio Capability Check

Syntax

--ueRadioCapabilityCheck <list-item>

Description

This parameter controls whether the AMF uses NGAP UE Radio Check procedure and the result of the procedure to define whether Voice over PS Sessions shall be supported for the UE on this PLMN.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Modify

sysadmin, manage

Delete

sysadmin, manage

List

sysadmin, manage, monitor

3.109 cmm amfPolicySelection

AMF Policy Selection. Syntax, description, parameters, and roles for cmm amfPolicySelection command.

Syntax

Description

AMF Policy Selection

Parameters

Name

servedPlmnName - served plmn name

Syntax

--servedPlmnName <string>

Description

served plmn name

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

entryId - Entry ID

Syntax

--entryId <integer>

Description

Entry ID

Class

Required key.

Type / Range

Integer in the range of 1 to 10,000

Name

amfAmPolicyProfileName - AMF AM Policy Profile Name

Syntax

--amfAmPolicyProfileName <string>

Description

AMF AM Policy Profile Name

Class

Required on create.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

gpsiRangeListName - GPSI Range

Syntax

--gpsiRangeListName <string>

Description

Name of the list consisting of one more GPSI ranges.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

shutdownPolicyProfile - Shutdown Policy Profile

Syntax

--shutdownPolicyProfile <list-item>

Description

Parameter shall be used to indicate if a rule is live or not. Shutdown == true implies the rule is not live and should be skipped

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

snssaiListName - SNSSAI List Name

Syntax

--snssaiListName <string>

Description

SNSSAI List Name

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

supiRangeListName - SUPI Range list

Syntax

--supiRangeListName <string>

Description

Name of the list consisting of SUPI ranges

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Default

""

3.110 cmm amfPraGnb

Presence Reporting Area for gNB. Syntax, description, parameters, and roles for cmm amfPraGnb command.

Syntax**Description**

Administer Presence Reporting Area for the gNB area type for AMF. AMF supports up to 64 gNBs per each CN predefined PRA.

Parameters

Name

amfPraId - AMF Presence Reporting Area Identifier

Syntax

--amfPraId <integer>

Description

An integer that identifies the core network predefined presence reporting area in the AMF.

Class

Required key.

Type / Range

Integer in the range of 8,388,608 to 16,777,215

Name

plmnName - Mobile network name

Syntax

--plmnName <string>

Description

A name that identifies mobile network.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Name

gnbId - Macro gNB Identifier

Syntax

--gnbId <integer>

Description

The identifier of the macro gNB. Equal to the leftmost bits of the NR Cell Identity IE contained in the NR CGI IE of each cell served by the gNB.

Class

Required key.

Type / Range

Integer in the range of 0 to 4,294,967,295

Name

gnbIdLength - GNB Identifier Length

Syntax

--gnbIdLength <integer>

Description

The length of the gNB identifier.

Class

Required on create, not modifiable.

Type / Range

Integer in the range of 22 to 32

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

sysadmin, manage, monitor

3.111 cmm amfPraNrCgi

Presence Reporting Area for NR CGI for AMF. Syntax, description, parameters, and roles for cmm amfPraNrCgi command.

Syntax**Description**

Administer Presence Reporting Area for New Radio Cell Global Identifier area type for AMF. AMF supports up to 64 NR CGIs per each CN predefined PRA.

Parameters**Name**

amfPraId - AMF Presence Reporting Area Identifier

Syntax

--amfPraId <integer>

Description

An integer that identifies the core network predefined presence reporting area in the AMF.

Class

Required key.

Type / Range

Integer in the range of 8,388,608 to 16,777,215

Name

plmnName - Mobile network name

Syntax

--plmnName <string>

Description

A name that identifies mobile network.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

nrCgi - New Radio Cell Global Identifier

Syntax

--nrCgi <integer>

Description

New Radio Cell Global Identifier for the NR CGI area type of the Presence Reporting Area.

Class

Required key.

Type / Range

Integer in the range of 0..68719476735

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

3.112 cmm amfPraSet

AMF Presence Reporting Area Set. Syntax, description, parameters, and roles for cmm amfPraSet command.

Syntax

Description

Administer AMF Presence Reporting Area set. A Core Network predefined PRA id must be unique in the system. A single PRA id may be contained in multiple PRA sets. PRA set id cannot be contained in the same or a different PRA set (i.e. nested PRA sets are not allowed). A PRA set can contain max 9 PRA ids. When PRA sets are used, only a single PRA set may be simultaneously triggered to be reported for a single UE.

Parameters

Name

amfPraSetId - AMF Presence Reporting Area Set Identifier

Syntax

--amfPraSetId <integer>

Description

An integer that identifies the core network predefined presence reporting area set in the AMF.

Class

Required key.

Type / Range

Integer in the range of 8,388,608 to 16,777,215

Name

amfPraId - AMF Presence Reporting Area Identifier

Syntax

--amfPraId <integer>

Description

An integer that identifies the core network predefined presence reporting area in the AMF.

Class

Required key.

Type / Range

Integer in the range of 8,388,608 to 16,777,215

Roles

3.113 cmm amfPraTai

Presence Reporting Area for TAI for AMF. Syntax, description, parameters, and roles for cmm amfPraTai command.

Syntax

Description

Administer Presence Reporting Area for Tracking Area Identity area type for the AMF. AMF supports up to 16 TAIs per each CN predefined PRA.

Parameters

Name

amfPraId - AMF Presence Reporting Area Identifier

Syntax

--amfPraId <integer>

Description

An integer that identifies the core network predefined presence reporting area in the AMF.

Class

Required key.

Type / Range

Integer in the range of 8,388,608 to 16,777,215

Name

plmnName - Mobile network name

Syntax

--plmnName <string>

Description

A name that identifies mobile network.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

amfTac - AMF TAC in the TAI of the PRA

Syntax

--amfTac <integer>

Description

AMF Tracking area code in the tracking area identity area type of the presence reporting area.

Class

Required key.

Type / Range

Integer in the range of 0 to 16,777,215

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

sysadmin, manage, monitor

3.114 cmm amfRanTimers

AMF NG-RAN Timers. Syntax, description, parameters, and roles for cmm amfRanTimers command.

Syntax**Description**

Define NG-RAN timers

Parameters

Name

amfTimerName - Timer name

Syntax

--amfTimerName <list-item>

Description

Name of timer.

Class

Required key.

List

- amfCnfgUpdate - NGAP AMF Configuration Update - When the AMF sends an AMF Configuration Update Request message to the gNB, it expects to receive a response message from the gNB (either AMF Configuration Update Acknowledge or AMF Configuration Update Failure). If the timer expires while waiting for the response, the AMF considers this NGAP Class 1 procedure failed.
- followOnRequest - Pending Follow On Request Timer - AMF maintains the UE N2 connection, after sending Registration Accept to the UE or receiving Registration Complete from the UE, for the period of the timer. The AMF starts the timer if 'Follow on Request pending' is set by the UE in the Registration Request.
- handoverRequest - Handover Request - When the AMF sends a handover request message to the NG-RAN, it expects to receive an acknowledgment response message from the NG-RAN. if the timer expires while waiting for this response, the AMF considers that this class 1 procedure failed.
- initCtxtSetup - NGAP Initial Context Setup - When the AMF sends an Initial Context Setup Request message to the gNB, it expects to receive a response message from the gNB (either Initial Context Setup Complete or Initial Context Setup Failure). if the timer expires while waiting for this response, the AMF considers this NGAP Class 1 procedure failed.
- locationRpCtrl - Timer For location reporting control Message - Guard timer for sending Location reporting control message towards NGRAN
- n1InactivityTimer - N1 NAS inactivity timer - When timer is set, AMF maintains the UE N2 connection after sending Registration Accept to the UE or receiving Registration Complete from the UE. The AMF starts the timer if UE didn't indicate 'Follow on Request pending' in the Registration Request and uplinkStatusPending is not set.
- n26HoResourceRelease - N26 Handover Resource Release - Timer starts at 5GS to EPS handover Source AMF after the AMF sends Forward Relocation Complete Notification ACK. On timer expiry, Source AMF releases all UE resources including N2 connection to the Source gNB

- **n2HoComplete** - N2 Handover Complete - Supervises the receipt of either: - a Handover Notify message from the target gNB, in the case of intra-AMF Handover or inter-AMF Handover (target AMF) or N26 EPS to 5GS Handover (target AMF) - an N2InfoNotify from the target AMF in the case of inter-AMF Handover (source AMF) - a Forward Relocation Complete Notification from the target MME, in the case of N26 5GS to EPS Handover (source AMF) The handover is not successful if the expected message is not received before the expiration of the timer.
- **n2HoResourceRelease** - N2 Handover Resource Release - Timer starts on receipt of Handover Notify if no AMF relocation or on receipt of N2InfoNotify if there is AMF relocation. On timer expiry, Source AMF releases all UE resources including N2 connection to the Source gNB
- **n2Reset** - N2 Reset Timer - AMF sends N2 Reset message to the gNB and waits to receive a Reset Acknowledgment response. If timer expires while waiting for this response, the AMF considers this class 1 procedure failed
- **nasNonDelivery** - NAS Non-Delivery - This timer is started whenever any N1 (NAS) message is sent towards the NG-RAN to be forwarded towards the UE. The AMF maintains the callback URI of the service consumer triggering the Namf_Communication_N1N2MessageTransfer when this timer is running.
- **ngapUeContextModify** - UE Context Modification Timer - This command sets the value of the ue-context-modify-timer which is used to supervise the CONTEXT MODIFICATION REQUEST/CONTEXT MODIFICATION RESPONSE exchange between the AMF and gNB
- **pduRsrcHoFailure** - PDU Session Resource Failure For HO Operations - PDU Session Resource Setup and Modify failures for HO operations. Includes XN-handover-triggered an NG-intra-system-handover-triggered.
- **pduRsrcMod** - PDU Session Resource Modify - When the AMF sends a PDU Session Resource Modify Request message to the gNB, it expects to receive a PDU Session Resource Modify Response from the gNB. if the timer expires while waiting for this response, the AMF considers this NGAP Class 1 procedure failed.
- **pduRsrcRel** - PDU Session Resource Release - When the AMF sends a PDU Session Resource Release Command message to the gNB, it expects to receive a PDU Session Resource Release Response from the gNB. if the timer expires while waiting for this response, the AMF considers this NGAP Class 1 procedure failed.
- **pduRsrcSetup** - PDU Session Resource Setup - When the AMF sends a PDU Session Resource Setup Request message to the gNB, it expects to receive a PDU Session Resource Setup Response from the gNB. if the timer expires while waiting for this response, the AMF considers this NGAP Class 1 procedure failed.
- **srvcc5gHoComplete** - SRVCC 5G HO Complete - Defines the time the AMF waits for 5G-SRVCC handover completion i.e. the receipt of N26 Forward Relocation Complete Notification from MME_SRVCC. The 5G-SRVCC handover is not considered successful if this message is not received before the expiration of the timer.

- ueCtxtRel - NGAP UE Context Release - When the AMF sends a UE Context Release Command message to the gNB, it expects to receive a UE Release Complete as a response. If the timer expires while waiting for this response, the AMF considers this NGAP Class 1 procedure failed.
- ueRadioCapabilityCheck - NGAP UE Radio Capability Check Response - Specifies the time the AMF waits for NGAP UE Radio Capability Check Response after it has sent NGAP UE Radio Capability Check Request. If timer expires while waiting for this response, the AMF considers this class 1 procedure failed.
- v2xPc5Guard - V2X PC5 Guard - Specifies how long the AMF is to keep the NAS connection open during N1 registration when the UE is authorized for V2X PC5 service. Values range from 0 to 5 seconds in increments of 100ms.

Name

amfTimerUnit - Timer unit

Syntax

--amfTimerUnit <list-item>

Description

Unit of measurement.

Class

Required on create, not modifiable.

List

- Millisecond - Specify timer unit of 1 millisecond
- Second - Specify timer unit of 1 second
- 2Second - 2 Second - Specify timer unit of 2 seconds
- 30Second - 30 Second - Specify timer unit of 30 seconds.
- Minute - Specify timer unit of 1 minute
- DeciHour - Specify timer unit of 1 decihour (6 minutes).
- 10Minute - 10 Minute - Specify timer unit of 10 minutes
- Hour - Specify timer unit of 1 hour
- 10Hour - 10 Hour - Specify timer unit of 10 hours.

Name

amfTimerValue - Timer value

Syntax

--amfTimerValue <integer>

Description

Numeric value of timer.

Class

Required on create.

Type / Range

Integer in the range of 0 to 65,535

The amfTimerValue string is based on the amfTimerName parameter:

Name

amfCnfgUpdate - NGAP AMF Configuration Update

Syntax

```
--amfTimerName amfCnfgUpdate --amfTimerValue <string> [ --  
amfTimerUnit Second ]
```

Description

When the AMF sends an AMF Configuration Update Request message to the gNB, it expects to receive a response message from the gNB (either AMF Configuration Update Acknowledge or AMF Configuration Update Failure). If the timer expires while waiting for the response, the AMF considers this NGAP Class 1 procedure failed.

Type / Range

Integer in the range of 1 to 60 in units of Second

Default

5

Name

followOnRequest - Pending Follow On Request Timer

Syntax

```
--amfTimerName followOnRequest --amfTimerValue <string> [ --  
amfTimerUnit Second ]
```

Description

AMF maintains the UE N2 connection, after sending Registration Accept to the UE or receiving Registration Complete from the UE, for the period of the timer. The AMF starts the timer if 'Follow on Request pending' is set by the UE in the Registration Request.

Type / Range

Integer in the range of 0 to 25 in units of Second

Default

15

Name

handoverRequest - Handover Request

Syntax

```
--amfTimerName handoverRequest --amfTimerValue <string> [ --  
amfTimerUnit Second ]
```

Description

When the AMF sends a handover request message to the NG-RAN, it expects to receive an acknowledgment response message from the NG-RAN. if the timer expires while waiting for this response, the AMF considers that this class 1 procedure failed.

Type / Range

Integer in the range of 1 to 60 in units of Second

Default

8

Name

initCtxtSetup - NGAP Initial Context Setup

Syntax

```
--amfTimerName initCtxtSetup --amfTimerValue <string> [ --  
amfTimerUnit Second ]
```

Description

When the AMF sends an Initial Context Setup Request message to the gNB, it expects to receive a response message from the gNB (either Initial Context Setup Complete or Initial Context Setup Failure). if the timer expires while waiting for this response, the AMF considers this NGAP Class 1 procedure failed.

Type / Range

Integer in the range of 1 to 60 in units of Second

Default

5

Name

locationRpCtrl - Timer For location reporting control Message

Syntax

```
--amfTimerName locationRpCtrl --amfTimerValue <string> [ --  
amfTimerUnit Second ]
```

Description

Guard timer for sending Location reporting control message towards NGRAN

Type / Range

Integer in the range of 1 to 60 in units of Second

Default

5

Name

n1InactivityTimer - N1 NAS inactivity timer

Syntax

```
--amfTimerName n1InactivityTimer --amfTimerValue <string> [ --  
amfTimerUnit Second ]
```

Description

When timer is set, AMF maintains the UE N2 connection after sending Registration Accept to the UE or receiving Registration Complete from the UE. The AMF starts the timer if UE didn't indicate 'Follow on Request pending' in the Registration Request and uplinkStatusPending is not set.

Type / Range

Integer in the range of 0 to 10 in units of Second

Default

0

Name

n26HoResourceRelease - N26 Handover Resource Release

Syntax

```
--amfTimerName n26HoResourceRelease --amfTimerValue <string> [ --  
amfTimerUnit Millisecond ]
```

Description

Timer starts at 5GS to EPS handover Source AMF after the AMF sends Forward Relocation Complete Notification ACK. On timer expiry, Source AMF releases all UE resources including N2 connection to the Source gNB

Type / Range

Integer in the range of 500 to 15,000 in units of Millisecond

Default

2000

Name

n2HoComplete - N2 Handover Complete

Syntax

```
--amfTimerName n2HoComplete --amfTimerValue <string> [ --amfTimerUnit  
Second ]
```

Description

Supervises the receipt of either: - a Handover Notify message from the target gNB, in the case of intra-AMF Handover or inter-AMF Handover (target AMF) or N26 EPS to 5GS Handover (target AMF) - an N2InfoNotify from the target AMF in the case of inter-AMF Handover (source AMF) - a Forward Relocation Complete Notification from the target MME, in the case of N26 5GS to EPS Handover (source AMF) The handover is not successful if the expected message is not received before the expiration of the timer.

Type / Range

Integer in the range of 1 to 15 in units of Second

Default

5

Name

n2HoResourceRelease - N2 Handover Resource Release

Syntax

```
--amfTimerName n2HoResourceRelease --amfTimerValue <string> [ --  
amfTimerUnit Millisecond ]
```

Description

Timer starts on receipt of Handover Notify if no AMF relocation or on receipt of N2InfoNotify if there is AMF relocation. On timer expiry, Source AMF releases all UE resources including N2 connection to the Source gNB

Type / Range

Integer in the range of 500 to 5,000 in units of Millisecond

Default

2000

Name

n2Reset - N2 Reset Timer

Syntax

```
--amfTimerName n2Reset --amfTimerValue <string> [ --amfTimerUnit  
Second ]
```

Description

AMF sends N2 Reset message to the gNB and waits to receive a Reset Acknowledgment response. If timer expires while waiting for this response, the AMF considers this class 1 procedure failed

Type / Range

Integer in the range of 1 to 180 in units of Second

Default

1

Name

nasNonDelivery - NAS Non-Delivery

Syntax

```
--amfTimerName nasNonDelivery --amfTimerValue <string> [ --  
amfTimerUnit Millisecond ]
```

Description

This timer is started whenever any N1 (NAS) message is sent towards the NG-RAN to be forwarded towards the UE. The AMF maintains the callback URI of the service consumer triggering the Namf_Communication_N1N2MessageTransfer when this timer is running.

Type / Range

Integer in the range of 0 to 10,000 in units of Millisecond

Default

1000

Name

ngapUeContextModify - UE Context Modification Timer

Syntax

```
--amfTimerName ngapUeContextModify --amfTimerValue <string> [ --  
amfTimerUnit Second ]
```

Description

This command sets the value of the ue-context-modify-timer which is used to supervise the CONTEXT MODIFICATION REQUEST/CONTEXT MODIFICATION RESPONSE exchange between the AMF and gNB

Type / Range

Integer in the range of 1 to 60 in units of Second

Default

8

Name

pduRsrcHoFailure - PDU Session Resource Failure For HO Operations

Syntax

```
--amfTimerName pduRsrcHoFailure --amfTimerValue <string> [ --  
amfTimerUnit Millisecond ]
```

Description

PDU Session Resource Setup and Modify failures for HO operations. Includes XN-handover-triggered an NG-intra-system-handover-triggered.

Type / Range

Integer range from 300 to 2000 in units of Millisecond

Default

500

Name

pduRsrcMod - PDU Session Resource Modify

Syntax

```
--amfTimerName pduRsrcMod --amfTimerValue <string> [ --amfTimerUnit  
Second ]
```

Description

When the AMF sends a PDU Session Resource Modify Request message to the gNB, it expects to receive a PDU Session Resource Modify Response from the gNB. If the timer expires while waiting for this response, the AMF considers this NGAP Class 1 procedure failed.

Type / Range

Integer in the range of 1 to 60 in units of Second

Default

5

Name

pduRsrcRel - PDU Session Resource Release

Syntax

```
--amfTimerName pduRsrcRel --amfTimerValue <string> [ --amfTimerUnit  
Second ]
```

Description

When the AMF sends a PDU Session Resource Release Command message to the gNB, it expects to receive a PDU Session Resource Release Response from the gNB. If the timer expires while waiting for this response, the AMF considers this NGAP Class 1 procedure failed.

Type / Range

Integer in the range of 1 to 60 in units of Second

Default

5

Name

pduRsrcSetup - PDU Session Resource Setup

Syntax

```
--amfTimerName pduRsrcSetup --amfTimerValue <string> [ --amfTimerUnit  
Second ]
```

Description

When the AMF sends a PDU Session Resource Setup Request message to the gNB, it expects to receive a PDU Session Resource Setup Response from the gNB. If the timer expires while waiting for this response, the AMF considers this NGAP Class 1 procedure failed.

Type / Range

Integer in the range of 1 to 60 in units of Second

Default

5

Name

srvcc5gHoComplete - SRVCC 5G HO Complete

Syntax

```
--amfTimerName srvcc5gHoComplete --amfTimerValue <string> [ --  
amfTimerUnit Second ]
```

Description

Defines the time the AMF waits for 5G-SRVCC handover completion i.e. the receipt of N26 Forward Relocation Complete Notification from MME_SRVCC. The 5G-SRVCC handover is not considered successful if this message is not received before the expiration of the timer.

Type / Range

Integer in the range of 1 to 15 in units of Second

Default

5

Name

ueCtxtRel - NGAP UE Context Release

Syntax

```
--amfTimerName ueCtxtRel --amfTimerValue <string> [ --amfTimerUnit  
Second ]
```

Description

When the AMF sends a UE Context Release Command message to the gNB, it expects to receive a UE Release Complete as a response. If the timer expires while waiting for this response, the AMF considers this NGAP Class 1 procedure failed.

Type / Range

Integer in the range of 1 to 60 in units of Second

Default

5

Name

ueRadioCapabilityCheck - NGAP UE Radio Capability Check Response

Syntax

```
--amfTimerName ueRadioCapabilityCheck --amfTimerValue <string> [ --  
amfTimerUnit Millisecond ]
```

Description

Specifies the time the AMF waits for NGAP UE Radio Capability Check Response after it has sent NGAP UE Radio Capability Check Request. If timer expires while waiting for this response, the AMF considers this class 1 procedure failed.

Type / Range

Integer in the range of 100 to 10,000 in units of Millisecond

Default

8000

Name

v2xPc5Guard - V2X PC5 Guard

Syntax

```
--amfTimerName v2xPc5Guard --amfTimerValue <string> [ --amfTimerUnit  
Millisecond ]
```

Description

Specifies how long the AMF is to keep the NAS connection open during N1 registration when the UE is authorized for V2X PC5 service. Values range from 0 to 5 seconds in increments of 100ms.

Type / Range

Integer in the range of 0 to 5,000 in units of Millisecond

Default

0

3.115 cmm amfRegionServingTai

TAI served by AMF in an AMF Region. Syntax, description, parameters, and roles for cmm amfRegionServingTai command.

Syntax

Description

This command used to provision list of TAI served by AMF in an AMF region.

Parameters

Name

amfRegionId - AMF Region Identifier

Syntax

```
--amfRegionId <integer>
```

Description

AMF Region Identifier.

Class

Required key.

Type / Range

Integer in the range of 0 to 255

Name

plmnName - PLMN Name

Syntax

--plmnName <string>

Description

PLMN name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Name

tac - Tracking Area Code

Syntax

--tac <integer>

Description

Tracking Area Code.

Class

Required key.

Type / Range

Integer in the range of 0 to 16777215

3.116 cmm amfRfspAccessRestrictionList

RFSP Access Restriction List for the AMF. Syntax, description, parameters, and roles for cmm amfRfspAccessRestrictionList command.

Syntax

Description

Creates list names to be used for an RFSP Access Restriction List

Parameters

Name

name - Name

Syntax

--name <string>

Description

The name of the RFSP Access Restriction List.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Roles

3.117 cmm amfRfspAccessRestrictionListItem

RFSP AMF Access Restriction List Item. Syntax, description, parameters, and roles for cmm amfRfspAccessRestrictionListItem command.

Syntax

Description

The RFSP value to assign to a RFSP AMF Access Restriction List.

Parameters

Name

amfRfspAccessRestrictionListName - RFSP AMF Access Restriction List Item

Syntax

--amfRfspAccessRestrictionListName <string>

Description

RFSP AMF Access Restriction List Item

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

amfRfspValue - RFSP Value

Syntax

--amfRfspValue <integer>

Description

Value of the RFSP to be assigned to a list.

Class

Required key.

Type / Range

Integer in the range of 1 to 256

3.118 cmm amfRfspLocalOverrideProfile

AMF RFSP Local Override Profile. Syntax, description, parameters, and roles for cmm amfRfspLocalOverrideProfile command.

Syntax

Description

Define local override profile for RAT Frequency Selection Priority (RFSP) index. One or multiple parameters can be defined, either any parameter in the profile defined set is required to match or all parameters in the set are required to match. Parameters that can be defined in the profile include -allowed S-NSSAI list -subscribed RFSP index (i.e. UDM RFSP) -UE's usage setting Max 128 profiles can be created. As a result of create and modify commands, at least one of S-NSSAI list, UDM RFSP and UE's Usage setting must be set, i.e. the result cannot be that the S-NSSAI list name is blank when also UDM RFSP is set to zero and UE's Usage Setting is set to notUsed.

Parameters

Name

name - Name

Syntax

--name <string>

Description

The name of the AMF RFSP Local Override Profile.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

matchLevel - Match Level

Syntax

--matchLevel <list-item>

Description

Whether all of the parameters or any of the provided parameters is/are required to match in order to apply the override profile.

Class

Required on create.

List

- anyMatch - Any Match - Any of the parameters provided in the AMF RFSP Override RFSP profile is required to match to apply the override.
- fullMatch - Full Match - All of the parameters provided in the AMF RFSP Override RFSP profile are required to match to apply the override.

Name

overrideRfsp - Override RFSP

Syntax

--overrideRfsp <integer>

Description

The value of the RFSP used by the AMF towards the other NW elements when the override applies.

Class

Required on create.

Type / Range

Integer in the range of 1 to 256

Name

amfSimpleRfspOverride - AMF Simple RFSP Override

Syntax

--amfSimpleRfspOverride <list-item>

Description

Defines the AMF simple UDM RFSP override policy. This parameter takes precedence over AMF RFSP Local Override Profile included parameters Match Level, Override Level, Allowed S-NSSAI List Name, UDM RFSP and UE's Usage Setting, i.e. the AMF ignores those parameters when this parameter is set to other value than Disabled.

Class

Optional.

List

- disabled - AMF simple RFSP override is disabled.
- amfOverrideUdmAlways - AMF Override UDM Always - AMF applies AMF locally provisioned RFSP index independently of the UDM provided RFSP index.
- amfOverrideNoUdmRfsp - AMF Override No UDM RFSP - AMF uses AMF locally provisioned RFSP index when UDM does not provide any RFSP index value.

Default

disabled

Name

overrideLevel - Override Level

Syntax

--overrideLevel <list-item>

Description

Defines the NW elements from which the AMF may receive the RFSP and override it with the AMF locally provisioned RFSP value.

Class

Optional.

List

- amfRfspOverridePcf - AMF RFSP Override PCF - The AMF overrides PCF provided RFSP value.
- amfRfspOverrideUdm - AMF RFSP Override UDM - The AMF overrides UDM provided RFSP value.
- amfRfspOverrideUdmPcf - AMF RFSP Override UDM PCF - The AMF overrides UDM and PCF provided RFSP values.

Default

amfRfspOverrideUdm

Name

snssaiListName - Allowed S-NSSAI List Name

Syntax

--snssaiListName <string>

Description

The name of the allowed S-NSSAI list to trigger the override. If the list is empty, the S-NSSAI list is not used in the override profile. If any of the allowed S-NSSAIs for the UE is present in the list, the S-NSSAI list is considered to match.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

""

Name

udmRfsp - UDM RFSP

Syntax

--udmRfsp <integer>

Description

The value of the UDM subscribed RFSP index to trigger the AMF override. 0 value stands for not used.

Class

Optional.

Type / Range

Integer in the range of 0 to 256

Default

0

Name

uesUsageSetting - UE's Usage Setting

Syntax

--uesUsageSetting <list-item>

Description

The UE's usage setting.

Class

Optional.

List

- dataCentric - Data Centric - UE's Usage setting is Data Centric.
- none - UE's usage setting is not provided.
- notUsed - Not Used - The UE's usage setting is not used.
- voiceCentric - Voice Centric - UE's Usage setting is Voice Centric.

Default

notUsed

3.119 cmm amfServiceIp

AMF Service IP. Syntax, description, parameters, and roles for cmm amfServiceIp command.

Syntax

Description

This command is used to administer a Service IP and includes parameters for defining AMF N2 and SB interfaces. For Multiple IPDS, the Service IPs have to be defined on all IPDS pools for the following interfaces: - N2 and - SBI and - N26

Parameters

Name

name - End Point Name

Syntax

--name <string>

Description

End point name of N2 interface or Service Based Interface.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Name

assignmentType - Assignment type

Syntax

--assignmentType <list-item>

Description

Assignment type: fixed or floating

Class

Optional.

List

- fixed - Fixed.
- floating - Floating.

Default

floating

Name

interfaceN2Name - N2 Interface Name

Syntax

--interfaceN2Name <list-item>

Description

This parameter defines the name used for N2 Interfaces (single homed and multi homed) when FDS is used.

Class

Optional.

List

- N2INTF2 - N2 INTF2 - This is used for the N2 Secondary Multi Homed Interface with SFDS
- N2INTF2_2 - N2 INTF2_2 - This is used for the second N2 Secondary Multi Homed Interface with SFDS
- N2INTF3_1 - N2 INTF3_1 - This is used for the third N2 Primary Multi Homed Interface with SFDS
- N2INTF3_2 - N2 INTF3_2 - This is used for the third N2 Secondary Multi Homed Interface with SFDS
- N2SH_2 - N2 SH_2 - This is used for the second N2 Single Homing with SFDS
- N2SH_3 - N2 SH_3 - This is used for the third N2 Single Homing with SFDS
- N2INTF1 - N2 INTF1 - This is used for the N2 Primary Multi Homed Interface with SFDS
- N2INTF2_1 - N2 INTF2_1 - This is used for the second N2 Primary Multi Homed Interface with SFDS
- N2SH - N2 SH - This is used for N2 Single Homing with SFDS
- NONE - When SFDS is not used - Default

Default

NONE

Name

poolId - Pool id

Syntax

--poolId <integer>

Description

Pool identification number.

Class

Optional.

Type / Range

Integer in the range of 0 to 39

Default

0

Name

poolMemberId - Pool member ID

Syntax

--poolMemberId <integer>

Description

Pool member identification number.

Class

Optional.

Type / Range

Integer in the range of 0 to 2

Default

0

Name

poolType - Pool type

Syntax

--poolType <list-item>

Description

Pool (service) type.

Class

Optional.

List

- ALMS - Alarm Service - Alarm Service.
- CPPS - Control plane processing service - Control plane processing service.
- CTCS - Call Trace Collection service - Call Trace Collection service.
- DBS - Database service - Database service.
- EEMS - Event Exposure Management service - Event Exposure Management service.
- IPDS - IP director service - IP director service.
- IPPS - IP packet processing service - IP packet processing service.
- LIHS - Lawful Interception Handling service
- MLIS - Machine Learning Intelligence Service
- NECC - Network element cluster controller - Network element cluster controller.

- NWDS - Network Data Service - NWDAF service
- PAPS - Packet processing service - Packet processing service.
- PCMS - Per Call Measurements Data Service - Per Call Measurements Data (PCMD) Service
- RCIS - Radio Capability Information storage Service
- SFDS - SCTP flow distributor service
- UCDS - User equipment Context Data-dump Service
- UFDS - UDP flow distributor service

Default

IPDS

Name

svclpV4 - Service IP address V4

Syntax

--svcIPv4 <string>

Description

Service IP address V4

Class

Optional.

Type / Range

Digit string of length 7 to 15 with the allowed pattern of [0-9\.]*

Default

0.0.0.0

Name

svclpV6 - Service IP address V6

Syntax

--svcIPv6 <string>

Description

Service IP address V6

Class

Optional.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of '[0-9a-f:]*'

Default

::

Name

useFds - Use Flow Distributor

Syntax

--useFds <list-item>

Description

Indicates whether this service IP shall be used as back-end for single-ip flow distributor

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

3.120 cmm amfServicesEndPointConfig

AMF Services End Point Configuration. Syntax, description, parameters, and roles for cmm amfServicesEndPointConfig command.

Syntax**Description**

This command is used to create, modify and delete AMF local endpoint configuration for the AMF supported services in the home network and AMFs in the shared network.

Parameters

Name

endPointName - AMF Local End Point Interface Name

Syntax

--endPointName <string>

Description

The parameter points to a set of parameters related with IP address configuration created using the 'endPointName' command.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

amfServiceInstanceName - AMF Service Instance Name

Syntax

--amfServiceInstanceName <string>

Description

Specifies the service instance of the own AMF for which the configuration applies. Each AMF Service Instance can be mapped to only one amfServicesEndPointConfig

Class

Required on create, not modifiable.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

amfServiceIpName - Service IP Name

Syntax

--amfServiceIpName <string>

Description

The parameter points to a set of parameters related with IP address configuration created using the 'serviceIp' command.

Class

Required on create.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

dscpCode - DSCP Code

Syntax

--dscpCode <list-item>

Description

Parameter to set DSCP code to be used for an IP packet.

Class

Optional.

List

- AF11 - Assured forwarding 11.
- AF12 - Assured forwarding 12.
- AF13 - Assured forwarding 13.
- AF21 - Assured forwarding 21.
- AF22 - Assured forwarding 22.
- AF23 - Assured forwarding 23.
- AF31 - Assured forwarding 31.
- AF32 - Assured forwarding 32.
- AF33 - Assured forwarding 33.
- AF41 - Assured forwarding 41.
- AF42 - Assured forwarding 42.
- AF43 - Assured forwarding 43.
- BE - BE.
- CS1 - Class selector 1.
- CS2 - Class selector 2.
- CS3 - Class selector 3.
- CS4 - Class selector 4.
- CS5 - Class selector 5.
- CS6 - Class selector 6.
- CS7 - Class selector 7.
- EF - Expedited forwarding.
- voiceAdmit - Voice Admit

Default

AF41

Name

httpProfileName - HTTP profile name

Syntax

--httpProfileName <string>

Description

Assign HTTP profile for the end point.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

default

Name

port - TCP Port

Syntax

--port <integer>

Description

TCP Port.

Class

Optional.

Type / Range

Integer in the range of 1 to 65,535

Default

8080

Name

tcpProfileName - TCP Profile Name

Syntax

--tcpProfileName <string>

Description

Configure TCP profile to the endpoint.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

default

Name

tlsProfileName - Transport Layer Security Certificate

Syntax

--tlsProfileName <string>

Description

Configure TLS certificate used in establishing secure communication.

Class

Optional.

Type / Range

Digit string of length 0 or 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

3.121 cmm amfSetSnssai

AMF set supported S-NSSAI. Syntax, description, parameters, and roles for cmm amfSetSnssai command.

Syntax**Description**

Command to provision list of S-NSSAI supported by an AMF set.

Parameters**Name**

plmnName - PLMN Name

Syntax

--plmnName <string>

Description

PLMN ID of the AMF set.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

amfRegionId - AMF Region Identifier

Syntax

--amfRegionId <integer>

Description

AMF Region ID of the AMF set.

Class

Required key.

Type / Range

Integer in the range of 0 to 255

Name

amfSetId - AMF Set Identifier

Syntax

--amfSetId <integer>

Description

AMF set identifier

Class

Required key.

Type / Range

5G AMF Set ID

Name

snssaiListName - SNSSAI List

Syntax

--snssaiListName <string>

Description

List of S-NSSAI supported by the AMF set.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Roles**Create**

3.122 cmm amfSmfNasMapping

SMF NAS mapping. Syntax, description, parameters, and roles for cmm amfSmfNasMapping command.

Syntax**Description**

Defines mapping from N11 HTTP Status code and protocol/application error code to 5GMM NAS cause code. A default profile, named 'default', is provided.

Parameters**Name**

smfNasMappingListName - SMF Error To NAS 5GMM Mapping Name

Syntax

--smfNasMappingListName <string>

Description

The name of the SMF error to NAS 5GMM mapping.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

procedure - Procedure

Syntax

--procedure <list-item>

Description

Defines the procedure to apply the SMF error code into 5GMM cause code mapping.

Class

Required key.

List

- ULNAS - UL NAS Transport - UL NAS Transport procedure.
- PDU_REACT_RESULT - PDU Reactivation Result - PDU Reactivation Result error code used on Registration Accept and Service Accept.

Name

smfError - SMF Error

Syntax

--smfError <list-item>

Description

Defines the SMF error to map the 5GMM cause into.

Class

Required key.

List

- 400_RESOURCE_CONTEXT_NOT_FOUND - 400 RESOURCE CONTEXT NOT FOUND - The notification request is rejected because the call back URI still exists in the receiver of the notification, but the specific resource context identified within the notification payload is not found in the NF service consumer.
- 400_UNKNOWN - 400 UNKNOWN - The 400_UNKNOWN is used when included problem details is not specified in 3GPP or it is not included.
- 403_CCA_VERIFICATION_FAILURE - 403 CCA VERIFICATION FAILURE - The request is rejected due to a failure to verify the CCA at the receiving entity (SMF).
- 403_DEFAULT_EBI_NOT_TRANSFERRED - 403 DEFAULT EBI NOT TRANSFERRED - It is used during 5GS to EPS mobility if the EBI of the default EPS bearer is included in the notToTransferEbiList attribute.
- 403_LATE_OVERLAPPING_REQUEST - The request is rejected because it collides with an existing SM context or PDU session context with a more recent origination timestamp.
- 403_UNKNOWN - 403 UNKNOWN - The 403_UNKNOWN is used when included problem details is not specified in 3GPP or it is not included.
- 404_UNKNOWN - 404 UNKNOWN - The 404_UNKNOWN is used when included problem details is not specified in 3GPP or it is not included.

- 409_HIGHER_PRIORITY_REQUEST_ONGOING - 409 HIGHER PRIORITY REQUEST ONGOING - The request is rejected temporarily due to procedure for higher priority session in progress.
- 409_UE_IN_CM_IDLE_STATE - UE IN CM IDLE STATE - The request is rejected due to the UE being in CM-IDLE state for the PDU session associated to non-3GPP access.
- 409_UNKNOWN - 409 UNKNOWN - The 409_UNKNOWN is used when included problem details is not specified in 3GPP or it is not included.
- 411_UNKNOWN - 411 UNKNOWN - The 411_UNKNOWN is used when included problem details is not specified in 3GPP or it is not included.
- 429_UNKNOWN - 429 UNKNOWN - The 429_UNKNOWN is used when included problem details is not specified in 3GPP or it is not included.
- 500_NF_FAILOVER - 500 NF FAILOVER - The request is rejected due to the unavailability of the NF (SMF), and the requester may trigger an immediate re-selection of an alternative NF based on this information.
- 500_NF_SERVICE_FAILOVER - The request is rejected due to the unavailability of the NF service, and the requester may trigger an immediate re-selection of an alternative NF service based on this information.
- 500_UNKNOWN - 500 UNKNOWN - The 500_UNKNOWN is used when included problem details is not specified in 3GPP or it is not included.
- 503_UNKNOWN - 503 UNKNOWN - The 503_UNKNOWN is used when included problem details is not specified in 3GPP or it is not included.
- 504_TARGET_NF_NOT_REACHABLE - The request is not served as the target NF (SMF) is not reachable.
- 504_TIMED_OUT_REQUEST - 504 TIMED OUT REQUEST - The request is rejected due a request that has timed out at the HTTP client based on origination timestamp.
- 504_UE_NOT_REACHABLE - 504 UE NOT REACHABLE - The UE is not reachable for service.
- 504_UNKNOWN - 504 UNKNOWN - The 504_UNKNOWN is used when included problem details is not specified in 3GPP or it is not included.
- 504_UPF_NOT_RESPONDING - 504 UPF NOT RESPONDING - The request is rejected due to no response received from the UPF.
- DEFAULT - This item defines the default entry to apply when no specific entry for an HTTP status code and protocol/application error is provisioned.
- 400_INVALID_API - 400 Bad Request Invalid API - HTTP status code 400 Bad Request, protocol or application error INVALID_API.
- 400_INVALID_MSG_FORMAT - 400 Bad Request Invalid Message Format - HTTP status code 400 Bad Request, protocol or application error INVALID_MSG_FORMAT.

- 400_INVALID_QUERY_PARAM - 400 Bad Request Invalid Query Parameter - HTTP status code 400 Bad Request, protocol or application error INVALID_QUERY_PARAM.
- 400_MANDATORY_QUERY_PARAM_INCORRECT - 400 Mandatory Query Param Incorrect - HTTP status code 400 Bad Request, protocol or application error MANDATORY_QUERY_PARAM_INCORRECT
- 400_OPTIONAL_QUERY_PARAM_INCORRECT - 400 Optional Query Param Incorrect - HTTP status code 400 Bad Request, protocol or application error OPTIONAL_QUERY_PARAM_INCORRECT
- 400_MANDATORY_QUERY_PARAM_MISSING - 400 Mandatory Query Param Missing - HTTP status code 400 Bad Request, protocol or application error MANDATORY_QUERY_PARAM_MISSING
- 400_MANDATORY_IE_INCORRECT - 400 Bad Request Mandatory IE Incorrect - HTTP status code 400 Bad Request, protocol or application error MANDATORY_IE_INCORRECT.
- 400_OPTIONAL_IE_INCORRECT - 400 Optional IE Incorrect - HTTP status code 400 Bad Request, protocol or application error OPTIONAL_IE_INCORRECT
- 400_MANDATORY_IE_MISSING - 400 Bad Request Mandatory IE Missing - HTTP status code 400 Bad Request, protocol or application error MANDATORY_IE_MISSING.
- 400_UNSPECIFIED_MSG_FAILURE - 400 Bad Request Unspecified Message Failure - HTTP status code 400 Bad Request, protocol or application error UNSPECIFIED_MSG_FAILURE.
- 403_MODIFICATION_NOT_ALLOWED - 403 Forbidden Modification Not Allowed - HTTP status code 403 Forbidden, protocol or application error MODIFICATION_NOT_ALLOWED.
- 403_N1_SM_ERROR - 403 Forbidden N1 SM Error - HTTP status code 403 Forbidden, application error N1_SM_ERROR.
- 403_SNSSAI_DENIED - 403 Forbidden S-NSSAI Denied - HTTP status code 403 Forbidden, application error SNSSAI_DENIED.
- 403_DNN_DENIED - 403 Forbidden DNN Denied - HTTP status code 403 Forbidden, application error DNN_DENIED.
- 403_PDUTYPE_DENIED - 403 Forbidden PDU Type Denied - HTTP status code 403 Forbidden, application error PDUTYPE_DENIED.
- 403_SSC_DENIED - 403 Forbidden SSC Denied - HTTP status code 403 Forbidden, application error SSC_DENIED.
- 403_SUBSCRIPTION_DENIED - 403 Forbidden Subscription Denied - HTTP status code 403 Forbidden, application error SUBSCRIPTION_DENIED.
- 403_DNN_NOT_SUPPORTED - 403 Forbidden DNN Not Supported - HTTP status code 403 Forbidden, application error DNN_NOT_SUPPORTED.

- 403_PDUTYPE_NOT_SUPPORTED - 403 Forbidden PDU Type Not Supported - HTTP status code 403 Forbidden, application error PDUTYPE_NOT_SUPPORTED.
- 403_SSC_NOT_SUPPORTED - 403 Forbidden SSC Not Supported - HTTP status code 403 Forbidden, application error SSC_NOT_SUPPORTED.
- 403_HOME_ROUTED_ROAMING_REQUIRED - 403 Forbidden Home Routed Roaming Required - HTTP status code 403 Forbidden, application error HOME_ROUTED_ROAMING_REQUIRED.
- 403_OUT_OF_LADN_SERVICE_AREA - 403 Forbidden Out of LADN Service Area - HTTP status code 403 Forbidden, application error OUT_OF_LADN_SERVICE_AREA.
- 403_N2_SM_ERROR - 403 Forbidden N2 SM Error - HTTP status code 403 Forbidden, application error N2_SM_ERROR.
- 403_PRIORITIZED_SERVICES_ONLY - 403 Forbidden Prioritized Services Only - HTTP status code 403 Forbidden, application error PRIORITIZED_SERVICES_ONLY.
- 403_PDU_SESSION_ANCHOR_CHANGE - 403 Forbidden PDU Session Anchor Change - HTTP status code 403 Forbidden, application error PDU_SESSION_ANCHOR_CHANGE.
- 403_TARGET_MME_CAPABILITY - 403 Forbidden Target MME Capability - HTTP status code 403 Forbidden, application error TARGET_MME_CAPABILITY.
- 403_NO_EPS_5GS_CONTINUITY - 403 Forbidden No EPS 5GS Continuity - HTTP status code 403 Forbidden, application error NO_EPS_5GS_CONTINUITY.
- 403_UNABLE_TO_PAGE_UE - 403 Forbidden Unable to Page UE - HTTP status code 403 Forbidden, application error UNABLE_TO_PAGE_UE.
- 403_UE_NOT_RESPONDING - 403 Forbidden UE Not Responding - HTTP status code 403 Forbidden, application error UE_NOT_RESPONDING.
- 403_REJECTED_BY_UE - 403 Forbidden Rejected by UE - HTTP status code 403 Forbidden, application error REJECTED_BY_UE.
- 403_REJECTED_DUE_VPLMN_POLICY - 403 Forbidden Rejected Due VPLMN Policy - HTTP status code 403 Forbidden, application error REJECTED_DUE_VPLMN_POLICY.
- 403_HO_TAU_IN_PROGRESS - 403 Forbidden HO TAU in Progress - HTTP status code 403 Forbidden, application error HO_TAU_IN_PROGRESS.
- 403_INTEGRITY_PROTECTED_MDR_NOT_ACCEPTABLE - 403 Forbidden Integrity Protected MDR not Acceptable - HTTP status code 403 Forbidden, application error INTEGRITY_PROTECTED_MDR_NOT_ACCEPTABLE.
- 403_EBI_EXHAUSTED - 403 Forbidden EBI Exhausted - HTTP status code 403 Forbidden, application error EBI_EXHAUSTED.
- 403_EBI_REJECTED_LOCAL_POLICY - 403 Forbidden EBI Rejected Local Policy - HTTP status code 403 Forbidden, application error EBI_REJECTED_LOCAL_POLICY.

- 403_EBI_REJECTED_NO_N26 - 403 Forbidden EBI Rejected No N26 - HTTP status code 403 Forbidden, application error EBI_REJECTED_NO_N26.
- 403_DEFAULT_EPS_BEARER_INACTIVE - 403 Default EPS Bearer Inactive - HTTP status code 403 Forbidden, application error DEFAULT_EPS_BEARER_INACTIVE.
- 403_HANDOVER_RESOURCE_ALLOCATION_FAILURE - 403 Forbidden Handover Resource Allocation Failure - HTTP status code 403 Forbidden, application error HANDOVER_RESOURCE_ALLOCATION_FAILURE.
- 403_NOT_SUPPORTED_WITH_ISMF - 403 Forbidden Not Supported With I-SMF - HTTP status code 403 Forbidden, application error NOT_SUPPORTED_WITH_ISMF.
- 403_SERVICE_NOT_AUTHORIZED_BY_NEXT_HOP - 403 Forbidden Service Not Authorized By Next Hop - HTTP status code 403 Forbidden, application error SERVICE_NOT_AUTHORIZED_BY_NEXT_HOP.
- 404_SUBSCRIPTION_NOT_FOUND - 404 Not Found Subscription Not Found - HTTP status code 404 Not Found, protocol or application error SUBSCRIPTION_NOT_FOUND.
- 404_RESOURCE_URI_STRUCTURE_NOT_FOUND - 404 Not Found Resource URI Structure Not Found - HTTP status code 404 Not Found, protocol or application error RESOURCE_URI_STRUCTURE_NOT_FOUND.
- 404_CONTEXT_NOT_FOUND - 404 Not Found Context Not Found - HTTP status code 404 Not Found, application error CONTEXT_NOT_FOUND.
- 411_INCORRECT_LENGTH - 411 Length Required Incorrect Length - HTTP status code 411 Length Required, protocol or application error INCORRECT_LENGTH.
- 429_NF_CONGESTION_RISK - 429 Too Many Requests NF Congestion Risk - HTTP status code 429 Too Many Requests, protocol or application error NF_CONGESTION_RISK.
- 500_INSUFFICIENT_RESOURCES - 500 Internal Server Error Insufficient Resources - HTTP status code 500 Internal Server Error, protocol or application error INSUFFICIENT_RESOURCES.
- 500_UNSPECIFIED_NF_FAILURE - 500 Internal Server Error Unspecified NF Failure - HTTP status code 500 Internal Server Error, protocol or application error UNSPECIFIED_NF_FAILURE.
- 500_SYSTEM_FAILURE - 500 Internal Server Error System Failure - HTTP status code 500 Internal Server Error, protocol or application error SYSTEM_FAILURE.
- 500_INSUFFICIENT_RESOURCES_SLICE - 500 Internal Server Error Insufficient Resources Slice - HTTP status code 500 Internal Server Error, application error INSUFFICIENT_RESOURCES_SLICE.
- 500_INSUFFICIENT_RESOURCES_SLICE_DNN - 500 Internal Server Error Insufficient Resources Slice DNN - HTTP status code 500 Internal Server Error, application error INSUFFICIENT_RESOURCES_SLICE_DNN.

- 503_NF_CONGESTION - 503 Service Unavailable NF Congestion - HTTP status code 503 Service Unavailable, protocol or application error NF_CONGESTION.
- 503_DNN_CONGESTION - 503 Service Unavailable DNN Congestion - HTTP status code 503 Service Unavailable, application error DNN_CONGESTION.
- 503_S_NSSAI_CONGESTION - 503 Service Unavailable S-NSSAI Congestion - HTTP status code 503 Service Unavailable, application error S-NSSAI_CONGESTION.
- 504_PEER_NOT_RESPONDING - 504 Gateway Timeout Peer Not Responding - HTTP status code 504 Gateway Timeout, application error PEER_NOT_RESPONDING.
- 504_NETWORK_FAILURE - 504 Gateway Timeout Network Failure - HTTP status code 504 Gateway Timeout, application error NETWORK_FAILURE.

Name

amf5gMmCc - 5GMM Cause Code

Syntax

--amf5gMmCc <integer>

Description

Defines the 5GMM cause code to use towards the UE for the given procedure case and the given SMF error (HTTP status code and application/protocol).

Class

Optional.

Type / Range

5GMM Cause Code. 0 stands for no cause to be provided

Name

errorSource - Error Source

Syntax

--errorSource <list-item>

Description

Defines the source of the SMF error according to AMF analysis of received error based on the Via and the Server headers. Only applied when amfGParm timerSmfReselection is set to 'true'.

Class

Optional.

List

- onlySmf - Only SMF - The SMF is the only used SMF for the PDU.
- ismfVsmf - I-SMF or V-SMF - The SMF is either in the role of an Intermediate SMF (I-SMF) or a visited SMF (V-SMF) for the PDU.

- remoteSmf - Remote SMF - Remote SMF is either the actual SMF (when also I-SMF is included on the path) or the H-SMF of the PDU. Note: remote SMF is only applicable when either I-SMF is added on the path, or home routed roaming is applied for the PDU.

Default

onlySmf

Name

n1Included - N1 Message Included

Syntax

--n1Included <list-item>

Description

Defines whether the SMF provided error response included a NAS Session Management message to be delivered back to the UE. Only applied when amfGParm timerSmfReselection is set to 'true'.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

reselectIsmfVsmf - Reselect I-SMF V-SMF

Syntax

--reselectIsmfVsmf <list-item>

Description

Defines whether the AMF for a UE triggered request overrides the provisioned NAS cause code mapping for the provisioned SMF error and instead of returning a NAS error code towards the UE the AMF attempts to reselect the I-SMF or the V-SMF during the same procedure. This parameter is also used to define whether the AMF reselects an I-SMF or a V-SMF on other procedures after an I-SMF or V-SMF reported error. Only applied when amfGParm timerSmfReselection is set to 'true'. Note: on the current release the AMF only reselects an SMF after receiving an error for an SM context create for an initially selected SMF.

Class

Optional.

List

- false - Boolean value of false.

- true - Boolean value of true.

Default

false

Name

reselectOnlySmf - Reselect Only SMF

Syntax

--reselectOnlySmf <list-item>

Description

Defines whether the AMF for a UE triggered request overrides the provisioned NAS cause code mapping for the provisioned SMF error and instead of returning a NAS error code towards the UE the AMF attempts to reselect the only SMF on the path for the PDU during the same procedure. Only applied when amfGParm timerSmfReselection is set to 'true'. Note: on the current release the AMF only reselects an SMF after receiving an error for an SM context create for an initially selected SMF.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

reselectRemote - Reselect Remote

Syntax

--reselectRemote <list-item>

Description

Defines whether the AMF for a UE triggered request overrides the provisioned NAS cause code mapping for the provisioned SMF error and instead of returning a NAS error code towards the UE the AMF attempts to reselect the remote SMF (i.e. the actual SMF when also I-SMF is used for the PDU, or the H-SMF) during the same procedure. Only applied when amfGParm timerSmfReselection is set to 'true'. Note: on the current release the AMF only reselects an SMF after receiving an error for an SM context create for an initially selected SMF.

Class

Optional.

List

- false - Boolean value of false.

- true - Boolean value of true.

Default

false

3.123 cmm amfSmfNasMappingList

SMF Error to NAS Mapping Profile List. Syntax, description, parameters, and roles for cmm amfSmfNasMappingList command.

Syntax**Description**

SMF Error to NAS Mapping Profile List.

Parameters**Name**

name - SMF error to NAS 5GMM mapping list name

Syntax

--name <string>

Description

SMF error to NAS 5GMM mapping list name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

3.124 cmm amfSmpToPagingPriorityProfile

AMF SMP to Paging Priority Level. Syntax, description, parameters, and roles for cmm amfSmpToPagingPriorityProfile command.

Syntax

Description

Defines the mapping from incoming SBI Message Priority (SMP) to a Paging Priority Level. Altogether 32 profiles may be defined on AMF.

Parameters

Name

amfSmpToPagingPriorityProfileListName - Name

Syntax

--amfSmpToPagingPriorityProfileListName <string>

Description

The name of the SMP to Paging priority level profile.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

sbiMessagePriority - SBI Message Priority

Syntax

--sbiMessagePriority <integer>

Description

Defines the SBI Message priority (SMP) value to map into Paging Priority Level.

Class

Required key.

Type / Range

Integer in the range of 0 to 23

Name

prioType - Priority Type

Syntax

--prioType <list-item>

Description

Defines the priority type.

Class

Required on create.

List

- amfPrioTypeMcs - AMF Priority Type MCS - Priority type Mission Critical Services.
- amfPrioTypeMps - AMF Priority Type MPS - Priority type Multimedia Priority Service.

Name

includePagingPriority - Include Paging Priority

Syntax

--includePagingPriority <list-item>

Description

Defines whether the AMF includes the Paging Priority parameter on the NGAP Paging message. When Paging Priority is not provisioned to be included, AMF applies the associated priority internally but does not include the Paging Priority parameter in the NGAP Paging message.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

pagingPriLevel - Paging Priority Level

Syntax

--pagingPriLevel <list-item>

Description

Defines the Paging Priority Level parameter.

Class

Optional.

List

- PrioLevel0 - Priority level 0 - Priority level 0. No paging priority is set.
- PrioLevel1 - Priority level 1 - Priority level 1. Highest Paging priority.
- PrioLevel2 - Priority level 2 - Priority level 2.
- PrioLevel3 - Priority level 3 - Priority level 3.
- PrioLevel4 - Priority level 4 - Priority level 4.
- PrioLevel5 - Priority level 5 - Priority level 5.
- PrioLevel6 - Priority level 6 - Priority level 6.
- PrioLevel7 - Priority level 7 - Priority level 7.
- PrioLevel8 - Priority level 8 - Priority level 8. Lowest Paging Priority.

Default

PrioLevel8

Name

prioDuration - Priority Duration

Syntax

--prioDuration <list-item>

Description

Defines the time the AMF provides priority treatment for the UE, when a matching SMP is used from other SBI NF.

Class

Optional.

List

- amfPrioDurationReg - AMF Prio Duration Current Registration - AMF provides priority for the UE during the current registration of the UE.
- amfPrioDurationTimer - AMF Priority Duration Timer - AMF provides priority for the UE during the time the uplift timer is running.

Default

amfPrioDurationTimer

Name

upliftTimer - Uplift Timer

Syntax

--upliftTimer <integer>

Description

The timer used to temporarily uplift the priority of the UE to the incoming request SMP value level.

Class

Optional.

Type / Range

Integer in the range of 1 to 900 in units of Second

Default

120

3.125 cmm amfSmpToPagingPriorityProfileList

AMF SMP to Paging Priority Level List. Syntax, description, parameters, and roles for cmm amfSmpToPagingPriorityProfileList command.

Syntax**Description**

Used to administer a AMF SMP to Paging Priority Level List. Altogether 32 lists may be defined on AMF, max 32 profiles per list.

Parameters**Name**

name - Name

Syntax

--name <string>

Description

Defines the SBI Message Priority (SMP) to a Paging Priority Level profile.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Roles

Create

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

sysadmin, manage, monitor

3.126 cmm amfSmsfNasMapping

AMF SMSF NAS mapping. Syntax, description, parameters, and roles for cmm amfSmsfNasMapping command.

Syntax

Description

Defines mapping from N20 HTTP Status code and SMSF returned protocol/application error code to 5GMM NAS cause code. When no cause is provisioned in the mapping, AMF performs SMSF reselection. A default profile, named 'default', is provided. The maximum number of profiles supported is 128.

Parameters

Name

smsfNasMappingListName - SMSF Error To NAS 5GMM Mapping List Name

Syntax

--smsfNasMappingListName <string>

Description

The name of the SMSF (N20) error to NAS 5GMM mapping.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

smsfError - SMSF Error

Syntax

--smsfError <list-item>

Description

Defines the SMSF error (HTTP status code and protocol/application error) to map the 5GMM cause code into.

Class

Required key.

List

- InvalidApi400 - 400 Bad Request Invalid API - HTTP status code 400 Bad Request, protocol or application error INVALID_API.
- InvalidMessageFormat400 - 400 Bad Request Invalid Message Format - HTTP status code 400 Bad Request, protocol or application error INVALID_MSG_FORMAT.
- InvalidQueryParameter400 - 400 Bad Request Invalid Query Parameter - HTTP status code 400 Bad Request, protocol or application error INVALID_QUERY_PARAM.
- MandatoryQueryParamIncorrect400 - 400 Bad Request Mandatory Query Param Incorrect - HTTP status code 400 Bad Request, protocol or application error MANDATORY_QUERY_PARAM_INCORRECT.
- OptionalQueryParamIncorrect400 - 400 Bad Request Optional Query Param Incorrect - HTTP status code 400 Bad Request, protocol or application error OPTIONAL_QUERY_PARAM_INCORRECT.
- MandatoryQueryParamMissing400 - 400 Bad Request Mandatory Query Param Missing - HTTP status code 400 Bad Request, protocol or application error MANDATORY_QUERY_PARAM_MISSING.
- MandatoryIeIncorrect400 - 400 Bad Request Mandatory IE Incorrect - HTTP status code 400 Bad Request, protocol or application error MANDATORY_IE_INCORRECT.
- OptionalIeIncorrect400 - 400 Bad Request Optional IE Incorrect - HTTP status code 400 Bad Request, protocol or application error OPTIONAL_IE_INCORRECT.
- MandatoryIeMissing400 - 400 Bad Request Mandatory IE Missing - HTTP status code 400 Bad Request, protocol or application error MANDATORY_IE_MISSING.
- UnspecifiedMessageFailure400 - 400 Bad Request Unspecified Message Failure - HTTP status code 400 Bad Request, protocol or application error UNSPECIFIED_MSG_FAILURE.

- **SmsPayloadMissing400** - 400 Bad Request SMS Payload Missing - HTTP status code 400 Bad Request, application error SMS_PAYLOAD_MISSING.
- **SmsPayloadError400** - 400 Bad Request SMS Payload Error - HTTP status code 400 Bad Request, application error SMS_PAYLOAD_ERROR.
- **ModificationNotAllowed403** - 403 Forbidden Modification Not Allowed - HTTP status code 403 Forbidden, protocol or application error MODIFICATION_NOT_ALLOWED.
- **ServiceNotAllowed403** - 403 Forbidden Service Not Allowed - HTTP status code 403 Forbidden, application error SERVICE_NOT_ALLOWED.
- **RoamingNotAllowed403** - 403 Roaming Not Allowed - HTTP status code 403 Forbidden, protocol or application error ROAMING_NOT_ALLOWED.
- **SubscriptionNotFound404** - 404 Not Found Subscription Not Found - HTTP status code 404 Not Found, protocol or application error SUBSCRIPTION_NOT_FOUND.
- **ResourceUriStructureNotFound404** - 404 Resource URI Structure Not Found - HTTP status code 404 Not Found, protocol or application error RESOURCE_URI_STRUCTURE_NOT_FOUND.
- **UserNotFound404** - 404 Not Found User Not Found - HTTP status code 404 Not Found, application error USER_NOT_FOUND.
- **ContextNotFound404** - 404 Not Found Context Not Found - HTTP status code 404 Not Found, application error CONTEXT_NOT_FOUND.
- **IncorrectLength411** - 411 Length Required Incorrect Length - HTTP status code 411 Length Required, protocol or application error INCORRECT_LENGTH.
- **NfCongestionRisk429** - 429 Too Many Requests NF Congestion Risk - HTTP status code 429 Too Many Requests, protocol or application error NF_CONGESTION_RISK.
- **InsufficientResources500** - 500 Internal Server Error Insufficient Resources - HTTP status code 500 Internal Server Error, protocol or application error INSUFFICIENT_RESOURCES.
- **UnspecifiedNfFailure500** - 500 Internal Server Error Unspecified NF Failure - HTTP status code 500 Internal Server Error, protocol or application error UNSPECIFIED_NF_FAILURE.
- **SystemFailure500** - 500 Internal Server Error System Failure - HTTP status code 500 Internal Server Error, protocol or application error SYSTEM_FAILURE.
- **NfCongestion503** - 503 Service Unavailable NF Congestion - HTTP status code 503 Service Unavailable, protocol or application error NF_CONGESTION.
- **CcaVerificationFailure403** - 403 Cca Verification Failure - The request is rejected due to a failure to verify the CCA at the receiving entity (SMSF).
- **NfFailover500** - 500 Nf Failover - The request is rejected due to the unavailability of the NF (SMSF), and the requester may trigger an immediate re-selection of an alternative NF based on this information.

- NfServiceFailover500 - 500 Nf Service Failover - The request is rejected due to the unavailability of the NF service, and the requester may trigger an immediate re-selection of an alternative NF service based on this information.
- ResourceContextNotFound400 - 400 Resource Context Not Found - The notification request is rejected because the call back URI still exists in the receiver of the notification, but the specific resource context identified within the notification payload is not found in the NF service consumer.
- TargetNfNotReachable504 - 504 Target Nf Not Reachable - The request is not served as the target NF (SMSF) is not reachable.
- TimedOutRequest504 - 504 Timed Out Request - The request is rejected due a request that has timed out at the HTTP client based on origination timestamp.
- Unknown400 - 400 Unknown - The 400 Unknown is used when included problem details is not specified in 3GPP or not included.
- Unknown403 - 403 Unknown - The 403 Unknown is used when included problem details is not specified in 3GPP or not included.
- Unknown404 - 404 Unknown - The 404 Unknown is used when included problem details is not specified in 3GPP or not included.
- Unknown411 - 411 Unknown - The 411 Unknown is used when included problem details is not specified in 3GPP or not included.
- Unknown429 - 429 Unknown - The 429 Unknown is used when included problem details is not specified in 3GPP or not included.
- Unknown500 - 500 Unknown - The 500 Unknown is used when included problem details is not specified in 3GPP or not included.
- Unknown503 - 503 Unknown - The 503 Unknown is used when included problem details is not specified in 3GPP or not included.
- Unknown504 - 504 Unknown - The 504 Unknown is used when included problem details is not specified in 3GPP or not included.

Name

amf5gMmCc - 5GMM Cause Code

Syntax

--amf5gMmCc <integer>

Description

Defines the 5GMM cause code to use towards the UE on NAS DL NAS Transport message as the 5GMM cause code for the given SMSF error (HTTP status code and application/protocol). If no 5GMM cause code is defined i.e. 5GMM cause code is 0, the AMF triggers SMSF reselection for the UE.

Class

Optional.

Type / Range

5GMM Cause Code. 0 stands for no cause to be provided

Default

0

3.127 cmm amfSmsfNasMappingList

AMF SMSF NAS Mapping List. Syntax, description, parameters, and roles for cmm amfSmsfNasMappingList command.

Syntax**Description**

SMFS (N20) Error to NAS Mapping Profile List.

Parameters**Name**

name - SMSF error to NAS 5GMM mapping list name

Syntax

--name <string>

Description

SMSF (N20) error to NAS 5GMM mapping list name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

3.128 cmm amfStormLimitsGParms

AMF Storm Limits. Syntax, description, parameters, and roles for cmm amfStormLimitsGParms command.

Syntax

Description

This command is used to administer Global Parameters related to AMF Storm Limits in the CMM.

Parameters

Name

amfGparmName - Parameter Name

Syntax

--amfGparmName <list-item>

Description

Name of parameter.

Class

Required key.

List

- initRegistrationRateLimitOverride - Initial Registrations Rate Limit Override - Number of allowed Initial Registrations per sec per IPDS after which the AMF starts dropping the requests until the rate is below limit. Value 0 means System Calculated, System Default. Non-zero means use this value directly
- initRegistrationRateRejectLimitOverride - Initial Registration Rate Reject Limit Override - Number of allowed Initial Registrations per sec per CPPS after which the AMF starts rejecting the requests until the rate is below limit. Value 0 means System Calculated, System Default. Non-zero means use this value directly
- irat4gTo5gTauRateDropLimitOverride - IRAT 4G to 5G TAU Rate Drop Limit Override - 4G to 5G IRAT TAUs allowed per sec after which AMF start dropping 4G to 5G IRAT TAUs

until rate is below limit. Value of 0 means use system calculated Default value. Non-zero means use this value directly

- **n1n2MessageTransferLimitOverride** - N1N2 Message Transfer Limit Override - Number of allowed N1N2 Message Transfer Requests for Idle UEs that initiate a new paging procedure per sec per CPPS after which the AMF will respond with HTTP/2 status code 503 with a possible retry-after timer. Value 0 means use system calculated Default value. Non-zero means use this value directly.
- **serviceReqRateDropLimitOverride** - Service Request Rate Drop Limit Override - Number of allowed 5G UE initiated Service Requests beyond which AMF/CMM will start to drop them on the IPDS. Value of 0 means use system calculated Default value. Non-zero means use this value directly.
- **serviceReqRateLimitOverride** - Service Request Rate Limit Override - Number of UE initiated service requests allowed per sec per CPPS after which CPPS starts dropping service requests until rate is below limit. Value 0 means System Calculated, System Default. Non-zero means use this value directly.
- **tcpOpenRateLimitOverride** - TCP Open Rate Limit Override - Number of allowed TCP open events per sec per IPDS after which the AMF starts dropping the requests until the rate is below limit. Value 0 means the feature is off. Non-zero value is the limit.

Name

amfGparmValue - Parameter Value

Syntax

```
--amfGparmValue <string>
```

Description

Value of parameter.

Class

Required on create.

Type / Range

Digit string of length 0 to 64

The amfGparmValue string is based on the amfGparmName parameter:

Name

initRegistrationRateLimitOverride - Initial Registrations Rate Limit Override

Syntax

```
--amfGparmName initRegistrationRateLimitOverride --amfGparmValue  
<string>
```

Description

Number of allowed Initial Registrations per sec per IPDS after which the AMF starts dropping the requests until the rate is below limit. Value 0 means System Calculated, System Default. Non-zero means use this value directly

Type / Range

Integer in the range of 0 to 9,999

Default

0

Name

initRegistrationRateRejectLimitOverride - Initial Registration Rate Reject Limit Override

Syntax

```
--amfGparmName initRegistrationRateRejectLimitOverride --  
amfGparmValue <string>
```

Description

Number of allowed Initial Registrations per sec per CPPS after which the AMF starts rejecting the requests until the rate is below limit. Value 0 means System Calculated, System Default. Non-zero means use this value directly

Type / Range

Integer in the range of 0 to 9,999

Default

0

Name

irat4gTo5gTauRateDropLimitOverride - IRAT 4G to 5G TAU Rate Drop Limit Override

Syntax

```
--amfGparmName irat4gTo5gTauRateDropLimitOverride --amfGparmValue  
<string>
```

Description

4G to 5G IRAT TAUs allowed per sec after which AMF start dropping 4G to 5G IRAT TAUs until rate is below limit. Value of 0 means use system calculated Default value. Non-zero means use this value directly

Type / Range

Integer in the range of 0 to 14,999

Default

0

Name

n1n2MessageTransferLimitOverride - N1N2 Message Transfer Limit Override

Syntax

```
--amfGparmName n1n2MessageTransferLimitOverride --amfGparmValue  
<string>
```

Description

Number of allowed N1N2 Message Transfer Requests for Idle UEs that initiate a new paging procedure per sec per CPPS after which the AMF will respond with HTTP/2 status code 503 with a possible retry-after timer. Value 0 means use system calculated Default value. Non-zero means use this value directly.

Type / Range

Integer in the range of 0 to 9,999

Default

0

Name

serviceReqRateDropLimitOverride - Service Request Rate Drop Limit Override

Syntax

```
--amfGparmName serviceReqRateDropLimitOverride --amfGparmValue  
<string>
```

Description

Number of allowed 5G UE initiated Service Requests beyond which AMF/CMM will start to drop them on the IPDS. Value of 0 means use system calculated Default value. Non-zero means use this value directly.

Type / Range

Integer in the range of 0 to 24,999

Default

0

Name

serviceReqRateLimitOverride - Service Request Rate Limit Override

Syntax

```
--amfGparmName serviceReqRateLimitOverride --amfGparmValue <string>
```

Description

Number of UE initiated service requests allowed per sec per CPPS after which CPPS starts dropping service requests until rate is below limit. Value 0 means System Calculated, System Default. Non-zero means use this value directly.

Type / Range

Integer in the range of 0 to 6,999

Default

0

Name

tcpOpenRateLimitOverride - TCP Open Rate Limit Override

Syntax

```
--amfGparmName tcpOpenRateLimitOverride --amfGparmValue <string>
```

Description

Number of allowed TCP open events per sec per IPDS after which the AMF starts dropping the requests until the rate is below limit. Value 0 means the feature is off. Non-zero value is the limit.

Type / Range

Integer in the range of 0, 75 to 150

Default

0

3.129 cmm amfSubDataSetsProfile

AMF Subscription DataSets Profile. Syntax, description, parameters, and roles for cmm amfSubDataSetsProfile command.

Syntax**Description**

Defines subscription datasets that amf can choose to combine when retrieving UE subscription data from the UDM. The maximum number of profiles supported is 128. A default profile, named 'default', is provided.

Parameters**Name**

name - Profile name

Syntax

--name <string>

Description

Identifies, via name, a given AMF Subscription DataSets Profile.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Name

accessMobility - Access Mobility DataSet

Syntax

--accessMobility <list-item>

Description

UE access mobility subscription data

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

amfRetrieveSubMultipleDataSets - AMF Retrieves Subscription Multiple Data

Syntax

--amfRetrieveSubMultipleDataSets <list-item>

Description

Determines whether AMF retrieves combined Datasets or not. When amfRetrieveSubMultipleDataSets is active(true) for each additional parameter (smfSel,smsSub,uecSmf,uecSmsf) will be included in a single combined message if active (set to true) or excluded (if set to false) and sent as a separate query message to UDM

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

smfSel - SMF Selection Subscription Data

Syntax

--smfSel <list-item>

Description

UE SMF Selection Subscription Data

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

smsSub - SMS Subscription Data

Syntax

--smsSub <list-item>

Description

SMS Subscription Data, when SMS feature is enabled

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

traceDataFromUdm - Trace Data From UDM

Syntax

--traceDataFromUdm <list-item>

Description

Trace Data From UDM when UDM Initiated Call Trace or MDT is enabled.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

uecSmf - UE Context in SMF DataSet

Syntax

--uecSmf <list-item>

Description

UE Context in SMF Data

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

uecSmsf - UE Context in SMSF

Syntax

--uecSmsf <list-item>

Description

UE Context in SMSF, when SMS is enabled

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

v2x - V2X

Syntax

--v2x <list-item>

Description

Specifies whether the v2x data type is to be requested from UDM

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

3.130 cmm amfSupiRangeServices

Services based on Supi Range within UE Network. Syntax, description, parameters, and roles for cmm amfSupiRangeServices command.

Syntax**Description**

This command is used to administer services based on Supi Range within UE Network.

Parameters**Name**

amfUePlmnServicesName - UE PLMN services name

Syntax

--amfUePlmnServicesName <string>

Description

Name of a UE PLMN services record

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Name

entryId - ENTRY ID

Syntax

--entryId <integer>

Description

ENTRY ID

Class

Required key.

Type / Range

Integer in the range of 1 to 10,000

Name

aliasDnnConversionProfileName - AMF Alias DNN Conversion Profile Name

Syntax

--aliasDnnConversionProfileName <string>

Description

Pointer to the Alias DNN Conversion Profile

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Default

default

Name

amfAccessRestrictionNasMappingProfileName - Name of access restriction to NAS cause code profile name

Syntax

--amfAccessRestrictionNasMappingProfileName <string>

Description

Profile name for access restriction to NAS cause code mapping.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Default

default

Name

amfAusfHttp2ToNasCcMappingListName - AUSF HTTP2 Status Code to 5GMM NAS Profile List Name

Syntax

--amfAusfHttp2ToNasCcMappingListName <string>

Description

The name of the AUSF HTTP2 Status Code to 5GMM NAS Cause Code mapping profile list.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Default

default

Name

amfDnnOverrideProfileName - AMF Dnn Override Profile Name

Syntax

--amfDnnOverrideProfileName <string>

Description

Pointer to the AMF DNN Override Profile

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Default

default

Name

amfEirOverrideProfileName - AMF EIR Override Profile Name

Syntax

--amfEirOverrideProfileName <string>

Description

Indicates the profile name used during Eir check.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z_\\-:@]*

Default

""

Name

amfEplmnListName - EPLMN list name

Syntax

--amfEplmnListName <string>

Description

Identifies Equivalent PLMN list name

Class

Optional.

Type / Range

Digit string of length 0 or 1 to 31 with the allowed pattern of [0-9a-zA-Z_\\-:@]*

Default

""

Name

amfEplmnListNameGnb - EPLMN list name for gNB

Syntax

--amfEplmnListNameGnb <string>

Description

Identifies Equivalent PLMN list name to be sent to gNB. Both gNB and UE Eplmn lists have to be populated if the list is to be sent to both. Content of both lists could be same or different based on operator choice.

Class

Optional.

Type / Range

Digit string of length 0 or 1 to 31 with the allowed pattern of [0-9a-zA-Z_\\-:@]*

Default

""

Name

amfMcsPagingPriProfileListName - AMF MCS Paging Priority Profile List Name

Syntax

--amfMcsPagingPriProfileListName <string>

Description

Name that identifies the AMF MCS Paging Priority Profile List.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

amfNrDualConnectivityProfileName - NR Dual Connectivity Profile Name

Syntax

--amfNrDualConnectivityProfileName <string>

Description

Identifies NR Dual Connectivity Profile Name.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

amfNrfHttp2ToNasCcMappingListName - NRF HTTP2 Status Code to 5GMM NAS Profile List Name

Syntax

--amfNrfHttp2ToNasCcMappingListName <string>

Description

The name of the NRF HTTP2 Status Code to 5GMM NAS Cause Code mapping profile list.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

default

Name

amfRfspAccessRestrictionListName - Access Restriction for RFSP List Name

Syntax`--amfRfspAccessRestrictionListName <string>`**Description**

A reference to a list of RFSP values for which access is to be restricted for the UE.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

amfRfspLocalOverrideProfileName - AMF RFSP Local Override Profile Name

Syntax`--amfRfspLocalOverrideProfileName <string>`**Description**

The name of the AMF RFSP Local Override Profile Name for the UE.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

amfSmpToPagingPriorityProfileListName - AMF SMP to Paging Priority Profile Name

Syntax`--amfSmpToPagingPriorityProfileListName <string>`**Description**

The name of the profile to map SBI message Priority (SMP) to Paging Priority Level.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

amfSubDataSetsProfileName - Subscription Data Sets Profile Name

Syntax

--amfSubDataSetsProfileName <string>

Description

Identifies subscription Data Sets profile name for retrieving UE subscription data.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Default

default

Name

amfSvcAgreementProfileName - Service agreement profile name

Syntax

--amfSvcAgreementProfileName <string>

Description

Defines the PLMN service agreement profile to be used for service.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Default

default

Name

amfTaiListName - TAI Area List Name

Syntax

--amfTaiListName <string>

Description

Defines the area in which the service agreement profile applies for the SUPI range.

Class

Optional.

Type / Range

Digit string of length 0 or 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Default

""

Name

amfUdmHttp2ToNasCcMappingListName - UDM HTTP2 Status Code to 5GMM NAS Profile List Name

Syntax

--amfUdmHttp2ToNasCcMappingListName <string>

Description

The name of the UDM HTTP2 Status Code to 5GMM NAS Cause Code mapping profile list.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Default

default

Name

amfUeMrlForbiddenTaiListName - Mobility Restriction TAI List Name

Syntax

--amfUeMrlForbiddenTaiListName <string>

Description

Name of the Forbidden TAI List in the Mobility Restriction List sent to the gNB(s).

Class

Optional.

Type / Range

Digit string of length 0 or 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Default

""

Name

amfUeNitzInfoOverrideProfileName - UE Nitz Information Override Profile Name

Syntax

--amfUeNitzInfoOverrideProfileName <string>

Description

Indicates the profile name used for the UE Nitz information.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Default

"

Name

amfUePriorityProfileName - AMF UE Priority Profile Name

Syntax

--amfUePriorityProfileName <string>

Description

The name of the UE Priority Profile

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

"

Name

areaCodeExtendedEmergencyNumListName - Area Code Extended Emergency Number List Name

Syntax

--areaCodeExtendedEmergencyNumListName <string>

Description

Extended Emergency Number List Name

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

"

Name

cag - Closed Access Group

Syntax

--cag <list-item>

Description

A control parameter to enable Closed Access Group (CAG) feature.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

defaultVsnssaiName - Default Vsnssai Name

Syntax

--defaultVsnssaiName <string>

Description

The default VPLMN Slice used when there is no matching VPLMN slice to the UE requested HPLMN Slice.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

dnnMccOverride - DNN MCC Override

Syntax

--dnnMccOverride <digits>

Description

Override of DNN domain derivation by using this mobility country code and the mobility network code represented by dnnMccOverride.

Class

Optional.

Type / Range

Digit string of length 0 or 3

Default

""

Name

dnnMncOverride - DNN MNC Override

Syntax

--dnnMncOverride <digits>

Description

Override of DNN domain derivation by using this mobility network code and the mobility country code represented by dncMncOverride.

Class

Optional.

Type / Range

Digit string of length 0 or 2 to 3

Default

""

Name

edrxNrAllowed - eDRX Allowed

Syntax

--edrxNrAllowed <list-item>

Description

Specifies whether UEs from this PLMN are allowed to use eDRX.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Recommended

false

Name

edrxNrDnnListName - eDRX DNN List Name

Syntax

--edrxNrDnnListName <string>

Description

Specifies name of a List of DNNs. A UE is allowed to use eDRX only if it is using at least one DNN in the list.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Default

"

Name

edrxNrProfileName - eDRX Profile Name

Syntax

--edrxNrProfileName <string>

Description

Specifies an eDRX profile that is used for negotiation of eDRX parameters with a UE.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

"

Recommended

"

Name

edrxNrRedcapProfileName - eDRX NR Redcap Profile Name

Syntax

--edrxNrRedcapProfileName <string>

Description

Specifies an eDRX profile that is used for negotiation of eDRX parameters with a UE when the UE is using NR Redcap.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

"

Recommended

"

Name

eirCheck - EIR Check

Syntax

--eirCheck <list-item>

Description

This command enables EIR check for subscriber(s) IMEISV based on Supi range local configuration rule(s)

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

emcNon3gppN3iwf - EMC Non-3GPP Access N3IWF

Syntax

--emcNon3gppN3iwf <list-item>

Description

Defines whether Emergency Services are supported for the UE over untrusted non-3GPP access via N3IWF.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

emcSupport - EMC Support

Syntax

--emcSupport <list-item>

Description

Defines whether Emergency Services are supported for the UE. It applies for a home UE or a roamer UE.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

emfSupport - EMF Support

Syntax

--emfSupport <list-item>

Description

Defines whether Emergency Fallback is supported for the UE. It applies for a home UE or a roamer UE.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

enabled - Enabled

Syntax

--enabled <list-item>

Description

Enable entry

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

extendedEmergencyNumListName - Extended Emergency Number List Name

Syntax

--extendedEmergencyNumListName <string>

Description

Extended Emergency Number List Name

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

"

Name

getAccMobDataCag - Get Access and Mobility Data Due to CAG Enabling

Syntax

--getAccMobDataCag <list-item>

Description

A control parameter to enable requesting again for Access and Mobility Subscription Data in intra-AMF Mobility and Periodic Registration due to CAG feature enabling

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

hlcomAllowed - HLCOM Allowed

Syntax

--hlcomAllowed <list-item>

Description

Specifies whether an eDRX UE from this PLMN is allowed to use High Latency Communication.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Recommended

false

Name

hlcomAllowedMico - HLCOM Allowed MICO

Syntax

--hlcomAllowedMico <list-item>

Description

Specifies whether the AMF will use MICO procedures, if provisioned and requested by the SMF, for UEs from this SUPI Range.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

hplmnToVplmnSnssaiMappingListName - H-PLMN to V-PLMN Snssai Mapping List Name

Syntax

--hplmnToVplmnSnssaiMappingListName <string>

Description

Identifies allowed Home PLMN to Visited PLMN Snssai Mapping list name.

Class

Optional.

Type / Range

Digit string of length 0 or 1 to 31 with the allowed pattern of [0-9a-zA-Z_\.\\-:@]*

Default

""

Name

ignoreAusfFailuresOptionalReAuthentications - Ignore AUSF Failures on Optional Re-Authentications

Syntax

--ignoreAusfFailuresOptionalReAuthentications <list-item>

Description

This parameter, when set, enables AMF to ignore AUSF dialog related failures during optional re-authentications. The UEs to apply the functionality to are provisioned on the AMF. The functionality is applied when the AMF is locally provisioned to perform an optional re-

authentication for a UE that is already registered on the AMF, but the re-authentication fails during the AUSF dialog and the AMF is able to continue serving the UE without the re-authentication

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

imsVoiceOverPsEpsFb - IMS Voice over PS EPS Fallback

Syntax

--imsVoiceOverPsEpsFb <list-item>

Description

This parameter controls whether IMS Voice over PS Sessions is supported for the UE SupiRange under the serving PLMN by EPS fallback.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

imsVoiceOverPsVoNR - IMS Voice over PS Voice over New Radio

Syntax

--imsVoiceOverPsVoNR <list-item>

Description

This parameter controls whether IMS Voice over PS Sessions is supported for the UE SupiRange under the serving PLMN by Voice over New Radio.

Class

Optional.

List

- false - Boolean value of false.

- true - Boolean value of true.

Default

false

Name

mappingOfAllowedHomeNssaiQuery - Mapping Of Allowed Home Nssai Query

Syntax

--mappingOfAllowedHomeNssaiQuery <list-item>

Description

Enables to query NSSF to map Allowed UE Home PLMN Nssai to Visited PLMN Nssai at UE initial registration or during idle or connected mode mobility. If NSSF query response doesn't include mapped Nssai, returns an error or the setting is set to false, AMF uses the local hplmn to vplmn mapping configuration.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

n26IwkRestrictionTaiListName - N26 IWK Restriction TAI List

Syntax

--n26IwkRestrictionTaiListName <string>

Description

N26 interworking restriction TAI list used by AMF to restrict 5G service when UE(s) move from LTE into the respective TACs in the TAI list.

Class

Optional.

Type / Range

Digit string of length 0 or 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:~@]*

Default

""

Name

nwdafUeMobilityProfileName - NWDAF Profile Name

Syntax

--nwdafUeMobilityProfileName <string>

Description

Reference to an NWDAF Profile. Default is blank.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

"

Name

pagingPriProfileListName - MPS Paging priority profile name

Syntax

--pagingPriProfileListName <string>

Description

Identifies the paging priority profile for MPS.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

""

Name

pcfPolicyAllowSnssaiListName - PCF Policy Allow S-NSSAI List Name

Syntax

--pcfPolicyAllowSnssaiListName <string>

Description

When a list is provided, and the corresponding Policy Association Profile indicates that UE Policy and/or AM Policy Services should be established, then an additional check is taken in to account so that the the policy establishment is triggered only if at least one of the UE's Subscribed S-NSSAI is also included in PCF Policy Allow S-NSSAI List. If the list is not provided or it is empty then the UEs Subscribed NSSAIs are not taken into account.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

""

Name

sbiTimersProfileListName - SBI Operation Response Timers and Operation Attempts

Syntax

--sbiTimersProfileListName <string>

Description

Profile consisting of SBI Operation Response Timers and Operation Attempts

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Default

default

Name

smfNasMappingListName - SMF NAS Mapping List Name

Syntax

--smfNasMappingListName <string>

Description

The name of the SMF error to 5GMM NAS mapping list.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Default

default

Name

smsfNasMappingListName - SMSF NAS Mapping List Name

Syntax

--smsfNasMappingListName <string>

Description

The name of the SMSF (N20) error to 5GMM NAS mapping list.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Default

default

Name

sor - Steering of Roaming

Syntax

--sor <list-item>

Description

Enables steering of roaming for roamers. The UDM can invoke steering of roaming toward the AMF when UE is in visited PLMN or in home PLMN.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

supiRangeListName - Supi Range List Name

Syntax

--supiRangeListName <string>

Description

Name of the SupiRange list.

Class

Optional.

Type / Range

Digit string of length 0 or 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Default

""

Name

support5gSrvcc - Support 5G-SRVCC

Syntax

--support5gSrvcc <list-item>

Description

Enables the 5G-SRVCC support for handing over regular voice calls from NG-RAN/5GS to 3GPP UTRAN/CS domain for the UE.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

ueAmbrDownlink - UE AMBR Downlink Bitrate

Syntax

--ueAmbrDownlink <integer>

Description

UE Aggregate Maximum Downlink Bitrate. Allowed for both home and roaming subscribers.

Restrictions

Both uplink/downlink must be 0 or both uplink/downlink must be non-zero.

Class

Optional.

Type / Range

Integer in the range of 0-1,000,000,000,000 bps. in units of Kbps

Default

0

Name

ueAmbrSrc - UE AMBR Source

Syntax

--ueAmbrSrc <list-item>

Description

Identifies UE AMBR source i.e. from UDM or locally provisioned.

Class

Optional.

List

- local - Local value - UE AMBR locally configured value.
- udm - udm value - Subscribed UE AMBR in UDM

Default

udm

Name

ueAmbrUplink - UE AMBR Uplink Bitrate

Syntax

--ueAmbrUplink <integer>

Description

UE Aggregate Maximum Uplink Bitrate. Allowed for both home and roaming subscribers.

Restrictions

Both uplink/downlink must be 0 or both uplink/downlink must be non-zero.

Class

Optional.

Type / Range

Integer in the range of 0-1,000,000,000,000 bps. in units of Kbps

Default

0

Name

useSupiForLocalSmfSelection - Use SUPI for local SMF selection

Syntax

--useSupiForLocalSmfSelection <list-item>

Description

When this parameter is set to true SUPI will be used when selecting SMF from locally provisioned NFs. The SUPI will not be used for SMF discovery/selection from NRF (or when searching for SMF in the NRF cache) even if this parameter is set to true. When SUPI is used for locally provisioned SMF selection the AMF shortlists first SMFs that support the SUPI. The selection parameter shall be handled as preferred-supi: SMFs that have SUPI range that include the specific SUPI and meet the other query criterions are shortlisted first. If no such SMF is found then this selection parameter is omitted (SMF with no SUPI range or with SUPI range that does not include the specific SUPI value) will be selected.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

3.131 cmm amfSvcAgreementProfile

AMF Service Agreement Profile. Syntax, description, parameters, and roles for cmm amfSvcAgreementProfile command.

Syntax

Description

Administers UE PLMN and Served PLMN Service Agreement Profile and includes parameters to manage HO and service restrictions for roamers.

Parameters

Name

name - Name of Service Agreement Profile

Syntax

--name <string>

Description

Defines the PLMN service agreement profile name to be used for service.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

edrxExtendedConnectSource - eDRX Extended Connect Source

Syntax

--edrxExtendedConnectSource <list-item>

Description

This field specifies the source for the Extended Connect Time.

Class

Optional.

List

- local - The locally provisioned value in the service agreement. A value of 0 means that the AMF is aware of pending traffic but will not provide a specific extended connect time to the RAN.
- none - The Extended Connect Feature is off and the AMF will not provide any extended connect information to the RAN.

Default

none

Name

extendedConnectTime - Extended Connect Time

Syntax

--extendedConnectTime <integer>

Description

Specifies the time in seconds for the AMF to keep a UE in connected mode when the AMF knows of a pending HLCOM DL packet at the SMF/UPF. The default is 10. The AMF supports a maximum value of 60 seconds.

Class

Optional.

Type / Range

Integer in the range of 0 to 60 in units of Second

Default

10

Name

interPlmnOauthSupport - Oauth Support

Syntax

--interPlmnOauthSupport <list-item>

Description

This parameter is deprecated. OAuth is always suppressed in inter-PLMN scenarios.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

mico - MICO Support

Syntax

--mico <list-item>

Description

Enable MICO support.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

micoActiveTime - MICO Active Time

Syntax

--micoActiveTime <list-item>

Description

Defines whether the UE is allowed to use a MICO active time.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

micoActiveTimerSource - MICO Active Time Source

Syntax

--micoActiveTimerSource <list-item>

Description

If a UE requests an active timer as part of MICO negotiation, this field specifies the source that the AMF shall use for the active timer (t3324) negotiation.

Class

Optional.

List

- local - Local Provisioning
- ue - UE

Default

local

Name

micoExtendedConnectSource - MICO Extended Connect Source

Syntax

--micoExtendedConnectSource <list-item>

Description

This field specifies the source for the Extended Connect Time.

Class

Optional.

List

- local - The locally provisioned value in the service agreement. A value of 0 means that the AMF is aware of pending traffic but will not provide a specific extended connect time to the RAN.
- none - The Extended Connect Feature is off and the AMF will not provide any extended connect information to the RAN.

Default

none

Name

micoT3512TimerSource - MICO Registration Timer Source

Syntax

--micoT3512TimerSource <list-item>

Description

Source of the MICO registration timer to be negotiated with the UE.

Class

Optional.

List

- localT3512Timer - Local t3512 timer - The provisioned t3512 timer on the AMF.
- localMicoT3512Timer - Local MICO t3512 timer - The provisioned MICO t3512 timer on the AMF.

- ue - UE

Default

localT3512Timer

Name

micoWithEdrx - MICO with eDRX

Syntax

--micoWithEdrx <list-item>

Description

Specifies whether a UE requesting both MICO with Active Time and eDRX is allowed to use both or one of them.

Class

Optional.

List

- both - A UE requesting both eDRX and MICO can use both.
- mico - A UE requesting both eDRX and MICO can use MICO.
- edrx - A UE requesting both eDRX and MICO can use eDRX.

Default

mico

Name

pc5V2xAllowed - PC5 V2X Allowed

Syntax

--pc5V2xAllowed <list-item>

Description

Specifies whether PC5 V2X is allowed. When yes, the AMF preferentially selects a PCF that supports V2x.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

pcfPolicyAssociation - PCF Policy Association

Syntax

--pcfPolicyAssociation <list-item>

Description

Specifies type of Policy Association to be enabled

Class

Optional.

List

- amPolicy - AM Policy - AM Policy to be enabled
- both - Both UE and AM policy association to be enabled.
- none - None of the policies will be enabled
- uePolicy - UE Policy - UE Policy association to be enabled.

Default

both

Name

restrictMobilityOnUdmOdbAllPacketBarred - Restrict Mobility on UDM ODB All Packet Barred

Syntax

--restrictMobilityOnUdmOdbAllPacketBarred <list-item>

Description

Defines whether the AMF -upon UDM data change notification with ODB all packet services barred, performs deregistration for the UE -upon receiving ODB all packet services barred as part of the UE Access and Mobility subscription profile rejects the UE registration.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

roam3gppAccessAllowed - Roaming allowed in 5G 3GPP Access

Syntax

--roam3gppAccessAllowed <list-item>

Description

Specifies if inbound roamers are allowed to roam in 5G 3GPP Access.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

roam3gppAccessPduSessionOption - Roaming Options for PDU Session Establishment

Syntax

--roam3gppAccessPduSessionOption <list-item>

Description

Specifies roaming options for PDU Session Establishment in the Serving PLMN.

Class

Optional.

List

- both - Local Break Out and Home Routed - Subscribers are allowed to establish PDU Session in V-PLMN (local breakout) if DNN is LBO enabled by UDM subscription or to establish PDU Session in H-PLMN (Home-routed) for non-LBO DNN when roaming outside their home network. If LBO DNN fails to establish in V-PLMN, AMF tries to establish in H-PLMN.
- hr - Home Routed - Subscribers are allowed to establish PDU Session in H-PLMN (Home-routed) when roaming outside their home network.
- lbo - Local Break Out - Subscribers are allowed to establish PDU Session in V-PLMN (local breakout) when roaming outside their home network if DNN is LBO enabled by UDM subscription.
- none - Neither Local Break Out nor Home Routed - Subscribers are not allowed to establish PDU Session in V-PLMN (local breakout) or H-PLMN (Home-routed) when roaming outside their home network. Only services like SMS could be allowed.

Default

none

Name

snpn - Standalone Non-Public Network

Syntax

--snpn <list-item>

Description

Current parameter enables SNPN type of service

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

v2xAllowed - V2X Allowed

Syntax

--v2xAllowed <list-item>

Description

Defines whether V2X is allowed. If so, the AMF shall preferentially select a PCF that supports V2X.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

3.132 cmm amfTai

Tracking Area ID. Syntax, description, parameters, and roles for cmm amfTai command.

Syntax

Description

Provision TAC for a serving PLMN. A serving PLMN may be AMF home PLMN or shared PLMN.

Parameters

Name

plmnName - Serving PLMN Name

Syntax

--plmnName <string>

Description

The serving PLMN name may be the name of the AMF home PLMN or shared PLMN.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

amfTac - AMF Tracking Area Code

Syntax

--amfTac <integer>

Description

Provision 5G TAC. 5G TAC is 3 octets long.

Class

Required key.

Type / Range

Integer in the range of 0 to 16777215

Name

amfRelativeCapacity - AMF Relative Capacity

Syntax

--amfRelativeCapacity <integer>

Description

Configures AMF relative capacity for the tracking area

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

5

Name

emergencyFallback - Emergency Fallback

Syntax

--emergencyFallback <list-item>

Description

Enables Emergency Fallback support in the tracking area. AMF indicates to the UE that emergency fallback is supported by the network if the emergency fallback is enabled in the tracking areas sent to the UE in the tracking area list. By default, the emergency fallback is not supported.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

emergencyServiceTai - Emergency Service TAI

Syntax

--emergencyServiceTai <list-item>

Description

This command is used to enable/disable Emergency service in the tracking area. AMF indicates to the UE that emergency service is supported by the network if the emergency service is enabled in the current tracking area and all other tracking areas sent to the UE in the tracking area neighbor list. By default, the emergency service is disabled.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

imsVopsSupport - IMS VoPS Support

Syntax

--imsVopsSupport <list-item>

Description

This parameter indicates whether IMS VoPS is supported on the Tracking Areas of the AMF. Voice over PS can be supported either via Voice over New Radio connected to 5G Core, or via VoLTE connected to EPS with the NG-RAN supporting handover or redirection to EPS for the UE at QoS Flow establishment for IMS voice.

Class

Optional.

List

- amfVopsNotSupported - AMF VoPS Not Supported - Voice over PS sessions is not supported on this Tracking Area of the AMF.
- amfVopsSupportedOverNrConnectedTo5gc - AMF VoPS Support Over New Radio Connected to 5GC - Voice over PS sessions is supported on this Tracking Area of the AMF by Voice over New Radio connected to 5G Core. Note: this value is only effective when gParm voNR is enabled.
- amfVopsSupportedVoNrVolteHoRe - AMF VoPS Supported VoNR and VoLTE Handover and Redirect - Voice over PS sessions on this Tracking Area of the AMF is supported by - Voice over New Radio connected to 5G Core, -Voice over LTE connected to EPS, and the NG-RAN supports both handover and redirection to EPS at QoS Flow establishment for IMS voice. Note: this value is only effective when gParms voiceEpsFallback and VoNR are enabled.
- amfVopsSupportedVolteHo - AMF VoPS Supported VoLTE Handover - Voice over PS sessions is supported on this Tracking Area of the AMF by Voice over LTE connected to EPS, and the NG-RAN supports handover to EPS at QoS Flow establishment for IMS voice. Note: this value is only effective when gParm voiceEpsFallback is enabled.
- amfVopsSupportedVolteHoRe - AMF VoPS Supported VoLTE Handover and Redirect - Voice over PS sessions on this Tracking Area of the AMF is supported by Voice over LTE connected to EPS, and the NG-RAN supports both handover and redirection to EPS at QoS Flow establishment for IMS voice. Note: this value is only effective when gParm voiceEpsFallback is enabled.
- amfVopsSupportedVolteRedirect - AMF VoPS Supported VoLTE Redirect - Voice over PS sessions on this Tracking Area of the AMF is supported by Voice over LTE connected to EPS, and the NG-RAN supports redirection to EPS at QoS Flow establishment for IMS voice. Note: this value is only effective when gParm voiceEpsFallback is enabled.

- amfVopsSupportedVonnrVolteHo - AMF VoPS Supported VoNR and VoLTE Handover - Voice over PS sessions on this Tracking Area of the AMF is supported by -Voice over New Radio connected to 5G Core, -Voice over LTE connected to EPS, and the NG-RAN supports handover to EPS at QoS Flow establishment for IMS voice. Note: this value is only effective when gParms voiceEpsFallback and VoNR are enabled.
- amfVopsSupportedVonnrVolteRe - AMF VoPS Supported VoNR and VoLTE Redirect - Voice over PS sessions on this Tracking Area of the AMF is supported by -Voice over New Radio connected to 5G Core, -Voice over LTE connected to EPS, and the NG-RAN supports redirection to EPS at QoS Flow establishment for IMS voice. Note: this value is only effective when gParms voiceEpsFallback and VoNR are enabled.

Default

amfVopsNotSupported

Name

provisionedStatus - Provisioned Status

Syntax

--provisionedStatus <list-item>

Description

Specifies how the amf tai was last updated. Values are provisioned, rangeDiscovered, and provisionedAndRangeDiscovered

Class

Read only.

List

- Provisioned - AMF TAI was explicitly provisioned
- RangeDiscovered - Range Discovered - AMF TAI was discovered matching a range in the amfTaiRangeDiscovery Translation
- RangeDiscoveredAndProvisioned - Range Discovered And Provisioned - AMF TAI was initially range discovered, but additional direct provisioning to the TAI was done.

Name

snssaiListName - SNSSAI List Name

Syntax

--snssaiListName <string>

Description

This parameter is a pointer to the S-NSSAI list. The S-NSSAI in the list are authorized in the TAI. If the TAI is not provisioned with a list or the list is empty then it is assumed that all S-NSSAIs that are supported by AMF and 5G-AN are authorized in the TAI. This parameter is not used if AMF is provisioned to use the NSSF Availability Service as in this case the Slices that are authorized in the TAI are provided by the NSSF.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

timeZoneName - Time Zone Name

Syntax

--timeZoneName <list-item>

Description

Provision time zone of the TAC.

Class

Optional.

List

- Africa/Abidjan - Timezone for africa/abidjan UTC offset of +00:00.
- Africa/Accra - Timezone for africa/accra UTC offset of +00:00.
- Africa/Addis_Ababa - Timezone for africa/addis_ababa UTC offset of +03:00.
- Africa/Algiers - Timezone for africa/algiers UTC offset of +01:00.
- Africa/Asmara - Timezone for africa/asmara UTC offset of +03:00.

3.133 cmm amfTaiDiscoveryLadnTailList

AMF TAI Discovery LADN List. Syntax, description, parameters, and roles for cmm amfTaiDiscoveryLadnTailList command.

Syntax

Description

creates a list name to hold LADN names for auto-discovery. 32 list names are supported.

Parameters

Name

name - Name

Syntax

--name <string>

Description

Name of the AMF TAI Discovery LADN List

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

3.134 cmm amfTaiDiscoveryLadnTaiListItem

AMF LADN TAI List Names. Syntax, description, parameters, and roles for cmm amfTaiDiscoveryLadnTaiListItem command.

Syntax

Description

This command is used to create a list of AMF LADN TAI List Name items. 16384 List Items are supported.

Parameters

Name

amfTaiDiscoveryLadnTailListName - AMF LADN TAI List Names

Syntax

```
--amfTaiDiscoveryLadnTailListName <string>
```

Description

The name of the list of AMF LADN TAI List items

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

amfLadnTailListName - Name

Syntax

```
--amfLadnTailListName <string>
```

Description

specifies the name for the list of AMF LADN List Name Items

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

3.135 cmm amfTaiDiscoveryPraId

AMF TAI Discovery PRA Insert. Syntax, description, parameters, and roles for cmm amfTaiDiscoveryPraId command.

Syntax

Description

Specifies pre-existing PRA IDs to which a discovered TAI is to be assigned. 8192 items are supported.

Parameters

Name

amfTaiDiscoveryPraIdListName - TAI Discovery Pra ID List Name

Syntax

--amfTaiDiscoveryPraIdListName <string>

Description

Specifies the name of the list of PRA IDs

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Name

amfPraId - AMF PRA ID

Syntax

--amfPraId <integer>

Description

Specifies the AMF PRA ID.

Class

Required key.

Type / Range

Integer in the range of 8,388,608 to 16,777,215

3.137 cmm amfTaiDiscoveryRegionId

AMF TAI Discovery Region ID Item. Syntax, description, parameters, and roles for cmm amfTaiDiscoveryRegionId command.

Syntax

Description

Creates an item in a amfTaiDiscoveryRegionId list. 8192 List Items are supported.

Parameters

Name

amfTaiDiscoveryRegionIdListName - AMF TAI Discovery Region ID List Name

Syntax

--amfTaiDiscoveryRegionIdListName <string>

Description

Specifies the name of a list of Region IDs

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Name

amfRegionId - AMF Region ID

Syntax

--amfRegionId <integer>

Description

Specifies the AMF Region ID. Used to identify an AMF group serving a region.

Class

Required key.

Type / Range

Integer in the range of 0 to 255

3.138 cmm amfTaiDiscoveryRegionIdList

AMF TAI Discovery Region Insert. Syntax, description, parameters, and roles for cmm amfTaiDiscoveryRegionIdList command.

Syntax

Description

Specifies pre-existing region Ids to which a discovered TAI is to be assigned. 32 list names are supported.

Parameters

Name

name - name

Syntax

--name <string>

Description

specifies the name of the list of Region IDs

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Roles

Create

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

3.139 cmm amfTaiDiscoveryTaiList

AMF Tai Discovery Tai List . Syntax, description, parameters, and roles for cmm amfTaiDiscoveryTaiList command.

Syntax

Description

Specifies the name for a list of amfTaiListname. 32 list names are supported.

Parameters

Name

name - Name

Syntax

--name <string>

Description

The name of a amfTaiDiscoveryTailist

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Roles

Create

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

3.140 cmm amfTaiDiscoveryTailistItem

AMF TAI List Names. Syntax, description, parameters, and roles for cmm amfTaiDiscoveryTailistItem command.

Syntax

Description

creates a list of AMF TAI List Name elements for use with amfTaiDiscovery. 8192 List Items are supported.

Parameters

Name

amfTaiDiscoveryTailListName - AMF TAI List Names Name

Syntax

--amfTaiDiscoveryTailListName <string>

Description

Name of the List of AMF TAI List Name items

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

amfTailListName - AMF TAI List Name

Syntax

--amfTailListName <string>

Description

Name of TAI list

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Roles

Create

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

List

sysadmin, manage, monitor

3.141 cmm amfTailList

List of TAIs. Syntax, description, parameters, and roles for cmm amfTailList command.

Syntax

Description

Administer List of TAIs

Parameters

Name

name - Name of TAI List

Syntax

--name <string>

Description

Name of TAI list

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Name

taiListType - AMF TAI List Type

Syntax

--taiListType <list-item>

Description

Identifies the type of the AMF TAI list associated or linked. TAI List Type of NF Instance and SUPI Range Services do not apply to Equivalent PLMN(s).

Class

Required on create, not modifiable.

List

- mrlForbiddenTacs - TAI List for Mobility Restriction List Forbidden Tacs - Identifies TAI List associated or linked to Mobility Restriction List.
- n26lwkRestTacs - TAI List for N26 Restriction - Identifies TAI List associated with N26 Restriction.
- nfInstance - TAI List for Network Function Instance(s) - Identifies TAI List associated or linked to Network Function Instance(s) such as AMF.
- supiRangeServices - TAI List for Supi Range Services - Identifies TAI List associated or linked to Supi Range Services.

Roles

Create

sysadmin, manage

3.142 cmm amfTaiRangeDiscoveryProfile

AMF Tai Discovery. Syntax, description, parameters, and roles for cmm amfTaiRangeDiscoveryProfile command.

Syntax

Description

Specifies fields to be entered in the amfTai translation for an auto-discovered AMF TAI. A maximum of 256 profiles is supported.

Parameters

Name

name - name

Syntax

--name <string>

Description

AMF TAI Range Discovery Profile name

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

maxTac - AMF TAC Max

Syntax

--maxTac <integer>

Description

The maximum TAC in the range

Class

Required on create.

Type / Range

Integer in the range of 0 to 16777215

Name

minTac - AMF TAC Min

Syntax

--minTac <integer>

Description

Lower Bound of the TAI Range

Class

Required on create.

Type / Range

Integer in the range of 0 to 16777215

Name

plmnName - Serving PLMN Name

Syntax

--plmnName <string>

Description

The serving PLMN name. It may be the name of the AMF home PLMN or shared PLMN

Class

Required on create, not modifiable.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

amfRelativeCapacity - AMF Relative Capacity

Syntax

--amfRelativeCapacity <integer>

Description

Configures AMF relative capacity for the tracking area

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

5

Name

amfTaiDiscoveryLadnTaiListName - AMF LADN TAI List Names

Syntax`--amfTaiDiscoveryLadnTaiListName <string>`**Description**

Name of the List of AMF LADN TAI List Items. This translation is referenced from amfTaiRangeDiscovery and is used for auto-inserting a discovered TAI into the amfTais.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

amfTaiDiscoveryPraIdListName - AMF TAI Discovery PRA Insert Name

Syntax`--amfTaiDiscoveryPraIdListName <string>`**Description**

Specifies the name of a list of PRAs into which a discovered TAI is to be inserted

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

amfTaiDiscoveryRegionIdListName - AMF Discovery Region Insert Name

Syntax`--amfTaiDiscoveryRegionIdListName <string>`**Description**

Specifies the name of the list of Region IDs into which a discovered TAI is to be inserted

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

amfTaiDiscoveryTailListName - AMF TAI List Names

Syntax

--amfTaiDiscoveryTailListName <string>

Description

Name of the List of AMF TAI List Names

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

emergencyFallback - Emergency Fallback

Syntax

--emergencyFallback <list-item>

Description

Enables Emergency Fallback support in the tracking area. AMF indicates to the UE that emergency fallback is supported by the network if the emergency fallback is enabled in the tracking areas sent to the UE in the tracking area list. By default, the emergency fallback is not supported.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

emergencyServiceTai - Emergency Service TAI

Syntax

--emergencyServiceTai <list-item>

Description

This command is used to enable/disable Emergency service in the tracking area. AMF indicates to the UE that emergency service is supported by the network if the emergency service is enabled in the current tracking area and all other tracking areas sent to the UE in the tracking area neighbor list. By default, the emergency service is disabled.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

imsVopsSupport - IMS VoPS Support

Syntax

--imsVopsSupport <list-item>

Description

This parameter indicates whether IMS VoPS is supported on the Tracking Areas of the AMF. Voice over PS can be supported either via Voice over New Radio connected to 5G Core, or via VoLTE connected to EPS with the NG-RAN supporting handover or redirection to EPS for the UE at QoS Flow establishment for IMS voice.

Class

Optional.

List

- amfVopsNotSupported - AMF VoPS Not Supported - Voice over PS sessions is not supported on this Tracking Area of the AMF.
- amfVopsSupportedOverNrConnectedTo5gc - AMF VoPS Support Over New Radio Connected to 5GC - Voice over PS sessions is supported on this Tracking Area of the AMF by Voice over New Radio connected to 5G Core. Note: this value is only effective when gParm voNR is enabled.
- amfVopsSupportedVoNrVolteHoRe - AMF VoPS Supported VoNR and VoLTE Handover and Redirect - Voice over PS sessions on this Tracking Area of the AMF is supported by - Voice over New Radio connected to 5G Core, -Voice over LTE connected to EPS, and the NG-RAN supports both handover and redirection to EPS at QoS Flow establishment for IMS voice. Note: this value is only effective when gParms voiceEpsFallback and VoNR are enabled.
- amfVopsSupportedVolteHo - AMF VoPS Supported VoLTE Handover - Voice over PS sessions is supported on this Tracking Area of the AMF by Voice over LTE connected

to EPS, and the NG-RAN supports handover to EPS at QoS Flow establishment for IMS voice. Note: this value is only effective when gParm voiceEpsFallback is enabled.

- amfVopsSupportedVolteHoRe - AMF VoPS Supported VoLTE Handover and Redirect - Voice over PS sessions on this Tracking Area of the AMF is supported by Voice over LTE connected to EPS, and the NG-RAN supports both handover and redirection to EPS at QoS Flow establishment for IMS voice. Note: this value is only effective when gParm voiceEpsFallback is enabled.
- amfVopsSupportedVolteRedirect - AMF VoPS Supported VoLTE Redirect - Voice over PS sessions on this Tracking Area of the AMF is supported by Voice over LTE connected to EPS, and the NG-RAN supports redirection to EPS at QoS Flow establishment for IMS voice. Note: this value is only effective when gParm voiceEpsFallback is enabled.
- amfVopsSupportedVonnrVolteHo - AMF VoPS Supported VoNR and VoLTE Handover - Voice over PS sessions on this Tracking Area of the AMF is supported by -Voice over New Radio connected to 5G Core, -Voice over LTE connected to EPS, and the NG-RAN supports handover to EPS at QoS Flow establishment for IMS voice. Note: this value is only effective when gParms voiceEpsFallback and VoNR are enabled.
- amfVopsSupportedVonnrVolteRe - AMF VoPS Supported VoNR and VoLTE Redirect - Voice over PS sessions on this Tracking Area of the AMF is supported by -Voice over New Radio connected to 5G Core, -Voice over LTE connected to EPS, and the NG-RAN supports redirection to EPS at QoS Flow establishment for IMS voice. Note: this value is only effective when gParms voiceEpsFallback and VoNR are enabled.

Default

amfVopsNotSupported

Name

snssaiListName - SNSSAI List Name

Syntax

--snssaiListName <string>

Description

The S-NSSAI in the list are authorized in the TAI. If TAI is not provisioned with a list then it is assumed that all S-NSSAIs that are supported by AMF and 5G-AN are authorized in the TAI. This parameter is not used if AMF is provisioned to use the NSSF Availability Service as in this case the Slices that are authorized in the TAI are provided by the NSSF.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

timeZoneName - Time Zone Name

Syntax

--timeZoneName <list-item>

Description

Provision time zone of the TAC.

Class

Optional.

List

- Africa/Abidjan - Timezone for africa/abidjan UTC offset of +00:00.
- Africa/Accra - Timezone for africa/accra UTC offset of +00:00.
- Africa/Addis_Ababa - Timezone for africa/addis_ababa UTC offset of +03:00.
- Africa/Algiers - Timezone for africa/algiers UTC offset of +01:00.
- Africa/Asmara - Timezone for africa/asmara UTC offset of +03:00.
- Africa/Asmera - Timezone for africa/asmera UTC offset of +03:00.
- Africa/Bamako - Timezone for africa/bamako UTC offset of +00:00.
- Africa/Bangui - Timezone for africa/bangui UTC offset of +01:00.
- Africa/Banjul - Timezone for africa/banjul UTC offset of +00:00.
- Africa/Bissau - Timezone for africa/bissau UTC offset of +00:00.
- Africa/Blantyre - Timezone for africa/blantyre UTC offset of +02:00.
- Africa/Brazzaville - Timezone for africa/brazzaville UTC offset of +01:00.
- Africa/Bujumbura - Timezone for africa/bujumbura UTC offset of +02:00.
- Africa/Cairo - Timezone for africa/cairo UTC offset of +02:00.
- Africa/Casablanca - Timezone for africa/casablanca UTC offset of +00:00.
- Africa/Ceuta - Timezone for africa/ceuta UTC offset of +01:00.
- Africa/Conakry - Timezone for africa/conakry UTC offset of +00:00.
- Africa/Dakar - Timezone for africa/dakar UTC offset of +00:00.
- Africa/Dar_es_Salaam - Timezone for africa/dar_es_salaam UTC offset of +03:00.
- Africa/Djibouti - Timezone for africa/djibouti UTC offset of +03:00.
- Africa/Douala - Timezone for africa/douala UTC offset of +01:00.
- Africa/El_Aaiun - Timezone for africa/el_aaiun UTC offset of +00:00.
- Africa/Freetown - Timezone for africa/freetown UTC offset of +00:00.
- Africa/Gaborone - Timezone for africa/gaborone UTC offset of +02:00.

- Africa/Harare - Timezone for africa/harare UTC offset of +02:00.
- Africa/Johannesburg - Timezone for africa/johannesburg UTC offset of +02:00.
- Africa/Juba - Timezone for africa/juba UTC offset of +03:00.
- Africa/Kampala - Timezone for africa/kampala UTC offset of +03:00.
- Africa/Khartoum - Timezone for africa/khartoum UTC offset of +03:00.
- Africa/Kigali - Timezone for africa/kigali UTC offset of +02:00.
- Africa/Kinshasa - Timezone for africa/kinshasa UTC offset of +01:00.
- Africa/Lagos - Timezone for africa/lagos UTC offset of +01:00.
- Africa/Libreville - Timezone for africa/libreville UTC offset of +01:00.
- Africa/Lome - Timezone for africa/lome UTC offset of +00:00.
- Africa/Luanda - Timezone for africa/luanda UTC offset of +01:00.
- Africa/Lubumbashi - Timezone for africa/lubumbashi UTC offset of +02:00.
- Africa/Lusaka - Timezone for africa/lusaka UTC offset of +02:00.
- Africa/Malabo - Timezone for africa/malabo UTC offset of +01:00.
- Africa/Maputo - Timezone for africa/maputo UTC offset of +02:00.
- Africa/Maseru - Timezone for africa/maseru UTC offset of +02:00.
- Africa/Mbabane - Timezone for africa/mbabane UTC offset of +02:00.
- Africa/Mogadishu - Timezone for africa/mogadishu UTC offset of +03:00.
- Africa/Monrovia - Timezone for africa/monrovia UTC offset of +00:00.
- Africa/Nairobi - Timezone for africa/nairobi UTC offset of +03:00.
- Africa/Ndjamena - Timezone for africa/ndjamena UTC offset of +01:00.
- Africa/Niamey - Timezone for africa/niamey UTC offset of +01:00.
- Africa/Nouakchott - Timezone for africa/nouakchott UTC offset of +00:00.
- Africa/Ouagadougou - Timezone for africa/ouagadougou UTC offset of +00:00.
- Africa/Porto-Novo - Timezone for africa/porto-novo UTC offset of +01:00.
- Africa/Sao_Tome - Timezone for africa/sao_tome UTC offset of +00:00.
- Africa/Timbuktu - Timezone for africa/timbuktu UTC offset of +00:00.
- Africa/Tripoli - Timezone for africa/tripoli UTC offset of +02:00.
- Africa/Tunis - Timezone for africa/tunis UTC offset of +01:00.
- Africa/Windhoek - Timezone for africa/windhoek UTC offset of +02:00.
- America/Adak - Timezone for america/adak UTC offset of -10:00.

