

CLI Reference Guide

CLOUD MOBILE GATEWAY

Release 25.7.R1

Final

DN1000134042

Issue 10-0

Nokia is committed to diversity and inclusion. We are continuously reviewing our customer documentation and consulting with standards bodies to ensure that terminology is inclusive and aligned with the industry. Our future customer documentation will be updated accordingly.

This document includes Nokia proprietary and confidential information, which may not be distributed or disclosed to any third parties without the prior written consent of Nokia.

This document is intended for use by Nokia's customers ("You"/"Your") in connection with a product purchased or licensed from any company within Nokia Group of Companies. Use this document as agreed. You agree to notify Nokia of any errors you may find in this document; however, should you elect to use this document for any purpose(s) for which it is not intended, You understand and warrant that any determinations You may make or actions You may take will be based upon Your independent judgment and analysis of the content of this document.

Nokia reserves the right to make changes to this document without notice. At all times, the controlling version is the one available on Nokia's site.

No part of this document may be modified.

NO WARRANTY OF ANY KIND, EITHER EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO ANY WARRANTY OF AVAILABILITY, ACCURACY, RELIABILITY, TITLE, NON-INFRINGEMENT, MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE, IS MADE IN RELATION TO THE CONTENT OF THIS DOCUMENT. IN NO EVENT WILL NOKIA BE LIABLE FOR ANY DAMAGES, INCLUDING BUT NOT LIMITED TO SPECIAL, DIRECT, INDIRECT, INCIDENTAL OR CONSEQUENTIAL OR ANY LOSSES, SUCH AS BUT NOT LIMITED TO LOSS OF PROFIT, REVENUE, BUSINESS INTERRUPTION, BUSINESS OPPORTUNITY OR DATA THAT MAY ARISE FROM THE USE OF THIS DOCUMENT OR THE INFORMATION IN IT, EVEN IN THE CASE OF ERRORS IN OR OMISSIONS FROM THIS DOCUMENT OR ITS CONTENT.

Copyright and trademark: Nokia is a registered trademark of Nokia Corporation. Other product names mentioned in this document may be trademarks of their respective owners.

Table of Contents

List of Tables.....	98
1 Getting started.....	104
2 Summary of changes.....	105
3 CLI usage.....	124
3.1 CLI structure.....	124
3.2 CLI contexts.....	124
4 Card and system management command reference.....	126
4.1 Card and system management command hierarchies.....	126
4.1.1 Card and system management configuration command hierarchies.....	126
4.1.1.1 Card configuration command hierarchy.....	126
4.1.1.2 Port configuration command hierarchy.....	126
4.1.1.3 Mobile-gateway system configuration command hierarchy.....	127
4.1.1.4 System security command hierarchy.....	128
4.1.1.5 Admin redundancy command hierarchy.....	129
4.1.1.6 Redundancy configuration command hierarchy.....	129
4.1.1.7 Accounting policy command hierarchy.....	130
4.1.2 Card and system management show command hierarchies.....	130
4.1.2.1 Show card command hierarchy.....	131
4.1.2.2 Show certificate command hierarchy.....	131
4.1.2.3 Show mobile gateway command hierarchy.....	131
4.1.2.4 Show redundancy command hierarchy.....	132
4.2 Card and system management command descriptions.....	132
4.2.1 Card and system management configuration command descriptions.....	132
4.2.1.1 Card configuration command descriptions.....	132
4.2.1.1.1 card.....	132
4.2.1.1.2 card-type.....	133
4.2.1.1.3 mda-type.....	134
4.2.1.2 Port configuration command descriptions.....	136
4.2.1.2.1 eth-pdu-port.....	136
4.2.1.3 Generic system configuration command descriptions.....	136
4.2.1.3.1 shutdown.....	136
4.2.1.4 Mobile-gateway system configuration command descriptions.....	137
4.2.1.4.1 system.....	137
4.2.1.4.2 call-insight.....	137
4.2.1.4.3 location.....	138
4.2.1.4.4 disable.....	138
4.2.1.4.5 limit.....	139

4.2.1.4.6	primary.....	139
4.2.1.4.7	max-files-number.....	140
4.2.1.4.8	disable-delayed-acct.....	140
4.2.1.4.9	error-indication-tx.....	141
4.2.1.4.10	group.....	141
4.2.1.4.11	card.....	143
4.2.1.4.12	pcmd-profile.....	144
4.2.1.4.13	override-profile.....	145
4.2.1.4.14	protect-active-delay.....	146
4.2.1.4.15	ipv6-path-mtu.....	146
4.2.1.4.16	ipv6-udp-checksum.....	147
4.2.1.4.17	non-terminating-rules.....	147
4.2.1.4.18	policer-distribution.....	148
4.2.1.4.19	resource-pool.....	148
4.2.1.4.20	thresholds.....	149
4.2.1.4.21	cam-utilization-threshold.....	150
4.2.1.4.22	system-mg-ism.....	151
4.2.1.4.23	counter.....	151
4.2.1.4.24	interval.....	152
4.2.1.4.25	ttc-accuracy.....	153
4.2.1.4.26	ue-fragmented-packets-handling.....	153
4.2.1.4.27	use-fixed-udp-src-port.....	154
4.2.1.4.28	security.....	155
4.2.1.4.29	dist-cpu-protection.....	155
4.2.1.4.30	policy.....	155
4.2.1.4.31	protocol.....	156
4.2.1.4.32	ssh.....	157
4.2.1.4.33	client-host-key-list.....	157
4.2.1.4.34	host-key.....	157
4.2.1.4.35	client-kex-list.....	159
4.2.1.4.36	kex.....	159
4.2.1.4.37	server-host-key-list.....	160
4.2.1.4.38	server-host-key-rsa-length.....	160
4.2.1.4.39	server-kex-list.....	161
4.2.1.4.40	tls.....	162
4.2.1.4.41	client-cipher-list.....	162
4.2.1.4.42	cipher.....	162
4.2.1.4.43	server-cipher-list.....	163
4.2.1.4.44	cipher.....	163
4.2.1.5	Admin redundancy command descriptions.....	164
4.2.1.5.1	redundancy.....	164
4.2.1.5.2	cpm-switchover.....	165
4.2.1.5.3	mc-master-lock.....	165
4.2.1.5.4	mc-mobile-switchover.....	166
4.2.1.5.5	mc-slave-lock.....	167
4.2.1.5.6	mg-switchover.....	168
4.2.1.5.7	group.....	169

4.2.1.6 Redundancy configuration command descriptions.....	170
4.2.1.6.1 multi-chassis.....	170
4.2.1.6.2 peer.....	170
4.2.1.6.3 mc-mobile.....	171
4.2.1.6.4 bfd-enable.....	171
4.2.1.6.5 diameter-connection-lost-detection.....	172
4.2.1.6.6 gx-failover.....	172
4.2.1.6.7 hold-on-neighbor-failure.....	173
4.2.1.6.8 keep-alive-interval.....	174
4.2.1.6.9 master-traffic-detection.....	174
4.2.1.6.10 mc-complete-ue-sync.....	175
4.2.1.6.11 mc-redirect.....	175
4.2.1.6.12 mobile-gateway.....	176
4.2.1.6.13 sync-mc-ipsec.....	177
4.2.1.6.14 tunnel-group.....	177
4.2.1.6.15 peer-connect.....	178
4.2.1.6.16 slave-traffic-delay-timer.....	178
4.2.1.6.17 traffic-detection.....	179
4.2.1.6.18 traffic-detection-poll-timer.....	180
4.2.1.7 Accounting policy command descriptions.....	181
4.2.1.7.1 record.....	181
4.2.2 Card and system management show command descriptions.....	187
4.2.2.1 Show card command descriptions.....	187
4.2.2.1.1 card.....	187
4.2.2.2 Show mobile gateway command descriptions.....	189
4.2.2.2.1 call-insight.....	189
4.2.2.2.2 all-ues.....	190
4.2.2.2.3 files.....	192
4.2.2.2.4 ue.....	193
4.2.2.2.5 ue-mask.....	195
4.2.2.2.6 connections.....	196
4.2.2.2.7 ism-mg.....	199
4.2.2.2.8 abs.....	200
4.2.2.2.9 cpu.....	201
4.2.2.2.10 memory-pools.....	204
4.2.2.2.11 sdf.....	207
4.2.2.2.12 mg-vm.....	209
4.2.2.2.13 cpu.....	209
4.2.2.2.14 memory-pools.....	211
4.2.2.2.15 system.....	214
4.2.2.3 Show redundancy command descriptions.....	219
4.2.2.3.1 mc-mobile.....	219
5 PDN command reference.....	233
5.1 PDN command hierarchies.....	233
5.1.1 PDN configuration command hierarchies.....	233
5.1.1.1 PDN command hierarchy.....	234

5.1.1.2 APN PDN command hierarchy.....	240
5.1.1.3 Bearer traffic PDN command hierarchy.....	254
5.1.1.4 Cloud database PDN command hierarchy.....	254
5.1.1.5 Charging PDN command hierarchy.....	255
5.1.1.6 Ga PDN command hierarchy.....	256
5.1.1.7 Gn PDN command hierarchy.....	256
5.1.1.8 Gp PDN command hierarchy.....	257
5.1.1.9 GTP load and overload control PDN command hierarchy.....	257
5.1.1.10 Gx PDN command hierarchy.....	259
5.1.1.11 Gy PDN command hierarchy.....	260
5.1.1.12 KPI-KCI PDN command hierarchy.....	261
5.1.1.13 N2 PDN command hierarchy.....	262
5.1.1.14 N3 PDN command hierarchy.....	262
5.1.1.15 N9 PDN command hierarchy.....	262
5.1.1.16 Network trace command hierarchy.....	263
5.1.1.17 NF profile attributes command hierarchy.....	263
5.1.1.18 NWu PDN command hierarchy.....	264
5.1.1.19 PFCP load and overload PDN command hierarchy.....	264
5.1.1.20 PGW selection PDN command hierarchy.....	265
5.1.1.21 Pi PDN command hierarchy.....	265
5.1.1.22 RADIUS PDN command hierarchy.....	266
5.1.1.23 Rf PDN command hierarchy.....	266
5.1.1.24 S1-u PDN command hierarchy.....	267
5.1.1.25 S11 PDN command hierarchy.....	268
5.1.1.26 S12 PDN command hierarchy.....	269
5.1.1.27 S2a PDN command hierarchy.....	269
5.1.1.28 S2b PDN command hierarchy.....	270
5.1.1.29 S4 PDN command hierarchy.....	270
5.1.1.30 S5 PDN command hierarchy.....	271
5.1.1.31 S6b PDN command hierarchy.....	272
5.1.1.32 S8 PDN command hierarchy.....	273
5.1.1.33 SBA client services PDN command hierarchy.....	274
5.1.1.34 SBA server services PDN command hierarchy.....	281
5.1.1.35 SBA service realm PDN command hierarchy.....	283
5.1.1.36 Sd PDN command hierarchy.....	283
5.1.1.37 Signaling PDN command hierarchy.....	284
5.1.1.38 STa PDN command hierarchy.....	285
5.1.1.39 SWm PDN command hierarchy.....	285
5.1.1.40 SWu PDN command hierarchy.....	286
5.1.1.41 SWw PDN command hierarchy.....	287
5.1.1.42 Sx-N4 PDN command hierarchy.....	287
5.1.1.43 T6c command hierarchy.....	288
5.1.1.44 Threshold PDN command hierarchy.....	288
5.1.1.45 Virtual APN selection PDN command hierarchy.....	289
5.1.2 PDN show command hierarchy.....	290
5.1.3 PDN clear command hierarchy.....	295
5.2 PDN command descriptions.....	297

5.2.1 PDN configuration command descriptions.....	298
5.2.1.1 Generic PDN command descriptions.....	299
5.2.1.1.1 description.....	299
5.2.1.1.2 shutdown.....	300
5.2.1.2 PDN command descriptions.....	301
5.2.1.2.1 pdn.....	301
5.2.1.2.2 5g-ims-fallback-timeout.....	301
5.2.1.2.3 aa-group.....	302
5.2.1.2.4 allow-duplicate-imei.....	303
5.2.1.2.5 allow-duplicate-msisdn.....	303
5.2.1.2.6 allow-multi-ue-session.....	304
5.2.1.2.7 allow-multiple-apn-pdn.....	305
5.2.1.2.8 apn.....	305
5.2.1.2.9 auto-set-handover-indication.....	307
5.2.1.2.10 call-procedure-retry.....	307
5.2.1.2.11 cam-optimization.....	308
5.2.1.2.12 dl-buffering.....	309
5.2.1.2.13 drop-oldest-pkt.....	310
5.2.1.2.14 max-pkt.....	310
5.2.1.2.15 max-pkt-size.....	311
5.2.1.2.16 total-buffer-capacity.....	312
5.2.1.2.17 total-buffer-pkts.....	312
5.2.1.2.18 create-procedure-retry.....	313
5.2.1.2.19 default-traffic-hash.....	314
5.2.1.2.20 del-bearer-reactivation-req-cause-pgw-failure.....	315
5.2.1.2.21 delay-nw-procedures.....	315
5.2.1.2.22 disable-hss-init-update-failure-delete.....	316
5.2.1.2.23 dns-client.....	317
5.2.1.2.24 cache-clear-no-such-name.....	317
5.2.1.2.25 dns-interface.....	317
5.2.1.2.26 dns-profile.....	318
5.2.1.2.27 enable-pcscf-low-ttl.....	319
5.2.1.2.28 refresh-interval.....	320

1 Getting started

Get general information about this guide.

About this guide

This guide describes features and functionality provided by the 7750 Service Router (SR) Mobile Gateway (7750 SR MG) and Cloud Mobile Gateway (CMG). It describes concepts and descriptions of the Command Line Interface (CLI) syntax and command reference.

The 7750 SR MG and the CMG products do not differ in network elements and configuration aspects, and the information described in this guide is generally applicable to both products, with the exception of the hardware information which is applicable to the 7750 SR MG only. For CMG-specific information, such as operation on physical hardware and virtual machine installation, refer to the *CMG Installation Guide*.

NOTE:

- Configuration outputs shown in this guide are examples only; actual displays may differ depending on supported functionality and user configuration.
- The CMG-specific administration, license, tools, and show commands are described in the *CMG Installation Guide*.
- This guide covers content for the release specified on the title page of the guide, and may also contain content that will be released in later maintenance loads. Refer to the applicable *7750 MG and CMG Release Notes* for information about features supported in each load of the release software.
- The information in this guide is intended to be used in conjunction with the other guides in the 7750 SR MG and CMG, and the 7750 SR configuration guides. The 7750 SR guides describe the SR OS service features that are supported by the 7750 SR MG and CMG and are mostly used without modification. These features apply to all mobile gateway types, unless explicitly noted.
- For more information about the acronyms included in this guide, refer to the *Acronyms and Terms*.

Audience

This guide is intended for network administrators who are responsible for configuring routers. It is assumed that the network administrators have an understanding of networking principles and configurations.

2 Summary of changes

Changes between guide issues.

For more information about the CMG features and enhancements, refer to the *CMG Feature Overview*.