- America/Anchorage - Timezone for america/anchorage UTC offset of -09:00.
- America/Anguilla - Timezone for america/anguilla UTC offset of -04:00.
- America/Antigua - Timezone for america/antigua UTC offset of -04:00.
- America/Araguaina - Timezone for america/araguaina UTC offset of -03:00.
- America/Argentina/Buenos_Aires - Timezone for america/argentina/buenos_aires UTC offset of -03:00.
- America/Argentina/Catamarca - Timezone for america/argentina/catamarca UTC offset of -03:00.
- America/Argentina/ComodRivadavia - Timezone for america/argentina/comodrivadavia UTC offset of -03:00.
- America/Argentina/Cordoba - Timezone for america/argentina/cordoba UTC offset of -03:00.
- America/Argentina/Jujuy - Timezone for america/argentina/jujuy UTC offset of -03:00.
- America/Argentina/La_Rioja - Timezone for america/argentina/la_rioja UTC offset of -03:00.
- America/Argentina/Mendoza - Timezone for america/argentina/mendoza UTC offset of -03:00.

3.143 cmm amfTais

AMF TAI List. Syntax, description, parameters, and roles for `cmm amfTais` command.

Syntax**Description**

This command creates a list of 5G TAI.

Parameters**Name**

amfTaiListName - Area List Name

Syntax

--amfTaiListName <string>

Description

Name of TAI list

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

servingPlmnName - Serving PLMN Name

Syntax

--servingPlmnName <string>

Description

Serving PLMN Name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

amfTac - AMF Tracking Area Code

Syntax

--amfTac <integer>

Description

AMF Tracking Area Code

Restrictions

Each List can have a maximum of 1024 TACs. Maximum number of TAI lists supported is 256.

Class

Required key.

Type / Range

Integer in the range of 0 to 16,777,215

3.144 cmm amfTimers

5G Timers. Syntax, description, parameters, and roles for cmm amfTimers command.

Syntax

Description

5G timers like NG-AP, mobility management, etc.

Parameters

Name

amfTimerName - Timer name

Syntax

--amfTimerName <list-item>

Description

Name of timer.

Class

Required key.

List

- amfLoadUpdate - AMF Load Update - Defines the period after which the AMF re-checks the AMF load info and updates NRF if needed.
- amfSbiDisabledLinkDel - SBI Link Inactive Timer for Disabled links - This parameter specifies the Link Inactive Timer for SBI Disabled Links
- amfSbiInactiveLinkDel - SBI Link Inactive Timer - This parameter specifies the Link Delete Timeout for SBI links
- ausfEapAuthOngoing - EAP AKA' Is Still Ongoing - A guard timer for receiving response from AUSF for EAP authentication ongoing message, 6000 ms (T3560) * 4 (retries) +ausf Gurad timer 3000=27000. Note: this timer value and/or its default should be updated whenever T3560 timer value and/or its default is changed. The max range value is capped at: 6000 ms (T3560) * 6 (retries) +ausf Gurad timer 3000+1000=40000.

- **cmassWarningMsgTimer** - CMAS Warning Message Timer - The warning message timer is an NG-AP interface timer. It indicates the time to wait (in seconds) for the Warning Message Delivery Service. Failure to receive a Write-Replace Warning Response from the gNB before the timer expires which indicates that the broadcast or broadcast cancellation is unsuccessful in that gNB.
- **epsFallbackNoPageTimer** - EPS Fallback no page timer - AMF suppresses UE paging while timer is running and uePageEpsFallback is set to true.
- **nssaafSliceAuthorizationOngoing** - NSSAA Is Still Ongoing - A guard timer for all pending S-NSSAIs. For the case the NSSAA is done in sequence and not in parallel for the 'pending' S-NSSAIs, the AMF shall check remaining time before starting NSSAA for next slice, so when there isn't enough time or timer expires the AMF shall update the UE with the S-NSSAI status up to that point and then resume NSSAA in next mobility procedure. $N(\text{NAS retries})=1$ as default value used here. So, $15000 \text{ ms (T3575)} + \text{nssaaf Guard timer } 5000 = 20000$. The max range value +retry in late phase could be capped at: $15000 \text{ ms (T3575)} * 3 (\text{retries}) + \text{nssaaf Guard timer } 5000 = 50000 \text{ ms}$. Default = $15000 \text{ ms} * 1 + 5000 = 20000 \text{ ms}$
- **pagingGapTimer** - Paging Gap Timer - This timer indicates the interval in which the AMF will suppress paging for a UE after multiple consecutive page response failures have occurred for the UE. a value of 0 indicates that paging should not be suppressed due to previous page response failures. Paging Gap timer will be stopped if the UE reconnects to the network with AMF call processing procedure such as Service Request. If the Paging Gap timer is stopped or expires, the AMF will once again trigger paging for that UE. If the UE fails to respond after the AMF paged the UE after the Paging Gap timer expired (i.e., the UE has still not connected to the network since Paging Gap timer was started), the Paging Gap timer will be started again. The trigger for starting suppression of AMF paging is 3 consecutive failed procedures due to an inability to reach a UE with paging.
- **radioCapInfoWait** - Radio Capability Info Waiting - Defines the time waiting for NGAP UE Radio Capability Info Indication after receiving Initial Context Setup Response and possibly UE Radio Capability Check Response. The timer is only started when AMF does not hold UE radio capability and UE radio capabilities are needed for either -enhanced voice rejection (registration needs to be rejected if UE does not support VoNR on VoNR only TA), or -EMC needs to be suppressed if UE does not support VoNR (and additionally optionally EMF needs to be suppressed if VoNR is supported), or -IMS VoPS needs to be suppressed if UE has disabled S1 support.
- **rrcInactiveTimerIncr** - RRC inactive timer increment - This timer is added to 24.501 and 38.413 timers when RRC Inactive feature is enabled.
- **smsNoLastMsgIndication** - SMS No Last Message Indication - Defines the timer value the AMF uses to release AMF reserved internal resources, if the SMSF does not provide the lastMsgIndication during Namf_Communication_N1N2MessageTransfer.
- **udmSubscriptionExpires** - UDM Subscription Expires timer - During a UDM subscribe to notification of data change procedure, the AMF can specify a data/time that the

subscription expires. The expiration date/time used will be the current data/time when subscribe is requested plus udmSubExpires. Note: On expiry, AMF sends a subscribe message with previously subscribed resources to UDM.

- vlrCleanupIratUeCtxt - VLR Cleanup IRAT UE Contexts - This parameter specifies the time for deleting from the VLR the preserved UE Contexts of the deregistered UEs that have moved to EPC. Value 0 means that the UE Contexts are not deleted from the VLR
- waitReleaseUeCtxtSrcAmf - Wait Release UE Context from Source AMF - Current timer enables maintaining the UE context as initial target AMF after receiving Create UE Context Response (success) from final target AMF in N2 Handover with AMF reselection scenario so that a Release UE Context Request due to handover Cancellation may still be sent to final target AMF. When the timer expires, initial target AMF shall release local resources. When timer is zero, the initial target AMF releases the UE Context immediately after sending Create UE Context Response to source AMF.
- waitRelocateCancelSrcMme - Wait Relocate Cancel from Source MME - Supervises receipt of Relocate Cancel Request from source MME after receiving Relocate UE Context Response from target AMF in EPS to 5GS with AMF relocation scenario. When timer expires, initial AMF shall release local resources

Name

amfTimerUnit - Timer unit

Syntax

--amfTimerUnit <list-item>

Description

Unit of measurement.

Class

Required on create, not modifiable.

List

- 320Hour - 320 hour - Specify timer unit of 320 hours.
- Millisecond - Specify timer unit of 1 millisecond.
- Second - Specify timer unit of 1 second.
- 2Second - 2 second - Specify timer unit of 2 seconds.
- 30Second - 30 second - Specify timer unit of 30 seconds.
- Minute - Specify timer unit of 1 minute.
- DeciHour - Specify timer unit of 1 decihour (6 minutes).
- 10Minute - 10 minute - Specify timer unit of 10 minutes.
- Hour - Specify timer unit of 1 hour.
- 10Hour - 10 hour - Specify timer unit of 10 hours.

Name

amfTimerValue - Timer value

Syntax

```
--amfTimerValue <integer>
```

Description

Numeric value of timer.

Class

Required on create.

Type / Range

Integer in the range of 0 to 65,535

The amfTimerValue string is based on the amfTimerName parameter:

Name

amfLoadUpdate - AMF Load Update

Syntax

```
--amfTimerName amfLoadUpdate --amfTimerValue <string> [ --  
amfTimerUnit Second ]
```

Description

Defines the period after which the AMF re-checks the AMF load info and updates NRF if needed.

Type / Range

Integer in the range of 1 to 60 in units of Second

Default

10

Name

amfSbiDisabledLinkDel - SBI Link Inactive Timer for Disabled links

Syntax

```
--amfTimerName amfSbiDisabledLinkDel --amfTimerValue <string> [ --  
amfTimerUnit 10Minute ]
```

Description

This parameter specifies the Link Inactive Timer for SBI Disabled Links

Type / Range

Integer in the range of 1 to 140 in units of 10Minute

Default

6

Name

amfSbiInactiveLinkDel - SBI Link Inactive Timer

Syntax

```
--amfTimerName amfSbiInactiveLinkDel --amfTimerValue <string> [ --  
amfTimerUnit 10Minute ]
```

Description

This parameter specifies the Link Delete Timeout for SBI links

Type / Range

Integer in the range of 1 to 140 in units of 10Minute

Default

6

Name

ausfEapAuthOngoing - EAP AKA' Is Still Ongoing

Syntax

```
--amfTimerName ausfEapAuthOngoing --amfTimerValue <string> [ --  
amfTimerUnit Millisecond ]
```

Description

A guard timer for receiving response from AUSF for EAP authentication ongoing message, 6000 ms (T3560) * 4 (retries) +ausf Gurad timer 3000=27000. Note: this timer value and/or its default should be updated whenever T3560 timer value and/or its default is changed. The max range value is capped at: 6000 ms (T3560) * 6 (retries) +ausf Gurad timer 3000+1000=40000.

Type / Range

Integer in the range of 10 to 40,000 in units of Millisecond

Default

27000

Name

cmassWarningMsgTimer - CMAS Warning Message Timer

Syntax

```
--amfTimerName cmassWarningMsgTimer --amfTimerValue <string> [ --  
amfTimerUnit Second ]
```

Description

The warning message timer is an NG-AP interface timer. It indicates the time to wait (in seconds) for the Warning Message Delivery Service. Failure to receive a Write-Replace Warning Response from the gNB before the timer expires which indicates that the broadcast or broadcast cancellation is unsuccessful in that gNB.

Type / Range

Integer in the range of 1 to 60 in units of Second

Default

8

Name

epsFallbackNoPageTimer - EPS Fallback no page timer

Syntax

```
--amfTimerName epsFallbackNoPageTimer --amfTimerValue <string> [ --  
amfTimerUnit Millisecond ]
```

Description

AMF suppresses UE paging while timer is running and uePageEpsFallback is set to true.

Type / Range

Integer in the range of 10 to 2000 in units of Millisecond

Default

1000

Name

nssaafSliceAuthorizationOngoing - NSSAA Is Still Ongoing

Syntax

```
--amfTimerName nssaafSliceAuthorizationOngoing --amfTimerValue  
<string> [ --amfTimerUnit Millisecond ]
```

Description

A guard timer for all pending S-NSSAIs. For the case the NSSAA is done in sequence and not in parallel for the 'pending' S-NSSAIs, the AMF shall check remaining time before starting NSSAA for next slice, so when there isn't enough time or timer expires the AMF shall update the UE with the S-NSSAI status up to that point and then resume NSSAA in next mobility procedure. N(NAS retries)=1 as default value used here. So, 15000 ms (T3575) +nssaaf Guard timer 5000=20000. The max range value +retry in late phase could be capped at: 15000 ms (T3575) * 3 (retries) +nssaaf Guard timer 5000 =50000 ms. Default=15000 ms*1+5000=20000 ms

Type / Range

Integer in the range of 10 to 60,000 in units of Millisecond

Default

20000

Name

pagingGapTimer - Paging Gap Timer

Syntax

```
--amfTimerName pagingGapTimer --amfTimerValue <string> [ --  
amfTimerUnit Minute ]
```

Description

This timer indicates the interval in which the AMF will suppress paging for a UE after multiple consecutive page response failures have occurred for the UE. a value of 0 indicates that

paging should not be suppressed due to previous page response failures. Paging Gap timer will be stopped if the UE reconnects to the network with AMF call processing procedure such as Service Request. If the Paging Gap timer is stopped or expires, the AMF will once again trigger paging for that UE. If the UE fails to respond after the AMF paged the UE after the Paging Gap timer expired (i.e., the UE has still not connected to the network since Paging Gap timer was started), the Paging Gap timer will be started again. The trigger for starting suppression of AMF paging is 3 consecutive failed procedures due to an inability to reach a UE with paging.

Type / Range

Integer in the range of 0 to 1,440 in units of Minute

Default

0

Name

radioCapInfoWait - Radio Capability Info Waiting

Syntax

```
--amfTimerName radioCapInfoWait --amfTimerValue <string> [ --  
amfTimerUnit Millisecond ]
```

Description

Defines the time waiting for NGAP UE Radio Capability Info Indication after receiving Initial Context Setup Response and possibly UE Radio Capability Check Response. The timer is only started when AMF does not hold UE radio capability and UE radio capabilities are needed for either -enhanced voice rejection (registration needs to be rejected if UE does not support VoNR on VoNR only TA), or -EMC needs to be suppressed if UE does not support VoNR (and additionally optionally EMF needs to be suppressed if VoNR is supported), or -IMS VoPS needs to be suppressed if UE has disabled S1 support.

Type / Range

Integer in the range of 0 to 3,000 in units of Millisecond

Default

500

Name

rrcInactiveTimerIncr - RRC inactive timer increment

Syntax

```
--amfTimerName rrcInactiveTimerIncr --amfTimerValue <string> [ --  
amfTimerUnit Second ]
```

Description

This timer is added to 24.501 and 38.413 timers when RRC Inactive feature is enabled.

Type / Range

Integer in the range of 0 to 3 in units of Second

Default

0

Name

smsNoLastMsgIndication - SMS No Last Message Indication

Syntax

```
--amfTimerName smsNoLastMsgIndication --amfTimerValue <string> [ --  
amfTimerUnit Second ]
```

Description

Defines the timer value the AMF uses to release AMF reserved internal resources, if the SMSF does not provide the lastMsgIndication during Namf_Communication_N1N2MessageTransfer.

Type / Range

Integer in the range of 1 to 10 in units of Second

Default

3

Name

udmSubscriptionExpires - UDM Subscription Expires timer

Syntax

```
--amfTimerName udmSubscriptionExpires --amfTimerValue <string> [ --  
amfTimerUnit Hour ]
```

Description

During a UDM subscribe to notification of data change procedure, the AMF can specify a data/time that the subscription expires. The expiration date/time used will be the current data/time when subscribe is requested plus udmSubExpires. Note: On expiry, AMF sends a subscribe message with previously subscribed resources to UDM.

Type / Range

Integer in the range of 1 to 700 in units of Hour

Default

168

Name

vlrCleanupIratUeCtxt - VLR Cleanup IRAT UE Contexts

Syntax

```
--amfTimerName vlrCleanupIratUeCtxt --amfTimerValue <string> [ --  
amfTimerUnit Minute ]
```

Description

This parameter specifies the time for deleting from the VLR the preserved UE Contexts of the deregistered UEs that have moved to EPC. Value 0 means that the UE Contexts are not deleted from the VLR

Type / Range

Integer in the range of 5 to 120, allowed 0 value also. in units of Minute

Default

5

Recommended

5

Name

waitReleaseUeCtxtSrcAmf - Wait Release UE Context from Source AMF

Syntax

```
--amfTimerName waitReleaseUeCtxtSrcAmf --amfTimerValue <string> [ --  
amfTimerUnit Millisecond ]
```

Description

Current timer enables maintaining the UE context as initial target AMF after receiving Create UE Context Response (success) from final target AMF in N2 Handover with AMF reselection scenario so that a Release UE Context Request due to handover Cancellation may still be sent to final target AMF. When the timer expires, initial target AMF shall release local resources. When timer is zero, the initial target AMF releases the UE Context immediately after sending Create UE Context Response to source AMF.

Type / Range

Integer in the range of 0 to 1,000 in units of Millisecond

Default

500

Name

waitRelocateCancelSrcMme - Wait Relocate Cancel from Source MME

Syntax

```
--amfTimerName waitRelocateCancelSrcMme --amfTimerValue <string> [ --  
amfTimerUnit Millisecond ]
```

Description

Supervises receipt of Relocate Cancel Request from source MME after receiving Relocate UE Context Response from target AMF in EPS to 5GS with AMF relocation scenario. When timer expires, initial AMF shall release local resources

Type / Range

Integer in the range of 0 to 1,000 in units of Millisecond

Default

500

3.145 cmm amfTnlaQuery

AMF TNLA Query. Syntax, description, parameters, and roles for cmm amfTnlaQuery command.

Syntax

Description

Outputs for a given AMF N2 IP address a list of NG-RAN gNBs that use the AMF N2 endpoint for a TNLA or as the initial AMF N2 endpoint used to perform the first N2 Setup procedure with the AMF.

Parameters

Name

amfIpAddress - AMF N2 IP address

Syntax

--amfIpAddress <string>

Description

Specifies AMF N2 local endpoint IP address

Class

Required key.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

assignMode - Assignment Mode

Syntax

--assignMode <integer>

Description

This field depicts the assignment mode for the SNPN

Class

Optional.

Type / Range

Integer in the range of 0 to 2

Default

0

Name

information - Information

Syntax

--information <string>

Description

Information

Class

Read only.

Type / Range

Digit string of length 0 to 256 with the allowed pattern of [0-9a-zA-Z\._:-]*

Name

initialTnla - Initial TNLA

Syntax

--initialTnla <list-item>

Description

Indicates if gNB used the AMF N2 local endpoint IP address to send its initial NG Setup Request to the AMF.

Class

Read only.

List

- false - Boolean value of false.
- true - Boolean value of true.

Name

linkIndex - AMF Link Index

Syntax

--linkIndex <integer>

Description

AMF link index

Class

Read only.

Type / Range

Integer in the range of 0 to 4,294,967,295

Name

mcc - Mobile country code

Syntax

--mcc <digits>

Description

3-digit number used to represent the mobile country code.

Class

Read only.

Type / Range

Digit string of length 3

Name

mnc - Mobile network code

Syntax

--mnc <digits>

Description

Digits used to represent mobile network code.

Class

Read only.

Type / Range

Digit string of length 2 to 3

Name

ngRanId - Global RAN Node ID

Syntax

--ngRanId <integer>

Description

Specifies Global RAN Node identifier as specified in TS 38.413

Class

Read only.

Type / Range

Integer in the range of 0 to 268,435,455

Name

ngRanIpAddress - TNLA RAN IP address

Syntax

```
--ngRanIpAddress <string>
```

Description

Specifies TNLA RAN IP address

Class

Read only.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

ngRanPort - TNLA RAN port number

Syntax

```
--ngRanPort <integer>
```

Description

Specifies the TNLA RAN port number

Class

Read only.

Type / Range

Integer in the range of 0 to 65,535

Name

nidValue - Nid value

Syntax

```
--nidValue <integer>
```

Description

This field depicts the Nid value of the NID for the SNPN

Class

Optional.

Type / Range

Integer in the Range 0 to 1099511627775

Default

0

Roles**List**

sysadmin, manage, monitor

3.146 cmm amfUdmHttp2ToNasCcMapping

AMF Udm Http2 To Nas Cc Mapping. Syntax, description, parameters, and roles for cmm amfUdmHttp2ToNasCcMapping command.

Syntax

Description

Defines UDM HTTP2 Status Codes Mapping to AMF NAS Cause Codes. The maximum number of profiles supported is 128. A default profile, named 'default', is provided.

Parameters

Name

amfUdmHttp2ToNasCcMappingListName - AMF UDM HTTP2 to NAS CC mapping list name

Syntax

--amfUdmHttp2ToNasCcMappingListName <string>

Description

The name of the HTTP2 to 5G NAS Cause Code mapping list

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

udmHttp2StatusCode - UDM HTTP2 Status Code

Syntax

--udmHttp2StatusCode <list-item>

Description

Defines the UDM HTTP2 Status Code to map to 5G NAS Cause Code

Class

Required key.

List

- 307_UNKNOWN - 307 UNKNOWN - The 307_UNKNOWN is used when included problem details is not specified in 3GPP or it is not included.
- 308_UNKNOWN - 308 UNKNOWN - The 308_UNKNOWN is used when included problem details is not specified in 3GPP or it is not included.

- **400_RESOURCE_CONTEXT_NOT_FOUND - 400 RESOURCE CONTEXT NOT FOUND** - The notification request is rejected because the call back URI still exists in the receiver of the notification, but the specific resource context identified within the notification payload is not found in the NF service consumer
- **400_UNKNOWN - 400 UNKNOWN** - The 400_UNKNOWN is used when included problem details is not specified in 3GPP or it is not included.
- **403_CCA_VERIFICATION_FAILURE - 403 CCA VERIFICATION FAILURE** - The request is rejected due to a failure to verify the CCA at the receiving entity (UDM).
- **403_SERVICE_NOT_ALLOWED - 403 SERVICE NOT ALLOWED** - The request is related to a service that is not allowed for the user in the 5GS subscription data (e.g. SMS is barred). Note: This Error Status is specific for Nudm_UEContextManagement service.
- **403_SERVICE_NOT_PROVISIONED - 403 SERVICE NOT PROVISIONED** - The request is related to a service that is not provisioned for the user in the 5GS subscription data (e.g. SMS teleservice not provisioned). Note: This Error Status is specific for Nudm_UEContextManagement service.
- **403_UNKNOWN - 403 UNKNOWN** - The 403_UNKNOWN is used when included problem details is not specified in 3GPP or it is not included.
- **404_UNKNOWN - 404 UNKNOWN** - The 404_UNKNOWN is used when included problem details is not specified in 3GPP or it is not included.
- **409_TEMPORARY_REJECT_HANDOVER_ONGOING - 409 TEMPORARY REJECT HANDOVER ONGOING** - The request cannot be processed due to an ongoing N2 handover procedure. Note: This Error Status is specific for Nudm_UEContextManagement service.
- **409_TEMPORARY_REJECT_REGISTRATION_ONGOING - 409 TEMPORARY REJECT REGISTRATION ONGOING** - The request cannot be processed due to an ongoing registration procedure. Note: This Error Status is specific for Nudm_UEContextManagement service.
- **409_UNKNOWN - 409 UNKNOWN** - The 409_UNKNOWN is used when included problem details is not specified in 3GPP or it is not included.
- **411_UNKNOWN - 411 UNKNOWN** - The 411_UNKNOWN is used when included problem details is not specified in 3GPP or it is not included.
- **422_UNKNOWN - 422 UNKNOWN** - The 422_UNKNOWN is used when included problem details is not specified in 3GPP or it is not included.
- **429_UNKNOWN - 429 UNKNOWN** - The 429_UNKNOWN is used when included problem details is not specified in 3GPP or it is not included.
- **500_NF_FAILOVER - 500 NF FAILOVER** - The request is rejected due to the unavailability of the NF (UDM), and the requester may trigger an immediate re-selection of an alternative NF based on this information.

- 500_NF_SERVICE_FAILOVER - 500 NF SERVICE FAILOVER - The request is rejected due to the unavailability of the NF service, and the requester may trigger an immediate re-selection of an alternative NF service based on this information.
- 500_UNKNOWN - 500 UNKNOWN - The 500_UNKNOWN is used when included problem details is not specified in 3GPP or it is not included.
- 501_UNKNOWN - 501 UNKNOWN - The 501_UNKNOWN is used when included problem details is not specified in 3GPP or it is not included.
- 503_UNKNOWN - 503 UNKNOWN - The 503_UNKNOWN is used when included problem details is not specified in 3GPP or it is not included.
- 504_TARGET_NF_NOT_REACHABLE - 504 TARGET NF NOT REACHABLE - The request is not served as the target NF (UDM) is not reachable.
- 504_TIMED_OUT_REQUEST - 504 TIMED OUT REQUEST - The request is rejected due a request that has timed out at the HTTP client based on origination stamp.
- 504_UNKNOWN - 504 UNKNOWN - The 504_UNKNOWN is used when included problem details is not specified in 3GPP or it is not included.
- 307_NF_CONSUMER_REDIRECT_ONE_TXN - 307 Temporary Redirect NF Consumer Redirect One TXN - The request has been asked to be redirected to a specified target for one transaction. Note: This Error Code is specific for Nudm_SubscriberDataManagement service.
- 308_CONTEXT_NOT_FOUND - 308 Permanent Redirect Context Not Found - The request has been asked to be redirected to a specified target. Note: This Error Status is specific for Nudm_SubscriberDataManagement service.
- 400_INVALID_API - 400 Bad Request Invalid API - The HTTP request contains an unsupported API name or API version in the URI.
- 400_INVALID_MSG_FORMAT - 400 Bad Request Invalid Msg Format - The HTTP request has an invalid format.
- 400_INVALID_QUERY_PARAM - 400 Bad Request Invalid Query Param - The HTTP request contains an unsupported query parameter in the URI.
- 400_MANDATORY_QUERY_PARAM_INCORRECT - 400 Bad Request Mandatory Query Param Incorrect - A mandatory query parameter, or a conditional query parameter but mandatory required, for an HTTP method was received in the URI with semantically incorrect value.
- 400_OPTIONAL_QUERY_PARAM_INCORRECT - 400 Bad Request Optional Query Param Incorrect - An optional query parameter for an HTTP method was received in the URI with a semantically incorrect value that prevents successful processing of the service request.
- 400_MANDATORY_QUERY_PARAM_MISSING - 400 Mandatory Query Param Missing - Query parameter which is defined as mandatory, or as conditional but mandatory required, for an HTTP method is not included in the URI of the request.

- **400_MANDATORY_IE_INCORRECT** - 400 Bad Request Mandatory IE Incorrect - A mandatory IE or conditional IE in data structure, but mandatory required, for an HTTP method was received with a semantically incorrect value.
- **400_OPTIONAL_IE_INCORRECT** - 400 Bad Request Optional IE Incorrect - An optional IE in data structure for an HTTP method was received with a semantically incorrect value that prevents successful processing of the service request.
- **400_MANDATORY_IE_MISSING** - 400 Bad Request Mandatory IE Missing - IE which is defined as mandatory or as conditional in data structure, but mandatory required, for an HTTP method is not included in the payload body of the request.
- **400_UNSPECIFIED_MSG_FAILURE** - 400 Bad Request Unspecified Msg Failure - The request is rejected due to unspecified client error.
- **403_MODIFICATION_NOT_ALLOWED** - 403 Forbidden Modification Not Allowed - The request is rejected because the contained modification instructions attempt to modify IE which is not allowed to be modified.
- **403_UNKNOWN_5GS_SUBSCRIPTION** - 403 Forbidden Unknown 5GS Subscription - No 5GS subscription is associated with the user. Note: This Error Status is specific for Nudm_UEContextManagement service
- **403_NO_PS_SUBSCRIPTION** - 403 Forbidden No PS Subscription - No PS (5GS, EPS, GPRS) subscription is associated with the user. Note: This Error Status is specific for Nudm_UEContextManagement service
- **403_ROAMING_NOT_ALLOWED** - 403 Forbidden Roaming Not Allowed - The subscriber is not allowed to roam within that PLMN. Note: This Error Status is specific for Nudm_UEContextManagement service.
- **403_ACCESS_NOT_ALLOWED** - 403 Forbidden Access Not Allowed - Access type not allowed for the user. Note: This Error Status is specific for Nudm_UEContextManagement service
- **403_RAT_NOT_ALLOWED** - 403 Forbidden RAT Not Allowed - RAT is not allowed for the user. Note: This Error Status is specific for Nudm_UEContextManagement service.
- **403_DNN_NOT_ALLOWED** - 403 Forbidden DNN Not Allowed - DNN not authorized for the user. Note: This Error Status is specific for Nudm_UEContextManagement service.
- **403_REAUTHENTICATION_REQUIRED** - 403 Forbidden Reauthentication Required - Due to operator policies the user needs to be re-authenticated, e.g. last valid authentication is considered obsolete Note: This Error Status is specific for Nudm_UEContextManagement service.
- **403_INVALID_GUAMI** - 403 Forbidden Invalid Guami - The AMF is not allowed to modify the registration information stored in the UDM, as it is not the registered AMF. Note: This Error Status is specific for Nudm_UEContextManagement service.

- **404_SUBSCRIPTION_NOT_FOUND** - 404 Not Found Subscription Not Found - The request for modification or deletion of subscription is rejected because the subscription is not found in the NF
- **404_RESOURCE_URI_STRUCTURE_NOT_FOUND** - 404 Not Found Resource Structure Not Found - The request is rejected because a fixed part after the first variable part of an `apiSpecificResourceUriPart` is not found in the NF. This fixed part of the URI may represent a sub-resource collection (e.g. contexts, subscriptions, policies) or a custom operation.
- **404_DATA_NOT_FOUND** - 404 Not Found Data Not Found - The requested UE subscription data is not found/does not exist. This error is applicable to all `Nudm_SDM` GET operations.
- **404_USER_NOT_FOUND** - 404 Not Found User Not Found - The user does not exist in the HPLMN when `Nudm_UEContextManagement` service is used. The user does not exist when `Nudm_SubscriberDataManagement` service is used. This error is applicable to all `Nudm_SDM` GET operations.
- **404_CONTEXT_NOT_FOUND** - 404 Not Found Context Not Found - It is used during the modification of an existing subscription when no corresponding context exists when `Nudm_SubscriberDataManagement` service is used. It is used when no corresponding context exists when `Nudm_UEContextManagement` service is used.
- **404_GROUP_IDENTIFIER_NOT_FOUND** - 404 Not Found Group Identifier Not Found - The requested Group Identifier does not exist. Note: This Error Status is specific for `Nudm_SubscriberDataManagement` service
- **411_INCORRECT_LENGTH** - 411 Length Required Incorrect Length - The request is rejected due to incorrect value of a Content-length header field.
- **422_UNPROCESSABLE_REQUEST** - 422 Unprocessable Entity Unprocessable Request - The request can not be processed due to semantic errors when trying to process a patch method. Note: This Error Status is specific for `Nudm_UEContextManagement` service.
- **429_NF_CONGESTION_RISK** - 429 Too Many Requests NF Congestion Risk - The request is rejected due to excessive traffic which, if continued over time, may lead to (or may increase) an overload situation.
- **500_INSUFFICIENT_RESOURCES** - 500 Internal Server Error Insufficient Resources - The request is rejected due to insufficient resources.
- **500_UNSPECIFIED_NF_FAILURE** - 501 Internal Server Error Unspecified NF Failure - The request is rejected due to unspecified reason at the NF.
- **500_SYSTEM_FAILURE** - 501 Internal Server Error System Failure - The request is rejected due to generic error condition in the NF.
- **501_UNSUPPORTED_RESOURCE_URI** - 501 Not Implemented Unsupported Resource URI - The `SDM` Subscription contains unsupported resource URI to be monitored when

Nudm_SubscriberDataManagement service is used. Note: This Error Status is specific for Nudm_SubscriberDataManagement service

- 503_NF_CONGESTION - 503 Service Unavailable NF Congestion - The NF experiences congestion and performs overload control, which does not allow the request to be processed.

Name

amf5gMmCc - 5GMM NAS Cause Code

Syntax

--amf5gMmCc <integer>

Description

Defines the 5GMM NAS cause code to use towards the UE based on the HTTP2 Status Code received from the UDM

Class

Optional.

Type / Range

5GMM Cause Code.

Default

15

Roles**Show**

sysadmin, manage, monitor

Modify

sysadmin, manage

List

sysadmin, manage, monitor

3.147 cmm amfUdmHttp2ToNasCcMappingList

AMF UDM HTTP2 To NAS CC Mapping List. Syntax, description, parameters, and roles for cmm amfUdmHttp2ToNasCcMappingList command.

Syntax**Description**

UDM HTTP2 status code to 5GMM NAS Cause Code mapping profile list

Parameters

Name

name - AMF UDM HTTP2 To NAS CC Mapping List Name

Syntax

--name <string>

Description

UDM HTTP2 Status Code to 5GMM NAS Cause Code mapping Profile List name

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Roles

Create

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

3.148 cmm amfUeNitzInfo

Ue Nitz Information. Syntax, description, parameters, and roles for cmm amfUeNitzInfo command.

Syntax

Description

Specifies parameters to be sent in NAS UE Configuration Procedure to the UE, e.g. during UE Registration procedure.

Parameters

Name

plmnName - Mobile network name

Syntax

--plmnName <string>

Description

Name that identifies mobile network (alternate key).

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

encodingName - Encoding name

Syntax

--encodingName <list-item>

Description

Indicates the encoding type to use for name fields.

Class

Optional.

List

- GSM default alphabet - Specifies GSM default alphabet encoding name.
- UCS2 - USC2 - Specifies USC2 encoding name.

Default

GSM default alphabet

Name

networkName - Network name

Syntax

--networkName <string>

Description

Unique network name.

Class

Optional.

Type / Range

The Network Name for the PLMN. The following characters in the GSM character set per 3GPP TS 23.038 Section 6.2.1.

Default

""

Name

networkShortName - Network short name

Syntax

--networkShortName <string>

Description

Unique short network name.

Class

Optional.

Type / Range

The Network Short Name for the PLMN. The following characters in the GSM character set per 3GPP TS 23.038 Section 6.2.1.

Default

"

Name

sendCountryInit - Send country init

Syntax

--sendCountryInit <list-item>

Description

Indicates whether or not the UE should display or not display the country initials.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

sendNetworkName - Send network name

Syntax

--sendNetworkName <list-item>

Description

Indicates whether or not to send the network names.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

sendTzOffSet - Send time zone offset

Syntax

--sendTzOffSet <list-item>

Description

Indicates whether or not to send the time zone offset.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

3.149 cmm amfUeNitzInfoOverrideProfile

UE Nitz Information Override Profile. Syntax, description, parameters, and roles for cmm amfUeNitzInfoOverrideProfile command.

Syntax

Description

This command is used to administer UE Nitz Information Override Profile.

Parameters

Name

name - UE Nitz Info Override Profile Name

Syntax

```
--name <string>
```

Description

Profile name for UE Nitz Information.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

encodingName - Encoding Name

Syntax

```
--encodingName <list-item>
```

Description

Indicates the encoding type to use for the network name fields

Class

Optional.

List

- GSM default alphabet - Specifies GSM default alphabet encoding name.
- UCS2 - USC2 - Specifies USC2 encoding name.

Default

GSM default alphabet

Name

networkName - Network Name

Syntax

```
--networkName <string>
```

Description

Unique network name

Class

Optional.

Type / Range

The Network Name for the PLMN. The following characters in the GSM character set per 3GPP TS 23.038 Section 6.2.1.

Default

"

Name

networkShortName - Network Short Name

Syntax

--networkShortName <string>

Description

Unique short network name.

Class

Optional.

Type / Range

The Network Short Name for the PLMN. The following characters in the GSM character set per 3GPP TS 23.038 Section 6.2.1.

Default

"

Name

sendCountryInit - Send Country Initials

Syntax

--sendCountryInit <list-item>

Description

Indicates whether or not the UE should display or not display the country initials.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

sendNetworkName - Send Network Name

Syntax

--sendNetworkName <list-item>

Description

Indicates whether or not to send the network names.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

sendTzOffSet - Send Time Zone Offset

Syntax

--sendTzOffSet <list-item>

Description

Indicates whether or not to send the time zone offset.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

3.150 cmm amfUePageFanoutControl

AMF 5G UE paging fanout overload control parameters. Syntax, description, parameters, and roles for `cmm amfUePageFanoutControl` command.

Syntax

Description

This command is used to set thresholds for 5G UE paging fan-out overload control

Parameters

Name

msgRateToSafetyNetThreshold - Message rate to total allowed message rate (Safety Net) threshold

Syntax

--msgRateToSafetyNetThreshold <integer>

Description

Threshold used for CMM total message to total allowed message rate (Safety Net), in conjunction with other parameters under this command above which to trigger paging restriction

Class

Optional.

Type / Range

Integer in the range of 0 to 100

Default

60

Name

pageFanoutToTotalMsgThreshold - UE paging fanout to total message rate threshold

Syntax

--pageFanoutToTotalMsgThreshold <integer>

Description

Threshold used for UE paging fan-out (number of GNBs contacted) contribution to total CMM message rate, in conjunction with other parameters under this command above which to trigger paging restriction

Class

Optional.

Type / Range

Integer in the range of 0 to 100

Default

50

Name

pagingFanoutThreshold - Paging fanout threshold

Syntax

--pagingFanoutThreshold <integer>

Description

Threshold used for UE paging fan-out (number of GNBs contacted) in conjunction with other parameters under this command above which to trigger paging restriction

Class

Optional.

Type / Range

Integer in the range of 0 to 100

Default

25

4 CMM CLI commands: cmm amfUePlmnServices - cmm genCdr

CMM CLI command descriptions: syntax, usage, parameters, and user roles.

4.1 cmm amfUePlmnServices

5G UE PLMN Services. Syntax, description, parameters, and roles for cmm amfUePlmnServices command.

Syntax

Description

This command is used to administer services to a UE PLMN based on UE PLMN and serving PLMN. Records should not be created for 'Multiple Home Network' UE PLMNs; Instead, the AMF uses the amfUePlmnServices record attributes associated with the AMF Home PLMN (where UE and Serving PLMN are set to the Home Network PLMN).

Parameters

Name

name - Name of the UE PLMN services for a serving PLMN

Syntax

```
--name <string>
```

Description

Name of a list of UE PLMN services for a UE PLMN and serving PLMN combination.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Name

servedPlmnName - Served Mobile Network Name

Syntax

```
--servedPlmnName <string>
```

Description

Name that identifies the serving network.

Class

Required on create, not modifiable.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

uePlmnName - UE Mobile Network Name

Syntax

--uePlmnName <string>

Description

PLMN name identifying the mobile network of the UE.

Class

Required on create, not modifiable.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

aasn - Alternative Anchor SMF Notification

Syntax

--aasn <list-item>

Description

Defines whether the AMF supports Alternative Anchor SMF Notification (AASN) on SM context create for the V-SMF to indicate alternatively selected anchor SMF. Note: on the current product release this is only supported for V-SMF.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

acscr - Absence of smfUri and hSmfUri in Create SM Context Request

Syntax

--acscr <list-item>

Description

Enables the feature Absence of smfUri and hSmfUri attributes in Create SM Context Request for procedures with I-SMF/V-SMF insertion/change other than PDU session establishment and EPS to 5GS mobility procedures. The support for this feature in AMF may remove the need for the AMF to fetch the smfUri or hsmfUri from the NRF where the anchor SMF profile is registered to fasten the mobility scenarios.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

additionalHsmfUri - Additional H-SMF URIs

Syntax

--additionalHsmfUri <integer>

Description

Identifies additional H-SMF URIs included by the AMF in the Create SM Context to the V-SMF for home routed traffic. V-SMF can use the additional H-SMF URIs if included primary H-SMF is not reachable or failed to establish the PDU Session. Default of 0 means no additional H-SMF URIs included.

Class

Optional.

Type / Range

Integer in the range of 0 to 6

Default

0

Name

aliasDnnConversionProfileName - AMF Alias DNN Conversion Profile Name

Syntax

--aliasDnnConversionProfileName <string>

Description

Pointer to the Alias DNN Conversion Profile

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

default

Name

allowEthernetPdnTypeN26 - Allow Ethernet PDN Type N26

Syntax

--allowEthernetPdnTypeN26 <list-item>

Description

Parameter controls sending in Forward Relocation Request allowing Ethernet PDN Type across N26 interface. By default this shall be set to false.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

allowNonIpPdnTypeN26 - Allow Non IP PDN Type N26

Syntax

--allowNonIpPdnTypeN26 <list-item>

Description

Parameter controls sending in Forward Relocation Request Non IP PDN Type across N26. By default this shall be set to Yes.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

alwaysQueryNssfForAmfSelection - Always Query NSSF for AMF Selection

Syntax

--alwaysQueryNssfForAmfSelection <list-item>

Description

This parameter determines whether AMF will query NSSF for AMF selection during UE Registration even when the AMF can serve all Requested and Valid -according to the UE subscription- Slices. Default value is 'false', which means the AMF will Query NSSF for AMF selection only when: - it does not support at least one of the valid Requested Slices. - UE is using non-standard slices in VPLMN and mapped HPLMN list is not provided by the UE.

Restrictions

Applies to home to roamer UEs.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

amfAccessRestrictionNasMappingProfileName - Name of access restriction to NAS cause
code profile name

Syntax

--amfAccessRestrictionNasMappingProfileName <string>

Description

Profile name for access restriction to NAS cause code mapping.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

default

Name

amfAdjacentPlmnListName - adjacent Plmn List Name

Syntax

--amfAdjacentPlmnListName <string>

Description

Identifies the Adjacent PLMN list name

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

""

Name

amfAusfHttp2ToNasCcMappingListName - AUSF HTTP2 Status Code to 5GMM NAS Profile
List Name

Syntax

--amfAusfHttp2ToNasCcMappingListName <string>

Description

The name of the AUSF HTTP2 Status Code to 5GMM NAS Cause Code mapping profile list

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

default

Name

amfDeregistrationBehaviorMappingProfileName - De-registration behavior mapping profile
name

Syntax

--amfDeregistrationBehaviorMappingProfileName <string>

Description

Identifies, via name, a given de-registration behavior mapping.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

default

Name

amfDnnOverrideProfileName - AMF Dnn Override Profile Name

Syntax

--amfDnnOverrideProfileName <string>

Description

Pointer to the AMF DNN Override Profile

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

default

Name

amfEirOverrideProfileName - AMF EIR Override Profile Name

Syntax

--amfEirOverrideProfileName <string>

Description

It indicates the profile name used during Eir check.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

""

Name

amfEplmnListName - EPLMN list name

Syntax

--amfEplmnListName <string>

Description

Identifies Equivalent PLMN list name

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

""

Name

amfEplmnListNameGnb - EPLMN list name for gNB

Syntax

--amfEplmnListNameGnb <string>

Description

Identifies Equivalent PLMN list name to be sent to gNB. Both gNB and UE Eplmn lists have to be populated if the list is to be sent to both. Content of both lists could be same or different based on operator choice.

Class

Optional.

Type / Range

Digit string of length 0 or 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Default

""

Name

amfEventProfileName - AMF Event Profile Name

Syntax

--amfEventProfileName <string>

Description

Pointer to the AMF Event Profile

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Default

default

Name

amfFreqCountMonitoringProfileName - AMF Frequency Count Monitoring Profile Name

Syntax

--amfFreqCountMonitoringProfileName <string>

Description

Defines the frequency count monitoring profile name applied for the UE.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Default

""

Name

amfMcsPagingPriProfileListName - AMF MCS Paging Priority Profile List Name

Syntax

--amfMcsPagingPriProfileListName <string>

Description

Name that identifies the AMF MCS Paging Priority Profile List.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

amfNrDualConnectivityProfileName - NR Dual Connectivity Profile Name

Syntax

--amfNrDualConnectivityProfileName <string>

Description

Identifies NR Dual Connectivity Profile Name.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

amfNrfHttp2ToNasCcMappingListName - NRF HTTP2 Status Code to 5GMM NAS Profile List Name

Syntax

--amfNrfHttp2ToNasCcMappingListName <string>

Description

The name of the NRF HTTP2 Status Code to 5GMM NAS Cause Code mapping profile list

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

default

Name

amfNssfHttp2ToNasCcMappingListName - NSSF HTTP2 Status Code to 5GMM NAS Profile List Name

Syntax

--amfNssfHttp2ToNasCcMappingListName <string>

Description

The name of the NSSF HTTP2 Status Code to 5GMM NAS Cause Code mapping profile list

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

default

Name

amfOlcTimersProfileName - AMF OLC Timers Profile Name

Syntax

--amfOlcTimersProfileName <string>

Description

Identifies AMF OLC Timers Profile Name.

Class

Optional.

Type / Range

Digit string of length 0 or 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

amfPcfTriggerProfileName - AMF PCF Policy Trigger Profile Name

Syntax

--amfPcfTriggerProfileName <string>

Description

The name of the AMF PCF Policy Trigger Profile.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

default

Name

amfPduDeletionProfileName - AMF PDU Deletion Profile Name

Syntax

--amfPduDeletionProfileName <string>

Description

The name of the AMF PDU Deletion Profile that applies for the UE.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

default

Name

amfRfspAccessRestrictionListName - Access Restriction for RFSP List Name

Syntax

--amfRfspAccessRestrictionListName <string>

Description

A reference to a list of RFSP values for which access is to be restricted for the UE.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

amfRfspLocalOverrideProfileName - AMF RFSP Local Override Profile Name

Syntax

--amfRfspLocalOverrideProfileName <string>

Description

The name of the AMF RFSP Local Override Profile Name for the UE.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

amfSelection - AMF selection

Syntax

--amfSelection <list-item>

Description

The parameter specifies the method of AMF selection used by the AMF for UE. If there are multiple AMF matches then the AMF will use the capacity parameter to load balance the UE across the AMFs.

Class

Optional.

List

- LocalProvisioning - Local Provisioning - AMF will use locally provisioned NF for the selection of a NF.
- NRF - Network Repository Function - Make use of NRF to select NF.
- NRFLocalProvisioning - NRF with Local Provisioning Override - The AMF will check the locally provisioned selection rules and if there is a match then the AMF will select the NF matching the rule. If there is no matching then AMF will use the NRF. The selection rule by default is that AMF will select a NF supporting a provisioned criterion for the NF

Default

LocalProvisioning

Name

amfSmpToPagingPriorityProfileListName - AMF SMP to Paging Priority Profile Name

Syntax

--amfSmpToPagingPriorityProfileListName <string>

Description

The name of the profile to map SBI message Priority (SMP) to Paging Priority Level.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

amfStatusSubscribe - AMF Status Subscribe

Syntax

--amfStatusSubscribe <list-item>

Description

Subscribe NRF for remote AMF status change event notifications.

Class

Optional.

List

- byNfType - All NF of a given NF type - AMF subscribes to get status of by NF type to get status of all NF registered with NRF whether AMF use them or not.
- noSubscription - Do not Subscribe to NF Status - AMF does not subscribe to get NF status .
- selectedOnly - Selected NFs only - AMF subscribes to get status of NF by instance ID for the NFs that are discovered via the NRF

Default

noSubscription

Name

amfSubDataSetsProfileName - Profile name

Syntax

- -amfSubDataSetsProfileName <string>

Description

Identifies, via name, a given AMF Subscription DataSets Profile.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Default

default

Name

amfSvcAgreementProfileName - Service agreement profile name

Syntax

- -amfSvcAgreementProfileName <string>

Description

Defines the PLMN service agreement profile to be used for service.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Default

default

NameamfUdmHttp2ToNasCcMappingListName - UDM HTTP2 Status Code to 5GMM NAS Profile
List Name

Syntax

--amfUdmHttp2ToNasCcMappingListName <string>

Description

The name of the UDM HTTP2 Status Code to 5GMM NAS Cause Code mapping profile list

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

default

Name

amfUeMrlForbiddenTaiListName - Mobility Restriction TAI List Name

Syntax

--amfUeMrlForbiddenTaiListName <string>

Description

Name of the Forbidden TAI List in the Mobility Restriction List sent to the gNB(s)

Restrictions

Applies to home or roamer UEs.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

amfUeNitzInfoOverrideProfileName - UE Nitz Information Override Profile Name

Syntax

--amfUeNitzInfoOverrideProfileName <string>

Description

Indicates the profile name used for the UE Nitz information.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

"

Name

amfUePriorityProfileName - AMF UE Priority Profile Name

Syntax

--amfUePriorityProfileName <string>

Description

The name of the UE Priority Profile.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

"

Name

amfUINasUnableToForwardProfileName - AMF Uplink NAS Unable to Forward Profile Name

Syntax

--amfUINasUnableToForwardProfileName <string>

Description

Defines the name of the AMF Uplink NAS Unable to Forward Profile that applies for the UE.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

default

Name

amfVoiceProfileName - AMf Voice Profile Name

Syntax

--amfVoiceProfileName <string>

Description

The name of the profile for voice related handling.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

default

Name

amPolicySelection - AM Policy Selection

Syntax

--amPolicySelection <list-item>

Description

if the parameter is set to 'true' then the AMF will always select an provisioned AM Policy for specific SUP/GPSI ranges.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

applProtFallbackN26ToS10 - Application Protocol Fallback from N26 to S10

Syntax

--applProtFallbackN26ToS10 <list-item>

Description

Current parameter enables fallback to search for 's10' candidate when DNS Query to find target MME during S10 handover using 'n26' fails. This parameter is expected to be used together with parameter Use N26 Service Parameter in 5GS to EPS Handover

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

areaCodeExtendedEmergencyNumListName - Area Code Extended Emergency Number List
Name

Syntax

--areaCodeExtendedEmergencyNumListName <string>

Description

Area Code Extended Emergency Number List Name

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

ausfSelection - AUSF Selection

Syntax

--ausfSelection <list-item>

Description

The parameter specifies the method of AUSF selection used by the AMF for UE. If there are multiple AUSF matches then the AMF will use the capacity parameter to load balance the UE across the AUSFs.

Class

Optional.

List

- LocalProvisioning - Local Provisioning - AMF will use locally provisioned NF for the selection of a NF.
- NRF - Network Repository Function - Make use of NRF to select NF.
- NRFLocalProvisioning - NRF with Local Provisioning Override - The AMF will check the locally provisioned selection rules and if there is a match then the AMF will select the NF matching the rule. If there is no matching then AMF will use the NRF. The selection rule by default is that AMF will select a NF supporting a provisioned criterion for the NF

Default

LocalProvisioning

Name

ausfStatusSubscribe - AUSF Status Subscribe

Syntax

--ausfStatusSubscribe <list-item>

Description

Subscribe NRF for AUSF status change event notifications.

Class

Optional.

List

- **byNfType** - All NF of a given NF type - AMF subscribes to get status of by NF type to get status of all NF registered with NRF whether AMF use them or not.
- **noSubscription** - Do not Subscribe to NF Status - AMF does not subscribe to get NF status .
- **selectedOnly** - Selected NFs only - AMF subscribes to get status of NF by instance ID for the NFs that are discovered via the NRF

Default

noSubscription

Name

cag - Closed Access Group

Syntax

--cag <list-item>

Description

A control parameter to enable Closed Access Group (CAG) feature.

Class

Optional.

List

- **false** - Boolean value of false.
- **true** - Boolean value of true.

Default

false

Name

checkImsDnnSubscriptionVops - Check IMS DNN Subscription IMS Voice Over PS

Syntax

--checkImsDnnSubscriptionVops <list-item>

Description

Defines whether the AMF checks IMS DNN subscription in determining network IMS voice over PS support for the UE.

Class

Optional.

List

- **false** - Boolean value of false.
- **true** - Boolean value of true.

Default

false

Name

default5GEIRSelection - Default 5GEIR Selection

Syntax

--default5GEIRSelection <list-item>

Description

if the parameter is set to 'true' then the AMF will select an 5GEIR provisioned as a default 5GEIR if the AMF fails to select 5GEIR supporting using NRF or a locally provisioned 5GEIR that meets all the selection criterion.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

defaultAmPolicySelection - Default AM Policy Selection

Syntax

--defaultAmPolicySelection <list-item>

Description

if the parameter is set to 'true' then the AMF will select locally provisioned AM Policy if the AMF fails to receive AM policy from PCF..

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

defaultAusfSelection - Default AUSF Selection

Syntax

--defaultAusfSelection <list-item>

Description

if the parameter is set to 'true' then the AMF will select an AUSF provisioned as a default AUSF if the AMF fails to select an AUSF supporting using NRF or a locally provisioned AUSF that meets all the selection criterion.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

defaultGmlcSelection - Default Gmlc Selection

Syntax

--defaultGmlcSelection <list-item>

Description

If the parameter is set to 'true' then the AMF will select an GMLC provisioned as a default GMLC if the AMF fails to select an GMLC using NRF.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

defaultLmfSelection - Default LMF Selection

Syntax

--defaultLmfSelection <list-item>

Description

If the parameter is set to 'true' then the AMF will select an LMF provisioned as a default LMF if the AMF fails to select an LMF using NRF or a locally provisioned LMF that meets all the selection criterion.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

defaultNssaafSelection - Default Nssaaf Selection

Syntax

--defaultNssaafSelection <list-item>

Description

if the parameter is set to 'true' then the AMF will select an NSSAAF provisioned as a default NSSAAF if the AMF fails to select an NSSAAF supporting using NRF or a locally provisioned NSSAAF that meets all the selection criterion.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

defaultPcfSelection - Default PCF Selection

Syntax

--defaultPcfSelection <list-item>

Description

if the parameter is set to 'true' then the AMF will select a PCF provisioned as a default PCF if the AMF fails to select a PCF using NRF or a locally provisioned PCF that meets all the selection criterion.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

defaultSmfSelection - Default SMF selection

Syntax

--defaultSmfSelection <list-item>

Description

If the parameter is set to 'true' then the AMF will select an SMF provisioned as a default SMF if the AMF fails to select SMF using NRF or a locally provisioned SMF that meets all the selection criterion.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

defaultSmsfSelection - Default SMSF Selection

Syntax

--defaultSmsfSelection <list-item>

Description

If the parameter is set to 'true' then the AMF will select an SMSF provisioned as a default SMSF if the AMF fails to select an SMSF using NRF or a locally provisioned SMSF that meets all the selection criterion.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

defaultSnssaiListName - Default S-NSSAI List Name

Syntax

--defaultSnssaiListName <string>

Description

Configure default S-NSSAI list to be used as UE default S-NSSAI. The list must have only eight S-NSSAI. If the list has more than 8, the AMF shall only use the first eight SNSSAI.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Default

"

Name

defaultSnssaiSelection - Default S-NSSAI Selection Options

Syntax

--defaultSnssaiSelection <list-item>

Description

This parameter is deprecated. Value should be set to UDM. Value LOCAL is only for test purposes and does not interwork properly with other slicing features. Configuration parameter was used to choose the locally provisioned S-NSSAI list or UDM provided.

Class

Optional.

List

- LOCAL - Locally provisioned. For roamers locally provisioned is used when none of the UE subscribed SNSSAI(s) is marked as "default" and the locally provisioned SNSSAI(s) is standardized 3GPP SNSSAI(s).
- UDM - UDM provided default S-NSSAI list.

Default

UDM

Name

defaultUdmSelection - Default UDM Selection

Syntax

--defaultUdmSelection <list-item>

Description

If the parameter is set to 'true' then the AMF will select a UDM th provisioned as a default UDM if the AMF fails to select a UDM using NRF or a locally provisioned UDM that meets all the selection criterion.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

defaultVsnssaiName - Default Vsnssai Name

Syntax

--defaultVsnssaiName <string>

Description

The default VPLMN Slice used when there is no matching VPLMN slice to the UE requested HPLMN Slice.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

delayUdmDuringRegistrationProfileName - Delay UDM During Registration Profile Name

Syntax

--delayUdmDuringRegistrationProfileName <string>

Description

The name of the Delay UDM During Registration Profile.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

default

Name

dnnMccOverride - DNN MCC Override

Syntax

--dnnMccOverride <digits>

Description

Override of DNN domain derivation by using this mobility country code and the mobility network code represented by dnnMccOverride.

Class

Optional.

Type / Range

Digit string of length 0 or 3

Default

""

Name

dnnMncOverride - DNN MNC Override

Syntax

--dnnMncOverride <digits>

Description

Override of DNN domain derivation by using this mobility network code and the mobility country code represented by dncMncOverride

Class

Optional.

Type / Range

Digit string of length 0 or 2 to 3

Default

""

Name

dnnToSnssaiListName - DNN to S-NSSAI List Name

Syntax

--dnnToSnssaiListName <string>

Description

Configure DNN to S-NSSAI list name.The AMF will use the list in n26 interworking scenarios

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

dnnToSnssaiPerPlmnListName - DNN to SNSSAI per PLMN List Name

Syntax

```
--dnnToSnssaiPerPlmnListName <string>
```

Description

Configure DNN to SNSSAI per PLMN List Name. The AMF will use the list in n26 inter-working scenarios for associated DNN and serving TAL.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Default

""

Name

edrxNrAllowed - eDRX Allowed

Syntax

```
--edrxNrAllowed <list-item>
```

Description

Specifies whether UEs from this PLMN are allowed to use eDRX.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Recommended

false

Name

edrxNrDnnListName - eDRX DNN List Name

Syntax

```
--edrxNrDnnListName <string>
```

Description

Specifies name of a List of DNNs. A UE is allowed to use eDRX only if it is using at least one DNN in the list.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

"

Name

edrxNrProfileName - eDRX Profile Name

Syntax

--edrxNrProfileName <string>

Description

Specifies an eDRX profile that is used for negotiation of eDRX parameters with a UE.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

"

Recommended

"

Name

edrxNrRedcapProfileName - eDRX NR Redcap Profile Name

Syntax

--edrxNrRedcapProfileName <string>

Description

Specifies an eDRX profile that is used for negotiation of eDRX parameters with a UE when the UE is using NR Redcap.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

"

Recommended

"

Name

eir5gStatusSubscribe - 5G EIR Status Subscribe

Syntax

--eir5gStatusSubscribe <list-item>

Description

Subscribe NRF for 5G EIR status change event notifications.

Class

Optional.

List

- byNfType - All NF of a given NF type - AMF subscribes to get status of by NF type to get status of all NF registered with NRF whether AMF use them or not.
- noSubscription - Do not Subscribe to NF Status - AMF does not subscribe to get NF status .
- selectedOnly - Selected NFs only - AMF subscribes to get status of NF by instance ID for the NFs that are discovered via the NRF

Default

noSubscription

Name

eirCheck - EIR Check

Syntax

--eirCheck <list-item>

Description

This command enables EIR check for subscriber(s) IMEISV.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

eirSelection - EIR Selection

Syntax

--eirSelection <list-item>

Description

The parameter specifies the method of EIR selection used by the AMF for UE. If there are multiple EIR matches then the AMF will the capacity parameter to load balance the UE across the EIRs.

Class

Optional.

List

- LocalProvisioning - Local Provisioning - AMF will use locally provisioned NF for the selection of a NF.
- NRF - Network Repository Function - Make use of NRF to select NF.
- NRFLocalProvisioning - NRF with Local Provisioning Override - The AMF will check the locally provisioned selection rules and if there is a match then the AMF will select the NF matching the rule. If there is no matching then AMF will use the NRF. The selection rule by default is that AMF will select a NF supporting a provisioned criterion for the NF

Default

LocalProvisioning

Name

emcNon3gppN3iwf - EMC Non-3GPP Access N3IWF

Syntax

--emcNon3gppN3iwf <list-item>

Description

Defines whether Emergency Services are supported for the UE over untrusted non-3GPP access via N3IWF.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

emcSupport - EMC Support

Syntax

--emcSupport <list-item>

Description

Defines whether Emergency Services are supported for the UE. It applies for a home UE or a roamer UE.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

emergencyNon3gppEpsPduHo - Emergency Non-3GPP Access EPS PDU Handover

Syntax

--emergencyNon3gppEpsPduHo <list-item>

Description

Enables the support for UE triggered emergency PDU handovers between untrusted non-3GPP via N3IWF/5GS and E-UTRAN/EPS for the UE.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

emfSupport - EMF Support

Syntax

--emfSupport <list-item>

Description

Defines whether Emergency Fallback is supported for the UE. It applies for a home UE or a roamer UE.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

epslwkWithoutN26 - EPS Interworking Without N26

Syntax

```
--epsIwkWithoutN26 <list-item>
```

Description

Enables the EPS interworking without N26 interface support for the UE.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

epsTo5gsSmfReselectFailMaintain - EPS to 5GS SMF Reselection Failure Maintain

Syntax

```
--epsTo5gsSmfReselectFailMaintain <list-item>
```

Description

Defines whether the AMF maintains PDU session in a situation where during EPS to 5GS mobility, the AMF detects the need to select a new I-SMF (or V-SMF) due to actual S-NSSAI not served by default I-SMF (or V-SMF) but SMF reselection fails. If set to 'false', AMF releases the PDU session (i.e. triggers Nsmf_PDUSession_UpdateSMContext with release indication towards the default V-SMF or I-SMF), otherwise the PDU is served by default V-SMF (or I-SMF) and default SNSSAI

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

epsUpip - EPS UPIP

Syntax

```
--epsUpip <list-item>
```

Description

Current parameter enables support for the EPS-UIPI (User Plane Integrity Protection)

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

extendedEmergencyNumListName - Extended Emergency Number List Name

Syntax

--extendedEmergencyNumListName <string>

Description

Extended Emergency Number List Name

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Default

''

Name

getAccMobDataCag - Get Access and Mobility Data Due to CAG Enabling

Syntax

--getAccMobDataCag <list-item>

Description

A control parameter to enable requesting again for Access and Mobility Subscription Data in intra-AMF Mobility and Periodic Registration due to CAG feature enabling

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

gmlcSelection - GMLC selection

Syntax

--gmlcSelection <list-item>

Description

The parameter specifies the method of GMLC selection used by the AMF. If there are multiple GMLC matches then the AMF will use the capacity parameter to load balance the UE across the GMLC.

Class

Optional.

List

- LocalProvisioning - Local Provisioning - AMF will use locally provisioned NF for the selection of a NF.
- NRF - Network Repository Function - Make use of NRF to select NF.
- NRFLocalProvisioning - NRF with Local Provisioning Override - The AMF will check the locally provisioned selection rules and if there is a match then the AMF will select the NF matching the rule. If there is no matching then AMF will use the NRF. The selection rule by default is that AMF will select a NF supporting a provisioned criterion for the NF

Default

LocalProvisioning

Name

gmlcStatusSubscribe - GMLC Status Subscribe

Syntax

--gmlcStatusSubscribe <list-item>

Description

Subscribe NRF for remote LMF status change event notifications.

Class

Optional.

List

- byNfType - All NF of a given NF type - AMF subscribes to get status of by NF type to get status of all NF registered with NRF whether AMF use them or not.
- noSubscription - Do not Subscribe to NF Status - AMF does not subscribe to get NF status .
- selectedOnly - Selected NFs only - AMF subscribes to get status of NF by instance ID for the NFs that are discovered via the NRF

Default

noSubscription

Name

hlcomAllowed - HLCOM Allowed

Syntax

--hlcomAllowed <list-item>

Description

Specifies whether an eDRX UE from this PLMN is allowed to use High Latency Communication.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Recommended

false

Name

hlcomAllowedMico - HLCOM Allowed MICO

Syntax

--hlcomAllowedMico <list-item>

Description

Specifies whether the AMF will use MICO procedures, if provisioned and requested by the SMF, for UEs from this PLMN.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

hoCellIdRestrictionListNameN14 - NR Cells Lists for Handover Restriction over N14

Syntax

--hoCellIdRestrictionListNameN14 <string>

Description

Identifies the list of source NR Cells that the UE is either allowed or restricted from being handover over between AMFs. The target AMF uses the list to either receive or reject the Create UE Context Request from the source AMF.

Class

Optional.

Type / Range

Digit string of length 0 or 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Default

""

Name

hplmnToVplmnSnssaiMappingListName - H-PLMN to V-PLMN Snssai Mapping List Name

Syntax

--hplmnToVplmnSnssaiMappingListName <string>

Description

Identifies allowed Home PLMN to Visited PLMN Snssai Mapping list name.

Class

Optional.

Type / Range

Digit string of length 0 or 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Default

""

Name

ignoreAusfFailuresOptionalReAuthentications - Ignore AUSF Failures on Optional Re-Authentications

Syntax

--ignoreAusfFailuresOptionalReAuthentications <list-item>

Description

This parameter, when set, enables AMF to ignore AUSF dialog related failures during optional re-authentications. The UEs to apply the functionality to are provisioned on the AMF. The functionality is applied when the AMF is locally provisioned to perform an optional re-authentication for a UE that is already registered on the AMF, but the re-authentication fails during the AUSF dialog and the AMF is able to continue serving the UE without the re-authentication

Class

Optional.

List

- false - Boolean value of false.

- true - Boolean value of true.

Default

false

Name

imsReestablishmentAfter5gSrvccCancel - IMS Re-Establishment After 5G-SRVCC Cancelled

Syntax

--imsReestablishmentAfter5gSrvccCancel <list-item>

Description

Enables the AMF support for NAS Event Notification for 5G-SRVCC handover cancelled, IMS re-establishment required indication towards the UE.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

imsVoiceOverPsEpsFb - IMS Voice over PS EPS Fallback

Syntax

--imsVoiceOverPsEpsFb <list-item>

Description

This parameter controls whether IMS Voice over PS Sessions is supported for the UE with this PLMN under the serving PLMN by EPS fallback.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

imsVoiceOverPsVoNR - IMS Voice over PS Voice over New Radio

Syntax

--imsVoiceOverPsVoNR <list-item>

Description

This parameter controls whether IMS Voice over PS Sessions is supported for the UE with this PLMN under the serving PLMN by Voice over New Radio.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

includeSelectedDnn - Include Selected DNN

Syntax

--includeSelectedDnn <list-item>

Description

Defines whether the AMF includes the selectedDnn attribute inside -SmContextCreateData towards the SMF/I-SMF/V-SMF and/or -PduSessionContext between old and new AMF during inter AMF mobility procedures, when a different DNN than the UE requested DNN has been selected for the PDU.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Recommended

The recommended value is TRUE.

Name

informUeEmergencyRegisteredOnly - Inform UE Emergency Registered Only

Syntax

--informUeEmergencyRegisteredOnly <list-item>

Description

AMF enables the option to inform the UE that it is emergency registered. The AMF uses this option if the AMF for a normally registered UE having an emergency session ongoing receives a trigger for network triggered deregistration. After the AMF in such a case has indicated to

SMF(s) that non-emergency PDU(s) are released, the AMF indicates on Registration Accept or Configuration Update Command that the UE is registered for emergency services.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

interPlmnApiRoot - Inter PLMN API Root

Syntax

--interPlmnApiRoot <list-item>

Description

When set to true the AMF supports receiving interPlmnApiRoot from SMF storing it in the UE Context and transferring to new AMF during UE mobility.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

interPlmnEmergencyHoSourceNode - Inter Plmn Emergency Call Handover Source Node

Syntax

--interPlmnEmergencyHoSourceNode <list-item>

Description

Identifies AMF source node behaviour (allow or reject) for inter plmn 5G to 5G handover of emergency calls triggered by the source gNB.

Class

Optional.

List

- both - Both LBO and Home Routed emergency calls are allowed by the source node to be handed over.

- hrt - Home Routed Traffic - when UE originates emergency call in UE H-PLMN, the call is allowed by source node to be handed over to V-PLMN as home routed call.
- lbo - Local Break Out - When roaming UE originates LBO emergency call in V-PLMN, the call is allowed by source node to be handed over to another PLMN (another V-PLMN or UE H-PLMN).
- none - Neither LBO nor Home Routed emergency calls are allowed by the source node to be handed over.

Default

both

Name

interPlmnEmergencyHoTargetNode - Inter PLMN Emergency Call Handover Target Node

Syntax

--interPlmnEmergencyHoTargetNode <list-item>

Description

Identifies AMF target node behaviour (allow or reject) for inter plmn 5G to 5G handover of emergency calls from AMF source node.

Class

Optional.

List

- both - LBO and HRT - Both LBO and Home Routed emergency calls are allowed by the target node to be handed in.
- hrt - Home Routed Traffic - When UE originates emergency call in UE H-PLMN, the call is allowed by V-PLMN target node to be handed in.
- lbo - Local Break Out - When roaming UE originates emergency call in V-PLMN, the call is allowed by target node in another Plmn (V-PLMN or H-PLMN) to be handed in.
- none - Neither LBO nor Home Routed emergency calls are allowed by the target node to be handed in.

Default

both

Name

interPlmnHandover - Inter-PLMN Handover

Syntax

--interPlmnHandover <list-item>

Description

Allows or restricts gNB triggered Handover at source AMF for intra 5GS Handover or 5GS to EPS Handover.

Class

Optional.

List

- 5gsToEps - 5G to EPS Handover Allowed - Source AMF allows inter-plmn Handover to LTE (target MME)
- both - 5GS to 5GS and 5GS to EPS Handover Allowed - Source AMF allows inter-plmn Handover to LTE (target MME) or to 5GS (target AMF)
- intra5gs - 5GS to 5GS Handover Allowed - Source AMF allows inter-plmn Handover to 5GS (target AMF)
- none - No Handover Allowed - Source AMF restricts inter-plmn Handover to LTE (target MME) or to 5GS (target AMF)

Default

none

Name

interPlmnHandoverTargetNodeBehavior - Inter PLMN Handover Target Node Behavior

Syntax

--interPlmnHandoverTargetNodeBehavior <list-item>

Description

Sets target AMF behaviour over N14 or N26 during inter-plmn Handover.

Class

Optional.

List

- both - Both N14 and N26 Interfaces - The target AMF allows inter-plmn Create UE Context procedure from source AMF or Forward Relocation Request procedure from source MME to proceed.
- n14 - N14 Interface - The target AMF allows inter-plmn Create UE Context procedure from source AMF to proceed.
- n26 - N26 Interface - The target AMF allows inter-plmn Forward Relocation Request procedure from source MME to proceed.
- none - The target AMF rejects inter-plmn Create UE Context from source AMF or Forward Relocation Request from source MME due to Handover not allowed.

Default

both

Name

interPlmnIdleModeMobSrcNodeBehavior - Inter PLMN Idle Mode Mobility Source Node Behavior

Syntax

--interPlmnIdleModeMobSrcNodeBehavior <list-item>

Description

Sets source or old AMF behaviour over N14 or N26 during inter-plmn UE Idle Mode Mobility.

Class

Optional.

List

- both - Both N14 and N26 - Source or old AMF allows UE Context Transfer procedure from new or target AMF or Context Request procedure from new or target MME to proceed based on Serving-Target PLMN ID combination during inter-plmn UE Idle Mode Mobility.
- n14 - N14 Interface - Source or old AMF allows UE Context Transfer procedure from new or target AMF to proceed based on Serving-Target PLMN ID combination during inter-plmn UE Mobility Registration Update.
- n26 - N26 Interface - Source or old AMF allows Context Request procedure from new or target MME to proceed based on Serving-Target PLMN ID combination during inter-plmn UE Tracking Area Update.
- none - Source or old AMF rejects UE Context Transfer procedure from new or target AMF or Context Request procedure from new or target MME based on Serving-Target PLMN ID combination during inter-plmn UE Idle Mode Mobility.

Default

both

Name

interPlmnInitRegAttachSrcNodeBehavior - Inter PLMN Initial Registration or Attach Source Node Behavior

Syntax

--interPlmnInitRegAttachSrcNodeBehavior <list-item>

Description

Sets source or old AMF behaviour over N14 or N26 during inter-plmn UE Initial Registration or Attach.

Class

Optional.

List

- both - Both N14 and N26 Interfaces - Source or old AMF allows both UE Context Transfer procedure from new or target AMF or Identification Request procedure from new or target MME to proceed based on Serving-Target PLMN ID combination during inter-plmn UE Initial Registration or Initial Attach procedure.

- n14 - n14 Interface - Source or old AMF allows UE Context Transfer procedure from new or target AMF to proceed based on Serving-Target PLMN ID combination during inter-plmn UE Initial Registration procedure.
- n26 - n26 Interface - Source or old AMF allows Identification Request procedure from new or target MME to proceed based on Serving-Target PLMN ID combination during inter-plmn UE Initial Attach procedure.
- none - Source or old AMF rejects UE Context Transfer procedure from new or target AMF or Identification Request procedure from new or target MME to proceed based on Serving-Target PLMN ID combination during inter-plmn UE Initial Registration or Initial Attach procedure.

Default

both

Name

interPlmnInitRegReq - Inter-PLMN Initial Registration Request

Syntax

--interPlmnInitRegReq <list-item>

Description

AMF allows or restricts inbound inter-plmn UE Initial Registration Request roaming from 5G NR or LTE based on UE GUTI PLMN ID. When restricted, AMF invokes NAS Identity Request toward the UE to retrieve UE SUCI and proceed with the initial registration.

Class

Optional.

List

- both - Both nr and lte - AMF allows inbound inter-plmn UE Initial Registration Request roaming from 5G NR or LTE.
- lte - AMF allows inbound inter-plmn UE Initial Registration Request roaming from LTE
- none - AMF restricts inbound inter-plmn UE Initial Registration Request roaming from 5G NR or LTE
- nr - 5G New Radio - AMF allows inbound inter-plmn UE Initial Registration Request roaming from 5G NR

Default

none

Name

interPlmnMobRegUpdtReq - Inter-PLMN Mobility Registration Update Request

Syntax

--interPlmnMobRegUpdtReq <list-item>

Description

Allows or restricts inbound inter-plmn idle Mobility Registration Update (MRU) from NR over N14, or from LTE over N26, or both based on UE GUTI PLMN ID. When restricted, AMF rejects the MRU with cause code #9, which triggers UE to initiate Initial Registration with SUCI.

Class

Optional.

List

- both - 4G LTE and 5G New Radio - Allows inbound inter-plmn idle Mobility Registration Update Request from source AMF or source MME
- lte - 4G LTE - Allows inbound inter-plmn idle Mobility Registration Update Request from source MME
- none - Neither 4G LTE nor 5G New Radio - Restricts inbound inter-plmn idle Mobility Registration Update Request from source AMF or source MME
- nr - 5G New Radio - Allows inbound inter-plmn idle Mobility Registration Update Request from source AMF

Default

none

Name

interPlmnN26EmergencyHoSourceNode - Inter Plmn N26 Emergency Call Handover Source Node

Syntax

--interPlmnN26EmergencyHoSourceNode <list-item>

Description

Identifies AMF source node behaviour (allow or reject) for inter plmn 5G to 4G handover of emergency calls triggered by the source gNB.

Class

Optional.

List

- both - Both LBO and Home Routed emergency calls are allowed by the source node to be handed over.
- hrt - Home Routed Traffic - when UE originates emergency call in UE H-PLMN, the call is allowed by source node to be handed over to V-PLMN as home routed call.
- lbo - Local Break Out - When roaming UE originates LBO emergency call in V-PLMN, the call is allowed by source node to be handed over to another PLMN (another V-PLMN or UE H-PLMN).
- none - Neither LBO nor Home Routed emergency calls are allowed by the source node to be handed over.

Default

both

Name

interPlmnN26EmergencyHoTargetNode - Inter PLMN N26 Emergency Call Handover Target Node

Syntax

--interPlmnN26EmergencyHoTargetNode <list-item>

Description

Identifies AMF target node behaviour (allow or reject) for inter plmn 4G to 5G handover of emergency calls from MME source node.

Class

Optional.

List

- both - LBO and HRT - Both LBO and Home Routed emergency calls are allowed by the target node to be handed in.
- hrt - Home Routed Traffic - When UE originates emergency call in UE H-PLMN, the call is allowed by V-PLMN target node to be handed in.
- lbo - Local Break Out - When roaming UE originates emergency call in V-PLMN, the call is allowed by target node in another Plmn (V-PLMN or H-PLMN) to be handed in.
- none - Neither LBO nor Home Routed emergency calls are allowed by the target node to be handed in.

Default

both

Name

interPlmnPcfSupport - Inter-PLMN PCF Support

Syntax

--interPlmnPcfSupport <list-item>

Description

Allows or restricts the use of PCF for Access Mobility and UE Policy Rules, based on roaming SLAs between operators.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

ladn - Local Area Data Network

Syntax

--ladn <list-item>

Description

Local Area Data Network. This parameter activates the LADN functionality support for the UE. With the LADN functionality, access to a provisioned data network is only provided on a restricted service area.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

lmfSelection - LMF Selection

Syntax

--lmfSelection <list-item>

Description

The parameter specifies the method of LMF selection used by the AMF. If there are multiple LMF matches then the AMF will use the capacity parameter to load balance the UE across the LMFs.

Class

Optional.

List

- LocalProvisioning - Local Provisioning - AMF will use locally provisioned NF for the selection of a NF.
- NRF - Network Repository Function - Make use of NRF to select NF.
- NRFLocalProvisioning - NRF with Local Provisioning Override - The AMF will check the locally provisioned selection rules and if there is a match then the AMF will select the NF matching the rule. If there is no matching then AMF will use the NRF. The selection rule by default is that AMF will select a NF supporting a provisioned criterion for the NF

Default

LocalProvisioning

Name

ImfStatusSubscribe - LMF Status Subscribe

Syntax

```
--lmfStatusSubscribe <list-item>
```

Description

Subscribe NRF for remote LMF status change event notifications.

Class

Optional.

List

- **byNfType** - All NF of a given NF type - AMF subscribes to get status of by NF type to get status of all NF registered with NRF whether AMF use them or not.
- **noSubscription** - Do not Subscribe to NF Status - AMF does not subscribe to get NF status .
- **selectedOnly** - Selected NFs only - AMF subscribes to get status of NF by instance ID for the NFs that are discovered via the NRF

Default

noSubscription

Name

mappingOfAllowedHomeNssaiQuery - Mapping Of Allowed Home Nssai Query

Syntax

```
--mappingOfAllowedHomeNssaiQuery <list-item>
```

Description

Enables to query NSSF to map Allowed UE Home PLMN Nssai to Visited PLMN Nssai at UE initial registration or during idle or connected mode mobility. If NSSF query response doesn't include mapped Nssai, returns an error or the setting is set to false, AMF uses the local hplmn to vplmn mapping configuration.

Class

Optional.

List

- **false** - Boolean value of false.
- **true** - Boolean value of true.

Default

false

Name

mergeUeAllowedNssaiAndSubInSliceSubChange - Merge UE Allowed NSSAI and Subscribed in Slice Subscription Change

Syntax

--mergeUeAllowedNssaiAndSubInSliceSubChange <list-item>

Description

When this parameter is enabled and the UDM send a Notification with slice change in the UE subscription the AMF will use the union the existing Allowed NSSAI with the Slices of the Subscribed NSSAI in replacement of the original Allowed NSSAI and use it to determine the final Allowed NSSAI and include it in the Configuration Update sent to the UE

Class

Optional.

List

- none - None
- allSubscribed - All Subscribed - All Subscribed S-NSSAIs

Default

none

Name

mergeUeReqNssaiAndSubInFirstReg - Merge UE Requested NSSAI and Subscribed in First Registration

Syntax

--mergeUeReqNssaiAndSubInFirstReg <list-item>

Description

When this parameter is enabled AMF will use the union the received Requested NSSAI with the Slices of the Subscribed NSSAI as the Requested NSSAI in Initial Registrations, Mobility Registration from different AMF or Mobility Registration from 4G.

Class

Optional.

List

- none - None
- allSubscribed - All Subscribed - All Subscribed S-NSSAIs

Default

none

Name

n26lwk - N26 interworking enabled

Syntax

--n26lwk <list-item>

Description

When set, N26 interworking is enabled

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

n26IwkRestrictionTaiListName - N26 IWK Restriction TAI List

Syntax

--n26IwkRestrictionTaiListName <string>

Description

N26 interworking restriction TAI list used by AMF to restrict 5G service when UE(s) move from LTE into the respective TACs in the TAI list.

Class

Optional.

Type / Range

Digit string of length 0 or 1 to 31 with the allowed pattern of [0-9a-zA-Z_\.\\-:@]*

Default

""

Name

non3gppAccessN3iwf - Non-3GPP access N3IWF

Syntax

--non3gppAccessN3iwf <list-item>

Description

Controls the support of non-3GPP access and the Non-3GPP Access Interworking Function (N3IWF) for the UE.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

non3gppAccessN3iwfImsVops - Non-3GPP Access N3IWF IMS Voice Over PS

Syntax

--non3gppAccessN3iwfImsVops <list-item>

Description

Controls whether IMS Voice over PS Sessions over untrusted non-3GPP access over N3IWF is supported for the UE with this PLMN under the serving PLMN.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

non3gppEpsPduHo - Non-3GPP Access EPS PDU Handover

Syntax

--non3gppEpsPduHo <list-item>

Description

Enables the support for UE triggered non-emergency PDU handovers between untrusted non-3GPP via N3IWF/5GS and E-UTRAN/EPS for the UE.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

non3gppPduHo - Non-3GPP PDU Handover

Syntax

--non3gppPduHo <list-item>

Description

Enables the support for UE triggered non-emergency PDU handovers between 3GPP and untrusted non-3GPP access via N3IWF for the UE.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

non3gppPduHoSmfHoFail - Non-3GPP PDU Handover SMF HO Failure

Syntax

- non3gppPduHoSmfHoFail <list-item>

Description

Defines whether the AMF supports the Nsmf_PDUSession service feature HOFail for the UE to indicate a failure of a PDU session handover between 3GPP and non-3GPP access types via SM context status notify.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

non3gppVopsN3iwfCheckImsDnn - Non-3GPP IMS VoPS N3IWF Check IMS DNN

Syntax

- non3gppVopsN3iwfCheckImsDnn <list-item>

Description

Defines whether the AMF checks IMS DNN subscription in determining network IMS voice over PS support over non-3GPP access for the UE, when the UE registers over untrusted non-3GPP access via N3IWF.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

non3gppVopsN3iwfCheckUeUsageSetting - Non-3GPP VoPS N3IWF Check UE Usage Setting

Syntax

--non3gppVopsN3iwfCheckUeUsageSetting <list-item>

Description

Controls whether the AMF requires UE's Usage Setting IE to be included in NAS Registration Request to indicate IMS voice over PS session over non-3GPP access as supported towards the UE and the UDM. If set to false, IMS voice over PS session support over non-3GPP access indication does not depend on whether the UE includes UE's Usage Setting IE. If set to true, AMF indicates IMS voice over PS session supported over non-3GPP access only if UE's Usage Setting IE is included in NAS Registration Request.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

nonEncryptedSuciNotAllowed - Non Encrypted SUCI Not Allowed

Syntax

--nonEncryptedSuciNotAllowed <list-item>

Description

When set, AMF rejects UE Registration if UE provided a non-encrypted SUCI in the Registration Request.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

npIiNon3gppAddUeLocation - NPLI Non-3GPP Additional UE Location

Syntax

```
--npliNon3gppAddUeLocation <list-item>
```

Description

Defines whether the AMF provides the additional non-3GPP access location as part of Network Provided Location Information (NPLI), when both 3GPP access location information and non-3GPP access location information are available for the UE.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

nssaa - NSSAA

Syntax

```
--nssaa <list-item>
```

Description

A control parameter to enable Network Slice-Specific Authentication and Authorization (NSSAA). If the parameter set to true, then AMF support NSSAA for this ue serving PLMN. Otherwise, AMF will not support it

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

nssaafSelection - Nssaaf Selection

Syntax

```
--nssaafSelection <list-item>
```

Description

This parameter specifies the method of NSSAAF selection used by the AMF for the NSSAA Authenticate svc operation.

Class

Optional.

List

- LocalProvisioning - Local Provisioning - AMF will use locally provisioned NF for the selection of a NF.
- NRF - Network Repository Function - Make use of NRF to select NF.
- NRFLocalProvisioning - NRF with Local Provisioning Override - The AMF will check the locally provisioned selection rules and if there is a match then the AMF will select the NF matching the rule. If there is no matching then AMF will use the NRF. The selection rule by default is that AMF will select a NF supporting a provisioned criterion for the NF

Default

LocalProvisioning

Name

nssaafStatusSubscribe - NSSAAF Status Subscribe

Syntax

--nssaafStatusSubscribe <list-item>

Description

Subscribe NRF for NSSAAF status change event notifications.

Class

Optional.

List

- byNfType - All NF of a given NF type - AMF subscribes to get status of by NF type to get status of all NF registered with NRF whether AMF use them or not.
- noSubscription - Do not Subscribe to NF Status - AMF does not subscribe to get NF status .
- selectedOnly - Selected NFs only - AMF subscribes to get status of NF by instance ID for the NFs that are discovered via the NRF

Default

noSubscription

Name

nssaiInclusionMode - NSSAI Inclusion Mode

Syntax

--nssaiInclusionMode <list-item>

Description

This Parameter control of the NSSAI inclusion mode is sent to the UE. Can have one of the following values: - None: Inclusion mode is not sent in the Registration Accept no matter if UE subscription allows inclusion modes. - Mode A: Inclusion mode A is sent in the

Registration Accept if UE subscription allows NSSAI Inclusion mode. Otherwise, no NSSAI Inclusion mode sent. - Mode B: Inclusion mode B is sent in the Registration Accept if UE subscription allows NSSAI Inclusion mode. Otherwise, no NSSAI Inclusion mode sent. - Mode C: Inclusion mode C is sent in the Registration Accept if UE subscription allows NSSAI Inclusion mode. Otherwise, no NSSAI Inclusion mode sent. - Mode D: Inclusion mode D is sent no matter if UE subscription allows inclusion modes.

Class

Optional.

List

- modeA - Mode A - NSSAI Inclusion mode A
- modeB - Mode B - NSSAI Inclusion mode B
- modeC - Mode C - NSSAI Inclusion mode C
- modeD - Mode D - NSSAI Inclusion mode D
- none - No NSSAI Inclusion mode

Default

none

Name

pagingPriProfileListName - Paging priority profile name

Syntax

--pagingPriProfileListName <string>

Description

Identifies the paging priority profile.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

pcfPolicyAllowSnssaiListName - PCF Policy Allow S-NSSAI List Name

Syntax

--pcfPolicyAllowSnssaiListName <string>

Description

When a list is provided, and the corresponding Policy Association Profile indicates that UE Policy and/or AM Policy Services should be established, then an additional check is taken in to account so that the the policy establishment is triggered only if at least one of the UE's Subscribed S-NSSAI is also included in PCF Policy Allow S-NSSAI List. If the list is not provided or it is empty then the UEs Subscribed NSSAIs are not taken into account.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

pcfSelection - PCF Selection

Syntax

--pcfSelection <list-item>

Description

The parameter specifies the method of PCF selection used by the AMF for UE. If there are multiple PCF matches then the AMF will use the capacity parameter to load balance the UE across the PCFs.

Class

Optional.

List

- LocalProvisioning - Local Provisioning - AMF will use locally provisioned NF for the selection of a NF.
- NRF - Network Repository Function - Make use of NRF to select NF.
- NRFLocalProvisioning - NRF with Local Provisioning Override - The AMF will check the locally provisioned selection rules and if there is a match then the AMF will select the NF matching the rule. If there is no matching then AMF will use the NRF. The selection rule by default is that AMF will select a NF supporting a provisioned criterion for the NF

Default

LocalProvisioning

Name

pcfStatusSubscribe - PCF Status Subscribe

Syntax

--pcfStatusSubscribe <list-item>

Description

Subscribe NRF for PCF status change event notifications.

Class

Optional.

List

- **byNfType** - All NF of a given NF type - AMF subscribes to get status of by NF type to get status of all NF registered with NRF whether AMF use them or not.
- **noSubscription** - Do not Subscribe to NF Status - AMF does not subscribe to get NF status .
- **selectedOnly** - Selected NFs only - AMF subscribes to get status of NF by instance ID for the NFs that are discovered via the NRF

Default

noSubscription

Name

preferredFullPlmn - Preferred Full PLMN

Syntax

--preferredFullPlmn <list-item>

Description

When set to true, the AMF includes Query-Params-Ext2 with preferred-full-plmn in the Get method.

Class

Optional.

List

- **false** - Boolean value of false.
- **true** - Boolean value of true.

Default

true

Name

preferredNfInstances - Preferred NF Instances

Syntax

--preferredNfInstances <list-item>

Description

Effective when ismf global parameter is set to 'true'. Controls whether the target AMF provides the anchor SMF and the I-SMF instance id(s) towards the NRF when performing I-SMF selection/checking the need to insert/change/remove I-SMF at AMF change.

Class

Optional.

List

- **false** - Boolean value of false.
- **true** - Boolean value of true.

Default

false

Name

preferredTaiSmfSelection - Preferred TAI SMF Selection

Syntax

--preferredTaiSmfSelection <list-item>

Description

Effective when ismf global parameter is set to 'true'. Controls the option to include 'preferred TAI' as part of the SMF selection criteria. Applicable to SMF selection based on both local provisioning and the NRF.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

preferSameSmfForAllPdus - Prefer Same SMF for All UE PDUs

Syntax

--preferSameSmfForAllPdus <list-item>

Description

When this parameter is set to true the AMF will select the same SMF for all PDU sessions of a UE when feasible. This can optimize the SGW/PGW collocation when the UE moves to RAT LTE in order to minimize the number of session on SGW and PGW not collocated.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

preferSameVsmfForAllPdus - Prefer Same V-SMF for All UE PDUs

Syntax

--preferSameVsmfForAllPduSes <list-item>

Description

When this parameter is set to true the AMF will select the same V-SMF for all PDU sessions of a UE when feasible. This can minimize the probability of collisions

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

queryNssfForConfigurationUpdate - Query NSSF For Configuration Update

Syntax

--queryNssfForConfigurationUpdate <list-item>

Description

This parameter defines where the AMF triggers the NSSF Get service operation of Nnssf_NSSelection service during UE Configuration Update procedure.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

reAuthTimePeriod - Reauthentication Time Period

Syntax

--reAuthTimePeriod <integer>

Description

This field defines the time period between successive UE authentications forced by the AMF. When value equals zero then the feature is disabled.

Class

Optional.

Type / Range

Integer in the range of 60 to 1440 including value zero in units of Minute

Default

0

Name

requiredFeaturesNrfDtssaSmf - Required-features DTSSA to NRF for SMF

Syntax

--requiredFeaturesNrfDtssaSmf <list-item>

Description

Defines whether the AMF includes the Deployments Topologies with specific SMF Service Areas (DTSSA) feature id inside required-features on NRF query when discovering the actual SMF, and I-SMF feature is enabled.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

reregisterAfterSliceModification - Reregister UE after Slice Modification

Syntax

--reregisterAfterSliceModification <list-item>

Description

Controls when the AMF indicates to the UE the need for the UE to perform Registration procedure without including the GUAMI or 5G-S-TMSI after a Slice modification.

Class

Optional.

List

- allPotentiallyAffectedUes - All Potentially Affected UEs - The AMF indicates to all potentially affected UE the need for the UE to perform Registration procedure without including the GUAMI or 5G-S-TMSI if any slice included the UEs configured NSSAI and UE's current TAI has been added irrelevant if the Allowed NSSAI has been affected.
- allowedNssaiChange - Allowed NSSAI - The AMF indicates to the UE the need for the UE to perform Registration procedure without including the GUAMI or 5G-S-TMSI when the UE's Allowed NSSAI has been changed irrelevant if existing Slice connectivity is affected.

- always - The AMF always indicates to all UE the need for the UE to perform Registration procedure without including the GUAMI or 5G-S-TMSI whenever there is a Slice change in the UEs Subscribed NSSAI or a Network Slice Change.
- existingSliceConnectivityAffected - Existing Slice Connectivity Affected - The AMF indicates to all UE the need for the UE to perform Registration procedure without including the GUAMI or 5G-S-TMSI when the UE's Allowed NSSAI has been changed only if existing connectivity is affected.

Default

allowedNssaiChange

Name

reselectPcfOnRegistration - Reselect PCF on Registration

Syntax

--reselectPcfOnRegistration <list-item>

Description

When this parameter is enabled AMF will (re)check that the existing PCF supports all mandatory criterions it would use to select a PCF when the UE performs a Registration (Periodic / Mobility). If the existing PCF meets all the criterions the existing PCF will be maintained. If not, a new PCF will be selected.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

reuseOldUeContextEpsTo5gs - Reuse Old UE Context When UE Moves to 5GS

Syntax

--reuseOldUeContextEpsTo5gs <list-item>

Description

With this parameter, the AMF reuses the subscription data of the old UE Context that were locally preserved when UE moved to EPS and skips SDM GET and SDM Subscribe operations towards UDM

Class

Optional.

List

- false - Boolean value of false.

- true - Boolean value of true.

Default

false

Name

roamDiscoverPcf - Discover PCF in HPLMN

Syntax

--roamDiscoverPcf <list-item>

Description

Specifies the option to discover H-PCF in the UE HPLMN to manage UE Policy rules based on roaming agreements between operators for Local Break Out roaming. When set, the AMF discovers H-PCH and includes in the UE Policy Association Creation request to the V-PCF which it uses to reach to the H-PCF to manage UE Policy Rules.

Restrictions

Applies to roamer UEs.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

sameSmfForMultiplePdus - Same SMF for Multiple PDUs

Syntax

--sameSmfForMultiplePdus <list-item>

Description

Defines whether the AMF supports the functionality to select same SMF for multiple PDUs per same (S-NSSAI, DNN) as indicated by UDM.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

sbiCommunicationProfileName - SBI Communication Profile Name

Syntax

--sbiCommunicationProfileName <string>

Description

The name of the sbiCommunicationProfile that is relevant in case of Roaming NFs

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

default

Name

sbiTimersProfileListName - SBI Operation Response Timers and Operation Attempts

Syntax

--sbiTimersProfileListName <string>

Description

Profile consisting of SBI Operation Response Timers and Operation Attempts.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

default

Name

sbiVersionControlProfileListName - SBI Version Control Profile List Name

Syntax

--sbiVersionControlProfileListName <string>

Description

Name of the SBI version control Profile. Refers to the 'default' profile a SBI Version Control Profile created via sbiVersionControlProfile CLI

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

default

Name

sbiVersionProducerControlProfileListName - SBI Version Producer Control Profile List Name

Syntax

--sbiVersionProducerControlProfileListName <string>

Description

Name of the SBI version producer control Profile. Refers to the 'default' profile a SBI Version Producer Control Profile created via sbiVersionProducerControlProfile CLI.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

default

Name

sendConfiguredNssaiInFirstReg - Send Configured NSSAI in First Registration

Syntax

--sendConfiguredNssaiInFirstReg <list-item>

Description

This parameter controls if AMF will always send the Configured NSSAI during Initial UE Registration, Mobility Registration from different AMF or Mobility Registration from 4G

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

smCtxtCreateSbiOriginationTimestamp - SM Context Create SBI Origination Timestamp

Syntax

--smCtxtCreateSbiOriginationTimestamp <list-item>

Description

Defines whether the AMF include the 3gpp-Sbi-Origination-Timestamp HTTP header on SM context create towards the SMF/I-SMF/V-SMF on SM context create request. This is aimed to help the SMF help handling colliding and late arriving requests.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

smfAddUeLocation - SMF Additional UE Location

Syntax

--smfAddUeLocation <list-item>

Description

AMF supports providing Additional UE Location as part of SM context create, update and delete towards the SMF, when additional location is available on AMF. The additional UE Location provides the 3GPP location information of a UE, when the corresponding PDU is related to non-3GPP access (i.e. access type for the SM context create/update/delete equals to non-3GPP access) and the AMF additionally holds valid 3GPP access location.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

smfExactDnnSelectionMatch - SMF Exact DNN Selection Match

Syntax

--smfExactDnnSelectionMatch <list-item>

Description

This parameter is applicable only for selection from locally provisioned SMFs. When the SMF Exact DNN Selection Match is set to true: If a DNN list is not provisioned with the Network Function Instances command, or the DNN list is empty, the defined NF (SMF) shall not be used if an explicit matching DNN is available on another SMF that matches all other selection

parameters. When the SMF Selection Match is set to false, the SMF is selected according to SMF selection and Default SMF selection parameters.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

smfNasMappingListName - SMF NAS Mapping List Name

Syntax

--smfNasMappingListName <string>

Description

The name of the SMF error to 5GMM NAS mapping list.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

default

Name

smfSelection - SMF Selection

Syntax

--smfSelection <list-item>

Description

The parameter specifies the method of SMF selection used by the AMF for UE requested PDU session establishment. If there are multiple SMF matches then the AMF will the capacity parameter to load balance the UE across the SMFs.

Class

Optional.

List

- LocalProvisioning - Local Provisioning - AMF will use locally provisioned NF for the selection of a NF.
- NRF - Network Repository Function - Make use of NRF to select NF.

- **NRFLocalProvisioning** - NRF with Local Provisioning Override - The AMF will check the locally provisioned selection rules and if there is a match then the AMF will select the NF matching the rule. If there is no matching then AMF will use the NRF. The selection rule by default is that AMF will select a NF supporting a provisioned criterion for the NF

Default

LocalProvisioning

Name

smfStatusSubscribe - SMF Status Subscribe

Syntax

--smfStatusSubscribe <list-item>

Description

Subscribe NRF for SMF status change event notifications.

Class

Optional.

List

- **byNfType** - All NF of a given NF type - AMF subscribes to get status of by NF type to get status of all NF registered with NRF whether AMF use them or not.
- **noSubscription** - Do not Subscribe to NF Status - AMF does not subscribe to get NF status .
- **selectedOnly** - Selected NFs only - AMF subscribes to get status of NF by instance ID for the NFs that are discovered via the NRF

Default

noSubscription

Name

smsfNasMappingListName - SMSF NAS Mapping List Name

Syntax

--smsfNasMappingListName <string>

Description

The name of the SMSF (N20) error to 5GMM NAS mapping list.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

default

Name

smsfSelection - SMSF Selection

Syntax

--smsfSelection <list-item>

Description

The parameter specifies the method of SMSF selection used by the AMF for delivering SMS over NAS. If there are multiple SMSF matches then the AMF will use the capacity parameter to load balance the UE across the SMSFs.

Class

Optional.

List

- LocalProvisioning - Local Provisioning - AMF will use locally provisioned NF for the selection of a NF.
- NRF - Network Repository Function - Make use of NRF to select NF.
- NRFLocalProvisioning - NRF with Local Provisioning Override - The AMF will check the locally provisioned selection rules and if there is a match then the AMF will select the NF matching the rule. If there is no matching then AMF will use the NRF. The selection rule by default is that AMF will select a NF supporting a provisioned criterion for the NF

Default

LocalProvisioning

Name

smsfStatusSubscribe - Subscribe to SMSF status

Syntax

--smsfStatusSubscribe <list-item>

Description

Subscribe NRF for SMSF status change event notifications

Class

Optional.

List

- byNfType - All NF of a given NF type - AMF subscribes to get status of by NF type to get status of all NF registered with NRF whether AMF use them or not.
- noSubscription - Do not Subscribe to NF Status - AMF does not subscribe to get NF status .
- selectedOnly - Selected NFs only - AMF subscribes to get status of NF by instance ID for the NFs that are discovered via the NRF

Default

noSubscription

Name

smsOverNasAllowed - SMS Over NAS Allowed

Syntax

--smsOverNasAllowed <list-item>

Description

Defines whether SMS over NAS is allowed. The Short Message is delivered via the NAS signalling from the UE to/from the AMF and further via the N20 interface towards the SMSF.

Class

Optional.

List

- ALLOWED - Allowed.
- DENIED - Denied.

Default

DENIED

Name

smsOverNasForImsCapableVoiceCentricUEs - SMS Over NAS for IMS Capable Voice Centric UEs

Syntax

--smsOverNasForImsCapableVoiceCentricUEs <list-item>

Description

Defines whether SMS over NAS is allowed for UEs indicating 'voice centric' on UE's usage setting IE on NAS Registration request, assuming that these IMS capable, voice centric UEs will get SMS service via IMS (and do not need SMS over NAS to be allowed).

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

smsPreferredAccess - SMS Preferred Access

Syntax

--smsPreferredAccess <list-item>

Description

Defines the preferred access for SMS over NAS delivery of MT SMS, when the UE is RM-REGISTERED and CM-CONNECTED via the same AMF over both 3GPP access and non-3GPP access types.

Class

Optional.

List

- amf3gppAccess - 3GPP Access - 3GPP Access type.
- amfNon3gppAccess - Non-3GPP access - Non-3GPP Access type.

Default

amfNon3gppAccess

Name

smsReattemptViaOtherAccess - SMS Reattempt via Other Access

Syntax

--smsReattemptViaOtherAccess <list-item>

Description

Defines whether the AMF reattempts the delivery of an MT SMS via the other access, when the UE is RM-REGISTERED and CM-CONNECTED via both 3GPP and non-3GPP access types and the initial SMS delivery has failed via the preferred access type.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

snssaiToDnnListName - S-NSSAI to Default DNN List Name

Syntax

--snssaiToDnnListName <string>

Description

Configure S-NSSAI to default DNN list. The AMF will use the list if the AMF failed to select a DNN for the UE requested S-NSSAI PDU connection.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

sor - Steering of Roaming

Syntax

--sor <list-item>

Description

Enables steering of roaming for roamers. The UDM can invoke steering of roaming toward the AMF when UE is in visited PLMN or in home PLMN.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

staticSmf - Static SMF

Syntax

--staticSmf <list-item>

Description

Enables the functionality to select static SMF for a PDU connection of a UE. The static SMF address is delivered from UDM inside SmfSelectionSubscriptionData per DNN. AMF primarily attempts to interpret the received SMF address as an instance id. If no match then the AMF interprets it as an FQDN.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

stdStaticSmf - Standard Static SMF

Syntax

--stdStaticSmf <list-item>

Description

Defines whether 3GPP standard based static SMF selection functionality is enabled for the UE. If static SMF list is defined for the DNN on UDM and AMF is not able to select any of the UDM provided SMF(s), the AMF will fail the PDU session establishment procedure.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

subscribedEmergencySnssai - Subscribed Emergency S-NSSAI

Syntax

--subscribedEmergencySnssai <list-item>

Description

Current parameter enables using the S-NSSAI from subscribed emergency DNN if such exists in subscription data

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

suciSchemeAllowedListName - UEs SUCI Scheme Output Allow List Name

Syntax

--suciSchemeAllowedListName <string>

Description

Identifies the name of the SUCI Scheme Output allowed list. The AMF will immediately reject the UE registration, without attempting to authenticate the UE, if the UE SUCI Scheme Output is not in the allowed list. The registration reject NAS cause code is configurable with default value set to 27.

Restrictions

This applies only to inbound roaming UEs.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

support5gSrvcc - Support 5G-SRVCC

Syntax

--support5gSrvcc <list-item>

Description

Enables the 5G-SRVCC support for handing over regular voice calls from NG-RAN/5GS to 3GPP UTRAN/CS domain for the UE.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

supportAnLevelSliceValidation - Support AN Level Slice Validation

Syntax

--supportAnLevelSliceValidation <list-item>

Description

When this feature is enabled, AMF will consider whether a Slice is actually supported by the specific 5G-AN Network Element (gNBs, N3IWF) the UE is currently connected to (i.e. not just the Tracking area level status) and act accordingly in the next UE Registration, Service Request, or Configuration Update. Note: This functionality is available only for non-roaming UEs.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

t3512Src - t3512 Source

Syntax

--t3512Src <list-item>

Description

Determines how the T3512 timer is set. this field provides the ability to override the AMF locally provisioned T3512 timer with the subscribed-periodic timer from UE subscription data in UDM.

Class

Optional.

List

- Provisioned - Use AMF locally provisioned T3512 periodic timer
- Subscribed - Use subscribed-periodic-timer value from UE subscription data in UDM

Default

Provisioned

Name

treatAsHomeSubscriber - FiveG Treat As Home Subscriber

Syntax

--treatAsHomeSubscriber <list-item>

Description

When set, treat a UE as if it were a home subscriber of the serving PLMN. Note: Intra-AMF inter-PLMN mobility is not supported among Serving PLMNs if the UEs roaming status is not uniform (i.e. the value of this parameter changes). In other words a UE must either be treated as Roamer in both Serving networks or as Home Subscriber in both Serving networks. Furthermore treating UEs belonging to a Home or a Shared PLMN (i.e. PLMN Type is Home or Shared Network) as Roamers is not supported (i.e. value should be set to true).

Restrictions

This element is not applicable when the serving and UE PLMNs are the same.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

trigUePolicyWhenNoUePolicyContainer - Trigger UE Policy When No UE Policy Container

Syntax

--trigUePolicyWhenNoUePolicyContainer <list-item>

Description

Parameter controls establishment of UE Policy Association based on received UE policy container from UE. By default, the flag shall be disabled.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

udmImmediateReport - UDM Immediate Report

Syntax

--udmImmediateReport <list-item>

Description

The AMF uses the Nudm SDM Subscribe service operation with the immediateReport indication to retrieve the UE Subscription Data and Subscribe for Data Change Notification in one combined operation.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

udmSelection - UDM Selection

Syntax

--udmSelection <list-item>

Description

The parameter specifies the method of UDM selection used by the AMF for UE. If there are multiple UDM matches then the AMF will use the capacity parameter to load balance the UE across the UDMs.

Class

Optional.

List

- LocalProvisioning - Local Provisioning - AMF will use locally provisioned NF for the selection of a NF.
- NRF - Network Repository Function - Make use of NRF to select NF.
- NRFLocalProvisioning - NRF with Local Provisioning Override - The AMF will check the locally provisioned selection rules and if there is a match then the AMF will select the NF matching the rule. If there is no matching then AMF will use the NRF. The selection rule by default is that AMF will select a NF supporting a provisioned criterion for the NF

Default

LocalProvisioning

Name

udmStatusSubscribe - UDM Status Subscribe

Syntax

--udmStatusSubscribe <list-item>

Description

Subscribe NRF for UDM status change event notifications.

Class

Optional.

List

- byNfType - All NF of a given NF type - AMF subscribes to get status of by NF type to get status of all NF registered with NRF whether AMF use them or not.
- noSubscription - Do not Subscribe to NF Status - AMF does not subscribe to get NF status .
- selectedOnly - Selected NFs only - AMF subscribes to get status of NF by instance ID for the NFs that are discovered via the NRF

Default

noSubscription

Name

udmSubscribeOptions - UDM Subscribe Options

Syntax

--udmSubscribeOptions <list-item>

Description

Options for AMF, in subscribe to notification of data change procedure, to specify the expiration of a subscription.

Class

Optional.

List

- both - ImplicitUnsubscribe And Expires - AMF sets implicitUnsubscribe to true and also includes "expires" IE/attribute. Upon expiry of "expires" time and UE Context still exists in the AMF, the AMF sends a Subscribe request to UDM (with same resource as previous subscribe). When AMF sends Deregistration request to UDM, AMF does not send Unsubscribe request to UDM. When UDM send DeregistrationNotificaton to AMF, AMF does not send Unsubscribe request to UDM.
- expires - Subscribing AMF Expires Timer - Upon expiry of "expires" time and UE Context still exists in the AMF, the AMF sends a Subscribe request (with same resources as previous subscribe). AMF sends Unsubscribe request to UDM when UE Context is removed from AMF.
- implicitUnsubscribe - Implicit Unsubscribe From UDM - When present and set to true, AMF subscription for UE is terminated at the UDM when the UE Context in the AMF no longer exists. When implicitUnsubscribe is not set to true or not present, AMF must send "expires" IE/attribute to the UDM. Note: When implicitUnsubscribe is set to true:
 - When AMF sends Deregistration request to UDM, AMF does not send Unsubscribe request to UDM.
 - When UDM send DeregistrationNotificaton to AMF, AMF does not send Unsubscribe request to UDM.

Default

expires

Name

ueAmbrDownlink - UE AMBR Downlink Bitrate

Syntax

--ueAmbrDownlink <integer>

Description

UE Aggregate Maximum Downlink Bitrate. Allowed for both home and roaming subscribers.

Restrictions

Both uplink/downlink must be 0 or both uplink/downlink must be non-zero.

Class

Optional.

Type / Range

Integer in the range of 0-1,000,000,000,000 bps. in units of Kbps

Default

0

Name

ueAmbrSrc - UE AMBR Source

Syntax`--ueAmbrSrc <list-item>`**Description**

Identifies UE AMBR source i.e. from UDM or locally provisioned.

Restrictions

Applies to home or roamer UEs.

Class

Optional.

List

- local - Local value - UE AMBR locally configured value.
- udm - udm value - Subscribed UE AMBR in UDM

Default

udm

Name

ueAmbrUplink - UE AMBR Uplink Bitrate

Syntax`--ueAmbrUplink <integer>`**Description**

UE Aggregate Maximum Uplink Bitrate. Allowed for both home and roaming subscribers.

Restrictions

Both uplink/downlink must be 0 or both uplink/downlink must be non-zero.

Class

Optional.

Type / Range

Integer in the range of 0-1,000,000,000,000 bps. in units of Kbps

Default

0

Name

ueRadioCapabilityCheck - UE Radio Capability Check

Syntax`--ueRadioCapabilityCheck <list-item>`

Description

This parameter controls whether the AMF uses NGAP UE Radio Check procedure and the result of the procedure to define whether Voice over PS Sessions shall be supported for the UE on this PLMN.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

unsupportedSliceHandlingInReg - Unsupported Slice Handling In Registration

Syntax

--unsupportedSliceHandlingInReg <list-item>

Description

When the parameter is set to rejectReg, AMF sends Registration Reject when AMF cannot serve all the UE Candidate slices and cannot discover the Target AMF for reallocating the UE Registration. Otherwise, when the parameter is set to rejectSlicePlmn, or rejectSliceRA, when at least one or more slices are allowed, the AMF sends Registration Accept and includes the unsupported slices in the Rejected NSSAI with configurable cause as SNSSAI not available in the current PLMN or SNPN, or SNSSAI not available in the current registration area respectively. This parameter is not applicable for Roaming subscribers.

Class

Optional.

List

- rejectReg - Reject Registration - When the parameter is set to RejectRegistration, AMF sends Registration Reject when AMF cannot serve all the UE Candidate slices and cannot discover the Target AMF for reallocating the UE Registration
- rejectSlicePlmn - Reject Slice Plmn - when the parameter is set to RejectSlicePlmn, when at least one or more slices are allowed, the AMF sends Registration Accept and includes the unsupported slices in the Rejected NSSAI with configurable cause as SNSSAI not available in the current PLMN or SNPN
- rejectSliceRA - Reject Slice Registration Area - when the parameter is set to RejectSliceRA, when at least one or more slices are allowed, the AMF sends Registration Accept and includes the unsupported slices in the Rejected NSSAI with configurable cause as SNSSAI not available in the current registration area

Default

rejectReg

Recommended

It is recommended to use the value "rejectSlicePlmn" assuming the UE Subscription errors are more probable than the AMF provisioning errors.

Name

useAllowedNssaiForPcfSelection - Use Allowed NSSAI for PCF Selection

Syntax

--useAllowedNssaiForPcfSelection <list-item>

Description

This parameter defines whether the AMF adds the UE's allowed NSSAI as a NF_Discovery GET Query Parameter for PCF selection. When the value is true, the Allowed NSSAI is added in the snnsais query Parameter for PCF selection. When the value is false the AMF does not include snnsais as a query Parameter for PCF selection. Default Value is false.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

useGpsiForPcfSelection - Use GPSI for PCF Selection

Syntax

--useGpsiForPcfSelection <list-item>

Description

This parameter defines whether the AMF adds the UE's GPSI as a query Parameter when discovering PCF from NRF, or when searching for matching PCF in the locally provisioned NFs list. When the value is true, the GPSI is used for PCF selection. When the value is false, the GPSI is not used for PCF selection. Default Value is false.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

useN26SvcParam5gsToEpsHo - Use N26 Service Parameter in 5GS to EPS Handover

Syntax

--useN26SvcParam5gsToEpsHo <list-item>

Description

Current parameter enables using N26 service parameter as part of DNS query for target MME selection during 5GS to EPS handover

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

useNssfSelectionServiceForSmf - Use NSSF Selection Service for Slice Info for SMF

Syntax

--useNssfSelectionServiceForSmf <list-item>

Description

Specifies options to use NSSF Selection Service for Slice Info during PDU Session Establishment.

Restrictions

This applies to roamer UEs.

Class

Optional.

List

- both - Local Break Out and Home Routed - AMF invokes NSSF Service for Slice Information during PDU Session Establishment when roaming subscriber is allowed PDU Session Service for Local Break Out and Home Routed.
- hr - Home Routed - AMF invokes NSSF Service for Slice Information during PDU Session Establishment when roaming subscriber is allowed PDU Session Service for Home Routed.
- lbo - Local Break OUT - AMF invokes NSSF Service for Slice Information during PDU Session Establishment when roaming subscriber is allowed PDU Session Service for Local Break Out.

- none - AMF doesn't invoke NSSF Service for Slice Information during PDU Session Establishment when roaming.

Default

none

Name

useTaiForSmfSelection - Use TAI for SMF Selection

Syntax

--useTaiForSmfSelection <list-item>

Description

Controls usage of TAI as a SMF selection criterion: - 'No' (default): TAI IE is not added in NRF Discovery Query for SMF selection and not used as a criterion when searching for SMF in local or external NRF Cache. - 'Yes' TAI IE is added in NRF Discovery Query for SMF selection and used as a criterion when searching for SMF from local or external NRF Cache.

Class

Optional.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

vsmfChange - VSMF Change

Syntax

--vsmfChange <list-item>

Description

Enables VSMF change including selection of a new VSMF when new UE location is not supported by current VSMF.

Restrictions

Requires vsmfChange gparm to be set to true to enable this parameter at the UE PLMN Services level.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

vsmfSelectionFailureMaintain - VSMF Selection Failure Maintain

Syntax

--vsmfSelectionFailureMaintain <list-item>

Description

Defines whether the AMF maintains PDU session when V-SMF change is enabled, and AMF detects the need to select a new V-SMF, but no V-SMF supporting the current UE service area is available. The parameter is similarly used when V-SMF needs to be changed but H-SMF does not support DTSSA. If set to false, AMF releases the PDU session (i.e. triggers Nsmf PDUSession UpdateSMContext with release indication towards the old SMF or V-SMF) if no new V-SMF is available for the current service area of the UE or H-SMF does not support DTSSA

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

vsmfSupportInd - V-SMF Support Indication to NRF for SMF

Syntax

--vsmfSupportInd <list-item>

Description

AMF includes V-SMF Indication Support in R15 API version when discovering an SMF in the V-PLMN for home routed traffic.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

4.2 cmm amfUePlmnServicesSecurity

amf UE Plmn Services Security. Syntax, description, parameters, and roles for **cmm amfUePlmnServicesSecurity** command.

Syntax

Description

This command is used to administer UE PLMN Services Security for AMF and includes parameters for defining the authentication interaction for AMF procedure(s). For UE Plmns of plmnType "Multiple Home Network", the security parameters associated with the Home Network amfUePlmnServicesName will be used.

Parameters

Name

amfUePlmnServicesName - UE PLMN services name

Syntax

--amfUePlmnServicesName <string>

Description

Name of a UE PLMN services record

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Name

amfProcedureName - AMF procedure name

Syntax

--amfProcedureName <list-item>

Description

Name of AMF procedure

Class

Required key.

List

- initialRegistration - Initial Registration - UE Initial Registration
- mobilityRegistrationUpdate - Mobility Registration Update - UE Mobility Registration Update
- periodicRegistration - Mobility Registration Update with type "Periodic Registration" - UE Periodic Mobility Registration
- deregistration - De-registration - UE Initiated De-registration
- serviceRequest - Service Request Procedure - Service Request Procedure Note: For GUTI Reallocation this represents mobile originated service request
- iratChange - IRAT Change
- amfChange - AMF Change
- nlServiceRequest - NI Service Request - Network-initiated Service Request Procedure

Name

authInteraction - Authentication Interaction

Syntax

--authInteraction <integer>

Description

The authentication repetition rate defines how many times a particular event occurs before an optional authentication needs to be performed. If the value is 0, no optional authentication is needed. If the value is N, the authentication is done in connection with every Nth event. The parameter values range from 0 to 255 except for inter-AMF and IRAT relocations the range is 0-1.