Changes between issue 9-2 (25.3.R3) and issue 10-0 (25.7.R1)

Feature or enhancement	Description	See
3GPP baseline updating to Rel 17 for SMF/UPF Lawful Intercept (MG-4100)	Added support for configuring the 3GPP release 17 baseline for the 5G LI interfaces	<i>config>li>mobile>3gpp-5g-release</i> (added the rel-17 option)
4G MPS support on ePDG (MG-4655)	Added 4G MPS support on ePDG	• <i>config>mobile>pdn>wps-profile</i> • <i>config>mobile>profile>wps-profile</i> – <i>arp</i> • <i>message-priority</i> – <i>all</i> – <i>gtpc</i> – <i>up-dscp-marking</i> • <i>down-link</i> • <i>up-link</i> • <i>show>mobile>profile>wps-profile</i> • <i>show>mobile>pdn>ref-point-stats s2b</i> (enhanced the output) • <i>show>mobile>pdn>pdn-context imsi detail</i> (enhanced the output) • <i>show>mobile>pdn>statistics</i> (enhanced the output)
5GSA virtual-DNN support (CC-based) (MG-4470)	Added support for CC-based DNN override mechanism	<i>config>mobile>pdn>apn>upf-selection>dnn</i>

Feature or enhancement	Description	See
CM-IDLE timer enhancement on SMF (MG-4287)	Added support for CM-IDLE timer on the SMF	<code>config>mobile>pdn>apn>cm-idle-timeout</code>
Disable UDM services per APN (MG-4532)	Added support for disabling the Nudm_SubscriberData Management and Nudm_UEContextManagement services	• <code>config>mobile>pdn>apn>udm-sdm-disabled</code> • <code>config>mobile>pdn>apn>udm-uecm-disabled</code>
ePDG Diffie-Hellman group 19 (MG-4317)	Added support for Diffie-Hellman group 19, which is of type Elliptic Curve Prime, for both IKEv2 and ESP protocols; additionally, increased the number of IKEv2 and ESP security proposal entries to 20, for each protocol type	• <code>config>mobile>profile>ipsec-profile>esp-sa>proposal-entry</code> (updated the value range) – <code>dh-group</code> (updated the value range) • <code>config>mobile>profile>ipsec-profile>ike-sa>proposal-entry</code> (updated the value range) – <code>dh-group</code> (updated the value range) • <code>show>mobile>pdn>ref-point-stats nwu</code> • <code>show>mobile>pdn>ref-point-stats swu</code> • <code>show>mobile>pdn>ref-point-stats swu-nwu</code> • <code>clear>mobile>pdn>ref-point-stats swu [card slot-number]</code>
I-UPF without the I-SMF (MG-4420)	Added support to the SMF for controlling both the I-UPF and the anchor UPF without the I-SMF	<code>config>mobile>pdn>i-upf-selection</code>
IP wildcard support for MG addr-list ip-address and remote-ip entries (MG-3315)	Added support for using wildcards within IPv6 addresses when defining flow filters	• <code>config>mobile>profile>addr-list>ip-address-group</code> • <code>config>mobile>profile>policy-options>policy-rule-unit>flow-</code>

Feature or enhancement	Description	See
		<i>description>match>remote-ip-address-group</i>
Inserting the active PCC rulebases in the HTTP header (MG-2063)	Added support for enriching the HTTP header with the active PCC rulebase name	<i>config>mobile>profile>pfcf>pfcf-translate-profile>field</i> (added the <i>hdr-enrich-pcc-rulebase</i> option) <i>config>app-assure>group>http-enrich>field</i> (added the <i>pcc-rulebase</i> value to the <i>field-name</i> parameter)
N11 paging dampening timer (MG-3127)	Added support for paging dampening	<i>config>mobile>pdn>sba-client-services>amf-client>namf-comm>paging-damp-timer</i>
NCGI level UPF/PSA selection (MG-4475)	Added support for UPF/PSA selection at the cell-id level	<i>config>mobile>profile>list>cell-id-list</i> <i>config>mobile>profile>list>cell-id-list>ncgi</i> <i>config>mobile>profile>node-selection>client-profile>entry>match>cell-id-list</i> <i>show>mobile>profile>list>cell-id-list</i> <i>show>mobile>profile>node-selection>client-profile</i> (enhanced the output)
Nchf converged and failopen enhancements (MG-4594)	Added support for requesting a specific amount of volume quota when sending RequestedUnits to the CHF and for overriding the PCF-provided online and offline flags when the PCF installs a dynamic rule with both online and offline flags set to false	<i>config>mobile>profile>charging>chf-profile>requested-unit-total-volume</i> <i>config>mobile>profile>charging>chf-profile>rating-group>requested-unit-total-volume</i> <i>config>mobile>profile>npcf>dynamic-pcc-online-offline-flags-override</i>

Feature or enhancement	Description	See
		<code>config>mobile>profile>policy-options>policy-rule-base>requested-unit-total-volume</code>
Preferred pcfld in model A	Added support to the SMF not to use the received PCF ID from the AMF in any selection logic, when the provisioning of "usePcflid" is set to "ignore"	<code>config>mobile>pdn>apn>pcf-selection>pcf-id</code>
SMF configuration of query parameters for UDM sm-data (MG-4509)	Added support for excluding the PLMN ID when the session management subscription data is retrieved from the UDM	<code>config>mobile>profile>udm-sdm-profile>get-sm-subscription-data>exclude-plmn-id</code>
SMF to support PCF provided CHF addresses (MG-4194)	Added support for specifying if the PCF is allowed to send the CHF addresses within the ChargingInfo IE	<code>config>mobile>profile>npcf>allow-pcf-provided-chf-address</code>
SMF use of UDM immediate report (MG-4582)	Added support for additional recovery option for UDM failure handling where the failed service operation is reattempted	<code>config>mobile>pdn>sba-client-services>udm-client>nudm-sdm>supported-features</code> – <code>immediate-report</code> <code>config>mobile>pdn>sba-client-services>udm-client>nudm-sdm>supported-features>immediate-report</code> <code>config>mobile>profile>udm-sdm-profile>continue-timer</code> (added the retry value to the action command) <code>config>mobile>profile>udm-uecm-profile>continue-timer</code> (added the retry value to the action command)

Feature or enhancement	Description	See
Support of small IP pools per enterprise DNN with multiple MG groups on SMF (MG-4119)	Added support for setting an APN/ DNN type as small to assign the UE sessions of small enterprises to a single CP MG group	<code>config>mobile>pdn>apn>apn-type</code> <code>show>mobile>pdn>apn</code> (enhanced the output)
TLS Header Enrichment - Extension Types (MG-4241)	Added support to the CMG for HTTPS (TLS) header enrichment	<code>config>app-assure>group>http-enrich>tls-extension>subtype</code> (added the <i>plmn-id</i> and <i>static-string</i> values to the <i>tls extension subtype</i> variable). <code>config>app-assure>group>http-enrich>tls-extension>subtype></code> <code>aes-initialization-vector</code> <code>encode</code> <code>extension-id</code> <code>static-string</code>
UPF IP address allocation enhancements (MG-4248)	Added support for customized and pre-defined call-flow alternatives	<code>config>mobile>pdn>apn>call-sequence</code>
—	Added a limitation about the maximum number of slice lists and slices that can be configured	<code>config>mobile>profile>list>slice-list</code> <code>config>mobile>profile>list>slice-list>slice</code>
—	Added a note about the retransmit message	<code>config>mobile>profile>namf-profile>transaction-timer</code>
—	Added a note about the use of the command in live deployments	<code>debug>mobile>call-insight>all-ues</code>
—	Added the <code>callback-type-preference</code> to the following contexts: <code>config>mobile>pdn>sba-client-services>amf-client>namf-comm</code>	—

Feature or enhancement	Description	See
	• <code>config>mobile>pdn>sba-client-services>amf-client>namf-evts</code> • <code>config>mobile>pdn>sba-client-services>pcf-client>npcf-smpolicycontrol</code> • <code>config>mobile>pdn>sba-client-services>udm-client>nudm-uecm</code>	
—	Removed the PDN shutdown requirement from selected SBI configuration commands	• <i>SBA client services PDN command descriptions</i> • <i>SBA server services PDN command descriptions</i>
—	Updated the description of the <i>config>mobile>pdn>n2>supported-ta-item>tac</i> command	—
—	Updated <code>udp-port</code> to include the value range for 7750 SR MG	• <i>config>service>vprn>twamp-light>reflector</i> • <i>config>router>twamp-light>reflector</i>

Changes between issue 9-1 (25.3.R2) and issue 9-2 (25.3.R3)

Feature or enhancement	Description	See
CMG CNF ISSD for 1:1 (CUPS / 5GC SMF, UPF) (MG-4404)	Added ISSD support for 1:1 intra-CNF redundancy	<i>admin>redundancy>mg-switchover>group</i> (added the downgrade) option

Changes between issue 9-0 (25.3.R1) and issue 9-1 (25.3.R2)

Feature or enhancement	Description	See
Cflowd RTT field in microseconds and removal of 0 values (MG-4555)	Enhanced the AA comprehensive Cflowd reporting of client side and network side round-trip time during TCP session establishment	<code>config>app-assure>group>cflowd>comprehensive>template>dynamic-fields>field</code>
Support of additional 5G and other Cflowd fields (MG-4319)	Added support of additional configurable fields (5G and others) to be included in the AA comprehensive Cflowd records	<code>config>mobile>profile>pfcg>pfcg-translate-profile>field</code> <code>config>app-assure>group>cflowd>comprehensive>template>dynamic-fields>field</code> <code>config>app-assure>group>cflowd>system-name</code>
DNS enrichment (MG-4320)	Added support for enriching DNS Request messages with an additional extension to be used by the DNS servers for content filtering	<code>config>app-assure>group>dns-enrich</code> • <code>gateway</code> • <code>description</code> • <code>option</code> • <code>packet-size-limit</code> • <code>shutdown</code> <code>config>app-assure>group>policy>aqp>entry>action>dns-enrich</code> <code>config>app-assure>group>cflowd>comprehensive>template>dynamic-fields>field</code> (added the ednsSubPolicy Id value) <code>show>app-assure>group>dns-enrich</code>
Support for HTTP header encryption method encryption aes-256-gcm-sha384 salt (MG-4720)	Added support to AA for encrypting HTTP headers with the aes256 gcm-sha384 salt algorithm	<code>config>app-assure>group>http-enrich>field>encode</code>

Changes between issue 8-0 (24.11.R1) and issue 9-0 (25.3.R1)

Feature or enhancement	Description	See
4G WPS support on ePDG based on preconfigured ARP values (MG-4517)	Added 4G WPS support on ePDG	• <i>config>mobile>pdn>wps-profile</i> • <i>config>mobile>profile>wps-profile</i> – <i>arp</i> • <i>message-priority</i> – <i>all</i> – <i>gtpc</i> – <i>up-dscp-marking</i> • <i>down-link</i> • <i>up-link</i> • <i>show>mobile>profile>wps-profile</i> • <i>show>mobile>pdn>ref-point-stats s2b</i> (enhanced the output) • <i>show>mobile>pdn>pdn-context imsi detail</i> (enhanced the output) • <i>show>mobile>pdn>statistics</i> (enhanced the output)
base64 encoding of AES encrypted Header Enrichment fields (MG-4503)	Added support for encoding in base64 AES encrypted Header Enrichment fields	<i>config>app-assure>group>http-enrich>field>encode</i>
CMG adapts LI solutions towards 3rd party LIMS (MG-4615)	Added support for configuring how the Network ID (NEID) is populated	<i>config>li>mobile>iri>neid</i>
Control UPF Selection via N7 policy rules (MG-4549)	Added support for UPF selection of PDU session through the N7 policy rules	<i>config>mobile>profile>policy-options>action-rule-unit>dnai-psa-select</i>

Feature or enhancement	Description	See
SCP statistics (MG-3479)	Added support for new SCP statistics	<i>show>mobile>pdn>service-stats</i>
SMF service recovery after UDM failure (MG-4058)	Adds recovery actions for sessions established while the UDM was unavailable and defines UDM blocking to avoid signaling towards unavailable UDM	<i>config>mobile>profile>udm-usm-profile</i> • <i>block-timer</i> • <i>continue-timer</i> <i>config>mobile>profile>udm-uecm-profile</i> • <i>block-timer</i> • <i>continue-timer</i> Added the <i>block</i> parameter: • <i>fh-session-no-response</i> • <i>http-status-code</i> Added the <i>udm</i> parameter: • <i>show>mobile>pdn>nf-peers</i>
Start time parameter to be included in all CDRs (MG-4519)	Added the <i>always-include</i> option in the command	<i>config>mobile>profile>charging>cdr-avp-options>start-time</i>
Support of CDR files without headers (MG-4528)	Added support for excluding the CDR file headers and the CDR headers as defined in 3GPP TS 32.297	<i>config>mobile>pdn>charging>remove-3gpp-headers</i>
—	Added a note about disabling the <i>client-identifier-msisdn-encoded</i>	<i>tools>perform>dhcp>test</i>
—	Added a note about the aging of locally configured peers	<i>tools>perform>mobile>pdn>force-clear>diameter-peer-destination-host</i>

Feature or enhancement	Description	See
—	Updated the value range of the http-to-5gsm and the 5gsm-cause parameters	<i>config>mobile>profile>sbi-error-mapping-profile>http-to-5gsm</i>
—	Updated the value range of the http-to-gtp and the gtp-error parameters	<i>config>mobile>profile>sbi-error-mapping-profile>http-to-gtp</i>

Deprecated commands

Changes between issue 7-1 (24.7.R1) and issue 8-0 (24.11.R1)

Feature or enhancement	Description	See
4G and 5G WPS support on SGW/PGW/SMF based on preconfigured ARP and QCI_5QI values (MG-3045)	Added support for 4G and 5G WPS on SGW/PGW/SMF based on preconfigured ARP and QCI_5QI values	• <i>config>mobile>pdn>wps-profile</i> • <i>config>mobile>profile>wps-profile</i> – <i>arp</i> • <i>message-priority</i> – <i>all</i> – <i>gtpc</i> – <i>pfc</i> – <i>sbi</i> – <i>up-dscp-marking</i> • <i>down-link</i> • <i>up-link</i> • <i>show>mobile>profile>wps-profile</i> • <i>show>mobile>pdn>apn statistics</i> (enhanced the output) • <i>show>mobile>pdn>bearer-context</i> (enhanced the output) • <i>show>mobile>pdn>call-flow-stats</i> (enhanced the output) • <i>show>mobile>pdn>pdn-context imsi detail</i> (enhanced the output)
AA Cflowd: throughput and latency fields (MG-4301)	Enhanced Application Assurance Cflowd comprehensive template with new selectable fields	• <i>config>app-assure>group>policer</i> – <i>action</i> • <i>config>app-assure>group>cflowd>comprehensive>template>dynamic-fields>field</i>

Feature or enhancement	Description	See
CHF/N40 reporting behavior modification (MG-4439)	Added support for reporting charging data to the CHF (proprietary functionality)	<code>config>mobile>profile>charging>chf-profile>custom-online-offline-reporting</code> <code>config>mobile>profile>policy-options>charging-rule-unit>custome-online-sru</code>
Enhanced LI X2/X3 link down detection (MG-4456)	Added support for detecting X2 and X3 interface connection status	<code>config>li>mobile>tcp-keepalive</code> <code>idle-time</code> <code>interval</code> <code>retries</code> <code>shutdown</code>
Enabling N7 PCF CMG specific behavior in mixed vendor GW network (MG-4410)	Added support for configuring the Nokia proprietary IE "vendor Specific-006527": {"smfNokia": 2}	<code>config>mobile>profile>n7-attributes-profile>nokia-smf-indicator-as-vsa</code>
Enhance CMG capacity to handle GTP-U echo requests (MG-4206)	Added support for distributing the GTP-U Echo Requests across the MG groups	<code>config>mobile>pdn>fwd-gtpu-echo-req-to-mg</code>
ICR SWO based on Gx failover (MG-4223)	Added support for configuring the ICR Gx connection failure detection	<code>config>redundancy>multi-chassis>peer>mc-mobile>diameter-connection-lost-detection</code> – <code>gx-failover</code> <code>show>redundancy>multi-chassis>mc-mobile</code> (enhanced the output)
N40 failopen to use a separate offline CHF (MG-4488)	Added support for configuring the Fail-Open failure handling parameters on a separate CCFH profile	<code>config>mobile>profile>charging>ccfh-profile>fail-open</code> <code>config>mobile>profile>charging>smf-charging>chf-selection>fail-open</code> – <code>chf-profile</code>

Feature or enhancement	Description	See
		– <i>nf-id-list</i>
PGW usage of UDM (MG-3400)	Added support for enabling the N10 functionality in the PGW for sessions with disabled 5G interworking	• <i>config>mobile>pdn>apn>converged-interface-support>converged-n10</i> • <i>config>mobile>pdn>sba-client-services>converged-interface-support>converged-n10</i> • <i>config>mobile>pdn>apn>slices>udm-based-slice-selection</i> • <i>config>mobile>profile>list>slice-list>slice>tai-list</i> • <i>config>mobile>profile>udm-sdm-profile>get-sm-subscription-data>send-sd-with-reserved-value</i> • <i>show>mobile>pdn>apn</i> • <i>show>mobile>profile>list>slice-list</i> • <i>show>mobile>profile>udm-sdm-profile</i>
PLMN-based SEPP selection (MG-4116)	Adds support for SMF SEPP selection based on the target PLMN	<i>config>mobile>pdn>sba-client-services>sepp-client>sepp>plmn-list</i>
SMF support of TAI in UF discovery (MG-4168)	Adds support for including the TAI in the query parameter when the SMF uses the NRF-based UPF discovery	<i>config>mobile>profile>node-selection>target-profile>entry>match>nrf-based</i>
SMF supports optimal PSA UPF reselection (MG-3069)	Added support for an optimal PSA UPF reselection in 5GC when the UE moves out of the UPF serving area	• <i>config>mobile>pdn>apn>ssc>pdu-session-reactivation-trigger</i> • <i>config>mobile>pdn>apn>ssc>pfcf-user-plane-inactivity-iupf-case</i> • <i>config>mobile>pdn>apn>ssc>upf-reselection</i> (added the i -