Restrictions

Default values: initialRegistration = 1 mobilityRegistrationUpdate = 1 periodicRegistration = 0 serviceRequest = 0 iratChange = 0 (range is 0-1) amfChange = 0 (range is 0-1) deregistration = 0

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

0

Name

gutiReallocation - 5G-GUTI Re-allocation

Syntax

--gutiReallocation <integer>

Description

The GUTI Re-allocation defines how many times a particular event occurs before a GUTI Re-allocation is performed. If the value is 0, no GUTI Re-allocation is performed. If the value is N, the GUTI Re-allocation is performed with every nth event. GUTI Re-allocation applies to Initial UE Registration, Mobility Registration Update, Periodic Mobility Registration and Service Request events. For inter-AMF and I-RAT relocation GUTI re-allocation is mandatory i.e. value can only be "1". For Deregistration value can only be "0". Default value can be different for each event

Restrictions

GUTI Re-allocation is restricted to Initial UE Registration, Mobility Registration Update and Service Request events. Default values: initialRegistration = 5 mobilityRegistrationUpdate = 5 periodicRegistration = 0 serviceRequest = 0 iratChange = 1 (range is 1) amfChange = 1 (range is 1) deregistration = 0 (range is 0)

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Default

0

Name

horizDerivatAtSourceAmf - Horizontal Derivation Required At Source AMF

Syntax

--horizDerivatAtSourceAmf <list-item>

Description

horizontal derivation is required at source AMF

Restrictions

only apply for the inter AMFs

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

horizDerivatAtTargetAmf - Horizontal Derivation Kamf At Target AMF

Syntax

--horizDerivatAtTargetAmf <list-item>

Description

if target AMF decide to use horizontal derivation Kamf received from source AMF

Restrictions

only apply for inter AMF

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

4.3 cmm amfUePriorityProfile

AMF UE Priority Profile. Syntax, description, parameters, and roles for cmm amfUePriorityProfile command.

Syntax

Description

Manage UE priority profile; control settings to allow priority services for the UE. AMF supports up to 64 UE priority profiles.

Parameters

Name

name - Name

Syntax

--name <string>

Description

The name of the UE Priority Profile.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

gtpMpN26Mcs - GTP Message Priority Over N26 MCS

Syntax

--gtpMpN26Mcs <list-item>

Description

Enables AMF to use GTP Message Priority value 0 over N26 interface for MCS priority UEs.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

gtpMpN26Mps - GTP Message Priority Over N26 MPS

Syntax

--gtpMpN26Mps <list-item>

Description

Enables AMF to use GTP Message Priority value 0 over N26 interface for MPS priority UEs.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

hpaInitialPriorityMpsMcs - High Priority Access Initial Priority MPS/MCS

Syntax

--hpaInitialPriorityMpsMcs <list-item>

Description

Defines whether the AMF provides initial priority for UEs indicating RRC establishment cause highPriorityAccess. The UE needs to have MPS or MCS subscribed, or have PDU with priority mapped ARP in order to be continued to be treated with priority.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

hpaInitialSbiMessagePriority - HPA Initial SBI Message Priority

Syntax

--hpaInitialSbiMessagePriority <integer>

Description

Defines the SBI Message Priority (SMP) that is used for UEs indicating RRC establishment cause highPriorityAccess. This SMP value is used only when enabled by the separate parameter High Priority Access Initial Priority as part of the UE priority profile. The AMF uses this SMP initially on AMF triggered request messages towards other NFs, prior to the AMF being able to validate the priority of the UE.

Class

Optional.

Type / Range

Integer in the range of 0 to 23

Default

23

Name

mcs - Mission Critical Services

Syntax`--mcs <list-item>`**Description**

Enables the use of Mission Critical Services (MCS) for the UE.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

mcsSbiMessagePriority - MCS SBI Message Priority

Syntax`--mcsSbiMessagePriority <integer>`**Description**

Defines the SBI Message Priority (SMP) that is used for MCS-detected UEs on AMF triggered request messages towards other NFs.

Class

Optional.

Type / Range

Integer in the range of 0 to 23

Default

23

Name

mps - Multimedia Priority Services

Syntax`--mps <list-item>`**Description**

Enables the use of Multimedia Priority Services (MPS) for the UE.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

mpsSbiMessagePriority - MPS SBI Message Priority

Syntax

--mpsSbiMessagePriority <integer>

Description

Defines the SBI Message Priority (SMP) that is used for MPS-detected UEs on AMF triggered request messages towards other NFs. AMF call processing treats any value defined between 24..31 according to the value of 23. This is to ensure all MPS calls will have higher priority than regular calls.

Class

Optional.

Type / Range

Integer in the range of 0 to 31

Default

23

Name

n1n2RejPrioIncludeHighestArp - N1 N2 Rejection due to Priority Include Highest ARP

Syntax

--n1n2RejPrioIncludeHighestArp <list-item>

Description

Defines whether AMF, when rejecting N1N2 Message Transfer request due to higher priority request ongoing, includes 'highestPrioArp' (Highest Priority ARP) into the reject message.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

sendPagingForSubsequentPrioN1N2 - Send paging for subsequent Priority N1N2 or EnableUeReachability request

Syntax

--sendPagingForSubsequentPrioN1N2 <list-item>

Description

Defines whether AMF sends Paging message with suitable Paging Priority, when AMF receives subsequent N1N2 Message Transfer request including priority defined ARP or Enable UE Reachability request with priority defined SMP. When set to false, AMF does not send any paging message when subsequent priority request(s) come before paging timer for the already started paging expires.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

4.4 cmm amfUINasUnableToForwardProfile

AMF Uplink NAS Unable to Forward Profile. Syntax, description, parameters, and roles for cmm amfUINasUnableToForwardProfile command.

Syntax

Description

Defines parameters when AMF is unable to forward an Uplink NAS message to the target NF. The maximum number of profiles supported is 128. A default profile, named 'default', is provided.

Parameters

Name

name - Name

Syntax

--name <string>

Description

Defines the name of the AMF Uplink NAS Unable to Forward Profile.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

smAmfLockedLinkLocked - SM AMF Locked Link Locked

Syntax

--smAmfLockedLinkLocked <integer>

Description

Defines NAS 5GMM cause that the AMF uses when the NAS: Uplink NAS carries an SM type Payload Container and the message cannot be forwarded to SMF due to AMF being locked or the S11 link is locked. Defining 0 stands for no cause code included on AMF triggered NAS: DL NAS message.

Class

Optional.

Type / Range

5GMM Cause Code. 0 stands for no cause to be provided

Default

90

Name

smDnnNotSubscribed - SM DNN Not Subscribed

Syntax

--smDnnNotSubscribed <integer>

Description

Defines NAS 5GMM cause that the AMF uses when the NAS: Uplink NAS carries an SM type Payload Container and the message cannot be forwarded to SMF due to DNN not subscribed in the slice. Defining 0 stands for no cause code included on AMF triggered NAS: DL NAS message.

Class

Optional.

Type / Range

5GMM Cause Code. 0 stands for no cause to be provided

Default

91

Name

smEmergencyNoNid - SM Emergency No NID

Syntax

--smEmergencyNoNid <integer>

Description

Defines NAS 5GMM cause that the AMF uses when the NAS: Uplink NAS carries an SM type Payload Container and the message cannot be forwarded to SMF due to NID not present for SNPN. Defining 0 stands for no cause code included on AMF triggered NAS: DL NAS message.

Class

Optional.

Type / Range

5GMM Cause Code. 0 stands for no cause to be provided

Default

90

Name

smEmergencyRegistered - SM Emergency Registered

Syntax

--smEmergencyRegistered <integer>

Description

Defines NAS 5GMM cause that the AMF uses when the NAS: Uplink NAS carries an SM type Payload Container and the message cannot be forwarded to SMF due to the Request Type not concerning an emergency session and the UE being emergency registered. Defining 0 stands for no cause code included on AMF triggered NAS: DL NAS message.

Class

Optional.

Type / Range

5GMM Cause Code. 0 stands for no cause to be provided

Default

90

Name

smInternalSwError - SM Internal SW Error

Syntax`--smInternalSwError <integer>`**Description**

Defines NAS 5GMM cause that the AMF uses when the NAS: Uplink NAS carries an SM type Payload Container and the message cannot be forwarded to SMF due to internal SW error. Defining 0 stands for no cause code included on AMF triggered NAS: DL NAS message.

Class

Optional.

Type / Range

5GMM Cause Code. 0 stands for no cause to be provided

Default

90

Name

smInvalidRequestTypeNoSmf - SM Invalid Request Type No SMF

Syntax`--smInvalidRequestTypeNoSmf <integer>`**Description**

Defines NAS 5GMM cause that the AMF uses when the NAS: Uplink NAS carries an SM type Payload Container and the message cannot be forwarded to SMF due to Request Type is not included or the Request Type value is unknown to AMF and the AMF does not have a PDU session routing context for the PDU session ID and the UE. Defining 0 stands for no cause code included on AMF triggered NAS: DL NAS message.

Class

Optional.

Type / Range

5GMM Cause Code. 0 stands for no cause to be provided

Default

90

Name

smPduSessionIdInvalidMissing - SM PDU Session Id Invalid or Missing

Syntax`--smPduSessionIdInvalidMissing <integer>`**Description**

Defines NAS 5GMM cause that the AMF uses when the NAS: Uplink NAS carries an SM type Payload Container and the message cannot be forwarded to SMF due to the PDU Session Id being invalid or missing. Defining 0 stands for no cause code included on AMF triggered NAS: DL NAS message.

Class

Optional.

Type / Range

5GMM Cause Code. 0 stands for no cause to be provided

Default

96

Name

smProcedureCollision - SM Procedure Collision

Syntax

--smProcedureCollision <integer>

Description

Defines NAS 5GMM cause that the AMF uses when the NAS: Uplink NAS carries an SM type Payload Container and the message cannot be forwarded to SMF due to procedure collision. Defining 0 stands for no cause code included on AMF triggered NAS: DL NAS message.

Class

Optional.

Type / Range

5GMM Cause Code. 0 stands for no cause to be provided

Default

90

Name

smRestrictedServiceArea - SM Restricted Service Area

Syntax

--smRestrictedServiceArea <integer>

Description

Defines NAS 5GMM cause that the AMF uses when the NAS: Uplink NAS carries an SM type Payload Container and the message cannot be forwarded to SMF due to restricted service area. Defining 0 stands for no cause code included on AMF triggered NAS: DL NAS message.

Class

Optional.

Type / Range

5GMM Cause Code. 0 stands for no cause to be provided

Default

28

Name

smSmfSelectionFails - SM SMF Selection Fails

Syntax`--smSmfSelectionFails <integer>`**Description**

Defines NAS 5GMM cause that the AMF uses when the NAS: Uplink NAS carries an SM type Payload Container and the message cannot be forwarded to SMF due to SMF selection failing. Defining 0 stands for no cause code included on AMF triggered NAS: DL NAS message.

Class

Optional.

Type / Range

5GMM Cause Code. 0 stands for no cause to be provided

Default

90

Name

smSnssaiNotAllowed - SM S-NSSAI Not Allowed

Syntax`--smSnssaiNotAllowed <integer>`**Description**

Defines NAS 5GMM cause that the AMF uses when the NAS: Uplink NAS carries an SM type Payload Container, and the message cannot be forwarded due to S-NSSAI not allowed. Defining 0 stands for no cause code included on AMF triggered NAS: DL NAS message.

Class

Optional.

Type / Range

5GMM Cause Code. 0 stands for no cause to be provided

Default

91

Name

smTimeout - SM Timeout

Syntax`--smTimeout <integer>`**Description**

Defines NAS 5GMM cause that the AMF uses when the NAS: Uplink NAS carries an SM type Payload Container and the message cannot be forwarded to SMF due to SMF timeout. Defining 0 stands for no cause code included on AMF triggered NAS: DL NAS message.

Class

Optional.

Type / Range

5GMM Cause Code. 0 stands for no cause to be provided

Default

90

4.5 cmm amfVoiceProfile

AMF Voice Profile. Syntax, description, parameters, and roles for cmm amfVoiceProfile command.

Syntax

Description

Controls 5GS voice service related parameters and AMF actions related to voice, emergency and emergency fallback services. The maximum number of profiles supported is 128. A default profile, named 'default', is provided.

Parameters

Name

name - AMF Voice Profile Name

Syntax

--name <string>

Description

The name of the profile for voice related handling.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

acceptVoiceNoUeCapCheck - Accept Voice No UE Capability Check

Syntax

--acceptVoiceNoUeCapCheck <list-item>

Description

Defines whether the AMF skips UE radio capability check during IMS voice over PS evaluation, when the UE radio capability check is provisioned to be run as part of the IMS voice over PS evaluation, but the UE radio capability check cannot be run due to Initial Context Setup Failure or timeout. When this parameter is set to true, the AMF then also skips the UE radio capability check on the IMS voice over PS evaluation. I.e. If the only reason for the AMF to not indicate IMS voice over PS as supported was the UE radio capability check not being possible to be run, the AMF indicates IMS voice over PS as supported for the UE. When this parameter is set to false, AMF considers the lack of the possibility to run the UE radio capability check (due to Initial Context Setup Failure) to cause IMS voice over PS as not supported for the UE, when provisioned to be run but cannot be run due to Initial context setup failure or timeout.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

emcSuppressNoVonnr - EMC Suppress No VoNR

Syntax

--emcSuppressNoVonnr <list-item>

Description

The AMF suppresses EMC support i.e. indicates 'Emergency services not supported' on 5GS Network Feature Support IE on NAS Registration Accept for the UE when UE radio capabilities indicate that the UE does not support VoNR.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

emfSuppressS1Disabled - EMF Suppress S1 Disabled

Syntax

--emfSuppressS1Disabled <list-item>

Description

Defines whether the AMF suppresses Emergency Services Fallback (EMF) when the UE has disabled S1 mode.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

emfSuppressVonn - EMF Suppress VoNR

Syntax

--emfSuppressVonn <list-item>

Description

Controls whether the AMF suppresses EMF when the UE supports VoNR. When set to true, and the EMC suppression (EMC Suppress No VoNR) is set to true for the UE (on the AMF Voice Profile on 5G UE PLMN Services), and the UE radio capabilities indicate that the UE supports VoNR, the AMF suppresses EMF support i.e. indicates 'Emergency services fallback not supported' on 5GS Network Feature Support IE on NAS Registration Accept for the UE. When set to false, or EMC suppression (EMC Suppress No VoNR) is set to false for the UE (on the AMF Voice Profile on 5G UE PLMN Services), or the UE does not support VoNR according to the UE radio capabilities, the AMF sets the EMF according to other EMF settings. The other settings for the EMF include -Emergency Fallback inside the AMF Emergency Profile from the AMF PLMN -Emergency Fallback under the AMF Tracking Area -EMF Support inside the AMF Voice Profile from the 5G UE PLMN Services

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

imsVopsNonVonrUeVonrTa - IMS Voice Over PS Non-VoNR UE on VoNR TA

Syntax

--imsVopsNonVonrUeVonrTa <list-item>

Description

Defines whether to set IMS voice over PS as not supported for UEs not supporting VoNR according to UE radio capabilities when camping on a VoNR only TA.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

imsVopsS1Disabled - IMS VoPS S1 Disabled

Syntax

--imsVopsS1Disabled <list-item>

Description

Enables AMF to adjust the IMS voice over PS sessions support when the UE disabled S1 mode. When IMS voice over PS is enabled by both VoNR and EPS FB for the UE and on the TA, but the UE has disabled the S1 mode support, the AMF checks the UE VoNR support from the UE radio capabilities. If the UE does not support VoNR (or the UE VoNR support is unknown), the AMF indicates IMS VoPS not supported for the UE.

Class

Optional.

List

- false - Boolean value of false.

- true - Boolean value of true.

Default

false

Name

rejectionCause - Rejection Cause

Syntax

--rejectionCause <integer>

Description

Indicates the 5GMM cause used on Registration Reject.

Class

Optional.

Type / Range

5GMM Cause Code.

Default

15

Name

rejectNoVoice - Reject No Voice

Syntax

--rejectNoVoice <list-item>

Description

Enables the functionality to reject 5GS Registration for any UE indicating 'voice centric' UE's Usage setting and not getting voice service ('IMS voice over PS session supported over 3GPP access') on the current Tracking Area.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

rejectOnVoNrTa - Reject On VoNR Tracking Area

Syntax

--rejectOnVoNrTa <list-item>

Description

Enables the functionality to investigate UE Radio Capability IE from NGAP UE Radio Capability Info Indication message in order to find out the UE support for VoNR. Further, when -this control parameter is set to 'true', -the UE does not support VoNR according to UE radio capabilities, -the current TA is VoNR only TA, -the UE indicates 'voice centric' in UE's usage setting, the AMF rejects 5GS Registration for such UE. The AMF uses provisioned 5GMM cause on the rejection.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

4.6 cmm apnAdministration

APN Administration. Syntax, description, parameters, and roles for cmm apnAdministration command.

Syntax**Description**

APN Administration. Parameters to administer the PDNs towards the APN(s) defined per serving PLMN. Maximum 10 PLMNs can simultaneously have APN administration list provisioned. Parameter backOffTimerMin value must be specified smaller than parameter backOffTimerMax value. Parameter t3396Min value must be specified smaller than parameter t3396Max value. When the functionality is

currently not active (APN Administration Statistics Actual Running Level indicates Not Running, Stopped During Deactivation, Stopped During Rejection, Timed Out During Deactivation, Timed Out During Rejection or the initial state when APN Administration Statistics is not present), the Action Level is not allowed to be set to Not Running. When the functionality is currently active (APN Administration Statistics Actual Running Level indicates Deactivating and Rejecting, Deactivation Aborted Rejecting Continues, Deactivation Successful Rejecting or Rejecting), the operation must first be stopped (i.e. set to Not Running) before changing to same or different action level.

Parameters

Name

actionLevel - Action Level

Syntax

```
--actionLevel <list-item>
```

Description

The action level the MME is operating on. The process to reject and/or deactivate the PDNs is started and stopped by operating this parameter.

Class

Required key.

List

- deactivatingRejecting - Deactivating and Rejecting - MME both rejects incoming PDN connectivity requests and also deactivates previously existing PDN connections towards the defined APN(s).
- notRunning - Not Running - APN administration process is currently not running.
- rejecting - MME rejects incoming PDN connectivity requests towards the defined APN(s).

Default

notRunning

Name

backOffTimerMax - Back-off Timer Max Value

Syntax

```
--backOffTimerMax <integer>
```

Description

Defines the maximum of the back-off timer value in seconds. The back-off timer is used on PDN Connectivity Reject messages. The MME generates the back-off timer value for each UE based on the provisioned minimum and maximum values.

Class

Optional.

Type / Range

Integer in the range of 1 to 600 in units of Second

Default

60

Name

backOffTimerMin - Back-Off Timer Min Value

Syntax

--backOffTimerMin <integer>

Description

Defines the minimum of the back-off timer value in seconds. The back-off timer is used on PDN Connectivity Reject messages. The MME generates the back-off timer value for each UE based on the provisioned minimum and maximum values.

Class

Optional.

Type / Range

Integer in the range of 0 to 599 in units of Second

Default

15

Name

deactivationCause - Deactivation Cause

Syntax

--deactivationCause <integer>

Description

ESM cause sent on Deactivate EPS Bearer Context Request, when the MME deactivates a previously existing default bearer towards the defined APN due to APN administration functionality.

Class

Optional.

Type / Range

Integer in the range of 8, 26-39, 41-47, 49-60, 65-66, 81, 95-101, 111-113

Default

26

Name

deactivationRate - Deactivation Rate

Syntax

--deactivationRate <integer>

Description

Defines the rate (in UEs/second) the MME performs the PDN deactivations/detaches when the MME is provisioned to deactivate previously existing PDN connections towards the defined APN(s). Must be a multiple of 10.

Class

Optional.

Type / Range

Integer in the range of 10 to 100

Default

100

Name

includeBackOffTimer - Include Back-Off Timer

Syntax

--includeBackOffTimer <list-item>

Description

Defines whether back-off timer is included when PDN rejection or deactivation happens due to APN administration. When set to true, the back-off timer IE is included in PDN Connectivity Reject messages (when configured ESM cause code is NOT one of the following: 50 'PDN type IPv4 only allowed', 51 'PDN type IPv6 only allowed', 54 'PDN connection does not exist', 57 'PDN type IPv4v6 only allowed', 58 'PDN type non IP only allowed', 65 'maximum number of EPS bearers reached'). When set to false, the back-off timer is not included in the above cases.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

includeT3396 - Include T3396

Syntax

--includeT3396 <list-item>

Description

Defines whether T3396 is included when PDN deactivation happens due to APN administration. When set to true, the T3396 IE is included in Deactivate EPS Bearer Context Request messages (when configured ESM cause code is 26 'insufficient resources'). When set to false, the T3396 is not included in the above case.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

maxDuration - Max Duration

Syntax

--maxDuration <integer>

Description

Defines the maximum time of the APN disabling state in seconds.

Class

Optional.

Type / Range

Integer in the range of 900 to 54,000 in units of Second

Default

5400

Name

pdnConnectivityRejectCause - PDN Connectivity Reject Cause

Syntax

--pdnConnectivityRejectCause <integer>

Description

ESM cause sent on PDN Connectivity Reject, when the MME rejects the PDN establishment during an Attach or standalone PDN connectivity request procedure due to APN administration functionality.

Class

Optional.

Type / Range

Integer in the range of 8, 26-39, 41-47, 49-60, 65-66, 81, 95-101, 111-113

Default

26

Name

t3396Max - T3396 Max Value

Syntax

--t3396Max <integer>

Description

Defines the maximum of the timer T3396 value in seconds. The timer T3396 is used on Deactivate EPS Bearer Context Request messages. The MME generates the timer T3396 value for each UE based on the provisioned minimum and maximum values.

Class

Optional.

Type / Range

Integer in the range of 1 to 600 in units of Second

Default

60

Name

t3396Min - T3396 Min Value

Syntax

--t3396Min <integer>

Description

Defines the minimum of the timer T3396 value in seconds. The timer T3396 is used on Deactivate EPS Bearer Context Request messages. The MME generates the timer T3396 value for each UE based on the provisioned minimum and maximum values.

Class

Optional.

Type / Range

Integer in the range of 0 to 599 in units of Second

Default

15

Roles**Modify**

sysadmin, manage

4.7 cmm apnAdministrationStats

APN Administration Statistics. Syntax, description, parameters, and roles for cmm apnAdministrationStats command.

Syntax

Description

Statistics of the APN Administration process.

Parameters

Name

startDateTime - Start Date and Time

Syntax

--startDateTime <string>

Description

Records the date and time at which the command was entered.

Class

Required key.

Type / Range

Date and Time Digit string of length 0 to 20 with the allowed pattern of '20[0-9][0-9]/[0-1][0-9]/[0-3][0-9] [0-2][0-9]:[0-5][0-9]:[0-5][0-9]'

Name

actualRunningLevel - Actual Running Level

Syntax

--actualRunningLevel <list-item>

Description

The action level the MME is/was last operating on.

Class

Read only.

List

- deactivatingRejecting - Deactivating and Rejecting - MME both deactivates previously existing PDN connections and rejects incoming PDN connectivity requests towards the defined APN(s).
- deactivationAbortedRejectingContinues - Deactivation Aborted Rejecting Continues - The APN administration deactivation process was aborted due to e.g. other scanning loop started during the deactivation process. MME action level is downgraded to incoming PDN connectivity request rejection.
- deactivationSuccessfulRejecting - Deactivation Successful Rejecting - Deactivation process was successfully finished for all impacted UEs. MME action level is downgraded to incoming PDN connectivity request rejection.
- notRunning - Not Running - APN administration is currently not running.
- rejecting - MME rejects incoming PDN connectivity requests.

- stoppedDuringDeactivation - Stopped During Deactivation - MME APN administration process was stopped during PDN deactivation process.
- stoppedDuringRejection - Stopped During Rejection - MME APN administration process was stopped during PDN rejection.
- timedOutDuringDeactivation - Timed Out During Deactivation - MME timed out (max duration reached) during deactivation process before handling all impacted UEs.
- timedOutDuringRejection - Timed Out During Rejection - MME timed out (max duration reached) during PDN connectivity rejection.

Name

backOffTimerMax - Back-off Timer Max Value

Syntax

--backOffTimerMax <integer>

Description

Defines the maximum of the back-off timer value in seconds. The back-off timer is used on PDN Connectivity Reject messages. The MME generates the back-off timer value for each UE based on the provisioned minimum and maximum values.

Class

Read only.

Type / Range

Integer in the range of 1 to 600

Name

backOffTimerMin - Back-Off Timer Min Value

Syntax

--backOffTimerMin <integer>

Description

Defines the minimum of the back-off timer value in seconds. The back-off timer is used on PDN Connectivity Reject messages. The MME generates the back-off timer value for each UE based on the provisioned minimum and maximum values.

Class

Read only.

Type / Range

Integer in the range of 0 to 599

Name

deactivationCause - Deactivation Cause

Syntax

--deactivationCause <integer>

Description

ESM cause sent on Deactivate EPS Bearer Context Request, when the MME deactivates a previously existing default bearer towards the defined APN due to APN administration functionality.

Class

Read only.

Type / Range

Integer in the range of 8, 26-39, 41-47, 49-60, 65-66, 81, 95-101, 111-113

Name

deactivationRate - Deactivation Rate

Syntax

--deactivationRate <integer>

Description

Defines the rate (in UEs/second) the MME performs the PDN deactivations/detaches when the MME is provisioned to deactivate previously existing PDN connections towards the defined APN(s).

Class

Read only.

Type / Range

Integer in the range of 10 to 100

Name

includeBackOffTimer - Include Back-Off Timer

Syntax

--includeBackOffTimer <list-item>

Description

Defines whether back-off timer is included when PDN rejection happens due to APN administration. When set to true, the back-off timer IE is included in PDN Connectivity Reject messages (when configured ESM cause code is NOT one of the following: 50 'PDN type IPv4 only allowed', 51 'PDN type IPv6 only allowed', 54 'PDN connection does not exist', 57 'PDN type IPv4v6 only allowed', 58 'PDN type non IP only allowed', 65 'maximum number of EPS bearers reached'). When set to false, the back-off timer is not included in the above cases.

Class

Read only.

List

- false - Boolean value of false.
- true - Boolean value of true.

Name

includeT3396 - Include T3396

Syntax

--includeT3396 <list-item>

Description

Defines whether T3396 is included when PDN deactivation happens due to APN administration. When set to true, the T3396 IE is included in Deactivate EPS Bearer Context Request messages (when configured ESM cause code is 26 'insufficient resources'). When set to false, the T3396 is not included in the above case.

Class

Read only.

List

- false - Boolean value of false.
- true - Boolean value of true.

Name

maxDuration - Max Duration

Syntax

--maxDuration <integer>

Description

Defines the maximum time of the APN disabling state in seconds.

Class

Read only.

Type / Range

Integer in the range of 900 to 54,000 in units of Second

Name

pdnConnectivityRejectCause - PDN Connectivity Reject Cause

Syntax

--pdnConnectivityRejectCause <integer>

Description

ESM cause sent on PDN Connectivity Reject, when the MME rejects the PDN establishment during an Attach or standalone PDN connectivity request procedure due to APN administration functionality.

Class

Read only.

Type / Range

Integer in the range of 8, 26-39, 41-47, 49-60, 65-66, 81, 95-101, 111-113

Name

requestedActionLevel - Requested Action Level

Syntax

--requestedActionLevel <list-item>

Description

The action level the MME is/was requested to operate on.

Class

Read only.

List

- deactivatingRejecting - Deactivating and Rejecting - MME both rejects incoming PDN connectivity requests and also deactivates previously existing PDN connections towards the defined APN(s).
- notRunning - Not Running - APN administration process is currently not running.
- rejecting - MME rejects incoming PDN connectivity requests towards the defined APN(s).

Name

t3396Max - T3396 Max Value

Syntax

--t3396Max <integer>

Description

Defines the maximum of the timer T3396 value in seconds. The timer T3396 is used on Deactivate EPS Bearer Context Request messages. The MME generates the timer T3396 value for each UE based on the provisioned minimum and maximum values.

Class

Read only.

Type / Range

Integer in the range of 1 to 600

Name

t3396Min - T3396 Min Value

Syntax

--t3396Min <integer>

Description

Defines the minimum of the timer T3396 value in seconds. The timer T3396 is used on Deactivate EPS Bearer Context Request messages. The MME generates the timer T3396 value for each UE based on the provisioned minimum and maximum values.

Class

Read only.

Type / Range

Integer in the range of 0 to 599 in units of Second

Roles

List

sysadmin, manage, monitor

4.8 cmm apnAdminList

APN Administration List. Syntax, description, parameters, and roles for cmm apnAdminList command.

Syntax

Description

APN (Access Point Name) Network Identifier (NI) list for administrative actions. Max 10 APN NIs may be included on a list. Max 10 APN NI lists may be defined.

Parameters

Name

name - APN Administration List

Syntax

--name <string>

Description

The name of the APN Administration List.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Roles

Create

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

sysadmin, manage, monitor

4.9 cmm apnAdminListNi

APN Administration List Network Identifier. Syntax, description, parameters, and roles for cmm apnAdminListNi command.

Syntax

Description

Administer the APN Network Identifiers in the APN Administration list.

Parameters

Name

apnAdminListName - APN Administration List

Syntax

--apnAdminListName <string>

Description

The name of the APN Administration List.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

apnNi - APN Network Identifier

Syntax

--apnNi <string>

Description

The Network Identifier (NI) of the Access Point Name (APN). Note: 'sos' APN is not allowed to be provisioned to ensure emergency service is not impacted.

Class

Required key.

Type / Range

Digit string of length 1 to 62 with the allowed pattern of [0-9a-zA-Z\._]*

Roles

Create

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

sysadmin, manage, monitor

4.10 cmm apnConversion

apnConversion. Syntax, description, parameters, and roles for cmm apnConversion command.

Syntax

Description

Configure, list and show APN conversion.

Parameters

Name

apnConversionId - ApnConversionId

Syntax

--apnConversionId <integer>

Description

Primary key of APN_CONVERSION table, numeric id for the table.

Class

Required key.

Type / Range

Integer in the range of 0 to 255

Name

plmnParamId - PLMN parameter set name

Syntax

--plmnParamId <string>

Description

PLMN parameter set name where this APN conversion belongs to. (corresponds to plmnparamid of plmnparam table. you must create that plmnparam first).

Class

Required key.

Type / Range

Digit string of length 1 to 15 with the allowed pattern of [0-9a-zA-Z\._:]*

Name

convertedApnIndex - Converted APN index

Syntax

--convertedApnIndex <integer>

Description

This parameter defines the index for APN name used as converted APN in APN conversion.

Class

Required on create.

Type / Range

Integer in the range of 0 to 1022

Name

requestedApnIndex - Requested APN index

Syntax

--requestedApnIndex <integer>

Description

This parameter defines the index for APN name used as requested APN in APN conversion.

Class

Required on create.

Type / Range

Integer in the range of 0 to 1022

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Modify

sysadmin, manage

Delete

sysadmin, manage

List

sysadmin, manage, monitor

4.11 cmm apnConversionList

APN Conversion List. Syntax, description, parameters, and roles for **cmm apnConversionList** command.

Syntax

Description

Administer APN Conversion List

Parameters

Name

name - APN Conversion List Name

Syntax

--name <string>

Description

APN conversion list name

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Roles

Create

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

sysadmin, manage, monitor

4.12 cmm apnConversionListNi

APN Conversion List NI. Syntax, description, parameters, and roles for **cmm apnConversionListNi** command.

Syntax

Description

Administer APN Conversion List NI.

Parameters

Name

apnConversionListName - APN Conversion List Name

Syntax

--apnConversionListName <string>

Description

APN Conversion List Name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

apnNi - APN Network Indicator

Syntax

--apnNi <string>

Description

APN NI for Conversion List

Class

Required key.

Type / Range

Digit string of length 1 to 62 with the allowed pattern of [0-9a-zA-Z\._]*

Roles

Create

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

sysadmin, manage, monitor

4.13 cmm apnImsiRangeServices

APN IMSI Range Services. Syntax, description, parameters, and roles for `cmm apnImsiRangeServices` command.

Syntax

Description

This command is used to administer APN IMSI Range Services. The 'shutdown' parameter is used to admin lock the APN Replace list for an IMSI range.

Parameters

Name

uePlmnServicesName - Roaming network name

Syntax

--uePlmnServicesName <string>

Description

Name that identifies the assigned network.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

entryId - Entry ID

Syntax

--entryId <integer>

Description

Entry ID.

Class

Required key.

Type / Range

Integer in the range of 1 to 10,000

Name

allowAutonomousLbo - Allow autonomous LBO

Syntax

--allowAutonomousLbo <list-item>

Description

Allows MME to support local breakout for a roamer PDN connection irrespective of setting of VPLMN dynamic address allowed AVP in UE subscription data.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

apnConversionListName - APN Conversion List Name

Syntax

--apnConversionListName <string>

Description

Used to assign a converted APN list to an IMSI range. APN Conversion List Name shall be used only when gParms aliasApnConversionPerImsi is enabled. Either apnReplaceListName or apnConversionListName must be set when shutdown is false. Both cannot be set at the same time.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

"

Name

apnReplaceListName - APN replace list name

Syntax

--apnReplaceListName <string>

Description

It is used to assign a replacement APN list to an IMSI range.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

apn-all

Name

description - IMSIRange entry description

Syntax

--description <string>

Description

Description for IMSI range services entry.

Class

Optional.

Type / Range

Digit string of length 0 to 160 with the allowed pattern of [0-9a-zA-Z\.\- _:@]*

Default

"

Name

maxImei - Maximum IMEISV

Syntax

--maxImei <string>

Description

The maximum masked IMEISV in range.

Class

Optional.

Type / Range

Digit string of length 15 to 16 with the allowed pattern of [0-9*]*

Default

Name

maxMsin - Maximum MSIN

Syntax

--maxMsin <digits>

Description

The maximum IMSI MSIN value.

Class

Optional.

Type / Range

Digit string of length 0 or 8 to 10

Default

9999999999

Name

minImei - Minimum IMEISV

Syntax

--minImei <string>

Description

The minimum masked IMEISV in range.

Class

Optional.

Type / Range

Digit string of length 15 to 16 with the allowed pattern of [0-9\]*

Default

Name

minMsin - Minimum MSIN

Syntax

--minMsin <digits>

Description

The minimum IMSI MSIN value.

Class

Optional.

Type / Range

Digit string of length 0 or 8 to 10

Default

000000000

Name

pdpTypeMappingOverride - PDP Type Mapping Override

Syntax

--pdpTypeMappingOverride <list-item>

Description

Parameter controls PDP Type Mapping which when set to Unsubscribed APN will cause MME to map a UE request PDP type of IPV4 to IPV6 if HSS subscription is IPV6, and to map UE requested PDP type of IPV6 to IPV4 if HSS Subscription is IPV4 when UE requests an APN that is not subscribed in the HSS or the UE did not provide a valid APN. PDN Type Mapping refers

to the UE requested PDN Type IE as per TS 3GPP 23.401 and the PDN Type AVP as per TS 3GPP 29.272. Default value shall be set to never, in which case MME will follow standards-based PDP Type conversion rules.

Class

Optional.

List

- never - Never
- unsubscribedApn - Unsubscribed APN

Default

never

Name

replacementAction - Replacement Action

Syntax

--replacementAction <list-item>

Description

Replacement Action field in the existing IMSI/IMEI table controls APN Override with the following values: - UseDefault: Means use the default APN in the HSS if it exists as correction APN (if the default APN does not exist, reject the attach or PDN connection). Any provisioned APN in the IMSI/IMEI table is ignored. - Reject: Means reject the attach/PDN connection regardless of any provisioned APN in the IMSI/IMEI table - UseMap: Use the APN in the IMSI/IMEI map.

Class

Optional.

List

- Reject - Reject means reject the attach/PDN connection regardless of any provisioned APN in the IMSI/IMEI table
- UseDefault - Use Default - UseDefault means use the default APN in the HSS if it exists as correction APN. Any provisioned APN in the IMSI/IMEI table is ignored.
- UseMap - Use Map - Use the APN in the IMSI/IMEI map.

Default

UseMap

Name

shutdown - Shutdown

Syntax

--shutdown <list-item>

Description

It is used to admin lock the APN replace list for an IMSI range.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

ueRequestedApnNi - UE requested APN NI

Syntax

--ueRequestedApnNi <string>

Description

It is used to assign a UE requested APN NI. apn-all is a special case value that will match any non-empty APN of 1 to 63 octets in length. apn-none is a special case value that will match a requested APN that is too long (more than 63 octets), or when no APN is requested. apn-all and apn-none have special meaning only when the APN Conversion Enhanced Map Treatment global parameter is enabled, else they are treated as a literal APN name for matching.

Class

Optional.

Type / Range

Digit string of length 1 to 62 with the allowed pattern of [0-9a-zA-Z\.\-]*

Default

all

Name

useMapTreatmentForSubscribedApn - Use Map Treatment For Subscribed APN

Syntax

--useMapTreatmentForSubscribedApn <list-item>

Description

Map Treatment shall be applied for Subscribed APNs with values: - Always Convert: the converted APN is used and the procedure will continue. - No Convert And Continue: no conversion is done and the procedure will continue with the requested APN

Class

Optional.

List

- alwaysConvert - Always Convert

- noConvertAndContinue - No Convert And Continue

Default

alwaysConvert

Name

useMapTreatmentForUnsubscribedApn - Use Map Treatment For Unsubscribed APN

Syntax

--useMapTreatmentForUnsubscribedApn <list-item>

Description

Map Treatment shall be applied for Unsubscribed APNs with values: - Apply Subscribed Default Then Convert (default): apply the treatment from feature f10107-12 - MME support for Custom Specific APN Correction - No Convert And Continue: no conversion is done and the procedure will continue with the requested APN - No Convert And Reject: no conversion is done and the procedure is rejected - Convert If Local Subscribed Else Reject: the APN in the APN Conversion List is used if the UE has a subscription. Otherwise the procedure is rejected. - Convert If Local Subscribed Else Lowest Context Id: the APN in the APN Conversion List is used if the UE has a subscription. Otherwise the APN with the lowest context Id in the HSS will be used and the procedure will continue. - No Convert and Use Lowest Context Id: no conversion is done and the lowest context Id in the HSS will be used and the procedure will continue. If APN Conversion List Name is not set, then it is considered no match with subscription and the subsequent treatment applies (Use Lowest Subscription ID or Reject, depending on setting).

Class

Optional.

List

- applySubscribedDefaultThenConvert - Apply Subscribed Default Then Convert
- convertIfLocalSubscribedElseLowestContextId - Convert If Local Subscribed Else Lowest Context Id
- convertIfLocalSubscribedElseReject - Convert If Local Subscribed Else Reject
- noConvertAndContinue - No Convert and Continue
- noConvertAndReject - No Convert and Reject
- noConvertAndUseLowestContextId - No Convert and Use Lowest Context Id

Default

applySubscribedDefaultThenConvert

4.14 cmm apnList

apnLists. Syntax, description, parameters, and roles for cmm apnList command.

Syntax

Description

Configure, list and show APN lists.

Parameters

Name

apnConversion - APN conversion list

Syntax

--apnConversion <list-item>

Description

APN conversion list.

Class

Optional, not filterable on list.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

ccPgw - Charging Characteristics for PGW selection

Syntax

--ccPgw <list-item>

Description

Defines whether Charging characteristics are appended to the APN FQDN during rel-8 DNS query for P-GW selection. When value is false (default) charging characteristics are not appended. When value is true charging characteristics are appended.

Class

Optional, not filterable on list.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

homeGgsn - Intelligent GGSN selection

Syntax

--homeGgsn <list-item>

Description

Intelligent GGSN selection (HGGSN).

Class

Optional, not filterable on list.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

hpGwCc - home PGW selection based on CC

Syntax

--hpGwCc <list-item>

Description

home PGW selection based on CC

Class

Optional, not filterable on list.

List

- false - Boolean value of false.

- true - Boolean value of true.

Default

false

Name

locationGw - Location Based PGW/GGSN Selection

Syntax

--locationGw <list-item>

Description

Location Based PGW/GGSN selection

Class

Optional, not filterable on list.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

msisdnPgw - MSISDN based PGW selection

Syntax

--msisdnPgw <list-item>

Description

MSISDN based PGW selection.

Class

Optional, not filterable on list.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

oneGtpTunnel - Direct Tunnel

Syntax

--oneGtpTunnel <list-item>

Description

Direct tunnel (DT).

Class

Optional, not filterable on list.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

pgw - APN based P-GW selection

Syntax

--pgw <list-item>

Description

APN based P-GW selection (P-GW).

Class

Optional, not filterable on list.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

id - Apn for the special handling

Syntax

<string>

Description

This parameter defines the external network to which the SGSN or MME is connected. In the GPRS backbone, the APN is a reference to the gateway GPRS support node (GGSN) to be used. The APN string is a set of labels separated by dots, for example, WWW.COMPANY.COM. The length of the identifier ranges from 2 to 100 alphanumeric and special characters. For the APN Conversion List the maximum length of the network identifier is 63 characters

Class

Required value.

Type / Range

Digit string of length 2 to 100 with the allowed pattern of [0-9a-zA-Z\.\-]*

4.15 cmm apnPagingTypeMapping

APN Paging Policy. Syntax, description, parameters, and roles for cmm apnPagingTypeMapping command.

Syntax

Description

This command is used to administer a APN based Paging Policy and includes parameters for defining the number of paging attempts, paging method, paging type, and paging response timer. Note, Coverage Enhancement paging and eDRX paging types would have higher precedence than APN paging.

Parameters

Name

plmnName - Serving PLMN Name

Syntax

--plmnName <string>

Description

The serving PLMN name may be the name of the MME home PLMN or shared PLMN.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

apnNi - APN network identifier

Syntax

--apnNi <string>

Description

APN network identifier

Class

Required key.

Type / Range

Digit string of length 1 to 62 with the allowed pattern of [0-9a-zA-Z\.\-]*

Name

apnPagingType - APN Paging Type

Syntax

--apnPagingType <list-item>

Description

Names the APN-related MME paging type for this mapping record.

Class

Required on create.

List

- APN1 - Paging Type for APN1
- APN10 - Paging Type for APN10
- APN2 - Paging Type for APN2
- APN3 - Paging type for APN3
- APN4 - Paging Type for APN4
- APN5 - Paging Type for APN5
- APN6 - Paging Type for APN6
- APN7 - Paging Type for APN7
- APN8 - Paging type for APN8
- APN9 - Paging Type for APN9

4.16 cmm apnPgwSelection

APN PGW selection. Syntax, description, parameters, and roles for `cmm apnPgwSelection` command.

Syntax

Description

APNs for PGW selection.

Parameters

Name

apnPgwSelectionListName - APN PGW selection list name

Syntax

--apnPgwSelectionListName <string>

Description

APN PGW selection list name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of `[0-9a-zA-Z\.\_:@]*`

Name

apnNi - APN network identifier

Syntax

--apnNi <string>

Description

APN network identifier.

Class

Required key.

Type / Range

Digit string of length 1 to 62 with the allowed pattern of `[0-9a-zA-Z\.\_]*`

4.17 cmm apnPgwSelectionList

APN PGW selection list. Syntax, description, parameters, and roles for `cmm apnPgwSelectionList` command.

Syntax

Description

List of APNs for PGW selections.

Parameters

Name

apnPgwSelectionListName - APN PGW selection list name

Syntax

--apnPgwSelectionListName <string>

Description

APN PGW selection list name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of `[0-9a-zA-Z\.\-_:@]*`

Roles

4.18 cmm apnPriority

APN Priority. Syntax, description, parameters, and roles for **cmm apnPriority** command.

Syntax

Description

This command is used to add an APN to the list of APNs whose PDN connections will be recovered for SGW enhanced recovery and/or PGW restart.

Parameters

Name

apnPriorityListName - APN priority list name

Syntax

--apnPriorityListName <string>

Description

APN priority list name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

apnPriorityNi - APN NI

Syntax

--apnPriorityNi <string>

Description

APN NI.

Class

Required key.

Type / Range

Digit string of length 1 to 62 with the allowed pattern of [0-9a-zA-Z\._]*

Name

apnPriorityValue - APN priority value

Syntax

--apnPriorityValue <integer>

Description

APN priority value (1 is the highest value).

Class

Optional.

Type / Range

Integer in the range of 1 to 8

Default

8

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

4.19 cmm apnPriorityList

APN Priority List. Syntax, description, parameters, and roles for **cmm apnPriorityList** command.

Syntax**Description**

This command defines an APN priority list for prioritizing UE recovery upon SGW failure/restart or UE recovery of PDN connections upon restart of a PGW based on the UE PDN connection to the APN in the list at the time of the failure. An APN priority list can only be deleted if it is not assigned to a network. The maximum number of APNs allowed is 8.

Parameters

Name

name - APN priority list name

Syntax

--name <string>

Description

APN priority list name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Roles

Create

sysadmin, manage

Show

4.20 cmm apnQciPpiMap

APN QciPpiMap. Syntax, description, parameters, and roles for **cmm apnQciPpiMap** command.

Syntax

Description

This command is used to define an APN-NI and includes parameters for defining Paging Policy Indication (PPI) and QoS Class Identifier (QCI) values.

Parameters

Name

apnQciPpiMapListName - APN QCI PPI mapping name

Syntax

```
--apnQciPpiMapListName <string>
```

Description

APN QCI PPI mapping name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

apnNi - Access point name - network indicator

Syntax

```
--apnNi <string>
```

Description

APN NI for this roaming QoS profile.

Class

Required key.

Type / Range

Digit string of length 1 to 62 with the allowed pattern of [0-9a-zA-Z\._]*

Name

qci - QoS class identifier

Syntax

```
--qci <integer>
```

Description

QoS class identifier number.

Class

Required key.

Type / Range

Integer in the range of 1-9,65-67,69-70

Default

5

Name

ppi - Paging policy indication

Syntax

```
--ppi <integer>
```

Description

Paging policy indication value.

Class

Required key.

Type / Range

Integer in the range of 0 to 63

Default

0

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

4.21 cmm apnQciPpiMapList

APN QCI PPI Mapping List. Syntax, description, parameters, and roles for `cmm apnQciPpiMapList` command.

Syntax**Description**

This command creates an APN to QCI to PPI mapping profile for use when MME determines whether to use Priority Paging Indicator value in DDN to initiate differentiated paging. For the selected HPLMN, the combination of APN/QCI/PPI defined by this command's mapping will be compared to the: - PPI value received in the DDN Paging Service Information IE - APN and QCI in the UE Context Database mapped to the EBI (EPS Bearer Identity) in the DDN Paging Service Information IE. If the values in/derived from the DDN Paging Service Information IE do not match the values provisioned in the APN QCI PPI mapping profile, differentiated paging service will not be provided for the DDN. The maximum number of APN mapping profiles supported is 8. The maximum number of combinations of QCI/PPI per APN is limited to 3.

Parameters**Name**

name - APN QCI PPI mapping name

Syntax

--name <string>

Description

APN QCI PPI mapping name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

4.22 cmm apnReplaceList

APN Replace List. Syntax, description, parameters, and roles for cmm apnReplaceList command.

Syntax**Description**

Administer APN Replace List.

Parameters**Name**

apnReplaceListName - APN replace list name

Syntax

--apnReplaceListName <string>

Description

APN replace list name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Roles

Create

sysadmin, manage

4.23 cmm apnReplaceListNi

APN Replace List NI. Syntax, description, parameters, and roles for cmm apnReplaceListNi command.

Syntax

Description

Administer APN Replace List NI.

Parameters

Name

apnReplaceListName - APN replace list name

Syntax

--apnReplaceListName <string>

Description

APN replace list name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

apnNi - Access point name - network indicator

Syntax

--apnNi <string>

Description

APN NI for replace list.

Class

Required key.

Type / Range

Digit string of length 1 to 62 with the allowed pattern of [0-9a-zA-Z\.\-]*

4.24 cmm apnWhiteList

APN White List. Syntax, description, parameters, and roles for cmm apnWhiteList command.

Syntax**Description**

This command is used to create an APN White List.

Parameters**Name**

name - APN white list name

Syntax

--name <string>

Description

APN white list name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Roles

Create

sysadmin, manage

4.25 cmm apnWhiteListNi

APN White List NI. Syntax, description, parameters, and roles for `cmm apnWhiteListNi` command.

Syntax

Description

This command is used to administer an APN White List and includes a parameter for defining an APN-NI.

Parameters

Name

apnWhiteListName - APN white list name

Syntax

--apnWhiteListName <string>

Description

APN white list name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

apnNi - Access point name - network indicator

Syntax

--apnNi <string>

Description

APN NI for white list.

Class

Required key.

Type / Range

Digit string of length 1 to 62 with the allowed pattern of [0-9a-zA-Z\.\-]*

4.26 cmm areaList

Area List. Syntax, description, parameters, and roles for cmm areaList command.

Syntax**Description**

This command is used to administer an Area List and includes parameters for defining the serving network name and list type.

Parameters**Name**

name - Area list name

Syntax

--name <string>

Description

Name associated with this list, provided as a way to have a brief but meaningful description of the list.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

plmnName - Served mobile network name

Syntax

--plmnName <string>

Description

Name that identifies serving network.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

listType - List type

Syntax

--listType <list-item>

Description

Indicates the type of list being provisioned: TAI List, LAI List, Forbidden TAI List, LTE HO Restrict List.

Class

Required on create, not modifiable.

List

- Forbidden TAI List - Forbidden tracking area identifier list.
- Forbidden TAI Range List - Forbidden Tracking Area List specified by a range.
- LAI List - Location area identifier list.
- LTE HO Restrict List - LTE handoff restriction list.
- TAI List - Tracking area identifier list.
- TAI Range List - Tracking Area List specified by a range.
- n26lwkRestTailList - TAI List for N26 Restriction - Identifies TAI List associated with N26 Restriction.

Name

areaListId - Associated table ID

Syntax

--areaListId <integer>

Description

ID associated with this list in the table containing the TAIs or LAIs themselves.

Class

Read only.

Type / Range

Integer in the range of 1 to 5,000

4.27 cmm arpPara

ARP Parameter. Syntax, description, parameters, and roles for `cmm arpPara` command.

Syntax**Description**

ARP parameters in the R8 mapping table.

Parameters**Name**

serviceLevel - Service Level

Syntax

`--serviceLevel <list-item>`

Description

This parameter specifies the service level. A service level is determined based on the traffic class, downlink guaranteed bit rate (GBR), and traffic handling priority (THP) in the QoS profile contained in the PDP context of a UE.

Class

Required key.

List

- BACKGROUND - BACKGROUND(Background): indicates a service
- CONVERSATION - indicates a service.
- INTERACTIVETRAFFICPRI1 - INTERACTIVETRAFFICPRI1(InteractiveTrafficPri1): indicates a service level whose traffic class is interactive and whose THP is 1.
- INTERACTIVETRAFFICPRI2 - INTERACTIVETRAFFICPRI2(InteractiveTrafficPri2): indicates a service level whose traffic class is interactive and whose THP is 2.
- INTERACTIVETRAFFICPRI3 - INTERACTIVETRAFFICPRI3(InteractiveTrafficPri3): indicates a service level whose traffic class is interactive and whose THP is 3
- STREAMINGGBRLESS24KBPS - streaming and whose downlink GBR is less than 25
- STREAMINGGBRMORE25KBPS - streaming and whose downlink GBR is greater

Name

userLevel - User Level

Syntax

--userLevel <list-item>

Description

The different user priority level based on received pre-R8 ARP under subscription data: ARP 1->high level; ARP 2-> Normal level; ARP 3-low level

Class

Required key.

List

- HighLevel - High Level User with ARP 1
- LowLevel - Low Level User with ARP 3
- NormalLevel - Normal Level User with ARP 2

Name

preLevel - Pre-emption Level

Syntax

--preLevel <integer>

Description

This parameter specifies the pre-emption capability of the requested radio bearer. This capability corresponds to the Pre-emption Capability IE in the ARP attribute of the radio bearer (see 3GPP TS 25.413). The default value for PCI shall be 1 (may trigger pre-emption). If it's configured as 0, SGSN Will send it to radio as 0 (shall not trigger pre-emption).

Class

Optional.

Type / Range

Integer in the range of 0 to 1

Default

1

Name

preVulnerability - Pre-emption Vulnerability

Syntax

--preVulnerability <integer>

Description

This parameter specifies the pre-emption vulnerability of the requested radio bearer. This vulnerability corresponds to the Pre-emption Vulnerability IE in the ARP attribute of the radio bearer. For details, see 3GPP TS 25.413. The default value of PVI shall be 0 (not pre-emptable). If it's configured as 1, SGSN will send it to radio as 1 (pre-emptable)

Class

Optional.

Type / Range

Integer in the range of 0 to 1

Default

0

Name

priorityLevel - Priority Level

Syntax

--priorityLevel <integer>

Description

This parameter specifies the bearer priority used in the resource allocation by the RNC. This priority corresponds to the Priority Level IE. The values 1 to 14 are arranged in descending order of priority, with 1 indicating the highest priority and 14 indicating the lowest priority. The value 15 indicates shall not trigger pre-emption

Class

Optional.

Type / Range

Integer in the range of 1 to 15

Default

7

Name

queue - Queue

Syntax

--queue <integer>

Description

Queuing Allowed. This parameter specifies whether a radio bearer setup request can be included in the resource allocation queue. This parameter corresponds to the Queuing Allowed IE in the ARP attribute of the radio bearer. For details, see 3GPP TS 25.413. The default value shall be 1 (queuing allowed). if it's configured to 0, SGSN Will send 0 to RNC (queuing not allowed).

Class

Optional.

Type / Range

Integer in the range of 0 to 1

Default

1

4.28 cmm assignEmergencyPgw

Assign Emergency PGW. Syntax, description, parameters, and roles for `cmm assignEmergencyPgw` command.

Syntax**Description**

Allows an operator to assign a specific emergency PGW to a specific group of subscribers based on the PDN type requested by the UE in the emergency PDN connection request

Parameters**Name**

uePlmnServicesName - Name of Services based on UE Network and Served Network

Syntax

```
--uePlmnServicesName <string>
```

Description

Name that identifies roaming agreement

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

pgwTypeReceived - PGW Type Received From UE

Syntax

```
--pgwTypeReceived <list-item>
```

Description

PGW Type Received From UE

Class

Required key.

List

- IPv4 - IPv4
- IPv4IPv6 - IPv4IPv6
- IPv6 - IPv6

Name

fqdnTag - FQDN Tag

Syntax

```
--fqdnTag <string>
```

Description

Tag (String to represent a FQDN label. All the rules of FQDN label apply. Provisioning of no string is valid.)

Class

Optional.

Type / Range

Digit string of length 0 or 1 to 128

Default

""

4.29 cmm authenticate

Authenticate. Syntax, description, parameters, and roles for `cmm authenticate` command.

Syntax**Description**

This command is used for authentication. It prompts the user for a Username and Password.

Parameters

N/A

Roles

sysadmin, manage

4.30 cmm authServer

authServer. Syntax, description, parameters, and roles for `cmm authServer` command.

Syntax**Description**

external authentication server IP/identity.

Parameters**Name**

priority - Server priority

Syntax

--priority <integer>

Description

External authentication server priority.

Class

Required key.

Type / Range

Integer in the range of 1 to 3

Name

ip - IP address

Syntax

--ip <string>

Description

IP of external authentication server.

Class

Required on create.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

extLdapProfileName - External LDAP Profile Name

Syntax

--extLdapProfileName <string>

Description

External LDAP Profile Name. When type is extldap this field must be entered.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

secret - Secret

Syntax

--secret <string>

Description

Shared secret for authentication between client and external authentication server. This field must be entered when Type is RADIUS or TACACS.

Restrictions

This field must be entered when Type is RADIUS or TACACS. Check must be in the backend.
This field is optional when type is externalLdap.

Class

Optional.

Type / Range

Authentication server secret for RADIUS/TACACS+. Following characters are supported: 0-9a-zA-Z.-_ and space.

Name

timeout - IP timeout

Syntax

--timeout <integer>

Description

External authentication server timeout.

Class

Optional.

Type / Range

Integer in the range of 1 to 10

Default

3

Name

type - Type of external AAA server

Syntax

--type <list-item>

Description

Type of external AAA server

Class

Not modifiable.

List

- RADIUS - RADIUS authentication server
- TACACS - TACACS+ - TACACS+ authentication server
- externalLdap - External LDAP

Default

RADIUS

4.31 cmm cacheAgeOut

Cache Ageout Quiet Timer configuration. Syntax, description, parameters, and roles for cmm cacheAgeOut command.

Syntax

Description

This command is used to administer the Quiet Timer configurations per UE class. The Quiet Timer defines the time of inactivity for a UE of a given time to be eligible for eviction from the CPPS cache.

Parameters

Name

iotQuietTimer - IoT UE Quiet Timer

Syntax

--iotQuietTimer <integer>

Description

This parameter defines the value of the Quiet Timer for IoT UEs. An IoT UE are identified as those 4G UEs that: a) Use NBIoT RAT, b) use S11U, c) use T6a, d) are registered without PDN connection, e) are catm1-cemodeb. Caching is controlled by the IoT Quiet timer. The value is by default zero. If the value is zero it means that UEs of the IoT type are not evicted from the cache. Minimum value is 1 minute , maximum value is 120 minutes.

Restrictions

If the parameter is zero then no cache evictions take place. the minimum value is 1 minute and the maximum value is 120.

Class

Optional.

Type / Range

Integer in the range of 0 to 120 in units of Minute

Default

0

Name

retainImsiGroupIdListName - Retain IMSI Group ID List Name

Syntax

--retainImsiGroupIdListName <string>

Description

List of IMSI Group IDs that are to be excluded from age-out

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

''

4.32 cmm callTraceAllowedRange

Call Trace Allowed Range. Syntax, description, parameters, and roles for cmm callTraceAllowedRange command.

Syntax**Description**

This command is used to create, delete, show and list the allowed call trace range.

Parameters

Name

name - Allowed List Name

Syntax

--name <string>

Description

Name of the allowed range list.

Class

Required key.

Type / Range

Digit string of length 1 to 32 with the allowed pattern of [0-9a-zA-Z\.\-:]*

Name

userIdentity - User identity

Syntax

--userIdentity <list-item>

Description

Call trace user identity.

Class

Required on create, not modifiable.

List

- imsi - Specify user identity by international mobile station identify.
- msisdn - Specify user identify by mobile station international subscriber directory number.

Name

maxImsi - Max Imsi

Syntax

--maxImsi <digits>

Description

Maximum IMSI for IMSI range.

Class

Optional.

Type / Range

Digit string of length 0 or 6 to 15 with the allowed pattern of [0-9]*

Default

""

Name

maxMsisdn - Max Msisdn

Syntax

--maxMsisdn <digits>

Description

Maximum MSISDN for MSISDN range.

Class

Optional.

Type / Range

Digit string of length 0 or 6 to 15 with the allowed pattern of [0-9]*

Default

""

Name

minImsi - Min Imsi

Syntax

--minImsi <digits>

Description

Minimum IMSI for IMSI range.

Class

Optional.

Type / Range

Digit string of length 0 or 6 to 15 with the allowed pattern of [0-9]*

Default

""

Name

minMsisdn - Min Msisdn

Syntax

--minMsisdn <digits>

Description

Minimum MSISDN for MSISDN range.

Class

Optional.

Type / Range

Digit string of length 0 or 6 to 15 with the allowed pattern of [0-9]*

Default

""

4.33 cmm callTraceJob

Call Trace Job. Syntax, description, parameters, and roles for `cmm callTraceJob` command.

Syntax

Description

Configuration context for specifying which UE the call-trace packets should be collected for.

Parameters

Name

userIdentity - User identity

Syntax

--userIdentity <list-item>

Description

Call trace user identity.

Class

Required key.

List

- imsi - Specify user identity by international mobile station identify.
- msisdn - Specify user identify by mobile station international subscriber directory number.

Name

digits - Digits

Syntax

--digits <digits>

Description

IMSI or MSISDN digits.

Class

Required key.

Type / Range

Digit string of length 6 to 15 with the allowed pattern of [0-9]*

Name

dns - DNS

Syntax

--dns <list-item>

Description

The call trace collection from DNS interface.

Class

Read only.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

dnssgsn - DNS for SGSN

Syntax

--dnssgsn <list-item>

Description

The call trace collection from SGSN DNS interface

Class

Read only.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

gb - Gb Interface

Syntax

--gb <list-item>

Description

The call trace collection from GB interface

Class

Read only.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

gf - Gf Interface

Syntax

--gf <list-item>

Description

The call trace collection from GF interface

Class

Read only.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

gn - Gn

Syntax

--gn <list-item>

Description

The call trace collection from Gn interface.

Class

Read only.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

gnsgsn - Gn Interface for SGSN

Syntax

--gnsgsn <list-item>

Description

The call trace collection from SGSN GN interface

Class

Read only.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

gr - Gr Interface

Syntax

--gr <list-item>

Description

The call trace collection from GR interface

Class

Read only.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

gs - Gs Interface

Syntax

--gs <list-item>

Description

The call trace collection from GS interface

Class

Read only.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

iucp - lu-C Interface

Syntax

--iucp <list-item>

Description

The call trace collection from IUCP interface

Class

Read only.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

mode - Debug mode

Syntax

--mode <list-item>

Description

Call trace debug mode. Ten IMSI/MSISDN may be under debug mode at one time.

Class

Optional.

List

- debug - Debug call trace mode.
- default - Default call trace mode.

Default

default

Name

n11 - N11 Session Management Function

Syntax

--n11 <list-item>

Description

The call trace collection from N11 interface.

Class

Read only.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

n12 - N12 Authentication Server Function

Syntax

--n12 <list-item>

Description

The call trace collection from N12 interface.

Class

Read only.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

n14 - N14 Access and MM Function

Syntax

--n14 <list-item>

Description

The call trace collection from N14 interface.

Class

Read only.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

n15 - N15 Policy Control Function

Syntax

--n15 <list-item>

Description

The call trace collection from N15 interface.

Class

Read only.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

n17 - N17 5G EIR

Syntax

--n17 <list-item>

Description

The call trace collection from N17 interface.

Class

Read only.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

n2 - N2 New Radio

Syntax

--n2 <list-item>

Description

The call trace collection from N2 interface.

Class

Read only.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

n20 - N20 SMS Function

Syntax

--n20 <list-item>

Description

The call trace collection from Nsms interface.

Class

Read only.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

n22 - N22 Network Slice Function

Syntax

--n22 <list-item>

Description

The call trace collection from N22 interface.

Class

Read only.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

n26 - N26 Mobility Management Entity

Syntax

--n26 <list-item>

Description

The call trace collection from N26 interface.

Class

Read only.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

n26mme - n26 MME

Syntax

--n26mme <list-item>

Description

N26 - Interface to AMF from MME

Class

Read only.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

n58 - N58

Syntax

--n58 <list-item>

Description

The call trace collection from N58 interface

Class

Read only.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

n8 - N8 Unified Data Management

Syntax

--n8 <list-item>

Description

The call trace collection from N8 interface.

Class

Read only.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

namfEvts - Namf Event Exposure Service

Syntax

--namfEvts <list-item>

Description

Namf Event Exposure Service

Class

Read only.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

namfServer - AMF Server

Syntax

--namfServer <list-item>

Description

The call trace collection from COMM, LOC on AMF

Class

Read only.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

nlg - NLg interface

Syntax

--nlg <list-item>

Description

The call trace collection from Nlg interface

Class

Read only.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

nls - NLS interface

Syntax

--nls <list-item>

Description

The call trace collection from NLS interface

Class

Read only.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

nnrf - Nnrf Network Resource Function

Syntax

--nnrf <list-item>

Description

The call trace collection from Nnrf interface.

Class

Read only.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

notificationService - AMF Notification Service

Syntax

--notificationService <list-item>

Description

This parameter represents the Notification Services on the AMF. Any NF that wants to notify the AMF will use one of these services.

Class

Read only.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

nr10 - NR10

Syntax

--nr10 <list-item>

Description

The call trace collection from NR10 interface

Class

Read only.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

rs10 - RS10

Syntax

--rs10 <list-item>

Description

The call trace collection from RS10 interface.

Class

Read only.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

s10 - S10

Syntax

--s10 <list-item>

Description

The call trace collection from S10 interface.

Class

Read only.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

s102 - S102

Syntax

--s102 <list-item>

Description

The call trace collection from S102 interface.

Class

Read only.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

s11 - S11

Syntax

--s11 <list-item>

Description

The call trace collection from S11 interface.

Class

Read only.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

s11u - S11U

Syntax

--s11u <list-item>

Description

The call trace collection from S11U interface.

Class

Read only.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

s13 - S13

Syntax

--s13 <list-item>

Description

The call trace collection from S13 interface.

Class

Read only.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

s13sgsn - S13 Interface for SGSN

Syntax

--s13sgsn <list-item>

Description

The call trace collection from S13sgsn interface

Class

Read only.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

s16 - S16 Interface

Syntax

--s16 <list-item>

Description

The call trace collection from S16 interface

Class

Read only.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

s1mme - S1MME

Syntax

--s1mme <list-item>

Description

The call trace collection from S1MME interface.

Class

Read only.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

s3 - S3

Syntax

--s3 <list-item>

Description

The call trace collection from S3 interface.

Class

Read only.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

s3sgsn - S3 Interface for SGSN

Syntax

--s3sgsn <list-item>

Description

The call trace collection from SGSN S3 interface

Class

Read only.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

s4 - S4 Interface

Syntax

--s4 <list-item>

Description

The call trace collection from S4 interface

Class

Read only.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

s4gn2gu - 2G Data

Syntax

--s4gn2gu <list-item>

Description

The call trace collection for 2G Data(Gn-U and S4-U)

Class

Read only.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

s4gn3gu - 3G Data

Syntax

--s4gn3gu <list-item>

Description

The call trace collection for 3G Data (Gn-U and S4-U).

Class

Read only.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

s6ad - S6ad

Syntax

--s6ad <list-item>

Description

The call trace collection from S6ad interface.

Class

Read only.

List

- false - Boolean value of false.

- true - Boolean value of true.

Default

true

Name

s6c - S6c

Syntax

--s6c <list-item>

Description

The call trace collection from S6c interface.

Class

Read only.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

s6d - S6d

Syntax

--s6d <list-item>

Description

The call trace collection from S6D interface

Class

Read only.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

sgd - SGd

Syntax

--sgd <list-item>

Description

The call trace collection from SGd interface.

Class

Read only.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

sgs - SGs

Syntax

--sgs <list-item>

Description

The call trace collection from SGs interface.

Class

Read only.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

sgslite - SGSLite

Syntax

--sgslite <list-item>

Description

The call trace collection from SGSLite interface.

Class

Read only.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

slg - Slg

Syntax

--slg <list-item>

Description

The call trace collection from Slg interface.

Class

Read only.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

sls - Sls

Syntax

--sls <list-item>

Description

The call trace collection from Sls interface.

Class

Read only.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

sv - Sv

Syntax

--sv <list-item>

Description

The call trace collection from Sv interface.

Class

Read only.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

t6a - T6A

Syntax

--t6a <list-item>

Description

The call trace collection from T6A interface.

Class

Read only.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

t6aU - T6AU

Syntax

--t6aU <list-item>

Description

The call trace collection from T6AU interface.

Class

Read only.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

traceld - Call trace job ID

Syntax

--traceId <integer>

Description

Call trace job ID.

Class

Read only.

Type / Range

Integer in the range of 1 to 65,535

Default

1

Name

traceSrc - Trace source

Syntax

--traceSrc <list-item>

Description

Call trace job source.

Class

Read only.

List

- hss - Home subscriber server - Specify trace source of home subscriber server.
- mgt - Management - Specify trace source of management.
- udm - United Data Management Server - Specify trace source of United Data Management Server

Default

mgt

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

sysadmin, manage, monitor

4.34 cmm callTraceJobStream

Streaming for call trace Job. Syntax, description, parameters, and roles for cmm callTraceJobStream command.

Syntax

Description

Associate a call trace Job with a streaming destination, i.e. define a remote call trace streaming server to receive call trace records related to a specific call trace job

Parameters

Name

traceJobId - Trace Job Identifier

Syntax

--traceJobId <integer>

Description

Trace job identifier produced by Call Trace Job command which identifies a specific call trace job.

Class

Required key.

Type / Range

Integer in the range of 1 to 65,535

Name

callTraceStreamingName - Name of the Streaming Destination

Syntax

--callTraceStreamingName <string>

Description

This is the name of the streaming destination (i.e stream profile) that will be used to associate a streaming remote endpoint to a call trace job.

Restrictions

This should be an existing streaming name defined earlier using the Call Trace Streaming command.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Roles

Create

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

sysadmin, manage, monitor

4.35 cmm callTraceSetting

Call Trace Interface Setting. Syntax, description, parameters, and roles for cmm callTraceSetting command.

Syntax

Description

Configuration Call Trace Default Interface Setting.

Parameters

Name

dns - DNS

Syntax

--dns <list-item>

Description

The call trace collection from DNS interface.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

dnssgsn - DNS Interface for SGSN

Syntax

--dnssgsn <list-item>

Description

The call trace collection from SGSN DNS interface

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

gb - Gb interface

Syntax

--gb <list-item>

Description

The Call Trace collection from Gb interface

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

gf - Gf Interface

Syntax

--gf <list-item>

Description

The call trace collection from GF interface

Class

Optional.

List

- false - Boolean value of false.

- true - Boolean value of true.

Default

true

Name

gn - Gn

Syntax

--gn <list-item>

Description

The call trace collection from Gn interface.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

gnsgsn - Gn Interface for SGSN

Syntax

--gnsgsn <list-item>

Description

The call trace collection from SGSN GN interface

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

gr - Gr Interface

Syntax

--gr <list-item>

Description

The call trace collection from GR interface

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

gs - Gs Interface

Syntax

--gs <list-item>

Description

The call trace collection from GS interface

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

iucp - lu-C interface

Syntax

--iucp <list-item>

Description

The call trace collection from IU-CP interface

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

n11 - N11 Session Management Function

Syntax

--n11 <list-item>

Description

The call trace collection from N11 interface.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

n12 - N12 Authentication Server Function

Syntax

--n12 <list-item>

Description

The call trace collection from N12 interface.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

n14 - N14 Access and MM function

Syntax

--n14 <list-item>

Description

The call trace collection from N14 interface.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

n15 - N15 Policy Control Function

Syntax

--n15 <list-item>

Description

The call trace collection from N15 interface.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

n17 - N17 5G EIR

Syntax

--n17 <list-item>

Description

The call trace collection from N17 interface.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

n2 - N2 New Radio

Syntax

--n2 <list-item>

Description

The call trace collection from N2 interface.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

n20 - N20 SMS Function

Syntax

--n20 <list-item>

Description

The call trace collection from Nsms interface.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

n22 - N22 Network Slice Selection Function

Syntax

--n22 <list-item>

Description

The call trace collection from N22 interface.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

n26 - N26 Mobility Management Function

Syntax

--n26 <list-item>

Description

The call trace collection from N26 interface.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

n26mme - n26 MME

Syntax

--n26mme <list-item>

Description

N26 - Interface to AMF from MME

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

n58 - N58 NSSAA Server Function

Syntax

--n58 <list-item>

Description

The call trace collection from N58 interface

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

n8 - N8 Unified Data Management

Syntax

--n8 <list-item>

Description

The call trace collection from N8 interface.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

namfEvts - Namf Event Exposure Service

Syntax

--namfEvts <list-item>

Description

Call Trace for Namf Event Exposure Service

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

namfServer - AMF Server

Syntax

--namfServer <list-item>

Description

The call trace collection from COMM, LOC on AMF

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

nlg - Nlg interface

Syntax

--nlg <list-item>

Description

The call trace collection from Nlg interface

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

nls - Nls interface

Syntax

--nls <list-item>

Description

The call trace collection from Nls interface

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

nnrf - Nnrf Network Resource Function

Syntax

--nnrf <list-item>

Description

The call trace collection from Nnrf interface.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

notificationService - AMF Notification Service

Syntax

--notificationService <list-item>

Description

This parameter represents the Notification Services on the AMF. Any NF that wants to notify the AMF will use one of these services.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

nr10 - NR10

Syntax

```
--nr10 <list-item>
```

Description

The call trace collection from NR10 interface

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

rs10 - RS10

Syntax

```
--rs10 <list-item>
```

Description

The call trace collection from RS10 interface.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

s10 - S10

Syntax

```
--s10 <list-item>
```

Description

The call trace collection from S10 interface.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

s102 - S102

Syntax

--s102 <list-item>

Description

The call trace collection from S102 interface.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

s11 - S11

Syntax

--s11 <list-item>

Description

The call trace collection from S11 interface.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

s11u - S11U

Syntax

--s11u <list-item>

Description

The call trace collection from S11U interface.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

s13 - S13

Syntax

--s13 <list-item>

Description

The call trace collection from S13 interface.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

s13sgsn - S13 Interface for SGSN

Syntax

--s13sgsn <list-item>

Description

The call trace collection from S13sgsn interface

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

s16 - S16 Interface

Syntax

--s16 <list-item>

Description

The call trace collection from S16 interface

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

s1mme - S1MME

Syntax

--s1mme <list-item>

Description

The call trace collection from S1MME interface.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

s3 - S3

Syntax

--s3 <list-item>

Description

The call trace collection from S3 interface.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

s3sgsn - S3 Interface for SGSN

Syntax

--s3sgsn <list-item>

Description

The call trace collection from SGSN S3 interface

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

s4 - S4 Interface

Syntax

--s4 <list-item>

Description

The call trace collection from S4 interface

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

s4gn2gu - 2G Data

Syntax

--s4gn2gu <list-item>

Description

The call trace collection for 2G Data(Gn-U and S4-U)

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

s4gn3gu - 3G Data

Syntax

--s4gn3gu <list-item>

Description

The call trace collection for 3G Data (Gn-U and S4-U).

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

s6ad - S6ad

Syntax

--s6ad <list-item>

Description

The call trace collection from S6ad interface.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

s6c - S6c

Syntax

--s6c <list-item>

Description

The call trace collection from S6c interface.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

s6d - S6d Interface

Syntax

--s6d <list-item>

Description

The call trace collection from S6D interface

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

sgd - SGd

Syntax

--sgd <list-item>

Description

The call trace collection from SGd interface.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

sgs - SGs

Syntax

--sgs <list-item>

Description

The call trace collection from SGs interface.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

sgslite - SGSLite

Syntax

--sgslite <list-item>

Description

The call trace collection from SGSLite interface.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

slg - Slg

Syntax

--slg <list-item>

Description

The call trace collection from Slg interface.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

sls - Sls

Syntax

--sls <list-item>

Description

The call trace collection from Sls interface.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

sv - Sv

Syntax

--sv <list-item>

Description

The call trace collection from Sv interface.

Class

Optional.

List

- false - Boolean value of false.

- true - Boolean value of true.

Default

true

Name

t6a - T6A

Syntax

--t6a <list-item>

Description

The call trace collection from T6A interface.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

t6aU - T6AU

Syntax

--t6aU <list-item>

Description

The call trace collection from T6AU interface.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

4.36 cmm callTraceStreaming

Call Trace streaming destination. Syntax, description, parameters, and roles for cmm callTraceStreaming command.

Syntax

Description

With this command, the Call Trace Streaming function of CMM is configured

Parameters

Name

name - Streaming Destination Name

Syntax

--name <string>

Description

This is the name of the streaming destination (i.e stream profile) that will be used to associate a streaming remote endpoint to a call trace job.

Restrictions

Only up to 5 streaming destination can be defined, so in maximum up to 5 records.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

port - Streaming Server Port

Syntax

--port <integer>

Description

Port of the streaming destination, i.e. this is the (remote) Port of the streaming server (e.g. LTMT).

Class

Required on create.

Type / Range

Integer in the range of 1,024 to 65,535

Name

streamIp - Streaming Server IP

Syntax

--streamIp <string>

Description

IP of the streaming destination, i.e. this is the (remote) IP of the streaming server (e.g. LTMT).

Class

Required on create.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

oamTlsProfileName - OAM TLS Profile

Syntax

--oamTlsProfileName <string>

Description

This parameter contains the profile for TLS. It contains the certificate names needed for establishing secure communication.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

"

Name

operationStateAct - Operation State Active

Syntax

--operationStateAct <list-item>

Description

Operation State of the particular call trace streaming destination

Class

Optional.

List

- false - Boolean value of false.

- true - Boolean value of true.

Default

false

Name

type - Trace Type

Syntax

--type <list-item>

Description

This parameter indicates the type of data in the streaming connection. For call trace the type is pcap, for Minimization of Drive Testing the type is mdt

Class

Optional.

List

- mdt - The value of mdt indicates that the data is for Minimization of Drive Testing.
- pcap - The value of pcap indicates that the data is for Call Trace.

Default

pcap

4.37 cmm causeCodeMappingSets

causeCodeSetsNew. Syntax, description, parameters, and roles for cmm causeCodeMappingSets command.

Syntax

Description

Configure, list and show cause code sets name. Each cause code set creates the respective `causeCodeMappingSetsProcs` and `causeCodeMappingSetsCauses`. The `causeCodeMappingSetsCauses` maps the internal cause codes to external ones as defined in this group. New cause code sets need to be created to be able to define the values for the mappings. Cause code mappings can be defined per NAS message (procedure).

Parameters

Name

name - name

Syntax

--name <string>

Description

Cause code set name

Class

Required key.

Type / Range

Digit string of length 1 to 8 with the allowed pattern of `[0-9a-zA-Z\.\-_:]*`

Roles

Create

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

4.38 cmm causeCodeMappingSetsCauses

causeCodeMappingSetsCauses. Syntax, description, parameters, and roles for **cmm causeCodeMappingSetsCauses** command.

Syntax

Description

Update, list and show cause code sets causes. Mapping of internal cause codes to external ones are defined in this group. New cause code sets need to be created to be able to define the values for the mappings. Cause code mappings can be defined per NAS message (procedure).

Parameters

Name

name - name

Syntax

--name <string>

Description

Cause code set name

Class

Required key.

Type / Range

Digit string of length 1 to 8 with the allowed pattern of [0-9a-zA-Z\.\-_:]*

Name

proc - proc

Syntax

--proc <list-item>

Description

The message used for the cause codes. This parameter identifies the procedure. Allowed values, attRej ... attach reject causes attAcc ... attach accept causes rauRej ... RAU reject causes rauAcc ... RAU accept causes det ... NW initiated detach causes pdpActRej ... PDP context activation reject causes pdpModRej ... PDP context modification reject causes pdpDeact ... PDP context deactivation causes servRej ... service request reject causes.

Class

Required key.

List

- attAcc - Attach accept - Attach accept causes.
- attRej - Attach reject - Attach reject causes.
- det - Detach - Network initiated detach causes.
- pdpActRej - PDP activation reject - PDP context activation reject causes.
- pdpDeact - PDP deactivation - PDP context deactivation causes.
- pdpModRej - PDP modification reject - PDP context modification reject causes.

- rauAcc - RAU accept - RAU accept causes.
- rauRej - RAU reject - RAU reject causes.
- servRej - Service request reject - Service request reject causes.

Name

intCause - internal cause

Syntax

--intCause <integer>

Description

internal cause to be mapped to an external cause

Class

Required key.

Type / Range

Integer in the range of 0 to 499

Name

extCause - external cause

Syntax

--extCause <integer>

Description

external cause mapped from an internal cause

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Roles**Show**

sysadmin, manage, monitor

Modify

sysadmin, manage

List

sysadmin, manage, monitor

4.39 cmm causeCodeMappingSetsProcs

causeCodeMappingSetsProcs. Syntax, description, parameters, and roles for cmm causeCodeMappingSetsProcs command.

Syntax

Description

List and show cause code sets procedures. Cause code mappings of internal cause codes to external ones are defined per NAS message (procedure).

Parameters

Name

name - name

Syntax

--name <string>

Description

Cause code set name

Class

Required key.

Type / Range

Digit string of length 1 to 8 with the allowed pattern of [0-9a-zA-Z\._]*

Name

proc - proc

Syntax

--proc <list-item>

Description

the message used for the cause code procedures. This parameter identifies the procedure. Allowed values, attRej ... Attach reject causes attAcc ... Attach accept causes rauRej ... RAU reject causes rauAcc ... RAU accept causes det ... NW initiated detach causes pdpActRej ... PDP context activation reject causes pdpModRej ... PDP context modification reject causes pdpDeact ... PDP context deactivation causes servRej ... Service request reject causes

Class

Required key.

List

- attAcc - Attach accept - Attach accept causes.
- attRej - Attach reject - Attach reject causes.
- det - Detach - Network initiated detach causes.
- pdpActRej - PDP activation reject - PDP context activation reject causes.
- pdpDeact - PDP deactivation - PDP context deactivation causes.

- pdpModRej - PDP modification reject - PDP context modification reject causes.
- rauAcc - RAU accept - RAU accept causes.
- rauRej - RAU reject - RAU reject causes.
- servRej - Service request reject - Service request reject causes.

Roles

Show

4.40 cmm cdrEncryption

CDR Encryption. Syntax, description, parameters, and roles for `cmm cdrEncryption` command.

Syntax

Description

This command is used to enable or disable the encryption in SGSN CDR files and set the encryption key.

Parameters

Name

enable - Enable

Syntax

--enable <list-item>

Description

Enables or disable CDR File encryption

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

encryptionKey - Encryption Key

Syntax

--encryptionKey <string>

Description

Key used to encrypt CDR files

Class

Optional.

Type / Range

Digit string of length 0 or 32 with the allowed pattern of [A-Za-z0-9+/=]*

Default

""

Roles**Show**

secadmin

Modify

secadmin

List

secadmin

4.41 cmm cdrFiles

CDR Files. Syntax, description, parameters, and roles for cmm cdrFiles command.

Syntax**Description**

Configure, modify and show CDR Files.

Parameters**Name**

cdrFilesId - Id for cdrfile

Syntax

--cdrFilesId <integer>

Description

Id for cdrfile - just set it to 1

Class

Required key.

Type / Range

Integer in the range of 1 to 1

Name

amountOfFiles - AmountOfFiles

Syntax

--amountOfFiles <integer>

Description

The total amount of CDR files/indexes to use. The resulting value when multiplied to the sizeperfile parameter, should be below 200GB.

Class

Optional.

Type / Range

Integer in the range of 0 to 68,000

Default

20000

Name

compression - Compression

Syntax

--compression <list-item>

Description

Set this to 'true' when cdr files should be compressed

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

noOfDigitsInFileName - noOfDigitsInFileName

Syntax

--noOfDigitsInFileName <integer>

Description

The number of digits in the filename of CDR file to use

Class

Optional.

Type / Range

Integer in the range of 4 to 5

Default

5

Name

overwrite - Overwrite

Syntax

--overwrite <list-item>

Description

When there is no available/free CDR file index to use, overwrite could be an option

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

sizePerFile - SizePerFile

Syntax

--sizePerFile <integer>

Description

The size per CDR file (in KBs) to use. The transmission of large file sizes could be more error prone.

Class

Optional.

Type / Range

Integer in the range of 3,072 to 10,240

Default

5120

Name

useControlfiles - UseControlfiles

Syntax

--useControlfiles <list-item>

Description

The operator has the possibility to select whether the cdrfiles are transferred towards the billing domain in a controlled way

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Modify

sysadmin, manage

sysadmin, manage, monitor

4.42 cmm cdrPapsCount

cdrPapsCount. Syntax, description, parameters, and roles for cmm cdrPapsCount command.

Syntax**Description**

cdr count of paps.

Parameters**Name**

papsId - Paps index

Syntax

--papsId <string>

Description

Index of paps.

Class

Optional.

Type / Range

Digit string of length 1 to 4 with the allowed pattern of [0-9a-zA-Z\._:-]*

Roles**List**

sysadmin, manage, monitor

4.43 cmm cellId

Cell Identifiers subject to Handover. Syntax, description, parameters, and roles for cmm cellId command.

Syntax**Description**

Administer Cell Identifiers subject to Handover Restriction

Parameters**Name**

name - Name of the Cell ID

Syntax

--name <string>

Description

Name of the cell identifier.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:-@]*

Name

cellIdentifier - Cell Identifier

Syntax

--cellIdentifier <integer>

Description

Identify the cell.

Class

Required on create, not modifiable.

Type / Range

Integer in the range of 0..68719476735

Name

plmnName - Mobile network name

Syntax

--plmnName <string>

Description

A name that identifies mobile network.

Class

Required on create, not modifiable.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

sysadmin, manage, monitor

4.44 cmm certificate

Certificate. Syntax, description, parameters, and roles for **cmm certificate** command.

Syntax

Description

Generate signed certificate.

Parameters

Name

privateKeyFile - Private key file

Syntax

--privateKeyFile <string>

Description

Private key file. Type it in format <path/yourPrivateKeyFileName>

Class

Optional, not filterable on list.

Type / Range

Digit string of length

Name

serverCertificate - Server Certificate

Syntax

--serverCertificate <string>

Description

Certificate which is created and stored

Class

Output only.

Type / Range

Digit string of length

Name

signedCertFile - Signed certificate file

Syntax

--signedCertFile <string>

Description

Signed certificate file. Type it in format <path/yourSignedCertFileName>

Class

Optional, not filterable on list.

Type / Range

Digit string of length

Name

id - Id

Syntax

<list-item>

Description

Just type 'cert' here.

Class

Required value.

List

- cert - cert

Roles**Create**

secadmin

Show

secadmin

Delete

secadmin

List

secadmin

4.45 cmm cgInfo

CG status information. Syntax, description, parameters, and roles for cmm cgInfo command.

Syntax**Description**

Charging Gateway runtime information.

Parameters**Name**

cgOrder - Order of charging gateways in the CG table

Syntax

--cgOrder <integer>

Description

Order of the Charging GW to be displayed. If cgOrder is specified, the status information for the specific CG will be displayed, else the status information for all CGs in the CG table will be displayed.

Class

Optional.

Type / Range

Integer in the range of 1 to 10

Roles**List**

sysadmin, manage, monitor

4.46 cmm cgw

Charging Gateways. Syntax, description, parameters, and roles for cmm cgw command.

Syntax**Description**

Management of the list of known Charging Gateways used by Ga interface.

Parameters**Name**

cgOrder - CG order

Syntax

--cgOrder <integer>

Description

Order of the CG in the CG table.

Restrictions

- Order field is a primary key for the CG table.
- There can only be one record in the CG table with a specific order value.
- There cannot be two records with different order value but the same (IPv4,remPort) pair values.

Class

Required key.

Type / Range

Order of charging gateways in the CG table

Name

adminState - Administrative state

Syntax

--adminState <list-item>

Description

Administrative state of the charging gateway

Class

Required on create.

List

- locked - Locked.
- unlocked - Unlocked.

Name

cglp - Charging Gateway IP

Syntax

--cgIp <string>

Description

Charging Gateway IP

Class

Required on create.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

operState - Operational state

Syntax

--operState <integer>

Description

Operational state of the charging gateway. This is set only from call processing

Class

Read only.

Type / Range

Integer in the range of 0 to 13

Default

9

Name

redirectInd - Redirect Indicator

Syntax

--redirectInd <integer>

Description

Index of a CG where CDRs are redirected to. This is set only from call processing

Class

Read only.

Type / Range

Integer in the range of 0 to 255

Default

255

Name

remPort - Remote UDP port

Syntax

--remPort <integer>

Description

Remote UDP port

Class

Optional.

Type / Range

Remote Port

Default

3386

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Modify

sysadmin, manage

Delete

sysadmin, manage

List

sysadmin, manage, monitor

4.47 cmm chargingCdr

Charging CDR. Syntax, description, parameters, and roles for cmm chargingCdr command.

Syntax

Description

Show and list subscriber CDR.

Parameters

Name

imsi - IMSI

Syntax

--imsi <digits>

Description

IMSI.

Class

Required on create.

Type / Range

Digit string of length 5 to 15

Roles

Show

sysadmin, manage, monitor

List

sysadmin, manage, monitor

4.48 cmm chargingChangeGroup

Charging Change Group. Syntax, description, parameters, and roles for cmm chargingChangeGroup command.

Syntax

Description

Configure, list and show Charging Change Group.

Parameters

Name

chargingChangeGroupId - ChargingChangeGroup id

Syntax

--chargingChangeGroupId <integer>

Description

Charging change group index.

Class

Required key.

Type / Range

Integer in the range of 1 to 50

Name

chargeRateIndex - Charge rate index

Syntax

--chargeRateIndex <string>

Description

Defines the charge rates that are used within a day. the character & is permissible. this parameter is given as a decimal number with values 1 to 4. a maximum of eight indices may be defined and there must be one extra index defined compared to the number of charge rate change times. the indices must be given in a chronological order.

Class

Required on create.

Type / Range

Digit string of length 0 to 16 with the allowed pattern of ([1-4])(&[1-4]){,7}

Name

changeTime - ChangeTime

Syntax

--changeTime <string>

Description

The change time of the charge rate (hours-minutes) within a day. the character & is permissible. a maximum of seven change times may be defined. the change times must be given in a chronological order.

Class

Optional.

Type / Range

Digit string of length 0 to 42 with the allowed pattern of `(([0-1][0-9]|2[0-3])-(00|15|30|45))`
`(&([0-1][0-9]|2[0-3])-(00|15|30|45))){{,6}}`

Roles

Create

sysadmin, manage

Show

sysadmin, manage, monitor

Modify

sysadmin, manage

Delete

sysadmin, manage

List

sysadmin, manage, monitor

4.49 cmm chargingCharAccessRestrictionProfile

Charging Characteristics Access Restriction Profile. Syntax, description, parameters, and roles for `cmm chargingCharAccessRestrictionProfile` command.

Syntax

Description

Defines parameters for charging characteristics based access restriction. Max 64 profiles are supported. The value of the T3346 Minimum must be set smaller than the value of the T3346 Maximum.

Parameters

Name

name - Name

Syntax

`--name <string>`

Description

The name of the profile.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of `[0-9a-zA-Z\.\_:@]*`

Name

chargingCharValue1 - Charging Characteristics Value 1

Syntax

--chargingCharValue1 <string>

Description

Defines the charging characteristics value 1 that triggers the access restriction.

Class

Required on create.

Type / Range

Digit string of length 4 with the allowed pattern of [0-9a-fA-F]*

Name

attachRejectCause - Attach Reject Cause

Syntax

--attachRejectCause <integer>

Description

Defines the Attach reject cause the MME uses.

Class

Optional.

Type / Range

Integer in the range of 3,6-8,11-15,22,25,35,42

Default

15

Name

chargingCharValue2 - Charging Characteristics Value 2

Syntax

--chargingCharValue2 <string>

Description

Defines the charging characteristics value 2 that triggers the access restriction. An empty value stands for this value being not in use.

Class

Optional.

Type / Range

Digit string of length 0 or 4 with the allowed pattern of [0-9a-fA-F]*

Default

""

Name

chargingCharValue3 - Charging Characteristics Value 3

Syntax

--chargingCharValue3 <string>

Description

Defines the charging characteristics value 3 that triggers the access restriction. An empty value stands for this value being not in use.

Class

Optional.

Type / Range

Digit string of length 0 or 4 with the allowed pattern of [0-9a-fA-F]*

Default

""

Name

chargingCharValue4 - Charging Characteristics Value 4

Syntax

--chargingCharValue4 <string>

Description

Defines the charging characteristics value 4 that triggers the access restriction. An empty value stands for this value being not in use.

Class

Optional.

Type / Range

Digit string of length 0 or 4 with the allowed pattern of [0-9a-fA-F]*

Default

""

Name

includeT3346 - Include T3346

Syntax

--includeT3346 <list-item>

Description

Defines whether MME includes T3346 value on the NAS rejection message. The MME only includes the T3346 in the rejection message when both this parameter is set to true and the Rejection cause is provisioned as 22 (congestion).

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

restrictAccess - Restrict Access

Syntax

--restrictAccess <list-item>

Description

Defines whether access is restricted based on provisioned charging characteristics value.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

t3346max - T3346 Maximum

Syntax

--t3346max <integer>

Description

Defines the maximum value for T3346.

Class

Optional.

Type / Range

Integer in the range of 0 to 11,160 in units of Second

Default

60

Name

t3346min - T3346 Minimum

Syntax

--t3346min <integer>

Description

Defines the minimum value for T3346.

Class

Optional.

Type / Range

Integer in the range of 0 to 11,159 in units of Second

Default

15

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Modify

sysadmin, manage

Delete

sysadmin, manage

List

sysadmin, manage, monitor

4.50 cmm chargingParams

Charging Parameters. Syntax, description, parameters, and roles for `cmm chargingParams` command.

Syntax**Description**

Configure, list and show Charging Parameters.

Parameters**Name**

chargingParamsId - ChargingParamsId

Syntax

--chargingParamsId <integer>

Description

ChargingParamsId - just set it to 1.

Class

Required key.

Type / Range

Integer in the range of 1 to 1

Name

cdrCreateDt - CdrCreateDt

Syntax

--cdrCreateDt <list-item>

Description

Direct tunnel S-CDRs generation mode off - S-CDRs for direct tunnel PDPs not generated on
- S-CDRs for direct tunnel PDPs generated.

Class

Optional.

List

- off - off.
- on - on.

Default

off

Name

cdrCreateGb - CdrCreateGb

Syntax

--cdrCreateGb <list-item>

Description

CDR generation mode for gb subscribers - all - S-CDR opening for roaming and home 2G
subscribers - home - S-CDR opening for home 2G subscribers - roam - S-CDR opening for
roaming 2G subscribers - none - no S-CDR opening for 2G subscribers.

Class

Optional.

List

- all - Specify CDR for both home and roaming subscribers.
- home - Specify CDR for home subscribers.
- none - Specify CDR for no subscribers.
- roam - Specify CDR for roaming subscribers.

Default

all

Name

cdrCreatelhspa - CdrCreatelhspa

Syntax

--cdrCreateIhspa <list-item>

Description

CDR generation mode for ihspa 3G subscribers - all - S-CDR opening for roaming and home ihspa 3G subscribers - home - S-CDR opening for home ihspa 3G subscribers - roam - S-CDR opening for roaming ihspa 3G subscribers - none - no S-CDR opening for ihspa 3G subscribers.

Class

Optional.

List

- all - Specify CDR for both home and roaming subscribers.
- home - Specify CDR for home subscribers.
- none - Specify CDR for no subscribers.
- roam - Specify CDR for roaming subscribers.

Default

all

Name

cdrCreatelu - CdrCreatelu

Syntax

--cdrCreateIu <list-item>

Description

CDR generation mode for iu subscribers - all - S-CDR opening for roaming and home 3G subscribers - home - S-CDR opening for home 3G subscribers - roam - S-CDR opening for roaming 3G subscribers - none - no S-CDR opening for 3G subscribers.

Class

Optional.

List

- all - Specify CDR for both home and roaming subscribers.
- home - Specify CDR for home subscribers.
- none - Specify CDR for no subscribers.
- roam - Specify CDR for roaming subscribers.

Default

all

Name

ctmNorm - Continuous trigger mode

Syntax

--ctmNorm <list-item>

Description

Continuous trigger mode - off - continuous trigger mode off for S-CDR triggers - timetr
- continuous trigger mode on for S-CDR time trigger the time trigger expires always as defined, that is, if parameter normal S-CDR time trigger has been set to 00-15 - 15 minutes, an intermediate S-CDR is generated in every 15 minutes with the closing cause - time limit
- even if another intermediate S-CDRs has been generated during this 15 minute period - with the closing cause - volume limit - or - max changes. - volumetr - continuous trigger mode on for 2G and 3G S-CDR vol trigger the volume trigger expires always as defined, that is, if parameter normal 2G data volume trigger is set to 500 KB, an intermediate S-CDR is generated after every 500 KB of data volumes with the closing cause - volume limit - even if another intermediate S-CDRs has been generated during this period - with the closing cause time limit or max changes. - both - continuous trigger mode on for S-CDR time and vol triggers continuous time and continuous volume triggers can be activated to be used simultaneously. basically this means that an intermediate S-CDR is generated every time when either time trigger or volume trigger expires even if there other intermediate S-CDRs have been generated during the collection period with closing causes max changes - volume limit - for continuous time trigger - and max changes and time limit - for continuous volume trigger.

Class

Optional.

List

- off - Continuous trigger mode off for S-CDR triggers.
- both - Both time and volume trigger - Continuous trigger mode on for S-CDR time and volume triggers. continuous time and continuous volume triggers can be activated to be used simultaneously. basically this means that an intermediate S-CDR is generated every time when either time trigger or volume trigger expires even if there other intermediate S-CDRs have been generated during the collection period with closing causes max changes - volume limit - for continuous time trigger - and max changes and time limit - for continuous volume trigger.
- timeTr - Time trigger - Continuous trigger mode on for S-CDR time trigger. the time trigger expires always as defined, that is, if parameter normal S-CDR time trigger has been set to 00-15 - 15 minutes, an intermediate S-CDR is generated in every 15 minutes with the closing cause - time limit - even if another intermediate S-CDRs has been generated during this 15 minute period - with the closing cause - volume limit - or - max changes. - .

- volumeTr - Volume trigger - Continuous trigger mode on for 2G and 3G S-CDR volume trigger. the volume trigger expires always as defined, that is, if parameter normal 2G data volume trigger is set to 500 KB, an intermediate S-CDR is generated after every 500 KB of data volumes with the closing cause - volume limit - even if another intermediate S-CDRs has been generated during this period - with the closing cause time limit or max changes.

Default

off

Name

direction - Direction

Syntax

--direction <list-item>

Description

CDR direction: off - Charging function disabled and no S-CDR generation bp - S-CDR generation with Bp interface on ga - S-CDR generation with Ga interface on

Restrictions

From ga or bp it is only possible to switch to off. From off, it is possible to switch to ga or bp.

Class

Optional.

List

- ga - S-CDR generation with bp interface on.
- off - Charging function disabled and no S-CDR generation.
- bp - S-CDR generation with bp interface on.

Default

off

Name

flatRate - Flat rate

Syntax

--flatRate <list-item>

Description

Flat rate S-CDR generation: off - no flat rate S-CDR generation on - flat rate S-CDR generation on.

Class

Optional.

List

- off - off.

- on - on.

Default

off

Name

minVol2g - Min volume trigger for normal 2G S-CDR

Syntax

--minVol2g <integer>

Description

Min volume trigger for normal 2G S-CDR - decimal value in KB, min 0 in 100 KB steps. normal vol2g value must be divisible by normal minvol2g value, if the normal minvol2g value is not 0 KB.

Class

Optional.

Type / Range

Integer in the range of 0 to 4,294,967,294

Default

3000

Name

minVol3g - Min volume trigger for normal 3G S-CDR

Syntax

--minVol3g <integer>

Description

Min volume trigger for normal 3G S-CDR - decimal value in KB, min 0 in 100 KB steps. normal vol3g value must be divisible by normal minvol3g value, if the normal minvol3g value is not 0 KB.

Class

Optional.

Type / Range

Integer in the range of 0 to 4,294,967,294

Default

15000

Name

periodicFileCloseTimer - Periodic File Close Timer

Syntax

--periodicFileCloseTimer <integer>

Description

This timer defines the period (in minutes) after which the SGSN Charging file will be closed and stored for retrieval even if the files provisioned size limit has not been reached. When the value is set to 0 (default) the files are not periodically closed.

Class

Optional.

Type / Range

Integer in the range of 0 to 1,440 in units of Minute

Default

0

Name

purgeCDRs - Purge S-CDRs

Syntax

--purgeCDRs <list-item>

Description

Purge and close all non-updated S-CDRs from database: - off - purge functionality off - 1day - purge S-CDRs not updated since last 24 h - 2day - purge S-CDRs not updated since last 48 h - 3day - purge S-CDRs not updated since last 72 h - 4day - purge S-CDRs not updated since last 96 h - 5day - purge S-CDRs not updated since last 120 h - 6day - purge S-CDRs not updated since last 144 h - 7day - purge S-CDRs not updated since last 168 h.

Class

Optional.

List

- off - Purge functionality off.
- 1day - 1 day - Purge S-CDRs not updated since last 24 hours.
- 2day - 2 days - Purge S-CDRs not updated since last 48 hours.
- 3day - 3 days - Purge S-CDRs not updated since last 72 hours.
- 4day - 4 days - Purge S-CDRs not updated since last 96 hours.
- 5day - 5 days - Purge S-CDRs not updated since last 120 hours.
- 6day - 6 days - Purge S-CDRs not updated since last 144 hours.
- 7day - 7 days - Purge S-CDRs not updated since last 168 hours.

Default

off

Name

sCdrDiscard - sCdr discard

Syntax

--sCdrDiscard <list-item>

Description

With this parameter operator can block the disk storing of S-CDRs for the charging parameter modification for direction, cdrCreateGb, cdrCreatelu or cdrCreatelhspa: off - the S-CDRs generated due to parameter modification are stored to disk on - the S-CDRs generated due to parameter modification are not stored to disk

Class

Optional.

List

- off - off.
- on - on.

Default

off

Name

t24h - Trigger for normal S-CDR, 24 hours

Syntax

--t24h <list-item>

Description

Trigger for normal S-CDR, 24 hours off - intermediate S-CDR is not generated due to T24H trigger at all on - intermediate S-CDR is generated due to T24H trigger if an S-CDR is open and its intermediate S-CDR has not been generated in the last 24 hours.

Class

Optional.

List

- off - off.
- on - on.

Default

off

Name

time - Time trigger for normal S-CDR

Syntax

--time <string>

Description

time trigger for normal S-CDR: hh-mm - minimum value 00-10, in one minute steps

Class

Optional.

Type / Range

Digit string of length 5 to 5 with the allowed pattern of (([0-2][0-9])-[0-5][0-9]))

Default

04-00

Name

ttcMode - Tunnel type change related S-CDR handling

Syntax

--ttcMode <list-item>

Description

Tunnel type change related S-CDR handling - blockingoncont - tunnel type change related container changes are blocked, no container change in S-CDR due to tunnel type change. - blockingoffcont - tunnel type change related container changes are not blocked, tunnel type change will cause container change in S-CDR. - blockingoncdr - tunnel type change related S-CDR generation is blocked, no S-CDR generation due to tunnel type change. - blockingoffcdr - tunnel type change related S-CDR generation is not blocked, tunnel type change will cause S-CDR generation. - blockingoncdrwodatavol - tunnel type change related S-CDR generation is blocked for S-CDRs without data volumes, only 2T S-CDRs with data volumes are generated due to tunnel type change.

Class

Optional.

List

- blockingOffCdr - Tunnel type change related S-CDR handling.
- blockingOffCont - Tunnel type change related container changes are not blocked, tunnel type change will cause container change in S-CDR. -.
- blockingOnCdr - Tunnel type change related S-CDR generation is blocked, no S-CDR generation due to tunnel type change.
- blockingOnCdrWoDatavol - Blocking on CDR without data volumes - Tunnel type change related S-CDR generation is blocked for S-CDRs without data volumes, only 2T S-CDRs with data volumes are generated due to tunnel type change.
- blockingOnCont - Blocking on container - Tunnel type change related container changes are blocked, no container change in S-CDR due to tunnel type change.

Default

blockingOnCont

Name

ttcTso - Tunnel type change related CDR timestamp override

Syntax

--ttcTso <list-item>

Description

Tunnel type change related CDR timestamp override off - timestamp override mechanism not in use on - timestamp override mechanism in use.

Class

Optional.

List

- off - off.
- on - on.

Default

off

Name

vol2g - Volume trigger for normal 2G S-CDR

Syntax

--vol2g <integer>

Description

Volume trigger for normal 2G S-CDR - decimal value in KB, min 500 in 100 KB steps. normal vol2g value must be divisible by normal minvol2g value, if the normal minvol2g value is not 0 KB.

Class

Optional.

Type / Range

Integer in the range of 500 to 4,294,967,294

Default

12000

Name

vol3g - Volume trigger for normal 3G S-CDR

Syntax

--vol3g <integer>

Description

Volume trigger for normal 3G S-CDR - decimal value in KB, min 1000 in 100 KB steps. normal vol3g value must be divisible by normal minvol3g value, if the normal minvol3g value is not 0 KB.

Class

Optional.

Type / Range

Integer in the range of 1,000 to 4,294,967,294

Default

60000

Roles**Create**

4.51 cmm chargingSpecialday

Charging Special day. Syntax, description, parameters, and roles for **cmm chargingSpecialday** command.

Syntax**Description**

Configure, list and show Charging Special day.

Parameters**Name**

date - Charging special day

Syntax

--date <string>

Description

Charging special day.

Class

Required key.

Type / Range

Digit string of length 0 to 10 with the allowed pattern of ((20[2-9][0-9])-(0[1-9])(1[0-2]))-(0[1-9]|[1-2][0-9]|3[0-1])), representing YYYY-MM-DD (year-month-day)

Name

changeGroupIndex - ChangeGroupIndex

Syntax

--changeGroupIndex <integer>

Description

Index to chargingchangeGroup.

Class

Required on create.

Type / Range

Integer in the range of 1 to 50

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Modify

sysadmin, manage

List

sysadmin, manage, monitor

4.52 cmm chargingWeekday

Charging Weekday. Syntax, description, parameters, and roles for cmm chargingWeekday command.

Syntax**Description**

Configure, list and show Charging Weekday.

Parameters**Name**

weekday - Weekday

Syntax

--weekday <list-item>

Description

Is the day of the week and what changegroupindex may be linked to this day of the week.

Class

Required key.

List

- MON - Specify weekday of monday.
- TUE - Specify weekday of tuesday.
- WED - Specify weekday of wednesday.
- THU - Specify weekday of thursday.
- FRI - Specify weekday of friday.
- SAT - Specify weekday of saturday.
- SUN - Specify weekday of sunday.

Name

changeGroupIndex - ChangeGroupIndex

Syntax

--changeGroupIndex <integer>

Description

Index to chargingchangegroup.

Class

Optional.

Type / Range

Integer in the range of 0 to 50

Default

0

Roles**Show**

sysadmin, manage, monitor

Modify

sysadmin, manage

List

sysadmin, manage, monitor

4.53 cmm ciotProfile

CloT Profile. Syntax, description, parameters, and roles for cmm ciotProfile command.

Syntax

Description

Defines profile for CloT settings to be used in IMSI Range Service

Parameters

Name

name - name

Syntax

--name <string>

Description

Profile Name

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

allowNonIpOverS1u - allow non IP over S1

Syntax

--allowNonIpOverS1u <list-item>

Description

specifies whether a non-IP connection is allowed over S1.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

ciotEmmRegisterdWithoutPdn - Enable EMM-REGISTERED without PDN connection for C-IOT UE.
Enable EMM-REGISTERED without PDN connection for C-IOT UE

Syntax

--ciotEmmRegisterdWithoutPdn <list-item>

Description

Enable EMM-REGISTERED without PDN connection for C-IOT UE.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

cpCioTDeliveryMechanism - CP CIOT delivery mechanism

Syntax

--cpCioTDeliveryMechanism <list-item>

Description

CP CIOT delivery mechanism

Class

Optional.

List

- all - Delivery using both S11-u and T6a is supported.
- scef - Delivery using T6a interface.
- sgi - Delivery using S11-u interface.

Default

sgi

Name

ePcoSupport - Extended protocol configuration option support

Syntax

--ePcoSupport <list-item>

Description

Extended protocol configuration option support

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

hlcomDdnAckWithDlBuffering - HLCOM ddn ack with downlink dl buffering

Syntax

--hlcomDdnAckWithDlBuffering <list-item>

Description

DDN ACK with downlink buffering for HLCOM.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

hlcomEnabled - HLCOM enabled

Syntax

--hlcomEnabled <list-item>

Description

HLCOM enabled

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

hlcomPsmDlBufferingPacketCount - HLCOM/PSM downlink buffering packet count

Syntax

--hlcomPsmDlBufferingPacketCount <integer>

Description

PSM downlink buffering packet count for HLCOM and PSM.

Class

Optional.

Type / Range

Integer in the range of 0 to 65,535

Default

1

Name

hlcomUseLocalDlBufferingPacketCount - HLCOM use local downlink buffering packet count

Syntax

--hlcomUseLocalDlBufferingPacketCount <list-item>

Description

Use local downlink buffering packet count for HLCOM.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

mmeNbIotCptoUpSwitch - Enable MME triggered control plane bearers to user plane bearers switch for CIOT UE

Syntax

--mmeNbIotCptoUpSwitch <list-item>

Description

This parameters enables MME triggered control plane (CP) bearers to use user plane (UP) i.e. S1-U bearers for CIOT UE. if this parameter is set then MME triggers CP bearers to UP. By default the parameter is not set.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

mmeWbEutranCpToUpSwitch - Enable MME triggered control plane bearers to user plane bearers switch for WB-EUTRAN UE

Syntax

--mmeWbEutranCpToUpSwitch <list-item>

Description

This parameters enables MME triggered control plane (CP) bearers to use user plane (UP) i.e. S1-U bearers for WB-EUTRAN UE. if this parameter is set then MME triggers CP bearers to UP. By default the parameter is not set.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

moEdtCp - Mobile originated Early Data Transfer over Control Plane

Syntax

--moEdtCp <list-item>

Description

Mobile Originated Early Data Transfer for Control Plane for S11u and T6a

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

mtEdtCp - Mobile Terminated Early Data Transfer over Control Plane

Syntax

--mtEdtCp <list-item>

Description

Mobile Terminated Early Data Transmission for Control Plane

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

mtEdtT6a - Mobile Terminated Early Data Transmission for T6a

Syntax

--mtEdtT6a <list-item>

Description

Mobile Terminated Early Data Transmission for T6a

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

mtEdtUp - Mobile Terminated Early Data Transfer over User Plane

Syntax

--mtEdtUp <list-item>

Description

Mobile Terminated Early Data Transmission for User Plane

Class

Optional.

List

- false - Boolean value of false.

- true - Boolean value of true.

Default

false

Name

mtSmsOpt2ForUeInPowerSavings - MT SMS option 2 deployment for UE in power savings

Syntax

--mtSmsOpt2ForUeInPowerSavings <list-item>

Description

Use deployment option 2 specified in TS 23.272 for handling mobile terminated SMS for UE in power savings (idle mode DRX and power savings mode). if this parameter is false then MME uses the option 1 specified in TS 23.272.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

nbIotDlDataSizeForCpToUpSwitch - Downlink data packet size threshold for CP bearers to UP bearers switch

Syntax

--nbIotDlDataSizeForCpToUpSwitch <integer>

Description

Provision the size of CIOT UE downlink control plane data packet size threshold in octets for MME to trigger control plane bearers to switch to use user plane bearers i.e. S1-U bearers. By default the data packet size is set to 120 octets. the range of allowed values are 20 to 1024 octets.

Class

Optional.

Type / Range

Integer in the range of 20 to 1,024

Default

120

Name

nbIotSmsWithoutCombinedAttach - Enable SMS without combined Attach For NB-IOT UE

Syntax

--nbiotSmsWithoutCombinedAttach <list-item>

Description

Enable SMS without combined Attach For NB-IOT UE

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

nBlotUeCpToUpSwitch - CIOT UE control plane bearer to user plane bearer switching

Syntax

--nBIotUeCpToUpSwitch <list-item>

Description

Parameter to allow/not allow CIOT UE control plane traffic to user plane i.e. setup radio bearers and transport user data over S1-U.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

nblotUlDataSizeForCpToUpSwitch - Upnlk data packet size threshold for CP bearers to UP bearers switch

Syntax

--nbIotUlDataSizeForCpToUpSwitch <integer>

Description

Provision the size of CIOT UE uplink control plane data packet size threshold in octets for MME to trigger control plane bearers to switch to use user plane bearers i.e. S1-U bearers. By default the data packet size is set to 120 octets. the range of allowed values are 20 to 1024 octets.

Class

Optional.

Type / Range

Integer in the range of 20 to 1,024

Default

120

Name

nonIpDataTrans - Non-IP data transport

Syntax

--nonIpDataTrans <list-item>

Description

Enable/disable non-ip data transport.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

rohc - ROHC

Syntax

--rohc <list-item>

Description

ROHC

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

s1uDataTrans - S1U data transfer

Syntax

```
--s1uDataTrans <list-item>
```

Description

Enable S1-U data transfer.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

serviceGapControlActive - Service Gap Control Active

Syntax

```
--serviceGapControlActive <list-item>
```

Description

Service Gap Control is active for UEs from the PLMN

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

serviceGapTimerSource - Service Gap Timer Source

Syntax

```
--serviceGapTimerSource <list-item>
```

Description

Specifies whether to use Service Gap Timer from HSS or Local provisioning

Class

Optional.

List

- Local - Use locally-provisioned Service Gap Timer

- HSS - Use HSS-provided Service Gap Timer

Default

HSS

Name

supportGrpSvcProvision - Support group service provision

Syntax

--supportGrpSvcProvision <list-item>

Description

Support group service provision

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

upCloT - UP CloT

Syntax

--upCIoT <list-item>

Description

Enable CP CIOT optimization.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

wbEutranDlDataSizeForCpToUpSwitch - Downlink data packet size threshold for CP bearers to UP bearers switch

Syntax

--wbEutranDlDataSizeForCpToUpSwitch <integer>

Description

Provision the size of WB-EUTRAN UE downlink control plane data packet size threshold in octets for MME to trigger control plane bearers to switch to use user plane bearers i.e. S1-U bearers. By default the data packet size is set to 120 octets. The range of allowed values are 20 to 1024 octets.

Class

Optional.

Type / Range

Integer in the range of 20 to 1,024

Default

120

Name

wbEutranUeCpToUpSwitch - WB-EUTRAN UE control plane bearers to user plane switching

Syntax

- -wbEutranUeCpToUpSwitch <list-item>

Description

Parameter to allow WB-EUTRAN UE control plane bearers switching to user plane i.e. set up radio bearers and transport user data over S1-U.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

wbEutranUlDataSizeForCpToUpSwitch - Uplink data packet size threshold for CP bearers to UP bearers switch

Syntax

- -wbEutranUlDataSizeForCpToUpSwitch <integer>

Description

Provision the size of WB-EUTRAN UE uplink control plane data packet size threshold in octets for MME to trigger control plane bearers to switch to use user plane bearers i.e. S1-U bearers. By default the data packet size is set to 120 octets. The range of allowed values are 20 to 1024 octets.

Class

Optional.

Type / Range

Integer in the range of 20 to 1,024

Default

120

4.54 cmm cipheringAlgorithm

Ciphering Algorithm. Syntax, description, parameters, and roles for cmm cipheringAlgorithm command.

Syntax

Description

This command sets the algorithms, in priority order, MME will use to negotiate encryption of NAS messages with the UE. At attach and TAU, the UE provides, in the UE EPS security capabilities, which encryption algorithms are supported. The MME will use the algorithm both supported by the UE and highest in priority in the eea ciphering algorithm priority list. - An algorithm must be chosen for 'priority-1' and 'priority-2'. - An additional selection, 'none', can be selected for 'priority-3' and 'priority-4' - effectively truncating the list. - If any ciphering algorithm (including null) is selected for 'priority-4', then 'priority-3' must not be 'none'. - An algorithm cannot be used for more than one priority (except for 'none'). Note: A pre-requisite for changing values in the cipheringAlgorithm is that MME aggregate service must be locked.

Parameters

Name

cipheringAlgPrio1 - Priority 1 ciphering algorithm

Syntax

--cipheringAlgPrio1 <list-item>

Description

Most preferred ciphering algorithm.

Class

Optional.

List

- aes - 128-EEA2 (AES) - Specify ciphering of 128-EEA2 (AES).
- noCiphering - 128-EEA0 (No ciphering) - Specify ciphering of 128-EEA0 (No ciphering).
- none - No algorithm selected - Specify ciphering of no algorithm selected.
- snow3G - 128-EEA1 (SNOW 3G) - Specify ciphering of 128-EEA1 (SNOW 3G).
- zuc - 128-EEA3 (ZUC) - Specify ciphering of 128-EEA3 (ZUC).

Default

snow3G

Name

cipheringAlgPrio2 - Priority 2 ciphering algorithm

Syntax

--cipheringAlgPrio2 <list-item>

Description

Second most preferred ciphering algorithm; used if the user element does not support algorithm(s) of higher priority.

Class

Optional.

List

- aes - 128-EEA2 (AES) - Specify ciphering of 128-EEA2 (AES).
- noCiphering - 128-EEA0 (No ciphering) - Specify ciphering of 128-EEA0 (No ciphering).
- none - No algorithm selected - Specify ciphering of no algorithm selected.
- snow3G - 128-EEA1 (SNOW 3G) - Specify ciphering of 128-EEA1 (SNOW 3G).
- zuc - 128-EEA3 (ZUC) - Specify ciphering of 128-EEA3 (ZUC).

Default

aes

Name

cipheringAlgPrio3 - Priority 3 ciphering algorithm

Syntax

--cipheringAlgPrio3 <list-item>

Description

Third most preferred ciphering algorithm; used if the user element does not support algorithm(s) of higher priority.

Class

Optional.

List

- aes - 128-EEA2 (AES) - Specify ciphering of 128-EEA2 (AES).
- noCiphering - 128-EEA0 (No ciphering) - Specify ciphering of 128-EEA0 (No ciphering).
- none - No algorithm selected - Specify ciphering of no algorithm selected.
- snow3G - 128-EEA1 (SNOW 3G) - Specify ciphering of 128-EEA1 (SNOW 3G).
- zuc - 128-EEA3 (ZUC) - Specify ciphering of 128-EEA3 (ZUC).

Default

none

Name

cipheringAlgPrio4 - Priority 4 ciphering algorithm

Syntax

--cipheringAlgPrio4 <list-item>

Description

Fourth most preferred ciphering algorithm; used if the user element does not support algorithm(s) of higher priority.

Class

Optional.

List

- aes - 128-EEA2 (AES) - Specify ciphering of 128-EEA2 (AES).
- noCiphering - 128-EEA0 (No ciphering) - Specify ciphering of 128-EEA0 (No ciphering).
- none - No algorithm selected - Specify ciphering of no algorithm selected.
- snow3G - 128-EEA1 (SNOW 3G) - Specify ciphering of 128-EEA1 (SNOW 3G).
- zuc - 128-EEA3 (ZUC) - Specify ciphering of 128-EEA3 (ZUC).

Default

none

4.55 cmm closeCdr

close CDR. Syntax, description, parameters, and roles for cmm c loseCdr command.

Syntax

Description

Close CDR

Parameters

Name

transferType - transferType

Syntax

--transferType <list-item>

Description

Transfer type of the S-CDRs to close.Offline means that Charging will go into offline mode afterwards.PAPS restart is then needed

Class

Required on create.

List

- currentFile - Current File - Specify transfer type of Current File.
- offline - Specify transfer type of offline.

Roles

Create

sysadmin, manage

4.56 cmm clusterMgmt

Cluster Management. Syntax, description, parameters, and roles for cmm c lusterMgmt command.

Syntax

Description

This command is used to manage clusters.

Parameters

Name

args - Arguments

Syntax

--args <string>

Description

Argument for the specified command that takes parameter.

Class

Optional.

Type / Range

Digit string of length

Name

target - Target

Syntax

--target <string>

Description

Target host. Example: ipds0 . Pattern matching is supported with pattern value surrounded by double quotes. Pattern value examples: *, necc*, ?p?s*

Class

Required.

Type / Range

Digit string of length

Roles

sysadmin, manage

4.57 cmm cmpPki

CMP PKI Connection. Syntax, description, parameters, and roles for cmm cmpPki command.

Syntax

Description

This command will set the parameters for a PKI connection using CMPv2.

Parameters

Name

pkild - PKI CMP Name

Syntax

--pkiId <integer>

Description

PKI CMP Name

Class

Required key.

Type / Range

Integer in the range of 1 to 10

Name

referenceNumber - PKI Reference Number

Syntax

--referenceNumber <string>

Description

Reference Number for PKI CMP interactions

Class

Required on create.

Type / Range

Digit string of length 1 to 64 with the allowed pattern of [0-9a-zA-Z\._:]*

Name

remotelp - Remote IP Address

Syntax

--remoteIp <string>

Description

Remote IP-address.

Class

Required on create.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

sharedKey - Shared Key

Syntax

--sharedKey <string>

Description

Shared key.

Restrictions

CMM shall encrypt the sharedKey in the Database

Class

Required on create.

Type / Range

String length of 1...256

Name

cmmDn - CMM distinguished name

Syntax

--cmmDn <string>

Description

Distinguished Name for CMM CMP

Class

Optional.

Type / Range

Distinguished name in CMPv2

Default

""

Name

pkiDn - Distinguished Name

Syntax

--pkiDn <string>

Description

Distinguished Name for PKI CMP

Class

Optional.

Type / Range

Distinguished name in CMPv2

Default

""

Name

remotePath - Remote path

Syntax

--remotePath <string>

Description

Remote path of the CMPv2 server

Class

Optional.

Type / Range

Remote path of the CMPv2 server

Default

/

Name

remotePort - CMPv2 Remote Port

Syntax

--remotePort <integer>

Description

CMPv2 Remote Port

Class

Optional.

Type / Range

PKI CMP remote port

Default

80

4.58 cmm cmpProc

CMPv2 Procedure. Syntax, description, parameters, and roles for `cmm cmpProc` command.

Syntax

Description

This command specifies the CMPv2 procedure to be executed.

Parameters

Name

pkild - PKI CMP Name

Syntax

--pkid <integer>

Description

PKI CMP Name

Class

Required key.

Type / Range

Integer in the range of 1 to 10

Name

cmpProcedureType - CMP Procedure Type

Syntax

--cmpProcedureType <list-item>

Description

This parameter specifies the CMPv2 Procedure to execute.

Class

Required on create, not modifiable.

List

- cr - Certificate Update - CMPv2 Certificate Update
- crl - Certificate Revocation List - CMPv2 Certificate Revocation List Request
- ir - Initial Request - CMPv2 Initial Request
- kur - Key Pair Update - CMPv2 Key Pair Update

Name

privateKeyFile - Private Key File Name

Syntax

--privateKeyFile <string>

Description

Absolute path of the private key file name. Example: /tmp/privkey.pem

Class

Required on create.

Type / Range

Digit string of length 1 to 100 with the allowed pattern of [0-9a-zA-Z\.\-_:&(),/]*

Name

signedCertFile - Signed Certificate File Name

Syntax

--signedCertFile <string>

Description

Absolute path of the signed certificate file name. Example: /tmp/certificate

Class

Required on create.

Type / Range

Digit string of length 1 to 100 with the allowed pattern of [0-9a-zA-Z\.\-_:&(),/]*

Name

tlsCertType - TLS Certificate Type

Syntax

--tlsCertType <list-item>

Description

Type of TLS Certificate to be generated with CMPv2

Class

Required on create.

List

- client - Client TLS certificate
- server - Server TLS certificate

Name

caCertificateFile - Certified Authority Certificate File

Syntax

--caCertificateFile <string>

Description

Absolute path of the signed certificate file name. Example: '/tmp/certificate'

Class

Optional.

Type / Range

Digit string of length 0 to 100 with the allowed pattern of [0-9a-zA-Z\.\-_:&(),/]*

Default

""

Name

cmpProcInfo - CMP Proc Info

Syntax

--cmpProcInfo <string>

Description

Information about command execution

Class

Read only.

Type / Range

Digit string of length 0 to 128

Roles**Create**

secadmin

4.59 cmm cnfLcmGParms

CNF CMM global parameters for LCM operations. Syntax, description, parameters, and roles for cmm cnfLcmGParms command.

Syntax**Description**

This command is used to modify global parameters that control the behavior of CNF CMM's operator pod in applicable LCM operations.

Parameters**Name**

cmGparmName - Parameter Name

Syntax

--cmGparmName <list-item>

Description

Name of the global parameter

Class

Required key.

List

- mmelssuWithoutSrs - MME ISSU Without SRS - When set to true, this parameter instructs the CMM operator pod to assume that SRS for MME is not available and make it allow a predefined amount of time between the update of EMMS and DBS layers for UE activity that will cause the 4G UEs to be assigned again on a CPPS. The waiting time is defined via the MME ISSU Without SRS Time for Sync global CNF LCM parameter.
- mmelssuWithoutSrsTimeForSync - MME ISSU Without SRS Waiting Time Between DBS and EMMS Upgrade - This parameter defines the amount of time in seconds that the CMM operator pod will allow between the update of EMMS and DBS layers for UE activity that will cause the 4G UEs to be assigned again on a CPPS. This parameter is only effective if MME ISSU Without SRS is true.

Name

cmGparmValue - Parameter Value

Syntax

--cmGparmValue <string>

Description

Value of parameter

Class

Required on create.

Type / Range

Digit string of length 0 to 64

The cmGparmValue string is based on the cmGparmName parameter:

Name

mmelssuWithoutSrs - MME ISSU Without SRS

Syntax

--cmGparmName mmeIssuWithoutSrs --cmGparmValue <string>

Description

When set to true, this parameter instructs the CMM operator pod to assume that SRS for MME is not available and make it allow a predefined amount of time between the update of EMMS and DBS layers for UE activity that will cause the 4G UEs to be assigned again on a

CPPS. The waiting time is defined via the MME ISSU Without SRS Time for Sync global CNF LCM parameter.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

mmeIssuWithoutSrsTimeForSync - MME ISSU Without SRS Waiting Time Between DBS and EMMS Upgrade

Syntax

```
--cmGparmName mmeIssuWithoutSrsTimeForSync --cmGparmValue <string>
```

Description

This parameter defines the amount of time in seconds that the CMM operator pod will allow between the update of EMMS and DBS layers for UE activity that will cause the 4G UEs to be assigned again on a CPPS. This parameter is only effective if MME ISSU Without SRS is true.

Type / Range

Integer in the range of 1 to 3,600

Default

900

4.60 cmm combinedAttachWithoutCsProfile

Combined Attach without CS Profile. Syntax, description, parameters, and roles for cmm combinedAttachWithoutCsProfile command.

Syntax

Description

Define the parameters for supporting combined attach without CS domain. Maximum number of profiles is 128.

Parameters

Name

name - Name

Syntax

--name <string>

Description

The name of the profile defining parameters for combined attached without CS.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

checkNetworkAccessMode - Check Network Access Mode

Syntax

--checkNetworkAccessMode <list-item>

Description

Defines whether the MME checks the Network Access Mode value from the HSS. When set to false, MME is able to accept combined attach without CS despite of the Network Access Mode parameter value from HSS. When set to true, MME only accepts combined attach without CS when Network Access Mode equals to PACKET_AND_CIRCUIT.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

combinedAttachWithoutCsEnabled - Combined Attach without CS Enabled

Syntax

--combinedAttachWithoutCsEnabled <list-item>

Description

Defines whether Combined Attach without CS is enabled for the UE.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

extendedServiceRequestRejectCc - Extended Service Request Reject CC

Syntax

--extendedServiceRequestRejectCc <integer>

Description

Defines the EMM cause code used to reject Extended Service Request when Combined Attach without CS is enabled.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

18

4.61 cmm connectedEnGnbQuery

Connected en-gNB Query. Syntax, description, parameters, and roles for cmm connectedEnGnbQuery command.

Syntax

Description

Dump command displays connected en-gNB List IE included in the S1 SETUP REQUEST message

Parameters

Name

enbId - engNB ID

Syntax

--enbId <integer>

Description

engNB identifier as specified in TS 36.413 v9.2.1.37

Class

Required key.

Type / Range

Integer in the range of 0 to 268,435,455

Name

mcc - Mobile country code

Syntax

--mcc <digits>

Description

3-digit number used to represent the mobile country code.

Class

Required key.

Type / Range

Digit string of length 3

Name

mnc - Mobile network code

Syntax

--mnc <digits>

Description

Digits used to represent mobile network code.

Class

Required key.

Type / Range

Digit string of length 2 to 3

Name

enGnbid - en Gnb Id

Syntax

--enGnbid <integer>

Description

engNB identifier

Class

Read only.

Type / Range

Integer in the range of 0 to 4,294,967,295

Name

enGnbMcc - en Gnb MCC

Syntax

--enGnbMcc <digits>

Description

3-digit number used to represent the mobile country code.

Class

Read only.

Type / Range

Digit string of length 3

Name

enGnbMnc - Mobile network code

Syntax

--enGnbMnc <digits>

Description

Digits used to represent mobile network code.

Class

Read only.

Type / Range

Digit string of length 2 to 3

Roles

List

sysadmin, manage, monitor

4.62 cmm consumerOAuthNfType

Consumer OAuth NF Type. Syntax, description, parameters, and roles for cmm consumerOAuthNfType command.

Syntax

Description

List of the NFTypes for which AMF supports OAuth as a Consumer.

Parameters

Name

consumerOAuthNfTypeListName - List Name

Syntax

--consumerOAuthNfTypeListName <string>

Description

Name of the list for which the NFType is relevant

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

nfType - NF Type

Syntax

--nfType <list-item>

Description

NFType of the consumer interface

Class

Required key.

List

- 5GEIR - 5G EIR - The network function type of 5G-Equipment Identity Register.

- AMF - Access and Mobility Manager Function - The network function type of Access and Mobility Manager Function.
- AUSF - Authentication Server Function - The network function type of Authentication Server Function.
- LMF - Location Management Function - The network function type of Location Management Function.
- PCF - Policy Control Function - The network function type of Policy Control Function.
- SMF - Session Management Function - The network function type of Session Management Function.
- SMSF - Short Message Service Function - The network function type of Short Message Service Function.
- UDM - Unified Data Manager - The network function type of Unified Data Manager.

Name

enable - Enable

Syntax

--enable <list-item>

Description

Enables OAuth2.0 as a Consumer for a NFType

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

4.64 cmm counter

Counter List. Syntax, description, parameters, and roles for cmm counter command.

Syntax

Description

This command is used to list counters, provide counter meta information, or show counters.

Parameters

Name

endTime - Ending time

Syntax

--endTime <string>

Description

Ending time('yyyy-mm-dd HH:MM:SS') Only the data of maximum last 15 minutes will be returned.

Class

Optional.

Type / Range

Digit string of length 19 to 19 with the allowed pattern of (\d{4}-\d{2}-\d{2} \d{2}:\d{2}:\d{2})

Name

entity - Entity filter

Syntax

--entity <string>

Description

Entity filter.

Class

Optional.

Type / Range

Digit string of length

Name

entity_actc - Entity ACTC

Syntax

--entity_actc <string>

Description

Entity ACTC.

Class

Optional.

Type / Range

Digit string of length

Name

entity_bearerclass - Entity bearer class

Syntax

--entity_bearerclass <string>

Description

Entity bearer class.

Class

Optional.

Type / Range

Digit string of length

Name

entity_cellid - Entity cell ID

Syntax

--entity_cellid <string>

Description

Entity cell ID.

Class

Optional.

Type / Range

Digit string of length

Name

entity_core - Entity core

Syntax

--entity_core <string>

Description

Entity core.

Class

Optional.

Type / Range

Digit string of length

Name

entity_disk - Entity disk

Syntax

--entity_disk <string>

Description

Entity disk.

Class

Optional.

Type / Range

Digit string of length

Name

entity_filesystem - Entity filesystem

Syntax

--entity_filesystem <string>

Description

Entity filesystem.

Class

Optional.

Type / Range

Digit string of length

Name

entity_hss - Entity HSS

Syntax

--entity_hss <string>

Description

Entity HSS.

Class

Optional.

Type / Range

Digit string of length

Name

entity_interface - Entity interface

Syntax

--entity_interface <string>

Description

Entity interface.

Class

Optional.

Type / Range

Digit string of length

Name

entity_interfacetype - Entity interface type

Syntax

--entity_interfacetype <string>

Description

Entity interface type.

Class

Optional.

Type / Range

Digit string of length

Name

entity_iulac - Entity IU LAC

Syntax

--entity_iulac <string>

Description

Entity IU LAC.

Class

Optional.

Type / Range

Digit string of length

Name

entity_iuraplmn - Entity IU RA PLMN

Syntax

--entity_iuraplmn <string>

Description

Entity IU RA PLMN.

Class

Optional.

Type / Range

Digit string of length

Name

entity_iurarac - Entity IU RA RAC

Syntax

--entity_iurarac <string>

Description

Entity IU RA RAC.

Class

Optional.

Type / Range

Digit string of length

Name

entity_iurarnc - Entity IU RA RNC

Syntax

--entity_iurarnc <string>

Description

Entity IU RA RNC.

Class

Optional.

Type / Range

Digit string of length

Name

entity_iusalac - Entity IU SA LAC

Syntax

--entity_iusalac <string>

Description

Entity IU SA LAC.

Class

Optional.

Type / Range

Digit string of length

Name

entity_iusaplmn - Entity IU SA PLMN

Syntax

--entity_iusaplmn <string>

Description

Entity IU SA PLMN.

Class

Optional.

Type / Range

Digit string of length

Name

entity_lac - Entity LAC

Syntax

--entity_lac <string>

Description

Entity LAC.

Class

Optional.

Type / Range

Digit string of length

Name

entity_lip - Entity local IP

Syntax

--entity_lip <string>

Description

Entity local IP.

Class

Optional.

Type / Range

Digit string of length

Name

entity_liptp - Entity local IP type

Syntax

--entity_liptp <string>

Description

Entity local IP type.

Class

Optional.

Type / Range

Digit string of length

Name

entity_ludp - Entity local UDP port

Syntax

--entity_ludp <string>

Description

Entity local UDP port.

Class

Optional.

Type / Range

Digit string of length

Name

entity_nsei - Entity NSEI

Syntax

--entity_nsei <string>

Description

Entity NSEI.

Class

Optional.

Type / Range

Digit string of length

Name

entity_nsvci - Entity NSVCI

Syntax

--entity_nsvci <string>

Description

Entity NSVCI.

Class

Optional.

Type / Range

Digit string of length

Name

entity_olac - Entity old LAC

Syntax

--entity_olac <string>

Description

Entity old LAC.

Class

Optional.

Type / Range

Digit string of length

Name

entity_operdefqci - Entity operdefqci

Syntax

--entity_operdefqci <string>

Description

Entity operdefqci.

Class

Optional.

Type / Range

Digit string of length

Name

entity_oplmn - Entity old PLMN

Syntax

--entity_oplmn <string>

Description

Entity old PLMN.

Class

Optional.

Type / Range

Digit string of length

Name

entity_orac - Entity old RAC

Syntax

--entity_orac <string>

Description

Entity old RAC.

Class

Optional.

Type / Range

Digit string of length

Name

entity_ornc - Entity old RNC

Syntax

--entity_ornc <string>

Description

Entity old RNC.

Class

Optional.

Type / Range

Digit string of length

Name

entity_pagingtype - Entity pagingtype

Syntax

--entity_pagingtype <string>

Description

Entity pagingtype.

Class

Optional.

Type / Range

Digit string of length

Name

entity_partner - Entity partner

Syntax

--entity_partner <string>

Description

Entity partner.

Class

Optional.

Type / Range

Digit string of length

Name

entity_plmn - Entity PLMN

Syntax

--entity_plmn <string>

Description

Entity PLMN.

Class

Optional.

Type / Range

Digit string of length

Name

entity_pltc - Entity PLTC

Syntax

--entity_pltc <string>

Description

Entity PLTC.

Class

Optional.

Type / Range

Digit string of length

Name

entity_rac - Entity RAC

Syntax

--entity_rac <string>

Description

Entity RAC.

Class

Optional.

Type / Range

Digit string of length

Name

entity_rautype - Entity RAU type

Syntax

--entity_rautype <string>

Description

Entity RAU type.

Class

Optional.

Type / Range

Digit string of length

Name

entity_reselection - Entity reselection

Syntax

--entity_reselection <string>

Description

Entity reselection.

Class

Optional.

Type / Range

Digit string of length

Name

entity_rip - Entity remote IP

Syntax

--entity_rip <string>

Description

Entity remote IP.

Class

Optional.

Type / Range

Digit string of length

Name

entity_riotp - Entity remote IP type

Syntax

--entity_riotp <string>

Description

Entity remote IP type.

Class

Optional.

Type / Range

Digit string of length

Name

entity_rncid - Entity RNC ID

Syntax

--entity_rncid <string>

Description

Entity RNC ID.

Class

Optional.

Type / Range

Digit string of length

Name

entity_rudp - Entity remote UDP port

Syntax

--entity_rudp <string>

Description

Entity remote UDP port.

Class

Optional.

Type / Range

Digit string of length

Name

entity_sac - Entity SAC

Syntax

--entity_sac <string>

Description

Entity SAC.

Class

Optional.

Type / Range

Digit string of length

Name

entity_snet - Entity signaling network

Syntax

--entity_snet <string>

Description

Entity signaling network.

Class

Optional.

Type / Range

Digit string of length

Name

entity_spc - Entity signaling point code

Syntax

--entity_spc <string>

Description

Entity signaling point code.

Class

Optional.

Type / Range

Digit string of length

Name

entity_ssname - Entity subsystem name

Syntax

--entity_ssname <string>

Description

Entity subsystem name.

Class

Optional.

Type / Range

Digit string of length

Name

entity_ssnumber - Entity subsystem number

Syntax

--entity_ssnumber <string>

Description

Entity subsystem number.

Class

Optional.

Type / Range

Digit string of length

Name

entity_tac - Entity TAC

Syntax

--entity_tac <string>

Description

Entity TAC.

Class

Optional.

Type / Range

Digit string of length

Name

group - CounterGroup PID

Syntax

--group <string>

Description

Counter Group PID(e.g. m128).

Class

Optional.

Type / Range

Digit string of length

Name

mode - Mode

Syntax

--mode <string>

Description

When set to 'detailed', show the counter definition when a counter value is unavailable.

Class

Optional.

Type / Range

Digit string of length

Name

period - Time period

Syntax

--period <string>

Description

Time period only within the last 15 minutes (e.g. 2m, 5m, 10m)

Class

Optional.

Type / Range

Digit string of length

Name

pid - Counter PID

Syntax

--pid <string>

Description

Counter PID(e.g. m101c001).

Class

Optional.

Type / Range

Digit string of length

Name

source - Source filter

Syntax

--source <string>

Description

Source filter.

Class

Optional.

Type / Range

Digit string of length

Name

sourceHost - Source hostname

Syntax

--sourceHost <string>

Description

Source hostname.

Class

Optional.

Type / Range

Digit string of length

Name

sourceIp - Source hostip

Syntax

--sourceIp <string>

Description

Source hostip.

Class

Optional.

Type / Range

Digit string of length

Name

startTime - Starting time

Syntax

--startTime <string>

Description

Starting time('yyyy-mm-dd HH:MM:SS') Only the data of maximum last 15 minutes will be returned.

Class

Optional.

Type / Range

Digit string of length 19 to 19 with the allowed pattern of (\d{4}-\d{2}-\d{2} \d{2}:\d{2}:\d{2})

Roles**List**

sysadmin, manage, monitor

Meta

sysadmin, manage

Show

sysadmin, manage, monitor

4.65 cmm counterDefinition

Counter Definition. Syntax, description, parameters, and roles for cmm counterDefinition command.

Syntax**Description**

This command has two operations: The list operation is used to list counter definitions. The show operation is used to show counter definitions. Note: Before CMM195BR, the command was cmm counter definition instead of cmm counterDefinition. For backwards compatibility, both versions of the command are supported.

Parameters**Name**

group - Counter group

Syntax

--group <string>

Description

CounterGroup PID(e.g. m101c0).

Class

Optional.

Type / Range

Digit string of length

Roles**List**

sysadmin, manage, monitor

Show

sysadmin, manage, monitor

4.66 cmm counterGroupDefinition

Counter Group Definition List. Syntax, description, parameters, and roles for cmm counterGroupDefinition command.

Syntax**Description**

This command is used to list or show counter group definitions. Note: Before CMM195BR, the command was cmm counterGroup definition instead of cmm counterGroupDefinition. For backwards compatibility, both versions of the command are supported.

Parameters

N/A

Roles**List**

sysadmin, manage, monitor

Show

sysadmin, manage, monitor

4.67 cmm cpi

Critical Performance Indicator Threshold. Syntax, description, parameters, and roles for cmm cpi command.

Syntax

Description

Administer the Critical Performance Indicator Threshold

Parameters

Name

cpiService - CPI service

Syntax

--cpiService <list-item>

Description

CPI service.

Class

Required key.

List

- CPPS - Control plane processing service - Specify service of control plane processing service.
- IPDS - Internet protocol director service - Specify service of internet protocol director service.
- PAPS - Packet processing service - Specify service of packet processing service.

Name

cpiElement - CPI element

Syntax

--cpiElement <list-item>

Description

CPI element name.

Class

Required key.

List

- AttachFailures - Failure rate for attach procedures.

- AttachFailuresSysRelated - Failure rate for system-related attach procedures.
- AttachWithPGWreselection - PGW reselection rate during attach.
- AttachWithSGWreselection - SGW reselection rate during attach.
- CreateDedicatedBearerFailures - Failure rate for create dedicated bearer procedure.
- DeactivateDedBearerFailures - Failure rate for deactivate dedicated bearer.
- EIRfailuresS13 - Failure rate for unsuccessful equipmentcheckrequests (ECRs) to the number of ECRs attempted.
- ExtServiceReqFailuresSysRelated - System related extended service request failures.
- ExtServiceRequestFailures - Extended service request failures.
- FailuresOverSGs - Failure rate for procedures between the MME and the UE context using SGs.
- GTPcResponseTOS3 - Failure rate for GTPc response to S3.
- GTPcResponseTO_Gn - Failure rate for GTPc expected response to messages timed out (Gn interface).
- GTPcResponseTO_S10 - Failure rate for GTP-C expected response messages timed out (S10 interface).
- GTPcResponseTO_S11 - Failure rate for GTP-C expected response messages timed out (S11 interface).
- GTPcResponseTO_Sv - Failure rate for GTPc expected response to messages timed out (Sv interface).
- HOFailuresTo3G2GOverGn - Failure rate for handover to UTRAN/GERAN scenarios over gn.
- HOFailuresToLTEOverGn - Failure rate for handover from UTRAN/GERAN scenarios over gn.
- HOfailuresFromGERANoverS3 - Handover from GERAN over S3.
- HOfailuresFromUTRANoverS3 - Handover failures from UTRAN over S3.
- HOfailuresRAUto2G3GOverS3 - Handover failures RAU to 2G3G over S3.
- HOfailuresRAUto2G3GnewSgwOverS3 - HOfailuresRAUto2G3GnewSgwOverS3 over S3 with SGW relocation.
- HOfailuresRAUto2G3GsameSgwOverS3 - RAU-Based handover to UTRAN/GERAN over S3 without SGW relocation.
- HOfailuresToGERANoverS3 - Handover to GERAN over S3.
- HOfailurestoUTRANoverS3 - Handover failures to UTRAN over S3.

- HOwMMERelocFailures_atSource - Failure rate for handover with MME relocation scenario (at a source MME).
- HOwMMERelocFailures_atTarget - Failure rate for handover with MME relocation scenario (at a target MME).
- HOwNoRelocFailures - Failure rate for handover without MME relocation.
- HOwSGWrelocFailures - Failure rate for handover without MME relocation and with SGW relocation scenario.
- HSSauthFailures - Failure rate for HSS authentication.
- HSSreselection - HSS reselection rate.
- MBMSSessionStartM3FailureRate - MBMS session start M3 failure rate.
- MBMSSessionStartSmFailureRate - MBMS session start sm failure rate.
- MBMSSessionStopM3FailureRate - MBMS session stop M3 failure rate.
- MBMSSessionStopSmFailureRate - MBMS session stop sm failure rate.
- MBMSSessionUpdateM3FailureRate - MBMS session update M3 failure rate.
- MBMSSessionUpdateSmFailureRate - MBMS session update sm failure rate.
- MMEUEcapacity - MME capacity thresholds.
- MobileTermLocRequestFailures - Mobile termination location request failures.
- NetwrkInducedLocRequestFailures - Network induced location request failures.
- NoPSHOFailuresOverSv - Failure rate for hand down to UTRAN/GERAN over Sv without PSHO.
- PDNconnWithPGWreselection - PGW reselection rate during PDN connectivity procedures.
- PSHOFailuresOverSv - Failure rate for hand down to UTRAN/GERAN over Sv with PSHO.
- S1MMEconnFailures - Failure rate for S1-MME failed connection attempts.
- S3TauFailures - S3 TAU failures.
- S3TauFailuresInterSgw - S3 TAU intersgw failures.
- S3TauFailuresIntraSGW - S3 TAU intrasgw failures.
- ServiceReqFailuresSysRelated - Failure rate for system-related UE service request procedures.
- ServiceRequestFailures - Failure rate for UE service request procedures.
- Sgsn2GattachFailures - GPRS attach failure in GERAN.
- Sgsn2GpagingFailures - PS paging failure in GERAN.
- Sgsn2GpdpActFailures - MS initiated PDP context activation failure in GERAN.

- Sgsn2GpdpDeactmsFailures - MS initiated PDP CONTEXT deactivation failure in GERAN.
- Sgsn2GrauFailures - RAU failure rate in GERAN.
- Sgsn3GattachFailures - GPRS attach failure in UTRAN.
- Sgsn3GpagingFailures - PS paging failure in UTRAN.
- Sgsn3GpdpActFailures - MS initiated PDP context activation failure in UTRAN.
- Sgsn3GpdpDeactmsFailures - MS initiated PDP context deactivation failure in UTRAN.
- Sgsn3GrauFailures - RAU failure rate in UTRAN.
- SgsnGtpcResponseTO_S16 - SGSN GTP-C expected response time out for S16.
- SgsnGtpcResponseTO_S3 - SGSN GTP-C expected response time out for S3.
- SgsnGtpcResponseTO_S4 - SGSN GTP-C expected response time out for S4.
- StopWarnMsgDeliveryS1MMEFailureRate - Stop warning message delivery S1MME failure rate.
- StopWarnMsgDeliverySBcFailureRate - Stop warning message delivery SBc failure rate.
- TauFailures - Failure rate for TAU scenario.
- TauFailuresInterMme - Failure rate for TAU inter-mme scenario.
- TauFailuresInterMmeInterSgw - Failure rate for TAU procedures for inter MME and inter SGW relocation.
- TauFailuresInterSgw - Failure rate for TAU inter-sgw scenario.
- UEauthFailures - UE authentication failures.
- UpdateBearerFailures - Failure rate for update bearer.
- UpdateDedicatedBearerFailures - Failure rate for update dedicated bearer.
- WarnMsgDeliveryS1MMEFailureRate - Warning message delivery S1MME failure rate.
- WarnMsgDeliverySBcFailureRate - Warning message delivery SBc failure rate.

Name

cpiCritical - Critical alarm

Syntax

--cpiCritical <integer>

Description

CPI threshold for critical alarm.

Class

Optional.

Type / Range

Integer in the range of -1 or 1 to 99 in units of %

Name

cpiEnabled - CPI enable

Syntax

--cpiEnabled <list-item>

Description

When checked (true), defines that CPIs are enabled.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Name

cpiMajor - Major alarm

Syntax

--cpiMajor <integer>

Description

CPI threshold for major alarm.

Class

Optional.

Type / Range

Integer in the range of -1 or 1 to 99 in units of %

Name

cpiMinAttempts - Min number of attempts

Syntax

--cpiMinAttempts <integer>

Description

CPI minimum attempt limit.

Class

Optional.

Type / Range

Integer in the range of 0 to 500

Default

100

Name

cpiMinor - Minor alarm

Syntax

--cpiMinor <integer>

Description

CPI threshold for minor alarm.

Class

Optional.

Type / Range

Integer in the range of -1 or 1 to 99 in units of %

4.68 cmm csfbEmlppPagPriProfile

CSFB eMLPP Paging Priority Profile. Syntax, description, parameters, and roles for cmm csfbEmlppPagPriProfile command.

Syntax**Description**

This command is used to administer a CSFB eMLPP Paging Priority Profile and includes a parameter for defining the paging priority level.

Parameters**Name**

csfbPagingPriProfileName - CSFB paging priority profile name

Syntax

--csfbPagingPriProfileName <string>

Description

Defines the CSFB paging priority profile name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

emlpp - eMLPP

Syntax

--emlpp <integer>

Description

eMLPP.

Class

Required key.

Type / Range

Integer in the range of 0 to 7

Name

pagingPriLevel - Paging priority level

Syntax

--pagingPriLevel <list-item>

Description

Paging priority level.

Class

Optional.

List

- PrioLevel0 - Priority level 0 - Priority level 0. No paging priority is set.
- PrioLevel1 - Priority level 1 - Priority level 1. Highest Paging priority.
- PrioLevel2 - Priority level 2 - Priority level 2.
- PrioLevel3 - Priority level 3 - Priority level 3.
- PrioLevel4 - Priority level 4 - Priority level 4.
- PrioLevel5 - Priority level 5 - Priority level 5.
- PrioLevel6 - Priority level 6 - Priority level 6.
- PrioLevel7 - Priority level 7 - Priority level 7.
- PrioLevel8 - Priority level 8 - Priority level 8. Lowest Paging Priority.

4.69 cmm csfbPagingPriProfile

CSFB Paging Priority Profile. Syntax, description, parameters, and roles for cmm csfbPagingPriProfile command.

Syntax

Description

This command is used to administer a CSFB Paging Priority Profile and includes a parameter for defining the No-eMLPP paging priority level.

Parameters

Name

name - CSFB paging priority profile name

Syntax

--name <digits>

Description

Defines the CSFB paging priority profile name.

Class

Required key.

Type / Range

Digit string of length 1 to 1 with the allowed pattern of [1-8]*

Name

description - Description

Syntax

--description <string>

Description

Profile description.

Class

Optional.

Type / Range

Digit string of length 0 to 160 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

''

Name

noeMlppPagingPriLevel - No-eMLPP paging priority level

Syntax

--noeMlppPagingPriLevel <list-item>

Description

No-eMLPP paging priority level.

Class

Optional.

List

- PrioLevel0 - Priority level 0 - Priority level 0. No paging priority is set.
- PrioLevel1 - Priority level 1 - Priority level 1. Highest Paging priority.
- PrioLevel2 - Priority level 2 - Priority level 2.
- PrioLevel3 - Priority level 3 - Priority level 3.
- PrioLevel4 - Priority level 4 - Priority level 4.
- PrioLevel5 - Priority level 5 - Priority level 5.
- PrioLevel6 - Priority level 6 - Priority level 6.
- PrioLevel7 - Priority level 7 - Priority level 7.
- PrioLevel8 - Priority level 8 - Priority level 8. Lowest Paging Priority.

4.70 cmm dataTrafficList

Data Traffic List. Syntax, description, parameters, and roles for cmm dataTrafficList command.

Syntax

Description

Data Traffic List.

Parameters

Name

name - Data traffic list name

Syntax

--name <string>

Description

Data traffic list name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

4.71 cmm dataTrafficListNi

Data Traffic List NI. Syntax, description, parameters, and roles for cmm dataTrafficListNi command.

Syntax**Description**

Administer Data Traffic List NI.

Parameters**Name**

dataTrafficListName - Data traffic list name

Syntax

--dataTrafficListName <string>

Description

Data traffic list name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

apnNi - Network indicator

Syntax

--apnNi <string>

Description

Access point name - network indicator.

Class

Required key.

Type / Range

Digit string of length 1 to 62 with the allowed pattern of [0-9a-zA-Z\._]*

Roles**Create**

sysadmin, manage

4.72 cmm dcaeServer

DCAE Server Interface. Syntax, description, parameters, and roles for **cmm dcaeServer** command.

Syntax**Description**

Provision the address of the ONAP Server for DCAE

Parameters**Name**

dcaeReportId - ONAP report ID

Syntax

--dcaeReportId <list-item>

Description

Type of report for the ONAP server.

Class

Required key.

List

- amfRTPMReport - AMF Real Time PM Report - AMF Real Time PM Data
- mmeRTPMReport - MME Real Time PM Report
- nonRTPMReport - Non Real Time PM Report - Non Real Time PM Data for AMF, MME, SGSN
- sgsnRTPMReport - SGSN Real Time PM Report

Name

primaryIp - ONAP server Primary IP

Syntax

--primaryIp <string>

Description

Primary IP address of the ONAP server.

Class

Required on create.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

primaryPort - Primary Port

Syntax

--primaryPort <integer>

Description

Primary port address of service.

Class

Required on create.

Type / Range

Integer in the range of 1,024 to 65,535

Name

dcaeConnName - Connection Name for DCAE

Syntax

--dcaeConnName <string>

Description

Name used to identify the AMF on DCAE connection

Restrictions

This parameter is required only if the dcaeReportId = NonRTPMReport

Class

Optional.

Type / Range

Digit string of length 0 or 1 to 64 with the allowed pattern of [0-9a-zA-Z\._:-]*

Default

"

Name

dcaeConnWord - DCAE Connection word

Syntax

--dcaeConnWord <string>

Description

Connection word for DCAE

Restrictions

This parameter is required only if the dcaeReportId = NonRTPMReport

Class

Optional.

Type / Range

Digit string of length 0 or 1 to 64 with the allowed pattern of [0-9a-zA-Z\.\-_:]*

Default

"

Name

dscpCode - DSCP Code

Syntax

--dscpCode <list-item>

Description

Parameter to set DSCP code to be used for an IP packet.

Class

Optional.

List

- AF11 - Assured forwarding 11.
- AF12 - Assured forwarding 12.
- AF13 - Assured forwarding 13.
- AF21 - Assured forwarding 21.
- AF22 - Assured forwarding 22.
- AF23 - Assured forwarding 23.
- AF31 - Assured forwarding 31.
- AF32 - Assured forwarding 32.
- AF33 - Assured forwarding 33.
- AF41 - Assured forwarding 41.
- AF42 - Assured forwarding 42.
- AF43 - Assured forwarding 43.
- BE - BE.
- CS1 - Class selector 1.
- CS2 - Class selector 2.

- CS3 - Class selector 3.
- CS4 - Class selector 4.
- CS5 - Class selector 5.
- CS6 - Class selector 6.
- CS7 - Class selector 7.
- EF - Expedited forwarding.
- voiceAdmit - Voice Admit

Default

AF41

Name

oamTlsProfileName - OAM TLS Profile

Syntax

--oamTlsProfileName <string>

Description

This parameter contains the profile for TLS. It contains the certificate names needed for establishing secure communication.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

"

Name

secondaryIp - ONAP server Secondary IP

Syntax

--secondaryIp <string>

Description

Secondary IP address of the ONAP server.

Class

Optional.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Default

0.0.0.0

Name

secondaryPort - Secondary Port

Syntax

--secondaryPort <integer>

Description

Secondary port address of service

Class

Optional.

Type / Range

Integer in the range of 0 or 1,024 to 65,535

Default

0

Name

tcpProfileName - TCP Profile Name

Syntax

--tcpProfileName <string>

Description

Configure TCP profile to the endpoint.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

4.73 cmm dcnIdUeUsageType

DCN ID supported UE Usage Types. Syntax, description, parameters, and roles for cmm dcnIdUeUsageType command.

Syntax

Description

This command is used to provision UE Usage Types for a DCN ID.

Parameters

Name

dcnId - Default Dedicated Core Network ID

Syntax

--dcnId <integer>

Description

DCN ID to which UE Usage Types are provisioned.

Class

Required key.

Type / Range

Integer in the range of 1 to 126 or 128 to 65,535

Name

ueUsageType - UE Usage Type

Syntax

--ueUsageType <integer>

Description

Provision UE Usage Types per DCN ID. A maximum of 32 UE Usage Types can be provisioned to a DCN ID. The UE Usage Types must be unique across DCN IDs

Class

Required key.

Type / Range

Integer in the range of 1 to 126 or 128 to 255

4.74 cmm dcnIdUutRoamers

DCN ID UE Usage TType for Roamers. Syntax, description, parameters, and roles for cmm dcnIdUutRoamers command.

Syntax

Description

This command maps an inbound roamer UUT, if present in subscription data, to an internal Dedicated Core Network ID.

Parameters

Name

uut - UE Usage Type

Syntax

--uut <integer>

Description

The UE Usage Type as specified in the profile from the HSS for the inbound roamer UE.

Class

Required key.

Type / Range

Integer in the range of 1 to 126 or 128 to 255

Name

dcnId - DCN ID

Syntax

--dcnId <integer>

Description

Dedicated Core Network Identifier

Class

Required on create.

Type / Range

Integer in the range of 1 to 126 or 128 to 65,535

Name

ueUsageTypeForGwSelection - UE Usage Type for GW Selection

Syntax

--ueUsageTypeForGwSelection <integer>

Description

UE Usage Type to be used solely for DNS selection queries for SGW and PGW.

Class

Required on create.

Type / Range

Integer in the range of 1 to 126 or 128 to 255

4.75 cmm dcnMmeGrp

MME Group for DCN. Syntax, description, parameters, and roles for cmm dcnMmeGrp command.

Syntax**Description**

MME Group provision for DCN

Parameters

Name

name - Name of the MME Group

Syntax

--name <string>

Description

Name of the MME group.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

mmeGi - MME Group Identifier

Syntax

--mmeGi <integer>

Description

MME Group Identifier

Class

Required on create, not modifiable.

Type / Range

Integer in the range of 0 to 65,535

Name

servedPlmnName - Served PLMN Name

Syntax

--servedPlmnName <string>

Description

Name of the PLMN to which the MME group belongs to.

Class

Required on create, not modifiable.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Roles

Create

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

4.76 cmm defaultNotifications

Default Notifications. Syntax, description, parameters, and roles for cmm defaultNotifications command.

Syntax

Description

List containing pointers to default notification subscriptions. A maximum of 16 default notification subscription pointers can be added.

Parameters

Name

defaultNotificationSubscriptionListName - Default Notification Subscription List Name

Syntax

```
--defaultNotificationSubscriptionListName <string>
```

Description

Default Notification Subscription List Name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

defaultNotificationSubscriptionName - Default Notification Subscription Name

Syntax

```
--defaultNotificationSubscriptionName <string>
```

Description

Default Notification Subscription Name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

4.77 cmm defaultNotificationSubscription

Notification endpoints for different notification types. Syntax, description, parameters, and roles for cmm defaultNotificationSubscription command.

Syntax**Description**

Default notification endpoints for different notifications. Other NF use this information to send notifications.

Parameters**Name**

name - Notification name

Syntax

--name <string>

Description

Notification name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

callbackUri - Callback URI

Syntax

--callbackUri <string>

Description

The callback URI used for the notification.

Class

Required on create.

Type / Range

Digit string of length 512 with the allowed pattern of (http:\\|https:\\)[0-9a-zA-Z\\.\\-\\~\$+* _;&=#?\\[\\]@,()\\! '%]*

Name

n1MessageClass - N1 Message Class

Syntax

--n1MessageClass <list-item>

Description

If the notification type is N1_MESSAGES, this IE must be provisioned to identify class of N1 messages.

Class

Optional.

List

- 5GMM - 5G Mobility Management N1 messages - The whole NAS message as received (for e.g. used in forwarding the Registration message to target AMF during Registration procedure with AMF redirection).
- LPP - LPP N1 message
- SM - Session Management N1 messages
- SMS - SMS N1 message - The N1 message of SMS type.

Default

5GMM

Name

n2InformationClass - N2 Information Class

Syntax

--n2InformationClass <list-item>

Description

If the notification type is N2_INFORMATION, this parameter must be provisioned to identify N2 Information Class.

Class

Optional.

List

- NRPPa - N2 NRRPa information
- PWS - N2 PWS Information
- PWS_BCAL - N2 Broadcast Completed Area List or the Broadcast Cancelled Area List.
- PWS_RF - N2 Restart Indication or Failure Indication
- RAN - N2 RAN related information
- SM - N2 SM Information

Default

NRPPa

Name

notificationType - Notification Type

Syntax

--notificationType <list-item>

Description

Type of notification for which the corresponding callback URI is provided.

Class

Optional.

List

- LOCATION_NOTIFICATION - Location Notification - Notification of Location Information by AMF towards NF Service Consumers (e.g GMLC).
- N1_MESSAGES - N1 Messages - Notification of N1 messages
- N2_INFORMATION - N2 Information - Notification of N2 information

Default

N1_MESSAGES

4.78 cmm defaultNotificationSubscriptionList

Default Notification Subscription List. Syntax, description, parameters, and roles for cmm defaultNotificationSubscriptionList command.

Syntax

Description

Create a Default Notification Subscription list.

Parameters

Name

name - List Name

Syntax

--name <string>

Description

List name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Roles

Create

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

4.79 cmm delayUdmDuringRegistrationProfile

Delay UDM During Registration Profile. Syntax, description, parameters, and roles for cmm delayUdmDuringRegistrationProfile command.

Syntax

Description

Define the parameters for delayed UDM dialogs during Registration, and for re-attempting the delayed UDM dialogs during subsequent procedures. Maximum number of profiles is 128.

Parameters

Name

name - Name

Syntax

--name <string>

Description

The name of the Delay UDM During Registration Profile.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

automaticReattempts - Automatic Reattempts

Syntax

--automaticReattempts <list-item>

Description

Enables the AMF to automatically reattempt any delayed UDM dialogs of the UE during subsequent UE triggered Registration/Service request procedures.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

delayUdmDuringRegistration - Delay UDM During Registration

Syntax

--delayUdmDuringRegistration <list-item>

Description

When the same AMF still holds the UE data internally after previous N26 mobility to EPS, this parameter enables AMF to successfully complete the registration procedure and suppress the UDM dialogs (Nudm_UECM_Registration, Nudm_SDM_Get and/or Nudm_SDM_Subscribe, depending on other settings) for the enabled UEs. The UDM dialogs will be re-attempted automatically according to provisioning. Note: this functionality only is effective when the AMF global parameter Keep VLR Entry is set to true.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Modify

sysadmin, manage

Delete

sysadmin, manage

List

sysadmin, manage, monitor

4.80 cmm detachBehaviorMappingProfile

Detach Behavior Mapping Profile. Syntax, description, parameters, and roles for cmm detachBehaviorMappingProfile command.

Syntax

Description

This command is used to administer a Detach Behavior Mapping Profile and includes parameters for defining cause codes and detach types for various scenarios related to UE detach. A default profile, named 'default' is provided.

Parameters

Name

name - Detach behavior mapping profile name

Syntax

--name <string>

Description

Identifies, via name, a given detach behavior mapping.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Name

adminDeleteUeContextCc - Delete UE context cause code

Syntax

--adminDeleteUeContextCc <integer>

Description

NAS Cause code to include in Detach Request when UE context is deleted

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

10

Name

adminDeleteUeContextDetachType - Delete UE context detach type

Syntax

--adminDeleteUeContextDetachType <list-item>

Description

Detach type when UE context is deleted via administrative action e.g. cli command

Class

Optional.

List

- Reattach not required - Reattached not required - Specifies detach type of reattach not required.
- Reattach required - Specifies detach type of reattach required.

Default

Reattach required

Name

adminDeleteUeContextNotifyIdleUe - Delete UE context notify idle UE

Syntax

--adminDeleteUeContextNotifyIdleUe <list-item>

Description

Page UE if in the CM-idle when deleting UE context via administrative action e.g. cli command

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

adminDeleteUeContextSendCc - Delete UE context send cause code

Syntax

--adminDeleteUeContextSendCc <list-item>

Description

Include cause code in detach request when detach reason is due to deleting UE context

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

apnAdminCc - APN Administration Cause Code

Syntax

--apnAdminCc <integer>

Description

Configure the NAS EMM cause code to be used on the Detach Request as part of the APN administration functionality. MME performs detach for a UE when the PDNs towards the provisioned APN(s) are commanded to be deactivated from MME, and the UE only has PDN(s) towards the defined APN(s).

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

10

Name

apnAdminDetachType - APN Administration Detach Type

Syntax

--apnAdminDetachType <list-item>

Description

Configure the detach type to be used for APN administration functionality. The MME detaches the UE when the PDNs towards defined APN(s) are to be deactivated and the UE only has PDN(s) towards the defined APN(s).

Class

Optional.

List

- Reattach not required - Reattached not required - Specifies detach type of reattach not required.
- Reattach required - Specifies detach type of reattach required.

Default

Reattach not required

Name

apnAdminNotifyIdleUe - APN Administration Notify Idle UE

Syntax

--apnAdminNotifyIdleUe <list-item>

Description

Define whether an ECM-IDLE UE will be paged for detaching due to the APN Administration.
By default the detaching will be implicit without contacting an ECM-IDLE UE.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

apnAdminSendCc - APN Administration Send CC

Syntax

--apnAdminSendCc <list-item>

Description

Define whether to include NAS EMM cause code on Detach Request when the MME detaches the UE due to APN Administration functionality.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

clrSubWithdrawalCc - CLR with cancellation type subscription withdrawal cause code

Syntax

--clrSubWithdrawalCc <integer>

Description

Cause code to send when detach reason is CLR with cancellation type subscription withdrawal.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

10

Name

clrSubWithdrawalDetachType - CLR with cancellation type subscription withdrawal detach type

Syntax

--clrSubWithdrawalDetachType <list-item>

Description

Detach type when detach reason is CLR with cancellation type subscription withdrawal.

Class

Optional.

List

- Reattach not required - Reattached not required - Specifies detach type of reattach not required.
- Reattach required - Specifies detach type of reattach required.

Default

Reattach not required

Name

clrSubWithdrawalNotifyIdleUe - CLR with cancellation type subscription withdrawal notify idle UE

Syntax

--clrSubWithdrawalNotifyIdleUe <list-item>

Description

Page a UE, if it is in the ECM idle state, when detach reason is CLR with cancellation type subscription withdrawal.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

clrSubWithdrawalSendCc - CLR with cancellation type subscription withdrawal send cause code

Syntax

--clrSubWithdrawalSendCc <list-item>

Description

Include cause code in detach when detach reason is CLR with cancellation type subscription withdrawal.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

delBearerReqCcCc - Delete bearer request with CC cause code

Syntax

--delBearerReqCcCc <integer>

Description

Cause code to send when detach reason is delete bearer request with cause code.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

10

Name

delBearerReqCcDetachType - Delete bearer request with CC detach type

Syntax

--delBearerReqCcDetachType <list-item>

Description

Detach type when detach reason is delete bearer request with cause code.

Class

Optional.

List

- Reattach not required - Reattached not required - Specifies detach type of reattach not required.
- Reattach required - Specifies detach type of reattach required.

Default

Reattach not required

Name

delBearerReqCcImsCc - IMS delete bearer request with CC cause code

Syntax

--delBearerReqCcImsCc <integer>

Description

Cause code to send for IMS when detach reason is delete bearer request with cause code.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

10

Name

delBearerReqCcImsDetachType - IMS delete bearer request with CC detach type

Syntax

--delBearerReqCcImsDetachType <list-item>

Description

Detach type for IMS when detach reason is delete bearer request with cause code.

Class

Optional.

List

- Reattach not required - Reattached not required - Specifies detach type of reattach not required.
- Reattach required - Specifies detach type of reattach required.

Default

Reattach not required

Name

delBearerReqCcImsNotifyIdleUe - IMS delete bearer request with CC notify idle UE

Syntax

--delBearerReqCcImsNotifyIdleUe <list-item>

Description

Page a UE for IMS, if it is in the ECM idle state, when detach reason is delete bearer request with cause code.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

delBearerReqCcImsSendCc - IMS delete bearer request with CC send cause code

Syntax

--delBearerReqCcImsSendCc <list-item>

Description

Include cause code for IMS in detach when detach reason is delete bearer request with cause code.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

delBearerReqCcNotifyIdleUe - Delete bearer request with CC notify idle UE

Syntax

--delBearerReqCcNotifyIdleUe <list-item>

Description

Page a UE, if it is in the ECM idle state, when detach reason is delete bearer request with cause code.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

delBearerReqCcSendCc - Delete bearer request with CC send cause code

Syntax

--delBearerReqCcSendCc <list-item>

Description

Include cause code in detach when detach reason is delete bearer request with cause code.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

delBearerReqNoCcCc - Delete bearer request with no CC cause code

Syntax

--delBearerReqNoCcCc <integer>

Description

Cause code to send when detach reason is delete bearer request with no cause code.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

10

Name

delBearerReqNoCcDetachType - Delete bearer request with no CC detach type

Syntax

--delBearerReqNoCcDetachType <list-item>

Description

Detach type when detach reason is delete bearer request with no cause code.

Class

Optional.

List

- Reattach not required - Reattached not required - Specifies detach type of reattach not required.
- Reattach required - Specifies detach type of reattach required.

Default

Reattach not required

Name

delBearerReqNoCclmsCc - IMS delete bearer request with no CC cause code

Syntax

--delBearerReqNoCcImsCc <integer>

Description

Cause code to send for IMS when detach reason is delete bearer request with no cause code.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

10

Name

delBearerReqNoCclmsDetachType - IMS delete bearer request with no CC detach type

Syntax

--delBearerReqNoCcImsDetachType <list-item>

Description

Detach type for IMS when detach reason is delete bearer request with no cause code.

Class

Optional.

List

- Reattach not required - Reattached not required - Specifies detach type of reattach not required.
- Reattach required - Specifies detach type of reattach required.

Default

Reattach not required

Name

delBearerReqNoCclmsNotifyIdleUe - IMS delete bearer request with no CC notify idle UE

Syntax

--delBearerReqNoCcImsNotifyIdleUe <list-item>

Description

Page a UE for IMS, if it is in the ECM idle state, when detach reason is delete bearer request with no cause code.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

delBearerReqNoCcImsSendCc - IMS delete bearer request with no CC send cause code

Syntax

--delBearerReqNoCcImsSendCc <list-item>

Description

Include cause code for IMS in detach when detach reason is delete bearer request with no cause code.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

delBearerReqNoCcNotifyIdleUe - Delete bearer request with no CC notify idle UE

Syntax

--delBearerReqNoCcNotifyIdleUe <list-item>

Description

Page a UE, if it is in the ECM idle state, when detach reason is delete bearer request with no cause code.

Class

Optional.

List

- false - Boolean value of false.

- true - Boolean value of true.

Default

false

Name

delBearerReqNoCcSendCc - Delete bearer request with no CC send cause code

Syntax

--delBearerReqNoCcSendCc <list-item>

Description

Include cause code in detach when detach reason is delete bearer request with no cause code.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

description - Profile description

Syntax

--description <string>

Description

Profile description.

Class

Optional.

Type / Range

Digit string of length 0 to 160 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

failopenRestorationCc - Failopen Restoration Cause Code

Syntax

--failopenRestorationCc <integer>

Description

Define the NAS EMM cause code on Detach Request due to HSS unavailability manual restoration, when the MME detaches a UE that has been attached with the help of the failopen profile.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

10

Name

failopenRestorationDetachType - Failopen Restoration Detach Type

Syntax

--failopenRestorationDetachType <list-item>

Description

Configure the Detach Type when the MME due to HSS unavailability manual restoration detaches a UE that has been attached with the help of the failopen profile.

Class

Optional.

List

- Reattach not required - Reattached not required - Specifies detach type of reattach not required.
- Reattach required - Specifies detach type of reattach required.

Default

Reattach required

Name

failopenRestorationNotifyIdleUe - Failopen Restoration Notify Idle UE

Syntax

--failopenRestorationNotifyIdleUe <list-item>

Description

Define whether an ECM-IDLE UE will be paged for detaching, when the MME due to HSS unavailability manual restoration detaches a UE that has been attached with the help of the failopen profile.

Class

Optional.

List

- false - Boolean value of false.

- true - Boolean value of true.

Default

false

Name

failopenRestorationSendCc - Failopen Restoration Send CC

Syntax

--failopenRestorationSendCc <list-item>

Description

Define whether to include NAS EMM cause code on Detach Request when the MME detaches the UE due to manual HSS unavailability restoration, and the UE has been attached with the help of the failopen profile. By default no EMM cause code is included.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

imsPdnActivationTimerExpiredCc - IMS PDN Activation Timer Expired CC

Syntax

--imsPdnActivationTimerExpiredCc <integer>

Description

Configure the NAS EMM cause code to be used on the Detach Request as part of the IMS supervision functionality. MME performs detach for a UE when the IMS PDN Activation Timer expires and IMS PDN is not activated.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

10

Name

imsPdnActivationTimerExpiredDetachType - IMS PDN Activation Timer Expired Detach Type

Syntax

--imsPdnActivationTimerExpiredDetachType <list-item>

Description

Configure the detach type to be used for IMS supervision functionality. The MME detaches the UE when the IMS PDN Activation Timer expires and IMS PDN is not activated.

Class

Optional.

List

- Reattach not required - Reattached not required - Specifies detach type of reattach not required.
- Reattach required - Specifies detach type of reattach required.

Default

Reattach not required

Name

imsPdnActivationTimerExpiredNotifyIdleUe - IMS PDN Activation Timer Expired Notify Idle UE

Syntax

```
--imsPdnActivationTimerExpiredNotifyIdleUe <list-item>
```

Description

Define whether an ECM-IDLE UE will be paged for detaching after the IMS PDN Activation Timer has expired and IMS PDN is not activated.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

imsPdnActivationTimerExpiredSendCc - IMS PDN Activation Timer Expired Send CC

Syntax

```
--imsPdnActivationTimerExpiredSendCc <list-item>
```

Description

Define whether to include NAS EMM cause code on Detach Request when the MME detaches the UE due to IMS PDN Activation Timer expiry and the IMS PDN is not activated. By default no EMM cause code is included.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

imsRegistrationFailedCc - IMS Registration Failed CC

Syntax

--imsRegistrationFailedCc <integer>

Description

Configure the NAS EMM cause code used on Detach Request when the IMS Registration Timer expires and the UE has not performed successful IMS registration.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

10

Name

imsRegistrationFailedDetachType - IMS Registration Failed Detach Type

Syntax

--imsRegistrationFailedDetachType <list-item>

Description

Configure the Detach Type when the UE is detached due to IMS Registration Timer expiry and the UE has not performed successful IMS registration.

Class

Optional.

List

- Reattach not required - Reattached not required - Specifies detach type of reattach not required.
- Reattach required - Specifies detach type of reattach required.

Default

Reattach required

Name

imsRegistrationFailedNotifyIdleUe - IMS Registration Failed Notify Idle UE

Syntax

```
--imsRegistrationFailedNotifyIdleUe <list-item>
```

Description

Define whether an ECM-IDLE UE will be paged for detaching when the IMS Registration Timer expires and the UE has not performed successful IMS registration.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

imsRegistrationFailedSendCc - IMS Registration Failed Send CC

Syntax

```
--imsRegistrationFailedSendCc <list-item>
```

Description

Define whether the NAS EMM cause is included in the Detach Request when the UE is detached due to IMS Registration Timer expiry and the UE has not performed successful IMS registration.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

noaUeCc - NOA user unknown NAS cause code

Syntax

```
--noaUeCc <integer>
```

Description

Configure NAS cause code sent when detach reason is user unknown received in notify response from HSS.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

8

Name

noaUeDetachType - NOA user unknown detach type

Syntax

--noaUeDetachType <list-item>

Description

Specify the detach type "Reattach required" or "Reattach not required".

Class

Optional.

List

- Reattach not required - Reattached not required - Specifies detach type of reattach not required.
- Reattach required - Specifies detach type of reattach required.

Default

Reattach not required

Name

noaUeNotifyIdleUe - NOA user unknown notify idle UE

Syntax

--noaUeNotifyIdleUe <list-item>

Description

Enable/disable explicit detach of an ECM-IDLE UE.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

noaUeSendCc - NOA user unknown send NAS cause code

Syntax

--noaUeSendCc <list-item>

Description

Enable/disable inclusion of EMM cause in detach request.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

pcscfBrrReactCc - PCSCF detach bearer request NAS cause code

Syntax

--pcscfBrrReactCc <integer>

Description

Configure NAS cause code sent when detach BR with reactivation requested.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

10

Name

pcscfBrrReactDetachType - PCSCF detach bearer request detach type

Syntax

--pcscfBrrReactDetachType <list-item>

Description

Configure reattach option for det BR with reactivation requested.

Class

Optional.

List

- Reattach not required - Reattached not required - Specifies detach type of reattach not required.
- Reattach required - Specifies detach type of reattach required.

Default

Reattach not required

Name

pcscfBrrReactNotifyIdleUe - PCSCF detach bearer request notify idle UE

Syntax

--pcscfBrrReactNotifyIdleUe <list-item>

Description

Enable/disable paging of idle UE when detach reason is det BR with reactivation requested.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

pcscfBrrReactSendCc - PCSCF detach bearer request send NAS cause code

Syntax

--pcscfBrrReactSendCc <list-item>

Description

Enable/disable inclusion of cause code when det BR with reactivation requested.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

pgwRstCc - PGW restart NAS cause code

Syntax

--pgwRstCc <integer>

Description

NAS cause code to be sent to UE if its detached.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

10

Name

pgwRstDetachType - PGW restart detach type

Syntax

--pgwRstDetachType <list-item>

Description

Specify the detach type "Reattach required" or "Reattach not required".

Class

Optional.

List

- Reattach not required - Reattached not required - Specifies detach type of reattach not required.
- Reattach required - Specifies detach type of reattach required.

Default

Reattach not required

Name

pgwRstNotifyIdleUe - PGW restart notify idle UE

Syntax

--pgwRstNotifyIdleUe <list-item>

Description

Enable/disable explicit detach of an ECM-IDLE UE.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

pgwRstSendCc - PGW restart send NAS cause code

Syntax

--pgwRstSendCc <list-item>

Description

Enable/disable inclusion of EMM cause in detach request.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

sgwRestartCc - SGW restart cause code

Syntax

--sgwRestartCc <integer>

Description

Cause code to send when detach reason is SGW restart.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

10

Name

sgwRestartDetachType - SGW restart detach type

Syntax

--sgwRestartDetachType <list-item>

Description

Detach type when detach reason is SGW restart.

Class

Optional.

List

- Reattach not required - Reattached not required - Specifies detach type of reattach not required.
- Reattach required - Specifies detach type of reattach required.

Default

Reattach required

Name

sgwRestartNotifyIdleUe - SGW restart notify idle UE

Syntax

--sgwRestartNotifyIdleUe <list-item>

Description

Page a UE, if it is in the ECM idle state, when detach reason is SGW restart.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

sgwRestartSendCc - SGW restart send cause code

Syntax

--sgwRestartSendCc <list-item>

Description

Include cause code in detach when detach reason is SGW restart.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

4.81 cmm dfltGateway

Default gateway. Syntax, description, parameters, and roles for cmm dfltGateway command.

Syntax

Description

This command is used to administer a default gateway and includes parameters for defining the pool type, ID, and member ID, assignment type, gateway IP address, and source IP address.

Parameters

Name

poolType - Pool type

Syntax

--poolType <list-item>

Description

Pool (service) type.

Class

Required key.

List

- ALMS - Alarm Service - Alarm Service.
- CPPS - Control plane processing service - Control plane processing service.
- CTCS - Call Trace Collection service - Call Trace Collection service.
- DBS - Database service - Database service.
- EEMS - Event Exposure Management service - Event Exposure Management service.
- IPDS - IP director service - IP director service.
- IPPS - IP packet processing service - IP packet processing service.
- LIHS - Lawful Interception Handling service

- MLIS - Machine Learning Intelligence Service
- NECC - Network element cluster controller - Network element cluster controller.
- NWDS - Network Data Service - NWDAF service
- PAPS - Packet processing service - Packet processing service.
- PCMS - Per Call Measurements Data Service - Per Call Measurements Data (PCMD) Service
- RCIS - Radio Capability Information storage Service
- SFDS - SCTP flow distributor service
- UCDS - User equipment Context Data-dump Service
- UFDS - UDP flow distributor service

Name

poolId - Pool id

Syntax

--poolId <integer>

Description

Pool identification number.

Class

Required key.

Type / Range

Integer in the range of 0 to 39

Name

poolMemberId - Pool member ID

Syntax

--poolMemberId <integer>

Description

Pool member identification number.

Class

Required key.

Type / Range

Integer in the range of 0 to 2

Name

assignmentType - Assignment type

Syntax

--assignmentType <list-item>

Description

Assignment type: fixed or floating

Class

Required key.

List

- fixed - Fixed.
- floating - Floating.

Name

ipv - IP version

Syntax

--ipv <integer>

Description

Internet protocol version number.

Class

Required key.

Type / Range

Integer in the range of 4 or 6

Name

gateway - Gateway IP

Syntax

--gateway <string>

Description

Gateway IP address.

Class

Required on create.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

srcIp - Source IP

Syntax

--srcIp <string>

Description

Source IP address.

Class

Optional.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

4.82 cmm diamAppProfile

diamAppProfile. Syntax, description, parameters, and roles for **cmm diamAppProfile** command.

Syntax**Description**

This command is used to administer an operator defined diameter application profile.

Parameters**Name**

diamAppProfileListName - Diameter Application Profile List Name

Syntax

--diamAppProfileListName <string>

Description

Diameter application profile name

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

diamAppType - Diameter Application Type

Syntax

--diamApplType <list-item>

Description

Diameter Application Types

Class

Required key.

List

- S13 - S13 diam application type.
- S6A - S6AD - S6AD diam application type.
- SGD - SGd diam application type.
- SLG - Slg diam application type.
- T6A - T6A diam application type.

Name

diamApplTimeOut - Diameter Application Timeout

Syntax

--diamApplTimeOut <integer>

Description

Diameter Application Timeout

Class

Optional.

Type / Range

Integer in the range of 1 to 10

Default

5

Roles**Create**

4.83 cmm diamApplProfileList

Diameter Application Profile List. Syntax, description, parameters, and roles for cmm diamApplProfileList command.

Syntax

Description

This command is used to administer the Diameter Application Profile List

Parameters

Name

name - Diameter Application Profile Name

Syntax

--name <string>

Description

Diameter Application Profile Name

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

4.84 cmm diamConnection

Diameter Connections. Syntax, description, parameters, and roles for cmm diamConnection command.

Syntax

Description

This command is used to administer a Diameter connection and includes parameters for defining Diameter request message timeout, application type, minimum number of active connections, origin host and realm names (FQDN), and endpoint names.

Parameters

Name

diamApplType - Application type

Syntax

--diamApplType <list-item>

Description

Diameter application type.

Class

Required key.

List

- S13 - S13 diam application type.
- S6A - S6AD - S6AD diam application type.
- SGD - SGd diam application type.
- SLG - Slg diam application type.
- T6A - T6A diam application type.

Default

S6A

Name

combineApplType - Combine application type

Syntax

--combineApplType <list-item>

Description

Combine application type.

Restrictions

This element must be 'Empty' when diamApplType is not S6A.

Class

Optional.

List

- S6A/S13/SGD - Combined S6a, S13, and SGd interfaces.
- S6A/S13/T6A - Combined S6a, S13, and T6a interfaces.
- S6A/S13/T6A/SGD - Combined S6a, S13, T6a, and SGd interfaces.
- S6A/T6A/SGD - Combined S6a, T6a, and SGd interfaces.
- " - Empty - Interfaces not combined.
- S6A/S13/SLG - Combined S6a, S13 and SLg interfaces.
- S6A/S13/SLG/T6A - Combined S6a, S13, SLg, and T6a interfaces.
- S6A/S13/SLG/SGD - Combined S6a, S13, SLg, and SGd interfaces.
- S6A/S13/SLG/T6A/SGD - Combined S6a, S13, SLg, T6a, and SGd interfaces.
- S6A/S13 - Combined S6a and S13 interfaces.
- S6A/SLG - Combined S6a and SLg interfaces.
- S6A/SGD - Combined S6a and SGd interfaces.
- S6A/SLG/SGD - Combined S6a, SLg, and SGd interfaces.
- S6A/SLG/T6A - Combined S6a, SLg, and T6a interfaces.
- S6A/SLG/T6A/SGD - Combined S6a, SLg, T6a, and SGd interfaces.
- S6A/T6A - Combined S6a, and T6a interfaces.

Default

""

Name

diamApplTimeOut - Application timeout

Syntax

--diamApplTimeOut <integer>

Description

Diameter request message timeout.

Class

Optional.

Type / Range

Integer in the range of 1 to 10

Default

5

Name

diamOrgHost - Origin host

Syntax

--diamOrgHost <string>

Description

FQDN defined for this MME.

Class

Optional.

Type / Range

Digit string of length 0 to 96 with the allowed pattern of [0-9a-zA-Z\.\-_:]*

Name

diamOrgRealm - Origin realm

Syntax

--diamOrgRealm <string>

Description

FQDN for all the MME nodes that can access the HSS host.

Class

Optional.

Type / Range

Digit string of length 0 to 96 with the allowed pattern of [0-9a-zA-Z\.\-_:]*

Name

diamProfileName - Diam profile name

Syntax

--diamProfileName <string>

Description

Diam profile name.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

default

Name

diamUseSctp - Use SCTP

Syntax

--diamUseSctp <list-item>

Description

When checked (true), indicates that SCTP is used to support the diameter sessions.

Restrictions

diamUseSctp must be true.

Class

Read only.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

endpoint1Name - Endpoint 1 name

Syntax

--endpoint1Name <string>

Description

Long name for endpoint 1 id matching the label specified in remote end point configuration.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

endpoint2Name - Endpoint 2 name

Syntax

--endpoint2Name <string>

Description

Long name for endpoint 2 id matching the label specified in remote end point configuration.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

endpoint3Name - Endpoint 3 name

Syntax

--endpoint3Name <string>

Description

Long name for endpoint 3 id matching the label specified in remote end point configuration.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

endpoint4Name - Endpoint 4 name

Syntax

--endpoint4Name <string>

Description

Long name for endpoint 4 id matching the label specified in remote end point configuration.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

endpoint5Name - Endpoint 5 name

Syntax

--endpoint5Name <string>

Description

Long name for endpoint 5 id matching the label specified in remote end point configuration.

Restrictions

This element only applies to diamApplType SLG.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

endpoint6Name - Endpoint 6 name

Syntax

--endpoint6Name <string>

Description

Long name for endpoint 6 id matching the label specified in remote end point configuration.

Restrictions

This element only applies to diamApplType SLG.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

endpoint7Name - Endpoint 7 name

Syntax

--endpoint7Name <string>

Description

Long name for endpoint 7 id matching the label specified in remote end point configuration.

Restrictions

This element only applies to diamApplType SLG.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

endpoint8Name - Endpoint 8 name

Syntax

--endpoint8Name <string>

Description

Long name for endpoint 8 id matching the label specified in remote end point configuration.

Restrictions

This element only applies to diamApplType SLG.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

minActiveConn - Min active connections

Syntax

--minActiveConn <integer>

Description

Percent of active connections dropping before switching to an alternate HSS host.

Class

Optional.

Type / Range

Integer in the range of 10 to 90

Default

50

Name

sgsnNumberUlr - SGSN Number In Ulr

Syntax

--sgsnNumberUlr <digits>

Description

MME supports to send SGSN number in ULR for combined MME/SGSN.

Class

Optional.

Type / Range

Digit string of length 0 to 18

Default

""

4.85 cmm diamNasMappingProfile

Diameter Code to NAS Cause Code Mapping. Syntax, description, parameters, and roles for cmm diamNasMappingProfile command.

Syntax

Description

This command is used to administer a Diameter Code to NAS Cause Code (CC) mapping. The MME uses this profile to select the right CC to send to the UE when MME rejects a UE mobility management request due to an error received from the HSS. The maximum number of profiles supported is 1024. A default profile, named 'default' is provided.

Parameters

Name

name - Diameter to NAS cause code mapping profile name

Syntax

--name <string>

Description

Defines all diameter code to NAS cause code mapping.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Name

appUnsupported - Application unsupported

Syntax

--appUnsupported <integer>

Description

Mapping for application unsupported to NAS code.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

17

Name

authenticationDataUnavailable - Authentication data unavailable

Syntax

--authenticationDataUnavailable <integer>

Description

Mapping for authentication data unavailable to NAS code.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

17

Name

authenticationRejected - Authentication rejected

Syntax

--authenticationRejected <integer>

Description

Mapping for authentication rejected to NAS code.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

17

Name

authorizationRejected - Authorization rejected

Syntax

--authorizationRejected <integer>

Description

Mapping for authorization rejected to NAS code.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

15

Name

avpNotAllowed - AVP not allowed

Syntax

--avpNotAllowed <integer>

Description

Mapping for AVP not allowed to NAS code.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

17

Name

avpOccursTooManyTimes - AVP occurs too many times

Syntax

--avpOccursTooManyTimes <integer>

Description

Mapping for AVP occurs too many times to NAS code.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

17

Name

avpUnsupported - AVP unsupported

Syntax

--avpUnsupported <integer>

Description

Mapping for AVP unsupported to NAS code.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

17

Name

commandUnsupported - Command unsupported

Syntax

--commandUnsupported <integer>

Description

Mapping for command unsupported to NAS code.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

17

Name

contradictingAvps - Contradicting AVPs

Syntax

--contradictingAvps <integer>

Description

Mapping for contradicting AVPs to NAS code.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

17

Name

description - Description

Syntax

--description <string>

Description

Profile description.

Class

Optional.

Type / Range

Digit string of length 0 to 160 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

"

Name

electionLost - Election lost

Syntax

--electionLost <integer>

Description

Mapping for election lost to NAS code.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

17

Name

equipmentUnknown - Equipment unknown

Syntax

--equipmentUnknown <integer>

Description

Mapping for equipment unknown to NAS code.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

6

Name

featureUnsupported - Feature unsupported

Syntax

--featureUnsupported <integer>

Description

Mapping for feature unsupported to NAS code.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

17

Name

hssOrEirDown - HSS or EIR down

Syntax

```
--hssOrEirDown <integer>
```

Description

Mapping for HSS or EIR down to NAS code.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

15

Name

invalidAvpBitCombination - Invalid AVP bit combination

Syntax

```
--invalidAvpBitCombination <integer>
```

Description

Mapping for invalid AVP bit combination to NAS code.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

17

Name

invalidAvpBits - Invalid AVP bits

Syntax

```
--invalidAvpBits <integer>
```

Description

Mapping for invalid AVP bits to NAS code.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

17

Name

invalidAvpLength - Invalid AVP length

Syntax

--invalidAvpLength <integer>

Description

Mapping for invalid AVP length to NAS code.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

17

Name

invalidAvpValue - Invalid AVP value

Syntax

--invalidAvpValue <integer>

Description

Mapping for invalid AVP value to NAS code.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

17

Name

invalidBitHeader - Invalid bit in header

Syntax

--invalidBitHeader <integer>

Description

Mapping for invalid bit in header to NAS code.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

17

Name

invalidHeaderBits - Invalid header bits

Syntax

--invalidHeaderBits <integer>

Description

Mapping for invalid header bits to NAS code.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

17

Name

invalidMessageLength - Invalid message length

Syntax

--invalidMessageLength <integer>

Description

Mapping for invalid message length to NAS code.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

17

Name

loopDetected - Loop detected

Syntax

--loopDetected <integer>

Description

Mapping for loop detected to NAS code.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

17

Name

missingAvp - Missing AVP

Syntax

--missingAvp <integer>

Description

Mapping for missing AVP to NAS code.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

17

Name

multiRoundAuth - Multi round authorization

Syntax

--multiRoundAuth <integer>

Description

Mapping for multi round authorization to NAS code.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

17

Name

noCommonApplication - No common application

Syntax

--noCommonApplication <integer>

Description

Mapping for no common application to NAS code.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

17

Name

noCommonSecurity - No common security

Syntax`--noCommonSecurity <integer>`**Description**

Mapping for no common security to NAS code.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

17

Name

noProvisionedHss - No provisioned HSS

Syntax`--noProvisionedHss <integer>`**Description**

Mapping for no provisioned HSS to NAS code.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

14

Name

noResponseFromHss - No Response from HSS

Syntax`--noResponseFromHss <integer>`**Description**

Mapping for no response from HSS to NAS code.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

17

Name

outOfSpace - Out of space

Syntax`--outOfSpace <integer>`**Description**

Mapping for out of space to NAS code.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

17

Name

overloadRetryNotAllowedAny - Overload retry not allowed to any

Syntax`--overloadRetryNotAllowedAny <integer>`**Description**

Mapping from diameter overload retry not allowed to any to NAS cause code.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

42

Name

ratNotAllowed - RAT not allowed

Syntax`--ratNotAllowed <integer>`**Description**

Mapping for RAT not allowed to NAS code.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

15

Name

realmNotServed - Realm not served

Syntax

--realmNotServed <integer>

Description

Mapping for realm not served to NAS code.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

17

Name

redirectionIndication - Redirection indication

Syntax

--redirectionIndication <integer>

Description

Mapping for redirection indication to NAS code.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

17

Name

resourcesExceeded - Resources exceeded

Syntax

--resourcesExceeded <integer>

Description

Mapping for resources exceeded to NAS code.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

17

Name

roamingNotAllowed - Roaming not allowed

Syntax

--roamingNotAllowed <integer>

Description

Mapping for roaming not allowed to NAS code.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

11

Name

roamingNotAllowedAllApn - Roaming not allowed all APN

Syntax

--roamingNotAllowedAllApn <integer>

Description

Mapping for roaming not allowed all APN to NAS code.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

19

Name

roamingNotAllowedHplmnApn - Roaming not allowed HPLMN APN

Syntax

--roamingNotAllowedHplmnApn <integer>

Description

Mapping for roaming not allowed HPLMN APN to NAS code.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

14

Name

roamingNotAllowedOther - Roaming not allowed, other

Syntax

--roamingNotAllowedOther <integer>

Description

Mapping for roaming not allowed, other to NAS code.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

17

Name

roamingNotAllowedVplmnApn - Roaming not allowed VPLMN APN

Syntax

--roamingNotAllowedVplmnApn <integer>

Description

Mapping for roaming not allowed VPLMN APN to NAS code.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

14

Name

tooBusy - Too busy

Syntax

--tooBusy <integer>

Description

Mapping for too busy to NAS code.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

17

Name

unableToComply - Unable to comply

Syntax

--unableToComply <integer>

Description

Mapping for unable to comply to NAS code.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

17

Name

unableToDeliver - Unable to deliver

Syntax

--unableToDeliver <integer>

Description

Mapping for unable to deliver to NAS code.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

17

Name

unknownEpsGprsData - Unknown EPS GPRS DATA

Syntax

--unknownEpsGprsData <integer>

Description

Mapping for unknown EPS GPRS DATA to NAS code.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

15

Name

unknownEpsNoGprsData - Unknown EPS no GPRS DATA

Syntax

--unknownEpsNoGprsData <integer>

Description

Mapping for unknown EPS no GPRS DATA to NAS code.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

7

Name

unknownEpsSubscription - Unknown EPS subscription

Syntax

--unknownEpsSubscription <integer>

Description

Mapping for unknown EPS subscription to NAS code.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

15

Name

unknownEpsSubscriptionOther - Unknown EPS subscription, other

Syntax

--unknownEpsSubscriptionOther <integer>

Description

Mapping for unknown EPS subscription, other to NAS code.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

15

Name

unknownPeer - Unknown peer

Syntax

--unknownPeer <integer>

Description

Mapping for unknown peer to NAS code.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

17

Name

unknownServingNode - Unknown serving node

Syntax

--unknownServingNode <integer>

Description

Mapping for unknown serving node to NAS code.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

2

Name

unknownSessionId - Unknown session ID

Syntax

--unknownSessionId <integer>

Description

Mapping for unknown session ID to NAS code.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

17

Name

unsupportedVersion - Unsupported version

Syntax

--unsupportedVersion <integer>

Description

Mapping for unsupported version to NAS code.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

17

Name

userUnknown - User unknown

Syntax

--userUnknown <integer>

Description

Mapping for user unknown to NAS code.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

8

4.86 cmm diamProfile

Diameter Profile. Syntax, description, parameters, and roles for `cmm diamProfile` command.

Syntax

Description

This command is used to administer a Diameter Profile and includes parameters for defining setup, connect, reconnect, frequency, and retransmission timers, and maximum number of retransmissions. A default profile, named 'default' is provided.

Parameters

Name

name - Diameter profile name

Syntax

--name <string>

Description

Profile name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Name

cerMsgTimer - CER message timer

Syntax

--cerMsgTimer <integer>

Description

Capability exchange request (Diameter setup) timer value.

Class

Optional.

Type / Range

Integer in the range of 100 to 10,000 in units of Millisecond

Default

3000

Name

cerRetransMax - CER max retransmissions

Syntax

--cerRetransMax <integer>

Description

Capability exchange request maximum retransmissions. when set to 0 if an MME initiated CER is lost or CEA is lost/delayed beyond timeout (CER message timer 3 sec) the connection shall be closed, it shall not be retransmitted, only connection timer shall be used to schedule the next re-connection.

Class

Optional.

Type / Range

Integer in the range of 0 to 5

Default

3

Name

connectTimer - Connect timer

Syntax

--connectTimer <integer>

Description

Connect timer in 100 msec increments.

Class

Optional.

Type / Range

Integer in the range of 100 to 10,000 in units of MilliSecond

Default

3000

Name

description - Description

Syntax

--description <string>

Description

Profile description.

Class

Optional.

Type / Range

Digit string of length 0 to 160 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

"

Name

diamProductName - Diameter product name

Syntax

--diamProductName <string>

Description

Unique diameter product name.

Class

Optional.

Type / Range

Digit string of length 1 to 100 with the allowed pattern of [0-9a-zA-Z\.\-_:]*

Default

LTE MME Diameter

Name

dprMsgTimer - DPR message timer

Syntax

--dprMsgTimer <integer>

Description

DPR timeout message timer value in 100 msec increments.

Class

Optional.

Type / Range

Integer in the range of 100 to 30,000 in units of MilliSecond

Default

6000

Name

dwrFreqTimer - DWR frequency timer

Syntax

--dwrFreqTimer <integer>

Description

DeviceWatchDog request frequency timer in 100 msec increments.

Class

Optional.

Type / Range

Integer in the range of 100 to 30,000 in units of Millisecond

Default

1000

Name

dwrMsgTimer - DWR message timer

Syntax

--dwrMsgTimer <integer>

Description

DeviceWatchDog request (heartbeat) message timer value in 100 msec increments.

Class

Optional.

Type / Range

Integer in the range of 100 to 30,000 in units of Millisecond

Default

200

Name

dwrRetransMax - DWR max retransmissions

Syntax

--dwrRetransMax <integer>

Description

DeviceWatchDog request maximum retransmissions. when set to 0 the first time a DWR is not responded or DWA is rejected the connection shall be closed. when set to 0, DWR frequency timer shall be still used to send DWR.

Class

Optional.

Type / Range

Integer in the range of 0 to 5

Default

3

Name

reconnectTimer - Reconnect timer

Syntax

--reconnectTimer <integer>

Description

Reconnect timer in 100 msec increments.

Class

Optional.

Type / Range

Integer in the range of 100 to 10,000 in units of MilliSecond

Default

3000

4.87 cmm district

district name. Syntax, description, parameters, and roles for cmm district command.

Syntax**Description**

create or delete a district

Parameters

Name

districtName - district Name

Syntax

--districtName <string>

Description

This parameter defines the name of district.

Class

Required key.

Type / Range

District type

Roles

Create

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

sysadmin, manage, monitor

4.88 cmm districtRai

RAI list under a district. Syntax, description, parameters, and roles for cmm districtRai command.

Syntax

Description

a RAI or more RAI defined under a district

Parameters

Name

mcc - mobile country code

Syntax

--mcc <digits>

Description

Mobile Country Code.

Class

Required key.

Type / Range

Digit string of length 3 to 3 with the allowed pattern of [0-9]*

Name

mnc - mobile network code

Syntax

--mnc <digits>

Description

Mobile Network Code.

Class

Required key.

Type / Range

Digit string of length 2 to 3 with the allowed pattern of [0-9]*

Name

rac - routing area code

Syntax

--rac <integer>

Description

Routing Area Code

Class

Required key.

Type / Range

Integer in the range of 0 to 255

Name

lac - location area code

Syntax

--lac <integer>

Description

Location Area Code

Class

Required key.

Type / Range

Integer in the range of 1 to 65,533

Name

districtName - name of district

Syntax

--districtName <string>

Description

This parameter defines the name of district. The parameter is obligatory when you have defined RAllist

Class

Required on create.

Type / Range

District type

Roles**Create**

4.89 cmm dnn

Data Network Name. Syntax, description, parameters, and roles for cmm dnn command.

Syntax**Description**

Add a DNN to a DNN list specified by a list name.

Parameters**Name**

dnnListName - List Name

Syntax

--dnnListName <string>

Description

Name of the DNN list.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

dataNetworkName - Data Network Name (DNN)

Syntax

--dataNetworkName <string>

Description

Add a DNN to the DNN list.

Class

Required key.

Type / Range

Data Network Name is basically APN Ni.

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

sysadmin, manage, monitor

4.90 cmm dnnList

DNN List. Syntax, description, parameters, and roles for cmm dnnList command.

Syntax**Description**

Creates IDNN list.

Parameters

Name

name - List Name

Syntax

--name <string>

Description

Name of the list.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Roles

Create

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

sysadmin, manage, monitor

4.91 cmm dnnToSnssai

dnnToSnssai. Syntax, description, parameters, and roles for **cmm dnnToSnssai** command.

Syntax

Description

DNN to S-NSSAI mapping that is used in n26 interworking scenarios

Parameters

Name

dnnToSnssaiListName - dnnToSnssaiListName

Syntax

--dnnToSnssaiListName <string>

Description

DNN to S-NSSAI List Name

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

dataNetworkName - dataNetworkName

Syntax

--dataNetworkName <string>

Description

Data Network Name

Class

Required key.

Type / Range

DataNetworkName is typically APN Ni, but also allows wildcard APN

Name

snssaiName - S-NSSAI Name

Syntax

--snssaiName <string>

Description

Name of the S-NSSAI

Class

Required on create.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Modify

sysadmin, manage

4.92 cmm dnnToSnssaiList

dnnToSnssaiList. Syntax, description, parameters, and roles for **cmm dnnToSnssaiList** command.

Syntax

Description

DNN to SNSSAI mapping list name

Parameters

Name

name - name

Syntax

--name <string>

Description

Name of the DNN to SNSSAI mapping list name

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Roles

Create

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

sysadmin, manage, monitor

4.93 cmm dnnToSnssaiPerPlmn

dnnToSnssaiPerPlmn. Syntax, description, parameters, and roles for cmm dnnToSnssaiPerPlmn command.

Syntax

Description

This commands enables creating map of {DNN, TAI List} to SNSSAI that is used in n26 interworking scenarios as part of default V-SMF selection

Parameters

Name

dnnToSnssaiPerPlmnListName - DNN to SNSSAI per PLMN List Name

Syntax

```
--dnnToSnssaiPerPlmnListName <string>
```

Description

Associated list name for {DNN, TAI} to SNSSAI mapping

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

dataNetworkName - Data Network Name

Syntax

```
--dataNetworkName <string>
```

Description

Data Network Name

Class

Required key.

Type / Range

DataNetworkName is typically APN Ni, but also allows wildcard APN

Name

servingPlmn - Serving PLMN

Syntax

```
--servingPlmn <string>
```

Description

Serving PLMN Name

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

amfTac - AMF TAC

Syntax

--amfTac <integer>

Description

AMF Tracking Area Code

Class

Required key.

Type / Range

Integer in the range of 0 to 16,777,215

Name

snssaiName - SNSSAI Name

Syntax

--snssaiName <string>

Description

Name of the S-NSSAI

Class

Required on create.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Modify

sysadmin, manage

sysadmin, manage, monitor

4.94 cmm dnnToSnssaiPerPlmnList

DNN to SNSSAI per PLMN List. Syntax, description, parameters, and roles for cmm dnnToSnssaiPerPlmnList command.

Syntax

Description

This commands enables creating list name for {DNN, TAI List} to SNSSAI mapping

Parameters

Name

name - Name

Syntax

--name <string>

Description

Name of the DNN to SNSSAI per PLMN mapping list name

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Roles

Create

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

sysadmin, manage, monitor

4.95 cmm dns

DNS configurations. Syntax, description, parameters, and roles for cmm dns command.

Syntax

Description

This command is used to administer DNS configurations and includes parameters for defining the external DNS IP addresses. The IP addresses must be added in order and no holes can be left during deletions.

Parameters

Name

dnsConfigName - DNS ID

Syntax

--dnsConfigName <list-item>

Description

Name of the DNS configuration.

Class

Required key.

List

- config - Config.

Name

priDnsIp - DNS primary ID

Syntax

--priDnsIp <string>

Description

The IP address of the primary external DNS.

Class

Optional.

Type / Range

Digit string of length 3 to 39 with valid IPv4 or IPv6 address

Name

quatDnsIp - DNS quaternary IP

Syntax

--quatDnsIp <string>

Description

The IP address of the quaternary external DNS.

Class

Optional.

Type / Range

Digit string of length 0 or 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Default

""

Name

secDnsIp - DNS secondary ID

Syntax

--secDnsIp <string>

Description

The IP address of the secondary external DNS.

Class

Optional.

Type / Range

Digit string of length 0 or 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

terDnsIp - DNS tertiary IP

Syntax

--terDnsIp <string>

Description

The IP address of the tertiary external DNS.

Class

Optional.

Type / Range

Digit string of length 0 or 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Default

""

4.96 cmm draDestFqdn

DRA Destination FQDN. Syntax, description, parameters, and roles for cmm draDestFqdn command.

Syntax**Description**

This command is used to administer a DRA Destination FQDN and includes parameters for defining the FQDN name and string.

Parameters**Name**

draDestFqdnName - DRA destination FQDN name

Syntax

--draDestFqdnName <string>

Description

DRA destination FQDN name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

draDestFqdnStr - DRA destination FQDN string

Syntax

--draDestFqdnStr <string>

Description

DRA destination FQDN string.

Class

Optional.

Type / Range

Digit string of length 1 to 128 with the allowed pattern of [0-9a-zA-Z\.\-:{}]@*

Default

epc.mnc{ueMnc}.mcc{ueMcc}.3gppnetwork.org

Roles

Create

sysadmin, manage

sysadmin, manage, monitor

4.97 cmm drmpCiotProfile

DRMP CIOT profile. Syntax, description, parameters, and roles for `cmm drmpCiotProfile` command.

Syntax

Description

Diameter Routing Message Priority cellular internet of things profile.

Parameters

Name

name - DRMP CIOT profile name

Syntax

--name <string>

Description

DRMP cellular internet of things profile name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Name

attachWithoutPdnAir - Attach without PDN, AIR

Syntax

--attachWithoutPdnAir <integer>

Description

Attach without PDN, AIR message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

14

Name

attachWithoutPdnUlr - Attach without PDN, ULR

Syntax

--attachWithoutPdnUlr <integer>

Description

Attach without PDN, ULR message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

12

Name

cirAuthorizationToIwkScef - CIR Authorization to IWK-SCEF

Syntax

--cirAuthorizationToIwkScef <integer>

Description

Specifies the message priority of the T6ai:CIR used to authorize an inbound roaming UE's monitoring events

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

12

Name

connectionUpdateCmr - Connection update, CMR

Syntax

--connectionUpdateCmr <integer>

Description

Connection update (update SCEF of node change), CMR message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

8

Name

connectModeTauMmeChangeUlr - Connect mode TAU MME change, ULR

Syntax

--connectModeTauMmeChangeUlr <integer>

Description

Connected mode TAU with MME change, ULR message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

10

Name

description - Description

Syntax

--description <string>

Description

Profile description.

Class

Optional.

Type / Range

Digit string of length 0 to 160 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

""

Name

eUtranAttachImsiGutiAir - eUTRAN attach IMSI GUTI, AIR

Syntax

--eUtranAttachImsiGutiAir <integer>

Description

eUTRAN attach by IMSI/by GUTI, AIR message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

12

Name

eUtranAttachImsiGutiNor - eUTRAN attach IMSI GUTI, NOR

Syntax

--eUtranAttachImsiGutiNor <integer>

Description

eUTRAN attach by IMSI/by GUTI, NOR message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

14

Name

eUtranAttachImsiGutiUlr - eUTRAN attach IMSI GUTI, ULR

Syntax

--eUtranAttachImsiGutiUlr <integer>

Description

eUTRAN attach by IMSI/by GUTI, ULR message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

10

Name

hssRestorationUlr - HSS restoration, ULR

Syntax

--hssRestorationUlr <integer>

Description

HSS restoration, ULR message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

14

Name

idleModeTauMmeChangeAir - Idle mode TAU MME change, AIR

Syntax

--idleModeTauMmeChangeAir <integer>

Description

Idle mode TAU with MME change (no SGW change), AIR message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

8

Name

idleModeTauMmeChangeUlr - Idle mode TAU MME change, ULR

Syntax

--idleModeTauMmeChangeUlr <integer>

Description

Idle mode TAU with MME change (no SGW change), ULR message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

8

Name

idleModeTauMmeSgwChangeAir - Idle mode TAU MME SGW change, AIR

Syntax`--idleModeTauMmeSgwChangeAir <integer>`**Description**

Idle mode TAU with MME change and SGW change, AIR message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

10

Name

idleModeTauMmeSgwChangeUlr - Idle mode TAU MME SGW change, ULR

Syntax`--idleModeTauMmeSgwChangeUlr <integer>`**Description**

Idle mode TAU with MME change and SGW change, ULR message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

8

Name

idleModeTauSgwChangeAir - Idle mode TAU SGW change, AIR

Syntax`--idleModeTauSgwChangeAir <integer>`**Description**

Idle mode TAU with SGW change, AIR message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

10

Name

initAttachMmeChangeAir - Initial attach MME change, AIR

Syntax`--initAttachMmeChangeAir <integer>`**Description**

Initial attach (usable GUTI) where MME change occurs, AIR message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

10

Name

initAttachMmeChangeNor - Initial attach MME change, NOR

Syntax`--initAttachMmeChangeNor <integer>`**Description**

Initial attach (usable GUTI) where MME change occurs, NOR message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

10

Name

initAttachMmeChangeUlr - Initial attach MME change, ULR

Syntax`--initAttachMmeChangeUlr <integer>`**Description**

Initial attach (usable GUTI) where MME change occurs, ULR message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

10

Name

interMmeInterPlmnHoTauAir - Inter MME inter PLMN HO TAU, AIR

Syntax

--interMmeInterPlmnHoTauAir <integer>

Description

Inter MME inter PLMN HO/TAU, AIR message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

8

Name

interMmeInterPlmnHoTauUlr - Inter MME inter PLMN HO TAU, ULR

Syntax

--interMmeInterPlmnHoTauUlr <integer>

Description

Inter MME inter PLMN HO/TAU, ULR message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

8

Name

lteTauNoSgwMmeChangesAir - LTE TAU no SGW MME changes, AIR

Syntax

--lteTauNoSgwMmeChangesAir <integer>

Description

LTE TAU without SGW/MME changes, AIR message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

10

Name

midCallUeAvailFailedDataAttemptCmr - Mid call UE availability failed data attempt, CMR

Syntax

--midCallUeAvailFailedDataAttemptCmr <integer>

Description

Mid call procedure - UE availability after failed SCEF initiated MT data attempt, CMR message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

8

Name

mmeFailureNewMmeUlr - MME failure new MME, ULR

Syntax

--mmeFailureNewMmeUlr <integer>

Description

MME failure (we are new MME), ULR message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

10

Name

mmeRestartUeSameMmeUlr - MME restart UE same MME, ULR

Syntax

--mmeRestartUeSameMmeUlr <integer>

Description

MME restart (UE comes back to same MME), ULR message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

10

Name

moDataOdr - MO data, ODR

Syntax

--moDataOdr <integer>

Description

MO data, ODR message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

8

Name

monitorEventReportRir - Monitoring event report, RIR

Syntax

--monitorEventReportRir <integer>

Description

Monitoring event report, RIR message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

10

Name

nonIpPdnActivationCmr - Non IP PDN activation, CMR

Syntax

--nonIpPdnActivationCmr <integer>

Description

Non-IP PDN activation, CMR message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

12

Name

roamerAir - Roamer, AIR

Syntax

--roamerAir <integer>

Description

Roamer, AIR message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

12

Name

roamerUlr - Roamer, ULR

Syntax

--roamerUlr <integer>

Description

Roamer, ULR message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

12

Name

s1HoMmeRelocDirectDataUlr - S1 HO MME relocation direct data, ULR

Syntax

--s1HoMmeRelocDirectDataUlr <integer>

Description

S1-based HO with MME relocation (Direct data tunnel), ULR message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

8

Name

s1HoMmeRelocIndirectDataUlr - S1 HO MME relocation indirect data, ULR

Syntax

--s1HoMmeRelocIndirectDataUlr <integer>

Description

S1-based HO with MME relocation (Indirect data tunnel), ULR message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

8

Name

s1HoMmeSgwRelocDirectDataUlr - S1 HO MME SGW relocation direct data, ULR

Syntax

--s1HoMmeSgwRelocDirectDataUlr <integer>

Description

S1-based HO with MME/SGW relocation (Direct data tunnel), ULR message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

8

Name

s1HoMmeSgwRelocIndirectDataUlr - S1 HO MME SGW relocation indirect data, ULR

Syntax

--s1HoMmeSgwRelocIndirectDataUlr <integer>

Description

S1-based HO with MME/SGW relocation (Indirect data tunnel), ULR message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

8

Name

smsAlr - SMS Alert, ALR

Syntax

--smsAlr <integer>

Description

SGd interface Alert Service Center Request (ALR) message. The MME uses the alert when either the UE has moved to another MME or SGSN area or the UE is available for MT SMS (after previously not being available for SMS).

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

12

Name

smsOfr - MO SMS delivery, OFR

Syntax

--smsOfr <integer>

Description

MO SMS delivery towards SMS router, SGd interface MO Forward Short Message Request (OFR) message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

12

Name

ueInitNonIpPdnDiscCmr - UE initiated non IP PDN disconnect, CMR

Syntax

--ueInitNonIpPdnDiscCmr <integer>

Description

UE initiated non-ip PDN disconnection, CMR message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

6

4.98 cmm drmpProfile

DRMP profile. Syntax, description, parameters, and roles for cmm drmpProfile command.

Syntax**Description**

Diameter Routing Message Priority profile.

Parameters**Name**

name - DRMP profile name

Syntax

--name <string>

Description

DRMP profile name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Name

connectModeTauMmeChangeEmpsUlr - Connect mode TAU MME change eMPS, ULR

Syntax

--connectModeTauMmeChangeEmpsUlr <integer>

Description

Connected mode TAU with MME change - while eMPS call is going on, ULR message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

0

Name

connectModeTauMmeChangeUlr - Connect mode TAU MME change, ULR

Syntax

--connectModeTauMmeChangeUlr <integer>

Description

Connected mode TAU with MME change, ULR message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

8

Name

description - Description

Syntax

--description <string>

Description

Profile description.

Class

Optional.

Type / Range

Digit string of length 0 to 160 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

""

Name

ehrpdlteHandoverAir - eHRPD LTE handover, AIR

Syntax

--ehrpdlteHandoverAir <integer>

Description

eHRPD - LTE handover, AIR message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

6

Name

ehrpdlteHandoverUlr - eHRPD LTE handover, ULR

Syntax

--ehrpdlteHandoverUlr <integer>

Description

eHRPD - LTE handover, ULR message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

6

Name

emerPdnInitAttachAir - Emergency PDN initial attach, AIR

Syntax

--emerPdnInitAttachAir <integer>

Description

Emergency PDN initial attach, AIR message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

4

Name

emerPdnInitAttachUlr - Emergency PDN initial attach, ULR

Syntax

--emerPdnInitAttachUlr <integer>

Description

Emergency PDN initial attach, ULR message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

4

Name

empsAir - eMPS AIR

Syntax

--empsAir <integer>

Description

Effective when gParm empsPrioToHss is set to Yes. DRMP value on S6a AIR for user indicating priority on RRC establishment cause.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

0

Name

empsUlr - eMPS ULR

Syntax

--empsUlr <integer>

Description

Effective when gParm empsPrioToHss is set to Yes. DRMP value on S6a ULR for user indicating priority on RRC establishment cause.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

0

Name

eUtranAttachImsiGutiAir - eUTRAN attach IMSI GUTI, AIR

Syntax

--eUtranAttachImsiGutiAir <integer>

Description

eUTRAN attach by IMSI/by GUTI, AIR message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

10

Name

eUtranAttachImsiGutiNor - eUTRAN attach IMSI GUTI, NOR

Syntax

--eUtranAttachImsiGutiNor <integer>

Description

eUTRAN attach by IMSI/by GUTI, NOR message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

12

Name

eUtranAttachImsiGutiUlr - eUTRAN attach IMSI GUTI, ULR

Syntax`--eUtranAttachImsiGutiUlr <integer>`**Description**

eUTRAN attach by IMSI/by GUTI, ULR message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

8

Name

handoverAttachAir - Handover attach, AIR

Syntax`--handoverAttachAir <integer>`**Description**

Handover attach (non-3gpp to LTE usable GUTI), AIR message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

6

Name

handoverAttachUlr - Handover attach, ULR

Syntax`--handoverAttachUlr <integer>`**Description**

Handover attach (non-3gpp to LTE usable GUTI), ULR message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

6

Name

hssRestorationUlr - HSS restoration, ULR

Syntax

--hssRestorationUlr <integer>

Description

HSS restoration, ULR message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

12

Name

idleModeTauMmeChangeAir - Idle mode TAU MME change, AIR

Syntax

--idleModeTauMmeChangeAir <integer>

Description

Idle mode TAU with MME change (no SGW change), AIR message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

6

Name

idleModeTauMmeChangeUlr - Idle mode TAU MME change, ULR

Syntax

--idleModeTauMmeChangeUlr <integer>

Description

Idle mode TAU with MME change (no SGW change), ULR message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

6

Name

idleModeTauMmeSgwChangeAir - Idle mode TAU MME SGW change, AIR

Syntax

--idleModeTauMmeSgwChangeAir <integer>

Description

Idle mode TAU with MME change and SGW change, AIR message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

8

Name

idleModeTauMmeSgwChangeUlr - Idle mode TAU MME SGW change, ULR

Syntax

--idleModeTauMmeSgwChangeUlr <integer>

Description

Idle mode TAU with MME change and SGW change, ULR message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

6

Name

idleModeTauSgwChangeAir - Idle mode TAU SGW change, AIR

Syntax

--idleModeTauSgwChangeAir <integer>

Description

Idle mode TAU with SGW change, AIR message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

8

Name

initAttachMmeChangeAir - Initial attach MME change, ULR

Syntax

--initAttachMmeChangeAir <integer>

Description

Initial attach (usable GUTI) where MME change occurs, AIR message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

8

Name

initAttachMmeChangeNor - Initial attach MME change, ULR

Syntax

--initAttachMmeChangeNor <integer>

Description

Initial attach (usable GUTI) where MME change occurs, NOR message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

10

Name

initAttachMmeChangeUlr - Initial attach MME change, ULR

Syntax

--initAttachMmeChangeUlr <integer>

Description

Initial attach (usable GUTI) where MME change occurs, ULR message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

8

Name

interMmeInterPlmnHoTauAir - Inter MME inter PLMN HO TAU, AIR

Syntax

```
--interMmeInterPlmnHoTauAir <integer>
```

Description

Inter MME inter PLMN HO/TAU, AIR message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

6

Name

interMmeInterPlmnHoTauUlr - Inter MME inter PLMN HO TAU, ULR

Syntax

```
--interMmeInterPlmnHoTauUlr <integer>
```

Description

Inter MME inter PLMN HO/TAU, ULR message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

6

Name

lteEhrpdHoAddPdnsPur - LTE eHRPD HO additional PDNs, PUR

Syntax

```
--lteEhrpdHoAddPdnsPur <integer>
```

Description

LTE-eHRPD HO additional PDNs, PUR message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

8

Name

lteTauNoSgwMmeChangesAir - LTE TAU no SGW MME changes, AIR

Syntax

--lteTauNoSgwMmeChangesAir <integer>

Description

LTE TAU without SGW/MME changes, AIR message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

8

Name

mmeFailureNewMmeUlr - MME failure new MME, ULR

Syntax

--mmeFailureNewMmeUlr <integer>

Description

MME failure (we are new MME), ULR message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

8

Name

mmeRestartUeSameMmeUlr - MME restart UE same MME, ULR

Syntax

--mmeRestartUeSameMmeUlr <integer>

Description

MME restart (UE comes back to same MME), ULR message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

8

Name

roamerAir - Roamer, AIR

Syntax

--roamerAir <integer>

Description

Roamer, AIR message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

10

Name

roamerEmerPdnInitAttachAir - Roamer emergency PDN initial attach, AIR

Syntax

--roamerEmerPdnInitAttachAir <integer>

Description

Roamer emergency PDN initial attach, AIR message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

4

Name

roamerEmerPdnInitAttachUlr - Roamer emergency PDN initial attach, ULR

Syntax

--roamerEmerPdnInitAttachUlr <integer>

Description

Roamer emergency PDN initial attach, ULR message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

4

Name

roamerUlr - Roamer, ULR

Syntax

--roamerUlr <integer>

Description

Roamer, ULR message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

10

Name

s1HoMmeRelocDirectDataUlr - S1 HO MME relocation direct data, ULR

Syntax

--s1HoMmeRelocDirectDataUlr <integer>

Description

S1-based HO with MME relocation (Direct data tunnel), ULR message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

6

Name

s1HoMmeRelocIndirectDataUlr - S1 HO MME relocation indirect data, ULR

Syntax

```
--s1HoMmeRelocIndirectDataUlr <integer>
```

Description

S1-based HO with MME relocation (Indirect data tunnel), ULR message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

6

Name

s1HoMmeSgwRelocDirectDataUlr - S1 HO MME SGW relocation direct data, ULR

Syntax

```
--s1HoMmeSgwRelocDirectDataUlr <integer>
```

Description

S1-based HO with MME/SGW relocation (Direct data tunnel), ULR message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

6

Name

s1HoMmeSgwRelocIndirectDataUlr - S1 HO MME SGW relocation indirect data, ULR

Syntax

```
--s1HoMmeSgwRelocIndirectDataUlr <integer>
```

Description

S1-based HO with MME/SGW relocation (Indirect data tunnel), ULR message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

6

Name

smsAlr - SMS Alert

Syntax

--smsAlr <integer>

Description

SGd interface Alert Service Center Request (ALR) message. The MME uses the alert when either the UE has moved to another MME or SGSN area or the UE is available for MT SMS (after previously not being available for SMS).

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

12

Name

smsOfr - SMS OFR

Syntax

--smsOfr <integer>

Description

MO SMS delivery towards SMS router, SGd interface MO Forward Short Message Request (OFR) message.

Class

Optional.

Type / Range

Integer in the range of 0, 2, 4, 6, 8, 10, 12, or 14

Default

12

4.99 cmm edrxApn

eDRX APN. Syntax, description, parameters, and roles for **cmm edrxApn** command.

Syntax**Description**

Administer eDRX for APN.

Parameters**Name**

edrxApnListName - eDRX APN list name

Syntax

--edrxApnListName <string>

Description

eDRX APN list name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Name

apnNi - APN NI

Syntax

--apnNi <string>

Description

APN NI.

Class

Required key.

Type / Range

Digit string of length 1 to 62 with the allowed pattern of [0-9a-zA-Z_\. \-]*

Name

edrxEnabled - eDRX enabled

Syntax

--edrxEnabled <list-item>

Description

eDRX enabled.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

nbEdrxCycleLength - NB-S1 mode eDRX cycle length

Syntax

--nbEdrxCycleLength <list-item>

Description

eDRX cycle value for NB-S1 UE.

Class

Optional.

List

- 20.48 - Specifies eDRX narrow band cycle length of 20.48 seconds.
- 40.96 - Specifies eDRX narrow band cycle length 40.96 seconds.
- 81.92 - Specifies eDRX narrow band cycle length 81.92 seconds.
- 163.84 - Specifies eDRX narrow band cycle length of 163.84 seconds.
- 327.68 - Specifies eDRX narrow band cycle length of 327.68 seconds.
- 655.36 - Specifies eDRX narrow band cycle length of 655.36 seconds.
- 1310.72 - Specifies eDRX narrow band cycle length of 1310.72 seconds.
- 2621.44 - Specifies eDRX narrow band cycle length of 2621.44 seconds.
- 5242.88 - Specifies eDRX narrow band cycle length of 5242.88 seconds.
- 10485.76 - Specifies eDRX narrow band cycle length of 10485.76 seconds.

Default

20.48

Name

nbEdrxPtw - NB-S1 mode PTW

Syntax

--nbEdrxPtw <list-item>

Description

PTW value for NB-S1 UE. PTW value must be less than the eDRX cycle value.

Class

Optional.

List

- 2.56 - Specifies eDRX narrow band paging time window of 2.56 seconds.
- 5.12 - Specifies eDRX narrow band paging time window of 5.12 seconds.
- 7.68 - Specifies eDRX narrow band paging time window of 7.68 seconds.
- 10.24 - Specifies eDRX narrow band paging time window of 10.24 seconds.
- 12.80 - Specifies eDRX narrow band paging time window of 12.80 seconds.
- 15.36 - Specifies eDRX narrow band paging time window of 15.36 seconds.
- 17.92 - Specifies eDRX narrow band paging time window of 17.92 seconds.
- 20.48 - Specifies eDRX narrow band paging time window of 20.48 seconds.
- 23.04 - Specifies eDRX narrow band paging time window of 23.04 seconds.
- 25.60 - Specifies eDRX narrow band paging time window of 25.60 seconds.
- 28.16 - Specifies eDRX narrow band paging time window of 28.16 seconds.
- 30.72 - Specifies eDRX narrow band paging time window of 30.72 seconds.
- 33.28 - Specifies eDRX narrow band paging time window of 33.28 seconds.
- 35.84 - Specifies eDRX narrow band paging time window of 35.84 seconds.
- 38.40 - Specifies eDRX narrow band paging time window of 38.40 seconds.
- 40.96 - Specifies eDRX narrow band paging time window of 40.96 seconds.

Default

10.24

Name

source - source

Syntax

--source <list-item>

Description

source.

Class

Optional.

List

- UE - description: Specifies eDRX/PSM source as UE.
- local - description: local means Specifies eDRX/PSM source as APN .

Default

local

Name

wbEdrxCycleLength - WB-S1 mode eDRX cycle length

Syntax

--wbEdrxCycleLength <list-item>

Description

eDRX cycle value for WB-S1 UE.

Class

Optional.

List

- 10.24 - Specifies eDRX wide band cycle length of 20.48 seconds.
- 20.48 - 10.48 - Specifies eDRX wide band cycle length of 20.48 seconds.
- 40.96 - Specifies eDRX wide band cycle length of 40.96 seconds.
- 61.44 - Specifies eDRX wide band cycle length of 61.44 seconds.
- 81.92 - Specifies eDRX wide band cycle length of 81.92 seconds.
- 102.40 - Specifies eDRX wide band cycle length of 102.40 seconds.
- 122.88 - Specifies eDRX wide band cycle length of 122.88 seconds.
- 143.36 - Specifies eDRX wide band cycle length of 143.36 seconds.
- 163.84 - Specifies eDRX wide band cycle length of 163.84 seconds.
- 327.68 - Specifies eDRX wide band cycle length of 327.68 seconds.
- 655.36 - Specifies eDRX wide band cycle length of 655.36 seconds.
- 1310.72 - Specifies eDRX wide band cycle length of 1310.72 seconds.
- 2621.44 - Specifies eDRX wide band cycle length of 2621.44 seconds.

Default

20.48

Name

wbEdrxPtw - WB-S1 mode PTW

Syntax

--wbEdrxPtw <list-item>

Description

PTW value for WB-S1 UE. PTW value must be less than the eDRX cycle value.

Class

Optional.

List

- 1.28 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 2.56 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 3.84 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 5.12 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 6.40 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 7.68 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 8.96 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 10.24 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 11.52 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 12.80 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 14.08 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 15.36 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 16.64 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 17.92 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 19.20 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 20.48 - Specifies eDRX wide band paging time window length of 1.28 seconds.

4.100 cmm edrxApnList

eDRX APN List. Syntax, description, parameters, and roles for cmm edrxApnList command.

Syntax

Description

Administer List of APNs for eDRX.

Parameters

Name

name - eDRX APN list name

Syntax

--name <string>

Description

eDRX APN list name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Name

description - Description

Syntax

--description <string>

Description

Profile description.

Class

Optional.

Type / Range

Digit string of length 0 to 160 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

4.101 cmm edrxHssPtwProfile

HSS PTW eDRX Profile. Syntax, description, parameters, and roles for cmm edrxHssPtwProfile command.

Syntax

Description

eDRX HSS PTW Profile used by eDRX and HLCOM.

Parameters

Name

name - Profile name

Syntax

--name <string>

Description

eDRX HSS PTW profile name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Name

description - Profile description

Syntax

--description <string>

Description

eDRX HSS PTW profile description.

Class

Optional.

Type / Range

Digit string of length 0 to 160 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

"

Name

nbEdrx10Ptw - NB-S1 mode eDRX-10 PTW length

Syntax

--nbEdrx10Ptw <list-item>

Description

PTW length for eDRX cycle length of 327.68 seconds for NB-S1 UE.

Class

Optional.

List

- 2.56 - Specifies eDRX narrow band paging time window of 2.56 seconds.
- 5.12 - Specifies eDRX narrow band paging time window of 5.12 seconds.
- 7.68 - Specifies eDRX narrow band paging time window of 7.68 seconds.
- 10.24 - Specifies eDRX narrow band paging time window of 10.24 seconds.
- 12.80 - Specifies eDRX narrow band paging time window of 12.80 seconds.
- 15.36 - Specifies eDRX narrow band paging time window of 15.36 seconds.
- 17.92 - Specifies eDRX narrow band paging time window of 17.92 seconds.
- 20.48 - Specifies eDRX narrow band paging time window of 20.48 seconds.
- 23.04 - Specifies eDRX narrow band paging time window of 23.04 seconds.
- 25.60 - Specifies eDRX narrow band paging time window of 25.60 seconds.
- 28.16 - Specifies eDRX narrow band paging time window of 28.16 seconds.
- 30.72 - Specifies eDRX narrow band paging time window of 30.72 seconds.
- 33.28 - Specifies eDRX narrow band paging time window of 33.28 seconds.

- 14.08 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 15.36 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 16.64 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 17.92 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 19.20 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 20.48 - Specifies eDRX wide band paging time window length of 1.28 seconds.

Default

20.48

Name

wbEdrx1Ptw - WB-S1 mode eDRX-1 PTW length

Syntax

--wbEdrx1Ptw <list-item>

Description

PTW length for eDRX cycle length of 10.24 seconds for WB-S1 UE.

Class

Optional.

List

- 1.28 - Specifies eDRX wide band paging time window of 1.28 seconds.
- 2.56 - Specifies eDRX wide band paging time window of 2.56 seconds.
- 3.84 - Specifies eDRX wide band paging time window of 3.84 seconds.
- 5.12 - Specifies eDRX wide band paging time window of 5.12 seconds.
- 6.40 - Specifies eDRX wide band paging time window of 6.40 seconds.

- 7.68 - Specifies eDRX wide band paging time window of 7.68 seconds.
- 8.96 - Specifies eDRX wide band paging time window of 8.96 seconds.

Default

6.40

Name

wbEdrx2Ptw - WB-S1 mode eDRX-2 PTW length

Syntax

--wbEdrx2Ptw <list-item>

Description

PTW length for eDRX cycle length of 20.48 seconds for WB-S1 UE.

Class

Optional.