Feature or enhancement	Description	See
		smf option to the <i>ssc-1-option</i> , <i>ssc-2-option</i> , and <i>ssc-3-option</i> parameters) • <i>config>mobile>pdn>apn>ssc>uuid-mask-length</i> • <i>show>mobile>pdn>apn</i> (added an output example)
Support of Protect Dedicated Bearer per UPF peer and optional APN (MG-4307)	Adds support for releasing sessions without dedicated bearer in a UPF peer and optionally for a specified APN	<i>clear>mobile>pdn>bearer-context[protect-dedicated-bearers] up-peer ipv4-address ipv6-address [apn name]</i>
UPF support of sdf-level QoS enforcement using dynamic PCC rules (MG-4232)	Added support for policing per service data flow for dynamic policy rules	<i>config>mobile>pdn>apn>dynamic-rule-policing</i>
UPF supports 5G LI_X3 Sequence Number (MG-4255)	Added support of the X3 Sequence Number IE in the UPF	<i>config>li>mobile>li-x3>li-x3-sequence</i>
—	Added the <i>relax-aar-dest-realm</i> command	<i>config>mobile>pdn>s6b>relax-aar-dest-realm</i>
—	Added a note about modifying on-the-fly an IP address list that is already referenced in a configuration	<i>config>mobile>profile>addr-list</i>
—	Added a note that this command is not supported in the current release	<i>config>mobile>profile>charging>cdr-avp-options>ims-sig-context</i>
—	Added the <i>ue-entry</i> command	<i>config>mobile>profile>canary-test>user-range>ue-entry</i>
—	Added the <i>canary-test</i> command	<i>show>mobile>pdn>canary-test</i>

Feature or enhancement	Description	See
—	Updated the note to indicate that a PDN shutdown is required when CMG operates in LB-less mode	<i>config>mobile>pdn>s11>signaling>gtp-c>ddn-extended-buffering-time</i>
—	7750 SR MG-specific content is removed in phases.	—

Changes between issue 7-0 (24.7.R1) and issue 7-1 (24.7.R1)

Feature or enhancement	Description	See
—	Added a note about PDN shutdown requirement	• <i>config>mobile>pdn>s1-u>signaling</i> • <i>config>mobile>pdn>s1-u>signaling>gtp-u</i> • <i>config>mobile>pdn>s1-u>signaling>gtp-u>profile</i>

Changes between issue 6-1 (24.3.R1) and issue 7-0 (24.7.R1)

Feature or enhancement	Description	See
5GS virtual DNN support (MG-4345)	Added virtual DNN support in 5GS	<i>config>mobile>pdn>apn>pcf-selection>dnn</i> (added the virtual and public options to the <i>type</i> parameter)
CMG support for network trace for non-SBI signaling messages and interfaces (MG-3499)	Added support for non-SBI interfaces in CMG and enhancements in vTAP solution	• <i>config>mobile>pdn>network-trace>instance</i> • <i>config>mobile>pdn>network-trace>instance>tapping-interface</i> • <i>config>mobile-gateway>profile>network-trace-profile>http2-profile</i>

Feature or enhancement	Description	See
		• <i>config>mobile>pdn>network-trace>instance>interface</i> (updated the context) • <i>config>mobile>pdn>network-trace>instance>network-trace-profile</i> (updated the context) • <i>config>mobile>pdn>network-trace>instance>shutdown</i> (updated the context) • <i>show>mobile>profile>network-trace-profile</i> (enhanced the output)
Configurable failure action if no response from UDM (MG-3486)	Added support for a configurable failure action if the UDM does not respond	• <i>clear>mobile>pdn>bearer-context>udm-no-get-response</i> • <i>config>mobile>profile>udm-sdm-profile>create-subscription>fh-session-no-response</i> • <i>config>mobile>profile>udm-sdm-profile>get-sm-subscription-data>fh-session-no-response</i> • <i>config>mobile>profile>udm-uecm-profile>register-smf>fh-session-no-response</i> • <i>show>mobile>profile>udm-sdm-profile</i> (enhanced the output) • <i>show>mobile>profile>udm-uecm-profile</i> (enhanced the output)
DHCP troubleshooting via CLI (MG-4093)	Added support for managing and monitoring the DHCP server status and performance using test CLI commands	• <i>tools>dump>dhcp>test</i> • <i>tools>perform>dhcp>test</i>
Domestic roaming in emergency (MG-4243)	Added support for domestic roaming support for LTE Data,	<i>config>mobile>profile>gx>supported-features>user-equipment-info-extension</i>

Feature or enhancement	Description	See
	Voice over LTE, and Emergency Call services	
ePDG as CNF: Support for geo-redundancy (UE-by-UE sync) (MG-3889)	Added support for geo-redundancy in ePDG as CNF	<i>config>redundancy>multi-chassis>peer>mc-mobile>mc-complete-ue-sync</i>
ePDG as VNF: ICR improvements – sync MG-ISM complete UE records for ePDG ICR (UE-by-UE) (MG-2655)	Added support for ICR UE-by-UE reconcile synchronization in ePDG as VNF	<i>config>redundancy>multi-chassis>peer>mc-mobile>mc-complete-ue-sync</i>
ePDG support for SMF set interworking (MG-4328)	Added support for ePDG-initiated PDN session restoration	• <i>config>mobile>pdn>session-restoration-rate</i> • <i>show>mobile>pdn>call-flow-stats</i> (enhanced the output)
Non-terminating policy rules (MG-2233)	Adds support for marking predefined policy rules as Non-Terminating	• <i>config>mobile>profile>policy-options>policy-rule>non-terminating</i> • <i>config>mobile>system>non-terminating-rules</i> • <i>show>mobile>pdn>statistics</i> (enhanced the output)
Preemptive RG indication on PCC rule or rulebase (MG-4125)	Added support for requesting preemptively quota for the rating group (or rating group and service identifier)	<i>config>mobile>profile>policy-options>charging-rule-unit>default-rg</i>
Serving node change limit (MG-3585)	Added support for disabling the serving node change limit	• <i>config>mobile>profile>charging>pgw-charging>off-line>part-rec-closure-trig>serving-node-change-limit</i> • <i>config>mobile>profile>charging>sgw-charging>off-line>part-rec-closure-trig>serving-node-change-limit</i>

Feature or enhancement	Description	See
		<code>config>mobile>profile>charging>event-triggers-fbc>serving-node-change-limit</code> <code>config>mobile>profile>charging>event-triggers-qbc>serving-node-change-limit</code>
SMF support including IpDomain in Npcf message (MG-3160)	Added support for including the ipDomain IE in the N7 and Gx interfaces	<code>config>mobile>profile>n7-attributes-profile</code> <code>config>mobile>profile>n7-attributes-profile>ip-domain</code> <code>config>mobile>profile>npcf>ip-domain-type</code> <code>config>mobile>profile>npcf>n7-attributes-profile</code> <code>config>mobile>profile>pfcf>up-peer-list>peer>upf-id</code> (added the string option) <code>config>mobile>profile>policy-options>gx-avp-options>include-ipdomain-upf-id</code>
—	Added the <code>cleanup-on-no-resp</code> option	<code>tools>perform>mobile>pdn>pfcf-stale-session-audit-init</code>
—	Added the IKE transform commands	<code>config>ipsec>ike-transform</code>
—	Added the <code>state</code> command	<code>config>router>policy-options>policy-statement>entry>from>state</code>
—	Updated the note about the S2a-PGW/S2b-PGW peers (TWAG/e PDG) exception	<code>tools>perform>mobile>pdn>force-clear>path</code>

3 CLI usage

This section describes information about the CLI structure and CLI usage.

3.1 CLI structure

7750 SR MG and CMG CLI is a command-driven interface accessible through the console, Telnet, and SSH. The CLI can be used for the configuration and management of 7750 SR MG virtualized platform.

The CLI commands are organized in a hierarchical inverted tree structure. At the highest level is the ROOT level. Below this level are other tree levels with the major command groups; for example, configuration commands and show commands are levels below ROOT.

The CLI is organized so related commands with the same scope are at the same level or in the same context. Sublevels or subcontexts have related commands with a more refined scope. Each section in this guide describes a particular branch of the tree in hierarchical format, with full descriptions of the commands at all the sublevels and subcontexts.

3.2 CLI contexts

Use the CLI to access, configure, and manage the Nokia 7750 SR MG and CMG.

CLI commands are entered at the command line prompt. Access to specific CLI commands is controlled by the permissions set by your system administrator. Entering a CLI command makes navigation possible from one command context (or level) to another.

When you initially enter a CLI session, you are in the ROOT context. Navigate to another level by entering the name of successively lower contexts. For example, enter either the `configure` or `show` commands at the ROOT context to navigate to the `config` or `show` context, respectively. For example, at the command prompt (`#`), enter `config`. The active context displays the following in the command prompt:

```
# config
# config#
```

In a specific CLI context, enter commands at that context level by entering the text. It is also possible to include a command in a lower context as long as the command is formatted in the proper command and parameter syntax.

The following examples show two methods to navigate to a service SDP ingress level.

Example: Method 1

```
# configure mobile-gateway profile call-insight
config>mobile>profile>call-insight#
```

Example: Method 2

```
config# mobile
config>mobile# profile
config>mobile>profile# call-insight
config>mobile>profile>call-insight#
```

When the syntax is incorrect, the CLI returns the following error message:

```
config# mobile
Error: Bad command.
```

For more details and features of CLI, refer to *7450 ESS, 7750 SR, 7950 XRS, and VSR Basic System Configuration Guide*.

4 Card and system management command reference

The card, system, administration, configuration redundancy, security and certificate commands that are specifically supported for the 7750 SR MG.

The 7750 SR MG also supports most of the 7750 SR card and system commands. For descriptions of all supported 7750 SR card and system commands, refer to the *7450 ESS, 7750 SR, 7950 XRS, and VSR Interface Configuration Guide*, *7450 ESS, 7750 SR, 7950 XRS, and VSR Basic System Configuration Guide*, and *7450 ESS, 7750 SR, 7950 XRS, and VSR System Management Guide*.

4.1.1.5 Admin redundancy command hierarchy

This section describes MG-specific administration redundancy commands. For information about additional supported admin redundancy commands, refer to the *7450 ESS, 7750 SR, 7950 XRS, and VSR Basic System Configuration Guide*.

admin

- *redundancy*
 - *cpm-switchover* [now]
 - [no] *mc-master-lock*
 - *mc-mobile-switchover* mobile-gateway *gw-id* peer *ip-address* [now] [abort] [reboot]
 - [no] *mc-slave-lock*
 - *mg-switchover*
 - *group* *mg-group-id* [now] [max-preparation-time *max-preparation-time*] [upgrade | downgrade]

4.1.1.6 Redundancy configuration command hierarchy

This section describes MG-specific configuration redundancy commands. For information about additional supported configuration redundancy commands, refer to the *7450 ESS, 7750 SR, 7950 XRS, and VSR Basic System Configuration Guide*.

configure

- *redundancy*
 - *multi-chassis*
 - [no] *peer ip-address*
 - [no] *mc-mobile*
 - *bfd-enable* [service *service-id*] interface *interface-name*
 - no *bfd-enable*
 - *diameter-connection-lost-detection*
 - *gx-failover* *guard-timer*
 - no *gx-failover*
 - *hold-on-neighbor-failure* *multiplier*

- no *hold-on-neighbor-failure*
- *keep-alive-interval interval*
- no *keep-alive-interval*
- *master-traffic-detection* {enable | disable}
- no *master-traffic-detection*
- *mc-complete-ue-sync* [partial-reconcile]
- no *mc-complete-ue-sync*
- [no] *mc-redirect*
- *mobile-gateway gw-id role role*
- no *mobile-gateway*
 - *sync-mc-ipsec*
 - [no] *tunnel-group tunnel-group-id*
- *peer-connect* {enable | disable}
- no *peer-connect*
- *slave-traffic-delay-timer delay-timer*
- no *slave-traffic-delay-timer*
- *traffic-detection* {strict | relaxed}
- no *traffic-detection*
- *traffic-detection-poll-timer seconds*
- no *traffic-detection-poll-timer*

4.1.1.7 Accounting policy command hierarchy

This section describes SR accounting policy commands, and includes the record command, which supports an option that is specific to the mobile gateway. For more information about accounting policy commands, refer to the *7450 ESS, 7750 SR, 7950 XRS, and VSR System Management Guide*.

configure

- log
 - accounting-policy *acct-policy-id*
 - no accounting-policy *acct-policy-id*
 - collection-interval *minutes*
 - no collection-interval
 - [no] default
 - description *description-string*
 - no description
 - [no] include-system-info
 - *record record-name*
 - no *record*
 - [no] shutdown
 - to file *log-file-id*

4.1.2 Card and system management show command hierarchies

- *Show card command hierarchy*
- *Show certificate command hierarchy*
- *Show mobile gateway command hierarchy*
- *Show redundancy command hierarchy*

4.1.2.1 Show card command hierarchy

```
show
  - card
  - card state
  - card [slot-number]
  - card [slot-number] detail
```

4.1.2.2 Show certificate command hierarchy

This section describes SR-specific certificate show commands applicable to ePDG. For more information about ePDG certificate area enhancements, refer to the *CMG ePDG Guide*.

```
show
  - certificate
  - ca-profile
```

4.1.2.3 Show mobile gateway command hierarchy

```
show
  - mobile-gateway
  - call-insight
    - all-ues
    - files [[long] | [finished [long]] | [running [long]]]
    - ue [[detail] | [imei imei [detail]] | [imsi imsi [detail]] | [mask-name mask-name [detail]] | [msisdn msisdn [detail]] | [mac-address mac-address [detail]]]
    - ue-mask [name name]
  - connections [detail]
  - ism-mg
    - abs [statistics]
    - cpu [slot number] [mda number] [repeat repeat-number]
    - cpu [repeat repeat-number] [vm vm-id] [vm-function vm-function-number]
    - memory-pools [slot number] [mda number] [repeat repeat-number]
  [process process-name]
```

```
– memory-pools [repeat repeat-number] [vm vm-id] [vm-function vm-function-number]  
– sdf [group number]  
– mg-vm  
– cpu [vm vm-id] [vm-function vm-function-number] [repeat repeat-number]  
– memory-pools [vm vm-id] [vm-function vm-function-number] [repeat repeat-number]  
– sdf [group-number]  
– system [gateway gw-id | group group-number | [card slot-number | vm vm-id]]  
[summary] [call-insight]
```

4.1.2.4 Show redundancy command hierarchy

```
show  
– redundancy  
– multi-chassis  
– mc-mobile peer {ip-address | ipv6-address}  
– mc-mobile peer {ip-address | ipv6-address} mc-red-tcp-stats
```

4.2 Card and system management command descriptions

- *Card and system management configuration command descriptions*
- *Card and system management show command descriptions*

4.2.1 Card and system management configuration command descriptions

- *Card configuration command descriptions*
- *Generic system configuration command descriptions*
- *Mobile-gateway system configuration command descriptions*
- *Admin redundancy command descriptions*
- *Redundancy configuration command descriptions*
- *Accounting policy command descriptions*

4.2.1.1 Card configuration command descriptions

4.2.1.1.1 card

Syntax

[no] card *slot-number*

Context

config

Description

This mandatory command enables access to the chassis card Input/Output Module (IOM), slot, and MDA CLI context.

The no form of this command removes the card from the configuration. All associated ports, services, and MDAs must be shutdown.

Default

No cards are configured.

Parameters

slot-number

the slot number of the card in the chassis

Values	1 to 10 depending on chassis model
–	1 to 20 for CMG

4.2.1.1.2 card-type

Syntax

card-type *card-type*

no card-type

Context

config>card

Description

This mandatory command adds an IOM to the device configuration for the slot. The card type can be pre-provisioned, meaning that the card does not need to be installed in the chassis.

NOTE:

This command describes configuration of the ISM-MG card. For CMG configuration examples, refer to the *CMG Installation Guide*.

A card must be provisioned before an MDA or port can be configured.

A card can only be provisioned in a slot that is vacant, meaning no other card can be provisioned (configured) for that particular slot. To reconfigure a slot position, use the no form of this command to remove the current information.

A card can only be provisioned in a slot if the card type is allowed in the slot. An error message is generated if an attempt is made to provision a card type that is not allowed.

If a card is inserted that does not match the configured card type for the slot, a medium severity alarm is raised. The alarm is cleared when the correct card type is installed or the configuration is modified.

A high severity alarm is raised if an administratively enabled card is removed from the chassis. The alarm is cleared when the correct card type is installed or the configuration is modified. A low severity trap is issued when a card is removed that is administratively disabled.