List

- 1.28 - Specifies EDRX wide band paging time window of 1.28 seconds.
- 2.56 - Specifies EDRX wide band paging time window of 2.56 seconds.
- 3.84 - Specifies EDRX wide band paging time window of 3.84 seconds.
- 5.12 - Specifies EDRX wide band paging time window of 5.12 seconds.
- 6.40 - Specifies EDRX wide band paging time window of 6.40 seconds.
- 7.68 - Specifies EDRX wide band paging time window of 7.68 seconds.
- 8.96 - Specifies EDRX wide band paging time window of 8.96 seconds.
- 10.24 - Specifies EDRX wide band paging time window of 10.24 seconds.
- 11.52 - Specifies EDRX wide band paging time window of 11.52seconds.
- 12.80 - Specifies EDRX wide band paging time window of 12.80 seconds.
- 14.08 - Specifies EDRX wide band paging time window of 14.08 seconds.
- 15.36 - Specifies EDRX wide band paging time window of 15.36 seconds.
- 16.64 - Specifies EDRX wide band paging time window of 16.64 seconds.
- 17.92 - Specifies EDRX wide band paging time window of 17.92 seconds.
- 19.20 - Specifies EDRX wide band paging time window of 19.20 seconds.

Default

6.40

Name

wbEdrx3Ptw - WB-S1 mode eDRX-3 PTW length

Syntax

--wbEdrx3Ptw <list-item>

Description

PTW length for eDRX cycle length of 40.96 seconds for WB-S1 UE.

Class

Optional.

List

- 1.28 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 2.56 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 3.84 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 5.12 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 6.40 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 7.68 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 8.96 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 10.24 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 11.52 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 12.80 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 14.08 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 15.36 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 16.64 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 17.92 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 19.20 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 20.48 - Specifies eDRX wide band paging time window length of 1.28 seconds.

Default

6.40

Name

wbEdrx4Ptw - WB-S1 mode eDRX-4 PTW length

Syntax

--wbEdrx4Ptw <list-item>

Description

PTW length for eDRX cycle length of 61.44 seconds for WB-S1 UE.

Class

Optional.

List

- 1.28 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 2.56 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 3.84 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 5.12 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 6.40 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 7.68 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 8.96 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 10.24 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 11.52 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 12.80 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 14.08 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 15.36 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 16.64 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 17.92 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 19.20 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 20.48 - Specifies eDRX wide band paging time window length of 1.28 seconds.

Default

6.40

Name

wbEdrx5Ptw - WB-S1 mode eDRX-5 PTW length

Syntax

--wbEdrx5Ptw <list-item>

Description

PTW length for eDRX cycle length of 81.92 seconds for WB-S1 UE.

Class

Optional.

List

- 1.28 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 2.56 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 3.84 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 5.12 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 6.40 - Specifies eDRX wide band paging time window length of 1.28 seconds.

- 7.68 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 8.96 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 10.24 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 11.52 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 12.80 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 14.08 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 15.36 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 16.64 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 17.92 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 19.20 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 20.48 - Specifies eDRX wide band paging time window length of 1.28 seconds.

Default

8.96

Name

wbEdrx6Ptw - WB-S1 mode eDRX-6 PTW length

Syntax

--wbEdrx6Ptw <list-item>

Description

PTW length for eDRX cycle length of 102.40 seconds for WB-S1 UE.

Class

Optional.

List

- 1.28 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 2.56 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 3.84 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 5.12 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 6.40 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 7.68 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 8.96 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 10.24 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 11.52 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 12.80 - Specifies eDRX wide band paging time window length of 1.28 seconds.

- 14.08 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 15.36 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 16.64 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 17.92 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 19.20 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 20.48 - Specifies eDRX wide band paging time window length of 1.28 seconds.

Default

10.24

Name

wbEdrx7Ptw - WB-S1 mode eDRX-7 PTW length

Syntax

--wbEdrx7Ptw <list-item>

Description

PTW length for eDRX cycle length of 122.88 seconds for WB-S1 UE.

Class

Optional.

List

- 1.28 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 2.56 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 3.84 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 5.12 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 6.40 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 7.68 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 8.96 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 10.24 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 11.52 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 12.80 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 14.08 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 15.36 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 16.64 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 17.92 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 19.20 - Specifies eDRX wide band paging time window length of 1.28 seconds.

- 20.48 - Specifies eDRX wide band paging time window length of 1.28 seconds.

Default

12.80

Name

wbEdrx8Ptw - WB-S1 mode eDRX-8 PTW length

Syntax

--wbEdrx8Ptw <list-item>

Description

PTW length for eDRX cycle length of 143.36 seconds for WB-S1 UE.

Class

Optional.

List

- 1.28 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 2.56 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 3.84 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 5.12 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 6.40 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 7.68 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 8.96 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 10.24 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 11.52 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 12.80 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 14.08 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 15.36 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 16.64 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 17.92 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 19.20 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 20.48 - Specifies eDRX wide band paging time window length of 1.28 seconds.

Default

14.08

Name

wbEdrx9Ptw - WB-S1 mode eDRX-9 PTW length

Syntax

--wbEdrx9Ptw <list-item>

Description

PTW length for eDRX cycle length of 163.84 seconds for WB-S1 UE.

Class

Optional.

List

- 1.28 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 2.56 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 3.84 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 5.12 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 6.40 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 7.68 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 8.96 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 10.24 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 11.52 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 12.80 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 14.08 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 15.36 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 16.64 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 17.92 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 19.20 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 20.48 - Specifies eDRX wide band paging time window length of 1.28 seconds.

4.102 cmm edrxNrProfile

eDRX NR Profile. Syntax, description, parameters, and roles for `cmm edrxNrProfile` command.

Syntax

Description

eDRX profile for UEs using NR, NR_Redcap, or both access types in the 5G RAN. 32 profiles are supported.

Parameters

Name

name - name

Syntax

--name <string>

Description

Name of the eDRX NR Profile

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

edrxHf1024Override - eDRX HF1024 Override

Syntax

--edrxHf1024override <list-item>

Description

Override value for the HF1024 cycle. Default is hf1024 (i.e. no override).

Class

Optional.

List

- hfquarter - HF Quarter - Quarter of a Hyperframe (2.56 seconds).
- hfhalf - HF Half - Half of a Hyperframe (5.12 seconds)
- hf1 - HF 1 - One Hyperframe (10.24 seconds)

- hf2 - HF 2 - Two Hyperframes (20.48 seconds)
- hf4 - HF 4 - Four Hyperframes (40.96 seconds)
- hf8 - HF 8 - Eight Hyperframes (81.92 seconds)
- hf16 - HF 16 - Sixteen Hyperframes (163.84 seconds)
- hf32 - HF 32 - 32 Hyperframes (327.68 seconds)
- hf64 - HF 64 - 64 Hyperframes (655.36 seconds)
- hf128 - HF 128 - 128 Hyperframes (1310.72 seconds)
- hf256 - HF 256 - 256 Hyperframes (2621.44 seconds)
- hf512 - 512 Hyperframes (5242.88 seconds)
- hf1024 - HF 1024 - 1024 Hyperframes (10485.76 seconds)

Default

hf1024

Recommended

hf1024

Name

edrxHf128Override - eDRX HF128 Override

Syntax

--edrxHf128Override <list-item>

Description

Override value for the HF128 cycle. Default is hf128 (i.e. no override).

Class

Optional.

List

- hfquarter - HF Quarter - Quarter of a Hyperframe (2.56 seconds).
- hfhalf - HF Half - Half of a Hyperframe (5.12 seconds)
- hf1 - HF 1 - One Hyperframe (10.24 seconds)
- hf2 - HF 2 - Two Hyperframes (20.48 seconds)
- hf4 - HF 4 - Four Hyperframes (40.96 seconds)
- hf8 - HF 8 - Eight Hyperframes (81.92 seconds)
- hf16 - HF 16 - Sixteen Hyperframes (163.84 seconds)
- hf32 - HF 32 - 32 Hyperframes (327.68 seconds)
- hf64 - HF 64 - 64 Hyperframes (655.36 seconds)

- hf128 - HF 128 - 128 Hypterframes (1310.72 seconds)
- hf256 - HF 258 - 256 Hyperframes (2621.44 seconds)
- hf512 - 512 Hyperframes (5242.88 seconds)

edrxHf512Override - eDRX HF512 Override

Syntax

--edrxHf512Override <list-item>

Description

Override value for the HF512 cycle. Default is hf512 (i.e. no override).

Class

Optional.

List

- hfquarter - HF Quarter - Quarter of a Hyperframe (2.56 seconds)
- hfhalf - HF Half - Half of a Hyperframe (5.12 seconds)
- hf1 - HF 1 - One Hyperframe (10.24 seconds)
- hf2 - HF 2 - Two Hyperframes (20.48 seconds)
- hf4 - HF 4 - Four Hyperframes (40.96 seconds)
- hf8 - HF 8 - Eight Hyperframes (81.92 seconds)
- hf16 - HF 16 - Sixteen Hyperframes (163.84 seconds)
- hf32 - HF 32 - 32 Hyperframes (327.68 seconds)
- hf64 - HF 64 - 64 Hyperframes (655.36 seconds)
- hf128 - HF 128 - 128 Hyperframes (1310.72 seconds)
- hf256 - HF 256 - 256 Hyperframes (2621.44 seconds)
- hf512 - 512 Hyperframes (5242.88 seconds)
- hf1024 - HF 1024 - 1024 Hyperframes (10485.76 seconds)

Default

hf512

Recommended

hf512

Name

edrxHf64Override - eDRX HF64 Override

Syntax

--edrxHf64Override <list-item>

Description

Override value for the HF64 cycle. Default is hf64 (i.e. no override).

Class

Optional.

List

- hfquarter - HF Quarter - Quarter of a Hyperframe (2.56 seconds).
- hfhalf - HF Half - Half of a Hyperframe (5.12 seconds)
- hf1 - HF 1 - One Hyperframe (10.24 seconds)
- hf2 - HF 2 - Two Hyperframes (20.48 seconds)
- hf4 - HF 4 - Four Hyperframes (40.96 seconds)
- hf8 - HF 8 - Eight Hyperframes (81.92 seconds)
- hf16 - HF 16 - Sixteen Hyperframes (163.84 seconds)
- hf32 - HF 32 - 32 Hyperframes (327.68 seconds)
- hf64 - HF 64 - 64 Hyperframes (655.36 seconds)
- hf128 - HF 128 - 128 Hyperframes (1310.72 seconds)
- hf256 - HF 256 - 256 Hyperframes (2621.44 seconds)
- hf512 - 512 Hyperframes (5242.88 seconds)
- hf1024 - HF 1024 - 1024 Hyperframes (10485.76 seconds)

Default

hf64

Recommended

hf64

Name

edrxHf8Override - eDRX HF8 Override

Syntax

--edrxHf8override <list-item>

Description

Override value for the HF8 cycle. Default is hf8 (i.e. no override).

Class

Optional.

List

- hfquarter - HF Quarter - Quarter of a Hyperframe (2.56 seconds).
- hfhalf - HF Half - Half of a Hyperframe (5.12 seconds)
- hf1 - HF 1 - One Hyperframe (10.24 seconds)
- hf2 - HF 2 - Two Hyperframes (20.48 seconds)
- hf4 - HF 4 - Four Hyperframes (40.96 seconds)

- hf8 - HF 8 - Eight Hyperframes (81.92 seconds)
- hf16 - HF 16 - Sixteen Hyperframes (163.84 seconds)
- hf32 - HF 32 - 32 Hyperframes (327.68 seconds)
- hf64 - HF 64 - 64 Hyperframes (655.36 seconds)
- hf128 - HF 128 - 128 Hypterframes (1310.72 seconds)
- hf256 - HF 258 - 256 Hyperframes (2621.44 seconds)
- hf512 - 512 Hyperframes (5242.88 seconds)
- hf1024 - HF 1024 - 1024 Hyperframes (10485.76 seconds)

Default

hf8

Recommended

hf8

Name

edrxHfhalfOverride - eDRX HF Half Override

Syntax

--edrxHfhalfOverride <list-item>

Description

Override value for the HF half cycle. Default is hfhalf (i.e. no override).

Class

Optional.

List

- hfquarter - HF Quarter - Quarter of a Hyperframe (2.56 seconds).
- hfhalf - HF Half - Half of a Hyperframe (5.12 seconds)
- hf1 - HF 1 - One Hyperframe (10.24 seconds)
- hf2 - HF 2 - Two Hyperframes (20.48 seconds)
- hf4 - HF 4 - Four Hyperframes (40.96 seconds)

- hf16 - HF 16 - Sixteen Hyperframes (163.84 seconds)
- hf32 - HF 32 - 32 Hyperframes (327.68 seconds)
- hf64 - HF 64 - 64 Hyperframes (655.36 seconds)
- hf128 - HF 128 - 128 Hypterframes (1310.72 seconds)
- hf256 - HF 258 - 256 Hyperframes (2621.44 seconds)

- hf512 - 512 Hyperframes (5242.88 seconds)
- hf1024 - HF 1024 - 1024 Hyperframes (10485.76 seconds)

Default

hfhalf

Recommended

hfhalf

Name

edrxHfquarterOverride - eDRX HF Quarter Override

Syntax

--edrxHfquarterOverride <list-item>

Description

Override value for the HF quarter cycle. Default is hfquarter (i.e. no override).

Class

Optional.

List

- hfquarter - HF Quarter - Quarter of a Hyperframe (2.56 seconds).
- hfhalf - HF Half - Half of a Hyperframe (5.12 seconds)
- hf1 - HF 1 - One Hyperframe (10.24 seconds)
- hf2 - HF 2 - Two Hyperframes (20.48 seconds)

Name

ptwHf8High - PTW HF8 high

Syntax

--ptwHf8High <list-item>

Description

Highest allowable PTW to be used with HF8.

Class

Optional.

List

- s1 - 1.28 Seconds
- s2 - 2.56 Seconds
- s3 - 3.84 Seconds
- s4 - 5.12 Seconds

s32

Name

ptwHf8Low - PTW HF8 low

Syntax

--ptwHf8Low <list-item>

Description

Lowest allowable PTW to be used with HF8. It is recommended that this time be at least as long as the RAN DRX timer.

Class

Optional.

List

- s1 - 1.28 Seconds
- s2 - 2.56 Seconds

4.103 cmm edrxProfile

eDRX Profile. Syntax, description, parameters, and roles for `cmm edrxProfile` command.

Syntax

Description

eDRX Profile used by eDRX and HLCOM.

Parameters

Name

name - Profile name

Syntax

--name <string>

Description

eDRX profile name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\.\-:@]*

Name

description - Profile description

Syntax

--description <string>

Description

eDRX profile description.

Class

Optional.

Type / Range

Digit string of length 0 to 160 with the allowed pattern of [0-9a-zA-Z_\.\-:@]*

Default

"

Name

edrx0CycleOverride - edrx-0 Override

Syntax

--edrx0CycleOverride <list-item>

Description

Enable parameter override for eDRX cycle length of 5.12 seconds

Class

Optional.

List

- 5.12 - Specifies EDRX cycle length of 5.12 seconds
- 10.24 - Specifies EDRX cycle length of 10.24 seconds.
- 20.48 - Specifies EDRX cycle length of 20.48 seconds.
- 40.96 - Specifies EDRX cycle length of 40.96 seconds.
- 61.44 - Specifies EDRX cycle length of 61.44 seconds.
- 81.92 - Specifies EDRX cycle length of 81.92 seconds.
- 102.40 - Specifies EDRX cycle length of 102.40 seconds.
- 122.88 - Specifies EDRX cycle length of 122.88 seconds.
- 143.36 - Specifies EDRX cycle length of 143.36 seconds.
- 163.84 - Specifies EDRX cycle length of 163.84 seconds.
- 327.68 - Specifies EDRX cycle length of 327.68 seconds.
- 655.36 - Specifies EDRX cycle length of 655.36 seconds.
- 1310.72 - Specifies EDRX cycle length of 1310.72 seconds.
- 2621.44 - Specifies EDRX cycle length of 2621.44 seconds.
- 5242.88 - Specifies EDRX cycle length of 5242.88 seconds.
- 10485.76 - Specifies EDRX cycle length of 10485.76 seconds.

Default

5.12

Name

edrx00override - eDRX-0 override

Syntax

--edrx00override <list-item>

Description

Enable parameter override for eDRX cycle length of 5.12 seconds

Class

Optional.

List

- false - Boolean value of false.

- true - Boolean value of true.

Default

false

Name

edrx10CycleOverride - eDRX-10 cycle override

Syntax

--edrx10CycleOverride <list-item>

Description

Override eDRX cycle selection length of 327.68 seconds.

Class

Optional.

List

- 5.12 - Specifies EDRX cycle length of 5.12 seconds
- 10.24 - Specifies EDRX cycle length of 10.24 seconds.
- 20.48 - Specifies EDRX cycle length of 20.48 seconds.
- 40.96 - Specifies EDRX cycle length of 40.96 seconds.
- 61.44 - Specifies EDRX cycle length of 61.44 seconds.
- 81.92 - Specifies EDRX cycle length of 81.92 seconds.
- 102.40 - Specifies EDRX cycle length of 102.40 seconds.
- 122.88 - Specifies EDRX cycle length of 122.88 seconds.
- 143.36 - Specifies EDRX cycle length of 143.36 seconds.
- 163.84 - Specifies EDRX cycle length of 163.84 seconds.
- 327.68 - Specifies EDRX cycle length of 327.68 seconds.
- 655.36 - Specifies EDRX cycle length of 655.36 seconds.
- 1310.72 - Specifies EDRX cycle length of 1310.72 seconds.
- 2621.44 - Specifies EDRX cycle length of 2621.44 seconds.
- 5242.88 - Specifies EDRX cycle length of 5242.88 seconds.
- 10485.76 - Specifies EDRX cycle length of 10485.76 seconds.

Default

327.68

Name

edrx10DataBufferCount - eDRX-10 data buffer count

Syntax

--edrx10DataBufferCount <integer>

Description

Suggested maximum number of DL packets buffered in the SGW for eDRX cycle length of 327.68 seconds.

Class

Optional.

Type / Range

Integer in the range of 1 to 65,535

Default

1

Name

edrx10Override - eDRX-10 override

Syntax

--edrx10override <list-item>

Description

Enable parameter override for eDRX cycle length of 327.68 seconds.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

edrx11CycleOverride - eDRX-11 cycle override

Syntax

--edrx11cycle0override <list-item>

Description

Override eDRX cycle selection length of 655.36 seconds.

Class

Optional.

List

- 5.12 - Specifies EDRX cycle length of 5.12 seconds
- 10.24 - Specifies EDRX cycle length of 10.24 seconds.

- 20.48 - Specifies EDRX cycle length of 20.48 seconds.
- 40.96 - Specifies EDRX cycle length of 40.96 seconds.
- 61.44 - Specifies EDRX cycle length of 61.44 seconds.
- 81.92 - Specifies EDRX cycle length of 81.92 seconds.
- 102.40 - Specifies EDRX cycle length of 102.40 seconds.
- 122.88 - Specifies EDRX cycle length of 122.88 seconds.
- 143.36 - Specifies EDRX cycle length of 143.36 seconds.
- 163.84 - Specifies EDRX cycle length of 163.84 seconds.
- 327.68 - Specifies EDRX cycle length of 327.68 seconds.
- 655.36 - Specifies EDRX cycle length of 655.36 seconds.
- 1310.72 - Specifies EDRX cycle length of 1310.72 seconds.
- 2621.44 - Specifies EDRX cycle length of 2621.44 seconds.
- 5242.88 - Specifies EDRX cycle length of 5242.88 seconds.
- 10485.76 - Specifies EDRX cycle length of 10485.76 seconds.

Default

655.36

Name

edrx11DataBufferCount - eDRX-11 data buffer count

Syntax

--edrx11DataBufferCount <integer>

Description

Suggested maximum number of DL packets buffered in the SGW for eDRX cycle length of 655.36 seconds.

Class

Optional.

Type / Range

Integer in the range of 1 to 65,535

Default

1

Name

edrx11Override - eDRX-11 override

Syntax

--edrx11override <list-item>

Description

Enable parameter override for eDRX cycle length of 655.36 seconds.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

edrx12CycleOverride - eDRX-12 cycle override

Syntax

--edrx12CycleOverride <list-item>

Description

Override eDRX cycle selection length of 1310.72 seconds.

Class

Optional.

List

- 5.12 - Specifies EDRX cycle length of 5.12 seconds
- 10.24 - Specifies EDRX cycle length of 10.24 seconds.
- 20.48 - Specifies EDRX cycle length of 20.48 seconds.
- 40.96 - Specifies EDRX cycle length of 40.96 seconds.
- 61.44 - Specifies EDRX cycle length of 61.44 seconds.
- 81.92 - Specifies EDRX cycle length of 81.92 seconds.
- 102.40 - Specifies EDRX cycle length of 102.40 seconds.
- 122.88 - Specifies EDRX cycle length of 122.88 seconds.
- 143.36 - Specifies EDRX cycle length of 143.36 seconds.
- 163.84 - Specifies EDRX cycle length of 163.84 seconds.
- 327.68 - Specifies EDRX cycle length of 327.68 seconds.
- 655.36 - Specifies EDRX cycle length of 655.36 seconds.
- 1310.72 - Specifies EDRX cycle length of 1310.72 seconds.
- 2621.44 - Specifies EDRX cycle length of 2621.44 seconds.
- 5242.88 - Specifies EDRX cycle length of 5242.88 seconds.

- 10485.76 - Specifies EDRX cycle length of 10485.76 seconds.

Default

1310.72

Name

edrx12DataBufferCount - eDRX-12 data buffer count

Syntax

--edrx12DataBufferCount <integer>

Description

Suggested maximum number of DL packets buffered in the SGW for eDRX cycle length of 1310.72 seconds.

Class

Optional.

Type / Range

Integer in the range of 1 to 65,535

Default

1

Name

edrx12Override - eDRX-12 override

Syntax

--edrx12override <list-item>

Description

Enable parameter override for eDRX cycle length of 1310.72 seconds.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

edrx13CycleOverride - eDRX-13 cycle override

Syntax

--edrx13CycleOverride <list-item>

Description

Override eDRX cycle selection length of 2621.44 seconds.

Class

Optional.

List

- 5.12 - Specifies EDRX cycle length of 5.12 seconds
- 10.24 - Specifies EDRX cycle length of 10.24 seconds.
- 20.48 - Specifies EDRX cycle length of 20.48 seconds.
- 40.96 - Specifies EDRX cycle length of 40.96 seconds.
- 61.44 - Specifies EDRX cycle length of 61.44 seconds.
- 81.92 - Specifies EDRX cycle length of 81.92 seconds.
- 102.40 - Specifies EDRX cycle length of 102.40 seconds.
- 122.88 - Specifies EDRX cycle length of 122.88 seconds.
- 143.36 - Specifies EDRX cycle length of 143.36 seconds.
- 163.84 - Specifies EDRX cycle length of 163.84 seconds.
- 327.68 - Specifies EDRX cycle length of 327.68 seconds.
- 655.36 - Specifies EDRX cycle length of 655.36 seconds.
- 1310.72 - Specifies EDRX cycle length of 1310.72 seconds.
- 2621.44 - Specifies EDRX cycle length of 2621.44 seconds.
- 5242.88 - Specifies EDRX cycle length of 5242.88 seconds.
- 10485.76 - Specifies EDRX cycle length of 10485.76 seconds.

Default

2621.44

Name

edrx13DataBufferCount - eDRX-13 data buffer count

Syntax

--edrx13DataBufferCount <integer>

Description

Suggested maximum number of DL packets buffered in the SGW for eDRX cycle length of 2621.44 seconds.

Class

Optional.

Type / Range

Integer in the range of 1 to 65,535

Default

1

Name

edrx13Override - eDRX-13 override

Syntax

--edrx13override <list-item>

Description

Enable parameter override for eDRX cycle length of 2621.44 seconds.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

edrx14CycleOverride - eDRX-14 cycle override

Syntax

--edrx14CycleOverride <list-item>

Description

Override eDRX cycle selection length of 5242.88 seconds.

Class

Optional.

List

- 5.12 - Specifies EDRX cycle length of 5.12 seconds
- 10.24 - Specifies EDRX cycle length of 10.24 seconds.
- 20.48 - Specifies EDRX cycle length of 20.48 seconds.
- 40.96 - Specifies EDRX cycle length of 40.96 seconds.
- 61.44 - Specifies EDRX cycle length of 61.44 seconds.
- 81.92 - Specifies EDRX cycle length of 81.92 seconds.
- 102.40 - Specifies EDRX cycle length of 102.40 seconds.
- 122.88 - Specifies EDRX cycle length of 122.88 seconds.
- 143.36 - Specifies EDRX cycle length of 143.36 seconds.
- 163.84 - Specifies EDRX cycle length of 163.84 seconds.

- 327.68 - Specifies EDRX cycle length of 327.68 seconds.
- 655.36 - Specifies EDRX cycle length of 655.36 seconds.
- 1310.72 - Specifies EDRX cycle length of 1310.72 seconds.
- 2621.44 - Specifies EDRX cycle length of 2621.44 seconds.
- 5242.88 - Specifies EDRX cycle length of 5242.88 seconds.
- 10485.76 - Specifies EDRX cycle length of 10485.76 seconds.

Default

5242.88

Name

edrx14DataBufferCount - eDRX-14 data buffer count

Syntax

--edrx14DataBufferCount <integer>

Description

Suggested maximum number of DL packets buffered in the SGW for eDRX cycle length of 5242.88 seconds.

Class

Optional.

Type / Range

Integer in the range of 1 to 65,535

Default

1

Name

edrx14Override - eDRX-14 override

Syntax

--edrx140verrride <list-item>

Description

Enable parameter override for eDRX cycle length of 5242.88 seconds.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

edrx15CycleOverride - eDRX-15 cycle override

Syntax

--edrx15CycleOverride <list-item>

Description

Override eDRX cycle selection length of 10485.76 seconds.

Class

Optional.

List

- 5.12 - Specifies EDRX cycle length of 5.12 seconds
- 10.24 - Specifies EDRX cycle length of 10.24 seconds.
- 20.48 - Specifies EDRX cycle length of 20.48 seconds.
- 40.96 - Specifies EDRX cycle length of 40.96 seconds.
- 61.44 - Specifies EDRX cycle length of 61.44 seconds.
- 81.92 - Specifies EDRX cycle length of 81.92 seconds.
- 102.40 - Specifies EDRX cycle length of 102.40 seconds.
- 122.88 - Specifies EDRX cycle length of 122.88 seconds.
- 143.36 - Specifies EDRX cycle length of 143.36 seconds.
- 163.84 - Specifies EDRX cycle length of 163.84 seconds.
- 327.68 - Specifies EDRX cycle length of 327.68 seconds.
- 655.36 - Specifies EDRX cycle length of 655.36 seconds.
- 1310.72 - Specifies EDRX cycle length of 1310.72 seconds.
- 2621.44 - Specifies EDRX cycle length of 2621.44 seconds.
- 5242.88 - Specifies EDRX cycle length of 5242.88 seconds.
- 10485.76 - Specifies EDRX cycle length of 10485.76 seconds.

Default

10485.76

Name

edrx15DataBufferCount - eDRX-15 data buffer count

Syntax

--edrx15DataBufferCount <integer>

Description

Suggested maximum number of DL packets buffered in the SGW for eDRX cycle length of 10485.76 seconds.

Class

Optional.

Type / Range

Integer in the range of 1 to 65,535

Default

1

Name

edrx15Override - eDRX-15 override

Syntax

--edrx15override <list-item>

Description

Enable parameter override for eDRX cycle length of 10485.76 seconds.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

edrx1CycleOverride - eDRX-1 cycle override

Syntax

--edrx1CycleOverride <list-item>

Description

Override eDRX cycle selection length of 10.24 seconds.

Class

Optional.

List

- 5.12 - Specifies EDRX cycle length of 5.12 seconds
- 10.24 - Specifies EDRX cycle length of 10.24 seconds.
- 20.48 - Specifies EDRX cycle length of 20.48 seconds.
- 40.96 - Specifies EDRX cycle length of 40.96 seconds.

- 61.44 - Specifies EDRX cycle length of 61.44 seconds.
- 81.92 - Specifies EDRX cycle length of 81.92 seconds.
- 102.40 - Specifies EDRX cycle length of 102.40 seconds.
- 122.88 - Specifies EDRX cycle length of 122.88 seconds.
- 143.36 - Specifies EDRX cycle length of 143.36 seconds.
- 163.84 - Specifies EDRX cycle length of 163.84 seconds.
- 327.68 - Specifies EDRX cycle length of 327.68 seconds.
- 655.36 - Specifies EDRX cycle length of 655.36 seconds.
- 1310.72 - Specifies EDRX cycle length of 1310.72 seconds.
- 2621.44 - Specifies EDRX cycle length of 2621.44 seconds.
- 5242.88 - Specifies EDRX cycle length of 5242.88 seconds.
- 10485.76 - Specifies EDRX cycle length of 10485.76 seconds.

Default

10.24

Name

edrx1DataBufferCount - eDRX-1 data buffer count

Syntax

--edrx1DataBufferCount <integer>

Description

Suggested maximum number of DL packets buffered in the SGW for eDRX cycle length of 10.24 seconds.

Class

Optional.

Type / Range

Integer in the range of 1 to 65,535

Default

1

Name

edrx1Override - eDRX-1 override

Syntax

--edrx10override <list-item>

Description

Enable parameter override for eDRX cycle length of 10.24 seconds.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

edrx2CycleOverride - eDRX-2 cycle override

Syntax

--edrx2CycleOverride <list-item>

Description

Override eDRX cycle selection length of 20.48 seconds.

Class

Optional.

List

- 5.12 - Specifies EDRX cycle length of 5.12 seconds
- 10.24 - Specifies EDRX cycle length of 10.24 seconds.
- 20.48 - Specifies EDRX cycle length of 20.48 seconds.
- 40.96 - Specifies EDRX cycle length of 40.96 seconds.
- 61.44 - Specifies EDRX cycle length of 61.44 seconds.
- 81.92 - Specifies EDRX cycle length of 81.92 seconds.
- 102.40 - Specifies EDRX cycle length of 102.40 seconds.
- 122.88 - Specifies EDRX cycle length of 122.88 seconds.
- 143.36 - Specifies EDRX cycle length of 143.36 seconds.
- 163.84 - Specifies EDRX cycle length of 163.84 seconds.
- 327.68 - Specifies EDRX cycle length of 327.68 seconds.
- 655.36 - Specifies EDRX cycle length of 655.36 seconds.
- 1310.72 - Specifies EDRX cycle length of 1310.72 seconds.
- 2621.44 - Specifies EDRX cycle length of 2621.44 seconds.
- 5242.88 - Specifies EDRX cycle length of 5242.88 seconds.
- 10485.76 - Specifies EDRX cycle length of 10485.76 seconds.

Default

20.48

Name

edrx2DataBufferCount - eDRX-2 data buffer count

Syntax

--edrx2DataBufferCount <integer>

Description

Suggested maximum number of DL packets buffered in the SGW for eDRX cycle length of 20.48 seconds.

Class

Optional.

Type / Range

Integer in the range of 1 to 65,535

Default

1

Name

edrx2Override - eDRX-2 override

Syntax

--edrx2Override <list-item>

Description

Enable parameter override for eDRX cycle length of 20.48 seconds.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

edrx3CycleOverride - eDRX-3 cycle override

Syntax

--edrx3CycleOverride <list-item>

Description

Override eDRX cycle selection length of 40.96 seconds.

Class

Optional.

List

- 5.12 - Specifies EDRX cycle length of 5.12 seconds
- 10.24 - Specifies EDRX cycle length of 10.24 seconds.
- 20.48 - Specifies EDRX cycle length of 20.48 seconds.
- 40.96 - Specifies EDRX cycle length of 40.96 seconds.
- 61.44 - Specifies EDRX cycle length of 61.44 seconds.
- 81.92 - Specifies EDRX cycle length of 81.92 seconds.
- 102.40 - Specifies EDRX cycle length of 102.40 seconds.
- 122.88 - Specifies EDRX cycle length of 122.88 seconds.
- 143.36 - Specifies EDRX cycle length of 143.36 seconds.
- 163.84 - Specifies EDRX cycle length of 163.84 seconds.
- 327.68 - Specifies EDRX cycle length of 327.68 seconds.
- 655.36 - Specifies EDRX cycle length of 655.36 seconds.
- 1310.72 - Specifies EDRX cycle length of 1310.72 seconds.
- 2621.44 - Specifies EDRX cycle length of 2621.44 seconds.
- 5242.88 - Specifies EDRX cycle length of 5242.88 seconds.
- 10485.76 - Specifies EDRX cycle length of 10485.76 seconds.

Default

40.96

Name

edrx3DataBufferCount - eDRX-3 data buffer count

Syntax

- edrx3DataBufferCount <integer>

Description

Suggested maximum number of DL packets buffered in the SGW for eDRX cycle length of 40.96 seconds.

Class

Optional.

Type / Range

Integer in the range of 1 to 65,535

Default

1

Name

edrx3Override - eDRX-3 override

Syntax

--edrx3override <list-item>

Description

Enable parameter override for eDRX cycle length of 40.96 seconds.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

edrx4CycleOverride - eDRX-4 cycle override

Syntax

--edrx4CycleOverride <list-item>

Description

Override eDRX cycle selection length of 61.44 seconds.

Class

Optional.

List

- 5.12 - Specifies EDRX cycle length of 5.12 seconds
- 10.24 - Specifies EDRX cycle length of 10.24 seconds.
- 20.48 - Specifies EDRX cycle length of 20.48 seconds.
- 40.96 - Specifies EDRX cycle length of 40.96 seconds.
- 61.44 - Specifies EDRX cycle length of 61.44 seconds.
- 81.92 - Specifies EDRX cycle length of 81.92 seconds.
- 102.40 - Specifies EDRX cycle length of 102.40 seconds.
- 122.88 - Specifies EDRX cycle length of 122.88 seconds.
- 143.36 - Specifies EDRX cycle length of 143.36 seconds.
- 163.84 - Specifies EDRX cycle length of 163.84 seconds.
- 327.68 - Specifies EDRX cycle length of 327.68 seconds.
- 655.36 - Specifies EDRX cycle length of 655.36 seconds.

- 1310.72 - Specifies EDRX cycle length of 1310.72 seconds.
- 2621.44 - Specifies EDRX cycle length of 2621.44 seconds.
- 5242.88 - Specifies EDRX cycle length of 5242.88 seconds.
- 10485.76 - Specifies EDRX cycle length of 10485.76 seconds.

Default

61.44

Name

edrx4DataBufferCount - eDRX-4 data buffer count

Syntax

--edrx4DataBufferCount <integer>

Description

Suggested maximum number of DL packets buffered in the SGW for eDRX cycle length of 61.44 seconds.

Class

Optional.

Type / Range

Integer in the range of 1 to 65,535

Default

1

Name

edrx4Override - eDRX-4 override

Syntax

--edrx4Override <list-item>

Description

Enable parameter override for eDRX cycle length of 61.44 seconds.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

edrx5CycleOverride - eDRX-5 cycle override

Syntax

--edrx5CycleOverride <list-item>

Description

Override eDRX cycle selection length of 81.92 seconds.

Class

Optional.

List

- 5.12 - Specifies EDRX cycle length of 5.12 seconds
- 10.24 - Specifies EDRX cycle length of 10.24 seconds.
- 20.48 - Specifies EDRX cycle length of 20.48 seconds.
- 40.96 - Specifies EDRX cycle length of 40.96 seconds.
- 61.44 - Specifies EDRX cycle length of 61.44 seconds.
- 81.92 - Specifies EDRX cycle length of 81.92 seconds.
- 102.40 - Specifies EDRX cycle length of 102.40 seconds.
- 122.88 - Specifies EDRX cycle length of 122.88 seconds.
- 143.36 - Specifies EDRX cycle length of 143.36 seconds.
- 163.84 - Specifies EDRX cycle length of 163.84 seconds.
- 327.68 - Specifies EDRX cycle length of 327.68 seconds.
- 655.36 - Specifies EDRX cycle length of 655.36 seconds.
- 1310.72 - Specifies EDRX cycle length of 1310.72 seconds.
- 2621.44 - Specifies EDRX cycle length of 2621.44 seconds.
- 5242.88 - Specifies EDRX cycle length of 5242.88 seconds.
- 10485.76 - Specifies EDRX cycle length of 10485.76 seconds.

Default

81.92

Name

edrx5DataBufferCount - eDRX-5 data buffer count

Syntax

--edrx5DataBufferCount <integer>

Description

Suggested maximum number of DL packets buffered in the SGW for eDRX cycle length of 81.92 seconds.

Class

Optional.

Type / Range

Integer in the range of 1 to 65,535

Default

1

Name

edrx5Override - eDRX-5 override

Syntax

--edrx5override <list-item>

Description

Enable parameter override for eDRX cycle length of 81.92 seconds.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

edrx6CycleOverride - eDRX-6 cycle override

Syntax

--edrx6CycleOverride <list-item>

Description

Override eDRX cycle selection length of 102.40 seconds.

Class

Optional.

List

- 5.12 - Specifies EDRX cycle length of 5.12 seconds
- 10.24 - Specifies EDRX cycle length of 10.24 seconds.
- 20.48 - Specifies EDRX cycle length of 20.48 seconds.
- 40.96 - Specifies EDRX cycle length of 40.96 seconds.
- 61.44 - Specifies EDRX cycle length of 61.44 seconds.
- 81.92 - Specifies EDRX cycle length of 81.92 seconds.
- 102.40 - Specifies EDRX cycle length of 102.40 seconds.

- 122.88 - Specifies EDRX cycle length of 122.88 seconds.
- 143.36 - Specifies EDRX cycle length of 143.36 seconds.
- 163.84 - Specifies EDRX cycle length of 163.84 seconds.
- 327.68 - Specifies EDRX cycle length of 327.68 seconds.
- 655.36 - Specifies EDRX cycle length of 655.36 seconds.
- 1310.72 - Specifies EDRX cycle length of 1310.72 seconds.
- 2621.44 - Specifies EDRX cycle length of 2621.44 seconds.
- 5242.88 - Specifies EDRX cycle length of 5242.88 seconds.
- 10485.76 - Specifies EDRX cycle length of 10485.76 seconds.

Default

102.40

Name

edrx6DataBufferCount - eDRX-6 data buffer count

Syntax

--edrx6DataBufferCount <integer>

Description

Suggested maximum number of DL packets buffered in the SGW for eDRX cycle length of 102.40 seconds.

Class

Optional.

Type / Range

Integer in the range of 1 to 65,535

Default

1

Name

edrx6Override - eDRX-6 override

Syntax

--edrx6Override <list-item>

Description

Enable parameter override for eDRX cycle length of 102.40 seconds.

Class

Optional.

List

- false - Boolean value of false.

- true - Boolean value of true.

Default

false

Name

edrx7CycleOverride - eDRX-7 cycle override

Syntax

--edrx7CycleOverride <list-item>

Description

Override eDRX cycle selection length of 122.88 seconds.

Class

Optional.

List

- 5.12 - Specifies EDRX cycle length of 5.12 seconds
- 10.24 - Specifies EDRX cycle length of 10.24 seconds.
- 20.48 - Specifies EDRX cycle length of 20.48 seconds.
- 40.96 - Specifies EDRX cycle length of 40.96 seconds.
- 61.44 - Specifies EDRX cycle length of 61.44 seconds.
- 81.92 - Specifies EDRX cycle length of 81.92 seconds.
- 102.40 - Specifies EDRX cycle length of 102.40 seconds.
- 122.88 - Specifies EDRX cycle length of 122.88 seconds.
- 143.36 - Specifies EDRX cycle length of 143.36 seconds.
- 163.84 - Specifies EDRX cycle length of 163.84 seconds.
- 327.68 - Specifies EDRX cycle length of 327.68 seconds.
- 655.36 - Specifies EDRX cycle length of 655.36 seconds.
- 1310.72 - Specifies EDRX cycle length of 1310.72 seconds.
- 2621.44 - Specifies EDRX cycle length of 2621.44 seconds.
- 5242.88 - Specifies EDRX cycle length of 5242.88 seconds.
- 10485.76 - Specifies EDRX cycle length of 10485.76 seconds.

Default

122.88

Name

edrx7DataBufferCount - eDRX-7 data buffer count

Syntax

--edrx7DataBufferCount <integer>

Description

Suggested maximum number of DL packets buffered in the SGW for eDRX cycle length of 122.88 seconds.

Class

Optional.

Type / Range

Integer in the range of 1 to 65,535

Default

1

Name

edrx7Override - eDRX-7 override

Syntax

--edrx70override <list-item>

Description

Enable parameter override for eDRX cycle length of 122.88 seconds.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

edrx8CycleOverride - eDRX-8 cycle override

Syntax

--edrx8CycleOverride <list-item>

Description

Override eDRX cycle selection length of 143.36 seconds.

Class

Optional.

List

- 5.12 - Specifies EDRX cycle length of 5.12 seconds
- 10.24 - Specifies EDRX cycle length of 10.24 seconds.

- 20.48 - Specifies EDRX cycle length of 20.48 seconds.
- 40.96 - Specifies EDRX cycle length of 40.96 seconds.
- 61.44 - Specifies EDRX cycle length of 61.44 seconds.
- 81.92 - Specifies EDRX cycle length of 81.92 seconds.
- 102.40 - Specifies EDRX cycle length of 102.40 seconds.
- 122.88 - Specifies EDRX cycle length of 122.88 seconds.
- 143.36 - Specifies EDRX cycle length of 143.36 seconds.
- 163.84 - Specifies EDRX cycle length of 163.84 seconds.
- 327.68 - Specifies EDRX cycle length of 327.68 seconds.
- 655.36 - Specifies EDRX cycle length of 655.36 seconds.
- 1310.72 - Specifies EDRX cycle length of 1310.72 seconds.
- 2621.44 - Specifies EDRX cycle length of 2621.44 seconds.
- 5242.88 - Specifies EDRX cycle length of 5242.88 seconds.
- 10485.76 - Specifies EDRX cycle length of 10485.76 seconds.

Default

143.36

Name

edrx8DataBufferCount - eDRX-8 data buffer count

Syntax

--edrx8DataBufferCount <integer>

Description

Suggested maximum number of DL packets buffered in the SGW for eDRX cycle length of 143.36 seconds.

Class

Optional.

Type / Range

Integer in the range of 1 to 65,535

Default

1

Name

edrx8Override - eDRX-8 override

Syntax

--edrx8Override <list-item>

Description

Enable parameter override for eDRX cycle length of 143.36 seconds.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

edrx9CycleOverride - eDRX-9 cycle override

Syntax

--edrx9CycleOverride <list-item>

Description

Override eDRX cycle selection length of 163.84 seconds.

Class

Optional.

List

- 5.12 - Specifies EDRX cycle length of 5.12 seconds
- 10.24 - Specifies EDRX cycle length of 10.24 seconds.
- 20.48 - Specifies EDRX cycle length of 20.48 seconds.
- 40.96 - Specifies EDRX cycle length of 40.96 seconds.
- 61.44 - Specifies EDRX cycle length of 61.44 seconds.
- 81.92 - Specifies EDRX cycle length of 81.92 seconds.
- 102.40 - Specifies EDRX cycle length of 102.40 seconds.
- 122.88 - Specifies EDRX cycle length of 122.88 seconds.
- 143.36 - Specifies EDRX cycle length of 143.36 seconds.
- 163.84 - Specifies EDRX cycle length of 163.84 seconds.
- 327.68 - Specifies EDRX cycle length of 327.68 seconds.
- 655.36 - Specifies EDRX cycle length of 655.36 seconds.
- 1310.72 - Specifies EDRX cycle length of 1310.72 seconds.
- 2621.44 - Specifies EDRX cycle length of 2621.44 seconds.
- 5242.88 - Specifies EDRX cycle length of 5242.88 seconds.

- 10485.76 - Specifies EDRX cycle length of 10485.76 seconds.

Default

163.84

Name

edrx9DataBufferCount - eDRX-9 data buffer count

Syntax

--edrx9DataBufferCount <integer>

Description

Suggested maximum number of DL packets buffered in the SGW for eDRX cycle length of 163.84 seconds.

Class

Optional.

Type / Range

Integer in the range of 1 to 65,535

Default

1

Name

edrx9Override - eDRX-9 override

Syntax

--edrx90override <list-item>

Description

Enable parameter override for eDRX cycle length of 163.84 seconds.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

nbEdrx10PtwOverride - NB-S1 mode eDRX-10 PTW length override

Syntax

--nbEdrx10PtwOverride <list-item>

Description

Override PTW length for eDRX cycle length of 327.68 seconds for NB-S1 UE.

Class

Optional.

List

- 2.56 - Specifies eDRX narrow band paging time window of 2.56 seconds.
- 5.12 - Specifies eDRX narrow band paging time window of 5.12 seconds.
- 7.68 - Specifies eDRX narrow band paging time window of 7.68 seconds.
- 10.24 - Specifies eDRX narrow band paging time window of 10.24 seconds.
- 12.80 - Specifies eDRX narrow band paging time window of 12.80 seconds.
- 15.36 - Specifies eDRX narrow band paging time window of 15.36 seconds.
- 17.92 - Specifies eDRX narrow band paging time window of 17.92 seconds.
- 20.48 - Specifies eDRX narrow band paging time window of 20.48 seconds.
- 23.04 - Specifies eDRX narrow band paging time window of 23.04 seconds.
- 25.60 - Specifies eDRX narrow band paging time window of 25.60 seconds.
- 28.16 - Specifies eDRX narrow band paging time window of 28.16 seconds.
- 30.72 - Specifies eDRX narrow band paging time window of 30.72 seconds.
- 33.28 - Specifies eDRX narrow band paging time window of 33.28 seconds.
- 35.84 - Specifies eDRX narrow band paging time window of 35.84 seconds.
- 38.40 - Specifies eDRX narrow band paging time window of 38.40 seconds.
- 40.96 - Specifies eDRX narrow band paging time window of 40.96 seconds.

Default

28.16

Name

nbEdrx11PtwOverride - NB-S1 mode eDRX-11 PTW length override

Syntax

--nbEdrx11PtwOverride <list-item>

Description

Override PTW length for eDRX cycle length of 655.36 seconds for NB-S1 UE.

Class

Optional.

List

- 2.56 - Specifies eDRX narrow band paging time window of 2.56 seconds.
- 5.12 - Specifies eDRX narrow band paging time window of 5.12 seconds.

- 7.68 - Specifies eDRX narrow band paging time window of 7.68 seconds.
- 10.24 - Specifies eDRX narrow band paging time window of 10.24 seconds.
- 12.80 - Specifies eDRX narrow band paging time window of 12.80 seconds.
- 15.36 - Specifies eDRX narrow band paging time window of 15.36 seconds.
- 17.92 - Specifies eDRX narrow band paging time window of 17.92 seconds.
- 20.48 - Specifies eDRX narrow band paging time window of 20.48 seconds.
- 23.04 - Specifies eDRX narrow band paging time window of 23.04 seconds.
- 25.60 - Specifies eDRX narrow band paging time window of 25.60 seconds.
- 28.16 - Specifies eDRX narrow band paging time window of 28.16 seconds.
- 30.72 - Specifies eDRX narrow band paging time window of 30.72 seconds.
- 33.28 - Specifies eDRX narrow band paging time window of 33.28 seconds.
- 35.84 - Specifies eDRX narrow band paging time window of 35.84 seconds.
- 38.40 - Specifies eDRX narrow band paging time window of 38.40 seconds.
- 40.96 - Specifies eDRX narrow band paging time window of 40.96 seconds.

Default

28.16

Name

nbEdrx12PtwOverride - NB-S1 mode eDRX-12 PTW length override

Syntax

--nbEdrx12PtwOverride <list-item>

Description

Override PTW length for eDRX cycle length of 1310.72 seconds for NB-S1 UE.

Class

Optional.

List

- 2.56 - Specifies eDRX narrow band paging time window of 2.56 seconds.
- 5.12 - Specifies eDRX narrow band paging time window of 5.12 seconds.
- 7.68 - Specifies eDRX narrow band paging time window of 7.68 seconds.
- 10.24 - Specifies eDRX narrow band paging time window of 10.24 seconds.
- 12.80 - Specifies eDRX narrow band paging time window of 12.80 seconds.
- 15.36 - Specifies eDRX narrow band paging time window of 15.36 seconds.
- 17.92 - Specifies eDRX narrow band paging time window of 17.92 seconds.

- 20.48 - Specifies eDRX narrow band paging time window of 20.48 seconds.
- 23.04 - Specifies eDRX narrow band paging time window of 23.04 seconds.
- 25.60 - Specifies eDRX narrow band paging time window of 25.60 seconds.
- 28.16 - Specifies eDRX narrow band paging time window of 28.16 seconds.
- 30.72 - Specifies eDRX narrow band paging time window of 30.72 seconds.
- 33.28 - Specifies eDRX narrow band paging time window of 33.28 seconds.
- 35.84 - Specifies eDRX narrow band paging time window of 35.84 seconds.
- 38.40 - Specifies eDRX narrow band paging time window of 38.40 seconds.
- 40.96 - Specifies eDRX narrow band paging time window of 40.96 seconds.

Default

28.16

Name

nbEdrx13PtwOverride - NB-S1 mode eDRX-13 PTW length override

Syntax

--nbEdrx13PtwOverride <list-item>

Description

Override PTW length for eDRX cycle length of 2621.44 seconds for NB-S1 UE.

Class

Optional.

List

- 2.56 - Specifies eDRX narrow band paging time window of 2.56 seconds.
- 5.12 - Specifies eDRX narrow band paging time window of 5.12 seconds.
- 7.68 - Specifies eDRX narrow band paging time window of 7.68 seconds.
- 10.24 - Specifies eDRX narrow band paging time window of 10.24 seconds.
- 12.80 - Specifies eDRX narrow band paging time window of 12.80 seconds.
- 15.36 - Specifies eDRX narrow band paging time window of 15.36 seconds.
- 17.92 - Specifies eDRX narrow band paging time window of 17.92 seconds.
- 20.48 - Specifies eDRX narrow band paging time window of 20.48 seconds.
- 23.04 - Specifies eDRX narrow band paging time window of 23.04 seconds.
- 25.60 - Specifies eDRX narrow band paging time window of 25.60 seconds.
- 28.16 - Specifies eDRX narrow band paging time window of 28.16 seconds.
- 30.72 - Specifies eDRX narrow band paging time window of 30.72 seconds.

- 33.28 - Specifies eDRX narrow band paging time window of 33.28 seconds.
- 35.84 - Specifies eDRX narrow band paging time window of 35.84 seconds.
- 38.40 - Specifies eDRX narrow band paging time window of 38.40 seconds.
- 40.96 - Specifies eDRX narrow band paging time window of 40.96 seconds.

Default

28.16

Name

nbEdrx14PtwOverride - NB-S1 mode eDRX-14 PTW length override

Syntax

--nbEdrx14PtwOverride <list-item>

Description

Override PTW length for eDRX cycle length of 5242.88 seconds for NB-S1 UE.

Class

Optional.

List

- 2.56 - Specifies eDRX narrow band paging time window of 2.56 seconds.
- 5.12 - Specifies eDRX narrow band paging time window of 5.12 seconds.
- 7.68 - Specifies eDRX narrow band paging time window of 7.68 seconds.
- 10.24 - Specifies eDRX narrow band paging time window of 10.24 seconds.
- 12.80 - Specifies eDRX narrow band paging time window of 12.80 seconds.
- 15.36 - Specifies eDRX narrow band paging time window of 15.36 seconds.
- 17.92 - Specifies eDRX narrow band paging time window of 17.92 seconds.
- 20.48 - Specifies eDRX narrow band paging time window of 20.48 seconds.
- 23.04 - Specifies eDRX narrow band paging time window of 23.04 seconds.
- 25.60 - Specifies eDRX narrow band paging time window of 25.60 seconds.
- 28.16 - Specifies eDRX narrow band paging time window of 28.16 seconds.
- 30.72 - Specifies eDRX narrow band paging time window of 30.72 seconds.
- 33.28 - Specifies eDRX narrow band paging time window of 33.28 seconds.
- 35.84 - Specifies eDRX narrow band paging time window of 35.84 seconds.
- 38.40 - Specifies eDRX narrow band paging time window of 38.40 seconds.
- 40.96 - Specifies eDRX narrow band paging time window of 40.96 seconds.

Default

28.16

Name

nbEdrx15PtwOverride - NB-S1 mode eDRX-15 PTW length override

Syntax`--nbEdrx15PtwOverride <list-item>`**Description**

Override PTW length for eDRX cycle length of 10485.76 seconds for NB-S1 UE.

Class

Optional.

List

- 2.56 - Specifies eDRX narrow band paging time window of 2.56 seconds.
- 5.12 - Specifies eDRX narrow band paging time window of 5.12 seconds.
- 7.68 - Specifies eDRX narrow band paging time window of 7.68 seconds.
- 10.24 - Specifies eDRX narrow band paging time window of 10.24 seconds.
- 12.80 - Specifies eDRX narrow band paging time window of 12.80 seconds.
- 15.36 - Specifies eDRX narrow band paging time window of 15.36 seconds.
- 17.92 - Specifies eDRX narrow band paging time window of 17.92 seconds.
- 20.48 - Specifies eDRX narrow band paging time window of 20.48 seconds.
- 23.04 - Specifies eDRX narrow band paging time window of 23.04 seconds.
- 25.60 - Specifies eDRX narrow band paging time window of 25.60 seconds.
- 28.16 - Specifies eDRX narrow band paging time window of 28.16 seconds.
- 30.72 - Specifies eDRX narrow band paging time window of 30.72 seconds.
- 33.28 - Specifies eDRX narrow band paging time window of 33.28 seconds.
- 35.84 - Specifies eDRX narrow band paging time window of 35.84 seconds.
- 38.40 - Specifies eDRX narrow band paging time window of 38.40 seconds.
- 40.96 - Specifies eDRX narrow band paging time window of 40.96 seconds.

Default

28.16

Name

nbEdrx2PtwOverride - NB-S1 mode eDRX-2 PTW length override

Syntax`--nbEdrx2PtwOverride <list-item>`**Description**

Override PTW length for eDRX cycle length of 20.48 seconds for NB-S1 UE.

Class

Optional.

List

- 2.56 - Specifies eDRX narrow band paging time window of 2.56 seconds.
- 5.12 - Specifies eDRX narrow band paging time window of 5.12 seconds.
- 7.68 - Specifies eDRX narrow band paging time window of 7.68 seconds.
- 10.24 - Specifies eDRX narrow band paging time window of 10.24 seconds.
- 12.80 - Specifies eDRX narrow band paging time window of 12.80 seconds.
- 15.36 - Specifies eDRX narrow band paging time window of 15.36 seconds.
- 17.92 - Specifies eDRX narrow band paging time window of 17.92 seconds.

Default

10.24

Name

nbEdrx3PtwOverride - NB-S1 mode eDRX-3 PTW length override

Syntax

--nbEdrx3PtwOverride <list-item>

Description

Override PTW length for eDRX cycle length of 40.96 seconds for NB-S1 UE.

Class

Optional.

List

- 2.56 - Specifies eDRX narrow band paging time window of 2.56 seconds.
- 5.12 - Specifies eDRX narrow band paging time window of 5.12 seconds.
- 7.68 - Specifies eDRX narrow band paging time window of 7.68 seconds.
- 10.24 - Specifies eDRX narrow band paging time window of 10.24 seconds.
- 12.80 - Specifies eDRX narrow band paging time window of 12.80 seconds.
- 15.36 - Specifies eDRX narrow band paging time window of 15.36 seconds.
- 17.92 - Specifies eDRX narrow band paging time window of 17.92 seconds.
- 20.48 - Specifies eDRX narrow band paging time window of 20.48 seconds.
- 23.04 - Specifies eDRX narrow band paging time window of 23.04 seconds.
- 25.60 - Specifies eDRX narrow band paging time window of 25.60 seconds.

- 28.16 - Specifies eDRX narrow band paging time window of 28.16 seconds.
- 30.72 - Specifies eDRX narrow band paging time window of 30.72 seconds.
- 33.28 - Specifies eDRX narrow band paging time window of 33.28 seconds.
- 35.84 - Specifies eDRX narrow band paging time window of 35.84 seconds.
- 38.40 - Specifies eDRX narrow band paging time window of 38.40 seconds.
- 40.96 - Specifies eDRX narrow band paging time window of 40.96 seconds.

Default

10.24

Name

nbEdrx5PtwOverride - NB-S1 mode eDRX-5 PTW length override

Syntax

--nbEdrx5PtwOverride <list-item>

Description

Override PTW length for eDRX cycle length of 81.92 seconds for NB-S1 UE.

Class

Optional.

List

- 2.56 - Specifies eDRX narrow band paging time window of 2.56 seconds.
- 5.12 - Specifies eDRX narrow band paging time window of 5.12 seconds.
- 7.68 - Specifies eDRX narrow band paging time window of 7.68 seconds.
- 10.24 - Specifies eDRX narrow band paging time window of 10.24 seconds.
- 12.80 - Specifies eDRX narrow band paging time window of 12.80 seconds.
- 15.36 - Specifies eDRX narrow band paging time window of 15.36 seconds.
- 17.92 - Specifies eDRX narrow band paging time window of 17.92 seconds.
- 20.48 - Specifies eDRX narrow band paging time window of 20.48 seconds.
- 23.04 - Specifies eDRX narrow band paging time window of 23.04 seconds.
- 25.60 - Specifies eDRX narrow band paging time window of 25.60 seconds.
- 28.16 - Specifies eDRX narrow band paging time window of 28.16 seconds.
- 30.72 - Specifies eDRX narrow band paging time window of 30.72 seconds.
- 33.28 - Specifies eDRX narrow band paging time window of 33.28 seconds.
- 35.84 - Specifies eDRX narrow band paging time window of 35.84 seconds.
- 38.40 - Specifies eDRX narrow band paging time window of 38.40 seconds.

- 40.96 - Specifies eDRX narrow band paging time window of 40.96 seconds.

Default

10.24

Name

nbEdrx9PtwOverride - NB-S1 mode eDRX-9 PTW length override

Syntax

--nbEdrx9PtwOverride <list-item>

Description

Override PTW length for eDRX cycle length of 163.84 seconds for NB-S1 UE.

Class

Optional.

List

- 2.56 - Specifies eDRX narrow band paging time window of 2.56 seconds.
- 5.12 - Specifies eDRX narrow band paging time window of 5.12 seconds.
- 7.68 - Specifies eDRX narrow band paging time window of 7.68 seconds.
- 10.24 - Specifies eDRX narrow band paging time window of 10.24 seconds.
- 12.80 - Specifies eDRX narrow band paging time window of 12.80 seconds.
- 15.36 - Specifies eDRX narrow band paging time window of 15.36 seconds.
- 17.92 - Specifies eDRX narrow band paging time window of 17.92 seconds.
- 20.48 - Specifies eDRX narrow band paging time window of 20.48 seconds.
- 23.04 - Specifies eDRX narrow band paging time window of 23.04 seconds.
- 25.60 - Specifies eDRX narrow band paging time window of 25.60 seconds.
- 28.16 - Specifies eDRX narrow band paging time window of 28.16 seconds.
- 30.72 - Specifies eDRX narrow band paging time window of 30.72 seconds.
- 33.28 - Specifies eDRX narrow band paging time window of 33.28 seconds.
- 35.84 - Specifies eDRX narrow band paging time window of 35.84 seconds.
- 38.40 - Specifies eDRX narrow band paging time window of 38.40 seconds.
- 40.96 - Specifies eDRX narrow band paging time window of 40.96 seconds.

Default

17.92

Name

ptwNbCarryover - PTW NB Carryover

Syntax

--ptwNbCarryover <list-item>

Description

If the MME is provisioned to allow paging to extend to another PTW, this field specifies the maximum WB eDRX cycle value that a UE is allowed to have for it to be eligible for paging carry over. The default is 20.48.

Class

Optional.

List

- 20.48 - Specifies eDRX narrow band cycle length of 20.48 seconds.
- 40.96 - Specifies eDRX narrow band cycle length 40.96 seconds.
- 81.92 - Specifies eDRX narrow band cycle length 81.92 seconds.
- 163.84 - Specifies eDRX narrow band cycle length of 163.84 seconds.
- 327.68 - Specifies eDRX narrow band cycle length of 327.68 seconds.
- 655.36 - Specifies eDRX narrow band cycle length of 655.36 seconds.
- 1310.72 - Specifies eDRX narrow band cycle length of 1310.72 seconds.
- 2621.44 - Specifies eDRX narrow band cycle length of 2621.44 seconds.
- 5242.88 - Specifies eDRX narrow band cycle length of 5242.88 seconds.
- 10485.76 - Specifies eDRX narrow band cycle length of 10485.76 seconds.

Default

20.48

Name

ptwWbCarryover - PTW WB Carryover

Syntax

--ptwWbCarryover <list-item>

Description

If the MME is provisioned to allow paging to extend to another PTW, this field specifies the maximum WB eDRX cycle value that a UE is allowed to have for it to be eligible for paging carry over. The default is 10.24.

Class

Optional.

List

- 10.24 - Specifies eDRX wide band cycle length of 20.48 seconds.
- 20.48 - 10.48 - Specifies eDRX wide band cycle length of 20.48 seconds.
- 40.96 - Specifies eDRX wide band cycle length of 40.96 seconds.

- 61.44 - Specifies eDRX wide band cycle length of 61.44 seconds.
- 81.92 - Specifies eDRX wide band cycle length of 81.92 seconds.
- 102.40 - Specifies eDRX wide band cycle length of 102.40 seconds.
- 122.88 - Specifies eDRX wide band cycle length of 122.88 seconds.
- 143.36 - Specifies eDRX wide band cycle length of 143.36 seconds.
- 163.84 - Specifies eDRX wide band cycle length of 163.84 seconds.
- 327.68 - Specifies eDRX wide band cycle length of 327.68 seconds.
- 655.36 - Specifies eDRX wide band cycle length of 655.36 seconds.
- 1310.72 - Specifies eDRX wide band cycle length of 1310.72 seconds.
- 2621.44 - Specifies eDRX wide band cycle length of 2621.44 seconds.

Default

10.24

Name

wbEdrx10PtwOverride - WB-S1 mode eDRX-10 PTW length override

Syntax

--wbEdrx10PtwOverride <list-item>

Description

Override PTW length for eDRX cycle length of 327.68 seconds for WB-S1 UE.

Class

Optional.

List

- 1.28 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 2.56 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 3.84 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 5.12 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 6.40 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 7.68 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 8.96 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 10.24 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 11.52 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 12.80 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 14.08 - Specifies eDRX wide band paging time window length of 1.28 seconds.

- 15.36 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 16.64 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 17.92 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 19.20 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 20.48 - Specifies eDRX wide band paging time window length of 1.28 seconds.

Default

20.48

Name

wbEdrx11PtwOverride - WB-S1 mode eDRX-11 PTW length override

Syntax

--wbEdrx11PtwOverride <list-item>

Description

Override PTW length for eDRX cycle length of 655.36 seconds for WB-S1 UE.

Class

Optional.

List

- 1.28 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 2.56 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 3.84 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 5.12 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 6.40 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 7.68 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 8.96 - Specifies eDRX wide band paging time window length of 1.28 seconds.

- 11.52 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 12.80 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 14.08 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 15.36 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 16.64 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 17.92 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 19.20 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 20.48 - Specifies eDRX wide band paging time window length of 1.28 seconds.

Default

20.48

Name

wbEdrx12PtwOverride - WB-S1 mode eDRX-12 PTW length override

Syntax`--wbEdrx12PtwOverride <list-item>`**Description**

Override PTW length for eDRX cycle length of 1310.72 seconds for WB-S1 UE.

Class

Optional.

List

- 1.28 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 2.56 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 3.84 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 5.12 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 6.40 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 7.68 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 8.96 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 10.24 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 11.52 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 12.80 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 14.08 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 15.36 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 16.64 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 17.92 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 19.20 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 20.48 - Specifies eDRX wide band paging time window length of 1.28 seconds.

Default

20.48

Name

wbEdrx13PtwOverride - WB-S1 mode eDRX-13 PTW length override

Syntax`--wbEdrx13PtwOverride <list-item>`

Description

Override PTW length for eDRX cycle length of 2621.44 seconds for WB-S1 UE.

Class

Optional.

List

- 1.28 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 2.56 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 3.84 - Specifies eDRX wide band paging time window length of 1.28 seconds.

- 11.52 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 12.80 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 14.08 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 15.36 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 16.64 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 17.92 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 19.20 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 20.48 - Specifies eDRX wide band paging time window length of 1.28 seconds.

Default

20.48

Name

wbEdrx1PtwOverride - WB-S1 mode eDRX-1 PTW length override

Syntax

--wbEdrx1PtwOverride <list-item>

Description

Override PTW length for eDRX cycle length of 10.24 seconds for WB-S1 UE.

Class

Optional.

List

- 1.28 - Specifies eDRX wide band paging time window of 1.28 seconds.

- 2.56 - Specifies eDRX wide band paging time window of 2.56 seconds.
- 3.84 - Specifies eDRX wide band paging time window of 3.84 seconds.
- 5.12 - Specifies eDRX wide band paging time window of 5.12 seconds.
- 6.40 - Specifies eDRX wide band paging time window of 6.40 seconds.
- 7.68 - Specifies eDRX wide band paging time window of 7.68 seconds.
- 8.96 - Specifies eDRX wide band paging time window of 8.96 seconds.

Default

6.40

Name

wbEdrx2PtwOverride - WB-S1 mode eDRX-2 PTW length override

Syntax

--wbEdrx2PtwOverride <list-item>

Description

Override PTW length for eDRX cycle length of 20.48 seconds for WB-S1 UE.

Class

Optional.

List

- 1.28 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 2.56 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 3.84 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 5.12 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 6.40 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 7.68 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 8.96 - Specifies eDRX wide band paging time window length of 1.28 seconds.

- 14.08 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 15.36 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 16.64 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 17.92 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 19.20 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 20.48 - Specifies eDRX wide band paging time window length of 1.28 seconds.

Default

12.80

Name

wbEdrx8PtwOverride - WB-S1 mode eDRX-8 PTW length override

Syntax

--wbEdrx8PtwOverride <list-item>

Description

Override PTW length for eDRX cycle length of 143.36 seconds for WB-S1 UE.

Class

Optional.

List

- 1.28 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 2.56 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 3.84 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 5.12 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 6.40 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 7.68 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 8.96 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 10.24 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 11.52 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 12.80 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 14.08 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 15.36 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 16.64 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 17.92 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 19.20 - Specifies eDRX wide band paging time window length of 1.28 seconds.

- 20.48 - Specifies eDRX wide band paging time window length of 1.28 seconds.

Default

14.08

Name

wbEdrx9PtwOverride - WB-S1 mode eDRX-9 PTW length override

Syntax

--wbEdrx9PtwOverride <list-item>

Description

Override PTW length for eDRX cycle length of 163.84 seconds for WB-S1 UE.

Class

Optional.

List

- 1.28 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 2.56 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 3.84 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 5.12 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 6.40 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 7.68 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 8.96 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 10.24 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 11.52 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 12.80 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 14.08 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 15.36 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 16.64 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 17.92 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 19.20 - Specifies eDRX wide band paging time window length of 1.28 seconds.
- 20.48 - Specifies eDRX wide band paging time window length of 1.28 seconds.

Default

16.64

4.104 cmm emergencyNum

Emergency Number List. Syntax, description, parameters, and roles for cmm emergencyNum command.

Syntax

Description

This command is used to administer an Emergency Number List and includes parameters for defining emergency numbers for ambulance, fire brigade, marine guard, mountain rescue, and police.

Parameters

Name

emergencyNumListName - Emergency number list table name

Syntax

--emergencyNumListName <string>

Description

Defines the emergency number list table name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

emergencyDigits - Emergency digits

Syntax

--emergencyDigits <string>

Description

Emergency number. only 8 unique numbers per emergency numbertableid.

Class

Required key.

Type / Range

Digit string of length 1 to 10 with the allowed pattern of [0-9][0-9A-Ca-c*#]*

Name

ambulance - Ambulance

Syntax

--ambulance <list-item>

Description

If emergency number digits apply to ambulance.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

fireBrigade - Fire brigade

Syntax

--fireBrigade <list-item>

Description

If Emergency Number Digits apply to Fire Brigade.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

marineGuard - Marine guard

Syntax

--marineGuard <list-item>

Description

If Emergency Number Digits apply to Marine Guard.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

mountainRescue - Mountain rescue

Syntax

--mountainRescue <list-item>

Description

If Emergency Number Digits apply to Mountain Rescue.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

police - Police

Syntax

--police <list-item>

Description

If emergency number digits apply to police.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

4.105 cmm emergencyNumList

Emergency Number List Table. Syntax, description, parameters, and roles for cmm emergencyNumList command.

Syntax

Description

This command is used to administer an Emergency Number List Table

Parameters

Name

name - Name

Syntax

--name <string>

Description

Defines the name of emergency number list table.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Name

description - Description

Syntax

--description <string>

Description

Description.

Class

Optional.

Type / Range

Digit string of length 0 to 160 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

"

4.106 cmm emergencyProfile

Emergency Profile. Syntax, description, parameters, and roles for cmm emergencyProfile command.

Syntax**Description**

This command is used to administer an Emergency Profile. MME allows creation of up to 10 emergency profiles for the shared network. An emergency profile can be assigned to an MME home PLMN or any one of the 8 shared PLMNs.

Parameters**Name**

name - Emergency profile name

Syntax

--name <string>

Description

Name that identifies emergency profile.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

ambrDL - AMBR downlink in bps

Syntax

--ambrDL <integer>

Description

AMBR downlink bandwidth in bits per second.

Class

Optional.

Type / Range

Integer in the range of 0 to 4,294,967,295

Default

4096000

Name

ambrUI - AMBR uplink in bps

Syntax

--ambrUI <integer>

Description

AMBR uplink bandwidth in bits per second.

Class

Optional.

Type / Range

Integer in the range of 0 to 4,294,967,295

Default

4096000

Name

apnNi - APN (NI)

Syntax

--apnNi <string>

Description

Access point name network identifier part.

Class

Optional.

Type / Range

Digit string of length 1 to 62 with the allowed pattern of [0-9a-zA-Z\.\-]*

Default

sos

Name

description - Description

Syntax

--description <string>

Description

Description.

Class

Optional.

Type / Range

Digit string of length 0 to 160 with the allowed pattern of [0-9a-zA-Z\.\- _:@]*

Default

"

Name

emerArp - Emergency ARP

Syntax

--emerArp <integer>

Description

Allocation and retention priority for emergency service default bearers.

Class

Optional.

Type / Range

Integer in the range of 1 to 15

Default

1

Name

emergencyGmlcAlternateName - Emergency GMLC alternate name

Syntax

--emergencyGmlcAlternateName <string>

Description

Emergency gateway mobile location center alternate name is the name associated with the IP address of Slg interface on remote end point configuration prior to entering the name in this field. this name must be provisioned on the diamconnection with Slg interface. this should be different from all other GMLCs in this profile table.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Name

emergencyGmlcPrimaryName - Emergency GMLC primary name

Syntax

--emergencyGmlcPrimaryName <string>

Description

Emergency gateway mobile location center primary name is the name associated with the IP address of Slg interface on remote end point configuration prior to entering the name in this field. this name must be provisioned on the diamconnection with Slg interface. this should be different from all other GMLCs in this profile table.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Name

emergencyNumListName - Emergency number list table name

Syntax

--emergencyNumListName <string>

Description

Defines the emergency number list table name.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Name

emerQci - Emergency QCI

Syntax

--emerQci <integer>

Description

QoS class identifier for emergency service default bearers.

Class

Optional.

Type / Range

Integer in the range of 5 to 9

Default

5

Name

esrvcBehavior - Service behavior

Syntax

--esrvcBehavior <list-item>

Description

MME behavior in providing emergency bearer support.

Class

Optional.

List

- All UEs are allowed - Specifies MME emergency bearer support to all UEs are allowed.
- Only UEs that are authenticated are allowed - Specifies MME emergency bearer support to only UEs that are authenticated are allowed.
- UE IMSI required, authentication optional - Specifies MME emergency bearer support to UE IMSI required, authentication optional.
- Valid UEs only - Specifies MME emergency bearer support to valid UEs only.

Default

All UEs are allowed

Name

esrvcBlackListedUe - Service for black listed UE

Syntax

--esrvcBlackListedUe <list-item>

Description

Emergency services shall be provided to a UE with an IMEI that is black listed in the EIR.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

esrvct3412Timer - Emergency T3412 timer in minutes

Syntax

--esrvct3412Timer <integer>

Description

Emergency T3412 timer in minutes. if it is 0, this timer is disabled and t3412 timer from timer table is used.

Class

Optional.

Type / Range

Integer in the range of 0 to 186 in units of Minute

Default

0

Name

horizontalAccuracy - Horizontal accuracy

Syntax

--horizontalAccuracy <integer>

Description

Horizontal accuracy parameter in the location request.

Class

Optional.

Type / Range

Integer in the range of 0 to 127

Default

20

Name

initiateLcsRequest - Initiate LCS request

Syntax

--initiateLcsRequest <list-item>

Description

Initiate LCS request indicates whether or not the MME shall initiate a location request for the UE. valid values are do not initiate, send SLR to GMLC with estimated UE location, send SLR without location estimate to GMLC.

Class

Optional.

List

- Do not initiate - Do not initiate.
- Send SLR to GMLC with estimated UE location - Send SLR to GMLC with estimated UE location.
- Send SLR without location estimate to GMLC - Send SLR without location estimate to GMLC.

Default

Do not initiate

Name

nilrLcsClientName - NI LR LCS EPS Client Name

Syntax

--nilrLcsClientName <string>

Description

NI-LR LCS EPS Client Name

Class

Optional.

Type / Range

Digit string of length 0 to 62 with the allowed pattern of [A-Za-z0-9._-]*

Default

""

Name

pdnGwFqdn - PDNGW FQDN

Syntax

--pdnGwFqdn <string>

Description

Emergency packet data network gateway fully qualified domain name.

Class

Optional.

Type / Range

Digit string of length 0 to 96 with the allowed pattern of [0-9a-zA-Z\._:\]*

Name

pdnGwIpV4 - PDNGW IPv4

Syntax

--pdnGwIpV4 <string>

Description

Emergency packet data network gateway IP V4 address.

Class

Optional.

Type / Range

Digit string of length 0 or 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Default

0.0.0.0

Name

pdnGwIpV6 - PDNGW IPv6

Syntax

--pdnGwIpV6 <string>

Description

Emergency packet data network gateway IP V6 address.

Class

Optional.

Type / Range

Digit string of length 0 or 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Default

::

Name

pdnTypeWhenv4v6Requested - PDN type when IPv4v6 requested

Syntax

--pdnTypeWhenv4v6Requested <list-item>

Description

PDN type used for the emergency session when the UE requests PDN type IPv4v6.

Class

Optional.

List

- v4 - IPv4 - Specify IPv4.

- v4v6 - IPv4 / IPv6 - Specify IPv4 / IPv6.
- v6 - IPv6 - Specify IPv6.

Default

v4v6

Name

pgwcSmfGwFqdn - PGW-C+SMF GW FQDN

Syntax

--pgwcSmfGwFqdn <string>

Description

Emergency PGW-C+SMF gateway fully qualified domain name.

Class

Optional.

Type / Range

FQDN string of length 0 to 96 with the allowed pattern of [0-9a-zA-Z.-]* where each label (separated by dot) must start with a letter and a single label must not exceed 63 characters in length

Default

""

Name

pgwcSmfGwIpv4 - PGW-C+SMF GW IPv4

Syntax

--pgwcSmfGwIpv4 <string>

Description

Emergency PGW-C+SMF gateway IP V4 address.

Class

Optional.

Type / Range

Digit string of length 7 to 15 with the allowed pattern of [0-9\.]*

Default

0.0.0.0

Name

pgwcSmfGwIpv6 - PGW-C+SMF GW IPv6

Syntax

--pgwcSmfGwIpv6 <string>

Description

Emergency PGW-C+SMF gateway IPv6 address

Class

Optional.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of '[0-9a-f:]*'

Default

::

Name

pgwcSmfGwPdnTypeWhenv4v6Requested - PGW-C+SMF GW PDN Type When v4v6 Requested

Syntax

- pgwcSmfGwPdnTypeWhenv4v6Requested <list-item>

Description

PDN type used for the emergency session when the UE requests PDN type IPv4v6

Class

Optional.

List

- v4 - IPv4 - Specify IPv4.
- v4v6 - IPv4 / IPv6 - Specify IPv4 / IPv6.
- v6 - IPv6 - Specify IPv6.

Default

v4v6

Name

preemptionCapability - Preemption capability

Syntax

--preemptionCapability <list-item>

Description

Preemption capability used for emergency service default bearers.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

preemptionVulnerability - Preemption vulnerability

Syntax

--preemptionVulnerability <list-item>

Description

Preemption vulnerability for emergency service default bearers.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

responseTime - Response time

Syntax

--responseTime <list-item>

Description

Response time parameter in the location request.

Class

Optional.

List

- Delay Tolerant - Specify response time of delay tolerant.
- Low Delay - Specify response time of low delay.

Default

Low Delay

Name

verticalAccuracy - Vertical accuracy

Syntax

--verticalAccuracy <integer>

Description

Vertical accuracy parameter in the location request.

Class

Optional.

Type / Range

Integer in the range of 0 to 127

Default

20

Name

verticalRequested - Vertical requested

Syntax

--verticalRequested <list-item>

Description

Vertical requested parameter in the location request.

Class

Optional.

List

- Requested - Specify vertical requested.
- Not Requested - Specify vertical not requested.

Default

Not Requested

4.107 cmm emmCauseCodeMapping

Configurable EMM causes mapping table. Syntax, description, parameters, and roles for cmm emmCauseCodeMapping command.

Syntax

Description

Configurable EMM causes mapping table.

Parameters

Name

emmCauseCodeMappingId - Configurable EMM causes mapping table ID

Syntax

--emmCauseCodeMappingId <integer>

Description

Configurable EMM causes mapping table ID - just type 1.

Class

Required key.

Type / Range

Integer in the range of 1 to 1

Name

intErrorBearerSetupFailed - EMM cause code for bearer setup failed

Syntax

--intErrorBearerSetupFailed <integer>

Description

EMM cause code to be sent if bearer setup failed.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

19

Name

intErrorCreateSessRespUserAuthFail - Create Session Response User Authentication Fail

Syntax

--intErrorCreateSessRespUserAuthFail <integer>

Description

EMM cause code sent to the UE upon receiving create session reject from SGW for attach request.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

17

Name

intErrorIpv4OnlyAllowed - EMM cause code for IPv4 only allowed

Syntax

--intErrorIpv4OnlyAllowed <integer>

Description

EMM cause code to be sent if IPv4 only allowed.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

19

Name

intErrorIpv6OnlyAllowed - EMM cause code for IPv6 only allowed

Syntax

--intErrorIpv6OnlyAllowed <integer>

Description

EMM cause code to be sent if IPv6 only allowed.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

19

Name

intErrorIpVerMismatchAtt - EMM cause code for IP version mismatch in attach

Syntax

--intErrorIpVerMismatchAtt <integer>

Description

EMM cause code to be sent if IP version mismatch in attach.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

19

Name

intErrorIpVerMismatchTau - EMM cause code for IP version mismatch in TAU

Syntax

--intErrorIpVerMismatchTau <integer>

Description

EMM cause code to be sent if IP version mismatch tau.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

17

Name

intErrorMandIeInc - EMM cause code for mandatory IE included

Syntax

--intErrorMandIeInc <integer>

Description

EMM cause code to be sent if mandatory IE included.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

19

Name

intErrorNoApnAllowedByHss - EMM cause code for no APN allowed by HSS

Syntax

--intErrorNoApnAllowedByHss <integer>

Description

EMM cause code to be sent if no apn allowed by HSS.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

19

Name

intErrorNoRespFromSgwAttPdn - EMM cause code for no resp from SGW attach PDN

Syntax

--intErrorNoRespFromSgwAttPdn <integer>

Description

EMM cause code to be sent if no response from SGW attach pdn.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

19

Name

intErrorNoRespFromSgwTau - EMM cause code for no resp from SGW TAU

Syntax

--intErrorNoRespFromSgwTau <integer>

Description

EMM cause code to be sent if no response from SGW tau.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

10

Name

intErrorOptIeInc - EMM cause code for optional IE included

Syntax

--intErrorOptIeInc <integer>

Description

EMM cause code to be sent if optional IE included.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

19

Name

intErrorServiceDenied - EMM cause code for servicedenied

Syntax

--intErrorServiceDenied <integer>

Description

EMM cause code to be sent if service denied.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

19

Name

intErrorSmcFailed - EMM cause code for SMC failed

Syntax

--intErrorSmcFailed <integer>

Description

EMM cause code to be sent if smc failed.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

3

Name

intErrorSystemFailure - EMM cause code for system failure

Syntax

--intErrorSystemFailure <integer>

Description

EMM cause code to be sent in system failure.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

19

4.108 cmm emmInfo

EMM Information. Syntax, description, parameters, and roles for `cmm emmInfo` command.

Syntax**Description**

This command is used to administer EMM information and configure parameters to be sent in NAS EMM INFORMATION message and also equivalent PLMNs to be sent in the NAS ATTACH ACCEPT and TAU ACCEPT messages.

Parameters**Name**

plmnName - Mobile network name

Syntax

--plmnName <string>

Description

Name that identifies mobile network (alternate key).

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

encodingName - Encoding name

Syntax

--encodingName <list-item>

Description

Indicates the encoding type to use for name fields.

Class

Optional.

List

- GSM default alphabet - Specifies GSM default alphabet encoding name.
- UCS2 - USC2 - Specifies USC2 encoding name.

Default

GSM default alphabet

Name

networkName - Network name

Syntax

--networkName <string>

Description

Unique network name.

Class

Optional.

Type / Range

The Network Name for the PLMN. The following characters in the GSM character set per 3GPP TS 23.038 Section 6.2.1.

Default

"

Name

networkShortName - Network short name

Syntax

--networkShortName <string>

Description

Unique short network name.

Class

Optional.

Type / Range

The Network Short Name for the PLMN. The following characters in the GSM character set per 3GPP TS 23.038 Section 6.2.1.

Default

"

Name

sendCountryInit - Send country init

Syntax

--sendCountryInit <list-item>

Description

Indicates whether or not the UE should display or not display the country initials.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

sendNetworkName - Send network name

Syntax

--sendNetworkName <list-item>

Description

Indicates whether or not to send the network names.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

sendOnAttach - Send On Attach

Syntax

```
--sendOnAttach <list-item>
```

Description

Defines whether the EMM information message is sent to the UE after the Attach procedure.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

sendOnInterMmeTau - Send On Inter MME TAU

Syntax

```
--sendOnInterMmeTau <list-item>
```

Description

Defines whether the EMM information message is sent to the UE after the Inter MME TAU procedure.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

sendOnIratTau - Send On IRAT TAU

Syntax

```
--sendOnIratTau <list-item>
```

Description

Defines whether the EMM information message is sent to the UE after the Inter RAT TAU procedure.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

sendOnNonPeriodicIntraMmeTau - Send On Non Periodic Intra MME TAU

Syntax

--sendOnNonPeriodicIntraMmeTau <list-item>

Description

Defines whether the EMM information message is sent to the UE after the Non Periodic Intra MME TAU procedure

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

sendOnPeriodicTau - Send On Periodic TAU

Syntax

--sendOnPeriodicTau <list-item>

Description

Defines whether the EMM information message is sent to the UE after the Periodic TAU procedure.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

sendOnSrsRecovery - Send On SRS Recovery

Syntax

--sendOnSrsRecovery <list-item>

Description

Defines whether the EMM information message is sent to the UE after UE data recovery with the help of the Session Restoration Server.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

sendOnTzChange - Send On Time Zone Change

Syntax

--sendOnTzChange <list-item>

Description

Defines whether the EMM information message is sent to the UE after Time Zone has changed after the last provided Network Identity and Time Zone delivery towards the UE.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

sendTzOffset - Send time zone offset

Syntax

--sendTzOffset <list-item>

Description

Indicates whether or not to send the time zone offset.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

4.109 cmm emmInfoOverrideProfile

Override of EMM Info for IMEI/SV. Syntax, description, parameters, and roles for cmm emmInfoOverrideProfile command.

Syntax**Description**

override information for TAC/SV based emmInfo

Parameters**Name**

name - Override of EMM Info by IMEI/SV

Syntax

--name <string>

Description

Override of EMM Info by IMEI/SV

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

encodingName - Encoding Name

Syntax

--encodingName <list-item>

Description

Indicates the encoding type to use for the name fields

Class

Optional.

List

- GSM default alphabet - Specifies GSM default alphabet encoding name.
- UCS2 - USC2 - Specifies USC2 encoding name.

Default

GSM default alphabet

Name

networkName - Network Name

Syntax

--networkName <string>

Description

Network Name

Restrictions

Digit string of length 0 or 3 to 64 with the allowed pattern of [0-9a-zA-Z\._&:]*

Class

Optional.

Type / Range

The Network Name for the PLMN. The following characters in the GSM character set per 3GPP TS 23.038 Section 6.2.1.

Default

""

Name

sendCountryInit - Send Country Initials

Syntax

--sendCountryInit <list-item>

Description

Indicates whether the UE should display the country initials

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

shortNetworkNameOverride - Short Network Name Override

Syntax

--shortNetworkNameOverride <string>

Description

Defines the network short name value that is to be used to activate a special icon in the UE

Class

Optional.

Type / Range

The Network Short Name for the PLMN. The following characters in the GSM character set per 3GPP TS 23.038 Section 6.2.1.

Default

""

Name

shortNetworkNameOverrideDeactivate - Short Network Name Override Deactivate

Syntax

--shortNetworkNameOverrideDeactivate <string>

Description

Defines the network short name value that is to be used to deactivate a special icon in the UE

Class

Optional.

Type / Range

The Network Short Name for the PLMN. The following characters in the GSM character set per 3GPP TS 23.038 Section 6.2.1.

Default

""

4.110 cmm emmInfoOverrideTacSv

EMM Info Override TAC SV. Syntax, description, parameters, and roles for cmm emmInfoOverrideTacSv command.

Syntax

Description

List of UE Type Approval Code (TAC) and Software Version (SV) that should have a specific EmmInfo profile instead of the system default.

Parameters

Name

imeiTac - IMEI TAC

Syntax

--imeiTac <digits>

Description

Type Approval Code (TAC) of the IMEI

Class

Required key.

Type / Range

Digit string of length 8 to 8

Name

svRange - SV Range

Syntax

--svRange <string>

Description

Software Version (SV) Range

Class

Required key.

Type / Range

Software Version Range, where each member of the range must be two digits (0..9), separated by a dash, and where the first range member must be less than or equal to the second range number.

Name

emmInfoOverrideProfileName - EMM Info Override Profile Name

Syntax

--emmInfoOverrideProfileName <string>

Description

EMM Info Override Profile to be used for this TAC/SV range

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\.\- _:@]*

4.111 cmm empsDscpMarking

eMPS DSCP Marking. Syntax, description, parameters, and roles for **cmm empsDscpMarking** command.

Syntax**Description**

Administer a list of derived DSCP code point to QCI-ARP mapping. The combination of a unique QCI-ARP pair defines the DSCP value derived from that pair. QCI may range from 1-9, 65-67, 69-70. ARP may range

from 1-15. Example: list administration can create individual entries such as (QCI = 1, ARP = 1), (QCI = 1, ARP = 2), and (QCI = 1, ARP = 3) where each may be marked with VOICE-ADMIT (DSCP44)

Parameters

Name

arp - ARP Priority Level

Syntax

--arp <integer>

Description

ARP (Allocation and Retention Priority) An integer ranging from 1 to 15, with 1 being the highest level of priority

Class

Required key.

Type / Range

Integer in the range of 1 to 15

Name

qci - QoS Class Identifier

Syntax

--qci <integer>

Description

QoS class identifier number.

Class

Required key.

Type / Range

Integer in the range of 1-9, 65-67, 69-70. Integer value represent the 3GPP QCI values, including mission critical value.

Name

dscpCode - DSCP Code

Syntax

--dscpCode <list-item>

Description

Differentiated Services Code Point (DSCP). A value utilized as a means of classifying and managing network traffic and of providing quality of service (QoS)

Class

Required on create.

List

- AF11 - Assured forwarding 11.
- AF12 - Assured forwarding 12.
- AF13 - Assured forwarding 13.
- AF21 - Assured forwarding 21.
- AF22 - Assured forwarding 22.
- AF23 - Assured forwarding 23.
- AF31 - Assured forwarding 31.
- AF32 - Assured forwarding 32.
- AF33 - Assured forwarding 33.
- AF41 - Assured forwarding 41.
- AF42 - Assured forwarding 42.
- AF43 - Assured forwarding 43.

4.112 cmm emsTrapNotification

EMS Trap Notification. Syntax, description, parameters, and roles for cmm emsTrapNotification command.

Syntax**Description**

This command is used to define a list of Element Management Systems for delivery of Northbound SNMP information and includes parameters for defining the EMS host, port, and port type, and SNMP user name, context name, row status, and user-based security level and model.

Parameters**Name**

emsHost - EMS host

Syntax

--emsHost <string>

Description

The IP address where the EMS is listening for notifications.

Class

Required key.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

emsPort - EMS port

Syntax

--emsPort <integer>

Description

The UDP port at which the EMS is listening for notifications.

Class

Required key.

Type / Range

Integer in the range of 1 to 65,535

Name

contextName - Context name

Syntax

--contextName <string>

Description

SNMP context name. this context name is same as in vacmaccessstable of VACM MIB RFC2575.

Class

Optional.

Type / Range

Digit string of length 0 to 64 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Default

NoAuth

Name

emsHostType - EMS host type

Syntax

--emsHostType <integer>

Description

The InetAddressType for the manager host. 0:unknown, 1:ipv4, 2:ipv6

Restrictions

Value of emsHostType is based on value of emsHost

Class

Read only.

Type / Range

Integer in the range of 0 to 2

Default

0

Name

rowStatus - Row status

Syntax

--rowStatus <integer>

Description

SNMP row status. used to manage insert/delete of SNMP conceptual row.

Class

Optional.

Type / Range

Integer in the range of 1 to 6

Default

4

Name

userName - User name

Syntax

--userName <string>

Description

SNMP user name.

Class

Optional.

Type / Range

Digit string of length 0 to 64 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

"

Name

userSecLevel - User security level

Syntax

--userSecLevel <integer>

Description

SNMP user-based security level. 1:noAuthNoPriv, 2:authNoPriv, 3:authPriv.

Class

Optional.

Type / Range

Integer in the range of 1 to 3

Default

1

Name

userSecModel - User security model

Syntax

--userSecModel <integer>

Description

SNMP user-based security model.

Restrictions

CMM only supports User-based Security model(USM).

Class

Read only.

Type / Range

Integer in the range of 0 to 2,147,483,647

Default

3

4.113 cmm enb

eNB. Syntax, description, parameters, and roles for cmm enb command.

Syntax

Description

This command is used to administer eNB time zone information for a mobile network and includes parameters for defining the macro eNB ID and region time zone.

Parameters

Name

plmnName - Mobile network name

Syntax

--plmnName <string>

Description

Name that identifies the mobile network.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Name

macroEnbId - Macro eNB id

Syntax

--macroEnbId <integer>

Description

Macro eNB identifier as specified in TS 36.413 v8.6.1.

Class

Required key.

Type / Range

Integer in the range of 0 to 1,048,575

Name

timeZoneName - Time zone name

Syntax

--timeZoneName <list-item>

Description

Provides time zone names that correspond to the region selected.

Restrictions

See comments on TIME_ZONE type in CfgDataType.xsd.

Class

Optional.

List

- Africa/Abidjan - Timezone for africa/abidjan UTC offset of +00:00.
- Africa/Accra - Timezone for africa/accra UTC offset of +00:00.
- Africa/Addis_Ababa - Timezone for africa/addis_ababa UTC offset of +03:00.
- Africa/Algiers - Timezone for africa/algiers UTC offset of +01:00.
- Africa/Asmara - Timezone for africa/asmara UTC offset of +03:00.
- Africa/Asmera - Timezone for africa/asmera UTC offset of +03:00.
- Africa/Bamako - Timezone for africa/bamako UTC offset of +00:00.
- Africa/Bangui - Timezone for africa/bangui UTC offset of +01:00.
- Africa/Banjul - Timezone for africa/banjul UTC offset of +00:00.
- Africa/Bissau - Timezone for africa/bissau UTC offset of +00:00.

- Africa/Blantyre - Timezone for africa/blantyre UTC offset of +02:00.
- Africa/Brazzaville - Timezone for africa/brazzaville UTC offset of +01:00.

4.114 cmm enbInfoQuery

eNB Info Query. Syntax, description, parameters, and roles for `cmm enbInfoQuery` command.

Syntax**Description**

List the info of the eNB(s) corresponding to the typed IP address

Parameters**Name**

enbId - eNB id

Syntax

--enbId <integer>

Description

eNB identifier as specified in TS 36.413

Class

Optional.

Type / Range

Integer in the range of 0 to 268,435,455

Name

enbIpAddress - enbIpAddress

Syntax

--enbIpAddress <string>

Description

eNB IP address that is used as key in query

Class

Optional.

Type / Range

Digit string of length 3 to 39 with valid IPv4 or IPv6 address

Name

enbIpAddress2 - enbIpAddress2

Syntax

--enbIpAddress2 <string>

Description

eNB IP address 2

Class

Optional.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

enbName - eNB name

Syntax

--enbName <string>

Description

eNB name

Class

Optional.

Type / Range

Digit string of length 0 or 1 to 255

Name

enbType - ENodeB type

Syntax

--enbType <list-item>

Description

Specifies which enodeb type of the enodeb

Class

Read only.

List

- home - Specify home eNodeB.
- macro - Specify macro eNodeB.

Name

information - information

Syntax

--information <string>

Description

Information about outcome of command

Class

Read only.

Type / Range

Digit string of length 0 to 256 with the allowed pattern of [0-9a-zA-Z\.\-_:]*

Name

linkAdminState - Link admin state

Syntax

--linkAdminState <list-item>

Description

Link admin state

Class

Read only.

List

- locked - Locked.
- unlocked - Unlocked.

Name

linkIndex - Link index

Syntax

--linkIndex <integer>

Description

Link index.

Class

Read only.

Type / Range

Integer in the range of 0 to 4,294,967,295

Name

linkOperationState - Link operation state

Syntax

--linkOperationState <list-item>

Description

Link operation state

Class

Read only.

List

- disabled - Disabled state.

- enabled - Enabled state.

Name

remotePort - Remote Port

Syntax

--remotePort <integer>

Description

Remote Port associated with the remote IP address

Class

Read only.

Type / Range

Integer in the range of 0 to 65,534

Name

tac - Tracking area code

Syntax

--tac <integer>

Description

Tracking area Code

Class

Read only.

Type / Range

Integer in the range of 1 to 65,535

Name

taiMcc - TAI MCC

Syntax

--taiMcc <digits>

Description

3-digit number used to represent the mobile country code for TAI.

Class

Read only.

Type / Range

Digit string of length 3

Name

taiMnc - TAI MNC

Syntax

--taiMnc <digits>

Description

Digits used to represent mobile network code for TAI.

Class

Read only.

Type / Range

Digit string of length 2 to 3

Roles**List**

sysadmin, manage, monitor

4.115 cmm enbTaiQuery

eNB TAI Query. Syntax, description, parameters, and roles for `cmm enbTaiQuery` command.

Syntax**Description**

List TAIs of eNB. By default, only TAIs with enbType 'macro' are shown

Parameters**Name**

mcc - Mobile country code

Syntax

--mcc <digits>

Description

3-digit number used to represent the mobile country code.

Class

Required key.

Type / Range

Digit string of length 3

Name

mnc - Mobile network code

Syntax

--mnc <digits>

Description

Digits used to represent mobile network code.

Class

Required key.

Type / Range

Digit string of length 2 to 3

Name

enbId - eNB id

Syntax

--enbId <integer>

Description

eNB identifier as specified in TS 36.413 v8.6.1.

Class

Required key.

Type / Range

Integer in the range of 0 to 268,435,455

Name

enbIpAddress - eNB IP address

Syntax

--enbIpAddress <string>

Description

eNB IP address.

Class

Read only.

Type / Range

Digit string of length 0 or 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

enbName - eNB name

Syntax

--enbName <string>

Description

eNB name.

Class

Read only.

Type / Range

Digit string of length 0 or 1 to 255

Name

enbType - ENodeB type

Syntax

--enbType <list-item>

Description

Specifies which ENodeB Type of the ENodeB. If not given then enbType 'macro' is assumed

Class

Optional.

List

- home - Specify home eNodeB.
- macro - Specify macro eNodeB.

Name

linkAdminState - Link admin state

Syntax

--linkAdminState <list-item>

Description

Link admin state.

Class

Read only.

List

- locked - Locked.
- unlocked - Unlocked.

Name

linkOperationState - Link operation state

Syntax

--linkOperationState <list-item>

Description

Link operation state.

Class

Read only.

List

- disabled - Disabled state.
- enabled - Enabled state.

Name

tac - Tracking area code

Syntax

--tac <integer>

Description

Tracking area code.

Class

Read only.

Type / Range

Integer in the range of 1 to 65,535

Name

taiMcc - TAI MCC

Syntax

--taiMcc <digits>

Description

3-digit number used to represent the mobile country code for TAI.

Class

Read only.

Type / Range

Digit string of length 3

Name

taiMnc - TAI MNC

Syntax

--taiMnc <digits>

Description

Digits used to represent mobile network code for TAI.

Class

Read only.

Type / Range

Digit string of length 2 to 3

Roles**List**

sysadmin, manage, monitor

4.116 cmm enbUeQuery

enb Ue Query. Syntax, description, parameters, and roles for cmm enbUeQuery command.

Syntax

Description

Provides information about number of UEs per connected eNB

Parameters

Name

disconnectTime - Disconnect Time

Syntax

--disconnectTime <string>

Description

This is the time that an enb is disconnected

Class

Read only.

Type / Range

Date and Time Digit string of length 0 or 19 with the allowed pattern of (20[0-9][0-9]/[0-1][0-9]/[0-3][0-9] [0-2][0-9]:[0-5][0-9]:[0-5][0-9])*

Name

enbId - eNB Id

Syntax

--enbId <integer>

Description

eNB identifier as specified in TS 36.413

Class

Optional.

Type / Range

Integer in the range of 0 to 268,435,455

Name

enbIpAddress - eNB IP Address

Syntax

--enbIpAddress <string>

Description

eNB IP address

Class

Optional.

Type / Range

Digit string of length 3 to 39 with valid IPv4 or IPv6 address

Name

enbIpAddress2 - eNB IP Address 2

Syntax

--enbIpAddress2 <string>

Description

eNB IP address 2

Class

Optional.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

enbName - eNB Name

Syntax

--enbName <string>

Description

eNB name

Class

Optional.

Type / Range

Digit string of length 0 or 1 to 255

Name

enbType - eNB Type

Syntax

--enbType <list-item>

Description

Specifies which enodeb type of the enodeb

Class

Optional.

List

- home - Specify home eNodeB.

- macro - Specify macro eNodeB.

Name

information - Information

Syntax

--information <string>

Description

Information about outcome of command

Class

Read only.

Type / Range

Digit string of length 0 to 256 with the allowed pattern of [0-9a-zA-Z\._:-]*

Name

mcc - Mobile Country Code

Syntax

--mcc <digits>

Description

Mobile Country Code

Class

Optional.

Type / Range

Digit string of length 3 to 3 with the allowed pattern of [0-9]*

Name

mnc - Mobile Network Code

Syntax

--mnc <digits>

Description

Mobile Network Code

Class

Optional.

Type / Range

Digit string of length 2 to 3 with the allowed pattern of [0-9]*

Name

s1ConnectionAmount - S1 Connection Amount

Syntax

--s1ConnectionAmount <integer>

Description

Number of UEs connected to a specific eNodeB

Class

Read only.

Type / Range

Integer in the range of 0 to 4,294,967,295

Roles**List**

sysadmin, manage, monitor

4.117 cmm enbUeQuerySum

enb Ue Query Sum. Syntax, description, parameters, and roles for cmm enbUeQuerySum command.

Syntax**Description**

Provides overview information about the total number of enodeBs, total number of S1 Connections and total number of disconnected enodeBs.

Parameters**Name**

information - Information

Syntax

--information <string>

Description

Information about outcome of command

Class

Read only.

Type / Range

Digit string of length 0 to 256 with the allowed pattern of [0-9a-zA-Z\._:\]*

Name

totalNumConnectedEnbs - Total Number eNBs

Syntax

--totalNumConnectedEnbs <integer>

Description

Provides information about the total number of connected eNBs

Class

Read only.

Type / Range

Integer in the range of 0 to 300000

Name

totalNumDisconnectedEnbs - Total Number Disconnected eNBs

Syntax

--totalNumDisconnectedEnbs <integer>

Description

Provides information about the total number of disconnected eNBs

Class

Read only.

Type / Range

Integer in the range of 0 to 300000

Name

totalNumS1Connections - Total Number S1 Connections

Syntax

--totalNumS1Connections <integer>

Description

Provides information about the total number of S1 connections

Class

Read only.

Type / Range

Integer in the range of 0 to 4,294,967,295

Roles**List**

sysadmin, manage, monitor

4.118 cmm enhancedDualConnectivityProfile

Enhanced Dual Connectivity Profile. Syntax, description, parameters, and roles for cmm enhancedDualConnectivityProfile command.

Syntax

Description

This profile lists the NR access restriction options, GW selection with NR, and Secondary Rat Usage Reporting for NSA Option 3A/3X.

Parameters

Name

name - Enhanced Dual Connectivity Profile Name

Syntax

--name <string>

Description

Identifies the name of the Enhanced Dual Connectivity Profile for NSA Option 3A/3X

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

accRestAvpAbsent - Access Restriction AVP Absent

Syntax

--accRestAvpAbsent <list-item>

Description

Identifies whether to allow or restrict a UE New Radio (NR) access when HSS doesn't include Access Restriction AVP and HSS Feature Support AVP for NR over S6a.

Class

Optional.

List

- ALLOW - Allow
- RESTRICT - Restrict

Default

RESTRICT

Name

accRestAvpNrAllow - UE NR Access Allowed in HSS

Syntax

--accRestAvpNrAllow <list-item>

Description

Identifies whether to allow or restrict a UE New Radio (NR) access when HSS indicates UE NR access is allowed in Access Restriction AVP but HSS Feature Support AVP for NR is absent over S6a.

Class

Optional.

List

- ALLOW - Allow
- RESTRICT - Restrict

Default

RESTRICT

Name

accRestAvpNrRestrict - UE NR Access Restricted in HSS

Syntax

--accRestAvpNrRestrict <list-item>

Description

Identifies whether to allow or restrict a UE New Radio (NR) access when HSS indicates UE NR access is Restricted in Access Restriction AVP but HSS Feature Support AVP for NR is absent over S6a.

Class

Optional.

List

- ALLOW - Allow
- RESTRICT - Restrict

Default

RESTRICT

Name

accRestNrAllow - UE NR Access & NR Feature support in HSS

Syntax

--accRestNrAllow <list-item>

Description

Identifies whether to allow or restrict a UE New Radio (NR) access when HSS indicates UE NR access is allowed or absent in Access Restriction AVP and HSS Feature Support AVP for NR is set.

Class

Optional.

List

- ALLOW - Allow
- RESTRICT - Restrict

Default

ALLOW

Name

accRestNrAllowGwNotNrCapable - UE NR Access Allow when GW not NR capable

Syntax

--accRestNrAllowGwNotNrCapable <list-item>

Description

When set to true, MME will not indicate NR Restriction in Handover Restriction List (HRL) to eNB or RestrictDCNR in the TAU Accept to NR Capable UE if returned SNAPTR SGW/PGW records (SGW, PGW or both SGW/PGW records) do not indicate NR capable SGW/PGW. This parameter applies to only idle Gn-TAU (with or without active flag).

Class

Optional.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

Yes

Name

dcnrIndToUe - DCNR support indication to UE

Syntax

--dcnrIndToUe <list-item>

Description

MME indicates DCNR support (RestrictDCNR=0) to the UE in Attach or TAU Accept message even if MME determined UE is DCNR Access Restricted and regardless of UE DCNR support indication (or lack of) in Attach or TAU Request. MME will still indicate UE DCNR restricted to the eNB.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

gwSelectionFallbackWithoutNr - S/PGW Selection Without NR

Syntax

--gwSelectionFallbackWithoutNr <list-item>

Description

Enables the MME to select S/PGW with no New Radio (NR) capability for NR capable UEs if SNAPTR query returned gateway candidate list has no S/PGW candidate nodes with service parameter '+nc-nr'.

Class

Optional.

List

- DISABLE - Disable
- ENABLE - Enable

Default

ENABLE

Name

iratNrGwReselection - IRAT TAU NR GW reselection

Syntax

--iratNrGwReselection <list-item>

Description

enables/disables PGW re-selection with +nc-nr when UE moves in idle mode from Gn-SGSN to MME.

Class

Optional.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

irPgw - PGW is intended recipient of Secondary RAT Usage Reports

Syntax

--irPgw <list-item>

Description

Identifies whether the Secondary RAT Usage Report(s) are intended (or not) for PGW.
irPgw=0, SGW does not forward report(s) to PGW irPgw=1, SGW forwards report(s) to PGW
irPgw applies only when Secondary RAT Usage Data Reporting is enabled

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

irSgw - SGW is intended recipient of Secondary RAT Usage Reports

Syntax

--irSgw <list-item>

Description

Identifies whether the Secondary RAT Usage Report(s) are intended (or not) for SGW.
irSgw=0, SGW ignores the report(s) and forward to PGW if irPgw=1 irSgw=1, SGW stores/
process the report(s) and also forward to PGW if irPGW=1 irSgw applies only when Secondary
RAT Usage Data Reporting is enabled

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

restrictDcnrToUePerTaiDcnrSupported - Restrict DCNR to UE Per TAI DCNR Supported

Syntax

--restrictDcnrToUePerTaiDcnrSupported <list-item>

Description

Specifies whether the MME is to restrict the UE's use of DC-NR via NAS messaging if the TAI
is locally provisioned as not allowing DC-NR.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

secondaryRatUsageDataReporting - Secondary RAT Usage Data Reporting for NSA Option 3A/3X

Syntax

--secondaryRatUsageDataReporting <list-item>

Description

Enables Secondary RAT Usage Data Reporting for NSA Option 3X. MME forwards usage data reports, if/when received from the eNB over S1AP, to S/PGW over S11.

Class

Optional.

List

- DISABLE - Disable
- ENABLE - Enable

Default

DISABLE

Name

triggerSgwChangePerTaiDcnrSupported - Trigger SGW Change Per TAI DCNR Supported

Syntax

--triggerSgwChangePerTaiDcnrSupported <list-item>

Description

This field controls whether the MME will attempt to change SGW if the UE moves from a TAI provisioned as supporting DCNR to a TAI marked as not supporting DCNR, as well as when the UE move from a TAI provisioned as not supporting DCNR to one that supports DCNR. For this field to be set true, useTaiDcnrSupportedInCsrToSgw must also be true.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

useTaiDcnrSupportedInCsrToSgw - Use TAI DCNR Supported

Syntax

--useTaiDcnrSupportedInCsrToSgw <list-item>

Description

This field controls whether the MME uses the TAI 'DCNR Supported' field when determining how to set the 'DCNR' bit in a Create Session Request message to the SGW.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

4.119 cmm ePlmnPerImsiTai

Equivalent PLMN per IMSI and TAI. Syntax, description, parameters, and roles for cmm ePlmnPerImsiTai command.

Syntax

Description

Equivalent PLMN List. The list can be provisioned to an IMSI series.

Parameters

Name

ePlmnListName - EPLMN list name

Syntax

--ePlmnListName <string>

Description

Equivalent PLMN list name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

equivalentPlmnName - Equivalent PLMN

Syntax

--equivalentPlmnName <string>

Description

Name of the PLMN to be treated as an equivalent PLMN.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Roles

sysadmin, manage

List

sysadmin, manage, monitor

4.120 cmm ePlmnPerImsiTaiList

EPLMN per IMSI and TAI List. Syntax, description, parameters, and roles for cmm ePlmnPerImsiTaiList command.

Syntax

Description

EPLMN List

Parameters

Name

name - Name of the list

Syntax

```
--name <string>
```

Description

Name of the list

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Roles

Create

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

sysadmin, manage, monitor

4.121 cmm eqPlmn

equivalent plmn. Syntax, description, parameters, and roles for cmm eqPlmn command.

Syntax

Description

Configure, list and show equivalent PLMN.

Parameters

Name

eqPlmnId - Primary key of EQPLMN table

Syntax

--eqPlmnId <integer>

Description

Primary key of EQPLMN table, numeric id for the table.

Class

Required key.

Type / Range

Integer in the range of 0 to 255

Name

plmnParamId - PLMN parameter set name

Syntax

--plmnParamId <string>

Description

PLMN parameter set name where this EQPLMN belongs to. (corresponds to plmnparamid of plmnparam table. you must create that plmnparam first).

Class

Required key.

Type / Range

Digit string of length 1 to 15 with the allowed pattern of [0-9a-zA-Z\._:-]*

Name

eplmnIndex - EplmnIndex

Syntax

--eplmnIndex <string>

Description

All index combinations from 1 to 5 is possible, some examples: 00000 - NO INDEX IN USE
00001 - INDEX 1 IN USE 00011 - INDEX 1 AND INDEX 2 IN USE 01010 - INDEX 2 AND INDEX 4
IN USE 01110 - INDEX 2, INDEX 3 AND INDEX 4 IN USE 11111 - ALL 5 INDEXES IN USE.

Class

Optional.

Type / Range

Digit string of length 5 to 5 with the allowed pattern of [0-9a-zA-Z\._ :]*

Default

00000

Name

mcc - MCC of equivalent PLMN

Syntax

--mcc <digits>

Description

This parameter defines the MCC of equivalent PLMN.

Class

Optional.

Type / Range

Digit string of length 3

Name

mnc - MNC of equivalent PLMN

Syntax

--mnc <digits>

Description

This parameter defines the MNC of equivalent PLMN.

Class

Optional.

Type / Range

Digit string of length 2 to 3

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

4.122 cmm equivalentPlmn

Equivalent PLMN. Syntax, description, parameters, and roles for cmm equivalentPlmn command.

Syntax

Description

This command is used to configure an existing network as an equivalent network and includes parameters for defining the serving and equivalent network names.

Parameters

Name

servedPlmnName - Serving mobile network

Syntax

--servedPlmnName <string>

Description

Name that identifies serving network.

Restrictions

plmnType of servedPlmnName must be Home or Shared Network

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Name

equivalentPlmnName - Equivalent network name

Syntax

--equivalentPlmnName <string>

Description

Name that identifies equivalent network.

Restrictions

plmnType of equivalentPlmnName must be Shared or Other Network

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

4.123 cmm esmCauseCodeMapping

Configurable ESM causes mapping table. Syntax, description, parameters, and roles for cmm esmCauseCodeMapping command.

Syntax

Description

Configurable ESM causes mapping table.

Parameters

Name

esmCauseCodeMappingId - Configurable ESM causes mapping table ID

Syntax

--esmCauseCodeMappingId <integer>

Description

Configurable ESM causes mapping table ID - just type 1.

Class

Required key.

Type / Range

Integer in the range of 1 to 1

Name

intErrorBearerSetupFailed - ESM cause code for bearer setup failed

Syntax

--intErrorBearerSetupFailed <integer>

Description

ESM cause code to be sent if bearer setup failed.

Class

Optional.

Type / Range

Integer in the range of 8, 26-39, 41-47, 49-60, 65-66, 81, 95-101, 111-113

Default

112

Name

intErrorIpv4OnlyAllowed - IntErrorIpv4OnlyAllowed

Syntax

--intErrorIpv4OnlyAllowed <integer>

Description

ESM cause code to be sent if IPv4 only allowed.

Class

Optional.

Type / Range

Integer in the range of 8, 26-39, 41-47, 49-60, 65-66, 81, 95-101, 111-113

Default

50

Name

intErrorIpv6OnlyAllowed - ESM cause code for IPv6 only allowed

Syntax

--intErrorIpv6OnlyAllowed <integer>

Description

ESM cause code to be sent if IPv6 only allowed.

Class

Optional.

Type / Range

Integer in the range of 8, 26-39, 41-47, 49-60, 65-66, 81, 95-101, 111-113

Default

51

Name

intErrorIpVerMismatchAtt - ESM cause code for IP version mismatch in attach

Syntax

--intErrorIpVerMismatchAtt <integer>

Description

ESM cause code to be sent if IP version mismatch in attach.

Class

Optional.

Type / Range

Integer in the range of 8, 26-39, 41-47, 49-60, 65-66, 81, 95-101, 111-113

Default

38

Name

intErrorMandleInc - ESM cause code for mandatory IE included

Syntax

--intErrorMandIeInc <integer>

Description

ESM cause code to be sent if mandatory IE included.

Class

Optional.

Type / Range

Integer in the range of 8, 26-39, 41-47, 49-60, 65-66, 81, 95-101, 111-113

Default

96

Name

intErrorMaxNumOfPdnPerApn - ESM cause code for max num of PDN per apn exceeded

Syntax

--intErrorMaxNumOfPdnPerApn <integer>

Description

ESM cause code to be sent if maximum number of PDN per apn.

Class

Optional.

Type / Range

Integer in the range of 8, 26-39, 41-47, 49-60, 65-66, 81, 95-101, 111-113

Default

55

Name

intErrorNoRespFromSgwAttPdn - ESM cause code for no resp from SGW attach PDN

Syntax

--intErrorNoRespFromSgwAttPdn <integer>

Description

ESM cause code to be sent if no response from SGW attach pdn.

Class

Optional.

Type / Range

Integer in the range of 8, 26-39, 41-47, 49-60, 65-66, 81, 95-101, 111-113

Default

26

Name

intErrorNoRespFromSgwBrrAlloc - ESM cause code for no resp from SGW on bearer allocation

Syntax

--intErrorNoRespFromSgwBrrAlloc <integer>

Description

ESM cause code to be sent if no response from SGW brr allocation.

Class

Optional.

Type / Range

Integer in the range of 8, 26-39, 41-47, 49-60, 65-66, 81, 95-101, 111-113

Default

30

Name

intErrorNoRespFromSgwBrrMod - ESM cause code for no resp from SGW on bearer modification

Syntax

--intErrorNoRespFromSgwBrrMod <integer>

Description

ESM cause code to be sent if no response from SGW brr modification.

Class

Optional.

Type / Range

Integer in the range of 8, 26-39, 41-47, 49-60, 65-66, 81, 95-101, 111-113

Default

31

Name

intErrorNoRespFromSgwSvcReq - ESM cause code for no resp from SGW service request

Syntax

--intErrorNoRespFromSgwSvcReq <integer>

Description

ESM cause code to be sent if no response from SGW svc request.

Class

Optional.

Type / Range

Integer in the range of 8, 26-39, 41-47, 49-60, 65-66, 81, 95-101, 111-113

Default

38

Name

intErrorOptIeInc - ESM cause code for optional IE included

Syntax

--intErrorOptIeInc <integer>

Description

ESM cause code to be sent if optional IE included.

Class

Optional.

Type / Range

Integer in the range of 8, 26-39, 41-47, 49-60, 65-66, 81, 95-101, 111-113

Default

100

Name

intErrorPdnRejectDueToNoApnSuppEscCc - ESM cause code for PDN reject due to no APN support

Syntax

--intErrorPdnRejectDueToNoApnSuppEscCc <integer>

Description

ESM cause code to be sent if PDN rejected due to no APN support for IMS roaming control.

Class

Optional.

Type / Range

Integer in the range of 8, 26-39, 41-47, 49-60, 65-66, 81, 95-101, 111-113

Default

66

Name

intErrorReqPdnNotAllowed - ESM cause code for req PDN not allowed

Syntax`--intErrorReqPdnNotAllowed <integer>`**Description**

ESM cause code to be sent if requested PDN not allowed.

Class

Optional.

Type / Range

Integer in the range of 8, 26-39, 41-47, 49-60, 65-66, 81, 95-101, 111-113

Default

112

Name

intErrorServiceDenied - ESM cause code for service denied

Syntax`--intErrorServiceDenied <integer>`**Description**

ESM cause code to be sent if service denied.

Class

Optional.

Type / Range

Integer in the range of 8, 26-39, 41-47, 49-60, 65-66, 81, 95-101, 111-113

Default

31

Name

intErrorSystemFailure - ESM cause code for system failure

Syntax`--intErrorSystemFailure <integer>`**Description**

ESM cause code to be sent in system failure.

Class

Optional.

Type / Range

Integer in the range of 8, 26-39, 41-47, 49-60, 65-66, 81, 95-101, 111-113

Default

38

Name

intErrorUserAuthenticationFailure - ESM cause code for user authentication failed from SGW

Syntax`--intErrorUserAuthenticationFailure <integer>`**Description**

ESM cause code to be sent if user authentication failed response received from SGW for standalone pdn connectivity request.

Class

Optional.

Type / Range

Integer in the range of 8, 26-39, 41-47, 49-60, 65-66, 81, 95-101, 111-113

Default

33

4.124 cmm esmlc

ESMLC. Syntax, description, parameters, and roles for `cmm esmlc` command.

Syntax**Description**

This command is used to create an Evolved Serving Mobile Location Center (E-SMLC) and to configure E-SMLC endpoint parameters.

Parameters**Name**

esmlcIdentity - ESMLC identifier

Syntax

--esmlcIdentity <integer>

Description

Evolved serving mobile location center identifier.

Class

Required key.

Type / Range

Integer in the range of 0 to 255

Name

esmlcEndPoint1Name - ESMC end point 1 name

Syntax

--esmlcEndPoint1Name <string>

Description

Name of primary evolved serving mobile location center end point. corresponds to the label field of the rmtendptcfg configuration table. name must be unique across all ESMC.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

"

Name

esmlcEndPoint2Name - ESMC end point 2 name

Syntax

--esmlcEndPoint2Name <string>

Description

Name of secondary evolved serving mobile location center end point. corresponds to the label field of the rmtendptcfg configuration table. name must be unique across all ESMC.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

"

Name

name - ESMC name

Syntax

--name <string>

Description

Evolved serving mobile location center identifier name.

Class

Optional.

Type / Range

Digit string of length 0 to 32 with the allowed pattern of [0-9a-zA-Z\.\-:]*

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Modify

sysadmin, manage

Delete

4.125 cmm extendedEmergencyNum

Extended Emergency Number List. Syntax, description, parameters, and roles for cmm extendedEmergencyNum command.

Syntax**Description**

This command is used to administer an Extended Emergency Number List Table Maximum of 25 Extended Emergency Number entries can be supported per extended emergency number list.

Parameters**Name**

extendedEmergencyNumListName - Extended Emergency Number List Name

Syntax

--extendedEmergencyNumListName <string>

Description

Defines the extended emergency number list table name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_\:@]*

Name

extendedEmergencyDigits - Extended Emergency Digits

Syntax

--extendedEmergencyDigits <string>

Description

Maximum of 25 items can be in a list.

Class

Required key.

Type / Range

Digit string of length 1 to 10 with the allowed pattern of [0-9][0-9A-Ca-c*#]*

Name

subServiceUrn - Sub-service URN

Syntax

--subServiceUrn <string>

Description

Name of the emergency service. If the associated emergency service URN is 'urn:service:sos.gas', there is only one sub-service provided in the sub-services field which is 'gas'. Following are some of the examples of URN services: 'urn:service:sos.ambulance', 'urn:service:sos.police', 'urn:service:sos.fire', 'urn:service:sos.marine', 'urn:service:sos.mountain', 'urn:service:sos.ecall.manual', 'urn:service:sos.ecall.automatic'. If the UE can determine the type of emergency service the UE shall use an emergency service URN with a sub-service type corresponding to the type of emergency service. There is no need to enter the prefix: urn:service:

Class

Required key.

Type / Range

Emergency Service Name

sysadmin, manage, monitor

4.126 cmm extendedEmergencyNumList

Extended Emergency Number List. Syntax, description, parameters, and roles for cmm extendedEmergencyNumList command.

Syntax

Description

This command is used to administer an Extended Emergency Number List. Maximum of 10 extended emergency number lists shall be supported.

Parameters

Name

name - Name

Syntax

--name <string>

Description

Defines the name of extended emergency number list table.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

extendedEmergencyNumberListValidity - Extended Emergency Number List Validity

Syntax

--extendedEmergencyNumberListValidity <list-item>

Description

Parameter specifies whether extended emergency number list validity is valid in the country or the PLMN from which this IE is received.

Class

Optional.

List

- country - Country Extended Emergency Number List Validity - Extended Local Emergency Numbers List is valid in the country of the PLMN from which this IE is received.
- plmn - PLMN Extended Emergency Number List Validity - Extended Local Emergency Numbers List is valid only in the PLMN from which this IE is received.

Default

country

4.127 cmm extLdapProfile

External LDAP Profile. Syntax, description, parameters, and roles for `cmm extLdapProfile` command.

Syntax

Description

This command is used to administer an External LDAP Profile. Maximum of 3 profiles are supported. This profile can be assigned on authServer

Parameters

Name

name - External LDAP Profile Name

Syntax

--name <string>

Description

External LDAP Profile Name

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

bindCredential - Bind Credential

Syntax

--bindCredential <string>

Description

Bind Credential used on the External ldap server for the Bind DN.

Class

Optional.

Type / Range

Digit string of length 0 to 128 with the allowed pattern of [\]0-9a-zA-Z\.\~\$+* _.;&=#?\[@,()
/!"%]* in units of Byte

Default

""

Name

bindDn - Bind DN

Syntax

--bindDn <string>

Description

DN on the external LDAP server used to use for performing External LDAP operations eg: ,
cn=admin, dc=example, dc=org

Class

Optional.

Type / Range

Digit string of length 0 to 128

Default

""

Name

connectionExpireTimeout - Connection Expire Timeout

Syntax

--connectionExpireTimeout <integer>

Description

Specifies a timeout (in seconds) that a connection to an LDAP server will be maintained. After this time, the connection will be re-established.

Class

Optional.

Type / Range

Integer in the range of 1 to 3,600

Default

900

Name

insecure - Insecure

Syntax

--insecure <list-item>

Description

When set to false, ldaps protocol is used using port 636 When set to true, ldap protocol is used using port 389. Insecure value of true is not recommended

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

kerberosRealm - Kerberos Realm

Syntax

--kerberosRealm <string>

Description

Kerberos Realm. This field is optional.

Class

Optional.

Type / Range

Digit string of length 96 with the allowed pattern of [0-9a-zA-Z.-]*

Name

kerberosServerAddress - Kerberos Server Address

Syntax

--kerberosServerAddress <string>

Description

Kerberos Server Address. This field is optional. Can be IPv4 or IPv6

Class

Optional.

Type / Range

Digit string of length 0 or 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

ldapSearchBase - LDAP Search Base

Syntax

--ldapSearchBase <string>

Description

LDAP Search Base. The default base DN to use for performing LDAP user operations. eg
dc=example,dc=com

Class

Optional.

Type / Range

Digit string of length 0 to 128 with the allowed pattern of [\\]0-9a-zA-Z\\.\\-~\$+*_.:;&=#?\\[\\@,
(/!'%"*]*

Name

oamTlsProfileName - OAM TLS Profile

Syntax

--oamTlsProfileName <string>

Description

This parameter contains the profile for TLS. It contains the certificate names needed for
establishing secure communication.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\\.\\-_:@]*

Default

""

Name

port - External LDAP Port

Syntax

--port <integer>

Description

External LDAP Port

Class

Optional.

Type / Range

Integer in the range of 1 to 65,535

Default

636

Name

rdnLdapAttribute - RDN LDAP Attribute Name

Syntax

--rdnLdapAttribute <string>

Description

External LDAP DN attribute Name

Class

Optional.

Type / Range

Digit string of length 0 to 128

Default

""

Name

schemaType - Schema Type

Syntax

--schemaType <list-item>

Description

Specifies the Schema Type in use on the External LDAP server.

Class

Optional.

List

- rfc2307bis - With rfc2307bis group members are listed by DN and stored in the member attribute.
- rfc2307 - With rfc2307, group members are listed by name in the memberUid attribute.
- ad - Active Directory

Default

rfc2307bis

Name

userNameLdapAttribute - User Name LDAP Attribute

Syntax

--userNameLdapAttribute <string>

Description

Name of the Remote LDAP Attribute which is mapped to local user name eg CN.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z]*

Default

""

Roles**Create**

secadmin

Show

secadmin

Modify

secadmin

Delete

secadmin

List

secadmin

4.128 cmm failopenProfile

Failopen profile. Syntax, description, parameters, and roles for cmm failopenProfile command.

Syntax**Description**

Failopen profile for HSS unavailability.

Parameters

Name

chargingCharacteristics - Charging characteristics

Syntax

--chargingCharacteristics <string>

Description

Charging characteristics.

Class

Optional.

Type / Range

Digit string of length 1 to 4 with the allowed pattern of [0-9a-fA-F]*

Default

0000

Name

defaultApnNi - APN NI type

Syntax

--defaultApnNi <string>

Description

Access point name network indicator type.

Class

Optional.

Type / Range

Digit string of length 0 to 62 with the allowed pattern of ([0-9a-zA-Z\.\-]*|*)

Default

''

Name

esmPdnConnRejectionCode - ESM PDN connection rejection code

Syntax

--esmPdnConnRejectionCode <integer>

Description

EPS session management packet data network connection rejection code.

Class

Optional.

Type / Range

Integer in the range of 8, 26-35, 38, 50-51, 53-55, 65-66, 95-112

Default

34

Name

networkAccessMode - Network access mode

Syntax`--networkAccessMode <list-item>`**Description**

Network access mode.

Class

Optional.

List

- Packet and Circuit - Specifies network access mode of packet and circuit.
- Packet only - Specifies network access mode of packet only.

Default

Packet and Circuit

Name

rfspId - RFSP ID

Syntax`--rfspId <integer>`**Description**

RAT/frequency selection priority identification.

Class

Optional.

Type / Range

Integer in the range of 1 to 256

Default

256

Name

ueAmbrDL - UE AMBR downlink

Syntax`--ueAmbrDL <integer>`**Description**

User equipment aggregate maximum bit rate downlink.

Class

Optional.

Type / Range

Integer in the range of 0, 1-63, 64- 568, 576-8640, 8700-16000, 17000-128000,
130000-4000000000

Default

128000

Recommended

The recommended value is 100000000.

Name

ueAmbrUl - UE AMBR uplink

Syntax

--ueAmbrUl <integer>

Description

User equipment aggregate maximum bit rate uplink.

Class

Optional.

Type / Range

Integer in the range of 0, 1-63, 64- 568, 576-8640, 8700-16000, 17000-128000,
130000-4000000000

Default

128000

Recommended

The recommended value is 100000000.

Roles**Show**

sysadmin, manage, monitor

Modify

sysadmin, manage

sysadmin, manage, monitor

4.129 cmm failopenProfileApn

Failopen Profile APN. Syntax, description, parameters, and roles for cmm failopenProfileApn command.

Syntax

Description

Define a failopen APN for HSS unavailability. The failopen APN is used instead of the HSS subscription profile when HSS is unavailable and the MME does not hold the UE subscription profile. MME supports up to 50 failopen profile APN lists and 50 APNs (i.e. APN NIs) altogether on all failopen profile APN lists.

Parameters

Name

failopenProfileApnListName - Failopen Profile APN List Name

Syntax

--failopenProfileApnListName <string>

Description

The name of the failopen profile associated APN list.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

apnNi - APN NI

Syntax

--apnNi <string>

Description

Access point name network indicator.

Class

Required key.

Type / Range

Digit string of length 1 to 62 with the allowed pattern of ([0-9a-zA-Z\._]*|*)

Name

apnAmbrDl - APN AMBR Downlink

Syntax

--apnAmbrDl <integer>

Description

Access point name aggregate maximum bit rate downlink.

Class

Optional.

Type / Range

Integer in the range of 0, 1-63, 64- 568, 576-8640, 8700-16000, 17000-128000,
130000-4000000000

Default

128000

Recommended

The recommended value is 100000000.

Name

apnAmbrUl - APN AMBR Uplink

Syntax

--apnAmbrUl <integer>

Description

Access point name aggregate maximum bit rate uplink.

Class

Optional.

Type / Range

Integer in the range of 0, 1-63, 64- 568, 576-8640, 8700-16000, 17000-128000,
130000-4000000000

Default

128000

Recommended

The recommended value is 100000000.

Name

arpPriorityLevel - ARP PL

Syntax

--arpPriorityLevel <integer>

Description

Allocation and retention priority, priority level.

Class

Optional.

Type / Range

Integer in the range of 1 to 15

Default

15

Name

interworking5gsIndicator - Interworking 5GS Indicator

Syntax

--interworking5gsIndicator <list-item>

Description

Indicates whether the interworking between 5GS and EPS is subscribed for the APN.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

pdnAddrType - PDN Address Type

Syntax

--pdnAddrType <list-item>

Description

PDN address type.

Class

Optional.

List

- ipv4 - Specify PDN address type of IPv4.
- ipv4OrIpv6 - Specify PDN address type of IPv4 or IPv6.
- ipv4v6 - Specify PDN address type of IPv4 and IPv6.
- ipv6 - Specify PDN address type of IPv6.

Default

ipv4

Name

qci - QCI

Syntax

--qci <integer>

Description

Quality of Service Class Identifier.

Class

Optional.

Type / Range

Integer in the range of 5 to 9

Default

9

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

Modify

4.130 cmm failopenProfileApnConfig

Failopen profile APN configuration. Syntax, description, parameters, and roles for cmm failopenProfileApnConfig command.

Syntax**Description**

Failopen profile APN configuration for HSS unavailability.

Parameters**Name**

apnNi - APN NI type

Syntax

--apnNi <string>

Description

Access point name network indicator type.

Class

Required key.

Type / Range

Digit string of length 1 to 62 with the allowed pattern of ([0-9a-zA-Z\.\-]*\|*)

Name

apnAmbrDL - APN AMBR downlink

Syntax

--apnAmbrDL <integer>

Description

Access point name aggregate maximum bit rate downlink.

Class

Optional.

Type / Range

Integer in the range of 0, 1-63, 64- 568, 576-8640, 8700-16000, 17000-128000,
130000-4000000000

Default

128000

Recommended

The recommended value is 100000000.

Name

apnAmbrUL - APN AMBR uplink

Syntax

--apnAmbrUL <integer>

Description

Access point name aggregate maximum bit rate uplink.

Class

Optional.

Type / Range

Integer in the range of 0, 1-63, 64- 568, 576-8640, 8700-16000, 17000-128000,
130000-4000000000

Default

128000

Recommended

The recommended value is 100000000.

Name

arpPL - ARP PL

Syntax

--arpPL <integer>

Description

Allocation and retention priority PL.

Class

Optional.

Type / Range

Integer in the range of 1 to 15

Default

15

Name

pdnAddrType - Charging characteristics

Syntax

--pdnAddrType <list-item>

Description

Charging characteristics.

Class

Optional.

List

- ipv4 - Specify PDN address type of IPv4.
- ipv4OrIpv6 - Specify PDN address type of IPv4 or IPv6.
- ipv4v6 - Specify PDN address type of IPv4 and IPv6.
- ipv6 - Specify PDN address type of IPv6.

Default

ipv4

Name

qci - QCI

Syntax

--qci <integer>

Description

Quality of service class identifier.

Class

Optional.

Type / Range

Integer in the range of 5 to 9

Default

9

4.131 cmm failopenProfileApnList

Failopen profile APN configuration list. Syntax, description, parameters, and roles for cmm failopenProfileApnList command.

Syntax

Description

Define the list of APN configuration profiles for a failopen profile. MME supports up to 16 APNs per APN configuration list. MME supports up to 50 APNs in all APN configuration lists. Applicable when enhanced failopen profile is enabled.

Parameters

Name

name - Failopen Profile APN Configuration List Name

Syntax

--name <string>

Description

The name of the failopen profile APN configuration list.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

4.132 cmm features

features. Syntax, description, parameters, and roles for **cmm features** command.

Syntax

Description

Configure, list and show the states of features.

Parameters

Name

parameter - Parameter

Syntax

--parameter <string>

Description

Name of the parameter.

Class

Output only.

Type / Range

Digit string of length 1 to 100 with the allowed pattern of [0-9a-zA-Z\._&(),/]*

Name

status - Status

Syntax

--status <list-item>

Description

Is feature active or not.

Class

Optional, not filterable on list.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

id - FeatureId

Syntax

<list-item>

Description

Feature for modification.

Class

Required value.

List

- 2gMocn - 2G multiple operator core network - 2G multiple operator core network functionality.
- 2gSubsOffloading - 2G subscriber offloading - 2G subscriber offloading.
- abnUeDetection - Abn UE detection - Abnormal signaling reduction functionality.
- addSupport - Add support - Add support.
- advancedCdr - Advanced CDR - Advanced CDR (PM) functionality.
- advancedData - Advanced data - Advanced data (PM) functionality.
- advancedData2 - Advanced data 2 - Advanced data 2 (PM) functionality.
- advancedMobilityMan - Advanced mobility management - Advanced mobility management (PM) functionality.
- advancedSessionMan - Advanced session management - Advanced session management (PM) functionality.
- advancedUser - Advanced user - Advanced user (PM) functionality.
- apnConv - APN conversion - APN conversion and correction functionality.
- apnDedicatedPrepaid - APN dedicated prepaid - APN dedicated prepaid functionality.
- attachCapacity - Attach capacity - Attach capacity. Warning: For Nokia personnel only.
- causeCodeFrwdS4 - Cause code forward S4 - Cause code forwarding over S4 interface functionality.

- ccGgsn - CC GGSN - CC GGSN.
- ccMapping - CC mapping - Cause code mapping functionality.
- cellSaStat - Cell SA statistics - Cell SA statistics (PM) functionality.
- cipheringGea3 - Ciphering GEA3 - Ciphering GEA3.
- configCharging - Configuration charging - Configurable charging functionality. Warning: For Nokia personnel only.
- controlledRoaming - Controlled roaming - Controlled roaming functionality.
- conversationalQoS - Conversational QoS - Conversational QoS functionality.
- csServices - CC services - CC services.
- directTunnelLicence - Direct tunnel licence - Direct tunnel functionality.
- dualStackPdp - Dual stack PDP - Dual stack PDP context support functionality.
- edgeSupport - Edge support - Edge support functionality.
- equivalentPlmn - Equivalent PLMN - Equivalent PLMN network selection services functionality.
- extdGtpTmrRoaming - Extend GTP timer roaming - Extend GTP timer roaming.
- externalNaccSupport - External NACC support - RIM procedures - external NACC support.
- faultyImeisv - Faulty IMEI Sv - Enable faulty IMEISV UE functionality.
- gbAttachCapacity - Gb attach capacity - Gb attach capacity. Warning: For Nokia personnel only.
- gbOverIp - Gb overlap - Gb over IP functionality.
- ggsnImei - GGSN IMEI - IMEI based GGSN selection functionality.
- gtpInfoSending - GTP information sending - GTP information sending.
- gwIpAddrSv - Gateway IP address Sv - Gateway IP address Sv. Warning: For Nokia personnel only.
- hlr2g3gAccCtr - HLR 2G/3G access control - HLR 2G/3G access control.
- homeGgsnSolution - Home GGSN solution - Home GGSN solution functionality.
- hsdpa168m - HSDPA 168M - HSDPA 168M functionality.
- hsdpa21m - HSDPA 21M - HSDPA 21M functionality.
- hsdpa28m - HSDPA 28M - HSDPA 28M functionality.
- hsdpa42m - HSDPA 42M - HSDPA 42M functionality.
- hsdpa84m - HSDPA 84M - HSDPA 84M functionality.
- hsdpaSupport - HSPDA support - HSPDA support functionality.

- hsdpaSupport12M - HSDPA support 12M - HSDPA support 12M functionality.
- hsdpaSupport16M - HSDPA support 16M - HSDPA support 16M functionality.
- hsdpaSupport4M - HSDPA support 4M - HSDPA support 4M functionality.
- hspaStatistics - HSPA statistics - HSPA statistics functionality.
- hsupa11m - HSUPA 11M - HSUPA 11M functionality.
- hsupa23m - HSUPA 23M - HSUPA 23M functionality.
- hsupa46m - HSUPA 46M - HSUPA 46M functionality.
- hsupaSupport1500k - HSUPA support 1500K - HSUPA support 1500K functionality.
- hsupaSupport2M - HSUPA support 2M - HSUPA support 2M functionality.
- hsupaSupport6M - HSUPA support 6M - HSUPA support 6M functionality.
- hsupaSupport8M - HSUPA support 8M - HSUPA support 8M functionality.
- iHspaEnabler - iHSPA enabler - I-HSPA enabler functionality.
- imeiRestrDetTimer - IMEI restr det timer - IMEI restricted detach timer functionality.
- imeisvInCdr - IMEISlvn CDR - IMEISV in CDR functionality.
- implmeiChk - Imp IMEI check - Enhanced IMEI check control functionality.
- imsiBasedHomeGgsnS - IMSI based home GGSNs - IMSI based home GGSNs selection functionality.
- imsiBasedOffload - IMSI Based Offload
- intGwSelRoamSubs - Int gateway selection roam subscribers - Int gateway selection roam subscribers.
- ipMultimediaSupport - IP multimedia support - IP multimedia support.
- ipv6UserLayer - IPv6 user layer - IPv6 user layer.
- iuAttachCapacity - Iu attach capacity - Iu attach capacity. Warning: For Nokia personnel only.
- lacBasedEplmn - LAC based equivalent PLMN - LAC based equivalent PLMN functionality.
- largeRaSupport - Large RA support - Large RA support.
- lcs - Location services - Location services. Warning: For Nokia personnel only.
- locInfoInScdr - Location information in S-CDR - Location information in S-CDR. Warning: For Nokia personnel only.
- localBreakout - Local breakout - Local breakout.
- localUiIntoPm - Local ui inform PM - Local ui inform PM. Warning: For Nokia personnel only.
- lrasEnhancement - LRAS enhancement - LRAS enhancement functionality.

- lteRoamQosControl - LTE roaming QoS control - LTE roaming QoS control.
- m3uaLoadMonitoring - M3UA load monitoring - M3UA load monitoring. Warning: For Nokia personnel only.
- mmCause2 - MM cause 2 - MM cause 2 (PM) functionality.
- mobilityManCause - Mobility management cause - Mobility management cause (PM) functionality.
- mocn - Multiple operator core network - Multiple operator core network functionality.
- mpAForMsc - Multipoint A support for MSC - SGSN Multipoint A support for MSC
- mpGb - MP gb - Multipoint gb functionality.
- mplu - MPLU - Multipoint iu functionality.
- mpluForMsc - Multipoint lu support for MSC - SGSN Multipoint lu support for MSC
- msisdNBasedGwCc - MSISDN based GW selection with CC
- msisdNBasedPgwSel - MSISDN based PQW selection - SGSN MSISDN based PGW selection.
- multiPdpCtxSubs - Multiple PDP context subscribers - Multiple PDP context for one subscriber functionality.
- multiSim - Multi-SIM - Multi-SIM.
- multipGbNri - Multip gb NRI - Multip gb NRI.
- multipointDns - Multipoint DNS - DNS query optimization for SGSN pool functionality.
- neLevelIpv6 - Network element level IPv6 - Network element level IPv6.
- nearestGgsn - Nearest GGSN - Nearest GGSN selection functionality.
- networkIdTimeZone - Network id time zone - Network id time zone.
- noCsDet - No CS determination - SGSN enabling blacklisted mobile to have CS service.
- nonStdGbp - Non-Standard gb OLP - Non-Standard gb over IP functionality.
- nseAmountInc2 - NSE amount inc 2 - NSE amount increase II functionality.
- numberOf2GCells - Number of 2G cells - Number of 2G cells.
- numberOfRncs - Number of RNCs - Number of RNCs.
- pagingOpt - Paging opt - Paging optimizations functionality.
- papuBloMaint - PAPU blo maint - PAPS blocking for maintenance functionality. Warning: For Nokia personnel only.
- pdpContextCapacity - PDP context capacity - PDP context capacity. Warning: For Nokia personnel only.

- pdpCtxMassDea - PDP context mass detach - PDP context mass deactivation protection functionality.
- plmnStatistics - PLMN level statistics - Home and foreign PLMN level statistics functionality.
- preventScdrForDt - Prevent S-CDR for direct tunnel - Prevent S-CDR for direct tunnel.
- psOperBarring - PS oper barring - PS oper barring.
- qosCtrRoamSub - QoS ctr roam subscriber - QoS control for roaming subscribers functionality.
- qqMessagingSupport - QQ message support - QQ message support. Warning: For Nokia personnel only.
- r8DnsForR7EpcSubs - R8 DNS for R7 EPC subscribers - R8 DNS query support for gn-sgsn functionality.
- r9RimFor2g3g - R9 RIM for 2G/3G - R9 NACC/RIM for 2G/3G support functionality.
- ranapCause - RANAP cause - RANAP cause (PM) functionality.
- roundTripTime - Round trip time - Round trip time counter (Advanced MM/SM) functionality.
- s13ImeiChecking - S13 IMEI checking - S13 IMEI checking.
- sccpLoadshAcross128 - SCCP load share across 128 - SCCP load share across 128. Warning: For Nokia personnel only.
- security - Security.
- selDetachTimer - Sel detach timer - Selective detach timer.
- sessionManCause - Session management cause - Session management cause (PM) functionality.
- sessionManCause2 - Session management cause 2 - Session management cause 2 (PM) functionality.
- sg01074OverReqApn - SG01074 over req APN - Override of requested APN functionality.
- sg02019OverReqApn - SG02019 over req APN - IMEI based APN override functionality.
- sgsnDetachTimer - SGSN detach timer - SGSN detach timer.
- signalReductM2m - Signaling reduction mobile to mobile - Signaling reduction for stationary devices (M2M) functionality.
- ss7NetworkSharing - SS7 network sharing - SS7 network sharing functionality.
- streamQualOpt - Stream qual opt - Streaming QoS optimizations functionality.
- streamingQoS - Streaming QoS - Streaming QoS functionality.

- subsOffloading - Subscriber offloading - Subscriber offloading.
- termManagSupp - Term management support - Term management support.
- throughputCap - Throughput capacity - Throughput capacity. Warning: For Nokia personnel only.
- totalAttachCapacitylocalCgf - Total attach capacity local CGF - Total attach capacity local CGF. Warning: For Nokia personnel only.
- ueCapBasedGwSel - UE capability based gateway selection - UE capability based gateway selection.
- updQosAboveHlr - Update QoS above HLR - Update QoS above HLR.

4.133 cmm firewallRule

Firewall Rules Configuration. Syntax, description, parameters, and roles for cmm firewallRule command.

Syntax

Description

This cli will give operator a alternative way for defining Dynamic firewall rule. Before, IP table is automatically formed by system

Parameters

Name

ruleName - firewall rule name

Syntax

--ruleName <string>

Description

Customer defined firewall rule name

Class

Required key.

Type / Range

Digit string of length 1 to 50 with the allowed pattern of [0-9a-zA-Z\.\-_:]*

Name

dport - Destination Port(s)

Syntax

--dport <string>

Description

destination ports

Class

Optional.

Type / Range

Digit string of length 0 to 11 with the allowed pattern of ((([0-9]{1,4})[1-5][0-9]{4}|6[0-4][0-9]{3}|65[0-4][0-9]{2}|655[0-2][0-9]|6553[0-5])|((([0-9]{1,4})[1-5][0-9]{4}|6[0-4][0-9]{3}|65[0-4][0-9]{2}|655[0-2][0-9]|6553[0-5])-([0-9]{1,4})[1-5][0-9]{4}|6[0-4][0-9]{3}|65[0-4][0-9]{2}|655[0-2][0-9]|6553[0-5])))

Name

externalIp - Source IP address

Syntax

--externalIp <string>

Description

Source IP address on which the firewall rule will apply (external IP)

Class

Optional.

Type / Range

Digit string of length 0 or 2 to 43 with the allowed pattern of [0-9a-fA-F\.:/*]

Name

firewallProtocol - Protocol

Syntax

--firewallProtocol <list-item>

Description

the protocol of rule apply

Class

Optional.

List

- all - All

- tcp - TCP
- udp - UDP

Default

all

Name

ruleResult - firewall rule effect

Syntax

--ruleResult <list-item>

Description

Determine the effect type of the firewall rule applied

Class

Optional.

List

- allow - Allow.
- block - Block.

Default

block

Name

sport - Source Port(s)

Syntax

--sport <string>

Description

source port

Class

Optional.

Type / Range

Digit string of length 0 to 11 with the allowed pattern of ((([0-9]{1,4})[1-5][0-9]{4})6[0-4][0-9]{3}|65[0-4][0-9]{2}|655[0-2][0-9]|6553[0-5])((([0-9]{1,4})[1-5][0-9]{4})6[0-4][0-9]{3}|65[0-4][0-9]{2}|655[0-2][0-9]|6553[0-5])-(|[0-9]{1,4})[1-5][0-9]{4}|6[0-4][0-9]{3}|65[0-4][0-9]{2}|655[0-2][0-9]|6553[0-5]))

4.134 cmm fluentdTcpConfig

PM FluentD TCP Streaming Option Configuration. Syntax, description, parameters, and roles for cmm fluentdTcpConfig command.

Syntax

Description

This command is used to add or delete IPs and Ports for the tcp input fluentD plugin. In addition the security aspects are also controlled via this command.

Parameters

Name

name - tcp socket name

Syntax

--name <string>

Description

This is the name of the tcp socket for the fluentD.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

fluentdIp - FluentD IP

Syntax

--fluentdIp <string>

Description

This parameter defines the IP to be used for the tcp input fluentD plugin. The number of the IPs could be up to 1.

Class

Required on create.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

fluentdPort - FluentD port

Syntax

--fluentdPort <integer>

Description

This parameter defines the port to be used for the tcp input fluentD plugin

Class

Required on create.

Type / Range

Integer in the range of 1,024 to 65,535

Name

oamTlsProfileName - OAM TLS Profile

Syntax

--oamTlsProfileName <string>

Description

This parameter contains the profile for TLS. It contains the certificate names needed for establishing secure communication.

Class

Optional.

Type / Range

Digit string of length 0 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Default

"

Name

securityProtocol - Security Protocol

Syntax

--securityProtocol <list-item>

Description

This parameter defines the security protocol for the communication between CMM and tcp input fluentD plugin.

Class

Optional.

List

- plaintext - Plain Text - Plain text would be the protocol to communicate with tcp input fluentD plugin
- ssl - SSL would be the protocol to communicate with tcp input fluentD plugi

Default

plaintext

4.135 cmm forbiddenRszc

Forbidden Zone Code PLMN List. Syntax, description, parameters, and roles for cmm forbiddenRszc command.

Syntax**Description**

This command is used to administer a Forbidden Zone Code PLMN list and includes parameters for defining the MCC, MNC, and regional subscription zone code for the forbidden network.

Parameters**Name**

plmnName - Mobile network name

Syntax

--plmnName <string>

Description

Name that identifies served mobile network.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

zcId - Zone code

Syntax

--zcId <integer>

Description

Regional subscription zone code.

Class

Required key.

Type / Range

Integer in the range of 0 to 127

Name

mcc - Mobile country code

Syntax

--mcc <digits>

Description

Mobile country code of forbidden network.

Class

Required key.

Type / Range

Digit string of length 3

Name

mnc - Mobile network code

Syntax

--mnc <digits>

Description

Mobile network code of forbidden network.

Class

Required key.

Type / Range

Digit string of length 2 to 3

Name

mncDigits - Number of MNC digits

Syntax

--mncDigits <list-item>

Description

Number of MNC digits of forbidden network.

Class

Optional.

List

- 2/3Digits - 2 or 3 digits - 2 or 3 digits.
- 2Digits - 2 digits - 2 digits.
- 3Digits - 3 digits - 3 digits.

Default

3Digits

4.136 cmm forbiddenRszcList

Restricted Zone Code per Served PLMN. Syntax, description, parameters, and roles for cmm forbiddenRszcList command.

Syntax

Description

This command is used to administer a Restricted Zone Code per Served PLMN.

Parameters

Name

plmnName - Mobile network name

Syntax

--plmnName <string>

Description

Name that identifies served mobile network.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

zcId - ZoneCode

Syntax

--zcId <integer>

Description

Regional subscription zone code.

Class

Required key.

Type / Range

Integer in the range of 0 to 127

4.137 cmm forbiddenTailList

List of forbidden TAls. Syntax, description, parameters, and roles for cmm forbiddenTailList command.

Syntax

Description

Administer List of forbidden TAIs.

Parameters

Name

areaListName - Name of TAI list

Syntax

--areaListName <string>

Description

Name of forbidden TAI list.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

servedPlmnName - Served mobile network name

Syntax

--servedPlmnName <string>

Description

Served mobile network name.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\.\-_:@]*

Name

tac - Tracking area code

Syntax

--tac <integer>

Description

Tracking area code.

Class

Required key.

Type / Range

Integer in the range of 1 to 65,535

Roles

Create

sysadmin, manage

Show

sysadmin, manage, monitor

Delete

sysadmin, manage

List

sysadmin, manage, monitor

4.138 cmm forcelpChange

force IP address Change. Syntax, description, parameters, and roles for **cmm forceIpChange** command.

Syntax

Description

Use this cli to manage the forced UE IP change operations in RA under a specific district (for example, initiate forced IP change, terminate forced IP change and interrogate the number of subscribers in RA) etc.

Parameters

Name

rac - rac

Syntax

--rac <integer>

Description

Routing Area Code

Class

Required key.

Type / Range

Integer in the range of 0 to 255

Name

lac - lac

Syntax

--lac <integer>

Description

Location Area Code

Class

Required key.

Type / Range

Integer in the range of 1 to 65,533

Name

mcc - mcc

Syntax

--mcc <digits>

Description

Mobile Country Code digits

Class

Required key.

Type / Range

Digit string of length 3 to 3 with the allowed pattern of [0-9]*

Name

mnc - mnc

Syntax

--mnc <digits>

Description

Mobile Network Code digits

Class

Required key.

Type / Range

Digit string of length 2 to 3 with the allowed pattern of [0-9]*

Name

papsId - papsid

Syntax

--papsId <integer>

Description

PAPS id

Class

Read only.

Type / Range

Integer in the range of 0 to 19

Name

progressSubs - forced IP count progress

Syntax

--progressSubs <integer>

Description

forced ms/ue count per paps

Class

Read only.

Type / Range

Integer in the range of 0 to 1,000,000

Default

0

Name

statusCode - forced IP change status

Syntax

--statusCode <string>

Description

RAI forced IP change status reported by each PAPS. Use modify command to set this parameter to STOP, if you want to terminate an ongoing RAI forced IP change command

Class

Optional.

Type / Range

Digit string of length

Roles

Create

sysadmin, manage

Show

sysadmin, manage, monitor

Modify

sysadmin, manage

Delete

sysadmin, manage

List

sysadmin, manage, monitor

4.139 cmm fqdnLabelMatchProfile

labelMatchProfile. Syntax, description, parameters, and roles for **cmm fqdnLabelMatchProfile** command.

Syntax

Description

Provision the Service Combinations for which fqdn label matching is enabled to when searching for SPGW pair . It is also used to provision the number of fqdn labels to match when searching for SGW-PGW pair. The number of labels to match applies commonly for all Service Combinations for which fqdn label matching is enabled. Value zero (0) for minLabelMatchValue means that minimum label matching is disabled

Parameters

Name

name - name

Syntax

--name <string>

Description

Identifies the name of the fqdn label match profile

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Name

minLabelMatchValue - minLabelMatchValue

Syntax

--minLabelMatchValue <integer>

Description

Minimum label match Value to be used across all Service Combinations when filtering out SPGW pairs Value 0 (default) means that min fqdn label matching is disabled

Class

Optional.

Type / Range

Integer in the range of 0 to 10

Default

0

Name

ncNrMinLabelMatch - nc nr Minimum Label Match

Syntax

--ncNrMinLabelMatch <list-item>

Description

This parameter defines the minimum matching fqdn labels between SGW and PGW fqdn(s) that is used for filtering out the candidate SPGW pairs found by DNS query when requested nc.nr service parameters. (Default) Value false means that minimum label matching is disabled for this combination of Service Parameters

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

ncNrSmfMinLabelMatch - ncNrSmfMinLabelMatch

Syntax

--ncNrSmfMinLabelMatch <list-item>

Description

This parameter defines the minimum matching fqdn labels between SGW and PGW fqdn(s) that is used for filtering out the candidate SPGW pairs found by DNS query when requested nc.nr.smf service parameters. (Default) Value false means that minimum label matching is disabled for this combination of Service Parameters

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

ncNrSmfUutMinLabelMatch - ncNrSmfUutMinLabelMatch

Syntax

--ncNrSmfUutMinLabelMatch <list-item>

Description

This parameter defines the minimum matching fqdn labels between SGW and PGW fqdn(s) that is used for filtering out the candidate SPGW pairs found by DNS query when requested nc.nr.smf+ue-<uut> service parameters. (Default) Value false means that minimum label matching is disabled for this combination of Service Parameters

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

ncNrUutMinLabelMatch - nc nr uut Minimum Label Match

Syntax

--ncNrUutMinLabelMatch <list-item>

Description

This parameter defines the minimum matching fqdn labels between SGW and PGW fqdn(s) that is used for filtering out the candidate SPGW pairs found by DNS query when requested nc.nr.+ue- service parameters. (Default) Value false means that minimum label matching is disabled for this combination of Service Parameters

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

ncSmfMinLabelMatch - ncSmfMinLabelMatch

Syntax

--ncSmfMinLabelMatch <list-item>

Description

This parameter defines the minimum matching fqdn labels between SGW and PGW fqdn(s) that is used for filtering out the candidate SPGW pairs found by DNS query when requested

nc.smf service parameter. (Default) Value false means that minimum label matching is disabled for this combination of Service Parameters

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

ncSmfUutMinLabelMatch - ncSmfUutMinLabelMatch

Syntax

--ncSmfUutMinLabelMatch <list-item>

Description

This parameter defines the minimum matching fqdn labels between SGW and PGW fqdn(s) that is used for filtering out the candidate SPGW pairs found by DNS query when requested nc.smf+Uut service parameters. (Default) Value false means that minimum label matching is disabled for this combination of Service Parameters

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

noModifiers - No Modifiers

Syntax

--noModifiers <list-item>

Description

This parameter is used for filtering out the candidate SPGW pairs found by DNS query when requested +noModifiers- service parameters. (Default) Value false means that minimum label matching is disabled for this combination of Service Parameters

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

ueLabelMatch - UE Label Match

Syntax

--ueLabelMatch <list-item>

Description

This parameter defines the minimum matching fqdn labels between SGW and PGW fqdn(s) that is used for filtering out the candidate SPGW pairs found by DNS query when requested +ue- service parameters. (Default) Value false means that minimum label matching is disabled for this combination of Service Parameters

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

4.140 cmm fqdnLabelMatchUut

fqdnLabelMatchUeUsageType. Syntax, description, parameters, and roles for cmm fqdnLabelMatchUut command.

Syntax

Description

Provision the UE Usage Type values for which min fqdn label matching applies. When minFqdnLabelMatch = false for specific UE Usage Type then label matching doesn't apply for that UE Usage Type

Parameters

Name

ueUsageType - UE Usage Type

Syntax

--ueUsageType <integer>

Description

This parameter defines the UE Usage Type associated with the configured min fqdn label matching parameter

Class

Required key.

Type / Range

Integer in the range of 1 to 126 or 128 to 255

Name

minFqdnLabelMatch - minfqdnLabelMatch

Syntax

--minFqdnLabelMatch <list-item>

Description

This parameter defines if min fqdn label matching needs be applied for associated UE Usage Type. (Default) Value false means that minimum label matching is disabled for the associated Ue Usage Type

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

4.141 cmm freqCountMonitoring

Frequency Count Monitoring. Syntax, description, parameters, and roles for cmm freqCountMonitoring command.

Syntax

Description

Manage MME actions related to frequency count monitoring functionality. The command supports three tasks. A task is created for each action. The create task dumps/exports currently blacklisted UEs into created file. The delete task deletes/purges all behavior contexts i.e. clears any blacklisting related information from MME internal storage. After performing this, blacklisted UEs can again access the MME (normal subscriber data is maintained). The count task outputs the number of blacklisted UEs.

Parameters

Name

freqMonTask - Frequency Monitoring Task

Syntax

--freqMonTask <list-item>

Description

Defines frequency count monitoring tasks to be executed

Class

Required key.

List

- blacklistedUeCount - Blacklisted Ue Count - Request blacklisted Ue count

- createBlacklistedUeFile - Create blacklisted UE file - Request to create a file with blacklisted UEs
- deleteBehaviorData - Request to delete all MME stored behavior data (for the UEs that have previously attempted to access the MME, blacklisted or not yet blacklisted)

Name

blacklistedUeCount - Blacklisted UE count

Syntax

--blacklistedUeCount <integer>

Description

The number of blacklisted UEs

Class

Read only.

Type / Range

Integer in the range of 0 to 4,294,967,295

Name

freqMonStatus - Frequency Monitoring Status

Syntax

--freqMonStatus <string>

Description

Shows current status of task

Class

Read only.

Type / Range

Digit string of length 0 to 64

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

4.142 cmm freqCountMonitoringProfile

Frequency Count Monitoring Profile. Syntax, description, parameters, and roles for cmm freqCountMonitoringProfile command.

Syntax

Description

This profile defines parameters for frequency count analysis. MME considers UE attempts for defined procedure(s) abnormally frequent if the number of attempts exceed the provisioned value during a provisioned time period. MME supports max 128 profiles.

Parameters

Name

name - Name

Syntax

--name <string>

Description

The name of the frequency count monitoring profile.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

attempts - Attempts

Syntax

--attempts <integer>

Description

Defines the number of ALL the procedure(s) attempts allowed for a single UE within the defined time interval before UE is blacklisted.

Class

Optional.

Type / Range

Integer in the range of 1 to 1000

Default

5

Name

emmCc - EMM Cause Code

Syntax

--emmCc <integer>

Description

The EMM cause code used on Attach Rejects and Detach Requests.

Class

Optional.

Type / Range

Integer in the range of 2-3, 5-26, 35, 39-40, 42, 95-101, 111

Default

7

Name

esmCc - ESM cause Code

Syntax

--esmCc <integer>

Description

The ESM Cause Code used on PDN Connectivity Reject.

Class

Optional.

Type / Range

Integer in the range of 8, 26-39, 41-47, 49-60, 65-66, 81, 95-101, 111-113

Default

55

Name

interval - Interval

Syntax

--interval <integer>

Description

Defines the monitoring interval within which the MME monitors the number of procedure attempts from a UE.

Class

Optional.

Type / Range

Integer in the range of 1 to 3,600 in units of Second

Default

60

Name

monitorAttaches - Monitor Attaches

Syntax

--monitorAttaches <list-item>

Description

Enables Attach procedure monitoring.

Class

Optional.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

monitorPdnConnReqs - Monitor PDN Connectedness Requests

Syntax

--monitorPdnConnReqs <list-item>

Description

Enables monitoring of Standalone PDN Connectivity Requests.

Class

Optional.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

monitorServiceReqs - Monitor Service Requests

Syntax

--monitorServiceReqs <list-item>

Description

Enables monitoring of Service Requests (including Control Plane Service Requests and Extended Service Requests).

Class

Optional.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

serviceRejectCause - Service Reject Cause

Syntax

--serviceRejectCause <integer>

Description

The EMM cause used for Service Rejects.

Class

Optional.

Type / Range

Integer in the range of 3,6-12,35,40,42

Default

7

4.143 cmm gaParams

Ga interface parameters. Syntax, description, parameters, and roles for cmm gaParams command.

Syntax**Description**

Use this command to configure parameters specific to the Ga interface.

Parameters

Name

gaParamsId - Ga Parameters set ID

Syntax

--gaParamsId <integer>

Description

Ga Parameters set ID. Exactly one Parameter set is supported.

Class

Required key.

Type / Range

Integer in the range of 1 to 1

Name

cdrResendDelay - CDR resend delay

Syntax

--cdrResendDelay <integer>

Description

CDR resend delay in seconds

Class

Optional.

Type / Range

CDR resend delay in seconds

Default

5

Name

cdrRetransmissions - CDR retransmission count

Syntax

--cdrRetransmissions <integer>

Description

CDR retransmission count on Ga interface

Class

Optional.

Type / Range

CDR retransmission count

Default

5

Name

dcpmException - DCPM exception handling

Syntax

--dcpmException <list-item>

Description

CDR exception handling (default instruction to alternative CGs on what to do in case of potentially duplicated CDR packets: values R (release) or C (cancel). Default R).

Class

Optional.

List

- cancel - DCPM on Ga sends CANCEL command in case of permanent CG failure
- release - DCPM on Ga sends RELEASE command in case of permanent CG failure

Default

release

Name

gaBackupOnDisk - Ga backup on Disk

Syntax

--gaBackupOnDisk <list-item>

Description

Ga backup on disk in case of risk to lose CDRs.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

gaEchoInt - Ga ECHO Interval

Syntax

--gaEchoInt <integer>

Description

Ga ECHO interval in seconds.

Class

Optional.

Type / Range

Ga echo interval

Default

120

Name

gaT3res - Ga T3 ECHO response

Syntax

--gaT3res <integer>

Description

Ga T3 ECHO response in seconds.

Class

Optional.

Type / Range

Ga Echo T3 Response

Default

3

Name

gaTick - Ga transmission period

Syntax

--gaTick <integer>

Description

Ga transmission period in steps of 0.01 seconds.

Class

Optional.

Type / Range

CDR transmission period on Ga interface in steps of 0.01 seconds

Default

1

Name

gaTickVolume - Ga transmission volume

Syntax

--gaTickVolume <integer>

Description

Ga CDR packets per tick transmission volume.

Class

Optional.

Type / Range

Transmitted CDR packets per tick, on Ga interface

Default

10

Roles**Create**

sysadmin, manage

Show

sysadmin, manage, monitor

sysadmin, manage

Delete

sysadmin, manage

List

sysadmin, manage, monitor

4.144 cmm gbBvcReset

Gb BVC reset. Syntax, description, parameters, and roles for cmm gbBvcReset command.

Syntax**Description**

The purpose is to trigger the BVCRESET procedure in order to reset the traffic to the sleeping cells.

Parameters**Name**

bvci - BVC index

Syntax

--bvci <integer>

Description

BSSGP virtual connection id (requires NSEI).

Class

Required on create.

Type / Range

Integer in the range of 2 to 65,535

Name

nsei - NSEI 0-65535

Syntax

--nsei <string>

Description

Network service entity identifier(s).

Class

Required on create.

Type / Range

Digit string of length 0 to 30 with the allowed pattern of ((([0-9]|[1-8][0-9]|9[0-9]|[1-8][0-9]{2}|9[0-8][0-9]|99[0-9]|[1-8][0-9]{3}|9[0-8][0-9]{2}|99[0-8][0-9]|999[0-9]|[1-5][0-9]{4}|6[0-4][0-9]{3}|65[0-4][0-9]{2}|655[0-2][0-9]|6553[0-5]))([,-]([0-9]|[1-8][0-9]|9[0-9]|[1-8][0-9]{2}|9[0-8][0-9]|99[0-9]|[1-8][0-9]{3}|9[0-8][0-9]{2}|99[0-8][0-9]|999[0-9]|[1-5][0-9]{4}|6[0-4][0-9]{3}|65[0-4][0-9]{2}|655[0-2][0-9]|6553[0-5]))))*

Name

cause - Cause

Syntax

--cause <string>

Description

Cause successful/unsuccessful.

Class

Optional.

Type / Range

Digit string of length

Roles**Create**

sysadmin, manage

4.145 cmm gbLinkInfo

GB Link Info. Syntax, description, parameters, and roles for cmm gbLinkInfo command.

Syntax

Description

GB Link Info.

Parameters

Name

adminState - Admin state

Syntax

--adminState <string>

Description

Administrative state.

Class

Optional.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z\._:@]*

Name

ldw - Local data weight

Syntax

--ldw <integer>

Description

Local data weight.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Name

lsw - Local sign weight

Syntax

--lsw <integer>

Description

Local sign weight.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Name

nsei - NSEI

Syntax

--nsei <string>

Description

Network service entity identifier.

Class

Optional.

Type / Range

Digit string of length 0 to 30 with the allowed pattern of ((([0-9]|[1-8][0-9]|9[0-9]|[1-8][0-9]{2}|9[0-8][0-9]|99[0-9]|[1-8][0-9]{3}|9[0-8][0-9]{2}|99[0-8][0-9]|999[0-9]|[1-5][0-9]{4}|6[0-4][0-9]{3}|65[0-4][0-9]{2}|655[0-2][0-9]|6553[0-5]))([, -]((([0-9]|[1-8][0-9]|9[0-9]|[1-8][0-9]{2}|9[0-8][0-9]|99[0-9]|[1-8][0-9]{3}|9[0-8][0-9]{2}|99[0-8][0-9]|999[0-9]|[1-5][0-9]{4}|6[0-4][0-9]{3}|65[0-4][0-9]{2}|655[0-2][0-9]|6553[0-5]))))*

Name

nsvci - NSVC

Syntax

--nsvci <integer>

Description

Network service virtual connection identifier.

Class

Optional.

Type / Range

Integer in the range of 0 to 65,535

Name

opState - Operational state

Syntax

--opState <integer>

Description

Operational state.

Class

Optional.

Type / Range

Integer in the range of 1 to 4

Name

papsId - PapsId

Syntax

--papsId <integer>

Description

PAPS index.

Class

Optional.

Type / Range

Integer in the range of 0 to 19

Name

rdw - Remote data weight

Syntax

--rdw <integer>

Description

Remote data weight.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Name

remotelp - Remote IP endpoint

Syntax

--remoteIp <string>

Description

Remote IP endpoint.

Class

Optional.

Type / Range

Digit string of length 0 or 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

remotePort - Remote udp port

Syntax

--remotePort <integer>

Description

Remote UDP port number.

Class

Optional.

Type / Range

Integer in the range of 0 to 65,535

Name

rsw - Remote sign weight

Syntax

--rsw <integer>

Description

Remote sign weight.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Roles**List**

sysadmin, manage, monitor

4.146 cmm gbNetworkInfo

Gb Network Info. Syntax, description, parameters, and roles for cmm gbNetworkInfo command.

Syntax**Description**

BVCIs of LAI, nse_bvci_pair_of_cell_req_s = 0xB7C3.

Parameters**Name**

bvci - BVC index

Syntax

--bvci <integer>

Description

BSSGP virtual connection id (requires NSEI).

Class

Optional.

Type / Range

Integer in the range of 2 to 65,535

Name

ci - Cell id

Syntax

--ci <integer>

Description

Cell identity, 0-65535.

Class

Optional.

Type / Range

Integer in the range of 0 to 65,535

Name

epind - Equivalent PLMN list index

Syntax

--epind <integer>

Description

.

Class

Optional.

Type / Range

Integer in the range of 0 to 255

Name

lac - LAC

Syntax

--lac <string>

Description

Location area code(s), use with MCC and MNC.

Class

Optional.

Type / Range

Digit string of length with the allowed pattern of ([1-9][1-8][0-9]9[0-9][1-8][0-9]{2}9[0-8][0-9]99[0-9][1-8][0-9]{3}9[0-8][0-9]{2}99[0-8][0-9]999[0-9][1-5][0-9]{4}6[0-4][0-9]{3}65[0-4][0-9]{2}655[0-2][0-9]6553[0-3])([,-]([1-9][1-8][0-9]9[0-9][1-8][0-9]{2}9[0-8][0-9]99[0-9][1-8][0-9]{3}9[0-8][0-9]{2}99[0-8][0-9]999[0-9][1-5][0-9]{4}6[0-4][0-9]{3}65[0-4][0-9]{2}655[0-2][0-9]6553[0-3]))*

Name

mcc - MCC

Syntax

--mcc <digits>

Description

MCC digits of broadcasted PLMN.

Class

Optional.

Type / Range

Digit string of length 3

Name

mnc - MNC

Syntax

--mnc <digits>

Description

MNC digits of broadcasted PLMN.

Class

Optional.

Type / Range

Digit string of length 2 to 3

Name

nsei - NSEI 0-65535

Syntax

--nsei <string>

Description

Network service entity identifier(s).

Class

Optional.

Type / Range

Digit string of length 0 to 30 with the allowed pattern of ((([0-9][1-8][0-9]9[0-9][1-8][0-9]{2}9[0-8][0-9]99[0-9][1-8][0-9]{3}9[0-8][0-9]{2}99[0-8][0-9]999[0-9][1-5][0-9]{4}6[0-4][0-9]{3}65[0-4][0-9]{2}655[0-2][0-9]6553[0-5]))([,-]([0-9][1-8][0-9]9[0-9][1-8][0-9]{2}9[0-8][0-9]99[0-9][1-8][0-9]{3}9[0-8][0-9]{2}99[0-8][0-9]999[0-9][1-5][0-9]{4}6[0-4][0-9]{3}65[0-4][0-9]{2}655[0-2][0-9]6553[0-5])))*

Name

papsId - PAPS index

Syntax

--papsId <integer>

Description

PAPS index (given as the only parameter).

Class

Optional.

Type / Range

Integer in the range of 0 to 19

Name

rac - RoutingAreaCode

Syntax

--rac <string>

Description

Routing area code(s), use with MCC, MNC and LAC.

Class

Optional.

Type / Range

Digit string of length with the allowed pattern of ((([0-9]|[1-8][0-9]|9[0-9]|1[0-9]{2}|2[0-4][0-9]|25[0-5]))(,[-]([0-9]|[1-8][0-9]|9[0-9]|1[0-9]{2}|2[0-4][0-9]|25[0-5])))*

Roles**List**

sysadmin, manage, monitor

4.147 cmm gbrQciQosProfile

GBR Dedicated Bearer per QCI QoS Profile. Syntax, description, parameters, and roles for cmm gbrQciQosProfile command.

Syntax**Description**

This command is used to administer a QCI QoS Profile for GBR Dedicated Bearers and includes parameters for defining Allocation and Retention Priority (ARP), uplink and downlink bitrates, Pre-emption Capability Indicator (PCI), and Pre-emption Vulnerability Indicator (PVI) values. The 'shutdown' parameter is used to enable/disable the profile.

Parameters

Name

qosProfileName - QoS profile name

Syntax

--qosProfileName <string>

Description

Identifies the enhanced QoS profile.

Class

Required key.

Type / Range

Digit string of length 1 to 31 with the allowed pattern of [0-9a-zA-Z_\. \-:@]*

Name

gbrDedBrrQci - Guaranteed dedicated bearer QCI

Syntax

--gbrDedBrrQci <integer>

Description

Guaranteed dedicated bearer QoS class identifier.

Class

Required key.

Type / Range

Integer in the range of 1 to 4

Name

gbrDedBrrArp - Guaranteed dedicated bearer ARP

Syntax

--gbrDedBrrArp <integer>

Description

Guaranteed dedicated bearer allocation and retention priority.

Class

Optional.

Type / Range

Integer in the range of 1 to 15

Default

15

Name

gbrDedBrrBitrateDownlink - Guaranteed dedicated bearer downlink bitrate

Syntax

--gbrDedBrrBitrateDownlink <integer>

Description

Guaranteed dedicated bearer downlink bitrate.

Restrictions

The granularity is 8 when the value is between 64 and 568. The granularity is 64 when the value is between 576 and 8640. The granularity is 100 when the value is between 8700 and 16000. The granularity is 1000 when the value is between 17000 and 128000. The granularity is 2000 when the value is between 130000 and 256000.

Class

Optional.

Type / Range

Integer in the range of 1-63, 64-568, 576-8640, 8700-16000, 17000-128000, 130000-256000, 260000-500000, 510000-1500000, 1600000-4000000000 in units of Kbps

Default

128000

Name

gbrDedBrrBitrateUplink - Guaranteed dedicated bearer uplink bitrate

Syntax

--gbrDedBrrBitrateUplink <integer>

Description

Guaranteed dedicated bearer uplink bitrate.

Restrictions

The granularity is 8 when the value is between 64 and 568. The granularity is 64 when the value is between 576 and 8640. The granularity is 100 when the value is between 8700 and 16000. The granularity is 1000 when the value is between 17000 and 128000. The granularity is 2000 when the value is between 130000 and 256000.

Class

Optional.

Type / Range

Integer in the range of 1-63, 64-568, 576-8640, 8700-16000, 17000-128000, 130000-256000, 260000-500000, 510000-1500000, 1600000-4000000000 in units of Kbps

Default

128000

Name

gbrDedBrrMaxBitrateDownlink - Guaranteed dedicated bearer maximum downlink bitrate

Syntax

--gbrDedBrrMaxBitrateDownlink <integer>

Description

Guaranteed dedicated bearer maximum downlink bitrate.

Restrictions

The granularity is 8 when the value is between 64 and 568. The granularity is 64 when the value is between 576 and 8640. The granularity is 100 when the value is between 8700 and 16000. The granularity is 1000 when the value is between 17000 and 128000. The granularity is 2000 when the value is between 130000 and 256000.

Class

Optional.

Type / Range

Integer in the range of 1-63, 64-568, 576-8640, 8700-16000, 17000-128000, 130000-256000, 260000-500000, 510000-1500000, 1600000-4000000000 in units of Kbps

Default

128000

Name

gbrDedBrrMaxBitrateUplink - Guaranteed dedicated bearer maximum uplink bitrate

Syntax

--gbrDedBrrMaxBitrateUplink <integer>

Description

Guaranteed dedicated bearer maximum uplink bitrate.

Restrictions

The granularity is 8 when the value is between 64 and 568. The granularity is 64 when the value is between 576 and 8640. The granularity is 100 when the value is between 8700 and 16000. The granularity is 1000 when the value is between 17000 and 128000. The granularity is 2000 when the value is between 130000 and 256000.

Class

Optional.

Type / Range

Integer in the range of 1-63, 64-568, 576-8640, 8700-16000, 17000-128000, 130000-256000, 260000-500000, 510000-1500000, 1600000-4000000000 in units of Kbps

Default

128000

Name

gbrDedBrrPci - Guaranteed dedicated bearer PCI

Syntax

--gbrDedBrrPci <list-item>

Description

Guaranteed dedicated bearer pre-emption capability indicator.

Class

Optional.

List

- Disabled - PCI disabled - Pre-emption capability disabled.
- Enabled - PCI enabled - Pre-emption capability enabled.

Default

Disabled

Name

gbrDedBrrPvi - Guaranteed dedicated bearer PVI

Syntax

--gbrDedBrrPvi <list-item>

Description

Guaranteed dedicated bearer pre-emption vulnerability indicator.

Class

Optional.

List

- Disabled - PVI disabled - Pre-emption vulnerability disabled.
- Enabled - PVI enabled - Pre-emption vulnerability enabled.

Default

Disabled

Name

shutdown - Shutdown

Syntax

--shutdown <list-item>

Description

Indicates if the profile is active.

Class

Optional.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Roles**Create**

4.148 cmm genCdr

generate CDR. Syntax, description, parameters, and roles for cmm genCdr command.

Syntax**Description**

Generate CDR.

Parameters**Name**

imsi - IMSI

Syntax

--imsi <digits>

Description

IMSI for the forced S-CDR closure.

Class

Required on create.

Type / Range

Digit string of length 5 to 15

Name

nsapi - NSAPI

Syntax

--nsapi <integer>

Description

NSAPI for the forced S-CDR closure.

Class

Optional.

Type / Range

Integer in the range of 5 to 15

Roles**Create**

sysadmin, manage

5 CMM CLI commands: cmm generalGParms - cmm ngReset

CMM CLI command descriptions: syntax, usage, parameters, and user roles.

5.1 cmm generalGParms

General Global Parameters. Syntax, description, parameters, and roles for cmm generalGParms command.

Syntax

Description

This command is used to administer General Global Parameters defined to configure global office data in CMM

Parameters

Name

cmGparmName - Parameter Name

Syntax

--cmGparmName <list-item>

Description

Name of the global parameter

Class

Required key.

List

- adaptiveSafetyNet - Adaptive Safety Net Control - Parameter to control adaptive safety net functionality for CMM. This global parameter controls allows operator to enable or disable a functionality that allows CMM to dynamically calculate the message rate safety net applicable for a CMM deployment. This applies to both CNF and VNF deployments. The dynamic safety net functionality applies to the following: 1. Per IPDS message rate safety net value 2. Total CMM message rate safety net value based on number of IPDSs present 3. Per AMMS and EMMS message rate safety net value
- allowEdrxCarryoverPaging - Allow EDRX Carryover Paging - Specifies whether the MME is allowed to implement carryover paging for an eDRX UE. If set, the settings in the corresponding edrxProfile define the eligible eDRX cycle values for carryover paging
- allowExtScefRefIdS10 - Allow Extended SCEF Reference ID Over S10 - Specifies whether a source MME is allowed to send the Extended SCEF Reference ID over S10 for MONTE event transfer. Also specifies whether a target MME will use the extended Reference ID information if present over S10. The default is false.

- **apnConversionEnhancedMapTreatment** - APN Conversion Enhanced Map Treatment - Parameter controls feature activation GPARAM flag. By default, flag shall be disabled. When enabled, MME shall support following list of enhancements/exceptions to existing custom APN override feature: 1) Support for rejecting with EMM cause code #19 once APN conversion is done upon requested APN does not match HSS subscription profile. 2) Support for handling special APN names (e.g. prepaid.customer.br) and IMS APN (ims.customer.com.br). 3) Support for lowest context id APN in HSS upon requested APN does not exist in HSS. Additionally, two Map Treatment fields under APN IMSI Range Services shall be used to determine the behavior of either rejecting, converting, or using lowest context id APN for various scenarios. This parameter can be enabled only when the Alias APN Conversion Per IMSI global parameter is enabled.
- **applProtocolFallbackN26ToS10** - Application Protocol Fallback from N26 to S10 - Current parameter enables fallback to search for 's10' candidate when DNS Query to find target MME during S10 handover using 'n26' fails. This parameter is expected to be used together with parameter Use N26 Service Parameter in S10 Handover
- **attachEirPercentageChecking** - Attach EIR Percentage Checking - Parameter controls feature activation GPARAM flag which shall be used or activated only to perform IMSI and GUTI initial attach EIR percentage. By default, flag shall be disabled.
- **automatedTlsCertManagement** - Automated TLS Certificate Management - This parameter controls the usage of Automated TLS Certificate Management using cert-manager and Kubernetes Secrets. If ENABLE automated TLS Certificate Management is active.
- **cc100SgwIsolate** - CC100 SGW Isolate - Defines whether the MME isolates SGW when the MME receives CC100/CS=0 in Create Session Response of Attach (including handover Attach). Current parameter takes effect only when parameter lteSgwIsolation is enabled
- **cc100SgwReselect** - CC100 SGW Reselection - Defines whether the MME does SGW reselection when the MME receives CC100/CS=0 in Create Session Response of Attach (including handover Attach). Because PGW reselection happens by default in such case, when current parameter is enabled, the MME does SPGW pair reselection
- **chargingCharAccessRestriction** - Charging Characteristics Access Restriction - Enables the MME to restrict access of UEs based on provisioned charging characteristics value.
- **checkTgtAmfN26StatusN26Ho** - Check Target AMF N26 Status in N26 Handover - Current parameter enables checking the N26 link/interface status of local target AMF node during N26 handover so that if it isn't available to use, then even if the local AMF can serve the target RAN, source MME will select an alternative node to complete the N26 handover.
- **doubleS1N26Mob** - Handle Double S1 at N26 Mobility - Enable processing of double S1 IRAT scenario where UE abandons N26 handover procedure and restarts idle mode IRAT TAU possibly at the same MME that served N26 handover so that the Create Session Request towards the new serving SGW, as part of the idle mode TAU, is sent before

Delete Session Request (Scope Indication) that is sent towards old SGW as part of resource cleanup of N26 handover context. The old and new SGW can be the same.

- **edrxExtendStopPageTime** - eDRX Extend Stop Page Time - Specifies whether the eDRX Stop Page Timer should be extended to be the true end of the paging time window for the UE
- **effectiveLoadForScaling** - Effective Load For Scaling - This parameter is to control effective load scaling feature for CNF Horizontal Auto Scaler. When set to false the feature to compute effective load is disabled. To enable Effective load computation set the parameter to true. This parameter is CNF specific.
- **empsGtpMessagePriorityN26** - MME eMPS GTP Message Priority N26 - Enables MME to use GTP Message Priority value 0 during N26 mobility procedures for priority UEs.
- **empsGtpMpOnlyWhenDscpMapped** - eMPS GTP Message Priority Only When DSCP Mapped - When this parameter is set to true, the MME will indicate the GTP Message Priority only when the GTP message involves a bearer whose QCI and ARP PL values map to a DSCP value on the eMPS DSCP Marking provisioning command. When set to false, GTP Message Priority is indicated for all GTP messages of the priority UE.
- **epsUip** - EPS UPIP - Current parameter enables support for the EPS-UIPI (User Plane Integrity Protection)
- **extendedEmergencyNumberListZoneCode** - Extended Emergency Number List Zone Code - Indicates provisioned extended emergency list zone code. When feature activation gParm is enabled and upon receiving Regional-Subscription-Zone-Code in UE Subscription data from HSS in ULA/IDR message, if received Zone Code matches provisioned zone code for this feature, MME shall send Extended Emergency Numbers List in the ATTACH and TAU ACCEPT message
- **fallbackFromLocationGatewaySelectionToNormalDns** - Fallback from Location Gateway Selection to Normal DNS - Parameter controls fallback to normal DNS operation. When the parameter is set to true, fallback to normal DNS query without tag is supported. If the parameter is not set (default) fallback is not supported.
- **gtpMpForEmergencyFallbackFrom5g** - GTP MP for Emergency Service Fallback from 5G - Defines whether the MME uses GTP Message Priority (MP) on GTP N26 Context Request towards the AMF, when the UE uses RRC establishment cause 'emergency' on TAU request and the MME sends N26 Context Request to the AMF as part of the procedure.
- **gtpMpValueForEmergency** - GTP MP Value for Emergency - Defines the GTP Message Priority (MP) value the MME uses, when GTP MP is provisioned to be used for emergency services.
- **healthCheckCompare** - Health Check Compare - This parameter is used to control when a comparison between the health check functionality results shall be executed.
- **inclBackoffTimerForImsPdnReqRej** - Include Backoff Timer For IMS PDN Request Reject - Parameter controls feature activation flag. By default, flag shall be disabled. When enabled, MME shall send T3396 back-off timer IE when rejecting IMS PDN Connectivity

Request that is sent either as standalone or as part of Attach procedure due to not subscribed IMS APN with cause code #27.

- **includeNwPolicyInAttachAndTauAccept** - Include Network Policy in Attach and TAU Accept - Parameter controls inclusion of Network Policy IE in Attach Accept and TAU Accept messages. By default, it shall be disabled. When enabled, MME shall include Network Policy IE in Attach Accept and TAU accept messages sent to the UE.
- **includeUliForMmeTauWithoutSgwChange** - Include ULI for MME TAU without SGW Change - Parameter controls inclusion of ULI in S11 message for the following procedure upon enabling the gparm flag. By default, flag shall be disabled. 1) TAU MME no change and no SGW change
- **includeUliForX2AndS1HoWithoutSgwChange** - Include ULI for X2 and S1 HO without SGW Change - Parameter controls inclusion of ULI in S11 messages for following procedures upon enabling the gparm flag. By default, the flag shall be disabled. 1) X2 HO with no SGW change 2) S1 HO with MME change and no SGW change 3) S1 HO with no MME change and no SGW change
- **keepUeCtxtN26Mobility** - Keep UE Context After N26 Mobility - Current parameter enables keeping the UE Context after UE has moved to 5G with N26 mobility (idle or connected mode). When the gParm is disabled then the UE Context is deleted at the end of the mobility procedure to 5G (default behavior).
- **locallyProvisionedImsLbo** - Locally Provisioned IMS LBO - Enables the locally provisioned IMS LBO functionality in the MME.
- **locationGatewaySelection** - Location Gateway Selection. - Parameter controls location based gateway selection. By default, it shall be set to false. When the parameter is set to true, MME will insert a tag (either zone name or TAC) to the DNS query for certain APNs.
- **memoryAlarmForRestrictedPaging** - Memory Overload Alarm for MME Restricted Paging - Memory Overload Alarm at which CMM starts MME Restricted Paging
- **mmeRateControlT6aDI** - MME Rate Control T6a Downlink - Specifies whether the MME is to enforce downlink Serving PLMN Rate Control for T6a bearers. If not set, the SCEF is expected to carry out the rate control. The default is for the MME not to enforce.
- **pdnReactivateN1Enable** - PDN Reactivation when N1 mode gets enabled - Current parameter enables the MME performing PDN deactivation (reactivation requested) for the non-emergency PDNs after TAU completes for which the UE re-enabled N1 mode for those PDN sessions that are established with standalone PGWs but the associated APNs allow 5GS IWK and UE is not 5G Restricted.
- **pdnTypeIpv6Restriction** - PDN Type IPv6 Restriction - Enables MME to restrict the use of PDN Type IPv6 and IPv4v6 for the provisioned UEs.
- **pdnTypeProtocolTypeGwReselection** - PDN Type or Protocol Type GW Reselection - Defines whether the MME reselects an alternate GW during Attach and PDN Connectivity procedures when SGW returns cause code 83 (Preferred PDN type not supported) or 86

(Protocol type not supported). MME reselects either SGW or PGW depending on which one (SGW or PGW) the cause source indicates. Setting this parameter to true requires that both global parameters Support alternate gw reselection feature and Enhanced Alternate GW Reselection are also set to Yes.

- **pmReportHssByName** - PM Report HSS by Name - Specifies whether PM counts reported by HSS are to use the name field from the remote endpoint configuration for that S6a interface. If false, the PM HSS name continues to use the endpoint ID from the remote endpoint configuration.
- **proactiveAdaptiveSafetyNet** - Proactive Adaptive Safety Net - Enables or disables proactive adaptive safety net enhancements, in particular the automatic, proactive lowering of the safety net threshold if it is predicted that the busiest IPDS will reach 80% CPU occupancy before the threshold would have been reached.
- **resendDnsQueryWithoutPdnTypeForTimeout** - Resend DNS Query Without PDN Type for Timeout - Parameter controls feature activation GPARAM flag which by default shall be disabled. When enabled, MME shall upon receiving no response from DNS/timeout shall resend the DNS query by excluding the PDN type information from APN FQDN.
- **resilientIpdsFdsFailure** - System Resilience on IPDS/FDS dual fail - This parameter specifies that system recovery is using the enhanced recovery method for dual IPDS or dual xFDS failure. This method will lock the CMM Aggregate Service if IPDSs and FDSs are not available after dual failure. The system will be unlocked when the normal state is recovered.
- **restorationWithFullBackup** - SRS Restoration with Full Backup - This parameter allows SRS restoration (MME failure) with MME Full Backup of UE Contexts. Previously full backup only allowed restoring Users during ISSU. This feature supports restoral of basic procedures on any MME in the pool, using a Full Context backup. The following global parameters must be enabled prior to enabling Restoration With Full Backup: Support Ue Restoration Context Deletion, Inhibit Peer Srs Responses, Ue Ctx Update In Patch Load Support, Session Ddn Restoration Std Based, and Support Full Ue Restoration.
- **rfspAccessRestriction** - RFSP Access Restriction - Feature control for RFSP Access Restriction for the MME.
- **roamerAttachRateLimitOverride** - Roamer Attach Rate Limit Override - IMSI and foreign GUTI Attaches allowed per second after which CMM starts dropping attaches for roamers until the rate is below the limit. If the Roamer Attach Rate Limit exceeds the general Attach Rate Limit for any reason, the Roamer Attach Rate Limit Override is effectively disabled. This is because the general Attach Rate Limit will be reached before the Roamer Attach Rate Limit. If the value is set to 0, it means the Roamer Attach Rate Limit is disabled. Value needs to be set to non-zero for the feature to be enabled. Refer to the description of the Attach Rate Limit Override global parameter to understand how this value is used in different CMM environments. Roamer Attach Rate Limit Override configuration is for both IPDS and mIPDS.

- **safetyNetVariation** - Safety Net Variation - Allows for variation in safety net in special circumstances. It is ordinarily not changed and should be changed only at the direction of Nokia personnel.
- **sendExtEmerNumberInAttachAndTauAccept** - Send Extended Emergency Number in Attach and TAU Accept - Parameter controls feature activation global parameter flag. By default, flag shall be disabled. When enabled, MME shall send Extended Emergency Numbers List IE in the ATTACH and TAU ACCEPT messages if one is provisioned on the MME.
- **sendOnlyImeiToEir** - Send Only IMEI to EIR - When this parameter is set to true MME will include only the IMEI part towards EIR for authentication even if the IMEI SV is available in the UEs MM context. When set to false the MME will include the IMEISV when this is available.
- **sendOnlyImeiToSgw** - Send Only IMEI to SGW - When this parameter is set to true MME will include only the IMEI towards SGW even if the IMEI SV is available in the UEs MM context. When set to false the MME will include the IMEISV when this is available.
- **sendOnlyRanSupportedPlmnsInS1** - Send Only RAN Supported PLMNs in S1 - Current parameter enables sending in SETUP RSP and MME Configuration Update only the PLMNs that are supported by the RAN even if additional PLMNs are configured at the MME
- **sendSgsMmeIdentityS6a** - Send SGs-MME-Identity AVP on S6a - Specifies whether the MME is to include the SGs-MME-Identity AVP in S6a messaging for a UE that is being registered over SGs. The default is false.
- **separateEplmnListNasS1ap** - Separate EPLMN List on NAS and S1AP - Enable sending separate Equivalent PLMN Lists to NAS and S1AP. The EPLMN Lists applied to NAS and S1AP are copied from EPLMN List Name and EPLMN List Name for eNB, respectively, that are provisioned in IMSI Range Services or UE PLMN Services.
- **serviceReqRateDropLimitOverride** - Service Request Rate Drop Limit Override - Number of allowed 4G UE initiated Service Requests beyond which MME/CMM will start to drop them on the IPDS. Value of 0 means use system calculated Default value. Non-zero means use this value directly.
- **sessionDdnRestorationStdBased** - Session DDN Restoration Standards Based - MME Session DDN Restoration based on Standards
- **sgsLocUpdCombTauAfterCsfb** - SGs Location Update for Combined TAU After CSFB - Current parameter enables the MME doing SGs Location Update when the UE does intra-MME Combined TAU after CSFB even if Old and New LAI are the same.
- **srStormInternalMonitoring** - Service Request Storm Internal Monitoring - This parameter enables internal software resource monitoring to further protect the CMM during Service Request Storms, taking action as necessary to prevent internal resource exhaustion and overloads, including in scenarios such as when SGW overloads result in delays in SGW responses to the CMM, which in turn could result in CMM overloads.

- **srsTrafficReduction** - SRS traffic reduction - This parameter enables using new format (compressed) to send NR10 update requests and NR10 fetch responses. For AMF, all the NR10 Update requests and Fetch responses will follow the new compressed format if the value of this parameter is set to true. For MME, Update Requests and Fetch Responses will follow the new compressed format when the value of this parameter is set to true as well as Support Full UE Restoration is enabled. If there is a need to change the value of this gParm please contact Nokia support team
- **staticPgwSelectionAllPlmns** - Static PGW selection for defined IMSIs on all serving PLMNs - MME supports static PGW selection for defined IMSIs on all available serving PLMNs.
- **tauRateDropLimitOverride** - IRAT tau Rate Drop Limit Override - 5G to 4G IRAT TAUs allowed per sec after which MME start dropping 5G to 4G IRAT TAUs until rate is below limit. Value of 0 means use system calculated Default value. Non-zero means use this value directly.
- **transferTo5gPdnWo5gslwk** - Transfer to 5GS PDN Session without 5GS IWK - Current parameter enables transferring to 5GS a PDN Session that is known that 5GSIWK flag were not sent in Create Session Request during PDN Session Establishment procedure of type handover.
- **ueRadioCapPagingS10** - UE Radio Capability Paging S10 - This gparm specifies whether the MME will include the 'UE Radio Capability for Paging' AVP, if available, in S10 messaging. The default is false. The same gparm specifies whether the MME will accept and store 'UE Radio Capability for Paging' AVP, if available in S10 messaging, in the UE context.
- **ueTzInCreateAndUpdateBearerResp** - UE Time Zone In Create And Update Bearer Response - Parameter controls feature activation GPARM flag. By default, flag shall be disabled. When enabled, MME will include UE Time Zone in S11 Create Bearer and Update Bearer Response messages for both homers and roamers.
- **useApnOiToDetermineHrt** - Use APN-OI to Determine HRT - Current parameter enables using the APN-OI instead of the PGW FQDN to determine if a PDN Session is HRT for a roaming subscriber when applying QoS modification for a PDN session in accordance to local configuration and when sending the UE Time Zone IE in UBR and CBR Response messages.
- **useDnsForN26Ho** - Use Dns for N26 handover - Current parameter enables using DNS for selecting target node as part of N26 handover even when local AMF of quad access node serves target RAN.
- **useLocalRfsspHssRfsspNotSub** - Use Local RFSP if RFSP isn't subscribed at the HSS - Current parameter enables using the locally provisioned RFSP value when local configuration at the uePlmnServices or imsiRangeServices indicates applying the HSS subscribed value but no RFSP value is received from the HSS

- useN26SvcParamS10Ho - Use N26 Service Parameter in S10 Handover - Current parameter enables using N26 service parameter as part of DNS query for target MME selection during S10 handover
- useSameIpDynStaticS11Link - Use Same IP Address for Dynamic and Static S11 Links - Enable using same IP address for dynamic and static S11 links.
- vlrCleanupBasedOnOccupancy - VLR Cleanup Based on Occupancy - Current parameter enables doing VLR cleanup of the VLR Contexts of deregistered UEs based on VLR Occupancy
- wifiHoConnectedUe - Wifi Handover for Connected Ue - When a Delete Bearer Request is received for a default bearer with the cause 'RAT changed from 3GPP to non-3GPP' for an ECM-CONNECTED UE and this is not the last bearer for the UE, instead of doing S1 Release and Release Access Bearer, the MME sends an S1AP ERAB Release Command for all bearers associated with the PDN session, but without including a NAS EPS Deactivate Bearer Context Request in the E-RAB Release.
- zeroOiCsrS10Tau - Set OI flag to Zero in CSR of S10 TAU - Current parameter enables setting OI flag to value zero in Create Session Request that MME sends as part of s10 Idle mobility. When this parameter is disabled, the MME sets OI flag to 1
- zoneCodeExtendedEmergencyNumberList - Zone Code Extended Emergency Number List - Parameter controls feature activation GPARM flag. By default, flag shall be disabled. When enabled, MME shall use the received regional zone code information from HSS to determine whether to send extended emergency number list to UE.
- zoneNameSwitch - Zone Name Switch - Parameter controls whether the mapping between zone names and TAC is enabled (switch on). If the parameter is set, zone name will be used as tag in the APN query. Otherwise, TAI will be used as tag in the APN query.

Name

cmGparmValue - Parameter Value

Syntax

--cmGparmValue <string>

Description

Value of parameter

Class

Required on create.

Type / Range

Digit string of length 0 to 64

The cmGparmValue string is based on the cmGparmName parameter:

Name

adaptiveSafetyNet - Adaptive Safety Net Control

Syntax

```
--cmGparmName adaptiveSafetyNet --cmGparmValue <string>
```

Description

Parameter to control adaptive safety net functionality for CMM. This global parameter controls allows operator to enable or disable a functionality that allows CMM to dynamically calculate the message rate safety net applicable for a CMM deployment. This applies to both CNF and VNF deployments. The dynamic safety net functionality applies to the following: 1. Per IPDS message rate safety net value 2. Total CMM message rate safety net value based on number of IPDSs present 3. Per AMMS and EMMS message rate safety net value

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

allowEdrxCarryoverPaging - Allow EDRX Carryover Paging

Syntax

```
--cmGparmName allowEdrxCarryoverPaging --cmGparmValue <string>
```

Description

Specifies whether the MME is allowed to implement carryover paging for an eDRX UE. If set, the settings in the corresponding edrxProfile define the eligible eDRX cycle values for carryover paging

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

allowExtScefRefIdS10 - Allow Extended SCEF Reference ID Over S10

Syntax

```
--cmGparmName allowExtScefRefIdS10 --cmGparmValue <string>
```

Description

Specifies whether a source MME is allowed to send the Extended SCEF Reference ID over S10 for MONTE event transfer. Also specifies whether a target MME will use the extended Reference ID information if present over S10. The default is false.

List

- false - Boolean value of false.

- true - Boolean value of true.

Default

false

Recommended

true

Name

apnConversionEnhancedMapTreatment - APN Conversion Enhanced Map Treatment

Syntax

--cmGparmName apnConversionEnhancedMapTreatment --cmGparmValue
<string>

Description

Parameter controls feature activation GPARM flag. By default, flag shall be disabled. When enabled, MME shall support following list of enhancements/exceptions to existing custom APN override feature: 1) Support for rejecting with EMM cause code #19 once APN conversion is done upon requested APN does not match HSS subscription profile. 2) Support for handling special APN names (e.g. prepaid.customer.br) and IMS APN (ims.customer.com.br). 3) Support for lowest context id APN in HSS upon requested APN does not exist in HSS. Additionally, two Map Treatment fields under APN IMSI Range Services shall be used to determine the behavior of either rejecting, converting, or using lowest context id APN for various scenarios. This parameter can be enabled only when the Alias APN Conversion Per IMSI global parameter is enabled.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

applProtocolFallbackN26ToS10 - Application Protocol Fallback from N26 to S10

Syntax

--cmGparmName applProtocolFallbackN26ToS10 --cmGparmValue <string>

Description

Current parameter enables fallback to search for 's10' candidate when DNS Query to find target MME during S10 handover using 'n26' fails. This parameter is expected to be used together with parameter Use N26 Service Parameter in S10 Handover

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

attachEirPercentageChecking - Attach EIR Percentage Checking

Syntax

--cmGparmName attachEirPercentageChecking --cmGparmValue <string>

Description

Parameter controls feature activation GPARM flag which shall be used or activated only to perform IMSI and GUTI initial attach EIR percentage. By default, flag shall be disabled.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

automatedTlsCertManagement - Automated TLS Certificate Management

Syntax

--cmGparmName automatedTlsCertManagement --cmGparmValue <string>

Description

This parameter controls the usage of Automated TLS Certificate Management using cert-manager and Kubernetes Secrets. If ENABLE automated TLS Certificate Management is active.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

cc100SgwIsolate - CC100 SGW Isolate

Syntax

--cmGparmName cc100SgwIsolate --cmGparmValue <string>

Description

Defines whether the MME isolates SGW when the MME receives CC100/CS=0 in Create Session Response of Attach (including handover Attach). Current parameter takes effect only when parameter lteSgwIsolation is enabled

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

cc100SgwReselect - CC100 SGW Reselection

Syntax

```
--cmGparmName cc100SgwReselect --cmGparmValue <string>
```

Description

Defines whether the MME does SGW reselection when the MME receives CC100/CS=0 in Create Session Response of Attach (including handover Attach). Because PGW reselection happens by default in such case, when current parameter is enabled, the MME does SPGW pair reselection

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

chargingCharAccessRestriction - Charging Characteristics Access Restriction

Syntax

```
--cmGparmName chargingCharAccessRestriction --cmGparmValue <string>
```

Description

Enables the MME to restrict access of UEs based on provisioned charging characteristics value.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

checkTgtAmfN26StatusN26Ho - Check Target AMF N26 Status in N26 Handover

Syntax

```
--cmGparmName checkTgtAmfN26StatusN26Ho --cmGparmValue <string>
```

Description

Current parameter enables checking the N26 link/interface status of local target AMF node during N26 handover so that if it isn't available to use, then even if the local AMF can serve the target RAN, source MME will select an alternative node to complete the N26 handover.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Recommended

true

Name

doubleS1N26Mob - Handle Double S1 at N26 Mobility

Syntax

```
--cmGparamName doubleS1N26Mob --cmGparamValue <string>
```

Description

Enable processing of double S1 IRAT scenario where UE abandons N26 handover procedure and restarts idle mode IRAT TAU possibly at the same MME that served N26 handover so that the Create Session Request towards the new serving SGW, as part of the idle mode TAU, is sent before Delete Session Request (Scope Indication) that is sent towards old SGW as part of resource cleanup of N26 handover context. The old and new SGW can be the same.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

edrxExtendStopPageTime - eDRX Extend Stop Page Time

Syntax

```
--cmGparamName edrxExtendStopPageTime --cmGparamValue <string>
```

Description

Specifies whether the eDRX Stop Page Timer should be extended to be the true end of the paging time window for the UE

List

- false - Boolean value of false.

- true - Boolean value of true.

Default

false

Name

effectiveLoadForScaling - Effective Load For Scaling

Syntax

--cmGparmName effectiveLoadForScaling --cmGparmValue <string>

Description

This parameter is to control effective load scaling feature for CNF Horizontal Auto Scaler. When set to false the feature to compute effective load is disabled. To enable Effective load computation set the parameter to true. This parameter is CNF specific.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

empsGtpMessagePriorityN26 - MME eMPS GTP Message Priority N26

Syntax

--cmGparmName empsGtpMessagePriorityN26 --cmGparmValue <string>

Description

Enables MME to use GTP Message Priority value 0 during N26 mobility procedures for priority UEs.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

empsGtpMpOnlyWhenDscpMapped - eMPS GTP Message Priority Only When DSCP Mapped

Syntax

--cmGparmName empsGtpMpOnlyWhenDscpMapped --cmGparmValue <string>

Description

When this parameter is set to true, the MME will indicate the GTP Message Priority only when the GTP message involves a bearer whose QCI and ARP PL values map to a DSCP value on

the eMPS DSCP Marking provisioning command. When set to false, GTP Message Priority is indicated for all GTP messages of the priority UE.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

epsUpip - EPS UPIP

Syntax

--cmGparmName epsUpip --cmGparmValue <string>

Description

Current parameter enables support for the EPS-UIP (User Plane Integrity Protection)

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

extendedEmergencyNumberListZoneCode - Extended Emergency Number List Zone Code

Syntax

--cmGparmName extendedEmergencyNumberListZoneCode --cmGparmValue
<string>

Description

Indicates provisioned extended emergency list zone code. When feature activation gParm is enabled and upon receiving Regional-Subscription-Zone-Code in UE Subscription data from HSS in ULA/IDR message, if received Zone Code matches provisioned zone code for this feature, MME shall send Extended Emergency Numbers List in the ATTACH and TAU ACCEPT message

Type / Range

Integer in the range of 0 to 65,535

Default

0

Name

fallbackFromLocationGatewaySelectionToNormalDns - Fallback from Location Gateway Selection to Normal DNS

Syntax

```
--cmGparamName fallbackFromLocationGatewaySelectionToNormalDns --  
cmGparamValue <string>
```

Description

Parameter controls fallback to normal DNS operation. When the parameter is set to true, fallback to normal DNS query without tag is supported. If the parameter is not set (default) fallback is not supported.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

gtpMpForEmergencyFallbackFrom5g - GTP MP for Emergency Service Fallback from 5G

Syntax

```
--cmGparamName gtpMpForEmergencyFallbackFrom5g --cmGparamValue <string>
```

Description

Defines whether the MME uses GTP Message Priority (MP) on GTP N26 Context Request towards the AMF, when the UE uses RRC establishment cause 'emergency' on TAU request and the MME sends N26 Context Request to the AMF as part of the procedure.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

gtpMpValueForEmergency - GTP MP Value for Emergency

Syntax

```
--cmGparamName gtpMpValueForEmergency --cmGparamValue <string>
```

Description

Defines the GTP Message Priority (MP) value the MME uses, when GTP MP is provisioned to be used for emergency services.

Type / Range

Integer in the range of 0 to 15

Default

0

Name

healthCheckCompare - Health Check Compare

Syntax

--cmGparamName healthCheckCompare --cmGparamValue <string>

Description

This parameter is used to control when a comparison between the health check functionality results shall be executed.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Recommended

true

Name

inclBackoffTimerForImsPdnReqRej - Include Backoff Timer For IMS PDN Request Reject

Syntax

--cmGparamName inclBackoffTimerForImsPdnReqRej --cmGparamValue <string>

Description

Parameter controls feature activation flag. By default, flag shall be disabled. When enabled, MME shall send T3396 back-off timer IE when rejecting IMS PDN Connectivity Request that is sent either as standalone or as part of Attach procedure due to not subscribed IMS APN with cause code #27.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

includeNwPolicyInAttachAndTauAccept - Include Network Policy in Attach and TAU Accept

Syntax

--cmGparamName includeNwPolicyInAttachAndTauAccept --cmGparamValue
<string>

Description

Parameter controls inclusion of Network Policy IE in Attach Accept and TAU Accept messages. By default, it shall be disabled. When enabled, MME shall include Network Policy IE in Attach Accept and TAU accept messages sent to the UE.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

includeUliForMmeTauWithoutSgwChange - Include ULI for MME TAU without SGW Change

Syntax

```
--cmGparamName includeUliForMmeTauWithoutSgwChange --cmGparamValue  
<string>
```

Description

Parameter controls inclusion of ULI in S11 message for the following procedure upon enabling the gparam flag. By default, flag shall be disabled. 1) TAU MME no change and no SGW change

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

includeUliForX2AndS1HoWithoutSgwChange - Include ULI for X2 and S1 HO without SGW Change

Syntax

```
--cmGparamName includeUliForX2AndS1HoWithoutSgwChange --cmGparamValue  
<string>
```

Description

Parameter controls inclusion of ULI in S11 messages for following procedures upon enabling the gparam flag. By default, the flag shall be disabled. 1) X2 HO with no SGW change 2) S1 HO with MME change and no SGW change 3) S1 HO with no MME change and no SGW change

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

keepUeCtxtN26Mobility - Keep UE Context After N26 Mobility

Syntax

--cmGparmName keepUeCtxtN26Mobility --cmGparmValue <string>

Description

Current parameter enables keeping the UE Context after UE has moved to 5G with N26 mobility (idle or connected mode). When the gParm is disabled then the UE Context is deleted at the end of the mobility procedure to 5G (default behavior).

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

locallyProvisionedImsLbo - Locally Provisioned IMS LBO

Syntax

--cmGparmName locallyProvisionedImsLbo --cmGparmValue <string>

Description

Enables the locally provisioned IMS LBO functionality in the MME.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

locationGatewaySelection - Location Gateway Selection.

Syntax

--cmGparmName locationGatewaySelection --cmGparmValue <string>

Description

Parameter controls location based gateway selection. By default, it shall be set to false. When the parameter is set to true, MME will insert a tag (either zone name or TAC) to the DNS query for certain APNs.

List

- false - Boolean value of false.

- true - Boolean value of true.

Default

false

Name

memoryAlarmForRestrictedPaging - Memory Overload Alarm for MME Restricted Paging

Syntax

--cmGparmName memoryAlarmForRestrictedPaging --cmGparmValue <string>

Description

Memory Overload Alarm at which CMM starts MME Restricted Paging

List

- minor - Minor Memory Alarm
- major - Major Memory Alarm
- critical - Critical Memory Alarm

Default

minor

Name

mmeRateControlT6aDI - MME Rate Control T6a Downlink

Syntax

--cmGparmName mmeRateControlT6aDI --cmGparmValue <string>

Description

Specifies whether the MME is to enforce downlink Serving PLMN Rate Control for T6a bearers. If not set, the SCEF is expected to carry out the rate control. The default is for the MME not to enforce.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

pdnReactivateN1Enable - PDN Reactivation when N1 mode gets enabled

Syntax

--cmGparmName pdnReactivateN1Enable --cmGparmValue <string>

Description

Current parameter enables the MME performing PDN deactivation (reactivation requested) for the non-emergency PDNs after TAU completes for which the UE re-enabled N1 mode

for those PDN sessions that are established with standalone PGWs but the associated APNs allow 5GS IWK and UE is not 5G Restricted.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

pdnTypeIpv6Restriction - PDN Type IPv6 Restriction

Syntax

```
--cmGparamName pdnTypeIpv6Restriction --cmGparamValue <string>
```

Description

Enables MME to restrict the use of PDN Type IPv6 and IPv4v6 for the provisioned UEs.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

pdnTypeProtocolTypeGwReselection - PDN Type or Protocol Type GW Reselection

Syntax

```
--cmGparamName pdnTypeProtocolTypeGwReselection --cmGparamValue  
<string>
```

Description

Defines whether the MME reselects an alternate GW during Attach and PDN Connectivity procedures when SGW returns cause code 83 (Preferred PDN type not supported) or 86 (Protocol type not supported). MME reselects either SGW or PGW depending on which one (SGW or PGW) the cause source indicates. Setting this parameter to true requires that both global parameters Support alternate gw reselection feature and Enhanced Alternate GW Reselection are also set to Yes.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

pmReportHssByName - PM Report HSS by Name

Syntax

--cmGparmName pmReportHssByName --cmGparmValue <string>

Description

Specifies whether PM counts reported by HSS are to use the name field from the remote endpoint configuration for that S6a interface. If false, the PM HSS name continues to use the endpoint ID from the remote endpoint configuration.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

proactiveAdaptiveSafetyNet - Proactive Adaptive Safety Net

Syntax

--cmGparmName proactiveAdaptiveSafetyNet --cmGparmValue <string>

Description

Enables or disables proactive adaptive safety net enhancements, in particular the automatic, proactive lowering of the safety net threshold if it is predicted that the busiest IPDS will reach 80% CPU occupancy before the threshold would have been reached.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

resendDnsQueryWithoutPdnTypeForTimeout - Resend DNS Query Without PDN Type for Timeout

Syntax

--cmGparmName resendDnsQueryWithoutPdnTypeForTimeout --cmGparmValue <string>

Description

Parameter controls feature activation GPARM flag which by default shall be disabled. When enabled, MME shall upon receiving no response from DNS/timeout shall resend the DNS query by excluding the PDN type information from APN FQDN.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

resilientIpdsFdsFailure - System Resilience on IPDS/FDS dual fail

Syntax

--cmGparmName resilientIpdsFdsFailure --cmGparmValue <string>

Description

This parameter specifies that system recovery is using the enhanced recovery method for dual IPDS or dual xFDS failure. This method will lock the CMM Aggregate Service if IPDSs and FDSs are not available after dual failure. The system will be unlocked when the normal state is recovered.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

restorationWithFullBackup - SRS Restoration with Full Backup

Syntax

--cmGparmName restorationWithFullBackup --cmGparmValue <string>

Description

This parameter allows SRS restoration (MME failure) with MME Full Backup of UE Contexts. Previously full backup only allowed restoring Users during ISSU. This feature supports restoral of basic procedures on any MME in the pool, using a Full Context backup. The following global parameters must be enabled prior to enabling Restoration With Full Backup: Support Ue Restoration Context Deletion, Inhibit Peer Srs Responses, Ue Ctx Update In Patch Load Support, Session Ddn Restoration Std Based, and Support Full Ue Restoration.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Recommended

true

Name

rfspAccessRestriction - RFSP Access Restriction

Syntax

--cmGparmName rfspAccessRestriction --cmGparmValue <string>

Description

Feature control for RFSP Access Restriction for the MME.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

roamerAttachRateLimitOverride - Roamer Attach Rate Limit Override

Syntax

--cmGparmName roamerAttachRateLimitOverride --cmGparmValue <string>

Description

IMSI and foreign GUTI Attaches allowed per second after which CMM starts dropping attaches for roamers until the rate is below the limit. If the Roamer Attach Rate Limit exceeds the general Attach Rate Limit for any reason, the Roamer Attach Rate Limit Override is effectively disabled. This is because the general Attach Rate Limit will be reached before the Roamer Attach Rate Limit. If the value is set to 0, it means the Roamer Attach Rate Limit is disabled. Value needs to be set to non-zero for the feature to be enabled. Refer to the description of the Attach Rate Limit Override global parameter to understand how this value is used in different CMM environments. Roamer Attach Rate Limit Override configuration is for both IPDS and mIPDS.

Type / Range

Integer in the range of 0 to 9,999

Default

0

Name

safetyNetVariation - Safety Net Variation

Syntax

--cmGparmName safetyNetVariation --cmGparmValue <string>

Description

Allows for variation in safety net in special circumstances. It is ordinarily not changed and should be changed only at the direction of Nokia personnel.

Restrictions

This parameter should be changed only at the direction of Nokia personnel.

List

- loadAlpha - This value should be used always unless directed otherwise by Nokia personnel.
- loadBeta - This value should be used only at the direction of Nokia personnel.
- loadDelta - This value should be used only at the direction of Nokia personnel.
- loadGamma - This value should be used only at the direction of Nokia personnel.

Default

loadAlpha

Name

sendExtEmerNumberInAttachAndTauAccept - Send Extended Emergency Number in Attach and TAU Accept

Syntax

```
--cmGparmName sendExtEmerNumberInAttachAndTauAccept --cmGparmValue <string>
```

Description

Parameter controls feature activation global parameter flag. By default, flag shall be disabled. When enabled, MME shall send Extended Emergency Numbers List IE in the ATTACH and TAU ACCEPT messages if one is provisioned on the MME.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

sendOnlyImeiToEir - Send Only IMEI to EIR

Syntax

```
--cmGparmName sendOnlyImeiToEir --cmGparmValue <string>
```

Description

When this parameter is set to true MME will include only the IMEI part towards EIR for authentication even if the IMEI SV is available in the UEs MM context. When set to false the MME will include the IMEISV when this is available.

List

- false - Boolean value of false.

- true - Boolean value of true.

Default

false

Name

sendOnlyImeiToSgw - Send Only IMEI to SGW

Syntax

--cmGparmName sendOnlyImeiToSgw --cmGparmValue <string>

Description

When this parameter is set to true MME will include only the IMEI towards SGW even if the IMEI SV is available in the UEs MM context. When set to false the MME will include the IMEISV when this is available.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

sendOnlyRanSupportedPlmnsInS1 - Send Only RAN Supported PLMNs in S1

Syntax

--cmGparmName sendOnlyRanSupportedPlmnsInS1 --cmGparmValue <string>

Description

Current parameter enables sending in SETUP RSP and MME Configuration Update only the PLMNs that are supported by the RAN even if additional PLMNs are configured at the MME

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

sendSgsMmeIdentityS6a - Send SGs-MME-Identity AVP on S6a

Syntax

--cmGparmName sendSgsMmeIdentityS6a --cmGparmValue <string>

Description

Specifies whether the MME is to include the SGs-MME-Identity AVP in S6a messaging for a UE that is being registered over SGs. The default is false.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

separateEplmnListNasS1ap - Separate EPLMN List on NAS and S1AP

Syntax

--cmGparmName separateEplmnListNasS1ap --cmGparmValue <string>

Description

Enable sending separate Equivalent PLMN Lists to NAS and S1AP. The EPLMN Lists applied to NAS and S1AP are copied from EPLMN List Name and EPLMN List Name for eNB, respectively, that are provisioned in IMSI Range Services or UE PLMN Services.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

serviceReqRateDropLimitOverride - Service Request Rate Drop Limit Override

Syntax

--cmGparmName serviceReqRateDropLimitOverride --cmGparmValue <string>

Description

Number of allowed 4G UE initiated Service Requests beyond which MME/CMM will start to drop them on the IPDS. Value of 0 means use system calculated Default value. Non-zero means use this value directly.

Type / Range

Integer in the range of 0 to 24,999

Default

0

Name

sessionDdnRestorationStdBased - Session DDN Restoration Standards Based

Syntax

--cmGparmName sessionDdnRestorationStdBased --cmGparmValue <string>

Description

MME Session DDN Restoration based on Standards

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

sgsLocUpdCombTauAfterCsfb - SGs Location Update for Combined TAU After CSFB

Syntax

```
--cmGparmName sgsLocUpdCombTauAfterCsfb --cmGparmValue <string>
```

Description

Current parameter enables the MME doing SGs Location Update when the UE does intra-MME Combined TAU after CSFB even if Old and New LAI are the same.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

srStormInternalMonitoring - Service Request Storm Internal Monitoring

Syntax

```
--cmGparmName srStormInternalMonitoring --cmGparmValue <string>
```

Description

This parameter enables internal software resource monitoring to further protect the CMM during Service Request Storms, taking action as necessary to prevent internal resource exhaustion and overloads, including in scenarios such as when SGW overloads result in delays in SGW responses to the CMM, which in turn could result in CMM overloads.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Recommended

true

Name

srsTrafficReduction - SRS traffic reduction

Syntax

--cmGparamName srsTrafficReduction --cmGparamValue <string>

Description

This parameter enables using new format (compressed) to send NR10 update requests and NR10 fetch responses. For AMF, all the NR10 Update requests and Fetch responses will follow the new compressed format if the value of this parameter is set to true. For MME, Update Requests and Fetch Responses will follow the new compressed format when the value of this parameter is set to true as well as Support Full UE Restoration is enabled. If there is a need to change the value of this gParam please contact Nokia support team

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Name

staticPgwSelectionAllPlmns - Static PGW selection for defined IMSIs on all serving PLMNs

Syntax

--cmGparamName staticPgwSelectionAllPlmns --cmGparamValue <string>

Description

MME supports static PGW selection for defined IMSIs on all available serving PLMNs.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

tauRateDropLimitOverride - IRAT tau Rate Drop Limit Override

Syntax

--cmGparamName tauRateDropLimitOverride --cmGparamValue <string>

Description

5G to 4G IRAT TAUs allowed per sec after which MME start dropping 5G to 4G IRAT TAUs until rate is below limit. Value of 0 means use system calculated Default value. Non-zero means use this value directly.

Type / Range

Integer in the range of 0 to 14,999

Default

0

Name

transferTo5gPdnWo5gsIwk - Transfer to 5GS PDN Session without 5GS IWK

Syntax`--cmGparamName transferTo5gPdnWo5gsIwk --cmGparamValue <string>`**Description**

Current parameter enables transferring to 5GS a PDN Session that is known that 5GSIWK flag were not sent in Create Session Request during PDN Session Establishment procedure of type handover.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Recommended

false

Name

ueRadioCapPagingS10 - UE Radio Capability Paging S10

Syntax`--cmGparamName ueRadioCapPagingS10 --cmGparamValue <string>`**Description**

This gparam specifies whether the MME will include the 'UE Radio Capability for Paging' AVP, if available, in S10 messaging. The default is false. The same gparam specifies whether the MME will accept and store 'UE Radio Capability for Paging' AVP, if available in S10 messaging, in the UE context.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

ueTzInCreateAndUpdateBearerResp - UE Time Zone In Create And Update Bearer Response

Syntax`--cmGparamName ueTzInCreateAndUpdateBearerResp --cmGparamValue <string>`

Description

Parameter controls feature activation GPARM flag. By default, flag shall be disabled. When enabled, MME will include UE Time Zone in S11 Create Bearer and Update Bearer Response messages for both homers and roamers.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

useApnOiToDetermineHrt - Use APN-OI to Determine HRT

Syntax

--cmGparmName useApnOiToDetermineHrt --cmGparmValue <string>

Description

Current parameter enables using the APN-OI instead of the PGW FQDN to determine if a PDN Session is HRT for a roaming subscriber when applying QoS modification for a PDN session in accordance to local configuration and when sending the UE Time Zone IE in UBR and CBR Response messages.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

useDnsForN26Ho - Use Dns for N26 handover

Syntax

--cmGparmName useDnsForN26Ho --cmGparmValue <string>

Description

Current parameter enables using DNS for selecting target node as part of N26 handover even when local AMF of quad access node serves target RAN.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

useLocalRfspHssRfspNotSub - Use Local RFSP if RFSP isn't subscribed at the HSS

Syntax

```
--cmGparmName useLocalRfspHssRfspNotSub --cmGparmValue <string>
```

Description

Current parameter enables using the locally provisioned RFSP value when local configuration at the uePlmnServices or imsiRangeServices indicates applying the HSS subscribed value but no RFSP value is received from the HSS

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

useN26SvcParamS10Ho - Use N26 Service Parameter in S10 Handover

Syntax

```
--cmGparmName useN26SvcParamS10Ho --cmGparmValue <string>
```

Description

Current parameter enables using N26 service parameter as part of DNS query for target MME selection during S10 handover

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

useSameIpDynStaticS11Link - Use Same IP Address for Dynamic and Static S11 Links

Syntax

```
--cmGparmName useSameIpDynStaticS11Link --cmGparmValue <string>
```

Description

Enable using same IP address for dynamic and static S11 links.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

vlrCleanupBasedOnOccupancy - VLR Cleanup Based on Occupancy

Syntax

--cmGparmName vlrCleanupBasedOnOccupancy --cmGparmValue <string>

Description

Current parameter enables doing VLR cleanup of the VLR Contexts of deregistered UEs based on VLR Occupancy

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

true

Recommended

true

Name

wifiHoConnectedUe - Wifi Handover for Connected Ue

Syntax

--cmGparmName wifiHoConnectedUe --cmGparmValue <string>

Description

When a Delete Bearer Request is received for a default bearer with the cause 'RAT changed from 3GPP to non-3GPP' for an ECM-CONNECTED UE and this is not the last bearer for the UE, instead of doing S1 Release and Release Access Bearer, the MME sends an S1AP ERAB Release Command for all bearers associated with the PDN session, but without including a NAS EPS Deactivate Bearer Context Request in the E-RAB Release.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

zeroOiCsrS10Tau - Set OI flag to Zero in CSR of S10 TAU

Syntax

--cmGparmName zeroOiCsrS10Tau --cmGparmValue <string>

Description

Current parameter enables setting OI flag to value zero in Create Session Request that MME sends as part of s10 Idle mobility. When this parameter is disabled, the MME sets OI flag to 1

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

zoneCodeExtendedEmergencyNumberList - Zone Code Extended Emergency Number List

Syntax

```
--cmGparmName zoneCodeExtendedEmergencyNumberList --cmGparmValue <string>
```

Description

Parameter controls feature activation GPARM flag. By default, flag shall be disabled. When enabled, MME shall use the received regional zone code information from HSS to determine whether to send extended emergency number list to UE.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

Name

zoneNameSwitch - Zone Name Switch

Syntax

```
--cmGparmName zoneNameSwitch --cmGparmValue <string>
```

Description

Parameter controls whether the mapping between zone names and TAC is enabled (switch on). If the parameter is set, zone name will be used as tag in the APN query. Otherwise, TAI will be used as tag in the APN query.

List

- false - Boolean value of false.
- true - Boolean value of true.

Default

false

5.2 cmm ggsnIpsWeight

Different weights on GGSN IP addresses for the host file. Syntax, description, parameters, and roles for cmm ggsnIpsWeight command.

Syntax

Description

This command is used in order to create/list/show different weights for the available GGSN IP addresses used in the host file

Parameters

Name

apnNI - APN Domain Name

Syntax

--apnNI <string>

Description

Use this parameter to specify the APN Domain Name

Class

Required key.

Type / Range

Use this parameter to specify the APN Domain Name

Name

mcc - mcc

Syntax

--mcc <digits>

Description

Mobile Country Code digits of broadcasted PLMN

Class

Required key.

Type / Range

"Mobile Country Code digits of broadcasted PLMN"

Name

mnc - mnc

Syntax

--mnc <digits>

Description

Mobile Network Code digits of broadcasted PLMN

Class

Required key.

Type / Range

Mobile Network Code digits of broadcasted PLMN

Name

ggsnIpAddress - GGSN IP Address

Syntax

--ggsnIpAddress <string>

Description

Use this parameter to specify the GGSN IP Address.

Class

Required key.

Type / Range

Digit string of length 2 to 39 with the allowed pattern of [0-9a-f\.:]*

Name

fullApn - Full APN Domain Name

Syntax

--fullApn <string>

Description

'This field contains the full APN Domain Name'

Class

Read only.

Type / Range

Digit string of length 1 to 100 with the allowed pattern of [0-9a-z\.\-]*

Name

ipAddressType - IP Address Type

Syntax

--ipAddressType <list-item>

Description

Use this parameter to specify the IP Address Type. Allowed values IPV4, IPV6

Class

Read only.

List

- IPV4 - Specify trace entity of IPv4.
- IPV6 - Specify trace entity of IPv6.

Default

IPV4

Name

weight - GGSN IP weight

Syntax

--weight <integer>

Description

Use this parameter to specify the weight for the GGSN IP address. Allowed values 0 to 10

Class

Optional.

Type / Range

Integer in the range of 0 to 10

Default

1

5.3 cmm gnbNbrMapDump

gNB Neighbor Map Dump. Syntax, description, parameters, and roles for cmm gnbNbrMapDump command.

Syntax

Description

This command outputs to a file the gNB Neighbor Map residing in the specified node.

Parameters

Name

gnbMapType - Map

Syntax

--gnbMapType <list-item>

Description

The requested map to be retrieved.

Class

Optional.

List

- active - The active gNB map in the requested node.
- updating - The updating gNB map in the requested node.

Default

active

Name

information - Information

Syntax

--information <string>

Description

Output information for the request.

Class

Read only.

Type / Range

Digit string of length 0 to 256 with the allowed pattern of [0-9a-zA-Z\._:\-]*

Name

macroGnbId - Macro gNB ID

Syntax

--macroGnbId <integer>

Description

Macro gNB ID

Class

Optional.

Type / Range

Integer in the range of 0 to 4,294,967,295

Name

neighborGnbId - Neighbor gNB ID

Syntax

--neighborGnbId <integer>

Description

Neighbor gNB ID

Class

Optional.

Type / Range

Integer in the range of 0 to 4,294,967,295

Name

poolId - Pool ID

Syntax

--poolId <integer>

Description

Pool ID

Class

Optional.

Type / Range

Integer in the range of 0 to 39

Name

poolType - Pool Type

Syntax

--poolType <list-item>

Description

Pool Type

Class

Optional.

List

- ALMS - Alarm Service - Alarm Service.
- CPPS - Control plane processing service - Control plane processing service.
- CTCS - Call Trace Collection service - Call Trace Collection service.
- DBS - Database service - Database service.
- EEMS - Event Exposure Management service - Event Exposure Management service.
- IPDS - IP director service - IP director service.
- IPPS - IP packet processing service - IP packet processing service.
- LIHS - Lawful Interception Handling service
- MLIS - Machine Learning Intelligence Service
- NECC - Network element cluster controller - Network element cluster controller.
- NWDS - Network Data Service - NWDAF service
- PAPS - Packet processing service - Packet processing service.
- PCMS - Per Call Measurements Data Service - Per Call Measurements Data (PCMD) Service
- RCIS - Radio Capability Information storage Service
- SFDS - SCTP flow distributor service
- UCDS - User equipment Context Data-dump Service
- UFDS - UDP flow distributor service

Name

weight - Weight

Syntax

--weight <integer>

Description

Weight

Class

Optional.

Type / Range

Integer in the range of 0 to 4,294,967,295

Roles

List

sysadmin, manage, monitor

5.4 cmm gParms

Global Parameters. Syntax, description, parameters, and roles for cmm gParms command.

Syntax

Description

This command is used to administer Global Parameters defined to configure global office data in CMM.

Parameters

Name

gParmName - Parameter name

Syntax

--gParmName <list-item>

Description

Name of parameter.

Class

Required key.

List

- 20bitHenbId - 20 bit home eNodeB identifier - Control flag for routing of S1AP HO messages based on target TAI when the target eNB with 20-bit eNB ID is not directly connected with the MME. no (default) - disable this routing. yes - enable this routing.
- 2g3gPgwlIsolation - 2g3g PGW isolation - Setting to yes enables PGW isolation feature on SGSN. setting to no disables PGW isolation feature on SGSN.
- 2g3gSgwlIsolation - 2g3g SGW isolation - Setting to yes enables SGW isolation feature on SGSN. setting to no disables SGW isolation feature on SGSN.
- 4g5gRetPrefPlmn - 4g5g Return Preferred Plmn - This parameter enables indicating to serving eNB the last visited 5GS PLMN as preferred indication to be used in future EPS to 5GS mobility.
- acceptActFlagTauCpsrForT6aonly - Accept active flag TAU CPSR for T6A ONLY - Enable acceptance of TAU with active flag and CPSR to establish S1-U bearers for a UE with SCEF PDN connections only.

- **acceptScefRelForPsmEdrx** - Accept SCEF Release for PSM eDRX - This gparm specifies whether the MME is to return diameter Success if the SCEF attempts to release a T6a bearer for an Idle UE in PSM or eDRX mode and unavailable for paging.
- **acceptSgsPageFromNonRegMsc** - Accept an SGs Page from non-registered MSC - This gparm specifies whether the CMM should accept and process an SGs page request from an MSC other than the currently registered MSC.
- **accessRestrictionToLte** - support ARD from s6d and pass it to Radio - This parameter allows SGSN to support ARD from s6d and pass it to Radio. This parameter also allows MME in combi node during attach or TAU to store 'WB-E-UTRAN Not Allowed' in the DB if receives DIAMETER_ERROR_USER_UNKNOWN during location updating. If the condition such user is still in the DB e.g. the subscriber was attached in the SGSN part before, purge is not done yet. MME will send #15 CC towards UE in this case. Default value is No, it means that both SGSN/MME will keep current behavior, no changes. If the parameter is set to Yes, above function will take in place.
- **activateHssUnavailBlacklisting** - Activate HSS unavailable blacklisting - Enable the extended HSS unavailability detection and blacklisting.
- **activateLcs** - Activate LCS - Indicates whether or not to activate LCS.
- **activateLcsClientTypeEmergencyServices** - Activate LCS client type emergency services - Activate LCS client type emergency services.
- **activateLcsClientTypeLawfulInterceptServices** - Activate LCS client type Lawful Intercept Services - Activate LCS client type Lawful Intercept Services.
- **activateLcsClientTypePlmnOperatorServices** - Activate LCS client type PLMN operator services - Activate LCS client type PLMN operator services.
- **activateLcsClientTypeValueAddedServices** - Activate LCS client type Value Added Services
- **aerialSubscriptionActive** - Aerial Subscription Feature Active - Specifies whether the MME is to include aerial subscription information (if available) in S1 messaging to the eNodeB.
- **alarmCmasFailure** - Alarm CMAS failure - Alarm CMAS failure.
- **alarmFailToReceiveCmasResponse** - Alarm fail to receive CMAS response - Alarm fail to receive CMAS response.
- **alarmFailToSendCmasMessage** - Alarm fail to send CMAS message - Alarm fail to send CMAS message.
- **aliasApnConversionPerImsi** - Alias APN Conversion Per IMSI - Parameter controls feature activation flag. By default, flag shall be disabled. When enabled, MME shall support converting the UE requested APN with the locally configured APN.
- **allApns** - All APNS - MME to store context of all PDN connections of UE on SRS.