Because the IOM3-XP integrated card does not have the capability to install separate MDAs, the configuration of the MDA is automatic. This configuration only includes the default parameters such as default buffer policies. Commands to manage the MDA such as shut down, named buffer pool, and so on will remain in the MDA configuration context.

An appropriate alarm is raised if a partial or complete card failure is detected. The alarm is cleared when the error condition ceases.

No cards are preconfigured for any slots. The IOM card is equipped and pre-provisioned for slot 1.

The no form of this command removes the card from the configuration. It cannot be used for the IOM card which is fixed.

Parameters

card-type

the type of card to be configured and installed in that slot

Values: iom-20g | miom2-20g | iom-20g-b|iom3-xp | imm48-1gb-sfp | imm48-1gb-tx |
imm8-10gb-xfp|imm4-10gb-xfp | imm5-10gb-xfp | imm1-oc768-tun | imm1-40gb-tun |
imm1-100gb-cfp | imm12-10gb-sf+ | iom3-xp-b | imm48-1gb-sfp-b | imm3-40gb-qsfp |
iom3-xp-c | imm-1pac-fp3 | imm-2pac-fp3 | imm48-1gb-sfp-c | ism-mg-2pac-fp3 | iom-v |
iom-v-mg | iom-v-mgd

4.2.1.1.3 mda-type

Syntax

```
mda-type mda-type  
no mda-type
```

Context

```
config>card>mda
```

Description

This mandatory command provisions a specific MDA type to the device configuration for the slot. The MDA can be pre-provisioned but an MDA must be provisioned before ports can be configured. Ports can be configured once the MDA is properly provisioned.

A maximum of two MDAs can be provisioned on an IOMXMA. Only one MDA can be provisioned per IOM MDA slot. To modify an MDA slot, shut down all port associations.

A maximum of six MDAs or eight CMAs (or a combination) can be provisioned on a 7750 SR-c12. A maximum of two MDAs or four CMAs (or a combination) can be provisioned on a 7710 SR-c4. Only one MDA/CMA can be provisioned per MDA slot. To modify an MDA slot, shut down all port associations.

CMAs do not rely on MCM configuration and are provisioned without MCMs.

An MDA can only be provisioned in a slot if the MDA type is allowed in the MDA slot. An error message is generated when an MDA is provisioned in a slot where it is not allowed.

A medium severity alarm is generated if an MDA is inserted that does not match the MDA type configured for the slot. This alarm is cleared when the correct MDA is inserted or the configuration is modified.

A high severity alarm is raised when an administratively enabled MDA is removed from the chassis. This alarm is cleared if either the correct MDA type is inserted or the configuration is modified. A low severity trap is issued if an MDA is removed that is administratively disabled.

An alarm is raised if partial or complete MDA/CMA failure is detected. The alarm is cleared when the error condition ceases.

All parameters in the MDA context remain and if non-default values are required then their configuration remains as it is on all existing MDAs.

The no form of this command deletes the MDA/CMA from the configuration. The MDA/CMA must be administratively shut down before it can be deleted from the configuration.

**NOTE:**

- This command describes configuration of the MDA type for the ISM-MG card. For information about the CMG, refer to the *CMG Installation Guide*.

- CMAs/XMAs are provisioned using MDA commands. A medium severity alarm is generated if an MDA/CMA is inserted that does not match the MDA/CMA type configured for the slot. This alarm is cleared when the correct MDA/CMA is inserted or the configuration is modified. A high severity alarm is raised when an administratively enabled MDA/CMA is removed from the chassis. This alarm is cleared if either the correct MDA/CMA type is inserted or the configuration is modified. A low severity trap is issued if an MDA/CMA is removed that is administratively disabled.

Default

No MDA types are configured for any slots by default.

Parameters

mda-type

The type of MDA selected for the slot position. The supported MDA types depend on the card type. The available MDA types can be displayed via CLI for the configured card type.

4.2.1.2 Port configuration command descriptions

4.2.1.2.1 eth-pdu-port

Syntax

```
[no] eth-pdu-port
```

Context

```
config>port>ethernet
```

Description

This command enables the detection of DL ethernet frames and session matching based on C-VLAN and S-VLAN tagging on a specific port.

The no form of this command reverts to the default (disabled).

4.2.1.3 Generic system configuration command descriptions

4.2.1.3.1 shutdown

Syntax

[no] shutdown

Context

config>mobile>system>threshold>system-mg-ism

config>mobile>system>group

Description

This command administratively disables the entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics. Many entities must be explicitly enabled using the no shutdown command.

The shutdown command administratively disables an entity. The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted.

4.2.1.4 Mobile-gateway system configuration command descriptions

4.2.1.4.1 system

Syntax

system *number*

Context

config>mobile

Description

This command enables the context to configure mobile gateway profiles.

Parameters

number

specifies a profile number identifier

Values: 0 to 255

4.2.1.4.2 call-insight

Syntax

```
call-insight
```

Context

```
config>mobile>system
```

Description

This command enables the context to configure global call trace settings.

4.2.1.4.3 location

Syntax

```
location location
```

Context

```
config>mobile>system>call-insight
```

Description

This command configures the location of the Compact Flash (CF) call trace storage.

Parameters

location

specifies the location of the call trace storage

Values: cf1 | cf2

Default: cf1

4.2.1.4.4 disable

Syntax

```
[no] disable
```

Context

config>mobile>system>call-insight>location

Description

This command enables or disables the specified storage location for call trace files.

Default

no disable

4.2.1.4.5 limit

Syntax

limit *limit*

no limit

Context

config>mobile>system>call-insight>location

Description

This command limits the total captured call trace files size per CF.

Parameters

limit

specifies the total captured call trace files size in megabytes

Values: 0 to 65536 (0 means unlimited)

Default: 1000

4.2.1.4.6 primary

Syntax

[no] primary

Context

config>mobile>system>call-insight>location

Description

This command sets the primary CF. The other CF is automatically set to be secondary.

4.2.1.4.7 max-files-number

Syntax

`max-files-number` *max-files-number*

`no` `max-files-number`

Context

`config>mobile>system>call-insight`

Description

This command configures the maximum number of files for call trace output.

Parameters

max-files-number

specifies the maximum call trace files

Values: 0 to 1024

Default: 200

4.2.1.4.8 disable-delayed-acct

Syntax

`[no]` `disable-delayed-acct`

Context

`config>mobile>system`

Description

This command disables delayed accounting when AA Deep Packet Inspection (DPI) is deployed.

The no form of this command reverts to the default (delayed accounting is enabled).

NOTE:

When configuring the `disable-delayed-acct` command, some sessions may experience errors in charging data counts. Any delayed accounting reported after configuring the `disable-delayed-acct` command will be ignored and some data flows with application identification still in progress may be undercharged. To avoid this, perform the configuration change when the gateway is in the shutdown state.

Default

`no disable-delayed-acct`

4.2.1.4.9 error-indication-tx

Syntax

`[no] error-indication-tx`

Context

`config>mobile>system`

Description

This command enables GTP Error Indication messages toward the originating GTP-U peer for all GTP-U interfaces.

The `no` form of command disables generation of Error Indication messages.

Default

`no error-indication-tx`

4.2.1.4.10 group

Syntax

`group group-number [[redundancy type gateway gw-id] | [resource-pool resource-pool-id]]`

`no group group-number`

Context

`config>mobile>system`

Description

This command configures the mobile-gateway system group with one or more Mobility Service Module (MSM) cards on a 7750 SR MG platform, or MG-VMs (cards) on a CMG platform. The redundancy type and gateway ID are used for 1:1 redundant systems, and the resource pool is used for N:K redundant systems.

The no form of this command removes the specified group row entry, when the group is in shutdown.

NOTE:

- For 1:1 (one-to-one) redundant systems, configure the redundancy type and gateway ID options; the resource-pool option is not required.
- For N:K (many-to-many) redundant systems, configure the resource-pool option instead of the redundancy type and gateway ID. The resource pool must be configured prior to configuring the mobile-gateway system group; see the `resource-pool` command.
- An N:K redundant system is defined as: number of MG groups = N and (number of cards minus number of MG groups) = K.
- The card configuration for the mobile-gateway system group or resource pool depends on the redundancy method used; see the `card` command.
- A mobile-gateway system group that is used in an N:K redundant system requires a dynamic SAP on its VPRNs and a dynamic MDA in its NAT groups. For more information, see the `config>service>vprn>if>dynamic-sap`, `config>isa>nat-group`, and `config>isa>nat-group>dynamic-mds` commands.
- A no shutdown must be explicitly executed for new N:K redundant groups.

Parameters

group-number

specifies a mobile-gateway system group

Values: 1 to 15

type

specifies the redundancy type; none means the cards in this group are unprotected, and one-to-one specifies that each card has one redundant backup card.

Values: one-to-one

gw-id

specifies the mobile gateway to which this system group belongs

Values: 1 to 8

NOTE:

For N:K redundant systems, do not specify the `redundancy` or `gw-id` parameters. Use the `resource-pool` command to configure these parameters. The following example shows the syntax to use to configure a mobile-gateway system group for N:K redundancy:

```
configure mobile-gateway system group 1 resource-pool 2
```

resource-pool-id

specifies the ID of the resource pool

Values: 1 to 4

NOTE:

For N:K redundant systems, configure the resource pool before the mobile-gateway system group; see the `resource-pool` command.

4.2.1.4.11 card

Syntax

```
card slot-number [working | protect]
```

```
no card slot-number
```

Context

```
config>mobile>system>group
```

```
config>mobile>system>resource-pool
```

Description

This command configures the `slot-number` of the respective MSM card in the 7750 chassis, or VM for the CMG platform, for the mobile-gateway system group or resource pool contexts. The card/VM can be assigned as an active (`working`) or standby (`protect`) card/VM only when configured. Depending on the failure scenario, either card can be in an active or standby state. The required configuration depends on the redundancy method used for the group or resource pool:

- A non-redundant system uses an active (`working`) card/VM.
- A 1:1 redundant system uses an active (`working`) and a standby (`protect`) card/VM.
- An N:K redundant system does not use an active (`working`) or a standby (`protect`) VM (card) and these parameters should not be configured.

**NOTE:**

An N:K redundant system is defined as: number of MG groups = N and (number of cards minus number of MG groups) = K.

Parameters

slot-number

specifies the card/VM slot number

Values: 1 to 20 depending on chassis model

working

specifies that the card is the active card/VM; use for one-to-one or non-redundant systems only

protect

specifies that the card is the standby card/VM; use for one-to-one redundant systems only

4.2.1.4.12 *pcmd-profile*

Syntax

```
pcmd-profile profile-name {inherit | none}
```

```
no pcmd-profile
```

Context

```
config>mobile>system>group
```

Description

This command configures a PCMD profile for the group (specified by the *group-number*) which configures the session and data records destinations for this group.

Only the destinations of the PCMD profile configured here are used. Other PCMD parameters are defined in the PDN level *pcmd profile*.

If the profile is set to none, no PCMD is generated from this group.

The no form of this command reverts to the default.

Default

```
no pcmd-profile
```

Parameters

profile-name

specifies the name of the PCMD profile configured in the context
config>mobile>profile>pcmd that contains the destinations to be applied for this group, up to 32 characters

inherit

specifies if the PCMD profile applied to the group is the one configured in the config>mobile>pdn>pcmd context
If no profile is configured in the PDN, the PCMD records are not generated from this group.

none

specifies that the PCMD records are not generated from this group
Default: inherit

4.2.1.4.13 override-profile

Syntax

```
override-profile override-profile-id  
no override-profile
```

Context

```
config>mobile>system>group
```

Description

This command configures the override profile for each MG group for GTP-U redirection. To remove an override profile from a group, you must first shut it down using the shutdown command in the config>mobile>system>group context.

The no form of this command removes the selected override profile.

NOTE:

This command applies only to CMG.

Default

```
no override-profile
```

Parameters

override-profile-id

specifies the profile ID to configure an MG group-specific override profile

Values: 1 to 32

4.2.1.4.14 protect-active-delay

Syntax

protect-active-delay *protect-active-delay*

Context

config>mobile>system>group

config>mobile>system>resource-pool

Description

This command specifies the time to wait for the working card to come online before a standby card becomes active.

Parameters

protect-active-delay

specifies the wait time in seconds

Values: 1 to 30

Default: 10

4.2.1.4.15 ipv6-path-mtu

Syntax

[no] ipv6-path-mtu

Context

config>mobile>system

Description

This command enables IPv6 path MTU discovery to dynamically lower the path MTU if the ICMPv6 Packet Too Big is received.

Default

no ipv6-path-mtu

NOTE:

The IPv6 path MTU discovery is only supported over the S1u reference point interface.

4.2.1.4.16 ipv6-udp-checksum

Syntax

[no] ipv6-udp-checksum

Context

config>mobile>system

Description

This command enables UDP checksum calculation while sending IPv6 packets for GTP tunnel transport. The IPv6 UDP checksum remains enabled by default.

The no form of this command disables the IPv6 UDP checksum calculation.

Default

ipv6-udp-checksum

4.2.1.4.17 non-terminating-rules

Syntax

non-terminating-rules {enable | disable}

no non-terminating-rules

Context

config>mobile>system

Description

This command enables the Non-Terminating Policy Rules functionality at CMG level. When enabled, policy rules marked as non-terminating are taken into account when matching traffic to policy rules.

When disabled, all policy rules are terminating (a packet can only match to one policy rule according to precedence).

The no form of this command reverts to the default.

Default

disable

4.2.1.4.18 policer-distribution

Syntax

```
policer-distribution dl-only dl-percent  
no policer-distribution
```

Context

```
config>mobile>system
```

Description

This command provides the ability to distribute the total available policers between downlink only (dl-only) and uplink and downlink on the PGW/GGSN. This applies to APN AMBR policers for non-GBR bearers and to MBR policers for GBR bearers.

The percent for uplink and downlink is determined based on the percent configured for downlink only (dl-only *dl-percent*). For example, if the *dl-percent* is set to 80, the uplink and downlink percent is 20. The total of the *dl-percent* plus the uplink and downlink percent is always 100.

Parameters

dl-percent

specifies the downlink only (dl-only) policer percentage

Values: 10 to 100

Default: 100

4.2.1.4.19 resource-pool

Syntax

```
resource-pool resource-pool-id redundancy type gateway gw-id  
no resource-pool resource-pool-id
```

Context

config>mobile>system

Description

This command configures a resource pool consisting of cards (VMs) on the CMG platform and the redundancy method to use when the resource pool is associated with a mobile-gateway system group. Currently this command supports configuration of N:K (many-to-many) redundant systems. The resource pool must also be associated with a mobile-gateway system group when configuring N:K redundancy. For more details, see the group command.

NOTE:

- This command is supported on the CMG platform only.
- For N:K redundant systems, this configuration includes all VMs (cards) to be used across multiple mobile-gateway system groups. The cards in this context must not be configured as active (working) or standby (protect); see the card command.
- An N:K redundant system is defined as: number of MG groups = N and (number of cards minus number of MG groups) = K.
- This configuration is not currently supported for 1:1 redundant systems. 1:1 redundant systems are configured using the *group* command.

Parameters

resource-pool-id

specifies the ID of the resource pool

Values: 1 to 4

type

specifies the redundancy method

Values: many-to-many

gw-id

specifies the ID of the mobile gateway to which the resource pool belongs

Values: 1 to 8

4.2.1.4.20 thresholds

Syntax

thresholds

Context

```
config>mobile>system
```

Description

This command enables the context to configure monitoring thresholds.

4.2.1.4.21 cam-utilization-threshold

Syntax

```
cam-utilization-threshold high-threshold high-threshold [low-threshold low-threshold]
```

```
no cam-utilization-threshold
```

Context

```
config>mobile>system>thresholds
```

Description

This command configures the raising threshold for the major and minor CAM utilization alarms. The major alarm is raised when the CAM utilization exceeds the high threshold configured value. The minor alarm is raised when the CAM utilization exceeds the low threshold configured value. The no form of this command reverts to the default values of the high and low thresholds.

Default

```
no cam-utilization-threshold
```

Parameters

high-threshold

specifies the percentage of the CAM utilization that defines when the major alarm is raised

Values: 0 (disabled) to 100

Default: 90

low-threshold

specifies the percentage of the CAM utilization that defines when the minor alarm is raised

Values: 0 (disabled) to 100

Default: 70

**NOTE:**

The low threshold must be configured with a value of at least 10% lower than the high threshold.

4.2.1.4.22 system-mg-ism

Syntax

```
system-mg-ism group-number  
no system-mg-ism
```

Context

```
config>mobile>system>thresholds
```

Description

This command configures monitoring thresholds for ISM-MG.

The no form of this command removes the monitoring thresholds from the configuration of the profile.

Parameters

group-number

specifies group number

Values: 1 to 8

4.2.1.4.23 counter

Syntax

```
counter {cp-isa-cpu | cp-isa-memory | cp-isa-uplink | cp-isa-downlink} high-  
threshold threshold [low-threshold threshold]  
no counter {cp-isa-cpu | cp-isa-memory | cp-isa-uplink | cp-isa-downlink}
```

Context

```
config>mobile>system>thresholds>mg-ism
```

Description

This command configures the high and low thresholds for each object.

The no form of this command removes the high and low thresholds from the configuration of the profile.

Parameters

cp-isa-cpu

keyword to specify thresholds for the CPU, in percentage

cp-isa-memory

keyword to specify thresholds for the memory, in percentage

cp-isa-uplink

keyword to specify thresholds for the uplink, in abs Mbytes

cp-isa-downlink

keyword to specify thresholds for the downlink, in abs Mbytes

threshold

specifies the high threshold value for the object

Values: 1 to 100

Values: 1 to 20000000

low-threshold *threshold*

specifies the low threshold value for the object

Values: 1 to 100

Values: 1 to 20000000

4.2.1.4.24 interval

Syntax

interval *minutes*

no interval

Context

config>mobile>system>thresholds>mg-ism

Description

This command configures the interval values for ISM-MG.

The no form of this command removes the intervals from the configuration of the profile.

Parameters

minutes

specifies group number

Values: 5 to 60

Default: 5

4.2.1.4.25 ttc-accuracy

Syntax

ttc-accuracy {true | false}

no ttc-accuracy

Context

config>mobile>system

Description

This command enables optimizing tariff time switch volume reporting from the user plane. Reporting the user plane volume both before the tariff time change, as well as between the tariff switch and the actual reporting time, facilitates accurate reporting to the charging server. It is recommended that consecutive tariff switch times be at least 10 minutes apart.

The no form of this command reverts to the default (false).

Default

no ttc-accuracy

Parameters

true

enables the TTC accuracy optimization

false

disables the TTC accuracy optimization

Default: false

4.2.1.4.26 ue-fragmented-packets-handling

Syntax

[no] ue-fragmented-packets-handling

Context

config>mobile>system

Description

This command enables IP packet reassembly of the user-level traffic (inner IP) for packet classification, to the correct bearer through rule matching. The packets leave the system to the exact same size as originally received.

The no form of this command reverts to the default.

Default

no ue-fragmented-packets-handling

NOTE:

Apart from the CLI knob that enables the feature, specific configuration is required per MG card where fragmentation is expected to be realized, for example, "mda-type isa-ip-reas-v" should be set under every required card-type "iom-v-mg".

4.2.1.4.27 use-fixed-udp-src-port

Syntax

[no] use-fixed-udp-src-port

Context

config>mobile>system

Description

This command enables the user to select a fixed UDP source port (2152) for all egress GTP-U packets. If disabled, a dynamic UDP source port from range 61440 to 65535 is used.

The no form of this command reverts to the default (disabled).

Default

no use-fixed-udp-src-port

NOTE:

If enabled for the APN, the `gtpu-source-port-dist` command takes precedence over the `use-fixed-udp-src-port` command at the APN level.

4.2.1.4.28 security

Syntax

```
security
```

Context

```
config>system
```

Description

This command enables the context to configure security settings.

4.2.1.4.29 dist-cpu-protection

Syntax

```
dist-cpu-protection
```

Context

```
config>system>security
```

Description

This command enables the context to configure the Distributed CPU Protection (DCP) feature.

4.2.1.4.30 policy

Syntax

```
policy policy-name [create]
```

```
no policy policy-name
```

Context

```
config>system>security>dist-cpu-protection
```

Description

This command configures one of the maximum 16 Distributed CPU Protection policies. These policies can be applied to objects such as SAPs and network interfaces.

Parameters

policy-name

specifies the name of the policy to be configured

create

creates the policy

4.2.1.4.31 protocol

Syntax

```
protocol name [create]
```

```
no protocol name
```

Context

```
config>system>security>dist-cpu-protection>policy
```

Description

This command creates the protocol for control in the policy. For a complete description of the command, refer to the *7450 ESS, 7750 SR, 7950 XRS, and VSR System Management Guide*.

Additional protocol name:

- gtp-err-ind. This protocol name can be used to configure the rate limiting of incoming GTP Error Indication messages, before these reach the processing unit. It can be used to protect the CPU and the processing of other important signaling in case of a GTP Error Indication signaling storm. The gtp-err-ind protocol name is supported only with a static policer in the DCP policy. For more information about the static policer configuration, refer to the *7450 ESS, 7750 SR, 7950 XRS, and VSR System Management Guide* in the following context:

```
config>sys>security>dist-cpu-protection>policy>static-policer
```

Default

none

Parameters

name

specifies the protocol name

Values: arp | dhcp | http-redirect | icmp| icmp-ping-check | igmp | mld | ndis | pppoe-pppoa | all-unspecified | mpls-ttl | bfd-cpm | bgp | eth-cfm | isis | ldp | ospf | pim | rsvp

For more information, refer to the *7450 ESS, 7750 SR, 7950 XRS, and VSR System Management Guide*.

create

creates the protocol

4.2.1.4.32 ssh

Syntax

```
ssh
```

Context

```
config>system>security
```

Description

This command enables the context to configure the list of the SSH host keys.

4.2.1.4.33 client-host-key-list

Syntax

```
client-host-key-list
```

Context

```
config>system>security>ssh
```

Description

This command enables the context to configure the list of the acceptable SSH server host keys for the SSH client.

4.2.1.4.34 host-key

Syntax

```
host -key index name key-name  
no host -key index
```

Context

```
config>system>security>ssh>client-host-key-list  
config>system>security>ssh>server-host-key-list
```

Description

This command configures the SSH host key algorithm list for the SSH server and client.

If an empty list is configured, the following default list is used:

- ssh-rsa
- ssh-dss

NOTE:

To apply any host key list configuration changes on the server, the SSH server must be restarted (shutdown/no shutdown) via a telnet session. If a telnet session is not available, create the following script:

Configure the script to run automatically once under a scheduled script execution in the following contexts:

```
config>system>script-control
```

```
config>system>cron
```

The no form of this command removes the specified host-key index.

Parameters

index

specifies the index of the algorithm in the list

Values: 1 to 255

key-name

specifies the algorithm for host key generation

Values: ssh-dss | ssh-rsa

4.2.1.4.35 client-kex-list

Syntax

```
client-kex-list
```

Context

```
config>system>security>ssh
```

Description

This command enables the context to configure SSH KEX algorithms for 7750 SR MG or CMG as a client.

The default list that the SSH KEX advertises is an empty list which contains the following algorithms:

- diffie-hellman-group16-sha512
- diffie-hellman-group14-sha256
- diffie-hellman-group14-sha1
- diffie-hellman-group14-sha1
- diffie-hellman-group1-sha1

4.2.1.4.36 kex

Syntax

```
kex index name kex-name
```

```
no kex index
```

Context

```
config>system>security>ssh>client-kex-list
```

```
config>system>security>ssh>server-kex-list
```

Description

This command configures phase 1 SSHv2 KEX algorithms for 7750 SR MG or CMG as an SSH server or client. By default, the client and server lists are empty. If you configure the list, SSH uses the hard-coded list with the first-listed algorithm having the highest priority and so on. An empty server or client list is the default list and contains the following algorithms:

- diffie-hellman-group16-sha512

- diffie-hellman-group14-sha256
- diffie-hellman-group14-sha1
- diffie-hellman-group14-sha1
- diffie-hellman-group1-sha1

The no form of this command removes the specified kex index. If all KEX indexes are removed, the default list is used.

Parameters

index

specifies the index of the kex algorithm in the client list; the lowest index in the list is negotiated first on the SSH negotiation list, while the highest index is at the bottom of the SSH negotiation list.

Values: 1 to 255

kex-name

specifies the kex name of the algorithm in the client list for computing the shared secret key

Values: diffie-hellman-group16-sha512 | diffie-hellman-group14-sha256 | diffie-hellman-group14-sha1 | diffie-hellman-group-exchange-sha1 | diffie-hellman-group1-sha1

4.2.1.4.37 server-host-key-list

Syntax

```
server-host-key-list
```

Context

```
config>system>security>ssh
```

Description

This command enables the context to configure the list of the SSH server host keys.

4.2.1.4.38 server-host-key-rsa-length

Syntax

```
server-host-key-rsa-length server-host-key-rsa-length
```

```
no server-host-key-rsa-length
```

Context

```
config>system>security>ssh
```

Description

This command configures the SSH server host key length with any of the allowed values.

NOTE:

To apply any host key list configuration changes on the server, the SSH server must be restarted (shutdown/no shutdown) via a telnet session. If a telnet session is not available, create the following script:

Configure the script to run automatically once under a scheduled script execution in the following contexts:

```
config>system>script-control
```

```
config>system>cron
```

The no form of this command reverts to the default value of the RSA length.

Parameters

server-host-key-rsa-length

specifies the length of the RSA host key

Values: 1024 | 2048 | 4096

Default: 1024

4.2.1.4.39 server-kex-list

Syntax

```
server-kex-list
```

Context

```
config>system>security>ssh
```

Description

The default list that the SSH KEX advertises is an empty list which contains the following algorithms:

- diffie-hellman-group16-sha512

- diffie-hellman-group14-sha256
- diffie-hellman-group14-sha1
- diffie-hellman-group14-sha1
- diffie-hellman-group1-sha1

4.2.1.4.40 **tls**

Syntax

`tls`

Context

`config>system>security`

Description

This command enables the context to configure the TLS options.

4.2.1.4.41 **client-cipher-list**

Syntax

`client-cipher-list`

Context

`config>system>security>tls`

Description

This command enables the context to configure the client desired TLS ciphers.

4.2.1.4.42 **cipher**

Syntax

`cipher index name cipher-suite-code`

`no cipher index`

Context

config>system>security>tls>client-cipher-list

Description

This command configures the cipher suite to be negotiated by the client.

The no form of this command removes the specified cipher index.

Parameters

index

specifies the index number that provides the location of the cipher in the negotiation list; a low index is high in the negotiation list, while a high index is at the bottom of the negotiation list

Values: 1 to 255

cipher-suite-code

specifies the cipher suite code

Values: tls-rsa-with3des-edc-cbc-sha | tls-rsa-with-aes128-cbc-sha | tls-rsa-with-aes256-cbc-sha | tls-rsa-with-aes128-cbc-sha256 | tls-rsa-with-aes256-cbc-sha256 | tls-dhe-rsa-with-aes128-gcm-sha256 | tls-dhe-rsa-with-aes256-gcm-sha384 | tls-ecdhc-ecdsa-with-aes128-gcm-sha256 | tls-ecdhc-ecdsa-with-aes256-gcm-sha384 | tls-ecdhc-rsa-with-aes128-gcm-sha256 | tls-ecdhc-rsa-with-aes256-gcm-sha384 | tls-dhe-rsa-with-aes128-ccm | tls-dhe-rsa-with-aes256-gcm | tls13-aes256-gcm-sha384 | tls13-aes128-gcm-sha256 | tls13-aes128-ccm8-sha256 | tls13-aes128-ccm-sha256

4.2.1.4.43 server-cipher-list

Syntax

server-cipher-list

Context

config>system>security>tls

Description

This command enables the context to configure the server desired TLS ciphers.

4.2.1.4.44 cipher

Syntax

```
cipher index name cipher-suite-code  
no cipher index
```

Context

```
config>system>security>tls>server-cipher-list
```

Description

This command configures the cipher suite to be negotiated by the server.

The no form of this command removes the specified cipher index.

Parameters

index

specifies the index number that provides the location of the cipher in the negotiation list; a low index is high in the negotiation list, while a high index is at the bottom of the negotiation list

Values: 1 to 255

cipher-suite-code

specifies the cipher suite code

Values: tls-rsa-with3des-edc-cbc-sha | tls-rsa-with-aes128-cbc-sha | tls-rsa-with-aes256-cbc-sha | tls-rsa-with-aes128-cbc-sha256 | tls-rsa-with-aes256-cbc-sha256 | tls-dhe-rsa-with-aes128-gcm-sha256 | tls-dhe-rsa-with-aes256-gcm-sha384 | tls-ecdhc-ecdsa-with-aes128-gcm-sha256 | tls-ecdhc-ecdsa-with-aes256-gcm-sha384 | tls-ecdhc-rsa-with-aes128-gcm-sha256 | tls-ecdhc-rsa-with-aes256-gcm-sha384 | tls-dhe-rsa-with-aes128-ccm | tls-dhe-rsa-with-aes256-gcm | tls13-aes256-gcm-sha384 | tls13-aes128-gcm-sha256 | tls13-aes128-ccm8-sha256 | tls13-aes128-ccm-sha256

4.2.1.5 Admin redundancy command descriptions

This section describes admin redundancy commands specific to the mobile gateway. For descriptions of all supported admin redundancy commands, see the *7450 ESS, 7750 SR, 7950 XRS, and VSR Basic System Configuration Guide*

4.2.1.5.1 redundancy

Syntax

redundancy

Context

admin

config

Description

This command enables the context to allow the user to perform redundancy operations.

4.2.1.5.2 cpm-switchover

Syntax

cpm-switchover [now]

Context

admin>redundancy

Description

This command triggers a controlled CPM switchover.

Parameters

now

specifies to perform the switchover without requesting confirmation

4.2.1.5.3 mc-master-lock

Syntax

[no] mc-master - lock

Context

admin>redundancy

Description

This command locks the gateway in the master operational role when ICR/geo-redundancy is deployed. The gateway remains in the master operational role regardless of any ICR master/slave election criteria that may occur.

The no form of this command unlocks and restores the use of normal ICR master/slave election criteria.

NOTE:

- When enabled, the manual switchover command (`admin>redundancy>mc-mobile-switchover>mobile-gateway`) is also locked from being used and an error is returned if attempted while the `mc-master-lock` command is enabled.
- When enabled together with the Diameter connection lost detection command (`config>redundancy>multi-chassis>peer>mc-mobile>diameter-connection-lost-detection>gx-failover`) and all the Gx connections are lost, it does not block the Gx guard timer from running; it blocks the FSWO.

NOTICE:

In a Master-Master case, the command must only be used on one node. If executed on both nodes, the MCS sync fails and an alarm is issued.

Default

no mc-master-lock

4.2.1.5.4 mc-mobile-switchover

Syntax

```
mc-mobile-switchover mobile-gateway gw-id peer ip-address [{reboot | now}] [abort]
no mc-mobile-switchover
```

Context

admin>redundancy

Description

This command issues a manual switchover so the master gateway transitions to a slave role and its peer gateway transitions to the master. The manual switchover is not hitless, but synchronizes the complete charging information and state for each bearer, enabling the slave to transition with minimum disruption and data loss.

This command supports an option to force the switchover, if the reconciliation fail. If the `now` option is specified and the ICR is in an Up state, the manual switchover can be performed even when the Geo-Redundancy state is not hot.

**NOTICE:**

If the `now` option is specified, the switchover will be executed, but the new master node might have incomplete UE records. In some cases this may be service impacting.

The `abort` option can be executed to abort the switchover only for an ongoing switchover that has been in progress for at least 5 minutes. The user must respond to a confirmation request to proceed. If `yes` is specified, the system issues a disconnect to the slave, making it master, switches to the slave state, and then activates the MC redirect tunnel.

Parameters

mobile-gateway

mandatory keyword

gw-id

specifies the gateway ID

Values: 1 to 8

peer

mandatory keyword to specify the peer IP address

ip-address

specifies the peer IP address for the manual switchover

Values: ip-address | ipv6-address

reboot

optional keyword that reboots this node after mc-mobile switchover

now

optional keyword that forces the switchover without full reconciliation

If this option is specified:

- the new master node might have incomplete UE records. In some cases this may be service impacting
- if the ICR is in the up state, the manual switchover can be performed even when the Geo-Redundancy state is not hot

abort

optional keyword that aborts mc-mobile switchover in progress; can only be executed for an ongoing switchover that has been in progress for at least 5 minutes

4.2.1.5.5 mc-slave-lock

Syntax

```
[no] mc-slave-lock
```

Context

```
admin>redundancy
```

Description

This command locks the gateway in the slave operational role when ICR/geo-redundancy is deployed. The gateway remains in the slave operational role regardless of any ICR master/slave election criteria that may occur.

The no form of this command unlocks and restores the use of normal ICR master/slave election criteria.

NOTE:

- When enabled, the manual switchover command (admin>redundancy>mc-mobile-switchover>mobile-gateway) is also locked from being used and an error is returned if attempted while the mc-slave-lock command is enabled.
- When enabled together with the Diameter connection lost detection command (config>redundancy>multi-chassis>peer>mc-mobile>diameter-connection-lost-detection>gx-failover) and all the Gx connections are lost, it does not block the Gx guard timer from running; it blocks the FSWO.