- **allowBrrDeactvtRglrDeactvt** - Allow bearer deactivate regular deactivate - Yes - enables the MME, upon receiving delete bearer request from the network during a PGW initiated PDN disconnection scenario with cause of 'Reactivation requested', to send deactivate EPS bearer context request message to the UE overriding the standard cause with 'regular deactivation'. upon receiving DEACTIVATE EPS BEARER CONTEXT ACCEPT message from the UE, the MME will send S11 delete bearer response message to the SGW. no (default) - in the scenario above, the MME will send the standard cause, 'reactivation requested', towards the UE.
- **allowEdrxValue0** - support eDRX cycle 5.12s - support eDRX cycle 5.12s. Default value is not set. In this case, MME will keep current behavior: a UE requests eDRX 0, MME responds with an ATTACH/TAU RESPONSE message with the eDRX IE not present. Since EMM currently rejects the use of eDRX 0, the UE will be paged the same as if the UE didn't request eDRX 0. When this gParm is set, then this feature function will be enable. MME will accept eDRX0, and a new paging type WB_eDRX_0 will be used
- **allowEnGnbRouting** - Allow En-Gnb Routing - Allow the use of the en-Gnb mapping to be used in routing the Enb Configuration Transfer message received at MME. When false, the en-gNB ID and TAC will be used in message routing. When true, message routing occurs using only the en-gNB ID.
- **allowExtendedImsiRangeServices** - Allow Extended Number of IMSIRangeServices - This parameter determines the use of an extended range of IMSIRangeServices. When set to no the number of IMSIRangeServices is limited to 4K. When set to yes, the number of MSIRangeServices is limited to 10K.
- **allowLIPAPDNWhenLITarget** - allow LIPA PDN Connections - Use this parameter to allow checks on LIPA PDN Connections.
- **allowMixedPdnAddressAllocationTypes** - Allow mixed PDN address allocation types - When set to yes PDN type is IPv4v6, if only one of the IP versions is statically provisioned in the HSS, set the other IP version to all zeros thus also allowing for dynamic PDN address allocation.
- **allowNonEmerAttachEmerArpProvCc** - Allow non-emergency Attach with emergency ARP when Provisionable Cause Code feature is enabled - When this parameter is enabled, the MME allows non-emergency Attach for which PDN session is associated with emergency ARP, as defined in local emergency profile, that is otherwise by default rejected when the Provisionable Cause Code feature is enabled.
- **allowProcEirFailure** - Allow Procedure EIR Failure - Feature introduces support for enhancing the EIR support by having MME reject a user's Attach when the IMEI is explicitly blacklisted in EIR. In all other cases attach should succeed, if for example - the AVP value is different from BLACKLISTED (ie UNKNOWN, WHITELISTED or GREYLISTED) - any other Diameter Error Code received on S13 '3GPP-ME-Identity_Check' - No response received from EIR - Any other diameter error cause codes received from EIR Feature shall be controlled by GPARM flag

- **allowR8ArpGnSgsn** - Allow R8 ARP Gn SGSN - Gn SGSN is pre-rel8 element and it connects/receives pre-rel8 ARP from HLR. With this parameter set to true, Gn SGSN allows customer configured mapping table and transfer rel8 ARP towards RNC. With this parameter set, a new configured Group IMSIs Will be given ARP 1 towards RNC. If the parameter is not set, then normal function will take place. Rel8 ARP will not allow to send to RNC.
- **allowScefMtEdt** - Allow SCEF MT-EDT - Allows MT-EDT to be used with SCEFs
- **allowTransferOfEmergencyBearersToGnSgsn** - Allow transfer of emergency bearers to Gn SGSN - This global parameter determines whether emergency bearers can be transferred to a Gn SGSN. yes: the MME allows transfer of emergency bearers to a Gn SGSN. no: the MME denies transfer of emergency bearers to a Gn SGSN.
- **allowTransferOfEmergencyBearersToS3sgsn** - Allow transfer of emergency bearers to S3 SGSN - This global parameter determines whether emergency bearers can be transferred to a S3 SGSN. yes: the MME allows transfer of emergency bearers to a S3 SGSN. no: the MME denies transfer of emergency bearers to a S3 SGSN.
- **allowUeInitiatedBearerResourceAllocationRequest** - Allow UE initiated bearer resource allocation request - If the bearer resource allocation request parameter is set to yes, the request shall be allowed. if the request parameter is set to FALSE, the request shall be rejected by the MME. MME shall send BEARER RESOURCE ALLOCATION REJECT message with the ESM cause value #97 message type non-existent or nor implemented to the UE.
- **allowUeOffloadOnMmeDuringMafCpuOverload** - Allow UE offload on MME during CPPS CPU overload - Enable UE offloading on the MME during CPPS CPU overload when lightly loaded CPPSs are available on the MME.
- **allowUnSupportDcnReroute** - Allow UnSupported DCN Reroute - Indicates to allow an unsupported Dcn Rerouted request to proceed on a non-default DCN MME
- **allowUnSupportDcnRerouteRoamer** - Allow UnSupported DCN Reroute for Roamer - This field specifies whether to allow an unsupported DCN Rerouted request to proceed on a non-default DCN at the MME. The default is No.
- **alwaysSndEpsNwFeatSuppt** - Always Send EPS Network Feature Support - Always send EPS Network Feature Support IE in attach and tau accept message
- **anyUeRequestedApn** - Any UE Requested APN - GPARM introduces APN override support for rogue APNs. GPARM allows a match on 'any' UE requested APN. There will be an apnImsiRangeServcies entry with IMSI or IMEI range and a UE requested apn of 'any'. If this gparm is enabled it shall replace the UE requested APN for the search in apnImsiRangeServices with our own string 'any'. By default this shall be disabled.
- **apnRateControlStatus** - APN Rate Control Status - When this gparm is set to yes, the MME will include any saved APN rate control status for the first newly created PDN for a given APN. The PGW and SCEF can provide the rate control status to the MME when the last PDN in a given APN is deleted.

- **apply2g3gApnWhiteList** - Apply 2g3g APN white list - It is used to enable/disable the LBO APN white list checks globally for 2G3G. If it is no, then SGSN will not apply LBO APN white list checks irrespective of the UE PLMN LBO APN white list provisioning.
- **applyDeleteGbrToVolteBearersOnly** - Apply Delete GBR timer only to VOLTE bearers - Parameter controls the usage of existing Delete GBR timer. When this parameter is enabled, then Delete GBR timer applies only for VOLTE bearers. When this parameter is disabled, then Delete GBR timer applies for all GBR beares.
- **applyLocallyProvQosValuesForHrt** - Apply Locally Provisioned QoS Values For HRT - Parameter controls the behaviour of MME whether to apply QCI/ARP/PCI/PVI values from the locally provisioned QoS values. If the parameter is enabled and if MME receives QCI/ARP/PCI/PVI values from gateways that are different than locally configured qos values, MME shall apply locally configured values for HRT scenarios. By default the flag shall be disabled.
- **applyLteApnWhiteList** - Apply LTE APN white list - It is used to enable/disable the LBO APN white list checks globally for LTE. If it is no, then MME will not apply LBO APN white list checks irrespective of the UE PLMN LBO APN white list provisioning.
- **arpHighPriorityAccessLevel** - ARP high priority access level - Allocation Retention Priority (ARP) priority level value indicating high priority access in MME. ARP priority level indicates the priority of allocation and retention and can take values between 1 and 15. Value 15 means 'no priority'. Values between 1 and 14 are ordered in decreasing order of priority, i.e., 1 indicates highest priority and 14 indicates lowest priority. The MME grants high priority access for a UE when SGW/PGW provides an ARP PL value equal to this MME provisioned value for a bearer of the UE.
- **arpLowAccessPriorityLevel** - ARP low access priority level - Allocation Retention Priority (ARP) priority level value indicating low priority traffic in MME. ARP priority level indicates the priority of allocation and retention and can take values between 1 and 15. Value 15 means 'no priority'. Values between 1 and 14 are ordered in decreasing order of priority, i.e., 1 indicates highest priority and 14 indicates lowest priority. MME detects low priority traffic based on SGW/PGW providing an ARP PL value equal to this MME provisioned value for a bearer of the UE.
- **attachRateLimitOverride** - Attaches allowed per sec after which CMM starts dropping attaches until the rate is below the limit. The limit value is specified as either 'systemDefault', which means the CMM determines what the value is, or a user provisioned number of attaches per second. If the user provisioned value is greater than the maximum effective value listed below, the limit value that the CMM actually uses will be the maximum effective value. For 10 vcpu EMMS in large CMM, systemDefault is calculated as 400 attaches per second times the number of CPPS VMs with a maximum value of 10000 attaches per second. If the value is provisioned, the maximum effective value is the lesser of 1000 attaches per second times the number of CPPS VMs or 10000 attaches per second. For 12 vcpu EMMS in large CMM, Attach storm rate is 480 attaches per second per cpps. For an openstack small CMM, systemDefault is calculated as 400 attaches per second times the number of CPPS VMs with a maximum value of

1600 attaches per second. If the value is provisioned, the maximum effective value is the lesser of 1000 attaches per second times the number of CPPS VMs or 1600 attaches per second. For an A8 appliance CMM, systemDefault is calculated as 400 attaches per second times the number of CPPS VMs with a maximum value of 10000 attaches per second. If the value is provisioned, the maximum effective value is the lesser of 1000 attaches per second times the number of CPPS VMs or 10000 attaches per second. For an A2 appliance CMM, systemDefault is calculated as 200 attaches per second times the number of CPPS VMs with a maximum value of 1750 attaches per second. If the value is provisioned, the maximum effective value is the lesser of 400 attaches per second times the number of CPPS VMs or 1750 attaches per second. The implementation of the systemDefault is done at each IPDS and not factored for a m-IPDS CMM. For a m-IPDS CMM with 3 IPDS pairs for example, the actual limit is effectively tripled. We strongly suggest customer to overwrite the systemDefault with an adjusted value.

- **attachRateRejectLimitOverride** - Attaches allowed per sec after which CMM starts rejecting attaches until the rate is below the limit. The limit value is specified as either 'systemDefault', which means the CMM determines what the value is, or a user provisioned number of attaches per second. If the user provisioned value is greater than the maximum effective value listed below, the limit value that the CMM actually uses will be the maximum effective value. For an openstack large CMM, systemDefault is 10000 attaches per second. If the value is provisioned, the maximum effective value is 10000 attaches per second. For an openstack small CMM, systemDefault is 1600 attaches per second. If the value is provisioned, the maximum effective value is 1600 attaches per second. For an A8 appliance CMM, systemDefault is 10000 attaches per second. If the value is provisioned, the maximum effective value is 10000 attaches per second. For an A2 appliance CMM, systemDefault is 1750 attaches per second. If the value is provisioned, the maximum effective value is 1750 attaches per second. The implementation of the systemDefault is done at each IPDS and not factored for a m-IPDS CMM. For a m-IPDS CMM with 3 IPDS pairs for example, the actual limit is effectively tripled. We strongly suggest customer to overwrite the systemDefault with an adjusted value.
- **attachRejForUnsublmsApn** - Attach Reject for Unsubscribed APN - Global Parameter controls the feature activation. By default the parameter shall be disabled. When enabled, MME shall reject with Cause Value #33 if IMS APN is not subscribed or if IMS APN is subscribed only via Wild Card APN.
- **attachRejForUnsublmsApnWithLogging** - MME Track VoLTE Fail - Parameter controls the feature activation. By default the parameter shall be disabled. When the parameter is enabled MME shall log PDN Connectivity Failures (standalone or part of the Attach) with ESM cause code 27 for IMS APN only. IMSI, MSISDN and IMEI shall be captured as part of the log.
- **attachSgsUnknownLaiEmmCause** - Attach SGs Unknown LAI EMM Cause - The parameter is used to provision EMM cause code to be sent to UE combined attach request if MME fails to select MSC due to LAI to TAI to MSC mapping provisioning errors.

- **authntDtchIntgChkFail** - Authenticate UE for Detach Request message Integrity Checks Fail - Parameter is used to activate MME to authenticate a UE if the UE sent Detach Request fails message integrity checks. If authentication fails or if MME is unable to authenticate the UE then MME does not detach the UE.
- **autoAddTaiToTaiList** - Auto add TAI to TAI list - Indicates how the 'Automatically add TAI to the TAI list' should be handled.
- **backoffTimerImspdnReqRej** - Back-off Timer Inclusion - Global Parameter controls the inclusion of back-off timer IE. By default this parameter shall be disabled. When this parameter is enabled MME shall send T3396 back-off timer IE when rejecting IMS PDN Connectivity Request that is sent either as standalone or as part of Attach procedure due to not subscribed IMS APN or IMS APN is subscribed via the wildcard APN. Particularly for the case where IMS APN is subscribed via wildcard APN, the MME shall reject Attach/PDN Connectivity procedure(s) towards the IMS APN when GPARM is enabled.
- **bandwidthRoundup** - Bandwidth roundup - Round up or round down AMBR, GBR and MBR sent to UE.
- **bssapPlusSsn** - BSSAP plus SSN - BSSAP+ protocol sub system number.
- **bufferCbrDuringHo** - Buffer Create Bearer Request During HO - When this parameter is enabled, then if the MME receives CBR, UBR or DBR while processing 5G to 4G HO or inter-MME handover, it places the CBR (or UBR, DBR) on hold that is processed after completion of connected mode TAU that follows handover procedure.
- **bufferCreateBearerRequestDuringTau** - Buffer Create Bearer Request During TAU - Parameter controls handling collision scenario. By default, the flag shall be disabled. When enabled, MME while processing Modify bearer Request during TAU procedure, receives Create Bearer Request from SGW, it shall be buffered and processed only upon completion of TAU procedure.
- **canonicalNodeNameLabel** - Canonical node name label - Comparison of S-GW and P-GW network names in order to decide whether they are far enough to trigger a PDN connection re-establishment.
- **catM1bPagingTimerIncr** - Category M1 CE mode b paging timer increment - This value is added to paging response timer for CAT-M1 CE mode b UE.
- **cc15eUtranAllowed** - CC 15 E-UTRAN allowed - Configures the E-UTRAN allowed bit of the extended EMM cause.
- **cgfAlwaysSetSequenceNumberToOne** - CFG Always Set Sequence Number to One - When this parameter is set to true SGSN support the optional customization to overwrite the 'recordSequenceNumber' field for each unique CDR with value 1
- **cgfServingPlmnSupport** - CFG Serving PLMN Support - When this parameter is set to true, SGSN stores in the S-CDR servingNodePLMNIdentifier field the PLMN of the RA the UE is in. When set to false the Serving PLMN will not be added in the CDR.

- **checkDcnUeUsageTypeSgsnToMme** - Check DCN UE Usage Type SGSN to MME - Specifies whether the MME shall use UE Usage Type during 2G/3G->4G Attach and TAU procedure in order to perform Decor functionality as part of the procedure.
- **checkDcnUeUsageTypeSgsnToMmeRoamer** - Check DCN UE Usage Type SGSN to MME for Roamer - Specifies whether the MME shall use UE Usage Type during 2G/3G to 4G Attach and TAU procedure in order to perform Decor functionality as part of the procedure. This setting applies only for inbound roamers. The default is No.
- **checkMatchApnConfig** - check matchApn configuration - Check matchApn configuration to decide on IMS APN. If matchApn is not configured and checkMatchApnConfig set to No - consider apn with QCI 5 as IMS APN Yes - consider apn with QCI 5 as non IMS APN
- **ciotS1APMsgTunneling** - CMM Support for Tunnelling of S1AP Messages Associated with CIOT or DCNR Attach/TAU Requests - Enables CMM message tunnelling support over S10 of S1AP messages associated with CIOT (f11728-01) or DCNR Attach/TAU Requests.
- **clrHandlingWithoutClrFlags** - CLR Handling Without Clr Flags - Some functions are missing when combined MME/Gn SGSN (S6d use) handles CLR without CLR flag. With this parameter enabled, missing function should be supported. By default, the missing function is not supported.
- **collDbreqUbreq** - Collision of DL and UL bearer request - Enable/Disable support for collision scenario.
- **colocatedGwSearchForNoMatch** - Co-located Gateway Search for No Match - Parameter controls the support for searching co-located gateways for UEs when the served PLMN does not match the PGW FQDN PLMN for gateway mode selection 2. By default the flag shall be disabled.
- **combinedAttachWithoutCs** - Combined Attach Without CS - Enables the support for combined attach without actual CS domain in the MME.
- **comboPgwcRetries3XUe** - Combo PGW-C Retries for 3X capable UE - Number of retries selecting combo PGW-C(s) during PDN Connectivity procedure before switching selecting standalone PGW-C for 3X capable UE(s)
- **comboPgwcRetriesN1Ue** - Combo PGW-C Retries for N1 capable UE - Number of retries selecting combo PGW-C(s) during PDN Connectivity procedure before switching selecting standalone PGW-C for N1 capable UE(s)
- **coreNetworkRestrictSupport** - Core Network Restrictions Support - Current parameter enables sending Core Network Restrictions field and NRNA bit of MM Context IE in s10 interface. Note that when n26 interworking is enabled, it is expected that this gParm is also enabled by the operator
- **coreNetworkSharing** - Core network sharing - Indicates whether core network sharing enabled or not the default is no, indicating core network sharing is not enabled.
- **coverageEnhancement** - Coverage enhancement - Enable the MME support for coverage enhancement level paging feature.

- cpCiotReloc - CP CloT Reloc - Feature activation for supporting NB-IoT Control Plane CloT Relocation
- cpDataPktSizeToSwitchCpToUp - CP Data Packet Size to Switch CP to UP - CP data packet size threshold in octets for MME to trigger CP to UP switch. The same parameters is used for both UL and DL. If UL or DL CP data packet size exceeds the provisioned threshold then MME shall switch CP bearers to UP. MME shall not perform CP to UP switch if MME has knowledge that no more UL or DL packets are expected or a single DL packet is expected. MME will have this knowledge from the UE sent ESM DATA TRANSFER message IE Release Assistance Indication.
- crsi - Change reporting support indication - Indicates whether to set the CRSI flag in MME GTPv2 messages.
- csfbReturnLastPlmn - CSFB return last PLMN - Configure MME to indicate MSC to return UE to the last PLMN after CSFB.
- csRecoveryIndication - MSC CS recovery indication support - When set to yes enables MME to accept SGsAP-PAGING REQUEST message with CS restoration indicator and paging of the UE in the location information provided by the MSC. when set to no disables the feature.
- ctrlRoamerQos - Control QoS for roaming subscribers - ctrlRoamerQos controls below functionality only for roaming subscribers: If it sets to YES: SGSN will 1 Sending of HSS/HLR subscribed QoS values to S/P-GW or GGSN. 2 Ignoring QoS changes (upgrade/downgrade) from S/P-GW or GGSN. 3 Sending local configured QoS parameters towards RAN in case of: - Inter RAT handover MME to S4/Gn-SGSN - RAU MME to S4/Gn-SGSN - Inter S4/Gn-SGSN RAU If it sets to No, SGSN has no changes. Default value is NO
- dcnrGwSellte - DCNR capable PGW-C Selection for LTE only UE - Enable selecting DCNR capable PGW-C for LTE only UE (i.e. without EN-DC support) during PDN Connectivity procedure
- dcnrOverrideLipa - DCNR overrides Lipa service - Allow MME to override local PGW selection for Lipa enabled PDN with mobile network PGW selection for DCNR capable UE(s) with allowed NR as a Secondary RAT service.
- dcPraActionAddProcs - DC PRA action additional procedures - Enables MME to react upon received PRA action for dual connectivity PRA, when MME receives new PRA action from SGW/PGW during -Dedicated bearer activation -Default/dedicated bearer modification -intra LTE Mobility procedures -PDN setup for a PDN being handed over from ePDG. -Change notification response Applied when either -PRA Dual connectivity segment reporting is set to other than DC Segment Reporting Disabled, or -Presence Reporting Area Dual Connectivity IPv4 is set to other than DC PRA IPv4 Reporting Disabled, or -PRA DC IPv6 Prefix is set to other than DC PRA IPv6 Prefix Disabled.
- dcPraInterMme - DC PRA Inter MME Mobility - Enables MME to hand over already started PRA action for DC PRA between MMEs during inter MME mobility. Applied when either -PRA Dual connectivity segment reporting is set to other than DC Segment Reporting Disabled, or -Presence Reporting Area Dual Connectivity IPv4 is set to other than DC

PRA IPv4 Reporting Disabled, or -PRA DC IPv6 Prefix is set to other than DC PRA IPv6 Prefix Disabled.

- **dcPraStart5gsToEps** - DC PRA action start 5GS to EPS Mobility - Enables MME to react upon received PRA action for dual connectivity PRA, when MME receives new PRA action for start reporting during 5GS to EPS mobility. Applied when either -PRA Dual connectivity segment reporting is set to other than DC Segment Reporting Disabled, or -Presence Reporting Area Dual Connectivity IPv4 is set to other than DC PRA IPv4 Reporting Disabled, or -PRA DC IPv6 Prefix is set to other than DC PRA IPv6 Prefix Disabled.
- **ddnAckWithDLBuffering** - DDN ack with DL buffering - Enable sending of DDN ack with downlink buffering duration set to number of page attempts times (T3413 timer + provisioned increment for ESM messages) seconds and DL buffering suggested packet count.
- **ddnRateLimitOverride** - Number of DDNs allowed per sec after which MME start dropping DDNs until rate is below limit.
- **decorRerouteSr** - Decor Reroute on SR - This parameter indicates whether MME is enabled to reroute a UE upon UE SR or CPSR to a MME group supporting the UE DCN ID if the current MME does not support the DCN ID. By default the parameter is set to False.
- **decorRerouteSrRoamer** - Decor Reroute on SR for Inbound Roamer - This parameter indicates whether the MME is enabled to reroute an inbound roamer UE upon UE SR or CPSR to an MME group supporting the UE DCN ID if the current MME does not support the DCN ID. By default the parameter is set to False.
- **dedicatedBearerPiggybackSupport** - Dedicated bearer piggyback support - This parameter indicates whether the MME should send piggyback support for dedicated bearer setup to the SGW in the create session message. if the parameter is yes the message will indicate MME support, if it is no the message will indicate non support.
- **defaultIpv4ForPdnTypeIpv4OrIpv6** - Default Ipv4 for Pdn Type Ipv4OrIpv6 - GPARM controls to choose between IPv4 and IPv6 upon receiving from HSS. When GPARM is set to Yes default is IPv4 for pdnType IPv4 or IPv6. When gparm is set to 'No' it means ipv6. By default this parameter shall be set to 'No'.
- **defaultPreferredDataMode** - Default preferred data mode - Select default preferred network behavior when preferred-data-mode AVP is not received for a PDN connection.
- **defaultRacForSrvccMscSelection** - Default RAC for SRVCC MSC selection - Default RAC for SRVCC MSC selection.
- **delbrrRateLimitOverride** - Number of delete bearers allowed per sec after which MME start dropping delete bearers until rate is below limit.
- **deletePdnSessionS11u** - Delete PDN session S11U - Delete PDN sessions using S11-U when UE moves in to TAI that does not support CP CIOT optimization.

- deletePdnSessionS1u - Delete PDN session S1U - Delete PDN sessions using S1-U when UE moves in to TAI that does not support S1-U data transport.
- deletePdnSessionT6a - Delete PDN session T6A - Delete PDN sessions using T6A when UE moves in to TAI that does not support T6A data transport.
- depthOfSgwPgwRetry - Depth of SGW PGW retry - Defines the number of retries MME takes when there is no response from SGW on CSR.
- detachUeMoveRegions2g3gEnable - Detach UE move regions 2G3G enable - Yes - feature 'detach ue move regions is enabled for 2g3g. no (default) - feature 'detach ue move regions is disabled for 2g3g.
- detachUeMoveRegionsLteApnSustOrDel - Detach UE move regions LTE APNs sustained or deleted with delay - MME feature with enhanced APN specific functionality for detaching UEs when moving between regions in LTE. The enhanced functionality enables defining two specific APN lists. One list defining APN(s) or which the PDN(s) are sustained despite of the UE moving between regions (=detaching is disabled), and the other list defining APN(s) for which the PDN(s) are deleted only when no dedicated bearer(s) exist (=detaching is delayed). This feature is only functional when the basic feature for detach UE move regions is enabled for LTE (detachUeMoveRegionsLteEnable).
- detachUeMoveRegionsLteEnable - Detach UE move regions LTE enable - Yes - feature 'detach ue move regions is enabled for lte. no (default) - feature 'detach ue move regions is disabled for lte.
- detachUeMoveRegionsMonitorTime - Detach UE move regions monitor time - Time slice for monitoring the number of detaches per UE due to move across regions. if the number of detaches for a given UE exceed 'Detach UE Move Regions Threshold' during this time slice, the CMM will NOT detach the UE for 'Detach UE Move Regions Suppress Time' minutes.
- detachUeMoveRegionsSuppressTime - Detach UE move regions suppress time - Time duration in which the WMM will suppress a UE detach due to move across regions. this is in order to prevent frequent detaches of a UE that is ping-ponging between two regions.
- detachUeMoveRegionsThreshold - Detach UE move regions threshold - Threshold for number of UE detaches due to move across regions. if threshold is met within 'DETACH UE MOVE REGIONS MONITOR TIME' then detach suppression kicks in for a given UE.
- detachUponSrMbrTimeout - Detach upon SR MBR timeout - Detach immediately upon service request modify bearer response timeout.
- diameterIgnoreUnknownAvp - Diameter ignore unknown AVP - Ignore unknown AVPs from HSS?.
- diameterMsgCiotPriority - Diameter CIOT message priority - Use message priority when handling cellular internet of things diameter messages.
- diameterMsgPriority - Diameter message priority - Use message priority when handling diameter messages.

- **disableMmeRateControlExecute** - disable ratue control execute/drop in MME - There are be different count between MME and GW for the packet for the downlink rate control. This has been noticed from testing with CMG for IPv6. This parameter is introduced to give operator choice, to disable MME drop more packets than already did by GW.
- **discoverMme** - Discover MME - Indicates whether or not (YES or NO) to use a DNS query to obtain a list of MME IP addresses for handling a given TAI. if set to yes, the S10 interface managed objects (MOs) are created dynamically. if set to 'no', the S10 interface MOs are created from provisioned data and are deleted when this provisioning data is removed from the system.
- **discoverMmeEnh** - Discover MME Enhancement - Parameter controls reselection of another MME if the response from the target MME times out or the first choice per DNS records is unavailable. By default the flag shall be set to No. When flag is set to Yes, MME shall select 2nd S10 link if the first choice (per DNS records) is unavailable or if the response from the target MME times out.
- **discoverSgw** - Discover SGW - Indicates whether or not (YES or NO) to use a DNS query to obtain a list of SGW IP addresses for handling a given TAI. if set to yes, the S11 interface managed objects (MOs) are created dynamically. if set to 'no', the S11 interface MOs are created from provisioned data and are deleted when this provisioning data is removed from the system.
- **discoverSrvccMsc** - Discover SRVCC MSC - Indicates whether to discover the MSC's SRVCC IP address via DNS. the default is no, indicating that the IP address must be provisioned.
- **discoverTaiDefaults** - Discover TAI Defaults - Feature activation for default TAC Mapping to TA Discovery Provisioned Parameters
- **discoverTais** - Discover TAIs - Enable WMM to discover non-provisioned TAIs.
- **dlBufferingPacketCount** - DL buffering suggested packet count - Downlink buffering suggested packet count.
- **dltPrevPdnConnOnNewReq** - Delete previous PDN connection on new request - This flag determines the call flow of a PDN connectivity request where a UE already has PDN connection. no (default) - the current call flow is used. when an additional PDN connection request is received after attach the MME checks to see whether there is already a PDN connection to the network specified by the APN in the request. when the received APN is the same as the APN of a PDN connection that has already been established for the given UE, the MME sends a PDN connectivity reject with cause code 55. yes - instead of sending a PDN connectivity reject the MME will first delete the previously established PDN connection and then honor the subsequent PDN connection request. note that if the PDN connectivity request with APN=x is for a UE with only one already established PDN connection and that connection is for APN x, the MME would have to reject the PDN connectivity request as is currently done.
- **dualConnectivity** - Dual connectivity - Enable/disable dual connectivity feature.

- **e911apnNiForMode1pgwSelection** - E911 APN NI for mode 1 PGW selection - If set to yes, MME will support the use of the E911 APN NI for the mode 1 selection of PGW for emergency attach and also PDN connection request to E911. if set to no, MME will default to using the S-NAPTR procedure to select a PGW.
- **edrxEpochLeapSeconds** - eDRX epoch leap second - Number of leap seconds that have occurred since the eDRX epoch time.
- **edrxEpochTime** - eDRX epoch time - Starting point in time of counting H-SFN for calculation of eDRX paging opportunities. Any valid past date (YYYY-MM-DD) and time (HH:MM:SS) in GMT can be entered.
- **edrxMaxPagingHoldTime** - eDRX maximum paging hold time - Maximum time interval (in milliseconds) that the MME will hold a call processing procedure.
- **edrxNewLeapSecondTime** - eDRX new leap second time - The date and time when an additional leap second will occur.
- **edrxNotifyHssTime** - eDRX notify HSS time - Time interval (in milliseconds) prior to the eDRX paging send time that the MME should send the notify command to HSS when handling a pending SMS request for an idle UE with eDRX enabled. this parameter is set to account for the time needed for the SMS service center to be informed of the UE's availability and the resulting SGS paging request to be sent to the MME.
- **edrxPagingSendTime** - eDRX paging send time - Time interval (in milliseconds) before paging time window (PTW) start time that the MME should start sending the S1AP-PAGING messages to the eNB. this parameter is set to account for small time synchronization differences between the MME and the eNB.
- **emergency5gslwkWoN26** - Emergency 5GS Interworking Without N26 - Enables emergency session to be handed over between 5GS and EPS without N26 interface in the MME. Applied when EPS-5GS Interworking without N26 is set to Yes for the MME.
- **emergencySimlessUeOverride** - Emergency SIMless UE override - Emergency SIMless UE override when set to yes MME will accept emergency attach from SIMless UEs from any TAI served by the MME irrespective of emergency provisioning per TAI.
- **emergencyWlanHo** - Emergency WLAN Handover - This parameter controls the support for IMS emergency session continuity for handovers between LTE access and WLAN for authenticated home subscribers. When supported, the MME receives WLAN access selected PGW information from HSS, and on handover to LTE the same PGW can be selected. When an emergency call is initially started on LTE access, the MME also registers via NOR the selected PGW to HSS to be possibly handed over to WLAN access.
- **emerMtLrNoEsmLc** - Emergency MT-LR do not contact E-SMLC for UE location information - If yes, when the MME receives mobile terminated location request with emergency client type or MT-LR with any client type while an emergency call is ongoing, the MME contacts the eNB for UE current E-CGI information. this information is sent back to the GMLC. the MME does not contact the E-SMLC to obtain any UE location information.

- **empsAdvancePriority** - EMPS advance priority - Enable the detection of advance priority eMPS users and eMPS IMS priority users (Non advance priority users).
- **empsDscp44Marking** - EMPS DSCP 44 Marking - Enable the ability to mark eMPS S11 and S10 messages with a provisionable DSCP value. Enabling the eMPS DSCP 44 Marking global parameter shall be denied if the eMPS Advance Priority global parameter is disabled. Disabling the eMPS Advance Priority global parameter shall be denied if the eMPS DSCP 44 Marking global parameter is enabled
- **empsPriorityOnlySubscriptionBased** - eMPS Priority Only Subscription Based - When set to Yes, enables MME to provide eMPS priority for UEs that have HSS subscription indicating MPS-EPS-Priority bit set on the MPS-Priority AVP. MME does not check other parameters for UEs that have MPS EPS functionality enabled on (on MME local provisioning on service agreement profile) and MPS-EPS-Priority bit set on the HSS subscription.
- **empsPrioToHss** - eMPS Priority to HSS - MME treats with priority any signal it receives with RRC establishment cause indicating priority. If set to no, MME only treats with priority a UE that additionally either has priority HSS subscription or a bearer is established with a priority ARP value.
- **enable2gBvccountIndb** - Ability to store BVC counts DB.
- **enable2GdataJumboFrame** - Enable 2G data Jumbo frame - This parameter enables the 2G data Jumbo Frame
- **enable2gEnhancesgblb** - Ability to load PAPSS using the number of BVCs assigned to NSEs.
- **enable2gUsrdataSafetynet** - Ability for WMM to detect 2G user data throughput safety net breach and throttle 2G attaches and PDP activations. 2G allowed user data throughput is 145000000 bits/sec.
- **enable3GdataJumboFrame** - Enable 3G data Jumbo frame - This parameter enables the 3G data Jumbo Frame
- **enableAlarmEventsStream** - Enables Alarm Events streaming via fluentd for CNF deployment
- **enableCacheAgeOut** - enable Cache Age Out feature - If the enableCacheAgeOut value is set to Yes the Cache Age Out feature uses defined Quiet-period-timers per UE Class. These timers are used to manage the CPPS cache. By default the enableCacheAgeOut is set to NO, the feature is by default disabled.
- **enableCallTraceBuffering** - Enable Call Trace Buffering - Enables the buffering of Call Trace messaging before IMSI/SUPI is known.
- **enableCapdegradeOn2gciphering** - Ability to downgrade WMM 2G capacity by 20% when 2G ciphering is on.
- **enableCpuBasedControlOnly** - Whether or not WMM performs overload control based on CPU only or take into account message rate and storm rate for controls.

- enableEffectiveloadSnalgo - Enable effective load snalgo.
- enableLocalRoamerQciArpOvr - Enable local roamer QCI ARP override - Enable local roamer QCI ARP override whereby skipping QCI and ARP override parameters for dedicated bearers in case of LBO traffic.
- enableLocalRoamerQosPolicy - Enable local roamer QoS policy - Enable local roamer QoS policy.
- enableLogEventsStream - Enables Log Events streaming via fluentd for CNF deployment
- enableMmeOverloadBackoffTimer - Enable MME overload backoff timer - This flag is used to enable the capability of MME to include a randomly-selected T3346 timer value whenever an attach request, TAU request, service request, or extended service request procedure is rejected due to IPDS CPU overload, CPPS CPU overload, or CXN object overload. no (default) - set the T3346 back-off timer to 0. yes - set the T3346 back-off timer to a randomly-selected value between provisioned minimum and maximum values.
- enableOLCContextDump - Whether or not WMM dumps service context data during overload report.
- enableOlcSchddelayDegrade - Whether or not VMM capacity should be degraded on scheduling delay.
- enableOldGutiPaging - Enable old GUTI paging per MME - Enable old GUTI paging per MME.
- enablePra - Enable presence reporting area - Enable MME support for presence reporting of an UE entering or leaving an area.
- enablePrometheusGW - Enable Prometheus Functionality - This parameter controls whether Prometheus functionality is enabled in the system. This means that this gParm does not control the way the PM data are sent/retrieved from Prometheus (i.e. sent via Prometheus Push GW or retrieved directly from Prometheus). This would be specified via a another gParm that is named Prometheus Mode.
- enableProvCc - Enable provisional cause code - Enable MME support for configurable or provisional cause code functionality.
- enablePsmT3412MinTime - Enable use of PSN T3412 Min Time - This parameter enables/disables the feature CMM support for Minimum T3412 Timer for UE Supporting Power Savings Mode'. By default the feature is disabled.
- enableRejectIdrepslocinfoOnol - Enable/Disable reject IDR with EPS location info request during overload.
- enbToSgwIpv4v6TransportLayerAddress - eNB/gNB IPv4v6 Transport Layer Address IP Type - MME passes eNB/gNB S1-u IPv4v6 Transport Layer Address to the SGW if it received this IP Type from eNB/gNB and this parameter is set to YES. Otherwise MME matches S1-C IP Address Type and passes it to the SGW.

- **enhancedAlternateGwReselection** - Enhanced Alternate GW Reselection - Defines whether the MME reselects an alternate SGW or PGW during the same procedure in defined error cases. Setting this parameter to 'Yes' requires that gParm supportAlternateGwReselection is also set to 'Yes'. MME reselects an alternate PGW during Attach and PDN Connectivity procedures when SGW returns cause code 72 (System failure), 78 (Missing or unknown APN), 84 (All dynamic addresses are occupied) or 91 (No memory available) and the cause source indicates PGW. MME also reselects an alternate PGW when SGW returns cause code 100 (Remote peer not responding) and cause source indicates SGW. MME reselects an alternate SGW during Attach and mobility procedures when SGW returns cause code 72 (System failure) or 91 (No memory available) and cause source indicates SGW.
- **enhancedPgwlIsolation** - Enhanced PGW Isolation - Defines whether the MME isolates PGW during additional cases. Enabling this parameter requires gParm ltePgwlIsolation to be set to 'Yes'. MME considers PGW related errors for PGW isolation functionality additionally to the legacy functionality when SGW returns error code 73 (No resources available), 91 (No memory available) or 100 (Remote peer not responding) and cause source indicates PGW. MME also considers SGW returned error for PGW isolation functionality when SGW returns error code 100 (Remote peer not responding) and cause source indicates SGW.
- **enhancedSgwIsolation** - Enhanced SGW Isolation - Defines whether the MME isolates SGW during additional cases. Enabling this parameter requires gParm lteSgwIsolation to be set to 'Yes'. MME considers SGW related errors for SGW isolation functionality additionally to the legacy functionality when SGW returns error code 73 (No resources available) or 91 (No memory available) and cause source indicates SGW.
- **enhancedSgwRestorationProcedures** - Enhanced SGW restoration procedures - Support enhanced SGW restoration procedures or not.
- **enhancedSGWselectionIRAT** - Enhanced SGW selection for IRAT mobility - Enable/Disable support enhanced SGW selection for IRAT mobility per MME.
- **enhApnCorrectionPerImsi** - Enhanced APN Correction per Imsi - Parameter controls when the rejection cause code shall be sent by MME. By default the flag shall be disabled, when enabled MME during an Attach or PDN Connectivity Request, if the APN received from the UE, is not an HSS provisioned APN and is not in locally configured in the MME correction/replacement table, MME shall reject the procedure with cause code 'Requested service option not subscribed'. In addition if the APN received from the UE, is locally configured in MME APN correction/replacement table but correction comes back with APN which is not an HSS provisioned APN. (In other words, even after correction the APN must be subscribed or it will be rejected) Feature shall be enabled when apnlist table is enabled.
- **ePlmnPerImsiTaiRange** - EPLMN per IMSI Range - MME uses the EPLMN list provisioned per IMSI and TAI range if the parameter is set to 'True'.
- **eps5gslwkWithoutN26** - EPS-5GS Interworking without N26 - Enables the EPS-5GS interworking without N26 interface support in the MME.

- **epsInfoInUlr** - Support of EPS info in ULR - When parameter is YES, EPS info is supported in updateGprsLocation message, otherwise it is not supported
- **epsNasSecurityContextInclusion** - EPS NAS Security Context Inclusion - Parameter controls inclusion of NAS security context at the end of MM Context IE. By default, flag shall be disabled. When enabled, MME will include NAS security context at the end of MM Context IE to indicate the mapped or native security context during the MME-1 to MME-2 reallocation
- **eutranSupportedRatType** - Eutran supported RAT type - Configure eutran supported RAT type. values are both, wbeutran and Clot.
- **exclDelayDlPktNotifReq** - Exclude delay downlink packet notification request - Control the inclusion of the delay downlink packet notification request.
- **excludeDestinationHost** - Exclude destination host - Enable or disable exclusion of destination host for S6ad and S13 interfaces.
- **excludeNbiotDrbCheckForCpCiot** - Exclude NB-IoT Check on DRB for CP Clot - The MME will not consider the NB-IOT UE support of multiple DRBs when the UE requests to set up a subsequent CP Clot bearer.
- **excludeUIExceptionReports** - exception reports are excluded from rate limit - By default MME rate control applies all packets. With this parameter is set, Mo exception data packet will be excluded in the rate limited (not count)
- **excludeVendorSpecificApplicationId** - Exclude vendor specific application id - Enable or disable exclusion of exclusion of vendor specific application id for S13 interface.
- **extendEmmCauseIe** - Extend EMM cause IE - Enable inclusion of extended cause IE in attach reject and TAU reject messages with EMM cause #15.
- **fallbackToDefaultApnOi** - Fallback to default APN-OI - Activate fallback to use of default APN-OI in NAPTR query if NAPTR query with APN-OI replacement fails.
- **fiveGcNotRestrictedIndicationSupport** - 5GC Not Restricted Indication Support - Parameter controls the support for 5GCNRI and 5GCNRS indication flags in create session request message. By default, the flag shall be disabled.
- **fmKafkaStream** - Kafka Stream for the Alarm Functionality - This parameter controls the option to stream the Alarms to an external KAFKA cluster. When this parameter is set, the Alarms would be streamed to a specific topic and broker of an external KAFKA cluster.
- **fnsBckpSrvrHbNoRspns** - FNS Backup Server No Responses to heartbeat message - If MME does not receive responses to the heartbeat messages for consecutive number of times specified by this parameter then MME declares the link is not available and generates a major alarm.
- **fnsBckupServer** - FNS Backup Server - Global parameter to enable support of FNS backup server. If the parameter is set to 'true' then CMM establishes TCP connection to the provisioned backup server and start updating the UE context.

- **fnsBckupSrvrHbTimer** - FNS Backup Server Heart Beat Timer - Parameter specifies the heart beat interval to the FNS backup server.
- **fnsBckupSrvrRspTimer** - FNS Backup Server Response Timer - Time to wait for FNS backup server response after sending a request to the server.
- **fnsBckupSrvrUpdateType** - FNS Backup Server Update Type - Parameter to specify which UE context needs to be stored on the FNS backup server.
- **fnsInMmePool** - FNS IN MME Pool - This parameter is used to indicate whether FNS MME and CMM MME are in the same pool. The parameter will be used by CMM uelb command directed move to FNS to make the CMM UELB is compatible with FNS directed move.
- **forcePgwReselectionOnCsRequestTimeout** - Force PGW reselection on CS request timeout - If set to yes, mme shall select an alternate PGW if there is no response to the create session request. the number of attempts to select PGW remains the same. the feature only applies to GW selection mode 2. the applicable procedures are attach and subsequent PDN connectivity request.
- **fourDigitMncMccSuppt** - Four Digit MNC MCC Support - The parameter controls whether four digit MNC and MCC is used in RAI and RNCid pre-REL8 DNS queries for Gn-SGSN. By default the parameter shall be disabled.
- **freqCountMonitoring** - Frequency Count Monitoring - Enables the MME functionality to monitor the frequency count of UE attempts for defined procedures.
- **freqCountMonitoringMtAccess** - Frequency Count Monitoring MT Access - Defines whether the MME, while frequency count monitoring functionality is activated, allows the Mobile Terminated Access for the UEs. If the UE is blacklisted but not yet implicitly detached, the network may page the UE due to e.g. incoming downlink data and the UE may trigger Service Request/Extended Service Request/Control Plane Service Request due to that. When MT access is allowed, MME does not increment procedure attempt counter for MT access attempts.
- **freqCountMonitoringSecurity** - Frequency Count Monitoring Security - Defines whether the MME increments procedure frequency count before or after running any of the security procedures (especially integrity check).
- **fullPgwApnGtpOvlControlSupport** - Full PGW APN or Node Level Overload Control Support - Defines whether the MME supports PGW indicated overload. -PGW Overload Control Information IE containing APN list on GTPv2 messages, when APN is congested on a PGW. -Back-off Time IE on Create Session Response when PGW rejects the request due to APN congestion.
- **gea1Degradation** - GEA1 degradation - GEA1 degradation percent. Warning: For Nokia personnel only.
- **gea2Degradation** - GEA2 degradation - GEA2 degradation percent. Warning: For Nokia personnel only.
- **gea3Degradation** - GEA3 degradation - GEA3 Degradation percent. Warning: For Nokia personnel only.

- **ggsnLbMode** - GGSN Load Balancing mode - Set the corresponding mode for GGSN Load Balancing
- **gmlcOverlappingLocationRequests** - GMLC overlapping location requests - Enable/disable GMLC overlapping UE location requests.
- **gnSgsnSnaptr** - Gn SGSN SNAPTR - None: gn-sgsn will not use S-NAPTR. pgw-ggsn: gn-sgsn will use S-NAPTR only for allocation of a co-located pgw-ggsn. all: gn-sgsn will use S-NAPTR for all FQDN resolutions.
- **gnSgsnSrv** - Gn SGSN SRV - None SRV RR only for pgw-ggsn selection.
- **gnTargetIdFormat** - Gn target id format - Determines how it encodes and decodes the target identification IE when the MME is sending a GTPv1 (Gn) message.
- **gprsSubscriptionData** - GPRS subscription data - Request the HSS to include GPRS subscription data in ULA if available.
- **gtpLoadControlSupport** - GTP load control support - GTP load control support.
- **gtpOvlControlSupport** - GTP OVL control support - Support for GTP overload control.
- **gwGtpOvlControlSupport** - GW GTP OVL control support - Support for GTP overload control from gateways to MME.
- **gwSelectionMode** - Gateway selection mode - Select PGW topologically close to selected SGW or topologically close SGW and PGW pair.
- **gwSelectionModeForSgsn** - SGW PGW Selection Enhancement for SGSN - This parameter controls the S/P -GW pair selection for S4-SGSN. When the parameter is GW Selection Mode 1 then the SGW priorities are taken into consideration for selecting the appropriate S/P -GW pair. When the parameter is GW Selection Mode 2 then the PGW priorities are taken into consideration for selecting the appropriate S/P -GW pair.
- **gxInterfacesNetworkAnsiSs7** - GX interfaces network ANSI SS7 - This flag configures the SS7 protocol type 'ANSI' or 'ITU' for the m3ua-network(s) of the gx (i.e. gr, gf, ge, gd) interfaces. when multiple m3ua-networks are defined for the gx interfaces, the protocol type must be the same across all the m3ua-networks.
- **highCapacityIHspa** - High Capacity iHSPA - When set to 'No' it is possible to create a total sum of 512 iHSPAs and RNCs When set to 'Yes' it is possible to create a total sum of 8192 iHSPAs and RNCs (of which only up to 512 may be RNCs)
- **homeDomainName** - Home domain name - Home domain name.
- **homogeneousIMSSupportAVP** - Whether or not WMM includes homogeneous IMS support AVP in ULR and NOR.
- **homogeneousSupportNblotTas** - Homogeneous support NB-IoT TAs - Controls whether the MME includes Tracking Areas supporting NB-IoT Radio Access Technology when evaluating Homogeneous support of Voice over PS sessions towards the HSS. Yes - NB-IoT TAs are included when evaluating Homogeneous support of IMS Voice over PS

sessions No - NB-IoT TAs are not included when evaluating Homogeneous support of IMS Voice over PS sessions

- homogeneousSupportTais - Homogeneous Support TAs - Defines whether MME includes IMS Voice over PS of the serving PLMN TAs or all TAs MME globally (serving PLMN and shared PLMN TAs) when evaluating homogeneous IMS voice over PS support towards the HSS.
- homogeneousVopsSrvccCapa - Homogeneous Voice over PS SRVCC Capability - MME provides Homogeneous-Support-of-IMS-Voice-Over-PS-Sessions towards HSS according to specific requirements: TAs support for IMS voice over PS (separate activation parameter controlling whether to include all TAs MME globally, or all TAs on the serving PLMN), voice over PS support for the UE (on svcAgreementProfile) and checking or not checking the UE SRVCC capability (separate parameter on svcAgreementProfile).
- hssInitiatedCallTrace - HSS initiated call trace - Support HSS initiated call trace or not.
- hssNorReduction - HSS NOR reduction - When set to yes: if MME selects the same PGW as in ULA/IDR from HSS, MME does not send NOR to HSS. when set to no: MME sends NOR to HSS for this case.
- hssRestorationMode - HSS Restoration Mode - Defines how HSS restoration is performed after HSS unavailability. The HSS restoration should only be enabled i.e. set to values other than 'HssRestorationNone' with MME only configurations.
- hssUlrReduction - HSS ULR reduction - When set to yes: if UE attaches with valid local GUTI and MME has IMSI and subscription data, MME does not send ULR to HSS. when set to no: MME sends ULR to HSS for this case.
- hssUnavailabilityContinueN26 - HSS Unavailability Continue N26 - Defines whether the MME continues the procedure when HSS is unavailable and the UE moves from 5GS via N26 to the MME, and the MME has available security context or mapped security context and thus the MME is able to continue serving the UE without new authentication on EPS.
- hssUnavailFailedPercentTriggerBlacklisting - HSS unavailable failed percentage triggering blacklisting - Percentage of failed MME attempted dialogs triggering blacklisting.
- ignoreSGSapMMInfo - IgnoreSGSapMMInfo.
- imeiOperatorPolicyAccessRestriction - IMEI Operator Policy Access Restriction - Enables IMEI based operator policy for access restrictions based on provisioned criteria.
- imeiOperatorPolicyAuthenticationDisabled - imeiTac Based Authentication - authentication to be enabled/disabled for a particular TAC, whereas entire network it might be running. Similarly based on TAC, IMSI Combination.
- imeiOperatorPolicyEirCheckDisabled - IMEI Operator Policy EIR Check Disabled - Enables IMEI based operator policy to disable EIR check of UEs matching the provisioned criteria.

- **immediateLrrDuringMtLr** - Immediate LRR During MT-LR - If the MME needs to send a LRR related to an emergency call event and there is an ongoing MT-LR procedure, this parameter controls whether the LRR is to be sent immediately when the event occurs or later after the MT-LR procedure completes. When enabled, the LRR is sent immediately.
- **imsEmergencySupportIndication** - IMS emergency support indication - Enable/Disable IMS voice enabled check for IMS emergency support indication.
- **imsilmeiLookupFail** - IMSI IMEI Lookup Fail - Parameter **imsilmeiLookupFail** controls APN Override feature with the values 'UseDefault and Reject. By default this parameter shall be disabled.
- **imsiPagingInAllMmeServingAreas** - IMSI paging in all MME serving areas - Allow IMSI paging in all MME serving areas?.
- **inclEmerNumListImsAllowed** - Include Emergency Number List When IMS Allowed - Parameter controls whether MME includes the UE the Emergency Number List for a UE that has EPS-Network-Feature-Support with IMS-voice-over-PS allowed, but EPS-Network-Feature-Support emergency call is not allowed on the MME. When Emergency Number list is included it uses the Serving PLMN Emergency Profile information for the Emergency Number List.
- **inclExt2InEPSQoSIEs** - Include extended 2 in EPS QoS IEs - Enable/Disable inclusion of extended-2 octets in EPS QoS IEs.
- **inclExt2InNegotiatedQoSIEs** - Include extended 2 in negotiated QoS IEs - Enable/Disable inclusion of extended-2-octets in R99 negotiated QoS IE.
- **includeActiveApnAvpInUlrAfterRsr** - Include active-apn AVP in ULR after RSR - Include active-apn AVP with PGW information in ULR after RSR.
- **includeEcgidPlainFailure** - Include ECGID in PLA in failure - Supports inclusion of ECGID in PSLR even if MME as not able to get UE location.
- **includeExtUeIndexInPagingMsg** - Include Extended UE Identity Index in PAGING message - If this parameter is set to 'Yes' then the MME shall include the Extended UE Identity Index IE in PAGING messages.
- **includeHrlAlways** - Include Handover Restriction List Always - When enabled, MME shall include the Handover Restriction List IE in S1AP messages irrespective of EPLMN, forbidden TA or forbidden LA provisioning. If EPLMN and forbidden TA and LA are not provisioned then MME shall only include the serving PLMN IE in the HRL IE.
- **includeMapped3gppQciToUe** - Include mapped 3GPP QCI value to UE - When set to yes, the 3GPP QCI value mapped from the operator defined QCI value will be included in the activate default bearer context request, activate dedicated bearer context request, and modify bearer context request messages sent to the UE. this applies to both default and dedicated bearers.
- **includeMappedGummei** - Include mapped GUMMEI - This command is only applicable for WMM deployed as a combo. this command enables/disables inclusion of the mapped GUMMEI in S1-AP S1 SETUP RESPONSE message and S1-MME CONFIGURATION UPDATE

message. the inclusion of the mapped GUMMEI facilitates eNB to select the same physical node supporting the combo MME/SGSN when UE is moving between 2G/3G and LTE area served by the same combo MME/SGSN.

- **includeNblotSmsServiceStatus** - Include CIOT SMS service status - Include SMS services status IE in attach accept and TAU accept message if MME fails to set up SMS for CIOT UEs and MME only accepts EPS attach only.
- **includeNeighborListInTaiList** - Include neighbor list in TAI list - Indicates whether the MME includes (Yes) the provisioned set of neighbor TAIs in the list of TAIs that is sent to the UE when the UE registers at the MME (Attach or TAU). if this parameter is set to 'No', the MME only includes the last seen TAI in the list of TAIs sent to the UE.
- **includeRanapTli** - Include RANAP TLI - Enables RANAP TLI in RAB assignment request to RNC triggered by GGSN PDP context modification.
- **includeServingNetworkS11ie** - Include serving network S11 IE - BSM to control whether the serving network IE is included in the modify bearer request when the PLMN has changed.
- **includeServingPlmnRateControl** - support Serving Plmn Rate Control function - With this parameter enable, Serving PLMN Rate Control will be supported
- **includeT3448Timer** - include T3448 timer in overload situation - support T3448 timer for overload control with limited data transfer. T3448 used for limited UE transfer data over CIOT Control Plane Optimization during timer run. With this parameter, T3448 is allowed to be used in CMM.
- **includeUliCrSessModBrr** - ULI Inclusion in Create Session And Mod Brr Msg - Parameter controls inclusion of 'ULI for SGW' IE in Create Session and Modify Bearer Request message that is sent to SGW. By default, the flag shall be set to Yes. When flag is set to 'No', MME will not include the IE in Create Session and Modify Bearer Request message that is sent to SGW.
- **includeUliForSgsn** - Include ULI for SGSN - This flag is used to enable/disable inclusion of the user location information IE in associated GTP messages over the Gn interface to the GGSN. no - indicates that the ULI IE is not included. yes (default) - indicates that the ULI IE is included.
- **inhibitPeerSrsResponses** - Inhibit Peer SRS Responses - This parameter provides the ability on the NR10 client side to inhibit NR10 responses from being sent by the peer NR10 server. When set to true, responses to update requests and delete requests are inhibited. This parameter applies to both AMF and MME NR10 functionality.
- **initialAttachIndicationInUlr** - Initial attach indication in ULR - Initial attach indication flag.
- **interPlmnTauAttach** - Inter PLMN TAU attach - If it is set to yes then MME shall check per PLMN provisioning whether inter-plmn S10/S3/Gn message can be sent. by default, the feature is disabled.

- **ipAddrInclusion** - IP Address Inclusion - Parameter controls inclusion of same IP address type as the destination address used in the IP header in the Create Session Request message. By default, the flag shall be disabled.
- **ipv4v6sgsn** - IPv4v6 SGSN - A value of yes indicates release 8 SGSN and above. a value of no indicates pre-release 8 SGSN.
- **ipv6SelectionAllowedOnGn** - IPv6 Selection Allowed on Gn - Use this parameter to allow IPV6 support on Gn-C.
- **iratGnMobilityQoSParametersUpdate** - IRAT Gn mobility QoS parameters update - Indicates whether MME sends modifybearercmd to SGW at the end of TAU when QoS parameters in S6ad ULA are different than those in Gn contextresponse.
- **iratMobilityWithOtherPLMNAllowed** - IRAT mobility with other PLMN allowed - IRAT mobility with other PLMN allowed.
- **iratS3mobilityQoSParametersUpdate** - IRAT S3 mobility QoS parameters update - Indicates whether MME sends modifybearercmd to SGW at the end of TAU when QoS parameters in S6ad ULA are different than those in S3 contextresponse.
- **iuAlgsSelection** - new algs support in lu interface - Customer is claiming that UIA1 and UEA1 is compromised already, thus, supporting UIA2 and UEA2 in 3G is needed. The parameter will control to use a configured preference list of algs or not. If the parameter is setting to Yes, then a preference list of algs needed to be configured by customer, SGSN will based on both UE capability and configured preference list to inform RNC the selected algs. If the parameter is set to No, then existing function is unchanged i.e. continue with UIA1/UEA1.
- **keepGbrWhenEnbFails** - Keep GBR when eNB fails - Indicates whether (Yes), or not (No), all the GBR bearers associated with an eNB are deactivated when the S1-MME link to that eNB fails.
- **keepGbrWhenPagingFails** - Keep GBR when paging fails - Indicates whether (Yes), or not (No), the GBR bearers of the UE are deactivated if paging fails to locate the UE.
- **keepSameSgw** - Keep the Same SGW - Keep the Same SGW during IRAT Mobility from 4G (in case of SGSN)
- **keepUpClotUeS1Bearer** - Keep UP ClOT UE S1-U bearer - Enable keeping of a S1-U bearer of a UE supporting UP ClOT moves into a TAI that does not support UP ClOT optimization and S1-U data transfer.
- **lawfulInterceptMtLrNoEsmlc** - lawful Intercept MT_LR no E-SMLC - This is for MT_LR client type lawful Intercept service do not contact E-SMLC for UE location information. If yes, when MME receives mobile terminated location request with client type=lawfulInterceptService, and activateLcsClientTypeLawfulInterceptServices is set, the MME contacts the eNB for UE current E-CGI information. This information is sent back to the GMLC. The MME does not contact the E-SMLC to obtain any UE location information. If no, nothing changes and keep existing function (i.e. MME contacts E-SMLC to obtain UE location)

- **lcsapNumberOfResetsWithoutAckForAlarm** - LCSAP number of resets without ack for alarm - LCSAP number of resets without ack for alarm.
- **limitS1apConnEst** - Limit S1AP conn est - The parameter is used to limit the sending of the S1AP CONNECTION ESTABLISHMENT INDICATION message to establish UE-associated logical S1-connection if the logical connection is already established. the UE-associated logical S1-connection would be established by the MME if the MME sends S1AP DOWNLINK NAS TRANSPORT before sending the S1AP CONNECTION ESTABLISHMENT INDICATION message.
- **linkAlarmCustomize** - Link alarm customize - If the global parameter is set to 'Yes', customized severity levels in the linkalarmcfg is used to set the alarm severity for links and interfaces. if the global parameter is set to 'No', customization of link alarm severity is not supported.
- **localImeiTacRejectionList** - Local IMEI-TAC Rejection List - Enables the functionality to provision IMEI-TAC rejection list locally in the MME. When a UE whose IMEI-TAC is included in the list attempts to attach in the MME, the MME rejects the attempt with a provisioned EMM cause code.
- **locallyProvisionedSgwPgw** - Locally provisioned SGW or PGW - Test switch to provision sgw idx in range from 241 to 256.
- **locallyProvisionedSgwPgwTopon** - Locally provisioned S/PGW Topological Selection - Enables topological S/PGW selection for locally provisioned S/PGW.
- **locationReportingForUeWithLppsSupportOnly** - Location reporting for UE with LPP support only - This flag indicates whether LCS will be supported for UEs with or without LPP capability. when flag is enabled only UEs that indicated LPP support can perform LCS procedure. this flag is used in conjunction with the other LCS feature activation fields. those fields apply as well. UE indicates support of LPP capability in the UE network capability IE of the attach request and/or TAU request message.
- **logEcgiReceivedInWriteReplaceWarningMessage** - Log ECGI Received In Write Replace Warning Message - Parameter controls feature activation GPARM flag. By default, flag shall be disabled. When enabled, MME shall log eCGI that is received in Write-Replace-Warning-Response Message from eNB.
- **longestGtDigitsMatch** - Longest GT Digits Match - This parameter allows or denies whether the SCCP is able to route on the longest GT digits match
- **lowPriorityAccess** - Low priority access - Activate the low access priority capabilities on MME.
- **lowPriorityTrafficDdnThrottling** - Low priority traffic DDN throttling - Throttling of DDN requests for the low priority traffic.
- **lraUli** - LRA ULI - Enable/Disable LRA-ULI.
- **ltePgwIsolation** - LTE PGW isolation - Setting to yes enables PGW isolation feature on MME. setting to no disables PGW isolation feature on MME.

- lteSgwIsolation - LTE SGW isolation - Setting to yes enables SGW isolation feature on MME. setting to no disables SGW isolation feature on MME.
- maintainErab - Maintain ERAB - When set to yes, MME will maintain E-RAB that are not successfully switched in the core network during the E-RAB modification indication procedure. when set to no, MME will release/delete e-rab that are not successfully switched in the core network during the E-RAB modification indication procedure.
- maskedImeIsV - Masked IMEISV - Masked IMEISV in S1AP messages.
- maxCid - Max CID - Max CID.
- maxEcgiAgeEmerMtLrNoEsmlc - Maximum time interval in seconds for requesting eCGI for emergency MT-LR - If the parameter is set to 0 with the global feature activation parameter emermtlrnoesmlc is yes, MME page ECM-IDLE UE and send eCGI information or send location-reporting control information for ECM. if the parameter is set to a non-zero value, when MME gets MT-LR request, MME will check the difference between MME stored eCGI timestamp of the UE and time received MT-LR. if the time difference is less than provisioned value, then the MME reports stored eCGI information to GMLC. if time difference is greater than the provisioned value, then MME will request current eCGI either via paging or location report control depends UE status.
- maxEcgiAgeLawfulInterceptMtLrNoEsmlc - Max eCGI age lawful intercept MT_LR_no E-SMLC - Maximum time interval in seconds for requesting eCGI for lawful intercept MT-LR. If the parameter is set to 0 with the global feature activation parameter lawfulInterceptMtLrNoEsmlc is yes, MME page ECM-IDLE UE and send eCGI information or send location-reporting control information for ECM_connected UE. if the parameter is set to a non-zero value, when MME gets MT-LR request, MME will check the difference between MME stored eCGI timestamp of the UE and time received MT-LR. if the time difference is less than provisioned value, then the MME reports stored eCGI information to GMLC. if time difference is greater than the provisioned value (or equal provisioned value), then MME will request current eCGI either via paging or location report control depends UE status
- maxEcgiAgePlmnOperMtLrNoEsmlc - Max eCGI age PLMN operator MT_LR no E-SMLC - Maximum time interval in seconds for requesting eCGI for PLMN Operator MT-LR. If the parameter is set to 0 with the global feature activation parameter plmnOperatorMtLrNoEsmlc is yes, MME page ECM-IDLE UE and send eCGI information or send location-reporting control information for ECM_connected UE. if the parameter is set to a non-zero value, when MME gets MT-LR request, MME will check the difference between MME stored eCGI timestamp of the UE and time received MT-LR. if the time difference is less than provisioned value, then the MME reports stored eCGI information to GMLC. if time difference is greater than the provisioned value ((or equal provisioned value), then MME will request current eCGI either via paging or location report control depends UE status
- maxEcgiAgeValueAddedMtLrNoEsmlc - Max eCGI age value added MT_LR no E-SMLC - Maximum time interval in seconds for requesting eCGI for value Added service MT-LR. If the parameter is set to 0 with the global feature activation parameter

valueAddedMtLrNoEsmIc is yes, MME page ECM-IDLE UE and send eCGI information or send location-reporting control information for ECM_connected UE. if the parameter is set to a non-zero value, when MME gets MT-LR request, MME will check the difference between MME stored eCGI timestamp of the UE and time received MT-LR. if the time difference is less than provisioned value, then the MME reports stored eCGI information to GMLC. if time difference is greater than the provisioned value (or equal provisioned value), then MME will request current eCGI either via paging or location report control depends UE status

- **maxEnbsPagedDuringMinorOverload** - Maximum eNBs paged during minor overload - The parameter specifies the maximum number of eNBs paged for a single page attempt when a minor overload condition is present.
- **maxMmeUeRadioCapLength** - Maximum MME Ue Radio Capability Length - Maximum Ue Radio Capability Length Supported on the MME. Default is 8192. Setting this value to 24576 or 49152 enables storage of Radio capability length greater than 8192 bytes in the RCIS if RCIS is available
- **maxNumberWarningAreasEcgi** - Max number warning areas ecgi - Maximum number of warning areas (ecgi) that can be includes in S1AP WRITE-REPLACE WARNING REQUEST or S1AP KIL-REQUEST messages sent to eNB.
- **maxTaRelativeCapacity** - Max TA relative capacity - Used to select to send to the eNB the maximum or minimum MME relative capacity of provisioned MME relative capacities of TAIs supported by an eNB to the eNB in S1-AP SETUP RESPONSE message and in MME CONFIGURATION UPDATE message.
- **mdt** - Minimization of drive tests - Activation/deactivation minimization of drive tests.
- **measInfoldUsage** - measInfold use in PM - This parameter describes the type of measInfold parameter to add to PM files.
- **minFqdnLabelMatching** - Enable applying minimum matching fqdn labels between SGW and PGW fqdn(s) during SPGW pair selection. When gParm is enabled, the MME use configuration from fqdnLabelMatchProfile and fqdnLabelMatchUut to further resolve min fqdn label matching per Service Combination and subscribed UE Usage Type
- **mmeAdditionalMsisdn** - MME Additional MSISDN - GPARM parameter
mmeAdditionalMsisdn controls the support for Additional MSISDN by MME. By default the parameter shall be no. When GPARM parameter mmeAdditionalMsisdn is yes, the MME shall inform HSS that it supports the A-MSISDN feature by setting the corresponding feature bit of the Feature List AVP in the Update Location Request, Insert Subscriber Data Answer and Delete Subscriber Data Answer commands.
- **mmeApnNiExtension** - MME APN NI extension - No (default) - for MME, disable the extension of the APN NI with configurable length of MSISDN digits. yes - for MME, enable the extension of the APN NI with configurable length of MSISDN digits.
- **mmeCpToUpBearerSwitch** - Enable MME Triggered CP to UP Bearer Switch - If this parameter is set, the MME shall proceed to switch CP bearers to UP if DL or UL CP data

packet size exceeds the provisioned threshold (cpDataPktSizeToSwitchCpToUp). If the parameter is not set, the MME shall not switch CP bearers to UP.

- **mmeOverloadMmRejectionNasCc** - MME overload MM rejection NAS CC - EMM NAS cause code to be sent in the mobility management reject messages (Attach reject, TAU reject and service reject) due to any MME overload or throttling of MM procedures. valid values are 2-3,5-26,35,39-40,42,95-101,111 per annex a of TS 24.301.
- **mmeOverloadPlaResult** - MME overload PLA result - Select diameter result to be sent in Slg provide subscriber location answer when MME is in major or critical overload.
- **mmePgwQueryEmptyflagRr** - MME PGW QUERY EMPTYFLAG RR - No (default) - disable the MME to support NAPTR RR with '' (empty) flag for PGW selection. yes - enable the MME to support NAPTR RR with '' (empty) flag for PGW selection.
- **mmeProseAuthorizationSupport** - Public safety proximity services - Public safety proximity services.
- **mmeSgwQueryEmptyflagRr** - MME SGW Query Empty Flag - This parameter is used to enable MME handling of reception of S-NAPTR RR with empty flag. By default, the capability disabled. If the parameter is set to 'Yes' then the capability is enabled.
- **mocnAccurateLoc** - P-GW/GGSN enhancement with 3G MOCN setup for location update. - In 3G MOCN setup, during SRNS relocation procedure or EUTRAN-to-UTRAN PS handover, it is possible that the PLMN ID received in RAU after relocation is not identical to the PLMN ID that the target SGSN learns with the GTP:FORWARD_RELOCATION_REQ message. Activate this parameter to force a GTP:UPDATE_PDP_CONTEXT message that updates PGW/GGSN with the correct PLMN ID. SGSN Multi Operator Core Network (3G MOCN) needs to be activated for this functionality.
- **monitoringConfigFailureSendNor** - Monitoring Config Failure Send Nor - Specifies whether the MME is to send a Notification Report to the HSS if a monitoring event cannot be configured at the MME (3GPP R14 functionality).
- **monitoringEventsDeletionByUla** - Monitoring Events Deletion by ULA - Parameter controls detection and deletion of monitoring event configuration AVPs received in ULA. When parameter is enabled, upon receiving one or more Monitoring-Event-Configuration AVP(s) in the ULA, the MME shall start the detection of the Monitoring events indicated in those AVP(s), if not already started, and shall stop the detection and delete the previous monitoring events (if any) which are not indicated in those AVP(s). If there is a failure when starting the detection (e.g. maximum resources exceeded), the MME shall not store the failed configuration(s) and shall send a notification of those events whose configuration have failed, If the Subscription-Data AVP is received in the ULA but it does not contain any Monitoring-Event-Configuration AVP(s), the MME shall stop the detection and delete all stored monitoring event configurations (if any).
- **monteCommFailRanUeInact** - Specifies whether the MME is to send a T6a:RIR Communication Failure Event Report if the RAN requests UE S1 release due to UE Inactivity.
- **mscLoadBalance** - MSC load balance - Configure MSC load balance algorithm.

- **mscSelMultipleCsCoreSuppt** - MSC selection of Multiple CS Core network - GPARM will control the feature flag. By default the global parameter shall be false/disabled.
- **mscVlrReselection** - MSC VLR reselection - Enable/disable alternate MSC selection if location update times out or MSC rejects the request with reject cause 'congestion.
- **msisdNHomeGwWithCc** - MSISDN Based Home GW selection with CC - MSISDN based home GW selection with CC(charging characteristic)
- **multipleIwsSupport** - Multiple IWS support - CLI command to control the support for multiple IWSs between ALU MME and 3rd party IWS.
- **multiPra** - Multiple PRAs - Enables support for -multiple Presence Reporting Areas (PRAs) per PDN connection in the MME, -multiple IP address segments per PRA identifier for Dual connectivity segment based reporting in the MME.
- **multiPraOperationEnbsEcgis** - Multiple PRA Operation eNBs and ECGIs - Enables the functionality to enter multiple eNBs and ECGIs with a single command addressing a Presence Reporting Area.
- **multiPraOperationTacsEnabled** - Multiple PRA Operation with TACs Enabled - Enables the functionality to enter multiple Tracking Areas with a single command addressing a Presence Reporting Area.
- **multiSimSupport** - Multi SIM Support - GPARM controls support for MultiSim with YES or NO flag with a default value of NO. When the parameter is set to YES the MME will drop an MT-LR if it only contains an MSISDN for the location query. With the default value setting of NO, the CMM will allow an MT-LR that contains only an MSISDN as the identifier
- **n26DirectFwd** - Indicates whether direct data forwarding is enabled or disabled on n26 handover.
- **n26IndirectFwd** - Indicates whether indirect data forwarding is enabled or disabled on n26 handover.
- **n26iwk** - N26iwk - N26 interworking - Enables N26 interworking.
- **nasNonDeliveryIndicationEsmDataTransfer** - Enable NAS Non Delivery Indication for ESM Data Transfer
- **nasTokensToCompare** - NAS tokens to compare - The number of NAS tokens to compare in determining whether a UE is authenticated in a handover scenario from UTRAN/GERAN to LTE.
- **nblotEmmTimerIncr** - CIOT EMM timer increment - This value is added to the timers in 10.2.2 of 24.301 for CIOT UE.
- **nblotEsmTimerIncr** - CIOT ESM timer increment - This value is added to the timers in 10.3.2 of 24.301 for CIOT UE.
- **nblotOlAtMinorOverload** - NB-IOT Overload Control At Minor Overload - If the parameter is Yes, the MME will perform NB-IOT overload control when the MME starts

experiencing minor overload. If the parameter is No, the MME would not take any NB-IOT overload control action until the MME starts experiencing major overload.

- **nblotPagingTimerIncr** - CIOT paging timer increment - This value is added to paging response timer for CIOT UE.
- **nbiotRatTypeToHss** - NBIOT RAT Type to HSS - If the global parameter is set to 'Yes' then MME shall send NB-IoT RAT Type to HSS. If the global parameter is set to 'No', then MME shall send EUTRAN RAT Type to HSS.
- **noClrRejForMissingClrFlags** - No CLR Reject for Missing CLR-Flags - Parameter controls rejecting CLR for Missing CLR-Flags AVP. By default the flag shall be disabled. When enabled MME will not reject CLR with Diameter Unable to Comply if CLR-Flags AVP is missing.
- **nonDdnPagingTauCollision** - Non DDN paging TAU collision - Enable MME to treat TAU request without active flag as a paging response and re-establish bearers if TAU is received while MME is paging a UE.
- **nonEmergencyPdnConnAsNewPdnConnAtAttach** - Non-emergency PDN connection as new PDN connection at attach - MME support to treat non-emergency PDN connection as a new PDN connection at attach.
- **nrBasedGwSelectionSgsn** - NR Capability based GW selection - This parameter enables SGSN selecting GW using NR capability of the UE. When this parameter is enabled, SGSN selects NR capable GW if NR capability is supported at the UE. If the parameter is setting to Yes, then a fixed tag=5gc will be added to pre-rel8 DNS query or rel8 DNS with service +nc-nr. If the parameter is set to No, then existing function is unchanged i.e. no changes for DNS query of 5G NSA UEs.
- **nrCcDoubleS1PsAck** - Normal release cause for double S1 connections and path switch request ack - If this parameter is set to 'Yes' then the cause IE of S1AP UE CONTEXT RELEASE COMMAND is set to 'Normal release' for the following cases.
- **nriLength** - Length of Network Resource Identifier, LEN - This parameter defines the length of Network Resource Identifier (NRI) in the CMM SGSN. Possible values are 0, 5, 6 and 7.
- **nrPriorityOverSmf** - NC-NR priority over SMF - When this parameter is enabled, then the MME gives priority to NC-NR capable gw against combo PGW-C capable gw when multiple candidates, each serving only one of these service parameters are retrieved by DNS query
- **nullNri** - Null network resource identifier - This parameter defines the null network resource identifier, 255 ... not defined (default) 0 to 31 ... valid values.
- **numIpsPerPgwFqdn** - Supported number of IPs per PGW FQDN - Sets the maximum number of IPv4 and IPv6 addresses per PGW FQDN. Only 2 values are supported (2 or 8). When set to '2' or '8', as many as 2 or 8 IPv4 and 2 or 8 IPv6 addresses are supported per PGW FQDN.

- **obtainPgwFqdnEps5gsMob** - Current parameter enables performing PGW FQDN lookup when PGW FQDN isn't available during EPS to 5GS mobility
- **ocCallTraceContinue** - OC call trace continue - Indicates whether or not call trace will continue (YES), or be suspended (NO), on a CPPS when the CPPS is in a major or critical overload condition.
- **ocSendOverloadStartAndStopToEnbs** - Overload control send overload start and stop messages to eNBs - A value of yes indicates the MME will send overload start and overload stop messages to eNBs as part of overload control. a value of no indicates the MME will not send overload start and overload stop messages.
- **octetEncodingSupport** - Octet Encoding Support - Parameter controls support for Octet Encoding for the Indication IE contained within messages sent over the S11 interface. By default the flag shall be disabled. When the flag is enabled, MME shall only encode the first three bytes of indication flags.
- **odbBitsSupport** - ODB Bits Support - Parameter controls feature activation. By default the GPARAM flag is off. When the feature is activated, MME upon receiving ODB AVP in ULA/IDR from HSS, shall set the following 2 bits: `hssPxy_SupportedFeatureList_ODBHplmnApn` and `hssPxy_SupportedFeatureList_ODBVplmnApn` regardless of `homer` vs. `homer`, and regardless of value of `odb_all_apn` and `odb_hplmn_apn` bits in `ServiceAgreementProfile`
- **overrideEnhEmmCcCreateSessRespUserAuthFail** - Override Enh EMM Cause Code Create Session Response User Auth Fail - This parameter controls whether to use `restNasMappingProfile` provisioning for Create Session Request cause code #72 or #92. By default, flag shall be disabled. When this parameter is enabled, `restNasMappingProfile` shall be used.
- **overrideVaa** - APN Override regardless the VAA parameter value - This parameter controls the APN override functionality of network identifier for roamer subscribers. When this parameter is ON the relevant functionality is decoupled from the value of the VAA parameter. When this value is OFF the relevant functionality continues to work as currently (i.e. coupled with the value of the VAA parameter)
- **pagingAfterInterRatRedirection** - Paging After Inter Rat Redirection - Parameter controls MME to allow paging to continue upon receiving a DDN after handling of an UE context release request with cause inter-rat-redirection, By default the flag shall be disabled. When enabled, MME upon receiving a DDN after handling of an UE context release request with cause inter-rat-redirection, MME shall allow paging to continue.
- **pagingGapFailCountTrigger** - Paging Gap Fail Count Trigger - Parameter Paging Gap Fail Count Trigger indicates the number of failed paging operations that start the paging gap timer.
- **pagingOptimizationInHenb** - Paging optimization in home eNB - Is paging optimization supported for the home eNB?
- **pagingOptimizationInMme** - Paging optimization in MME - A value of y indicates that paging optimization is supported for the MME.

- **pagingOverloadPrevention** - Paging Overload Prevention - Parameter controls feature activation. By default the flag shall be always enabled.
- **pagingUponTadsReceived** - Paging Upon T-ADS Received - Parameter controls paging upon receiving T-ADS from HSS in IDR message. By default, flag shall be disabled. When enabled, MME upon receiving T-ADS in IDR message from HSS when UE is in either registered or in idle state, shall respond with Insert Subscriber-Data Answer (with IMS-Voice-Over-PS Sessions-Supported (1) and shall immediately starts paging the UE.
- **passiveOffload** - Passive offload - MME is in passive offload mode or not.
- **passiveUelbOfLoadRate** - UELB Off-Load Rate - For Passive UELB this parameter specifies the per CPPS of load rate
- **pcmdSheddingDuringOverload** - PCMD shedding during overload - Control flag for PCMD shedding during overload. this flag can be used to determine MME behavior related to PCMD during CPU overload.
- **pcscfRecovery** - PCSCF recovery - Configure P-CSCF recovery or not.
- **pdnConnEstEnhSupport** - PDN Connection Re-establishment after SGW Change with Roamers and Voice Enhancements - Parameter controls enabling or disabling the support for enhancements to PDN Connection Re-establishment after SGW change with Roamers and Voice feature. By default this parameter shall be disabled.
- **pdnDifferentApnOi** - PDN connection for a different APN OI - This parameter is used to enable/disable MME to set up a second PDN connection with a different APN OI for APN when UE already has a PDN connection for the same APN.
- **pdnHoS11ApnFormulation** - PDN Handover S11 APN Formulation - Defines how the MME forms the APN-OI of the APN IE on S11 Create Session Request towards the SGW, when the MME receives a 'Handover' PDN Connectivity Request from the UE. When set to 'Yes', the MME uses enhanced logic to utilise either the possibly provisioned override PLMN id, the PLMN id obtained from the UE's IMSI or the UE's requested APN-OI. When set to 'No' (default), the MME uses the Destination-Realm as received from the HSS indicating the selected PGW of the PDN to set the APN-OI on S11 CSR.
- **pdnReestablishSgwChange** - PDN reestablish SGW change - All PDN connections for each UE shall be always examined for PDN-reestablishment after every SGW change.
- **pdnRejectDueToSubscriptionEsmCc** - ESM cause for PDN rejected due to subscription - ESM cause code in PDN connection reject message when PDN connection request is rejected due to subscription.
- **pdnReleaseNrSecRatRestriction** - Release PDN connection due to NR as Secondary RAT restriction - Allow MME to release a PDN Connection for a DCNR capable UE after MME determines UE is restricted access for NR as a Secondary RAT.
- **pgwAddrOnS6aAndPgwFinding** - PGW Address on S6a and PGW Finding - **pgwAddrOnS6aAndPgwFinding** parameter has two purposes for e.g. VoLTE - VoWifi handovers: it -controls which received PGW IP address(es) the MME uses, when the MME sends the selected PGW information inside the MIP6-Agent-Info AVP on the S6a NOR

and the S6a ULR (Active-APN AVP(s)). -controls how the MME finds the PGW for the PDN when the MME receives Attach Request or PDN Connectivity Request with Request type Handover and establishes the PDN with Create Session Request.

- **pgwApnGtpOvlControlSupport** - APN Level Overload Control Support - When enabled the MME shall support APN level overload control functionality, whenever overload information is provided on APN level from the PGW.
- **pgwIsolationFaultThreshold** - PGW isolation fault threshold - This command is used to provision PGW fault threshold for the PGW isolation. if the number of the PGW faults (remote peer not responding cause received in the S11/S4 create session response) exceed the provisioned threshold in a provisioned duration timer then WMM will isolate the PGW from the selection to new PDN connection for provisionable duration.
- **pgwPlmnIdExclusionSupport** - PGW plmn ID exclusion support - Enable/Disable exclusion of PGW PLMN ID AVP when PGW FQDN is present in NOR.
- **pgwRestartNotification** - PGW restart notification - If it is yes, then MME/S4-SGSN sends support of PGW restart notification indication in node feature IE of GTPv2 echo request and echo response. if it is no, then MME will not indicate the support of PGW restart notification to the SGW.
- **pgwSelectionRestrictedToColocatedGgsnPgW** - PGW Selection Restricted To Colocated GGSN/PGW - Parameter controls MME support for Configuration Control for Restriction of PGW Selection to Colocated GGSN/PGW during IRAT Mobility scenario. By default, flag shall be disabled. When enabled, restriction for gp-service for roamer and gn-service for homer shall be removed. This shall apply to Gateway Mode Selection 2.
- **pgwSelectionWithNonNcSmf** - PGW Selection With Non nc-smf - Parameter controls feature activation. By default the flag shall be disabled. When enabled, MME shall support preferring PGW(s) which specifically have a non nc-smf tagged service type for non N1 mode UEs. In other words, with the new gParm enabled, MME shall enforce associating LTE only UE with non-combo PGW. This feature shall be applied only for gateway mode selection 2.
- **pgwSelectionWithSnaptr** - PWG selection with snaptr - Enable/Disable support for PGW selection with snaptr.
- **plmnCtrlPreferGw** - plmn level control of preferred Gw - PLMN Level Control of Preferred Gateway. Customer preferred control of GW type selection. This gParm is to control this feature. When this plmnCtrlPreferGw parameter is set, then PLMN level Control of Preferred Gateway will be enable. If the parameter is false (default value), then S4 SGSN keeps existing behaviour.
- **plmnOperMtlrNoEsmIc** - PLMN operator MT_LR no E-SMLC - MT_LR client type PLMN Operator Service do not contact E-SMLC for UE location information. If yes, when MME receives mobile terminated location request with client type=plmnOperatorServices, and activateLcsClientTypePlmnOperatorServices is set, the MME contacts the eNB for UE current E-CGI information. This information is sent back to the GMLC. The MME does not contact the E-SMLC to obtain any UE location information. If no, nothing changes

and keep existing function (i.e. MME contacts E-SMLC to obtain UE location for this MT-LR type) .

- **plmnS6dSelection** - PLMN level s6d&Gr selection - When rel8 architecture enable, S4-SGSN always selects HSS. With this feature enable, PLMN level control to select either S6d/Gr will be controlled by operators. Also fallback from s6d to Gr could be also controlled by operators. When this parameter set to true (yes), then above mentioned two parameters can be configured by operator/PLMN level. If the parameter set to false (no, default), then SGSN keeps the same as current. When this feature is enable, then SG01236 is not used.
- **pmFileToFluentd** - Send PM File to Fluentd - This parameter controls the functionality for sending PM XML file to fluentd.
- **pMtuDiscoveryS1IpV6** - Path MTU Discovery for IPv6 S1/M3 links - Controls Path MTU Discovery for IPv6 S1/M3 links. no (default) - disable Path MTU Discovery yes - enable Path MTU Discovery
- **powerSavingsMode** - Power savings mode - Support for UE power saving mode.
- **praDclpv4** - Presence Reporting Area Dual Connectivity IPv4 - Activates customized Presence Reporting Area (PRA) functionality for dual connectivity. When dual connectivity is applied for a UE, presence reporting is used to inform the SGW/PGW/PCRF (upon request) whether the UE currently uses a 5G gNB (UE is inside) or not (UE is outside). The gNBs use IPv4 addressing. MME uses a customized schema in analyzing whether a provided RAN IPv4 user plane endpoint belongs to an eNB or a gNB.
- **praDclpv6Prefix** - PRA DC IPv6 Prefix - Activate the Presence Reporting Area functionality to report on dual connectivity with IPv6 prefixes. MME detects the dual connectivity usage based on provisioned IPv6 address prefixes. The functionality uses CN predefined PRAs. The MME reports via PRA reporting that a UE is inside the area when the MME detects that the gNB user plane IP address is covered by the provisioned IPv6 address prefix i.e. UE is using dual connectivity with a 5G gNB. The UE is outside the area when the gNB user plane IP address is not covered by the provisioned IPv6 address prefix i.e. UE is not using dual connectivity with a 5G gNB.
- **praDcSegment** - PRA Dual connectivity segment reporting - Activate the Presence Reporting Area functionality to report on dual connectivity utilizing a provisioned IPv6 address segment. The functionality uses CN predefined PRAs. The MME reports via PRA reporting that a UE is inside the area when the MME detects that a 5G gNB having a provisioned IPv6 address segment is added with dual connectivity for the UE. The UE is outside the area when the corresponding 5G gNB is removed for the UE.
- **praDcSingleTimerAllowedRestartCount** - PRA DC Single Timer Allowed Restart Count - Defines the number of times the MME is sequentially allowed to restart the single DC PRA optimisation timer. When the MME has already previously restarted the single optimisation timer the times allowed by this parameter and the MME still receives new RAN endpoints causing DC PRA status change (and the MME would in this case again restart the single optimisation timer without this limit), the MME stops the single

optimisation timer and sends out the current status of the DC PRAs that is not yet reported towards the SGW/PGW. This parameter is only applied when global parameter PRA Dual connectivity segment reporting is set to DC Segment Optimized Single Timer.

- **praDormantState** - PRA Dormant State Enabled - Enables the functionality to change the state of the CN predefined Presence Reporting Area (PRA) between active (i.e. normal) and dormant. In dormant PRA state, the MME suppresses any PRA status (inside/outside) reports towards the SGW/PGW. In dormant PRA state the MME still accepts and stores PRA action to request PRA status reporting. Dormant PRA state is applicable for both 3GPP standard based PRA functionality as well as the dual connectivity segment based reporting functionality.
- **praForRoamers** - PRA for roamers - When set to Yes, this parameter allows MME to support Presence Reporting Area (PRA) functionality for roaming UEs.
- **praldleState** - PRA Idle State - Enables Presence Reporting Area (PRA) functionality clarification change. If the UE is in ECM-IDLE state, the MME may either bring the UE into ECM-CONNECTED state, or, report based on the UE's last known location and when the UE was there.
- **praModifyAction** - PRA Modify Action - Controls whether the MME reports immediately 'inside'/'outside' when receiving PRA action with action value 'modify' independently of the previous report. When set to 'yes', MME always reports immediately 'inside'/'outside' even if previous report was the same. When set to 'no', MME does not report immediately 'inside'/'outside' if previous report was the same.
- **praModifyEnabling** - PRA Modify Enabling - Enables Presence Reporting Area (PRA) modify action support in the MME.
- **praPace** - Presence Reporting Area Pace - The pace to send Presence Reporting Area Information towards the SGW/PGW with the standard based Presence Reporting Area functionality. This setting is applicable for both dual connectivity segment based PRA and standard based PRA functionalities. The pace is defined in messages/second per CPPS.
- **praPacing** - PRA Pacing - Enables Presence Reporting Area pacing functionality to ensure the surrounding network elements are not impacted by bursts of Presence Area Reporting Information.
- **praRel145** - Presence Reporting Area 3GPP Rel 14-15 - Enables 3GPP Release 14-15 enhancements for Presence Reporting Area functionalities: e.g. multiple PRA ids per PDN, PRA sets and PRA modify action.
- **praSets** - Enables support of Presence Reporting Area (PRA) sets in MME.
- **praStdSuppressInitialOut** - PRA Standard Suppress Initial Out - Controls whether on 3GPP Standard Presence Reporting Area (PRA) functionality the first/initial outside report is suppressed. If set to Yes and MME receives PRA action Start from SGW/PGW, MME only sends initial PRA report (PRA Information) to SGW/PGW when the UE is/has arrived inside the corresponding area. If set to No, the MME will send the initial report

(PRA Information) immediately after receiving PRA action Start from SGW/PGW despite of UE being inside or outside of the corresponding area initially.

- **praStdSuppression** - PRA Standard Suppression - Enables MME suppression of too frequent PRA reports for 3GPP standard based PRA (Presence Reporting Area) functionality. If set to Yes, the MME suppresses a subsequent PRA report inside the PRA suppress time period, unless the PRA status stays the same for the PRA suppress cancel defined time period. If set to No, MME sends subsequent PRA reports according to UE mobility based on 3GPP standard definitions with no restriction to reporting frequency.
- **pRau2g** - PRAU timer in 2G - This parameter controls the usage of independent 2G and 3G pRau timers. If the parameter is set, then SGSN is allowed to configure pRau timer differently in 2G and 3G. If the parameter is not set, existing functionality will be used (2G and 3G with the same value for pRau timer).
- **preferDataMode** - Prefer data mode - Selection of preferred data mode when a UE subscription has APN configuration.
- **preferredPgwId** - Preferred PGW Identifier - Preferred PGW identifier to determine PGW identity
- **prefGnToGGSNIpVer** - IP address version-preference for transport layer - Use this parameter to control the IP address version-preference for transport layer.
- **preRel8DomainName** - Pre release 8 domain name - Pre release 8 domain name.
- **prometheusFormat** - Prometheus Format - This option controls the format of the data model and notation used to report Prometheus Counters. This option is applicable in all cases i.e. either when CMM is configured to push the Prometheus Counters to PrometheusPushGW or when Prometheus Server directly scrapes the Prometheus Counters from CMM.
- **prometheusMode** - Prometheus Mode - There are two functionalities supported for Prometheus Server in order to retrieve the relevant PM Data. The first functionality is when CMM pushes the relevant PM Counters to PrometheusPushGW and then Prometheus Serves scrapes the relevant PM Counters from PrometheusPushGW. The second functionality is when Prometheus Server directly scrapes the relevant PM Counters from CMM. The scope of this parameter is control which functionality will be enabled from CMM.
- **prometheusRequests** - Prometheus Requests - This parameter defines the maximum allowed number of Prometheus Requests, in the specific Prometheus Sliding Window (defined with parameter **prometheusSlidingWindow**) , that could in parallel directly scrape the relevant PM Counters from CMM. This parameter is applicable only when the functionality/option to allow Prometheus Server to directly scrape the relevant PM Counters from CMM is configured. Warning: For Nokia personnel only.
- **prometheusSlidingWindow** - Prometheus Sliding Window - This parameter defines the CMM sliding window (in seconds) in which Requests from Prometheus Server to directly scrape the data from CMM are accepted. The number of parallel requests in this sliding window are defined with parameter **prometheusRequests**. This parameter is applicable

only when the functionality/option to allow Prometheus Server to directly scrape the relevant PM Counters from CMM is configured. Warning: For Nokia personnel only.

- provPciPvi - Provisionable PCI and PVI value supported - Supports provisionable PCI and PVI values.
- psCsCoordination - PS CS coordination - PS CS coordination capability for MOCN configuration.
- pseudoRandomTlliCollisionHandling - Pseudo-random Tlli Collision Handling - When parameter is set to No existing collision handling mechanism is maintained regarding 2G Attach with random TLLI. When status is set to Yes collision handling will not be applied for a 2G Attach with Random TLLI even if is already used by an ongoing Attach procedure, as long as Attach message was received via different nsei/bvci pair. Furthermore the SGSN will silently drop a new Attach request with a random TLLI when the included random TLLI in the Attach request is already used by ongoing Attach from the same nsei/bvci pair.
- pseudoSpgwIpv4address - Pseudo SPGW IPv4 address - The SGW/PGW IPv4 address used in creating the S1-U SGW tunnel IDs to be sent to eNB in S1AP INITIAL UE CONTEXT SETUP message when MME does not use SGW or PGW for bearer creation during SDS UE attach request.
- pseudoSpgwIpv6address - Pseudo SPGW IPv6 address - The SGW/PGW IPv6 address used in creating the S1-U SGW tunnel IDs to be sent to eNB in S1AP INITIAL UE CONTEXT SETUP message when MME does not use SGW or PGW for bearer creation during SDS UE attach request.
- pseudoUeIpv4address - Pseudo UE IPv4 address - The UE IPv4 address to be used for an SDS UE when MME does not use SGW and PGW for bearer session setup during attach procedure.
- pseudoUeIpv6address - Pseudo UE IPv6 address - The UE IPv6 address to be used for an SDS UE when MME does not use SGW and PGW for bearer session setup during attach procedure.
- purFlagsAvp - PUR-Flags AVP - PUR-Flags.
- purgeUeWhenHandoffToEhrpd - Purge UE when UE hands off to eHRPD - When UE hands off to eHRPD, if this global parameter is yes, MME deletes VLR and sends PUR to HSS.
- pwsRestartProcedure - PWS restart procedure - Forwarding of PWS RESTART INDICATION message to CBC.
- qci1HoRejectionGeran - QCI1 HO Rejection GERAN - When set to 'Yes', MME rejects incoming S1AP Handover Required attempts when -the handover is attempted towards 2G i.e. Handover Type is set to 'LTEtoGERAN' -the Handover Required message does NOT include SRVCC HO Indication IE -the UE currently has a dedicated bearer with QCI1 established. The MME sends Handover Preparation Failure with cause 'Handover Failure In Target EPC/eNB Or Target System' and does not proceed further with the handover. When set to 'No', MME proceeds with the handover normally.

- **qci1HoRejectionUtran** - QCI1 HO Rejection UTRAN - When set to 'Yes', MME rejects incoming S1AP Handover Required attempts when -the handover is attempted towards 3G i.e. Handover Type is set to 'LTEtoUTRAN' -the Handover Required message does NOT include SRVCC HO Indication IE -the UE currently has a dedicated bearer with QCI1 established. The MME sends Handover Preparation Failure with cause 'Handover Failure In Target EPC/eNB Or Target System' and does not proceed further with the handover. When set to 'No', MME proceeds with the handover normally.
- **qosModCollEnh** - QoS Modification Collision Enhancements - This parameter controls the feature activation. By default this parameter shall be set to value 'No'.
- **queueUeCtxtRelUserInactivityErabModIndication** - Queue UE Context Release Request User Inactivity During E-RAB Modification Indication - Defines whether the MME queues an incoming S1AP UE Context Release Request with radio network cause 'user inactivity' from eNB when the MME has received S1AP E-RAB Modification Indication from the eNB and has not yet sent E-RAB Modification Confirm as response. When set to Yes, MME triggers UE Context Release Command after sending out E-RAB Modification Confirm. When set to No (default), MME drops the incoming UE Context Release Request with radio network cause 'user inactivity'.
- **raiBasedDeactPdpRate** - deactivation PDP rate - This parameter determines with what rate (reactivations per second) PDP context reactivations should be done during RAI-based context reactivation.
- **raiBasedUeHandlingEnabled** - RAI based UE handling - RAI/RAI group based UE handling
- **ranapResetAfterSysRestart** - Enables performing SGSN init RANAP RESET after system restart/upgrade
- **rangeDiscoverTais** - Range Discover TAIs - Feature activation for Enhanced TA Discovery Auto-Provisioning
- **rateLimitPerApn** - Rate Limit Per APN - Whether the MME should enforce PLMN Rate Control per APN/PDN per 3GPP TS 23.401 CR 3486 or per PDN. The default is no rate control per PDN.
- **rcvryDlSdsMaxLimitOverride** - Maximum number of recovery DL SDS messages allowed to protect SRS from MME.
- **rcvrySrUlrLimitOverride** - Recovery SR ULRs allowed per second after which CPPS will start dropping recovery ULRs until rate is below limit.
- **rcvrySrUlrMaxdeferCountOverride** - Maximum number of times recovery SR ULRs can be deferred to protect MME and HSS during recovery ULR storm.
- **redirectionCommandRate** - Redirection command rate - Maximum allowed rate of S102 redirection command messages.
- **regionalSubscription** - Regional subscription - Setting to yes activates regional subscription on the gn-sgsn. setting to no deactivates regional subscription on the gn-sgsn.

- **rejDtrExtendedServiceRequest** - Reject Dual Transceiver Receiver Extended Service Request - MME shall be provisioned with GPARAM flag 'rejDtrExtendedServiceRequest' to control sending UE Context Modification Request message to E-UTRAN upon receiving Extended Service Request that is attached to E-UTRAN. By default this flag shall be disabled. When the flag is enabled, MME shall send cause code #18 (CS Domain not available) in service reject to eNodeB. When the flag is disabled, MME shall act as it did before introduction of this functionality, i.e. MME upon receiving Extended Service Request shall send UE Context Modification Request message to E-UTRAN.
- **rejectAlgorithmDuringOverload** - Reject algorithm during overload - Overload control logic with a different set of messages/procedures to shed at major and critical overload thresholds.
- **rejectCcForGmmErrorCode11** - Reject Cause Code for GMM Error Code 11 - This parameter defines which Reject Cause code will be used for GMM Error Code 11.
- **rejectCcForGmmErrorCode12** - Reject Cause Code for GMM Error Code 12 - This parameter defines which Reject Cause code will be used for GMM Error Code 12.
- **rejectCcForGmmErrorCode13** - Reject Cause Code for GMM Error Code 13 - This parameter defines which Reject Cause code will be used for GMM Error Code 13.
- **rejectCcForGmmErrorCode14** - Reject Cause Code for GMM Error Code 14 - This parameter defines which Reject Cause code will be used for GMM Error Code 14.
- **rejectCcForGmmErrorCode15** - Reject Cause Code for GMM Error Code 15 - This parameter defines which Reject Cause code will be used for GMM Error Code 15.
- **rejectEsrNoSrvcc** - Reject ESR no SRVCC - Reject ESR requested by an ECM-CONNECTED UE with IMS voice bearer.
- **rejectNodeRelocatingPeriodicTau** - Reject node relocating periodic TAU - Enable/disable MME support for enhanced handling of intermme TAU with update type periodic.
- **requestPsCellInLrc** - Request PS Cell in LRC - When location reporting control procedure is used in MME, if Request PS Cell in LRC is set, then MME includes additional location information towards eNB. eNB will include the current PSCell in the report if EN-DC is activated. If Request PS Cell in LRC is not set, MME will not request additional location information under location reporting procedure as existing function, then eNB will not report PSCell in location report.
- **reservedBoolParameter1** - Reserved bool parameter 1 - This parameter is reserved for future use.
- **reservedBoolParameter2** - Reserved bool parameter 2 - This parameter is reserved for future use.
- **reservedBoolParameter3** - Reserved bool parameter 3 - This parameter is reserved for future use.
- **reservedBoolParameter4** - Reserved bool parameter 4 - This parameter is reserved for future use.

- reservedBoolParameter5 - Reserved bool parameter 5 - This parameter is reserved for future use.
- reservedIntParameter1 - Reserved int parameter 1 - This parameter is reserved for future use.
- reservedIntParameter2 - Reserved int parameter 2 - This parameter is reserved for future use.
- reservedIntParameter3 - Reserved int parameter 3 - This parameter is reserved for future use.
- reservedIntParameter4 - Reserved int parameter 4 - This parameter is reserved for future use.
- reservedIntParameter5 - Reserved int parameter 5 - This parameter is reserved for future use.
- restrictPagingDuringOverload - Restrict paging during overload - Restrict paging during overload.
- restrictS10linksToNeighborMme - Restrict S10 links to neighbor MME - MME support for restricting S10 to neighboring MME.
- restrictSubExtQoS - Restrict Subscribed Extended QoS - CMM MME restricts subscribed extended QoS when UE is 5G DCNR restricted or 5G DCNR not capable. MME limits QoS to 4.29 Gbps or less when setting up or modifying default, GBR, or non-GBR bearer(s).
- retransCsSvcNotifyOnNasNonDeliveryRadioConnLost - Retransmit CS Service Notify NAS Non-Delivery Radio Conn Lost - Current gParm enables treating NAS Non-Delivery Indication msg carrying cause 'radio connection with ue lost' the same as if cause were 'S1 intra system Handover triggered', or 'X2 Handover triggered' for SGs downlink service operation. When parameter is enabled, then when receiving NAS Non Delivery Indication (cause=radio connection with ue lost) the MME will expect to receive X2 Handover safeguarded by timer, at expiration of which the CS Service Notification will be resent
- retriesForDcNrUes - Retries for DCNR Capable UE - Number of retries selecting PGW-C(s) during PDN Connectivity procedure upon receiving GTP error or timeout from gateway for DCNR Capable UEs.. For example, MME will send its first attempt to the PGW, if it receives no response within a certain period of time, the MME will retransmit the same request to the SGW/PGW and if/when it gets an error back from the SGW then it will move on to select the next best gateway to try. Assuming there is only one PGW in the sub-area, this means that the MME will perform round 2 (look for +ue entries but not find any) and then round 3 (look for _nc-nr entries, where it will find many to choose from). The next MME attempt will then be to a nearby +nc-nr PGW.
- retriesForUutUes - Retries For UUT UEs - Number of retries selecting PGW-C(s) during PDN Connectivity procedure upon receiving GTP error or timeout from the gateway for UUT UE(s) For example, MME will send its first attempt to the PGW, if it receives no response within a certain period of time, the MME will retransmit the same request to

the SGW/PGW and if/when it gets an error back from the SGW then it will move on to select the next best gateway to try. Assuming there is only one PGW in the sub-area, this means that the MME will perform round 2 (look for +ue<uut> entries but not find any) and then round 3 (look for _nc-nr entries, where it will find many to choose from). The next MME attempt will then be to a nearby +nc-nr PGW.

- **retrieveCellId** - Retrieve cell id - Yes - enable retrieval of ECGI from the eNB to be included in the LSC-AP location request message sent to the E-SMLC when MME is triggered either by GMLC or by HSS to get UE location. the retrieval of the ECGI applies to all client types. no (default) - disable the retrieval and MME sends the ECGI that was received in the most recent S1-AP message.
- **retrieveUeLocation** - Retrieve UE location - This flag determines whether UE location information is retrieved from the eNB. no (default) - indicates that the operator policy is to use the last known user location information. yes - indicates that the WMM operator policy is to use the location reporting procedure (23.401 section 5.9.1) to retrieve the ECGI from the eNB.
- **retryPagingForSgsPageRequest** - Retry paging for SGs page request - A value of yes indicates that the MME will perform additional page attempts for each SGs page request received until the UE responds or all page attempts in the paging policy have been exhausted. a value of no indicates that the MME will perform only one page attempt for each SGs page request received. if needed, the MSC must trigger additional page attempts with new SGs page requests.
- **rfspIndexSelectionOption** - RFSP Index Selection Option - When this parameter is enabled, then the MME enables using rfspSelOption option, available in SvcAgreementProfile, to decide the way for assigning RFSP Index for the UE
- **rfspIndexVallmeiTac** - Support RFSP Index Value - GPARM controls the feature activation. By default the parameter shall be disabled. When parameter is enabled, MME shall validate the TAC received in IMEI against provisioned TAC entry and if there is a match, MME shall apply the provisioned RFSP value.
- **rfspInS4Sgsn** - support RFSP in S4 SGSN
- **rfspOverridelmeilmsi** - RFSP Override by IMEI TAC and IMSI - RFSP Override by IMEI TAC and IMSI, giving priority to IMEI TAC
- **roamerQosForWpsUserSupport** - Roamer QoS Profile for WPS User Support - Parameter controls feature activation flag. By default, flag shall be disabled, when enabled MME shall support provisioned Roamer QoS Profile for WPS user.
- **roamQciSuppt** - Roam QCI Support - Upon setting the parameter to TRUE, MME shall check the received inbound roamer GBR QCI value and if the received GBR QCI value is 2, it shall be rejected. With the Default value setting of FALSE, MME shall work as it had before the introduction of this feature.
- **roamQosOvdForRan** - Roamer QoS Override for RAN - When this parameter is on, locally configured QoS for Roamers is sent only towards RAN. The default value shall be off.

- **rsrUlrPercentForCtrlPlaneServiceReq** - Percentage of control-plane service req that MME sends ULR - Percentage of control-plane service request that MME sends ULR due to HSS reset.
- **rsrUlrPercentForDdnServiceRequest** - Percentage of ddn service req that MME sends ULR - Parameter controls percentage of ddn service req that MME sends ULR
- **rsrUlrPercentForServiceReq** - Percentage of MO Service Req that MME sends ULR and UE-Act-Ind - Percentage of MO Service Request that MME sends S6a ULR to HSS, and sends SGs UE-Activity-Indication to MSC/VLR due to HSS Reset; MT Service Request (following Paging) does not trigger ULR due to HSS reset.
- **rsrVlrScanPercentWithoutOverload** - (Reset Subscriber Request) Vlr Scan Percentage Without Overload - When Reset Subscriber Request(RSR)including Subscription-Data or Subscription-Data-Deletion AVP is received in CPPS, VLR scan is triggered in CPPS to find VLR entries that match the RSR user-ids and/or reset-ids AVPs. This VLR scan is triggered periodically to avoid system overload. When the system is not in overload, the number of scanned entries per period is defined in this gParm as percentage of 50000(which is hardcoded). The allowed percentages are [10, 20, ... , 90, 100]. Warning: For Nokia personnel only.
- **rsrVlrScanPercentWithOverload** - (Reset Subscriber Request) Vlr Scan Percentage With Overload - When Reset Subscriber Request(RSR)including Subscription-Data or Subscription-Data-Deletion AVP is received in CPPS, VLR scan is triggered in CPPS to find VLR entries that match the RSR user-ids and/or reset-ids AVPs. This VLR scan is triggered periodically to avoid system overload. If the system is in overload, VLR scan is postponed for the next period. If VLR scan is postponed for 5 consecutive times, VLR scan is triggered in the next period, but the number of scanned entries is reduced. The percentage of the scanned entries is defined in this gParm as percentage of 25000(which is hardcoded). The allowed percentages are [10, 20, ... , 90, 100]. Note that 'rsrVlrScanPercentWithOverload * 25000' must be smaller than 'rsrVlrScanPercentWithoutOverload * 50000'. Warning: For Nokia personnel only.
- **s102** - MME to send S102 redirection command to the IWS obtained from the SRS in case of UE recovery if the UE previously registered with CIOT IWS.
- **s1021xRttRcidInSlr** - S102 CIOT RCID in SLR - Include CIOT reference cell ID in Slg subscriber location report message.
- **s10InterPlmnRelocationQci1Only** - S10 Inter PLMN Relocation QCI-1 Only - Parameter controls feature activation GPARM flag. By default, flag shall be disabled. When enabled, source MME upon receiving inter plmn handover request from eNB will find target MME from TAC reported by eNB, will send forward relocation request to target MME. Target MME upon receiving forward location request will check for the presence of QCI-1 bearer and if QCI-1 bearer is not present target MME shall reject the handover with cause value handover reject target not allowed. Additionally, for TAU, upon receiving context request without QCI-1, Context Response reject with a cause code Target access restricted for the subscriber shall be sent.

- **s10mobilityQosParametersUpdate** - Inter MME S10 mobility QoS parameters update - Indicates whether MME sends modifybearercmd to SGW at the end of TAU when QoS parameters in S6ad ULA are different than those in S10 Context Response or Forward Relocation
- **s11CauseRsrcUnavailPdnDelInSr** - S11 Cause Resource Unavailable PDN Delete Session Request in Service Request - Parameter controls MME sending Delete Session Request to SGW upon receiving Modify Bearer Response with 'Resources not available'. By default the flag shall be disabled.
- **s11ipAddressLoadBalancer** - S11 IP Address Load Balancer - Parameter when enabled prevents MME from creating an S11 link/MO directly to an S11 load balancer. An IP is determined to be a load balancer if the MME has received a Create Session Response with a sender F-TEID for ctrl plane specifying a different IP address than the IP header. If we subsequently receive a Create Session Response from an LB IP and FTEID matches the IP header, an S11 link/MO will not be created. By default, the flag shall be disabled.
- **s11sendCidfDuringS1ho** - S11 send CIDF during S1HO - To enable/disable sending of the S11 create indirect forwarding tunnel request message during an S1HO.
- **s11SuspendNotificationSentPerLbi** - S11 suspend notification sent per LBI - Setting to yes enables S11 suspend notification sent per LBI feature. setting to no disables S11 suspend notification sent per LBI feature.
- **s11uBearerSetUp** - S11-U Bearer Set Up - Enable MME to setup S11-U bearer for a UE supporting both CP and UP optimization indicates preference for UP CloT optimization but the MME is not provisioned to support UP CloT optimization.
- **s11uDIDataBuffering** - S11-U bearer downlink data buffering - Enable S11-U downlink data buffering to handle collision of downlink data with ESM procedures.
- **s13retryDifferentEir** - S13 retry different EIR - When MME gets some errors from EIR (too busy, out of space, etc) or EIR does not respond, MME sends the same request to another EIR in the same PLMN or IMSI range.
- **s1ResumeSecurityContextUpdate** - S1 Resume Security Context Update - If the parameter is set to 'Yes' then MME includes the Security Context ID in the S1AP UE CONTEXT RESUME RESPONSE message.
- **s1SendAllServedPlmnsToEnb** - Send all Served Plmns to Enb - When enabled, MME includes all configured home and shared PLMN IDs in the MME Served PLMNs list when MME sends S1AP Configuration Update, or in S1AP Setup Response when MME responds to eNB S1AP Setup Request.
- **s1SuspendSecurityContextUpdate** - S1 Suspend Security Context Update - If the parameter is set to 'Yes' then MME includes the Security Context ID in the S1AP UE CONTEXT SUSPEND RESPONSE message.
- **s3GnIndirectForwarding** - S3 Gn indirect forwarding - Indicates whether inter-rat handover using Gn or S3 always employs indirect data forwarding (ALWAYS), does not

employ indirect data forwarding (NEVER), or employs indirect 4290 data forwarding for inter-plmn inter-rat handover (INTER-PLMN/RAT ONLY).

- **s4Func** - allow SGSN S4 functionality (Gr/S6d) - Use this parameter to allow SGSN S4 functionality (Gr/S6d).
- **s4SgsnLbo** - S4 SGSN support LBO - S4 SGSN support local breakout function. With this parameter set, the feature will be enable.
- **s6aDraRoamingSupported** - S6ad DRA roaming supported - When set to yes: use provisioned destinationrealm in remoteendpoint table only for homer. for roamer, use hard-coded 'epc.mnc###.mcc###.3gppnetwork.org' instead of provisioned destinationrealm when set to no: regular S6ad DRA.
- **s6adUeTimeZoneRetrieval** - S6ad UE time zone retrieval - This flag is used to enable the retrieval of UE time zone information. no (default) - indicates that UE time zone retrieval is not enabled. yes - indicates that UE time zone retrieval is enabled.
- **s6aFaultContinueProcedureWithAkaOptional** - S6A fault continue procedure with AKA optional - This flag determines whether processing will continue without authentication when there are no active enabled S6a links for the home PLMN and it has been determined that authentication is optional. no (default) - processing will not continue without authentication. yes - processing will continue without authentication.
- **s6aHssUpdateEnbCapacity** - S6A HSS update eNB capacity - This flag identifies how HSS links will be monitored.
- **s6aReportPreviousHssSelectionForHssDown** - S6A Report Previous HSS Selection For HSS Down - Parameter controls feature activation. By default, flag parameter shall be disabled. When enabled, if an HSS selection rule is found (matched) and no HSS available (all links down for hssGrp selection) report 'hssOrEirDown' even when no other HSS selection (fall-back) rule is provisioned. Else continue reporting 'noProvisionedHss' when no HSS can be found and no other available HSS selection rule is provisioned. In other words, when a single no IMSI group does not have (imsiToHss) is found with an HSS association provisioned, MME shall consider the 'noProvisionedHss'. Otherwise existing functionality shall be used, which looks at all IMSI group availability/provisioning before declaring unavailable or down.
- **s6aRetryDifferentHss** - S6AD retry different HSS - When WMM receives certain errors from HSS (too busy, out of space, etc) or HSS does not respond, WMM sends the same request to another HSS in the same PLMN or IMSI range.
- **s6dDiameter** - allow SGSN S6d/Gr Selection - Use this parameter to allow SGSN S6d/Gr Selection.
- **scefHighLatencySupport** - SCEF high latency communication support - This parameter indicates to the MME whether SCEF supports buffering of MT data if UE is not reachable due to power savings.

- **secureHandlingOfAttachTau** - Secure Handling of Attach and TAU Requests - The parameter is used to enable the secure handling of Attach and TAU Requests if these messages fail integrity checks.
- **selectedPgwFormat** - Selected PGW Format - selectedPgwFormat parameter controls how the MME formulates the selected PGW information inside the MIP6-Agent-Info AVP, which the MME sends on the S6a NOR and the S6a ULR (Active-APN AVP(s)). When 'selectedPgwFormat' is set to value
- **selectiveVolteEmerAllowed** - Selective volte enablement feature emergency call handling - If selectivevolteenabled is enabled, allow/disallow IMS emergency call.
- **selectiveVolteEnabled** - Selective volte enablement feature - Enable/Disable selective volte enablement to deny certain types of UEs access to LTE.
- **sendCallRelOnSlrEmerOrigFailure** - Send Call Release On SLR Emergency Call Origination Failure - When the parameter is Yes, if the MME sent LRR Emergency Origination to the GMLC and did not receive a successful LRR ACK, the MME will send LRR Emergency Release when the Emergency bearer is removed or deleted. When the parameter is No, LRR Emergency Release is sent after receiving a successful LRR ACK for the LRR Emergency Origination.
- **sendDdnAckWithContextNotFoundForAbnormalSgwSwitchover** - Send DDN Ack with Context Not Found for Abnormal SGW Switchover - Parameter controls feature activation. By default, flag shall be disabled. When enabled, MME upon getting a DDN with a CV of 254, and if the TEID is recognized but the DDN is from the wrong SGW, the MME shall respond with a DDN Ack, with a TEID of 0 (zero), with the same sequence number as in the DDN, and with a CV of 64 (context not found), back to the sending (wrong) SGW, so that SGW will know to clean up automatically.
- **sendDeleteSessionReqForIntersystemRau** - Send Delete Session Request for Intersystem RAU - Parameter controls sending Delete Session Request to SGW upon receiving Cancel Location Request from HSS with cancellation Type=MME Update Procedure during Gn based Inter System RAU and S3 based Inter System RAU with SGW relocation. By default the flag shall be disabled.
- **sendEquivalentPlmnListOnlytoEnbInHandoverRestrictionList** - Send Equivalent Plmn List Only to Enb in Handover Restriction List - Parameter controls feature activation. By default, the flag shall be disabled. When enabled, MME shall send Equivalent Plmn List only to eNB in Handover Restriction List. Sending to the UE shall be suppressed even if ePLMN List Name is provisioned. When gparm is disabled, if ePLMN List Enb is empty, ePLMN List shall be copied.
- **sendEsmDummyAttachPdnRejected** - Send ESM Dummy Attach PDN Rejected - MME sends Attach Accept with ESM Dummy esmMsgContainer, if PDN is Rejected and Attach is accepted, for Attach Request with PDN Connectivity Request, from an UE supporting and allowed for, registration without PDN Values: Yes - Send Attach Accept with esmMsgContainer -> ESM DUMMY message No - Send Attach Accept with esmMsgContainer -> PDN CONNECTIVITY REJECT message

- **sendForbiddenTaiListDCsOnly** - Send forbidden TAI list for data centric CS voice only - UE usage setting is data centric and voice domain preference is CS only. if **sendforbiddentailistdcsonly** is yes, send the forbidden TAI list.
- **sendForbiddenTaiListDCsPrefer** - Send forbidden TAI list for data centric CS voice preferred - UE usage setting is data centric and voice domain preference is CS preferred, IMS secondary. if **sendforbiddentailistdcprefer** is yes, send the forbidden TAI list.
- **sendForbiddenTaiListDlmsOnly** - Send forbidden TAI list for data centric IMS PS voice only - UE usage setting is data centric and voice domain preference is IMS only. if **sendforbiddentailistdimsonly** is yes, send the forbidden TAI list.
- **sendForbiddenTaiListDlmsPrefer** - Send forbidden TAI list for data centric IMS PS voice preferred - UE usage setting is data centric and voice domain preference is IMS preferred, CS secondary. if **sendforbiddentailistdimsprefer** is yes, send the forbidden TAI list.
- **sendForbiddenTaiListNone** - Selective volte enablement feature send forbidden TAI list none - UE does not indicate both UE usage setting and voice domain preference. if **sendforbiddentailistnone** is yes, send the forbidden TAI list.
- **sendForbiddenTaiListVCsOnly** - Send forbidden TAI list for voice centric CS voice only - UE usage setting is voice centric and voice domain preference is CS only. if **sendforbiddentailistvcsonly** is yes, send the forbidden TAI list.
- **sendForbiddenTaiListVCsPrefer** - Send forbidden TAI list for voice centric CS voice preferred - UE usage setting is voice centric and voice domain preference is CS preferred, IMS secondary. if **sendforbiddentailistvcprefer** is yes, send the forbidden TAI list.
- **sendForbiddenTaiListVlmsOnly** - Send forbidden TAI list for voice centric IMS PS voice only - UE usage setting is voice centric and voice domain preference is IMS only. if **sendforbiddentailistvimsonly** is yes, send the forbidden TAI list.
- **sendForbiddenTaiListVlmsPrefer** - Send forbidden TAI list for voice centric IMS PS voice preferred - UE usage setting is voice centric and voice domain preference is IMS preferred, CS secondary. if **sendforbiddentailistvimsprefer** is yes, send the forbidden TAI list.
- **sendFwdRelCancelAndHoPrepFailure** - Send Forward Relocation Cancel and HO Preparation Failure - Parameter controls sending Forward Relocation Cancel and HO preparation failure message upon indirect forwarding failure at SGW. By default the flag shall be disabled
- **sendingMBR** - Sending MBR - Sending modify bearer request.
- **sendLtemRatTypeToScef** - Specifies whether the MME can send the 'LTE-M' RAT to the SCEF in T6a CMR message.
- **sendLtemRatTypeToSgw** - Specifies whether the MME is to send the 'LTE-M' RAT Type to SGWs for UEs that are identified as LTE-M..