Default

```
no mc-slave-lock
```

4.2.1.5.6 mg-switchover

Syntax

```
mg-switchover
```

Context

```
admin>redundancy
```

Description

This command enables the context to perform a controlled MG-VM switchover.

**NOTE:**

The command is only supported for 1:1 redundant systems.

4.2.1.5.7 group

Syntax

```
group mg-group-id [now] [max-preparation-time max-preparation-time] [upgrade |  
downgrade]
```

Context

```
admin>redundancy>mg-switchover
```

Description

This command triggers an MG-VM controlled switchover.

Parameters

mg-group-id

specifies the MG group ID for which to perform the controlled switchover

Values: 1 to 15

now

specifies to perform the controlled switchover without requesting confirmation

max-preparation-time

specifies the waiting time, in seconds, that the MG-VM uses to process all charging data before the standby MG-VM becomes active; when set to 0, the switchover proceeds without a maximum preparation time, until all charging data has been processed

**NOTE:**

Incoming control messages are not served during the preparation phase defined by the *max-preparation-time* parameter.

Values: 0 (disabled) to 60

Default: 5

upgrade

initiates the switchover from the active card (running the older software version) to the standby card (running the newer software version). When executed, the standby card

becomes the active card for the MG group with ID *mg-group-id* (and the initial active card becomes the new standby card for the group) and the group is upgraded. For more information, refer to the *In-service software upgrade (ISSU) with intra-CNF redundancy (N:K)* and *In-service software upgrade (ISSU) with intra-CNF redundancy (1:1)* sections in the *CMG Software Upgrade Guide*.

downgrade

initiates the switchover from the active card (running the newer software version) to the standby card (running the older software version). When executed, the standby card becomes the active card for the MG group with ID *mg-group-id* (and the initial active card becomes the new standby card for the group) and the group is downgraded. For more information, refer to the *In-service software downgrade (ISSD) with intra-CNF redundancy (1:1)* section in the *CMG Software Upgrade Guide*.

NOTE:

The options upgrade and downgrade are supported during the 1:1 and N:K ISSU/ISSD and only when the active and standby card of the MG group are in different software versions.

4.2.1.6 Redundancy configuration command descriptions

This section describes redundancy configuration commands specific to the mobile gateway. For descriptions of all supported redundancy configuration commands, see the *7450 ESS, 7750 SR, 7950 XRS, and VSR Basic System Configuration Guide*.

4.2.1.6.1 multi-chassis

Syntax

```
multi-chassis
```

Context

```
config>redundancy
```

Description

This command enables the context to configure multi-chassis redundancy information.

4.2.1.6.2 peer

Syntax

[no] peer *ip-address*

Context

config>redundancy>multi-chassis

Description

This command configures a multi-chassis redundancy peer.

Parameters

ip-address

specifies a peer IP address; multicast addresses are not allowed

4.2.1.6.3 mc-mobile

Syntax

[no] mc-mobile

Context

config>redundancy>multi-chassis>peer

Description

This command enables the context to configure MC mobile parameters.

Default

no mc-mobile

4.2.1.6.4 bfd-enable

Syntax

bfd-enable [service *service-id*] interface *interface-name*

no bfd-enable

Context

```
config>redundancy>multi-chassis>peer>mc-mobile
```

Description

This command enables the use of Bi-directional Forwarding Detection (BFD) to be associated with the peer. The mc-mobile redundancy protocol will use the BFD state to determine liveness of its peer. The parameters for the BFD session are set via the BFD command under the IP interface configuration.

Default

no bfd-enable

Parameters

service-id

specifies the service identifier string, up to 64 characters

Values: 1 to 2147483648

interface-name

specifies the interface name, up to 32 characters

4.2.1.6.5 diameter-connection-lost-detection

Syntax

```
diameter-connection-lost-detection
```

Context

```
config>redundancy>multi-chassis>peer>mc-mobile
```

Description

This command enables the context to configure the Diameter connection failure detection.

4.2.1.6.6 gx-failover

Syntax

```
gx-failover guard-timer
```

```
no gx-failover
```

Context

```
config>redundancy>multi-chassis>peer>mc-mobile>diameter-connection-lost-detection
```

Description

This command enables the ICR Gx connection failure detection. If all the Gx connections on the master CMG node are detected as lost while the MCS is up, this command triggers an ICR FSWO.

NOTE:

- The ICR Gx failover handling only applies when the ICR MCS (mc-mobile) is up. When the MCS (mc-mobile) is detected as down, the ICR traffic detection is used.
- You must first enable the ICR Gx failover handling on the ICR node that has the slave operational role and then enable it on the ICR node that has the master operational role.

Parameters

guard-timer

specifies the time, in minutes, to delay the ICR FSWO when all the Gx connections are detected as lost; if the Gx connections are detected again up before the timer expires, the CMG cancels the ICR FSWO and resumes monitoring the Gx connections

Values: 1 to 15

Default: 2

4.2.1.6.7 hold-on-neighbor-failure

Syntax

```
hold-on-neighbor-failure multiplier
```

```
no hold-on-neighbor-failure
```

Context

```
config>redundancy>multi-chassis>peer>mc-mobile
```

Description

This command specifies the number of keep-alive intervals that may expire before the local node decides that the peer has failed. A peer failure will be declared if no keep-alive responses are received after a `hold-on-neighbor-failure x keep-alive-interval`.

Parameters

multiplier

specifies the multiplier

Values: 2 to 25

Default: 3

4.2.1.6.8 keep-alive-interval

Syntax

```
keep-alive-interval interval
```

```
no keep-alive-interval
```

Context

```
config>redundancy>multi-chassis>peer>mc-mobile
```

Description

This command sets the interval at which keep-alive messages are sent to the peer when the BFD is not enabled or is down.

Parameters

interval

specifies the interval, in tenths of a second

Values: 5 to 500

Default: 10

4.2.1.6.9 master-traffic-detection

Syntax

```
master-traffic-detection {enable | disable}
```

```
no master-traffic-detection
```

Context

```
config>redundancy>multi-chassis>peer>mc-mobile
```

Description

This command enables or disables the traffic detection and only applies to the master operational role.

Parameters

enable

specifies to enable traffic detection

disable

specifies to disable traffic detection

Default: enable

4.2.1.6.10 mc-complete-ue-sync

Syntax

```
mc-complete-ue-sync [partial-reconcile]
```

```
no mc-complete-ue-sync
```

Context

```
config>redundancy>multi-chassis>peer>mc-mobile
```

Description

This command enables data synchronization between the master and the slave nodes in MC redundancy at the call flow level (synchronization in Hot state) and the UE level (synchronization in reconcile state).

When enabled, the MC mobile synchronization goes immediately into the ICR Hot state and the progress of the synchronization from the master to the slave node is completed UE by UE for all UE records. This allows a switchover to take place at any time if an issue arises, or if a failover occurs the number of UEs synced thus far will all survive.

Default

```
no mc-complete-ue-sync
```

NOTE:

The `mc-complete-ue-sync` command must be enabled for all ICR-configured mobile gateway systems except for the HRPD Home Agent.

4.2.1.6.11 mc-redirect

Syntax

[no] mc-redirect

Context

config>redundancy>multi-chassis>peer>mc-mobile

Description

This command enables the use of the MC redirect.

Default

no mc-redirect

4.2.1.6.12 mobile-gateway

Syntax

mobile-gateway *gw-id* role *role*

no mobile-gateway

Context

config>redundancy>multi-chassis>peer>mc-mobile

Description

This command sets whether the mobile gateway acts in a primary or secondary role. If set to primary, the peer must be configured as a secondary mobile gateway and vice-versa.

NOTE:

Multiple gateway IDs are supported per multi-chassis peer. However, only one *gw-id* per peer is supported in this release. Furthermore, only one MC mobile peer is supported in this release.

Parameters

gw-id

specifies the gateway ID

Values: 1 to 8

role

specifies the role of the gateway

Values: primary | secondary

4.2.1.6.13 sync-mc-ipsec

Syntax

sync-mc-ipsec

Context

config>redundancy>multi-chassis>peer>mc-mobile>mobile-gateway

Description

This command configures the association to the MC IPSec with the IPSec tunnel group that the MC mobile will use.

4.2.1.6.14 tunnel-group

Syntax

[no] tunnel-group *tunnel-group-id*

Context

config>redundancy>multi-chassis>peer>mc-mobile>mobile-gateway>sync-mc-ipsec

Description

This command configures the IPSec tunnel group number associated to the MC mobile and the mobile gateway.

**NOTE:**

The tunnel group ID must be configured under the config>redundancy>multi-chassis>peer>mc-ipsec>tunnel-group context.

Parameters***tunnel-group-id***

specifies the tunnel group ID used by for MC mobile and the mobile gateway

Values: 1 to 16

4.2.1.6.15 peer-connect

Syntax

```
peer-connect {enable | disable}
no peer-connect
```

Context

```
config>redundancy>multi-chassis>peer>mc-mobile
```

Description

This command is configured when the ICR routing and the MC mobile are left configured on the primary node, and the secondary node is removed. For example, when the ICR is used only for ISSU and, after the ISSU process, the secondary node is removed.

NOTE:

- This command must be set in enabled state during the normal ICR operation, that is, when both the primary and the secondary ICR nodes are deployed.
- This command is only supported on CMG and LB-less mode.

Parameters

enable

enables the peer connect state

disable

disables the peer connect state

Default: enable

4.2.1.6.16 slave-traffic-delay-timer

Syntax

```
slave-traffic-delay-timer delay-timer
no slave-traffic-delay-timer
```

Context

```
config>redundancy>multi-chassis>peer>mc-mobile
```

Description

This command configures a timer that is enabled when the MCS is detected as lost. The timer delays the start of traffic detection and thus, prevents switchovers when the MCS link is restored before the timer expires. If MC redirection is enabled (using the `mc-redirect` command), the slave node continues to try and route any traffic over the MC redirect tunnel.

The `no` form of this command disables the timer (the timer is set to 0 seconds).

NOTICE:

Before executing the command, make sure that a switchover is not in progress.

Default

```
no slave-traffic-delay-timer
```

Parameters

delay-timer

specifies the timer value, in seconds

Values: 0 to 60

Default: 0 (disabled)

4.2.1.6.17 traffic-detection

Syntax

```
traffic-detection {strict | relaxed}
```

```
no traffic-detection
```

Context

```
config>redundancy>multi-chassis>peer>mc-mobile
```

Description

This command configures the ICR traffic detection criteria.

**NOTE:**

- This command can apply to special 7750 SR MG and CMG ICR deployments, with a very small number of attached UEs, or very low, or no active user traffic. The `relaxed` option must not be used for any regular 7750 SR MG and CMG deployments.
- The mobile gateway ICR relaxed mode is only supported on 2G (GGSN) without any charging and policy or RADIUS deployed.

Parameters

strict

specifies that, when ICR traffic detection is enabled, three traffic types are required for the node to transition into or stay in the ICR Operational Role Master

relaxed

specifies that, when ICR traffic detection is enabled, one traffic type is sufficient for the node to transition into or stay in the ICR Operational Role Master

Default: `strict`

4.2.1.6.18 traffic-detection-poll-timer

Syntax

```
traffic-detection-poll-timer seconds
```

```
no traffic-detection-poll-timer
```

Context

```
config>redundancy>multi-chassis>peer>mc-mobile
```

Description

This command configures the traffic detection poll timer.

The `no` form of this command reverts to the default value.

**NOTE:**

Nokia recommends configuring the same value for the traffic detection poll timer in the primary and secondary gateways.

Default

no traffic-detection-poll-timer

Parameters

seconds

specifies the timer value, in seconds

Values: 5 to 1200

Default: 5

4.2.1.7 Accounting policy command descriptions

For descriptions of all additional accounting policy log commands, refer to the *7450 ESS*, *7750 SR*, *7950 XRS*, and *VSR System Management Guide*.

4.2.1.7.1 record

Syntax

[no] record *record-name*

Context

config>log>accounting-policy

Description

This command adds the accounting record type to the accounting policy to be forwarded to the configured accounting file. A record name can only be used in one accounting policy. To obtain a list of all record types that can be configured, use the `show log accounting-records` command.

NOTE:

aa, video and subscriber records are not applicable to the 7950 XRS.

```
# show log accounting-records
=====
Accounting Policy Records

=====
```

To configure an accounting policy for access ports, select a service record (for example, service-ingress-octets). To change the record name to another service record then the record command with the new record name can be entered and it will replace the old record name.

When configuring an accounting policy for network ports, a network record should be selected. When changing the record name to another network record, the record command with the new record name can be entered and it will replace the old record name.

If the change required modifies the record from network to service or from service to network, the old record name must be removed using the no form of this command.

Only one record may be configured in a single accounting policy. For example, if an accounting-policy is configured with a access-egress-octets record, to change it to service-ingress-octets, use the no record command under the accounting-policy to remove the old record and then enter the service-ingress-octets record.

**NOTE:**

Collecting excessive statistics can adversely affect the CPU utilization and take up large amounts of storage space.

The no form of this command removes the record type from the policy.

Default

no record

Parameters

record-name

Specifies the accounting record name. *Default collection interval for accounting records* lists the accounting record names available and the default collection interval.

Table 1: Default collection interval for accounting records

Record type	Accounting record name	Default interval
1	service-ingress-octets	5

4.2.2 Card and system management show command descriptions

- *Show card command descriptions*
- *Show mobile gateway command descriptions*
- *Show redundancy command descriptions*

4.2.2.1 Show card command descriptions

4.2.2.1.1 card

Syntax

card state

`card [slot-number]`

`card [slot-number] detail`

Context

show

Description

This command displays physical card related information.

For further information about cards, MDAs, and ports, refer to the appropriate Interface Guide.

Parameters

slot-number

specifies the slot number

detail

displays detailed information about the specified card

Output

The following output example shows card information, and [Show card output fields](#) describes the fields.

Example output card statistics

```
# config>card# show card
=====

ue [[detail] | [imei imei [detail]] | [imsi imsi [detail]] | [mask-name mask-name [detail]] |
[msisdn msisdn [detail]] | [mac-address mac-address [detail]]]
```

Context

```
show>mobile>call-insight
```

Description

This command displays Call Trace information for the specified UE type.

Parameters

detail

keyword to display detailed Call Trace information

imei

specifies an IMEI identification string, up to 16 characters

imsi

specifies an IMSI identification string, up to 15 characters

mask-name

specifies a mask name, up to 16 characters

msisdn

specifies an MSISDN identification string, up to 15 characters

mac-address

specifies the UE MAC-address that the packet capture is based on

Values: xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx [x - hexadecimal digit]

Output

The following output examples show Call Trace UE information.

Table 4: Show connections fields

Label	Description
CLOSED	Closed. The socket is not being used
LISTEN	Listening for incoming associations
ESTABLISHED	Association has been established
COOKIE-WAIT	INIT has been sent to the peer, awaiting acknowledgment
COOKIE-ECHOED	State cookie from the INIT-ACK has been sent to the peer, awaiting acknowledgment
SHUTDOWN-PENDING	SHUTDOWN has been received from the upper layer, awaiting acknowledgment of all outstanding DATA from the peer
SHUTDOWN-SENT	All outstanding data has been acknowledged in the SHUTDOWN-SENT state. SHUTDOWN has been sent to the peer, awaiting acknowledgment
SHUTDOWN-RECEIVED	SHUTDOWN has been received from the peer, awaiting acknowledgment of all outstanding DATA

4.2.2.2.7 ism-mg

Syntax

```
ism-mg
```

Context

```
show>mobile
```

Description

This command displays information about the ISM-MG.

4.2.2.2.8 abs

Syntax

```
abs [statistics]
```

Context

```
show>mobile>ism-mg
```

Description

The mobile gateway overload protection mechanism (ABS – Anti-Breakdown System) has a set of internal parameters to monitor signaling/processing latency and memory utilization on each of the ISM-MGs on the system independently. This command displays statistics and a table of ABS status per ISM-MG card (only MDA 1 is supported).

Parameters

statistics

shows ABS in more detailed statistics

Output

The following output examples show ABS information for the ISM-MG card and *Show ISM-MG ABS fields* describes the output fields.

- *Example output ISM-MG ABS*
- *Example output ISM-MG ABS statistics*

Example output ISM-MG ABS

```
# show mobile-gateway ism-mg abs

=====
```

Table 5: Show ISM-MG ABS fields

Label	Description
S	Physical slot number for the ISM-MG
M	MDA number for the physical slot; only 1 is supported for the ISM-MG card
G	Group number
GW-ID	Gateway ID (1 to 8)
Signal-Overload	Indicates signaling overload
Memory-Overload	Indicates memory overload
First Occurrence	Time stamp of the first time that overload protection was triggered per ISM-MG
Last Occurrence	Time stamp of the last time that overload protection was triggered per ISM-MG
Tot	Indicates the total number that overload protection was triggered

4.2.2.2.9 cpu

Syntax

cpu [slot *number*] [mda *number*] [repeat *repeat-number*]

cpu [repeat *repeat-number*] [vm *vm-id*] [vm-function *vm-function-number*]

Context

show>mobile>ism-mg

Description

This command displays the CPU utilization for the ISM-MG card (only MDA 1 is supported).

Parameters

number

specifies the slot number of the ISM-MG card

mda number

specifies the MDA number within the ISM-MG slot

Values: 1 | 2 (only MDA 1 is supported for the ISM-MG)

repeat-number

specifies the sample period, the number of times to repeat the sampling

Values: 1 to 5

vm-id

specifies the VM ID

Values: 1 to 20

vm-function-number

specifies the VM function

Values: 1 | 2

Output

The following 7750 SR MG output examples show CPU utilization information for the ISM-MG card and *Show ISM-MG CPU utilization fields* describes the output fields.

NOTE:

The outputs of a CMG system are identical to the 7750 SR MG outputs except they have some CMG-specific fields displayed instead of hardware components (for example, VM is displayed instead of Card).

- *Example output ISM-MG CPU utilization summary statistics*

4.2.2.2.11 sdf

Syntax

```
sdf [group-number]
```

Context

```
show>mobile>ism-mg
```

```
show>mobile>mg-vm
```

Description

This command displays the SDF tables utilization for the ISM-MG SDF group (7750 SR MG) or the MG-VM SDF group (CMG). The SDF is an aggregate set of packet flows carried through the PCEF that matches a service data flow template. The utilization of SDFs is tracked against the relative limits.

Parameters

group-number

specifies the number of the ISM-MG or MG-VM group

Values: 1 to 15

Output

The following two examples shows SDF utilization statistics for the ISM-MG and the MG-VM SDF groups. *Show mobile gateway ISM-MG and MG-VM SDF output fields* describes the output fields.

Example output SDF statistics

```
# show mobile-gateway ism-mg sdf

=====
```

Table 8: Show mobile gateway ISM-MG and MG-VM SDF output fields

Label	Description
Group	The number of the ISM-MG SDF or the MG-VM SDF group
In use	The actual number of SDFs that are programmed in the Fast Path (FP)
Assigned	The number of SDFs that are provisioned on the LCP
FP Total	The total number of FP (hardware) boot time parameters. This is chosen depending on the card type. FP has a fixed eight million entries. SDFs from the LCP pool move to FP when traffic is seen and move back to the LCP pool when they are idle.

Table 8: Show mobile gateway ISM-MG and MG-VM SDF output fields (continued)

Label	Description
FP Utilization	The percentage of the hardware pool that is utilized, based on user traffic on sessions
LCP Total	The total number of LCP (IOM/MSM software) boot time parameters. This is chosen based on the card type. LCP is oversubscribed entries (64 million). SDFs from the LCP pool move to FP when traffic is seen and move back to the LCP pool when they are idle.
LCP Utilization	The percentage of the assigned LCP software pool that is utilized, based on the number of calls and polices

4.2.2.2.12 mg-vm

Syntax

```
mg - vm
```

Context

```
show>mobile
```

Description

This command displays information about the MG-VM for CMG systems.

4.2.2.2.13 cpu

Syntax

```
cpu [vm vm-id] [vm-function vm-function-number] [repeat repeat-number]
```

Context

```
show>mobile>mg-vm
```

Description

This command displays the CPU utilization of MG-VMs.

Parameters

vm-id

specifies the VM number

vm-function-number

specifies the MG-VM function number

Values: 1 | 2

repeat-number

specifies the sample period, the number of times to repeat the sampling

Values: 1 to 5

Output

The following output examples show CPU utilization information for MG-VMs and *Show MG-VM CPU utilization fields* describes the output fields.

- *Example output MG-VM CPU utilization summary statistics*
- *Example output MG-VM CPU utilization statistics for a specified MG-VM*

Table 10: Show MG-VM memory utilization fields

Label	Description
VM	MG-VM number
VMF	MG-VM function number
Group	Group number

Table 10: Show MG-VM memory utilization fields (continued)

Label	Description
GW-ID	Gateway ID (1 to 8)
Current size	Total available memory size (per VM/VM function or interface)
In use	Total memory that is allocated (per VM/VM function or interface)
Avail Virt Mem	Total available virtual memory (per VM/VM function)
Avail Phys Mem	Total available physical memory (per VM/VM function)
Name	Protocol or interface name

4.2.2.2.15 system

Syntax

system [gateway *gw-id* | group *group-number* | [card *slot-number* | vm *vm-id*]] [summary]

system [call-insight]

Context

show>mobile

Description

This command displays mobile gateway system information.

Parameters

gw-id

specifies the gateway ID

Values: 1

group-number

specifies the group number

Values: 1 to 15

slot-number

specifies the card slot number (applicable only to 7750 SR MG)

Values: 1 to 20 | A | B

vm-id

specifies the VM ID (applicable only to CMG)

Values: 1 to 20 | A | B

summary

shows aggregated statistics per-peer level

Output

The following output examples show system information and *Show mobile gateway system information* describes the output fields.

- *Example output system information (one-to-one redundancy)*
- *Example output system information (many-to-many redundancy for CMG)*

NOTE:

CMG system outputs may be identical to the 7750 SR MG outputs, with some CMG-specific fields displayed instead of hardware components (for example, VM is displayed instead of Card).

Example output system information (one-to-one redundancy)

```
# show mobile-gateway system

Table 11: Show mobile gateway system information

Label	Description
Use-fixed-udp-src-port	Indicates if a fixed UDP source port is used Enabled or disabled (default)
Ue-fragmented-packets-handling	Indicates if the IP packet reassembly of the user-level traffic for packet classification is used Enabled or disabled (default)

Table 11: Show mobile gateway system information (continued)

Label	Description
ttc-accuracy	TTC accuracy optimization
GTP-U Source Port Dist	Selects a UDP source port for GTP-U packets
Gateway	Gateway ID (1 to 8)
Instance type	User-plane node (UPF/SGW-U/PGW-U, combined SGW-U/PGW-U) Control-plane node (SMF/SGW-C/PGW-C, combined SGW-C/PGW-C)
Admin State	The administratively applied state of the gateway (Up or Down)
Oper State	The operational state of the gateway (Up or Down)
Suspend	Indicates if the gateway is in a suspended state, in which case it does not accept new session, but continues to support call-flow on existing sessions
Suspend since	The time at which the gateway was suspended
Restart counter	Restart counter value
EPC Node	EPC node name; can be 31 characters maximum composed of the following: <MCC>.<MNC>.<SGW PGW ePDG TWAG>.<Region String>.<Group Id>.<Node Id>
AA-grp/Part-id	The AA group/partition ID assigned to the mobile-gateway system
Def app profile	The default AA application profile assigned to the mobile-gateway system
parent-ctl-cc-na	The optional parental control ASO charging characteristic name, when the AA group and default application profile are configured
Admin Uptime	Time at which the gateway was administratively up

Table 11: Show mobile gateway system information (continued)

Label	Description
Gateway Uptime	Time the gateway was operationally up
PFCP Recover Time	Time of the PFCP recovery Note: It is displayed only in case CUPS is set up.
Group	Mobile-gateway system group number (1 to 8)
Admin State	The administratively applied state of the group (up or down)
Oper state	Operational state of the group (up, down, in transition, and scale-in in progress)
Override profile	Indicates if an override profile is configured, or not, for each group for GTP-U redirection; applicable to CMG only
Group Uptime	Time at which the group was operationally up
Red State	Redundancy state (hot or cold)
Switch over count	Indicates for the group, the number of switchovers for each {active to standby} transition of the VM/Card
Switch over time	Time of the last switchover
Switch over state	The state of the switchover
Resource pool	The resource pool assigned to the group defines the VM resources (cards) and the redundancy method used for the group; applicable to CMG only
Redundancy	Many-to-many ("M" active VMs are configured to have "N" standby/ spares to provide HOT redundancy) One-to-one (each group is configured to provide HOT redundancy per VM/Card)

Table 11: Show mobile gateway system information (continued)

Label	Description
PCMD Profile	Indicates if the group inherits the PCMD profile: inherit — the PCMD profile configured in the config>mobile>profile>pcmd context is applied to the group none — PCMD records are not generated for this group
PCMD Oper state	Operational state of the PCMD (up or down)
Card/VM	Card/VM slot number
Role/Red state	Indicates the working/active or protect/standby state of the VM/ Card

4.2.2.3 Show redundancy command descriptions

4.2.2.3.1 mc-mobile

Syntax

```
mc-mobile peer {ip-address | ipv6-address}  
mc-mobile peer {ip-address | ipv6-address} mc-red-tcp-stats
```

Context

```
show>redundancy>multi-chassis>mc-mobile
```

Description

This command displays LAG (Link Aggregation Group) information.

Parameters

ip-address

shows information for the specified IPv4 peer

ipv6-address

shows information for the specified IPv6 peer

mc-red-tcp-stats

displays MC redundancy red state TCP connection statistics

Output

The following output examples show Multi-Chassis (MC) redundancy information.

- [Example output MC redundancy statistics \(UE-by-UE reconcile synchronization disabled\)](#)
- [Example output MC redundancy statistics \(UE-by-UE reconcile synchronization enabled\)](#)
- [Example output MC redundancy statistics \(traffic detection enabled\)](#)
- [Example output MC redundancy red state TCP connection statistics](#)

Example output MC redundancy statistics (UE-by-UE reconcile synchronization disabled)

The following output example shows MC redundancy information when the UE-by-UE reconcile synchronization is disabled and [Show redundancy MC mobile output fields](#) explains the output fields.

```

Table 12: Show redundancy MC mobile output fields

Label	Description
Peer	IP address of the ICR multi-chassis mobile peer
Last State Change	Date and time of the most recent state change of the peer
Admin State	Current administrative state
Oper State	Current operational state
Peer Version	Software version of the peer
Keep Alive	Configured keep alive time
Hold on NBR Fail	The number of keep-alive-intervals that may expire before the local node decides that the neighboring (NBR) peer has failed
BFD Svc ID	ID of the BFD service
BFD Interface Name	Name of the BFD interface
MC-Redirect	Indicates the status of MC redirection
Admin MC-complete-ue-sync	Indicates the status of the MC UE-by-UE ICR synchronization that is locally configured
Oper MC-complete-ue-sync	Indicates the operational synchronization that is currently running The master node dictates the ICR sync type that must be used
Slave Traffic Detection Delay Timer	Indicates the status when disabled and the configured value when enabled

Table 12: Show redundancy MC mobile output fields (continued)

Label	Description
Gateway ID	ID of the gateway
Admin Role	Administrative role of the gateway: Primary the gateway that is intended to be the master Secondary the gateway that is intended to be the slave
Oper Role	Current operational role of the gateway: Master the gateway that is currently forwarding mobile traffic and participating in signaling with the SGW, SGSN, and so on Slave the gateway that is ready to take over in case the master fails
Peer Admin Role	Administrative role of the peer gateway: Primary the gateway that is intended to be the master Secondary the gateway that is intended to be the slave
Peer Oper Role	Current operational role of the peer gateway: Master the gateway that is currently forwarding mobile traffic and participating in signaling with the SGW, SGSN, and so on

Table 12: Show redundancy MC mobile output fields (continued)

Label	Description
	Slave the gateway that is ready to take over in case the master fails
Advertised metric	Indicates if the advertised metrics are for the master, slave, pre-slave, or none This field is always present regardless of the MCS connection state
Traffic Detection	Indicates if all, partial, or no traffic is detected This field is displayed only when the MCS connection is lost
Diameter Connection Lost Detection	The status of the Diameter Connection Lost Detection
Gx Peer Guard Timer	The time, in minutes, and status of the Gx guard timer to delay the ICR FSWO when all the Gx connections are detected as lost
Last Time Peer Connected	Date and time of the last peer connection
Last Oper Role Change ¹	Date and time of the last operational role change

¹ The values of these fields change only when the election is done and there is a change in the operational role.

Scenario example:

- peer C is the master, peer A is the slave and ICR is HOT
- the MCS link between the geo-redundant nodes (C and A) goes down; because of this, the ICR goes COLD
- while the MCS link is down:
 - the old master (C) continues to receive all three types of traffic (UL control, UL data, and DL data) and stays as the master
 - the old slave (A) starts receiving all three types of traffic (UL control, UL data, and DL data) and takes up the role of the master
- when the MCS link is up, both geo-redundant nodes exchange their states and other parameters, for example:

Table 12: Show redundancy MC mobile output fields (continued)

Label	Description
Last Oper Role Chg Rsn ¹	Reason for the last operational role change
Geo-Redundancy State	Geo-redundant state: Hot MCS protocol is up and successfully syncing Warm MCS protocol is up, but not syncing (for example when the peer system is in the process of booting up) Cold MCS protocol is down
FSWO synchronization in progress	Indicates if a forced switchover is in progress
MC-master-lock	Indicates whether the gateway is locked in the master operational role
MC-slave-lock	Indicates whether the gateway is locked in the slave operational role
MC redirect trap set	Indicates whether an MC redirect trap is set
Remaining Slave Traffic Detection Delay Timer	Indicates the remaining time before the slave detection delay timer expires (if enabled)

-
- the master (C) sends its current PDN session count of 800K
 - the old slave that turned to master (A) sends its current PDN session count of 300K
 - as part of the election process, since C is the master with higher PDN session count, it takes up the role of master and A assumes the role of the slave
 - in this case, the geo-redundancy operational roles before and after the MCS link down events are the same (that is, C master and A slave)

In this example, since there is no change in the operational roles, there is no change in the Last Oper Role Chg Rsn and Last Oper Role Change fields in the output of the `show>redundancy>multi-chassis>mc-mobile>peer` command.

Table 12: Show redundancy MC mobile output fields (continued)

Label	Description
Traffic detection Poll timer	Indicates the configured value for the traffic detection poll timer
Master Traffic Detection	Indicates whether the ICR Traffic Detection is Enabled or Disabled in the master operational role The default value of this configuration is Enabled and is only applies to the gateway in the master operational role
Traffic Detection	Indicates the configured ICR traffic detection criteria Can apply to special 7750 SR MG and CMG ICR deployments, with a very small number of attached UEs, or very low, or no active user traffic. The relaxed option must not be used for any regular 7750 SR MG and CMG deployments. It is only supported on 2G (GGSN) without any charging and policy or RADIUS deployed.
Remaining Traffic Detection Poll Timer	Indicates the remaining time in the current traffic detection polling interval (the value configured using the traffic-detection-poll-timer command) This label is displayed in the CLI output only when the ICR traffic detection is running
Total Remaining Traffic Detection Poll Timer	Indicates the total remaining time in the traffic detection timer (1200 seconds); when the timer expires, the ICR traffic detection is disabled if no traffic is detected This label is displayed in the CLI output only when the ICR traffic detection is running
MC-Redirect Trap Details	
VPRN ID	VPRN ID for the MC redirect trap
Interface Name	Name of the VPRN interface for the MC redirect trap
Trap set count	Number of traps that have been set

Table 12: Show redundancy MC mobile output fields (continued)

Label	Description
Last trap timestamp	Date and time of the most recent trap
FSWO Progress	
MG/CPM group Id	ID of the gateway or CPM group for which the failed switchover is in progress
State	Geo-redundant state: Hot MCS protocol is up and successfully syncing Warm MCS protocol is up, but not syncing (for example when the peer system is in the process of booting up) Cold MCS protocol is down
MCS sync use	The percentage of MCS synchronization that is in use
FSWO tasks synced	The number of failed switchover tasks that have synchronized
Synced UEs	The number of UEs that have synchronized Visible only when the Oper MC-complete-ue-sync is enabled

Status of the admin MC-complete-ue-sync and oper MC-complete-ue-sync on the master and slave nodes lists the indicated status of the Admin MC-complete-ue-sync and Oper MC-complete-ue-sync fields on the master and slave nodes based on the status of the MC UE-by-UE reconcile synchronization feature.