- **sendMappedGuami** - Current parameter enables sending in S1 Setup Response mapped GUMMEI(s) pointing to the AMF GUAMI(s) for the associated PLMN(s) that coexist in both 4G and 5G at local CMM node
- **sendMaximumUeAvailabilityTimeInNor** - Send Maximum UE Availability Time in NOR - Parameter controls support for sending maximum ue availability time to hss in NOR message. By default the flag shall be disabled.
- **sendNasRanCauseOnS11** - Send NAS RAN cause on S11 - Indicates whether (Yes) or not (No) to send the NAS or RAN failure indication code on the S11 interface to the SGW.
- **sendNorWithPgwInfoAfterTauUla** - Send NOR with PGW information after TAU ULA - Send NOR with PGW information after TAU ULA.
- **sendPdnConnRejWithReactReq** - Send PDN Connectivity Reject With CC#54 (PDN connection does not exist) - Parameter controls sending PDN Connectivity Reject with cause code #54 (PDN connection does not exist).. By default the flag shall be No.
- **sendRabrDuringDoubleS1ServiceRequest** - Send Release Access Bearer Request During Double S1 Service Request - When enabled, upon receiving Double S1 Service Request, MME shall release the old S1 connection before sending any Modify Bearer Request to SGW. MME shall send Release Access Bearer Request to SGW to release the old S1U connection on SGW for the UE. As a result SGW shall not send data over the old S1U to the enB during the Double S1 procedure. By default, flag shall be disabled.
- **sendRabUponEcmConnectedDdn** - Send RAB upon ECM-CONNECTED DDN - Specifies whether MME shall send DDN ack with cause 'Unable to page UE', followed by a release access bearer (RAB) to the SGW upon the receipt of a DDN for a ECM-CONNECTED UE.
- **sendRequestedApn** - Send requested APN - This parameter indicates to send either the UE requested APN-NI or the replacement APN-NI.
- **sendSgw3gppNasRanCause** - Send SGW 3GPP NAS ran cause - Enable/disable inclusion of NAS or RAN failure indication cause code on S11 interface to SGW.
- **sendSgw3gppS11cc** - Send SGW 3GPP S11 cause code - Sent in GTPv2 message to SGW across S11 interface. a value of 'Yes' indicates that MME shall support and send cause code 110 to SGW.
- **sendUeUnreachable** - Send UE UN_REACHABLE - Parameter controls MME behavior related to SGs Paging and specifically controlling if/when an SGs Paging Reject is sent (with UE_UNREACHABLE). Parameter allows customization of when an SGs Paging Reject is sent with a cause of UE_UNREACHABLE. When the global parameter flag is disabled, an SGs Paging Reject with the UE_UNREACHABLE cause is sent when the MME is unable to page the UE (i.e., due to UE inactivity or MME paging suppression). When the global parameter flag is enabled, the MME will also send an SGs Paging Reject with the UE_UNREACHABLE when MME paging times out trying to reach the UE. By default, flag shall be disabled.
- **sendUpdatedRfspReceivedInIdr** - Send Updated RFSP Received in IDR - Parameter controls sending updated Subscriber Profile ID IE to eNb in UE Context Modification

message. By default, the flag shall be disabled. When enabled, MME shall send updated Subscriber Profile ID IE that it receives in IDR message from HSS to eNb in UE Context Modification message.

- **serveS6dClrBySgsnOnly** - Serve S6d CLR by SGSN Only - Current parameter controls the handling of s6d CLR (cancellation-type= initial attach procedure) with the 'S6a/S6d-Indicator' flag indicating the SGSN as the affected part of combo node. When the parameter is disabled and the UE isn't found in SGSN side, then the CLR is forwarded to the MME side for 4G detach. When the parameter is enabled then the CLR isn't forwarded to the MME side for 4G detach
- **serviceGapControlActive** - Service Gap Control Active - Global Feature Flag for the Service Gap Control Feature
- **serviceGapControlSendBackoffTimer** - Service Gap Control Backoff Timer - Specifies whether the MME is to provide the UE with a backoff timer in case the UE access is blocked due to the Service Gap Control Feature
- **serviceModifiersWithLabelMatching** - Service Modifiers with Label Matching - Parameter controls feature activation flag. By default, flag shall be disabled. When enabled, MME shall support the following four service combinations: +nc-nr+ue, +ue, +nc-nr, and no modifiers.
- **serviceReqRateLimitOverride** - Number of UE initiated service requests allowed per sec per CPPS after which CPPS starts dropping service requests until rate is below limit.
- **serviceReqRateLimitOverrideSRS** - Number of service requests (that requiring SRS) allowed per sec per CPPS, after which CPPS starts rejecting service request until rate is below limit.
- **servingNodeInLRR** - Serving node in LRR - If this parameter is set to 'Yes' then then MME shall include the serving node AVP in LRR of all location scenarios.
- **sessionRestoration** - Session Restoration - Enable Session Restoration
- **setCapdegradeOn2gcipherGea1** - Set 2G capacity degrade percentage for GEA1 ciphering algorithm.
- **setCapdegradeOn2gcipherGea2** - Set 2G capacity degrade percentage for GEA2 ciphering algorithm.
- **setCapdegradeOn2gcipherGea3** - Set 2G capacity degrade percentage for GEA3 ciphering algorithm.
- **setlaiForGutiAttach** - Set IAI for GUTI attach - Set initialattachindication in ULR for GUTI attach when UE IMSI is not received directly from the UE during the ongoing attach procedure.
- **sgs** - Recovery of 3GPP CSFB services of UE using SRS.
- **sgsAssStateCsfbEmergencyCall** - SGS ass state CSFB emergency call - Configure to change the SGs association state to SGS-NULL.

- **sgsLinkLock** - SGS link lock - Enable/Disable support of MME to change SCTP state when locking SGs links.
- **sgsLiteDetachIndicationAttempts** - Detach indication attempts - Configure maximum number of transmit attempts for SGsLite-IMSI-DETACH-INDICATION message.
- **sgsLiteLocationUpdateAttempts** - Location update attempts - Configure maximum number of transmit attempts for SGsLite-LOCATION-UPDATE message.
- **sgsLiteUplinkDataAttempts** - Uplink data attempts - Configure maximum number of transmit attempts for SGsLite-UPLINK-UNITDATA message.
- **sgsnCsfbReturnLastPlmn** - SGSN CSFB return last PLMN - Configure SGSN to support return UE to last PLMN by including the last used LTE PLMN ID into the equivalent PLMN list provided to the UE in RAU accept message.
- **sgsnDiscoveryMethod** - SGSN discovery method - Method used to discover SGSN IP address for inter-rat handover to UTRAN/GERAN.
- **sgsnId** - SGSN ID - This parameter defines the SGSN identifier, SGID. Possible identifier values range from 1 to 31. 0 means not used.
- **sgsnInformImplicitlyDetachedUEs** - SGSN informs Implicitly Detached UEs - This parameter controls if the SGSN shall take action to inform UEs that have been implicitly detached due to PAPS reset that their MM context has been lost.
- **sgsnIntPreluGbSessionResiliency** - SGSN support for Internal Preparation for Lu Gb Session Resiliency - Enable SGSN support for Internal Preparation for Lu Gb Session Resiliency. Warning: For Nokia personnel only.
- **sgsnIpAddrCmpSgwSel** - SGSN IP Address Comparison During SGW Selection - Current gParm enables S4 SGSN recognizing that same SGW has been selected during inter-PLMN mobility (RAU and handover) by comparing the IP addresses of the source and target SGW(s).
- **sgsnIpv4AddressForUserTraffic** - SGSN IPv4 address for user traffic - SGSN IPv4 address for user traffic to support the SGSN context acknowledge message sent from the MME during a gn/gp SGSN to MME TAU
- **sgsnMonLogSheddingDuringOverload** - Monitor Logs Shedding During Overload - This parameter handles shedding of SGSN Monitoring Logs during overload in PAPS. Warning: For Nokia personnel only.
- **sgsnNumberSending** - SGSN Number Sending - This parameter is to control sending SGSN number to HSS via diameter to HSS. By default, this parameter is set to No, which means Not Send.
- **sgsnPoolId** - SGSN pool ID - This parameter defines the SGSN pool identifier. Possible values range from 0 to 3.
- **sgsnUseCclnApnForR8DnsPgW** - SGSN use of Charging Characteristics in APN for R8 DNS query for P-GW selection - Defines if SGSN will add Charging Characteristics in APN for

Rel-8 DNS query for P-GW selection. - 'No' (default) CC is not added - 'Yes' CC added when APN is in the apnList and marked to use CC for Rel-8 DNS P-GW selection

- sgsSvMscPreference - SGS Sv MSC preference - Configure UE assignment preference for MSC supporting both SGs and Sv interface.
- sgwIsolationFaultThreshold - SGW isolation fault threshold - This command is used to provision SGW fault threshold for the SGW isolation. If the number of the SGW faults (number of S11/S4 create session response timeouts) exceed the provisioned threshold in a provisioned duration timer then WMM will isolate the SGW from the selection for provisionable duration.
- sgwRelocationOnMbrFailure - SGW relocation on MBR failure - Enable SGW relocation if MME times out waiting for SGW response to modify bearer requests or modify access bearer request.
- sgwRelocationRestriction - SGW relocation restriction - If the feature is activated then, MME shall not perform SGW relocation for TAU request, X2 HO, S1HO and MME relocations.
- sgwSelectionWithSnaptr - SGW selection with snaptr - Enable/Disable support for SGW selection with snaptr.
- sgwSelForHomeRoutedGwSelMode - SGW Selection for GW Selection Mode 1 - Parameter controls feature activation flag. By default the flag shall be disabled. When enabled MME shall then if the UE is a home-routed roamer, the s8-gtp order and preference for each of the SGW candidates will be used to determine which SGW to select instead of the order and preference for s5-gtp, and also the selection of an SGW that supports only s8-gtp and not s5-gtp will be supported.
- sgwToEnblpv4v6TransportLayerAddress - SGW IPv4v6 Transport Layer Address IP Type - MME passes SGW S1-u IPv4v6 Transport Layer Address to the eNB/gNB if it received this IP Type from the SGW and this parameter is set to YES. Otherwise MME matches S1-C IP Address Type and passes it to the eNB/gNB.
- shortDataService - Short data service - Enable/disable short data service at MME level.
- signalingOnlyUe - Signaling only UE - Enable/disable feature 'MME support for UE with signalling connections only.
- singlePdpPerApnSgsn - SGSN allows one PDP Per APN - This parameter enables restriction the number of active PDPs towards same APN to one. When the parameter is not set (by default), the UE may have multiple active PDP(s) towards same APN. When the parameter is set, then UE is allowed having only one active PDP towards same APN.
- singleThreadOlcSheddingEffectiveness - Single Thread OLC Shedding Effectiveness - When enabled, OLC will determine the effectiveness of shedding during a single thread CPU overload. If shedding is ineffective, then OLC will turn shedding off, else the shedding will continue. This feature applies to IPDS and CPPS.
- skipSubscriptionData - Skip subscription data - HSS may skip subscription data in the ULA if subscription data has not changed since last successful update.

- skipUlrForSgsnToMmeTau - Skip ULR for SGSN to MME Tracking Area Update - Parameter controls sending NOR message to HSS at the end of SGSN to MME TAU procedure (applies to both Gn and S3 SGSN) instead of ULR, for the case where subscription data is already available in MME. By default the flag shall be disabled
- slgRetryLrrEmergencySameDra - SLG Retry LRR Emergency Same DRA - This parameter will control MME to retry the same DRA/GMLC when MME receives Diameter error 3002 (DIAMETER_UNABLE_TO_DELIVER). If the parameter is enabled, MME will retry the diameter message in SLG the same DRA for LRR related with emergency. If the parameter is disabled, MME will keep existing function (i.e. no retry). By default, the parameter is disabled.
- slrEmergencyInitiationDedicatedBearer - SLR emergency initiation based on dedicated bearer - SLR emergency initiation based on dedicated bearer.
- slrSenderDuringHandover - SLR sender during handover - Specifies whether the source or target MME sends the SLR to the GMLC during handover. the default is the target MME.
- smfPgwcSelSupport - SMF Combo PGW-C Selection support - Selection of combo PGW-C is done using only HSS subscription information as criteria, without considering UE N1 mode support
- smsInMme - SMS in MME - Activate the SMS in MME feature. This feature enables the possibility to deploy the SMS service without the use of the CS domain.
- sourceMmeRelocSgsDetach - Source MME reloc send SGs detach - This flag controls whether the source MME for a SGS associated UE (i.e. a combined attach UE) will send an SGs detach message to the MSC/VLR following a successful relocation. yes - source MME sends a SGs detach message to the MSC/VLR following a successful relocation no - source MME do not sends a SGs detach message to the MSC/VLR following a successful relocation.
- spcmdSheddingDuringOverload - SPCMD Shedding During Overload - This parameter handles shedding of SGSN PCMD records during overload in PAPS
- srvcc - MME support of SRVCC with the parameters obtained from the SRS.
- srvccCollSendDbrCc110 - SRVCC Collision Send Del brr response - Global Parameter flag 'srvccCollSendDbrCc110' controls the feature activation. By default the flag shall be disabled. When enabled, MME shall support sending Delete Bearer Response with Cause Code 110 during SRVCC collision.
- srvccForAllImsEme - SRVCC for all IMS EME - Use the srvccforallimseme to ensure all UEs making an IMS emergency call (and supporting SRVCC) will be allowed to perform SRVCC.
- staticGwSelection - STATIC GGSN/GW SELECTION - StaticGwSelection shall be used to control static GGSN/GW selection for SGSN. When it's set, then the new function f52070-01 (configured GWs) will apply. Otherwise, exist function will be used.
- stdPraActionAddProcs - Standard PRA Action Additional Procedures - Enables MME to react upon received PRA action for standard PRA, when MME receives new PRA action

from SGW/PGW during 5GS to EPS mobility, or during PDN setup for a PDN being handed over from ePDG. Applied when Enable Presence Reporting Area functionality is set to Yes. For modify action also the PRA Modify Enabling parameter must be set to Yes.

- **stdsNotifyResponse** - Stds notify response - Standards specified MME behavior upon receiving notify response from HSS.
- **stopWarningIndication** - Stop warning indication - Sending of STOP WARNING MESSAGE TO the CBC.
- **subscriberDataExtraction** - Subscriber Data Extraction - Enable/disable periodic subscriber data extraction
- **supportAlternateGwReselection** - Support alternate gw reselection feature - If enabled, the feature does not check the source bit of cause IE received in create session response for reselection of GW on failures instead MME uses the cause code to determine GW reselection.
- **supportApnCorrection** - Support APN correction - Configure whether or not APN correction is enabled.
- **supportAsstData** - Support Assistance Data - Parameter controls the support for Assistance Data for Recommended Cells info that MME receives info in the S1 CONTEXT RELEASE COMPLETE message shall store it in the VLR and shall include the IE in the paging message. The IE in UE CONTEXT RELEASE COMPLETE that contains the info is 'Information on Recommended Cells' and eNBs for Paging. The info from this IE shall be stored in VLR until a new UE CONTEXT RELEASE COMPLETE message is received. The contents of this IE shall be used to populate Assistance Data for Recommended Cells IE of the Assistance Data for Paging of S1AP PAGING. By default the flag shall be disabled.
- **supportCatM1b** - Support category M1 CE mode b UE - Support category M1 CE mode b UE.
- **supportCmasRestriction** - Support cmas restriction - Feature activation per MME.
- **supportCppsAutoPersonalityChange** - Support CPPS Auto Personality Change - Parameter controls whether CMM changes CPPS personality between EMMS and AMMS based on 4G and 5G traffic load.
- **supportCsgChangeReporting** - Support CSG change reporting - Is support for CSG change reporting to be provided?.
- **supportDedicatedBearerUli** - Support dedicated bearer ULI - Enable or disable ULI enhancement for dedicated bearer activation, update and delete bearer response messages.
- **supportDelayedNor** - Support delayed NOR - Delay NOR when the HSS is unavailable.
- **supportDelayedUlr** - Support delayed ULR - Delay ULR when the HSS is unavailable.
- **supportDfltBearerOperDefQci** - Support Default Bearer Operator Defined Qci - Enable or Disable the support for Default Bearers to use Operator Defined QCIs

- supportDnsSrv - Support DNS SRV - MME support for service (SRV) resource records (RR) for MME DNS discovery of MME/PGW/SGW/SGSN.
- supportDupAppProtDnsRec - Support Duplicate 'app-protocol' DNS Records - When this parameter is enabled, the MME does not discard DNS records carrying multiple app-protocol entries of the same app-protocol value, and the MME assumes that the record supports the superset of the supported services across the multiple app-protocol entries.
- supportEdrxRelatedRat - Support eDRX Related RAT - Parameter controls eDRX related RAT support by MME. By default the flag shall be disabled. When the gparm is off existing behavior (i.e. if eDRX-Cycle-Length-Withdrawal is provided the edrx cycle length is removed for both nb-iot and e-utran). If the gparm is enabled, then the only edrx-cycle length deleted will be what the AVP specified. By default, the flag shall be disabled.
- supportForAiMlFunctionalities - Support for AI/ML functionalities in CMM - This global parameter can be used to enable or disable Artificial Intelligence and Machine Learning (AIML) capabilities in a CMM. By default the global parameter should be disabled (set to No). The AIML functionalities are only applicable to CNF based CMMs, hence, this parameter should always be disabled in VNF based CMMs. When enabled, the Machine Learning Intelligence Service (MLIS) will setup client-server connections with call processing pods for data streaming. When enabled, MLIS pod will collect necessary data to serve AIML algorithms/models in the CMM.
- supportFullUeRestoration - Full 4G SRS Restoration - If this gparm is enabled full UE Contexts will be stored in the Backup. Restorations will take place on the Full UE Contents. This feature allows rolling update of DBS for 4G in Containers
- supportImeiDigitValidation - Support IMEI digit validation - This command enables/disables IMEI validation.
- supportImsIimeiApnEnh - Support IMS IIMEI APN enhancement - Parameter controls feature activation. By default the parameter shall be disabled. When enabled, MME shall use the replacement APN NI in the DNS query. Replacement APN NI shall be sent in the Create Session Request towards SGW. QoS and other parameters shall be used from the subscription data. In addition, MME shall send the NOR message with default APN context identifier
- supportMmeSrvcc - MME Supporting 5G-SRVCC - Enables the MME functionality to act in the intermediary role of the MME_SRVCC (MME supporting 5G-SRVCC) to perform the 5G-SRVCC handover for regular voice calls from NG-RAN/5GS to 3GPP UTRAN/CS domain.
- supportMmeSrvccEmergency - Support MME_SRVCC Emergency - Enables the MME functionality to act in the intermediary role of the MME_SRVCC (MME supporting 5G-SRVCC) to perform the 5G-SRVCC handover for emergency calls from NG-RAN/5GS to 3GPP UTRAN/CS domain.
- supportModifyAccessBearerRequest - Support modify access bearer request - Support for S11 modify access bearer request message.

- supportMsisdnInEcrMsg - Support MSISDN in ECR message - When set to yes, MME shall populate MSISDN AVP in the ECR message towards EIR that is sent across S13/S13' interface as part of ME identity check procedure.
- supportNonhomeTaiLaiMapping - Support Non-home TAI/LAI Mapping - Feature activation for Non-home TAI/LAI Mapping
- supportOrigTimeStampMaxWait - Support Origination Time Stamp and Maximum Wait Time IE - Parameter controls support for Origination Time stamp and Maximum Wait Time IE inclusion in Create Session Request message. By default this flag shall be disabled. When enabled, MME shall include Origination Time stamp and Maximum Wait Time IEs in Create Session Request that is sent on S11 message to gateways.
- supportQoSOverride - Support QoS Override - Parameter controls the feature activation. By default this shall be disabled. When enabled, MME shall support HSS/P-GW QoS Parameter Override for home subscribers
- supportReattachRequired - Support reattach required - Enables/Disables the ability to detach the UE based on the bit 'Reattach-Required' bit received from HSS.
- supportSbcAccessControl - Support SBC access control - When support SBC access control set to yes, access control list for SBC provisioned on the MMERmtEndPtCfgr is used for access control of SBC.
- supportSdsUeRestoration - Support SDS UE restoration - When enabled, MME supports sending data for SDS UEs to SRS.
- supportSessionRestoration - Support session restoration - Support session restoration or not.
- supportSgsnOperDefQci - Support SGSN Operator Defined QCI - Defines if SGSN supports the provisioned Operator Defined QCI. Up to 32 SGSN supported Operator Defined QCI can be defined via CLI oprDefQciToRel99QoSMapping
- supportSignalingOnlyUeRestoration - Support signaling only UE restoration - When enabled, MME supports sending data for signaling-only UEs to SRS.
- supportTwoUeBearersForDualPdnType - Support two UE bearers for dual PDN type - Support two PDN connections to the same APN if the value is 'false', then 2 PDN connections to the same APN shall not be allowed.
- supportUeRestorationContextDeletion - Support UE restoration context deletion - Enables/Disables UE restoration context deletion functionality on MME.
- suppressRegisteredLai - Suppress Registered LAI - If the feature is enabled (Yes) then MME shall not include the Registered LAI IE in the S1AP INITIAL CONTEXT SETUP and UE CONTEXT MODIFICATION REQUEST messages
- suppressSendingAltGnGgsnAddress - Suppress Sending Alternate Gn GGSN Address - MME shall be provisioned with a global parameter flag that controls sending two IEs (Alternative GGSN Address for control Plane and the Alternative GGSN Address for

user traffic IEs) in forward relocation message and context response message during handover scenario. By default, the flag shall be disabled.

- **supptIMSIIMEIAPNconv** - Support IMSI IMEI APN conversion - Support IMSI IMEI APN conversion.
- **switchPdnToLipa** - Switch PDN to LIPA - Enables MME to dis-connect a LIPA enabled PDN Connection and to re-establish it when UE in idle mode performs a TAU in a LIPA area. MME detaches UE with 're-attach required' to trigger UE to re-establish the PDN connection in the LIPA area.
- **t6aDiamOverloadControl** - T6A diam overload control - Enable(Yes)/disable(No) T6A overload control.
- **t6aRetryDifferentScef** - T6A retry different SCEF - When MME gets some errors from SCEF (too busy, out of space, etc) or SCEF does not respond, MME sends the same request to another SCEF in the same PLMN.
- **tappingActivated** - Status of MME/SGSN Tapping functionality - This parameter controls the activated/deactivated status of MME/SGSN Tapping
- **tauDdnCollision** - TAU DDN collision - Configure MME handling TAU request collision with an ongoing DDN procedure.
- **tauRateLimitOverride** - SGSN to MME IRAT TAUs allowed per sec after which MME start dropping SGSN to MME IRAT TAUs until rate is below limit.
- **tauSgsUnknownLaiEmmCause** - TAU SGs Unknown LAI EMM Cause - The parameter is used to provision EMM cause code to be sent to UE combined TAU request if MME fails to select MSC due to LAI to TAI to MSC mapping provisioning errors.
- **teidToSgsn** - Tunnel endpoint identifier data to SGSN - Tunnel endpoint identifier data II information element parameters to support the SGSN context acknowledge message sent from the MME during a gn/gp SGSN to MME TAU enum takes all zero and all ones.
- **threegAttachRateLimitOverride** - 3G attaches allowed per sec per PAPS after which PAPS start dropping attaches until rate is below limit.
- **threegAttachRateLimitOverrideAtlpds** - 3G Attach Rate Limit Override - 3G Attaches allowed per sec per PAPS after which PAPS start dropping attaches until rate is below limit at IPDS
- **threegControlMsgLimit** - 3G control message limit - 3G control messages per second without ciphering. Warning: For Nokia personnel only.
- **threeglsauRateLimitOverride** - Number of 3G ISRAUs allowed per sec per PAPS, after which PAPS starts dropping 3G ISRAUs until rate is below limit.
- **threeglsauRateLimitOverrideAtlpds** - 3G Isau Rate Limit Override - Number of 3G ISRAUs allowed per sec per CPPS, after which CPPS starts dropping 3G ISRAUs until rate is below limit at IPDS

- **timeBasedAuthFrequency** - Time Based Authentication Frequency - Parameter controls feature activation. By default, the flag shall be disabled. When enabled, MME shall support time-based authentication in accordance with new option(s) defined in UE PLMN Services and IMSI Range Services configuration.
- **timeZoneUpdateRate** - Time zone update rate - Configure time zone update rate.
- **timeZoneUpdateThrottling** - Time zone update throttling - Activate controlling the rate of time zone updates to PGW due to DST change.
- **tmsiBasedNriMscSelection** - TMSI based NRI MSC selection - When set to yes enables the capability to map NRI in TMSI received from the UE to a MSC so that SGs update location is sent to the same MSC as UE was registered with previously to avoid dual VLR registrations. enabling of this feature also requires an operator to provision a non-broadcasting LAC and also NRI for each provisioned MSC. when set to no disables the feature.
- **topologicalLabelMatchingForS8pgwSelection** - Topological label matching for S8 PGW selection - This parameter controls whether or not topological label matching is used to compare the selected SGW FQDN labels with the candidate S8 PGW FQDN labels when selecting a PGW candidate for roaming. when the topological label matching for S8 PGW selection parameter is set to false, the MME will not attempt to use label matching to select the PGW but instead use just the DNS order and preference values. when the parameter is set to true, the MME will use the same label matching algorithm used for S5 PGW selection for S8 PGW selection. when this parameter is set to true, it is up to the service provider to ensure that the labels provided in the SGW and PGW FQDNs are consistent so that label matching will be effective. in particular, the SGW and PGW FQDN values provisioned in the DNS server for MNC and MCC must match.
- **topologicalSGWselectionIRAT** - Topological SGW Selection IRAT - Performs topological matching of SGW to PGW for iRAT TAU and GW Selection Mode 2, when the PGW FQDN had been derived from the PGW IP address, even when pre-existing APNs for the bearers have PLMNs that don't match the UE's selected PLMN
- **tracAreaRelativeCapacity** - Trac area relative capacity - Enable/disable feature to MME support of configuration of MME relative capacity.
- **trafloadCombPgw3XUe** - Traffic Load to Combo PGW-C for 3X capable UE - This parameter controls percentage (0% - 100%) of traffic that shall be sent to combo PGW-C for 3X UE(s) eligible using combo PGW-C. If parameter is set to 0%, then MME shall not send any traffic to combo PGW-C.
- **trafloadCombPgwN1Ue** - Traffic Load to Combo PGW-C for N1 capable UE - This parameter controls percentage (0% - 100%) of traffic that shall be sent to combo PGW-C for N1 UE(s) eligible using combo PGW-C. If parameter is set to 0%, then MME shall not send any traffic to combo PGW-C.
- **treatGbrTauActiveTau** - Treat GBR TAU active TAU - Enable(Yes)/disable(No) the feature during TAU request with GBR bearers present regardless of active flag value. if set to yes, then MME shall check to determine whether an ECM-IDLE UE has any GBR bearers

when TAU request is received. if yes, MME shall treat the TAU request as though TAU request is received with active flags set regardless of active flags setting in the received TAU request and bring up all the bearers. this feature applies to both relocating and non-relocating TAU.

- **treatIratTauActiveTau** - Treat inter TAU active TAU - Controls to determine whether or not the active flag is treated as if it were set whenever interrta TAU requests are processed.
- **treatMip6AgentInfoInIidrAsOneEntity** - Treat MIP6Agent-Info in IDR as one Entity - GPARAM controls the support for treating the MIP6-Agent-Info in IDR as one entity rather than individually modifiable elements. When the GPARAM is enabled MME will treat MIP6-Agent-Info in IDR as one entity, By default this shall be disabled.
- **twogAttachRateLimitOverride** - 2G attaches allowed per sec per PAPS after which PAPS start dropping attaches until rate is below limit.
- **twogControlMsgLimit** - 2G control message limit - 2G control messages per second without ciphering. Warning: For Nokia personnel only.
- **twogDataMsgLimit** - 2G data message limit - 2G data messages per second without ciphering. Warning: For Nokia personnel only.
- **twogGnThroughput** - 2G Gn throughput - 2G Gn throughput (Mbps). Warning: For Nokia personnel only.
- **twogImpactOfCiphering** - 2G impact of ciphering - 2G impact of ciphering (%). Warning: For Nokia personnel only.
- **twogIsauRateLimitOverride** - Number of 2G ISRAUs allowed per sec per PAPS, after which PAPS starts dropping 2G ISRAUs until rate is below limit.
- **twogMaxPktsConcurrentDataPresence** - 2G max packets concurrent data presence - Max 2G control packets due to concurrent 2G data presence. Warning: For Nokia personnel only.
- **twogUeThroughput** - 2G UE throughput - 2G UE throughput (Mbps). Warning: For Nokia personnel only.
- **twothreegAttachRateLimitOverride** - Number of 2G and 3G ISRAUs allowed per sec per CPPS, after which CPPS starts dropping 2G and 3G attaches until rate is below limit.
- **ubrRejCauseDuringIratRedirect** - UBR Reject Cause During Interrat-Redirection - A user specified GTPv2 cause to be used within the Update Bearer Response sent back to the SGW, when the Update Bearer Request is received during an interrta-redirection scenario.
- **ueCpToUpBearerSwitch** - Enable UE Triggered CP to UP Bearer Switch - If this parameter is set, the MME shall proceed with the UE request to switch CP bearers to UP. If the parameter is not set, the MME shall reject the UE request to switch CP bearers to UP.
- **ueCtxUpdateInPatchLoadSupport** - Support for UE Context Update Over NR10 in Patch Loads - Support for UE Context Update over NR10 in patch loads

- **ueEnbServingCellChangeReporting** - UE eNB serving cell change reporting - Indicates whether UE eNB serving cell change reporting is enabled or not the default is no, indicating UE eNB serving cell change reporting is not enabled.
- **ueReachTAdsInSupportedFeaturesAvp** - UE reach T-ADS in supported features AVP - A value of yes indicates that MME shall send UE-reachability-Notification and T-ADS data retrieval in the in the supported-features AVP, in the feature-list AVP, by setting bits 26 and 27 of the feature-list flags.
- **ueSrvccCapabilityHss** - UE SRVCC Capability HSS - This parameter controls the value of the UE-SRVCC-Capability AVP the MME sends towards the HSS. UE-SRVCC-Capability AVP is absent when the UE does not include MS network capability IE. MME sends UE-SRVCC-Capability AVP as 'UE-SRVCC-NOT-SUPPORTED' when the UE does not support 'SRVCC to GERAN/UTRAN capability' on MS network capability, or MME does not support SRVCC for the UE according to provisioning (as part of svcAgreementProfile). MME sends UE-SRVCC-Capability AVP as 'UE-SRVCC-SUPPORTED' if the MME supports SRVCC for the UE according to provisioning, and the UE supports 'SRVCC to GERAN/UTRAN capability' on MS network capability.
- **ueUnreachableMsgSgsEdrxPsmCause** - SGs cause code UE unreachable - Use 'UE unreachable' instead of the default 'UE temporarily unreachable' as cause code with SGs cause IE in SGs interface
- **uliEnhancement** - ULI enhancement - Indicates whether ULI enhancement is enabled or not the default is no, indicating ULI enhancement is not enabled.
- **uliHomeRoutedUe** - ULI home routed UE - This flag determines whether ULI will be included for home routed UEs. no - ULI will not be included for home routed UEs. yes (default) - ULI will be included for home routed UEs.
- **uliInS11messagesWithSgwRelocation** - Enable ULI in S11 messages with SGW relocation - A value of yes for the parameter shall indicate that the WMM will include the ULI (ECGI + TAI) for S11 messages with SGW relocation. a value of no for the parameter shall indicate that existing, 29.274 standards based IE inclusion policy shall apply.
- **unconditionallyAddHrIe** - Unconditionally Add HRL IE - When enabled, MME shall unconditionally include the Handover Restriction List IE in all S1AP messages as described within 3GPP specifications.
- **upper20BitHenbGwRouting** - Upper 20-Bit henb GW routing - Enable/disable non-standard usage of upper 20 bits of the received 28-bit henb ID to route to the henb GW.
- **use3gpplmsiHashForSgs** - Use 3GPP IMSI Hash for SGs - Specifies whether the CMM is to use the 3GPP IMSI Hash Algorithm specified in TS 23.236 for UE distribution to MSCs via the SGs interface. The default is no. When this field is set to no, the CMM shall use its proprietary IMSI hash algorithm.
- **useExplicitDetach** - Use explicit detach - Indicates whether explicit detach is used (and the MME pages the UE as part of the explicit detach procedure), or whether an implicit detach is used (and the MME does not page the UE).

- **useFailopenProfile** - Use failopen profile - Enable the use of the failopen profile for attach and PDN connectivity procedures, used for home subscribers and roamers considered as homers.
- **useHplmnforSgsInterface** - Use Home PLMN For SGs Interface - MME shall be provisioned with GPARM 'useHplmnforSgsInterface' flag. By default, this flag shall be disabled. When the flag is enabled, MME shall always use home plmn of the specific UE towards MSS across SGs interface.
- **useLocalDnsHost** - Use Local DNS Host - Use local DNS host.
- **useModifiedSbcAsn1** - Use Modified 29.168 SBC ASN.1 - Parameter controls the GPARM flag. By default, this flag shall be disabled. When the flag is enabled, MME shall use the modified version of 29.168 ASN.1.
- **useMTUpathdiscoveryforDFflag** - use MTU path discovery for DF flag - This parameter indicates whether to use MTU path discovery to set the DF flag for IP for S1mme. If it is set to yes, then DF flag will be set if MTU path discovery is enabled. If it is set to no, then the DF flag will not be set, even if MTU path discovery is enabled.
- **useNon3gppEmergencyPolicy** - Use Non-3GPP NW provided Policies for emergency calls - This parameter is used to enable MME to include the Non-3GPP NW provided policies IE in the Attach Request and TAU Request message. By default the IE is not included.
- **usePcmdZstdCompression** - Use PCMD zstd compression - When this is set to Yes, zstd compression is applied at PCMD files under /data-pcmd/ directory. When this is No, gzip compression is applied instead.
- **useTopologicalLabelMatchingAlways** - Use Topological Label Matching Always - Provisioned Parameter 'UseTopologicalLabelMatchingAlways' for Gateway selection controls whether topological matching shall be used to select SGW and PGW, regardless of whether SGW/PGW FQDN MNC/MCC identifies UE PLMN or Serving PLMN or MME Home PLMN or some other PLMN, during Attach Request procedures and to select a PGW during PDN Connectivity Request procedures. By default, GPARM shall be disabled. GPARM is valid only for GW selection mode 2 and shall not have any effect if GW selection Mode 1 is enabled.
- **valueAddedMtLrNoEsmlc** - Value added MT_LR no E-SMLC - MT_LR client type value-added do not contact E-SMLC for UE location information. If yes, when MME receives mobile terminated location request with client type=valueAdded, and activateLcsClientTypeValueAddedServices is set, the MME contacts the eNB for UE current E-CGI information. This information is sent back to the GMLC. The MME does not contact the E-SMLC to obtain any UE location information. If no, nothing change and keep existing function (i.e. MME contacts E-SMLC to obtain UE location for this MT-LR type).
- **vdpForbiddenTaiListOnVdpProfile** - VDP Forbidden TAI List on VDP Profile - Defines whether the VDP Profile associated Forbidden TAI List is sent according to global parameters or VDP Profile level parameters. When set to Yes, and MME finds a matching VDP Profile for the UE, the MME sends VDP profile associated Forbidden TAI List for

UEs according to VDP Profile level settings for UE's usage type and Voice Domain Preference, i.e. parameters Data Centric CS Voice Only Send Forbidden TAI List, Data Centric CS Voice Preferred Send Forbidden TAI List, etc. MME ignores global parameters Send forbidden TAI list for data centric CS voice only, Send forbidden TAI list for data centric CS voice preferred, etc. When a) set to Yes and MME does not find a matching VDP Profile for the UE, or b) when set to No, MME sends VDP profile associated Forbidden TAI List for UEs according to global parameters Send forbidden TAI list for data centric CS voice only, Send forbidden TAI list for data centric CS voice preferred, etc. MME ignores VDP profile level parameters Data Centric CS Voice Only Send Forbidden TAI List, Data Centric CS Voice Preferred Send Forbidden TAI List, etc.

- vlrAutoRecoveryPurgeCount - VLR auto recovery purge count - VLR auto recovery purge count when set to 0, the counter is disabled.
- warningRetransmissions - Warning retransmissions - The number of times the MME will attempt to send a S1 CMAS message to a eNB.
- warningSystemLog - Warning system log - Warning system log.
- weightedSgslmsiHash - Weighted SGs IMSI Hash - Specifies whether the MME is to use a weighted IMSI hash distribution for assigning UEs to an SGs MSC.
- writeReplaceWarningIndication - Write replace warning indication - Enable MME sending of broadcast completed area list to the CBC.
- wusProfilesEnabled - WUS Profiles Enabled - Specifies whether a WUS profile name referenced in UE PLMN Services and IMSI Range Services can be used. Default is No.
- x2hoInclSgwUlteid - X2 HO include SGW ul - Enable the E-RAB to BE switched in uplink list IE in the S1AP PATH SWITCH REQUEST ACKNOWLEDGE message irrespective of SGW relocation.
- zeroOiCsrN26Tau - Set OI flag to Zero in CSR of N26 TAU - Current parameter enables setting OI flag to value zero in Create Session Request that MME sends as part of n26 Idle mobility. When this parameter is disabled, the MME sets OI flag to 1

Name

gParmValue - Parameter value

Syntax

--gParmValue <string>

Description

Value of parameter.

Class

Optional.

Type / Range

Digit string of length 0 to 64

The gParmValue string is based on the gParmName parameter:

Name

20bitHenbld - 20 bit home eNodeB identifier

Syntax

--gParmName 20bitHenbId --gParmValue <string>

Description

Control flag for routing of S1AP HO messages based on target TAI when the target eNB with 20-bit eNB ID is not directly connected with the MME. no (default) - disable this routing. yes - enable this routing.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

2g3gPgwlIsolation - 2g3g PGW isolation

Syntax

--gParmName 2g3gPgwlIsolation --gParmValue <string>

Description

Setting to yes enables PGW isolation feature on SGSN. setting to no disables PGW isolation feature on SGSN.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

2g3gSgwlIsolation - 2g3g SGW isolation

Syntax

--gParmName 2g3gSgwlIsolation --gParmValue <string>

Description

Setting to yes enables SGW isolation feature on SGSN. setting to no disables SGW isolation feature on SGSN.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

4g5gRetPrefPlmn - 4g5g Return Preferred Plmn

Syntax

--gParmName 4g5gRetPrefPlmn --gParmValue <string>

Description

This parameter enables indicating to serving eNB the last visited 5GS PLMN as preferred indication to be used in future EPS to 5GS mobility.

List

- OFF - OFF
- ON - ON

Default

OFF

Name

acceptActFlagTauCpsrForT6aonly - Accept active flag TAU CPSR for T6A ONLY

Syntax

--gParmName acceptActFlagTauCpsrForT6aonly --gParmValue <string>

Description

Enable acceptance of TAU with active flag and CPSR to establish S1-U bearers for a UE with SCEF PDN connections only.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

Yes

Name

acceptScefRelForPsmEdrx - Accept SCEF Release for PSM eDRX

Syntax

--gParmName acceptScefRelForPsmEdrx --gParmValue <string>

Description

This gparm specifies whether the MME is to return diameter Success if the SCEF attempts to release a T6a bearer for an Idle UE in PSM or eDRX mode and unavailable for paging.

List

- No - Boolean value of no.

- Yes - Boolean value of yes.

Default

No

Name

acceptSgsPageFromNonRegMsc - Accept an SGs Page from non-registered MSC

Syntax`--gParmName acceptSgsPageFromNonRegMsc --gParmValue <string>`**Description**

This gparm specifies whether the CMM should accept and process an SGs page request from an MSC other than the currently registered MSC.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

accessRestrictionToLte - support ARD from s6d and pass it to Radio

Syntax`--gParmName accessRestrictionToLte --gParmValue <string>`**Description**

This parameter allows SGSN to support ARD from s6d and pass it to Radio. This parameter also allows MME in combi node during attach or TAU to store 'WB-E-UTRAN Not Allowed' in the DB if receives DIAMETER_ERROR_USER_UNKNOWN during location updating. If the condition such user is still in the DB e.g. the subscriber was attached in the SGSN part before, purge is not done yet. MME will send #15 CC towards UE in this case. Default value is No, it means that both SGSN/MME will keep current behavior, no changes. If the parameter is set to Yes, above function will take in place.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

activateHssUnavailBlacklisting - Activate HSS unavailable blacklisting

Syntax`--gParmName activateHssUnavailBlacklisting --gParmValue <string>`

Description

Enable the extended HSS unavailability detection and blacklisting.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

activateLcs - Activate LCS

Syntax

```
--gParmName activateLcs --gParmValue <string>
```

Description

Indicates whether or not to activate LCS.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

activateLcsClientTypeEmergencyServices - Activate LCS client type emergency services

Syntax

```
--gParmName activateLcsClientTypeEmergencyServices --gParmValue  
<string>
```

Description

Activate LCS client type emergency services.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

activateLcsClientTypeLawfulInterceptServices - Activate LCS client type Lawful Intercept
Services

Syntax

```
--gParmName activateLcsClientTypeLawfulInterceptServices --gParmValue  
<string>
```

Description

Activate LCS client type Lawful Intercept Services.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

activateLcsClientTypePlmnOperatorServices - Activate LCS client type PLMN operator services

Syntax

```
--gParmName activateLcsClientTypePlmnOperatorServices --gParmValue  
<string>
```

Description

Activate LCS client type PLMN operator services.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

activateLcsClientTypeValueAddedServices - Activate LCS client type Value Added Services

Syntax

```
--gParmName activateLcsClientTypeValueAddedServices --gParmValue  
<string>
```

Description

Activate LCS client type Value Added Services

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

aerialSubscriptionActive - Aerial Subscription Feature Active

Syntax

```
--gParmName aerialSubscriptionActive --gParmValue <string>
```

Description

Specifies whether the MME is to include aerial subscription information (if available) in S1 messaging to the eNodeB.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

alarmCmasFailure - Alarm CMAS failure

Syntax

```
--gParmName alarmCmasFailure --gParmValue <string>
```

Description

Alarm CMAS failure.

List

- Critical - Alarm level to be used for this message (Critical).
- Major - Alarm level to be used for this message (Major).
- Minor - Alarm level to be used for this message (Minor).
- None - Alarm level to be used for this message (None).

Default

None

Name

alarmFailToReceiveCmasResponse - Alarm fail to receive CMAS response

Syntax

```
--gParmName alarmFailToReceiveCmasResponse --gParmValue <string>
```

Description

Alarm fail to receive CMAS response.

List

- Critical - Alarm level to be used for this message (Critical).
- Major - Alarm level to be used for this message (Major).
- Minor - Alarm level to be used for this message (Minor).

- None - Alarm level to be used for this message (None).

Default

None

Name

alarmFailToSendCmasMessage - Alarm fail to send CMAS message

Syntax

```
--gParmName alarmFailToSendCmasMessage --gParmValue <string>
```

Description

Alarm fail to send CMAS message.

List

- Critical - Alarm level to be used for this message (Critical).
- Major - Alarm level to be used for this message (Major).
- Minor - Alarm level to be used for this message (Minor).
- None - Alarm level to be used for this message (None).

Default

None

Name

aliasApnConversionPerImsi - Alias APN Conversion Per IMSI

Syntax

```
--gParmName aliasApnConversionPerImsi --gParmValue <string>
```

Description

Parameter controls feature activation flag. By default, flag shall be disabled. When enabled, MME shall support converting the UE requested APN with the locally configured APN.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

allApns - All APNS

Syntax

```
--gParmName allApns --gParmValue <string>
```

Description

MME to store context of all PDN connections of UE on SRS.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

allowBrrDeactvtRglrDeactvt - Allow bearer deactivate regular deactivate

Syntax

--gParmName allowBrrDeactvtRglrDeactvt --gParmValue <string>

Description

Yes - enables the MME, upon receiving delete bearer request from the network during a PGW initiated PDN disconnection scenario with cause of 'Reactivation requested', to send deactivate EPS bearer context request message to the UE overriding the standard cause with 'regular deactivation'. upon receiving DEACTIVATE EPS BEARER CONTEXT ACCEPT message from the UE, the MME will send S11 delete bearer response message to the SGW. no (default) - in the scenario above, the MME will send the standard cause, 'reactivation requested', towards the UE.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

allowEdrxValue0 - support eDRX cycle 5.12s

Syntax

--gParmName allowEdrxValue0 --gParmValue <string>

Description

support eDRX cycle 5.12s. Default value is not set. In this case, MME will keep current behavior: a UE requests eDRX 0, MME responds with an ATTACH/TAU RESPONSE message with the eDRX IE not present. Since EMM currently rejects the use of eDRX 0, the UE will be paged the same as if the UE didn not request eDRX 0. When this gParm is set, then this feature function will be enable. MME will accept eDRX0, and a new paging type WB_eDRX_0 will be used

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

allowEnGnbRouting - Allow En-Gnb Routing

Syntax

--gParmName allowEnGnbRouting --gParmValue <string>

Description

Allow the use of the en-Gnb mapping to be used in routing the Enb Configuration Transfer message received at MME. When false, the en-gNB ID and TAC will be used in message routing. When true, message routing occurs using only the en-gNB ID.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

allowExtendedImsiRangeServices - Allow Extended Number of IMSIRangeServices

Syntax

--gParmName allowExtendedImsiRangeServices --gParmValue <string>

Description

This parameter determines the use of an extended range of IMSIRangeServices. When set to no the number of IMSIRangeServices is limited to 4K. When set to yes, the number of MSIRangeServices is limited to 10K.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

allowLIPAPDNWhenLITarget - allow LIPA PDN Connections

Syntax

--gParmName allowLIPAPDNWhenLITarget --gParmValue <string>

Description

Use this parameter to allow checks on LIPA PDN Connections.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

allowMixedPdnAddressAllocationTypes - Allow mixed PDN address allocation types

Syntax

--gParmName allowMixedPdnAddressAllocationTypes --gParmValue <string>

Description

When set to yes PDN type is IPv4v6, if only one of the IP versions is statically provisioned in the HSS, set the other IP version to all zeros thus also allowing for dynamic PDN address allocation.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

allowNonEmerAttachEmerArpProvCc - Allow non-emergency Attach with emergency ARP when Provisionable Cause Code feature is enabled

Syntax

--gParmName allowNonEmerAttachEmerArpProvCc --gParmValue <string>

Description

When this parameter is enabled, the MME allows non-emergency Attach for which PDN session is associated with emergency ARP, as defined in local emergency profile, that is otherwise by default rejected when the Provisionable Cause Code feature is enabled.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

allowProcEirFailure - Allow Procedure EIR Failure

Syntax

--gParmName allowProcEirFailure --gParmValue <string>

Description

Feature introduces support for enhancing the EIR support by having MME reject a user's Attach when the IMEI is explicitly blacklisted in EIR. In all other cases attach should succeed, if for example - the AVP value is different from BLACKLISTED (ie UNKNOWN, WHITELISTED or GREYLISTED) - any other Diameter Error Code received on S13 '3GPP-ME-Identity_Check' - No response received from EIR - Any other diameter error cause codes received from EIR Feature shall be controlled by GPARM flag

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

allowR8ArpGnSgsn - Allow R8 ARP Gn SGSN

Syntax

```
--gParmName allowR8ArpGnSgsn --gParmValue <string>
```

Description

Gn SGSN is pre-rel8 element and it connects/receives pre-rel8 ARP from HLR. With this parameter set to true, Gn SGSN allows customer configured mapping table and transfer rel8 ARP towards RNC. With this parameter set, a new configured Group IMSIs Will be given ARP 1 towards RNC. If the parameter is not set, then normal function will take place. Rel8 ARP will not allow to send to RNC.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

allowScefMtEdt - Allow SCEF MT-EDT

Syntax

```
--gParmName allowScefMtEdt --gParmValue <string>
```

Description

Allows MT-EDT to be used with SCEFs

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

allowTransferOfEmergencyBearersToGnSgsn - Allow transfer of emergency bearers to Gn SGSN

Syntax

```
--gParmName allowTransferOfEmergencyBearersToGnSgsn --gParmValue  
<string>
```

Description

This global parameter determines whether emergency bearers can be transferred to a Gn SGSN. yes: the MME allows transfer of emergency bearers to a Gn SGSN. no: the MME denies transfer of emergency bearers to a Gn SGSN.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

allowTransferOfEmergencyBearersToS3sgsn - Allow transfer of emergency bearers to S3 SGSN

Syntax

```
--gParmName allowTransferOfEmergencyBearersToS3sgsn --gParmValue  
<string>
```

Description

This global parameter determines whether emergency bearers can be transferred to a S3 SGSN. yes: the MME allows transfer of emergency bearers to a S3 SGSN. no: the MME denies transfer of emergency bearers to a S3 SGSN.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

allowUeInitiatedBearerResourceAllocationRequest - Allow UE initiated bearer resource allocation request

Syntax

```
--gParmName allowUeInitiatedBearerResourceAllocationRequest --  
gParmValue <string>
```

Description

If the bearer resource allocation request parameter is set to yes, the request shall be allowed. if the request parameter is set to FALSE, the request shall be rejected by the MME. MME shall send BEARER RESOURCE ALLOCATION REJECT message with the ESM cause value #97 message type non-existent or nor implemented to the UE.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

allowUeOffloadOnMmeDuringMafCpuOverload - Allow UE offload on MME during CPPS CPU overload

Syntax

```
--gParmName allowUeOffloadOnMmeDuringMafCpuOverload --gParmValue  
<string>
```

Description

Enable UE offloading on the MME during CPPS CPU overload when lightly loaded CPPSs are available on the MME.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

allowUnSupportDcnReroute - Allow UnSupported DCN Reroute

Syntax

```
--gParmName allowUnSupportDcnReroute --gParmValue <string>
```

Description

Indicates to allow an unsupported Dcn Rerouted request to proceed on a non-default DCN MME

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

allowUnSupportDcnRerouteRoamer - Allow Unsupported DCN Reroute for Roamer

Syntax

--gParmName allowUnSupportDcnRerouteRoamer --gParmValue <string>

Description

This field specifies whether to allow an unsupported DCN Rerouted request to proceed on a non-default DCN at the MME. The default is No.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

alwaysSndEpsNwFeatSuppt - Always Send EPS Network Feature Support

Syntax

--gParmName alwaysSndEpsNwFeatSuppt --gParmValue <string>

Description

Always send EPS Network Feature Support IE in attach and tau accept message

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

anyUeRequestedApn - Any UE Requested APN

Syntax

--gParmName anyUeRequestedApn --gParmValue <string>

Description

GPARAM introduces APN override support for rogue APNs. GPARAM allows a match on 'any' UE requested APN. There will be an apnImsiRangeServcies entry with IMSI or IMEI range and a UE requested apn of 'any'. If this gparm is enabled it shall replace the UE requested APN for the search in apnImsiRangeServices with our own string 'any'. By default this shall be disabled.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

apnRateControlStatus - APN Rate Control Status

Syntax

```
--gParmName apnRateControlStatus --gParmValue <string>
```

Description

When this gparm is set to yes, the MME will include any saved APN rate control status for the first newly created PDN for a given APN. The PGW and SCEF can provide the rate control status to the MME when the last PDN in a given APN is deleted.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

apply2g3gApnWhiteList - Apply 2g3g APN white list

Syntax

```
--gParmName apply2g3gApnWhiteList --gParmValue <string>
```

Description

It is used to enable/disable the LBO APN white list checks globally for 2G3G. if it is no, then SGSN will not apply LBO APN white list checks irrespective of the UE PLMN LBO APN white list provisioning.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

applyDeleteGbrToVolteBearersOnly - Apply Delete GBR timer only to VOLTE bearers

Syntax

```
--gParmName applyDeleteGbrToVolteBearersOnly --gParmValue <string>
```

Description

Parameter controls the usage of existing Delete GBR timer. When this parameter is enabled, then Delete GBR timer applies only for VOLTE bearers. When this parameter is disabled, then Delete GBR timer applies for all GBR beares.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

applyLocallyProvQosValuesForHrt - Apply Locally Provisioned QoS Values For HRT

Syntax

```
--gParmName applyLocallyProvQosValuesForHrt --gParmValue <string>
```

Description

Parameter controls the behaviour of MME whether to apply QCI/ARP/PCI/PVI values from the locally provisioned QoS values. If the parameter is enabled and if MME receives QCI/ARP/PCI/PVI values from gateways that are different than locally configured qos values, MME shall apply locally configured values for HRT scenarios. By default the flag shall be disabled.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

applyLteApnWhiteList - Apply LTE APN white list

Syntax

```
--gParmName applyLteApnWhiteList --gParmValue <string>
```

Description

It is used to enable/disable the LBO APN white list checks globally for LTE. if it is no, then MME will not apply LBO APN white list checks irrespective of the UE PLMN LBO APN white list provisioning.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

arpHighPriorityAccessLevel - ARP high priority access level

Syntax

```
--gParmName arpHighPriorityAccessLevel --gParmValue <string>
```

Description

Allocation Retention Priority (ARP) priority level value indicating high priority access in MME. ARP priority level indicates the priority of allocation and retention and can take values between 1 and 15. Value 15 means 'no priority'. Values between 1 and 14 are ordered in decreasing order of priority, i.e., 1 indicates highest priority and 14 indicates lowest priority. The MME grants high priority access for a UE when SGW/PGW provides an ARP PL value equal to this MME provisioned value for a bearer of the UE.

Type / Range

Integer in the range of 1 to 15

Default

3

Name

arpLowAccessPriorityLevel - ARP low access priority level

Syntax

```
--gParmName arpLowAccessPriorityLevel --gParmValue <string>
```

Description

Allocation Retention Priority (ARP) priority level value indicating low priority traffic in MME. ARP priority level indicates the priority of allocation and retention and can take values between 1 and 15. Value 15 means 'no priority'. Values between 1 and 14 are ordered in decreasing order of priority, i.e., 1 indicates highest priority and 14 indicates lowest priority. MME detects low priority traffic based on SGW/PGW providing an ARP PL value equal to this MME provisioned value for a bearer of the UE.

Type / Range

Integer in the range of 1 to 15

Default

15

Name

attachRateLimitOverride - AttachRateLimitOverride

Syntax

```
--gParmName attachRateLimitOverride --gParmValue <string>
```

Description

Attaches allowed per sec after which CMM starts dropping attaches until the rate is below the limit. The limit value is specified as either 'systemDefault', which means the CMM determines what the value is, or a user provisioned number of attaches per second. If the

user provisioned value is greater than the maximum effective value listed below, the limit value that the CMM actually uses will be the maximum effective value. For 10 vcpu EMMS in large CMM, systemDefault is calculated as 400 attaches per second times the number of CPPS VMs with a maximum value of 10000 attaches per second. If the value is provisioned, the maximum effective value is the lesser of 1000 attaches per second times the number of CPPS VMs or 10000 attaches per second. For 12 vcpu EMMS in large CMM, Attach storm rate is 480 attaches per second per cpps. For an openstack small CMM, systemDefault is calculated as 400 attaches per second times the number of CPPS VMs with a maximum value of 1600 attaches per second. If the value is provisioned, the maximum effective value is the lesser of 1000 attaches per second times the number of CPPS VMs or 1600 attaches per second. For an A8 appliance CMM, systemDefault is calculated as 400 attaches per second times the number of CPPS VMs with a maximum value of 10000 attaches per second. If the value is provisioned, the maximum effective value is the lesser of 1000 attaches per second times the number of CPPS VMs or 10000 attaches per second. For an A2 appliance CMM, systemDefault is calculated as 200 attaches per second times the number of CPPS VMs with a maximum value of 1750 attaches per second. If the value is provisioned, the maximum effective value is the lesser of 400 attaches per second times the number of CPPS VMs or 1750 attaches per second. The implementation of the systemDefault is done at each IPDS and not factored for a m-IPDS CMM. For a m-IPDS CMM with 3 IPDS pairs for example, the actual limit is effectively tripled. We strongly suggest customer to overwrite the systemDefault with an adjusted value.

Type / Range

Integer in the range of systemDefault or 0 to 9,999

Default

systemDefault

Name

attachRateRejectLimitOverride - AttachRateRejectLimitOverride

Syntax

--gParmName attachRateRejectLimitOverride --gParmValue <string>

Description

Attaches allowed per sec after which CMM starts rejecting attaches until the rate is below the limit. The limit value is specified as either 'systemDefault', which means the CMM determines what the value is, or a user provisioned number of attaches per second. If the user provisioned value is greater than the maximum effective value listed below, the limit value that the CMM actually uses will be the maximum effective value. For an openstack large CMM, systemDefault is 10000 attaches per second. If the value is provisioned, the maximum effective value is 10000 attaches per second. For an openstack small CMM, systemDefault is 1600 attaches per second. If the value is provisioned, the maximum effective value is 1600 attaches per second. For an A8 appliance CMM, systemDefault is 10000 attaches per second. If the value is provisioned, the maximum effective value is 10000 attaches per second. For an A2 appliance CMM, systemDefault is 1750 attaches per second. If the value is provisioned, the maximum effective value is 1750 attaches per second. The implementation

of the systemDefault is done at each IPDS and not factored for a m-IPDS CMM. For a m-IPDS CMM with 3 IPDS pairs for example, the actual limit is effectively tripled. We strongly suggest customer to overwrite the systemDefault with an adjusted value.

Type / Range

Integer in the range of systemDefault or 0 to 9,999

Default

systemDefault

Name

attachRejForUnsubImsApn - Attach Reject for Unsubscribed APN

Syntax

```
--gParmName attachRejForUnsubImsApn --gParmValue <string>
```

Description

Global Parameter controls the feature activation. By default the parameter shall be disabled. When enabled, MME shall reject with Cause Value #33 if IMS APN is not subscribed or if IMS APN is subscribed only via Wild Card APN.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

attachRejForUnsubImsApnWithLogging - MME Track VoLTE Fail

Syntax

```
--gParmName attachRejForUnsubImsApnWithLogging --gParmValue <string>
```

Description

Parameter controls the feature activation. By default the parameter shall be disabled. When the parameter is enabled MME shall log PDN Connectivity Failures (standalone or part of the Attach) with ESM cause code 27 for IMS APN only. IMSI, MSISDN and IMEI shall be captured as part of the log.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

attachSgsUnknownLaiEmmCause - Attach SGs Unknown LAI EMM Cause

Syntax

```
--gParmName attachSgsUnknownLaiEmmCause --gParmValue <string>
```

Description

The parameter is used to provision EMM cause code to be sent to UE combined attach request if MME fails to select MSC due to LAI to TAI to MSC mapping provisioning errors.

Type / Range

Integer in the range of 2 or 16 to 18 or 22

Default

16

Name

authntDtchIntgChkFail - Authenticate UE for Detach Request message Integrity Checks Fail

Syntax

```
--gParmName authntDtchIntgChkFail --gParmValue <string>
```

Description

Parameter is used to activate MME to authenticate a UE if the UE sent Detach Request fails message integrity checks. If authentication fails or if MME is unable to authenticate the UE then MME does not detach the UE.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

autoAddTaiToTaiList - Auto add TAI to TAI list

Syntax

```
--gParmName autoAddTaiToTaiList --gParmValue <string>
```

Description

Indicates how the 'Automatically add TAI to the TAI list' should be handled.

List

- Basic - MME adds the old last seen TAI to the TAI list determined by the provisioning of "Neighbor list in the registration TAI list", and the enhanced list is sent to the UE (note: only a unique set of TAIs is sent).
- Enhanced - MME adds the previous old last seen TAI and the old last seen TAI to the TAI list determined by the provisioning of "Neighbor list in the registration TAI list", and the enhanced list is sent to the UE (note: only a unique set of TAIs is sent).

- Off - MME uses the list determined by the provisioning of 'Neighbor list in the registration TAI list' to determine the set of TAIs that is sent to the UE.
- UpdateThree - Update three - No cyclical behavior is required for update-three option.

Default

Basic

Name

backoffTimerImspdnReqRej - Back-off Timer Inclusion

Syntax

--gParmName backoffTimerImspdnReqRej --gParmValue <string>

Description

Global Parameter controls the inclusion of back-off timer IE. By default this parameter shall be disabled. When this parameter is enabled MME shall send T3396 back-off timer IE when rejecting IMS PDN Connectivity Request that is sent either as standalone or as part of Attach procedure due to not subscribed IMS APN or IMS APN is subscribed via the wildcard APN. Particularly for the case where IMS APN is subscribed via wildcard APN, the MME shall reject Attach/PDN Connectivity procedure(s) towards the IMS APN when GPARAM is enabled.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

bandwidthRoundup - Bandwidth roundup

Syntax

--gParmName bandwidthRoundup --gParmValue <string>

Description

Round up or round down AMBR, GBR and MBR sent to UE.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

bssapPlusSsn - BSSAP plus SSN

Syntax

```
--gParmName  bssapPlusSsn --gParmValue <string>
```

Description

BSSAP+ protocol sub system number.

Type / Range

Integer in the range of 0 to 254

Default

192

Name

bufferCbrDuringHo - Buffer Create Bearer Request During HO

Syntax

```
--gParmName  bufferCbrDuringHo --gParmValue <string>
```

Description

When this parameter is enabled, then if the MME receives CBR, UBR or DBR while processing 5G to 4G HO or inter-MME handover, it places the CBR (or UBR, DBR) on hold that is processed after completion of connected mode TAU that follows handover procedure.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

bufferCreateBearerRequestDuringTau - Buffer Create Bearer Request During TAU

Syntax

```
--gParmName  bufferCreateBearerRequestDuringTau --gParmValue <string>
```

Description

Parameter controls handling collision scenario. By default, the flag shall be disabled. When enabled, MME while processing Modify bearer Request during TAU procedure, receives Create Bearer Request from SGW, it shall be buffered and processed only upon completion of TAU procedure.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

canonicalNodeNameLabel - Canonical node name label

Syntax

```
--gParmName canonicalNodeNameLabel --gParmValue <string>
```

Description

Comparison of S-GW and P-GW network names in order to decide whether they are far enough to trigger a PDN connection re-establishment.

Type / Range

Integer in the range of 2 to 4

Default

2

Name

catM1bPagingTimerIncr - Category M1 CE mode b paging timer increment

Syntax

```
--gParmName catM1bPagingTimerIncr --gParmValue <string>
```

Description

This value is added to paging response timer for CAT-M1 CE mode b UE.

Type / Range

Integer in the range of 0 to 100

Default

0

Name

cc15eUtranAllowed - CC 15 E-UTRAN allowed

Syntax

```
--gParmName cc15eUtranAllowed --gParmValue <string>
```

Description

Configures the E-UTRAN allowed bit of the extended EMM cause.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

cgfAlwaysSetSequenceNumberToOne - CFG Always Set Sequence Number to One

Syntax

```
--gParmName cgfAlwaysSetSequenceNumberToOne --gParmValue <string>
```

Description

When this parameter is set to true SGSN support the optional customization to overwrite the 'recordSequenceNumber' field for each unique CDR with value 1

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

cgfServingPlmnSupport - CFG Serving PLMN Support

Syntax

```
--gParmName cgfServingPlmnSupport --gParmValue <string>
```

Description

When this parameter is set to true, SGSN stores in the S-CDR servingNodePLMNIdentifier field the PLMN of the RA the UE is in. When set to false the Serving PLMN will not be added in the CDR.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

checkDcnUeUsageTypeSgsnToMme - Check DCN UE Usage Type SGSN to MME

Syntax

```
--gParmName checkDcnUeUsageTypeSgsnToMme --gParmValue <string>
```

Description

Specifies whether the MME shall use UE Usage Type during 2G/3G->4G Attach and TAU procedure in order to perform Decor functionality as part of the procedure.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

checkDcnUeUsageTypeSgsnToMmeRoamer - Check DCN UE Usage Type SGSN to MME for Roamer

Syntax

--gParmName checkDcnUeUsageTypeSgsnToMmeRoamer --gParmValue <string>

Description

Specifies whether the MME shall use UE Usage Type during 2G/3G to 4G Attach and TAU procedure in order to perform Decor functionality as part of the procedure. This setting applies only for inbound roamers. The default is No.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

checkMatchApnConfig - check matchApn configuration

Syntax

--gParmName checkMatchApnConfig --gParmValue <string>

Description

Check matchApn configuration to decide on IMS APN. If matchApn is not configured and checkMatchApnConfig set to No - consider apn with QCI 5 as IMS APN Yes - consider apn with QCI 5 as non IMS APN

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

ciotS1ApMsgTunneling - CMM Support for Tunnelling of S1AP Messages Associated with CIOT or DCNR Attach/TAU Requests

Syntax

--gParmName ciotS1ApMsgTunneling --gParmValue <string>

Description

Enables CMM message tunnelling support over S10 of S1AP messages associated with CIOT (f11728-01) or DCNR Attach/TAU Requests.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

clrHandlingWithoutClrFlags - CLR Handling Without Clr Flags

Syntax

```
--gParmName clrHandlingWithoutClrFlags --gParmValue <string>
```

Description

Some functions are missing when combined MME/Gn SGSN (S6d use) handles CLR without CLR flag. With this parameter enabled, missing function should be supported. By default, the missing function is not supported.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

colldbreqUbreq - Collision of DL and UL bearer request

Syntax

```
--gParmName colldbreqUbreq --gParmValue <string>
```

Description

Enable/Disable support for collision scenario.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

colocatedGwSearchForNoMatch - Co-located Gateway Search for No Match

Syntax

```
--gParmName colocatedGwSearchForNoMatch --gParmValue <string>
```

Description

Parameter controls the support for searching co-located gateways for UEs when the served PLMN does not match the PGW FQDN PLMN for gateway mode selection 2. By default the flag shall be disabled.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

combinedAttachWithoutCs - Combined Attach Without CS

Syntax

```
--gParmName combinedAttachWithoutCs --gParmValue <string>
```

Description

Enables the support for combined attach without actual CS domain in the MME.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

comboPgwcRetries3XUe - Combo PGW-C Retries for 3X capable UE

Syntax

```
--gParmName comboPgwcRetries3XUe --gParmValue <string>
```

Description

Number of retries selecting combo PGW-C(s) during PDN Connectivity procedure before switching selecting standalone PGW-C for 3X capable UE(s)

Type / Range

Integer in the range of 0 to 4

Default

0

Name

comboPgwcRetriesN1Ue - Combo PGW-C Retries for N1 capable UE

Syntax

```
--gParmName comboPgwcRetriesN1Ue --gParmValue <string>
```

Description

Number of retries selecting combo PGW-C(s) during PDN Connectivity procedure before switching selecting standalone PGW-C for N1 capable UE(s)

Type / Range

Integer in the range of 0 to 4

Default

0

Name

coreNetworkRestrictSupport - Core Network Restrictions Support

Syntax

```
--gParmName coreNetworkRestrictSupport --gParmValue <string>
```

Description

Current parameter enables sending Core Network Restrictions field and NRNA bit of MM Context IE in s10 interface. Note that when n26 interworking is enabled, it is expected that this gParm is also enabled by the operator

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

coreNetworkSharing - Core network sharing

Syntax

```
--gParmName coreNetworkSharing --gParmValue <string>
```

Description

Indicates whether core network sharing enabled or not the default is no, indicating core network sharing is not enabled.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

coverageEnhancement - Coverage enhancement

Syntax

```
--gParmName coverageEnhancement --gParmValue <string>
```

Description

Enable the MME support for coverage enhancement level paging feature.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

cpCiotReloc - CP CloT Reloc

Syntax

```
--gParmName cpCiotReloc --gParmValue <string>
```

Description

Feature activation for supporting NB-IoT Control Plane CloT Relocation

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

crsi - Change reporting support indication

Syntax

```
--gParmName crsi --gParmValue <string>
```

Description

Indicates whether to set the CRSI flag in MME GTPv2 messages.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

Yes

Name

csfbReturnLastPlmn - CSFB return last PLMN

Syntax

```
--gParmName csfbReturnLastPlmn --gParmValue <string>
```

Description

Configure MME to indicate MSC to return UE to the last PLMN after CSFB.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

csRecoveryIndication - MSC CS recovery indication support

Syntax

```
--gParmName csRecoveryIndication --gParmValue <string>
```

Description

When set to yes enables MME to accept SGsAP-PAGING REQUEST message with CS restoration indicator and paging of the UE in the location information provided by the MSC. when set to no disables the feature.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

ctrlRoamerQos - Control QoS for roaming subscribers

Syntax

```
--gParmName ctrlRoamerQos --gParmValue <string>
```

Description

ctrlRoamerQos controls below functionality only for roaming subscribers: If it sets to YES: SGSN will 1 Sending of HSS/HLR subscribed QoS values to S/P-GW or GGSN. 2 Ignoring QoS changes (upgrade/downgrade) from S/P-GW or GGSN. 3 Sending local configured QoS parameters towards RAN in case of: - Inter RAT handover MME to S4/Gn-SGSN - RAU MME to S4/Gn-SGSN - Inter S4/Gn-SGSN RAU If it sets to No, SGSN has no changes. Default value is NO

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

dcnrGwSelLte - DCNR capable PGW-C Selection for LTE only UE

Syntax

--gParmName dcnrGwSelLte --gParmValue <string>

Description

Enable selecting DCNR capable PGW-C for LTE only UE (i.e. without EN-DC support) during PDN Connectivity procedure

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

Yes

Name

dcnrOverrideLipa - DCNR overrides Lipa service

Syntax

--gParmName dcnrOverrideLipa --gParmValue <string>

Description

Allow MME to override local PGW selection for Lipa enabled PDN with mobile network PGW selection for DCNR capable UE(s) with allowed NR as a Secondary RAT service.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

dcPraActionAddProcs - DC PRA action additional procedures

Syntax

--gParmName dcPraActionAddProcs --gParmValue <string>

Description

Enables MME to react upon received PRA action for dual connectivity PRA, when MME receives new PRA action from SGW/PGW during -Dedicated bearer activation -Default/dedicated bearer modification -intra LTE Mobility procedures -PDN setup for a PDN being handed over from ePDG. -Change notification response Applied when either -PRA Dual connectivity segment reporting is set to other than DC Segment Reporting Disabled, or -Presence Reporting Area Dual Connectivity IPv4 is set to other than DC PRA IPv4 Reporting Disabled, or -PRA DC IPv6 Prefix is set to other than DC PRA IPv6 Prefix Disabled.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

dcPraInterMme - DC PRA Inter MME Mobility

Syntax

--gParmName dcPraInterMme --gParmValue <string>

Description

Enables MME to hand over already started PRA action for DC PRA between MMEs during inter MME mobility. Applied when either -PRA Dual connectivity segment reporting is set to other than DC Segment Reporting Disabled, or -Presence Reporting Area Dual Connectivity IPv4 is set to other than DC PRA IPv4 Reporting Disabled, or -PRA DC IPv6 Prefix is set to other than DC PRA IPv6 Prefix Disabled.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

dcPraStart5gsToEps - DC PRA action start 5GS to EPS Mobility

Syntax

--gParmName dcPraStart5gsToEps --gParmValue <string>

Description

Enables MME to react upon received PRA action for dual connectivity PRA, when MME receives new PRA action for start reporting during 5GS to EPS mobility. Applied when either -PRA Dual connectivity segment reporting is set to other than DC Segment Reporting Disabled, or -Presence Reporting Area Dual Connectivity IPv4 is set to other than DC PRA IPv4 Reporting Disabled, or -PRA DC IPv6 Prefix is set to other than DC PRA IPv6 Prefix Disabled.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

ddnAckWithDLBuffering - DDN ack with DL buffering

Syntax

```
--gParmName ddnAckWithDLBuffering --gParmValue <string>
```

Description

Enable sending of DDN ack with downlink buffering duration set to number of page attempts times (T3413 timer + provisioned increment for ESM messages) seconds and DL buffering suggested packet count.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

ddnRateLimitOverride - DdnRateLimitOverride

Syntax

```
--gParmName ddnRateLimitOverride --gParmValue <string>
```

Description

Number of DDNs allowed per sec after which MME start dropping DDNs until rate is below limit.

Type / Range

Integer in the range of systemDefault or 0 to 31,999

Default

systemDefault

Name

decorRerouteSr - Decor Reroute on SR

Syntax

```
--gParmName decorRerouteSr --gParmValue <string>
```

Description

This parameter indicates whether MME is enabled to reroute a UE upon UE SR or CPSR to a MME group supporting the UE DCN ID if the current MME does not support the DCN ID. By default the parameter is set to False.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

decorRerouteSrRoamer - Decor Reroute on SR for Inbound Roamer

Syntax

```
--gParmName decorRerouteSrRoamer --gParmValue <string>
```

Description

This parameter indicates whether the MME is enabled to reroute an inbound roamer UE upon UE SR or CPSR to an MME group supporting the UE DCN ID if the current MME does not support the DCN ID. By default the parameter is set to False.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

dedicatedBearerPiggybackSupport - Dedicated bearer piggyback support

Syntax

```
--gParmName dedicatedBearerPiggybackSupport --gParmValue <string>
```

Description

This parameter indicates whether the MME should send piggyback support for dedicated bearer setup to the SGW in the create session message. if the parameter is yes the message will indicate MME support, if it is no the message will indicate non support.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

Yes

Name

defaultIpv4ForPdnTypeIpv4OrIv6 - Default Ipv4 for Pdn Type IPv4OrIv6

Syntax

```
--gParmName defaultIpv4ForPdnTypeIpv4OrIv6 --gParmValue <string>
```

Description

GPARAM controls to choose between IPv4 and IPv6 upon receiving from HSS. When GPARAM is set to Yes default is IPv4 for pdnType IPv4 or IPv6. When gparm is set to 'No' it means ipv6. By default this parameter shall be set to 'No'.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

defaultPreferredDataMode - Default preferred data mode

Syntax

```
--gParmName defaultPreferredDataMode --gParmValue <string>
```

Description

Select default preferred network behavior when preferred-data-mode AVP is not received for a PDN connection.

List

- Control Plane - Default preferred data mode type of control plane.
- User Plane - Default preferred data mode type of user plane.

Default

User Plane

Name

defaultRacForSrvccMscSelection - Default RAC for SRVCC MSC selection

Syntax

```
--gParmName defaultRacForSrvccMscSelection --gParmValue <string>
```

Description

Default RAC for SRVCC MSC selection.

Type / Range

Integer in the range of 0 to 255

Default

255

Name

delbrrRateLimitOverride - DelbrrRateLimitOverride

Syntax

```
--gParmName delbrrRateLimitOverride --gParmValue <string>
```

Description

Number of delete bearers allowed per sec after which MME start dropping delete bearers until rate is below limit.

Type / Range

Integer in the range of systemDefault or 0 to 23,999

Default

systemDefault

Name

deletePdnSessionS11u - Delete PDN session S11U

Syntax

```
--gParmName deletePdnSessionS11u --gParmValue <string>
```

Description

Delete PDN sessions using S11-U when UE moves in to TAI that does not support CP CIOT optimization.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

deletePdnSessionS1u - Delete PDN session S1U

Syntax

```
--gParmName deletePdnSessionS1u --gParmValue <string>
```

Description

Delete PDN sessions using S1-U when UE moves in to TAI that does not support S1-U data transport.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

deletePdnSessionT6a - Delete PDN session T6A

Syntax

```
--gParmName deletePdnSessionT6a --gParmValue <string>
```

Description

Delete PDN sessions using T6A when UE moves in to TAI that does not support T6A data transport.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

depthOfSgwPgwrtry - Depth of SGW PGW retry

Syntax

```
--gParmName depthOfSgwPgwrtry --gParmValue <string>
```

Description

Defines the number of retries MME takes when there is no response from SGW on CSR.

Type / Range

Integer in the range of 1 to 2

Default

2

Name

detachUeMoveRegions2g3gEnable - Detach UE move regions 2G3G enable

Syntax

```
--gParmName detachUeMoveRegions2g3gEnable --gParmValue <string>
```

Description

Yes - feature 'detach ue move regions is enabled for 2g3g. no (default) - feature 'detach ue move regions is disabled for 2g3g.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

detachUeMoveRegionsLteApnSustOrDel - Detach UE move regions LTE APNs sustained or deleted with delay

Syntax

```
--gParmName detachUeMoveRegionsLteApnSustOrDel --gParmValue <string>
```

Description

MME feature with enhanced APN specific functionality for detaching UEs when moving between regions in LTE. The enhanced functionality enables defining two specific APN lists. One list defining APN(s) or which the PDN(s) are sustained despite of the UE moving between regions (=detaching is disabled), and the other list defining APN(s) for which the PDN(s)

are deleted only when no dedicated bearer(s) exist (=detaching is delayed). This feature is only functional when the basic feature for detach UE move regions is enabled for LTE (detachUeMoveRegionsLteEnable).

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

detachUeMoveRegionsLteEnable - Detach UE move regions LTE enable

Syntax

```
--gParmName detachUeMoveRegionsLteEnable --gParmValue <string>
```

Description

Yes - feature 'detach ue move regions is enabled for lte. no (default) - feature 'detach ue move regions is disabled for lte.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

detachUeMoveRegionsMonitorTime - Detach UE move regions monitor time

Syntax

```
--gParmName detachUeMoveRegionsMonitorTime --gParmValue <string>
```

Description

Time slice for monitoring the number of detaches per UE due to move across regions. if the number of detaches for a given UE exceed 'Detach UE Move Regions Threshold' during this time slice, the CMM will NOT detach the UE for 'Detach UE Move Regions Suppress Time' minutes.

Type / Range

Integer in the range of 1 to 3,600

Default

300

Name

detachUeMoveRegionsSuppressTime - Detach UE move regions suppress time

Syntax

```
--gParmName detachUeMoveRegionsSuppresTime --gParmValue <string>
```

Description

Time duration in which the WMM will suppress a UE detach due to move across regions. this is in order to prevent frequent detaches of a UE that is ping-ponging between two regions.

Type / Range

Integer in the range of 1 to 60

Default

10

Name

detachUeMoveRegionsThreshold - Detach UE move regions threshold

Syntax

```
--gParmName detachUeMoveRegionsThreshold --gParmValue <string>
```

Description

Threshold for number of UE detaches due to move across regions. if threshold is met within 'DETACH UE MOVE REGIONS MONITOR TIME' then detach suppression kicks in for a given UE.

Type / Range

Integer in the range of 1 to 16

Default

5

Name

detachUponSrMbrTimeout - Detach upon SR MBR timeout

Syntax

```
--gParmName detachUponSrMbrTimeout --gParmValue <string>
```

Description

Detach immediately upon service request modify bearer response timeout.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

Yes

Name

diameterIgnoreUnknownAvp - Diameter ignore unknown AVP

Syntax

```
--gParmName diameterIgnoreUnknownAvp --gParmValue <string>
```

Description

Ignore unknown AVPs from HSS?.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

Yes

Name

diameterMsgCiotPriority - Diameter CIOT message priority

Syntax

```
--gParmName diameterMsgCiotPriority --gParmValue <string>
```

Description

Use message priority when handling cellular internet of things diameter messages.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

diameterMsgPriority - Diameter message priority

Syntax

```
--gParmName diameterMsgPriority --gParmValue <string>
```

Description

Use message priority when handling diameter messages.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

disableMmeRateControlExecute - disable ratue control execute/drop in MME

Syntax

```
--gParmName disableMmeRateControlExecute --gParmValue <string>
```

Description

There are be different count between MME and GW for the packet for the downlink rate control. This has been noticed from testing with CMG for IPv6. This parameter is introduced to give operator choice, to disable MME drop more packets than already did by GW.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

discoverMme - Discover MME

Syntax

```
--gParmName discoverMme --gParmValue <string>
```

Description

Indicates whether or not (YES or NO) to use a DNS query to obtain a list of MME IP addresses for handling a given TAI. if set to yes, the S10 interface managed objects (MOs) are created dynamically. if set to 'no', the S10 interface MOs are created from provisioned data and are deleted when this provisioning data is removed from the system.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

discoverMmeEnh - Discover MME Enhancement

Syntax

```
--gParmName discoverMmeEnh --gParmValue <string>
```

Description

Parameter controls reselection of another MME if the response from the target MME times out or the first choice per DNS records is unavailable. By default the flag shall be set to No. When flag is set to Yes, MME shall select 2nd S10 link if the first choice (per DNS records) is unavailable or if the response from the target MME times out.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

discoverSgw - Discover SGW

Syntax

--gParmName discoverSgw --gParmValue <string>

Description

Indicates whether or not (YES or NO) to use a DNS query to obtain a list of SGW IP addresses for handling a given TAI. if set to yes, the S11 interface managed objects (MOs) are created dynamically. if set to 'no', the S11 interface MOs are created from provisioned data and are deleted when this provisioning data is removed from the system.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

Yes

Name

discoverSrvccMsc - Discover SRVCC MSC

Syntax

--gParmName discoverSrvccMsc --gParmValue <string>

Description

Indicates whether to discover the MSC's SRVCC IP address via DNS. the default is no, indicating that the IP address must be provisioned.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

discoverTaiDefaults - Discover TAI Defaults

Syntax

--gParmName discoverTaiDefaults --gParmValue <string>

Description

Feature activation for default TAC Mapping to TA Discovery Provisioned Parameters

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

discoverTais - Discover TAIs

Syntax

```
--gParmName discoverTais --gParmValue <string>
```

Description

Enable WMM to discover non-provisioned TAIs.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

dlBufferingPacketCount - DL buffering suggested packet count

Syntax

```
--gParmName dlBufferingPacketCount --gParmValue <string>
```

Description

Downlink buffering suggested packet count.

Type / Range

Integer in the range of 0 to 10

Default

2

Name

dltPrevPdnConnOnNewReq - Delete previous PDN connection on new request

Syntax

```
--gParmName dltPrevPdnConnOnNewReq --gParmValue <string>
```

Description

This flag determines the call flow of a PDN connectivity request where a UE already has PDN connection. no (default) - the current call flow is used. when an additional PDN connection request is received after attach the MME checks to see whether there is already a PDN connection to the network specified by the APN in the request. when the received APN is the same as the APN of a PDN connection that has already been established for the given UE, the MME sends a PDN connectivity reject with cause code 55. yes - instead of sending a PDN connectivity reject the MME will first delete the previously established PDN connection and then honor the subsequent PDN connection request. note that if the PDN connectivity

request with APN=x is for a UE with only one already established PDN connection and that connection is for APN x, the MME would have to reject the PDN connectivity request as is currently done.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

dualConnectivity - Dual connectivity

Syntax

```
--gParmName dualConnectivity --gParmValue <string>
```

Description

Enable/disable dual connectivity feature.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

e911apnNiForMode1pgwSelection - E911 APN NI for mode 1 PGW selection

Syntax

```
--gParmName e911apnNiForMode1pgwSelection --gParmValue <string>
```

Description

If set to yes, MME will support the use of the E911 APN NI for the mode 1 selection of PGW for emergency attach and also PDN connection request to E911. if set to no, MME will default to using the S-NAPTR procedure to select a PGW.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

edrxEpochLeapSeconds - eDRX epoch leap second

Syntax

```
--gParmName edrxEpochLeapSeconds --gParmValue <string>
```

Description

Number of leap seconds that have occurred since the eDRX epoch time.

Type / Range

Integer in the range of 0 to 100

Default

18

Name

edrxEpochTime - eDRX epoch time

Syntax

```
--gParmName edrxEpochTime --gParmValue <string>
```

Description

Starting point in time of counting H-SFN for calculation of eDRX paging opportunities. Any valid past date (YYYY-MM-DD) and time (HH:MM:SS) in GMT can be entered.

Type / Range

Digit string of length 19 to 19 with the allowed pattern of (\d{4}-\d{2}-\d{2} \d{2}:\d{2}:\d{2})

Default

1980-01-06 00:00:00

Name

edrxMaxPagingHoldTime - eDRX maximum paging hold time

Syntax

```
--gParmName edrxMaxPagingHoldTime --gParmValue <string>
```

Description

Maximum time interval (in milliseconds) that the MME will hold a call processing procedure.

Type / Range

Integer in the range of 3,000 to 15,000

Default

10000

Name

edrxNewLeapSecondTime - eDRX new leap second time

Syntax

```
--gParmName edrxNewLeapSecondTime --gParmValue <string>
```

Description

The date and time when an additional leap second will occur.

Type / Range

Digit string of length 0 or 19 to 19 with the allowed pattern of (\d{4}-\d{2}-\d{2} \d{2}:\d{2}:\d{2})*\d{2})*

Name

edrxNotifyHssTime - eDRX notify HSS time

Syntax

```
--gParmName edrxNotifyHssTime --gParmValue <string>
```

Description

Time interval (in milliseconds) prior to the eDRX paging send time that the MME should send the notify command to HSS when handling a pending SMS request for an idle UE with eDRX enabled. this parameter is set to account for the time needed for the SMS service center to be informed of the UE's availability and the resulting SGS paging request to be sent to the MME.

Type / Range

Integer in the range of 100 to 3,000

Default

500

Name

edrxPagingSendTime - eDRX paging send time

Syntax

```
--gParmName edrxPagingSendTime --gParmValue <string>
```

Description

Time interval (in milliseconds) before paging time window (PTW) start time that the MME should start sending the S1AP-PAGING messages to the eNB. this parameter is set to account for small time synchronization differences between the MME and the eNB.

Type / Range

Integer in the range of 100 to 5,000

Default

2000

Name

emergency5gsIwkWoN26 - Emergency 5GS Interworking Without N26

Syntax

```
--gParmName emergency5gsIwkWoN26 --gParmValue <string>
```

Description

Enables emergency session to be handed over between 5GS and EPS without N26 interface in the MME. Applied when EPS-5GS Interworking without N26 is set to Yes for the MME.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

emergencySimlessUeOverride - Emergency SIMless UE override

Syntax

--gParmName emergencySimlessUeOverride --gParmValue <string>

Description

Emergency SIMless UE override when set to yes MME will accept emergency attach from SIMless UEs from any TAI served by the MME irrespective of emergency provisioning per TAI.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

emergencyWlanHo - Emergency WLAN Handover

Syntax

--gParmName emergencyWlanHo --gParmValue <string>

Description

This parameter controls the support for IMS emergency session continuity for handovers between LTE access and WLAN for authenticated home subscribers. When supported, the MME receives WLAN access selected PGW information from HSS, and on handover to LTE the same PGW can be selected. When an emergency call is initially started on LTE access, the MME also registers via NOR the selected PGW to HSS to be possibly handed over to WLAN access.

List

- ewLanHoDisabled - Emergency WLAN Handover Disabled - Feature is disabled.
- ewLanHoSendHost - Emergency WLAN Handover Send Host - Feature is enabled and when MME sends NOR to HSS for emergency WLAN Handover session continuity, the MME sends the PGW information on MIP6-Agent-Info AVP as MIP-Home-Agent-Host, if it is available. If the hostname is not available, the MME sends the IP address(es).
- ewLanHoSendIp - Emergency WLAN Handover Send Ip - Feature is enabled and when MME sends NOR to HSS for emergency WLAN Handover session continuity, the MME sends the PGW information on MIP6-Agent-Info AVP as MIP-Home-Agent-Address(es).

Default

ewLanHoDisabled

Name

emerMtLrNoEsmLc - Emergency MT-LR do not contact E-SMLC for UE location information

Syntax

--gParmName emerMtLrNoEsmLc --gParmValue <string>

Description

If yes, when the MME receives mobile terminated location request with emergency client type or MT-LR with any client type while an emergency call is ongoing, the MME contacts the eNB for UE current E-CGI information. this information is sent back to the GMLC. the MME does not contact the E-SMLC to obtain any UE location information.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

empsAdvancePriority - EMPS advance priority

Syntax

--gParmName empsAdvancePriority --gParmValue <string>

Description

Enable the detection of advance priority eMPS users and eMPS IMS priority users (Non advance priority users).

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

empsDscp44Marking - EMPS DSCP 44 Marking

Syntax

--gParmName empsDscp44Marking --gParmValue <string>

Description

Enable the ability to mark eMPS S11 and S10 messages with a provisionable DSCP value. Enabling the eMPS DSCP 44 Marking global parameter shall be denied if the eMPS Advance

Priority global parameter is disabled. Disabling the eMPS Advance Priority global parameter shall be denied if the eMPS DSCP 44 Marking global parameter is enabled

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

empsPriorityOnlySubscriptionBased - eMPS Priority Only Subscription Based

Syntax

--gParmName empsPriorityOnlySubscriptionBased --gParmValue <string>

Description

When set to Yes, enables MME to provide eMPS priority for UEs that have HSS subscription indicating MPS-EPS-Priority bit set on the MPS-Priority AVP. MME does not check other parameters for UEs that have MPS EPS functionality enabled on (on MME local provisioning on service agreement profile) and MPS-EPS-Priority bit set on the HSS subscription.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

empsPrioToHss - eMPS Priority to HSS

Syntax

--gParmName empsPrioToHss --gParmValue <string>

Description

MME treats with priority any signal it receives with RRC establishment cause indicating priority. If set to no, MME only treats with priority a UE that additionally either has priority HSS subscription or a bearer is established with a priority ARP value.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

enable2gBvccountIndb - Enable2gBvccountIndb

Syntax

--gParmName enable2gBvccountIndb --gParmValue <string>

Description

Ability to store BVC counts DB.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

Yes

Name

enable2GdataJumboFrame - Enable 2G data Jumbo frame

Syntax

--gParmName enable2GdataJumboFrame --gParmValue <string>

Description

This parameter enables the 2G data Jumbo Frame

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

enable2gEnhancesgbaLb - Enable2gEnhancesgbaLb

Syntax

--gParmName enable2gEnhancesgbaLb --gParmValue <string>

Description

Ability to load PAPSs using the number of BVCs assigned to NSEs.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

Yes

Name

enable2gUsrdataSafetynet - Enable2gUsrdataSafetynet

Syntax

```
--gParmName enable2gUsrdataSafetynet --gParmValue <string>
```

Description

Ability for WMM to detect 2G user data throughput safety net breach and throttle 2G attaches and PDP activations. 2G allowed user data throughput is 145000000 bits/sec.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

Yes

Name

enable3GdataJumboFrame - Enable 3G data Jumbo frame

Syntax

```
--gParmName enable3GdataJumboFrame --gParmValue <string>
```

Description

This parameter enables the 3G data Jumbo Frame

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

enableAlarmEventsStream - enableAlarmEventsStream

Syntax

```
--gParmName enableAlarmEventsStream --gParmValue <string>
```

Description

Enables Alarm Events streaming via fluentd for CNF deployment

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

enableCacheAgeOut - enable Cache Age Out feature

Syntax

```
--gParmName enableCacheAgeOut --gParmValue <string>
```

Description

If the enableCacheAgeOut value is set to Yes the Cache Age Out feature uses defined Quiet-period-timers per UE Class. These timers are used to manage the CPPS cache. By default the enableCacheAgeOut is set to NO, the feature is by default disabled.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

enableCallTraceBuffering - Enable Call Trace Buffering

Syntax

```
--gParmName enableCallTraceBuffering --gParmValue <string>
```

Description

Enables the buffering of Call Trace messaging before IMSI/SUPI is known.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Recommended

Recommended value is Yes

Name

enableCapdegradeOn2gciphering - EnableCapdegradeOn2gciphering

Syntax

```
--gParmName enableCapdegradeOn2gciphering --gParmValue <string>
```

Description

Ability to downgrade WMM 2G capacity by 20% when 2G ciphering is on.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

Yes

Name

enableCpuBasedControlOnly - EnableCpuBasedControlOnly

Syntax

--gParmName enableCpuBasedControlOnly --gParmValue <string>

Description

Whether or not WMM performs overload control based on CPU only or take into account message rate and storm rate for controls.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

enableEffectiveloadSnalgo - EnableEffectiveloadSnalgo

Syntax

--gParmName enableEffectiveloadSnalgo --gParmValue <string>

Description

Enable effective load snalgo.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

Yes

Name

enableLocalRoamerQciArpOvrd - Enable local roamer QCI ARP override

Syntax

--gParmName enableLocalRoamerQciArpOvrd --gParmValue <string>

Description

Enable local roamer QCI ARP override whereby skipping QCI and ARP override parameters for dedicated bearers in case of LBO traffic.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

enableLocalRoamerQoSPolicy - Enable local roamer QoS policy

Syntax

```
--gParmName enableLocalRoamerQoSPolicy --gParmValue <string>
```

Description

Enable local roamer QoS policy.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

enableLogEventsStream - enableLogEventsStream

Syntax

```
--gParmName enableLogEventsStream --gParmValue <string>
```

Description

Enables Log Events streaming via fluentd for CNF deployment

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

enableMmeOverloadBackoffTimer - Enable MME overload backoff timer

Syntax

```
--gParmName enableMmeOverloadBackoffTimer --gParmValue <string>
```

Description

This flag is used to enable the capability of MME to include a randomly-selected T3346 timer value whenever an attach request, TAU request, service request, or extended service request procedure is rejected due to IPDS CPU overload, CPPS CPU overload, or CXN object overload. no (default) - set the T3346 back-off timer to 0. yes - set the T3346 back-off timer to a randomly-selected value between provisioned minimum and maximum values.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

enableOLCContextDump - EnableOLCContextDump

Syntax

```
--gParmName enableOLCContextDump --gParmValue <string>
```

Description

Whether or not WMM dumps service context data during overload report.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

Yes

Name

enableOlcSchddelayDegrade - EnableOlcSchddelayDegrade

Syntax

```
--gParmName enableOlcSchddelayDegrade --gParmValue <string>
```

Description

Whether or not VMM capacity should be degraded on scheduling delay.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

enableOldGutiPaging - Enable old GUTI paging per MME

Syntax

```
--gParmName enableOldGutiPaging --gParmValue <string>
```

Description

Enable old GUTI paging per MME.

List

- No - Boolean value of no.

- Yes - Boolean value of yes.

Default

No

Name

enablePra - Enable presence reporting area

Syntax

--gParmName enablePra --gParmValue <string>

Description

Enable MME support for presence reporting of an UE entering or leaving an area.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

enablePrometheusGW - Enable Prometheus Functionality

Syntax

--gParmName enablePrometheusGW --gParmValue <string>

Description

This parameter controls whether Prometheus functionality is enabled in the system. This means that this gParm does not control the way the PM data are sent/retrieved from Prometheus (i.e. sent via Prometheus Push GW or retrieved directly from Prometheus). This would be specified via a another gParm that is named Prometheus Mode.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

enableProvCc - Enable provisional cause code

Syntax

--gParmName enableProvCc --gParmValue <string>

Description

Enable MME support for configurable or provisional cause code functionality.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

enablePsmT3412MinTime - Enable use of PSN T3412 Min Time

Syntax

```
--gParmName enablePsmT3412MinTime --gParmValue <string>
```

Description

This parameter enables/disables the feature CMM support for Minimum T3412 Timer for UE Supporting Power Savings Mode'. By default the feature is disabled.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

enableRejectIdrepslocinfoOnol - EnableRejectIdrepslocinfoOnol

Syntax

```
--gParmName enableRejectIdrepslocinfoOnol --gParmValue <string>
```

Description

Enable/Disable reject IDR with EPS location info request during overload.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

Yes

Name

enbToSgwIpv4v6TransportLayerAddress - eNB/gNB IPv4v6 Transport Layer Address IP Type

Syntax

```
--gParmName enbToSgwIpv4v6TransportLayerAddress --gParmValue <string>
```

Description

MME passes eNB/gNB S1-u IPv4v6 Transport Layer Address to the SGW if it received this IP Type from eNB/gNB and this parameter is set to YES. Otherwise MME matches S1-C IP Address Type and passes it to the SGW.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

enhancedAlternateGwReselection - Enhanced Alternate GW Reselection

Syntax

--gParmName enhancedAlternateGwReselection --gParmValue <string>

Description

Defines whether the MME reselects an alternate SGW or PGW during the same procedure in defined error cases. Setting this parameter to 'Yes' requires that gParm supportAlternateGwReselection is also set to 'Yes'. MME reselects an alternate PGW during Attach and PDN Connectivity procedures when SGW returns cause code 72 (System failure), 78 (Missing or unknown APN), 84 (All dynamic addresses are occupied) or 91 (No memory available) and the cause source indicates PGW. MME also reselects an alternate PGW when SGW returns cause code 100 (Remote peer not responding) and cause source indicates SGW. MME reselects an alternate SGW during Attach and mobility procedures when SGW returns cause code 72 (System failure) or 91 (No memory available) and cause source indicates SGW.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

enhancedPgwlIsolation - Enhanced PGW Isolation

Syntax

--gParmName enhancedPgwlIsolation --gParmValue <string>

Description

Defines whether the MME isolates PGW during additional cases. Enabling this parameter requires gParm ltePgwlIsolation to be set to 'Yes'. MME considers PGW related errors for PGW isolation functionality additionally to the legacy functionality when SGW returns error code 73 (No resources available), 91 (No memory available) or 100 (Remote peer not responding) and cause source indicates PGW. MME also considers SGW returned error for PGW isolation functionality when SGW returns error code 100 (Remote peer not responding) and cause source indicates SGW.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

enhancedSgwIsolation - Enhanced SGW Isolation

Syntax

```
--gParmName enhancedSgwIsolation --gParmValue <string>
```

Description

Defines whether the MME isolates SGW during additional cases. Enabling this parameter requires gParm lteSgwIsolation to be set to 'Yes'. MME considers SGW related errors for SGW isolation functionality additionally to the legacy functionality when SGW returns error code 73 (No resources available) or 91 (No memory available) and cause source indicates SGW.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

enhancedSgwRestorationProcedures - Enhanced SGW restoration procedures

Syntax

```
--gParmName enhancedSgwRestorationProcedures --gParmValue <string>
```

Description

Support enhanced SGW restoration procedures or not.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

enhancedSGWselectionIRAT - Enhanced SGW selection for IRAT mobility

Syntax

```
--gParmName enhancedSGWselectionIRAT --gParmValue <string>
```

Description

Enable/Disable support enhanced SGW selection for IRAT mobility per MME.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

Yes

Name

enhApnCorrectionPerImsi - Enhanced APN Correction per Imsi

Syntax`--gParmName enhApnCorrectionPerImsi --gParmValue <string>`**Description**

Parameter controls when the rejection cause code shall be sent by MME. By default the flag shall be disabled, when enabled MME during an Attach or PDN Connectivity Request, if the APN received from the UE, is not an HSS provisioned APN and is not in locally configured in the MME correction/replacement table, MME shall reject the procedure with cause code 'Requested service option not subscribed'. In addition if the APN received from the UE, is locally configured in MME APN correction/replacement table but correction comes back with APN which is not an HSS provisioned APN. (In other words, even after correction the APN must be subscribed or it will be rejected) Feature shall be enabled when apnlist table is enabled.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

ePlmnPerImsiTaiRange - EPLMN per IMSI Range

Syntax`--gParmName ePlmnPerImsiTaiRange --gParmValue <string>`**Description**

MME uses the EPLMN list provisioned per IMSI and TAI range if the parameter is set to 'True'.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

eps5gslwkWithoutN26 - EPS-5GS Interworking without N26

Syntax

```
--gParmName eps5gsIwkWithoutN26 --gParmValue <string>
```

Description

Enables the EPS-5GS interworking without N26 interface support in the MME.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

epsInfoInUlr - Support of EPS info in ULR

Syntax

```
--gParmName epsInfoInUlr --gParmValue <string>
```

Description

When parameter is YES, EPS info is supported in updateGprsLocation message, otherwise it is not supported

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

epsNasSecurityContextInclusion - EPS NAS Security Context Inclusion

Syntax

```
--gParmName epsNasSecurityContextInclusion --gParmValue <string>
```

Description

Parameter controls inclusion of NAS security context at the end of MM Context IE. By default, flag shall be disabled. When enabled, MME will include NAS security context at the end of MM Context IE to indicate the mapped or native security context during the MME-1 to MME-2 reallocation

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

eutranSupportedRatType - Eutran supported RAT type

Syntax

--gParmName eutranSupportedRatType --gParmValue <string>

Description

Configure eutran supported RAT type. values are both, wbeutran and ClOT.

List

- both - Both wide band EUTRAN and CIOT.
- nbiot - CIOT - CIOT.
- wbeutran - Wide band EUTRAN - Wide band EUTRAN.

Default

wbeutran

Name

exclDelayDlPktNotifReq - Exclude delay downlink packet notification request

Syntax

--gParmName exclDelayDlPktNotifReq --gParmValue <string>

Description

Control the inclusion of the delay downlink packet notification request.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

excludeDestinationHost - Exclude destination host

Syntax

--gParmName excludeDestinationHost --gParmValue <string>

Description

Enable or disable exclusion of destination host for S6ad and S13 interfaces.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

excludeNbiotDrbCheckForCpCiot - Exclude NB-IoT Check on DRB for CP CIoT

Syntax

```
--gParmName excludeNbiotDrbCheckForCpCiot --gParmValue <string>
```

Description

The MME will not consider the NB-IOT UE support of multiple DRBs when the UE requests to set up a subsequent CP CIoT bearer.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

Yes

Name

excludeUIExceptionReports - exception reports are excluded from rate limit

Syntax

```
--gParmName excludeUIExceptionReports --gParmValue <string>
```

Description

By default MME rate control applies all packets. With this parameter is set, Mo exception data packet will be excluded in the rate limited (not count)

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

excludeVendorSpecificApplicationId - Exclude vendor specific application id

Syntax

```
--gParmName excludeVendorSpecificApplicationId --gParmValue <string>
```

Description

Enable or disable exclusion of exclusion of vendor specific application id for S13 interface.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

extendEmmCauseIe - Extend EMM cause IE

Syntax

```
--gParmName extendEmmCauseIe --gParmValue <string>
```

Description

Enable inclusion of extended cause IE in attach reject and TAU reject messages with EMM cause #15.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

fallbackToDefaultApnOi - Fallback to default APN-OI

Syntax

```
--gParmName fallbackToDefaultApnOi --gParmValue <string>
```

Description

Activate fallback to use of default APN-OI in NAPTR query if NAPTR query with APN-OI replacement fails.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

fivegcNotRestrictedIndicationSupport - 5GC Not Restricted Indication Support

Syntax

```
--gParmName fivegcNotRestrictedIndicationSupport --gParmValue  
<string>
```

Description

Parameter controls the support for 5GCNRI and 5GCNRS indication flags in create session request message. By default, the flag shall be disabled.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

fmKafkaStream - Kafka Stream for the Alarm Functionality

Syntax

--gParmName fmKafkaStream --gParmValue <string>

Description

This parameter controls the option to stream the Alarms to an external KAFKA cluster. When this parameter is set, the Alarms would be streamed to a specific topic and broker of an external KAFKA cluster.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

fnsBckpSrvrHbNoRspns - FNS Backup Server No Responses to heartbeat message

Syntax

--gParmName fnsBckpSrvrHbNoRspns --gParmValue <string>

Description

If MME does not receive responses to the heartbeat messages for consecutive number of times specified by this parameter then MME declares the link is not available and generates a major alarm.

Type / Range

Integer in the range of 1 to 10

Default

3

Name

fnsBckupServer - FNS Backup Server

Syntax

--gParmName fnsBckupServer --gParmValue <string>

Description

Global parameter to enable support of FNS backup server. If the parameter is set to 'true' then CMM establishes TCP connection to the provisioned backup server and start updating the UE context.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

fnsBckupSrvrHbTimer - FNS Backup Server Heart Beat Timer

Syntax

--gParmName fnsBckupSrvrHbTimer --gParmValue <string>

Description

Parameter specifies the heart beat interval to the FNS backup server.

Type / Range

Integer in the range of 1 to 600 in units of Second

Default

10

Name

fnsBckupSrvrRspTimer - FNS Backup Server Response Timer

Syntax

--gParmName fnsBckupSrvrRspTimer --gParmValue <string>

Description

Time to wait for FNS backup server response after sending a request to the server.

Type / Range

Integer in the range of 1 to 10 in units of Second

Default

2

Name

fnsBckupSrvrUpdateType - FNS Backup Server Update Type

Syntax

--gParmName fnsBckupSrvrUpdateType --gParmValue <string>

Description

Parameter to specify which UE context needs to be stored on the FNS backup server.

List

- All - ALL UE - Store IMSI and last visited TA of all UE.
- IMS - Store IMSI and last visited TA of all UE with IMS PDN connection.
- IMS_AND_CSFBCK - IMS and CS Fallback - Store IMSI and last visited TA of all UE with IMS PDN connection and UE combined attach with CSFB. Combined attach UE with SMS only service are not stored for this option.

Default

All

Name

fnsInMmePool - FNS IN MME Pool

Syntax`--gParmName fnsInMmePool --gParmValue <string>`**Description**

This parameter is used to indicate whether FNS MME and CMM MME are in the same pool. The parameter will be used by CMM uelb command directed move to FNS to make the CMM UELB is compatible with FNS directed move.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

forcePgwReselectionOnCsRequestTimeout - Force PGW reselection on CS request timeout

Syntax`--gParmName forcePgwReselectionOnCsRequestTimeout --gParmValue
<string>`**Description**

If set to yes, mme shall select an alternate PGW if there is no response to the create session request. the number of attempts to select PGW remains the same. the feature only applies to GW selection mode 2. the applicable procedures are attach and subsequent PDN connectivity request.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

fourDigitMncMccSuppt - Four Digit MNC MCC Support

Syntax

```
--gParmName fourDigitMncMccSuppt --gParmValue <string>
```

Description

The parameter controls whether four digit MNC and MCC is used in RAI and RNCid pre-REL8 DNS queries for Gn-SGSN. By default the parameter shall be disabled.

List

- OFF - OFF
- ON - ON

Default

OFF

Name

freqCountMonitoring - Frequency Count Monitoring

Syntax

```
--gParmName freqCountMonitoring --gParmValue <string>
```

Description

Enables the MME functionality to monitor the frequency count of UE attempts for defined procedures.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

freqCountMonitoringMtAccess - Frequency Count Monitoring MT Access

Syntax

```
--gParmName freqCountMonitoringMtAccess --gParmValue <string>
```

Description

Defines whether the MME, while frequency count monitoring functionality is activated, allows the Mobile Terminated Access for the UEs. If the UE is blacklisted but not yet implicitly detached, the network may page the UE due to e.g. incoming downlink data and the UE may trigger Service Request/Extended Service Request/Control Plane Service Request due to that. When MT access is allowed, MME does not increment procedure attempt counter for MT access attempts.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

Yes

Name

freqCountMonitoringSecurity - Frequency Count Monitoring Security

Syntax

--gParmName freqCountMonitoringSecurity --gParmValue <string>

Description

Defines whether the MME increments procedure frequency count before or after running any of the security procedures (especially integrity check).

List

- AfterSecurity - After Security - MME increments frequency count monitoring procedure attempt counter after running any of the security procedures (e.g. integrity check).
- BeforeSecurity - Before Security - MME increments frequency count monitoring procedure attempt counter before running any of the security procedures (e.g. integrity check).

Default

AfterSecurity

Name

fullPgwApnGtpOvlControlSupport - Full PGW APN or Node Level Overload Control Support

Syntax

--gParmName fullPgwApnGtpOvlControlSupport --gParmValue <string>

Description

Defines whether the MME supports PGW indicated overload. -PGW Overload Control Information IE containing APN list on GTPv2 messages, when APN is congested on a PGW. -Back-off Time IE on Create Session Response when PGW rejects the request due to APN congestion.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

gea1Degradation - GEA1 degradation

Syntax

```
--gParmName gea1Degradation --gParmValue <string>
```

Description

GEA1 degradation percent. Warning: For Nokia personnel only.

Type / Range

Integer in the range of 0 to 100

Default

52

Name

gea2Degradation - GEA2 degradation

Syntax

```
--gParmName gea2Degradation --gParmValue <string>
```

Description

GEA2 degradation percent. Warning: For Nokia personnel only.

Type / Range

Integer in the range of 0 to 100

Default

64

Name

gea3Degradation - GEA3 degradation

Syntax

```
--gParmName gea3Degradation --gParmValue <string>
```

Description

GEA3 Degradation percent. Warning: For Nokia personnel only.

Type / Range

Integer in the range of 0 to 100

Default

28

Name

ggsnLbMode - GGSN Load Balancing mode

Syntax

```
--gParmName ggsnLbMode --gParmValue <string>
```

Description

Set the corresponding mode for GGSN Load Balancing

List

- DNS - Weighted round robin (DNS)

- HOST - Weighted round robin (HOST)
- RROFF - Round robin is not in use
- RRON - Round Robin is in use

Default

RROFF

Name

gmlcOverlappingLocationRequests - GMLC overlapping location requests

Syntax`--gParmName gmlcOverlappingLocationRequests --gParmValue <string>`**Description**

Enable/disable GMLC overlapping UE location requests.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

gnSgsnSnaptr - Gn SGSN SNAPTR

Syntax`--gParmName gnSgsnSnaptr --gParmValue <string>`**Description**

None: gn-sgsn will not use S-NAPTR. pgw-ggsn: gn-sgsn will use S-NAPTR only for allocation of a co-located pgw-ggsn. all: gn-sgsn will use S-NAPTR for all FQDN resolutions.

List

- all - Specify S-NAPTR type of all.
- none - Specify S-NAPTR type of none.
- pgw-ggsn - Specify S-NAPTR type of PGW / GGSN.

Default

none

Name

gnSgsnSrv - Gn SGSN SRV

Syntax`--gParmName gnSgsnSrv --gParmValue <string>`**Description**

None SRV RR only for pgw-ggsn selection.

List

- none - Specify SRV type of none.
- pgw-ggsn - Specify SRV type of PGW / GGSN.

Default

none

Name

gnTargetIdFormat - Gn target id format

Syntax

--gParmName gnTargetIdFormat --gParmValue <string>

Description

Determines how it encodes and decodes the target identification IE when the MME is sending a GTPv1 (Gn) message.

List

- ASN.1 With Choice/Options Octet - Encode according to type 1 in SEI-d59695-Gn_SEI-100.
- ASN.1 Without Choice/Options Octet - Encode according to type 2 in SEI-d59695-Gn_SEI-100.
- GTP with CN-order of PLMN Digits - Encode according to type 3 in SEI-d59695-Gn_SEI-100.
- GTP with RANAP-order of PLMN Digits - Encode according to type 4 in SEI-d59695-Gn_SEI-100.

Default

ASN.1 With Choice/Options Octet

Name

gprsSubscriptionData - GPRS subscription data

Syntax

--gParmName gprsSubscriptionData --gParmValue <string>

Description

Request the HSS to include GPRS subscription data in ULA if available.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

gtpLoadControlSupport - GTP load control support

Syntax

```
--gParmName gtpLoadControlSupport --gParmValue <string>
```

Description

GTP load control support.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

gtpOvlControlSupport - GTP OVL control support

Syntax

```
--gParmName gtpOvlControlSupport --gParmValue <string>
```

Description

Support for GTP overload control.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

gwGtpOvlControlSupport - GW GTP OVL control support

Syntax

```
--gParmName gwGtpOvlControlSupport --gParmValue <string>
```

Description

Support for GTP overload control from gateways to MME.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

gwSelectionMode - Gateway selection mode

Syntax

--gParmName gwSelectionMode --gParmValue <string>

Description

Select PGW topologically close to selected SGW or topologically close SGW and PGW pair.

List

- GW Selection Mode 1 - MME will select a PGW topologically close to the selected SGW.
- GW Selection Mode 2 - MME will select topologically close SGW and PGW pair.

Default

GW Selection Mode 1

Name

gwSelectionModeForSgsn - SGW PGW Selection Enhancement for SGSN

Syntax

--gParmName gwSelectionModeForSgsn --gParmValue <string>

Description

This parameter controls the S/P -GW pair selection for S4-SGSN. When the parameter is GW Selection Mode 1 then the SGW priorities are taken into consideration for selecting the appropriate S/P -GW pair. When the parameter is GW Selection Mode 2 then the PGW priorities are taken into consideration for selecting the appropriate S/P -GW pair.

List

- GW Selection Mode 1 - SGSN will use as a reference the S-GW priorities in order to select a S/P-GW pair
- GW Selection Mode 2 - SGSN will use as a reference the P-GW priorities in order to select a S/P-GW pair

Default

GW Selection Mode 1

Name

gxInterfacesNetworkAnsiSs7 - GX interfaces network ANSI SS7

Syntax

--gParmName gxInterfacesNetworkAnsiSs7 --gParmValue <string>

Description

This flag configures the SS7 protocol type 'ANSI' or 'ITU' for the m3ua-network(s) of the gx (i.e. gr, gf, ge, gd) interfaces. when multiple m3ua-networks are defined for the gx interfaces, the protocol type must be the same across all the m3ua-networks.

List

- ANSI - Specify SS7 variant of american national standards institute.
- ITU - Specify SS7 variant of international telecommunication union - telecommunications.

Default

ITU

Name

highCapacityIHspa - High Capacity iHSPA

Syntax

--gParmName highCapacityIHspa --gParmValue <string>

Description

When set to 'No' it is possible to create a total sum of 512 iHSPAs and RNCs When set to 'Yes' it is possible to create a total sum of 8192 iHSPAs and RNCs (of which only up to 512 may be RNCs)

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

No

Name

homeDomainName - Home domain name

Syntax

--gParmName homeDomainName --gParmValue <string>

Description

Home domain name.

Type / Range

Digit string of length 0 to 62 with the allowed pattern of [0-9a-zA-Z\.\-]*

Name

homogeneousIMSSupportAVP - HomogeneousIMSSupportAVP

Syntax

--gParmName homogeneousIMSSupportAVP --gParmValue <string>

Description

Whether or not WMM includes homogeneous IMS support AVP in ULR and NOR.

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

Yes

Name

homogeneousSupportNblotTas - Homogeneous support NB-IoT TAs

Syntax

```
--gParmName homogeneousSupportNbIotTas --gParmValue <string>
```

Description

Controls whether the MME includes Tracking Areas supporting NB-IoT Radio Access Technology when evaluating Homogeneous support of Voice over PS sessions towards the HSS. Yes - NB-IoT TAs are included when evaluating Homogeneous support of IMS Voice over PS sessions No - NB-IoT TAs are not included when evaluating Homogeneous support of IMS Voice over PS sessions

List

- No - Boolean value of no.
- Yes - Boolean value of yes.

Default

Yes

Name

homogeneousSupportTais - Homogeneous Support TAs

Syntax

```
--gParmName homogeneousSupportTais --gParmValue <string>
```

Description

Defines whether MME includes IMS Voice over PS of the serving PLMN TAs or all TAs MME globally (serving PLMN and shared PLMN TAs) when evaluating homogeneous IMS voice over PS support towards the HSS.

List

- HomogeneousSupportAllTais - Homogeneous Support All TAs - MME includes IMS Voice over PS support of all TAs MME globally (TAs of the serving PLMN as well as TAs of shared PLMNs) when evaluating Homogeneous voice over PS support.