Table 13: Status of the admin MC-complete-ue-sync and oper MC-complete-ue-sync on the master and slave nodes

MC-complete-ue-sync Status	Master node		Slave node	
	Admin MC-complete-ue-sync	Oper MC-complete-ue-sync	Admin MC-complete-ue-sync	Oper MC-complete-ue-sync
Disabled on master and slave	Disabled	Disabled	Disabled	Disabled
Enabled on master and disabled on slave	Enabled	Enabled	Disabled	Enabled
Disabled on the fly on master and disabled on slave	Disabled	Disabled	Disabled	Disabled
Disabled on master and enabled on slave	Disabled	Disabled	Enabled	Disabled

Values of the Last Oper Role Chg Rsn field describes the values of the Last Oper Role Chg Rsn field and their definitions on the master and slave nodes.

Table 14: Values of the Last Oper Role Chg Rsn field

Code	Description (Master)	Description (Slave)
No peer mcm	N/A	The node has transitioned to slave because: - the admin>multi-chassis>peer>shutdown command was issued, or - the MCS link is being lost
Cfg primary	The node is configured as primary and the peer is not master	N/A

Table 14: Values of the Last Oper Role Chg Rsn field (continued)

Code	Description (Master)	Description (Slave)
Cfg secondary	N/A	The node is configured as secondary and the peer is the master
Peer restart	The peer has restarted	—
Traffic event	The node has received all three types of traffic (UL control, UL data, and DL data) while traffic detection is enabled	N/A
Peer disc	The node has transitioned to master because: - the admin>multi-chassis>peer>shutdown command was issued on the peer node - the admin>redundancy>mc-mobile-switchover>mobile-gateway command with the now option was issued on the peer node	N/A
Manual switchover	The node has transitioned to master after the admin>redundancy>mc-mobile-switchover>mobile-gateway command was issued on the peer node	—
Traffic absent	N/A	The node did not receive any traffic while traffic monitoring was enabled and thus, was forced to transition to slave
Manual Switchover with MC-Redirect	The admin>redundancy>mc-mobile-switchover>mobile-gateway was issued on the peer and MC-redirect (shunt) is in use	N/A

Table 14: Values of the Last Oper Role Chg Rsn field (continued)

Code	Description (Master)	Description (Slave)
Master lock	The node is locked to be the master	The peer node is locked to be the master
Slave lock	The peer node is locked to be the slave	The node is locked to be the slave
Previous role	The node is the only one suitable to be the master due to its previous role	The node is not suitable to be the master due to its previous role
PDN shutdown	The node has transitioned to master because a PDN shutdown (using the config>mobile>pdn>shutdown command) is in progress on the peer node	The node has transitioned to slave because a PDN shutdown (using the config>mobile>pdn>shutdown command) is in progress on this node but the peer is operational
Session count	The node has transitioned to master because it has a higher number of sessions than its peer	The node has transitioned to slave because it has a lower number of sessions than its peer

Example output MC redundancy red state TCP connection statistics

The following output example shows MC redundancy red state TCP connection statistics and *Show redundancy MC mobile red state TCP connection output fields* explains the output fields.

```
# show redundancy multi-chassis mc-mobile peer 10.90.1.2 mc-red-tcp-stats

5.2.1.1 Generic PDN command descriptions

5.2.1.1.1 description

Syntax

`description description-string`

`no description`

Context

`config>mobile>pdn>apn`

Description

This command enables a text description stored in the configuration file for a configuration context.

The `description` command associates a text string with a configuration context to help identify the content in the configuration file.

The `no` form of this command removes the string from the configuration.

Default

no description

Parameters

description-string

the description character string; allowed values are any string up to 80 characters long composed of printable, 7-bit ASCII characters; if the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes

5.2.1.1.2 shutdown

Syntax

[no] shutdown

Context

config>mobile>pdn

config>mobile>pdn>apn

config>mobile>pdn>gn

config>mobile>pdn>gp

config>mobile>pdn>threshold

config>aa>group[:partition]>wap1x

Description

This command administratively disables an entity (admin state down). When disabled, an entity does not change, reset, or remove any configuration settings or statistics. The operational state of the entity is disabled as well as the operational state of any entities contained within. Many entities must be shut down before they may be deleted.

Many entities must be explicitly enabled using the `no shutdown` command.

NOTICE:

The use of the `config>mobile>pdn>shutdown` command on the mobile gateway and in the Master Operation Role in ICR/geographical redundancy deployments will affect the service. When the command is issued a warning informs the administrator that the execution of the command will affect the service.

**NOTE:**

The shutdown command at the APN level only affects new sessions, meaning that operational state of APN related to existing sessions remains up while the administrative state is down. The gateway still forwards user traffic for the remaining sessions.

5.2.1.2 PDN command descriptions

5.2.1.2.1 pdn

Syntax

[no] pdn *gw-id*

Context

config>mobile

Description

This command configures a generic Packet Data Network (PDN) gateway instance. PDN accepts any type of session including SGW, PGW, GGSN and so on.

The no form of this command removes the gateway instance from the configuration.

Parameters

gw-id

specifies the gateway ID

Values: 1 to 8

5.2.1.2.2 5g-ims-fallback-timeout

Syntax

5g-ims-fallback-timeout *timeout*

no 5g-ims-fallback-timeout

Context

config>mobile>pdn

Description

This command configures the maximum time for the 5G IMS EPS fallback or RAT fallback for an IMS voice call, before the SMF/PGW aborts the setup of the IMS voice call.

Parameters

timeout

specifies the timeout, in seconds

Values: 1 to 20

Default: 5

5.2.1.2.3 aa-group

Syntax

```
aa-group [aa-group-id[:partition-id]] [def-app-profile profile-name] [parent-ctl-cc-name value]
```

```
no aa-group
```

Context

```
mobile>pdn
```

```
mobile>pdn>apn
```

Description

This command associates an aa-group with a PDN gw-id or with an individual APN.

When used at the PDN level, the aa-group names the aa-group that is associated with the *gw-id* and also all APNs that are supported for that gw-id. The partition-id is optional. If included the partition-id should be the default used for all APNs. It does not restrict the APNs from using their own partition-ids.

When used at the APN level, the aa-group-id identifies the aa-group and partition that should be used for this APN. The APN aa-group-id must match the aa-group-id specified at the PDN level. (Different mapping between APN and aa-group-ids may be possible in future releases.) The partition-id defines the partition to be used for this APN. The partition-id does not have to match the partition-id defined at the PDN level.

NOTE:

This command requires a PDN or an APN shutdown respectively.

Parameters

aa-group-id

specifies an integer that identifies an AA group

Values: 1 to 255

partition

specifies an integer that identifies a particular partition on this AA group

Values: 1 to 65535

profile-name

specifies an application profile name, up to 32 characters

value

specifies the optional parental control ASO charging characteristic name, when the AA group and the default application profile are configured, up to 32 characters

5.2.1.2.4 allow-duplicate-imei

Syntax

```
[no] allow-duplicate-imei
```

Context

```
config>mobile>pdn
```

Description

This command controls whether the gateway allows more than 1 UE to use a particular value of IMEI (SV). By default, the gateway will only allow 1 UE to use an IMEI. If this command is present the gateway will allow multiple UEs to attach with the same IMEI.

NOTE:

- If the `config>mobile>pdn>allow-duplicate-imei` command is enabled, the `show>mobile>pdn>pdn-context>imei` command does not show the existing sessions of the specified IMEI.
- This command requires a PDN shutdown.

Default

```
no allow-duplicate-imei
```

5.2.1.2.5 allow-duplicate-msisdn

Syntax

```
[no] allow-duplicate-msisdn
```

Context

```
config>mobile>pdn
```

Description

This command controls whether the gateway allows more than 1 UE to use a particular value of MSISDN (SV). By default, the gateway will only allow one UE to use an MSISDN. If this command is present the gateway will allow multiple UEs to attach with the same MSISDN.

NOTE:

- If the `config>mobile>pdn>allow-duplicate-imei` command is enabled, the `show>mobile>pdn>pdn-context>imei` command does not show the existing sessions of the specified MSISDN.
- This command requires a PDN shutdown.

Default

```
no allow-duplicate-msisdn
```

5.2.1.2.6 allow-multi-ue-session

Syntax

```
[no] allow-multi-ue-session
```

Context

```
config>mobile>pdn
```

Description

This command enables multiple UE session bonding support on the PDN gateway. To enable multiple UE session support, the `config>mobile>pdn>allow-duplicate-msisdn` command must be enabled and APN-level configuration is required to enable multiple UE bonding for a specific APN.

The no form of this command disables multiple UE session bonding.

**NOTE:**

- The `allow-multi-ue-session` command requires RADIUS support with IP subnets and UE IP address allocation received by the Framed-Route/Frame-IPv6-Route and the Framed-IP-Address/Framed-IPv6-Prefix attributes.
- This command requires a PDN shutdown.

Default

no allow-multi-ue-session

5.2.1.2.7 allow-multiple-apn-pdn

Syntax

[no] allow-multiple-apn-pdn

Context

config>mobile>pdn

Description

This command enables the SGW/PGW/GGSN to create multiple PDN sessions for the same (IMSI, APN). The handling for the PGW/GGSN and SGW is described in section *Enable Multiple PDNs per APN* in the *CMG Configuration Guide*; for more information, refer to tables *PGW/GGSN (S5/S8/Gn/Gp) Behavior* and *SGW (S11) Behavior*.

Default

no allow-multiple-apn-pdn

5.2.1.2.8 apn

Syntax

[no] apn {*apn-name* | unknown}

Context

config>mobile>pdn

Description

This command configures an Access Point Name (APN). Each APN represents a service provided by an upstream service provider. APNs can be classified as consumer APNs such as Internet, IMS, and Walled Garden) and corporate APNs (using L2TP, IPsec, GRE-IP VPNs).

The APN string may consist of NI + OI (upstream network provider identification + operator MCC and MNC identification) or just the NI part. The configured APN must match exactly to what is received as the real APN in the incoming session creation messages.

APN configuration in the CMG may use both APN-NI and full APN to as the identifier. When the PDP context is activated, CMG will use following steps to find the matching APN from the configuration:

1. If there is configured APN identified by APN-NI and it matches with the APN-NI in the Create PDP Context request, the matching configured APN is used to activate the PDP context.
2. If there is only one configured APN identified by the full APN where the APN-NI part matches with the APN-NI in the Create PDP Context request, the matching configured APN is used to activate the PDP context.
3. Two full APNs are constructed using the initial five and six digits of the authenticated IMSI and the APN-NI in the Create PDP Context request. If both of these constructed APN values matches with configured APNs the PDP context activation fails. If only one of the constructed APN values matches with configured APNs, the matching configured APN is used to activate the PDP context.
4. If no matching configured APN has not been found in the previous steps, but there is configuration for the unknown APN, the PDP context activation is done with this configuration. If there is no configuration for unknown APN, the PDP context activation fails.

To facilitate configuration and service provisioning, the real APNs can be further mapped to virtual APNs using various methods.

The no form of this command removes the APN from the configuration.

If the gateway is configured as user plane function using the `mobile>config>pdn>instance-type` command, this command specifies the network realm name associated for the APN/virtual router instance on the user plane function where the UE IP pools are located. This realm name is communicated in the Network-Instance IE part of the Sx/N4 interface session establishment/modification process together with the allocated UE IP address from the control plane function.

NOTE:

New APNs can be added without PDN shutdown. To delete an APN from the configuration, follow this procedure:

- shutdown the APN
- clear all sessions from the APN with `clear-mobile-gateway` command
- delete the APN

Parameters

apn-name

specifies an APN name, up to 80 characters

NOTE:

For UP function, the *apn-name* may be defined as APN-NI and APN-OI. The APN-NI must not exceed 63 characters.

unknown

specifies a reserved APN name that serves unknown APNs

5.2.1.2.9 auto-set-handover-indication

Syntax

[no] auto-set-handover-indication

Context

config>mobile>pdn

Description

This command enables the ePDG to automatically set the hand over indication bit, to better accommodate hand overs from LTE to WiFi. This is especially useful if a UE is performing the hand over without including its LTE IP address in the IKE request. Normally the ePDG checks the LTE IP address in the IKE request to detect hand overs. If the automatic hand over indication is enabled, the ePDG sets the hand over indication in Create Session request messages on the S2b. If the PGW rejects a request with a "Context Not Found" failure code, the ePDG will re-send it with the hand over indication set to bit_cleared_.

NOTE:

This command requires a PDN shutdown.

Default

no auto-set-handover-indication

5.2.1.2.10 call-procedure-retry

Syntax

```
call-procedure-retry retry-time seconds retry-attempts value [retry-delay retry-delay-msec]  
  
no call-procedure-retry
```

Context

```
config>mobile>pdn
```

Description

This command allows enabling and setting the retry time and the retry attempts for a local retry, which will be used instead of a trigger from a peering node (for example, the PCRF) on a call flow failure. The call procedure retry is supported for PGW/SMF-initiated procedures while the handover or TAU is in progress. The retries for delete bearer procedures for dedicated bearers are also supported.

The retry delay specifies for how long the PGW/SMF must wait after the TAU/HO, if the PGW/SMF retries the procedure immediately after the TAU/HO.

Default

```
no call-procedure-retry
```

Parameters

seconds

specifies the retry time, in seconds

Values: 1 to 20

Default: 1

value

specifies the number of retry attempts

Values: 0 to 5

Default: 0 (disabled)

retry-delay-msec

specifies the retry delay, in milliseconds

Values: 0 to 1000

Default: 0

5.2.1.2.11 cam-optimization

Syntax

```
cam-optimization {enable | disable}  
no cam-optimization
```

Context

```
config>mobile>pdn
```

Description

This command enables or disables CAM optimization. When enabled, a rule is split in two parts. The first part consists of the IP address and protocol and the second part consists of the source and destination ports that are programmed to a port list. Dynamic PCC rules with destination port but no protocol ID in flow description are rejected if the cam-optimization feature is disabled in SMF. Nokia recommends enabling the feature on both SMF and UPF.

The no form of this command reverts to the default (disable).

Default

```
no cam-optimization
```

Parameters

enable

enables the CAM optimization

disable

disables the CAM optimization

Default: disable

5.2.1.2.12 dl-buffering

Syntax

```
dl-buffering
```

Context

```
config>mobile>pdn
```

Description

This command enables the context to configure DL buffering per UE.

5.2.1.2.13 drop-oldest-pkt

Syntax

[no] drop-oldest-pkt

Context

config>mobile>pdn>dl-buffering

Description

This command enables dropping the oldest packet when the maximum number of DL buffering packets is reached.

The no form of this command reverts to the default behavior; that is, the incoming packet is dropped when the maximum number of DL buffering packets is reached.

Default

no drop-oldest-pkt

5.2.1.2.14 max-pkt

Syntax

max-pkt *limit*

no max-pkt

Context

config>mobile>pdn>dl-buffering

Description

This command configures the maximum number of packets for DL buffering per UE and is applicable to all paging scenarios. Until the DDN Acknowledge message with the DL Buffering Duration IE is received, the DL packets are buffered for a default duration of 30 seconds and up to the configured value of the max-pkt command.

The no form of this command reverts to the default.

**NOTE:**

This command applies only to CMG.

Parameters

limit

specifies the maximum number of packets for DL buffering

Values: 12 | 32 | 64 | 128

Default: 12

5.2.1.2.15 max-pkt-size

Syntax

max-pkt [*bytes*]

no max-pkt

Context

config>mobile>pdn>dl-buffering

Description

This command configures the maximum allowed size of the downlink buffered packet per UE. In addition to the UE payload, the outer headers and metadata of up to 78 bytes are taken into account while calculating the max-pkt-size.

The no form of this command reverts to the default value (2048 bytes).

**NOTE:**

- This command applies only to CMG.
- For a UE in idle state, a DL packet larger than the max-pkt-size and additional per-packet metadata will be dropped by CMG, but will still trigger the paging call flow.

Parameters

bytes

specifies the maximum allowed size, in bytes

Default: 2048

5.2.1.2.16 total-buffer-capacity

Syntax

```
total-buffer-capacity value  
no total-buffer-capacity
```

Context

```
config>mobile>pdn>dl-buffering
```

Description

This command configures the maximum allowed downlink buffering capacity per MG-VM.

The no form of this command reverts to the default value (128 Mbytes).

NOTE:

- This command applies only to CMG.
- This command configures system-level memory limits and on-the-fly changes are not allowed. Nokia recommends configuring this command during the initial CMG configuration. Any subsequent changes require a PDN shutdown.
- When the total-buffer-capacity limit is reached, any additional DL packets to be buffered will get dropped and this will not trigger the paging call flow.

Parameters

value

specifies the maximum allowed downlink buffering capacity, in Mbytes

Values: 4 to 65536 (in increments of 4)

Default: 128

5.2.1.2.17 total-buffer-pkts

Syntax

```
total-buffer-pkts value  
no total-buffer-pkts
```

Context

config>mobile>pdn>dl-buffering

Description

This command configures the maximum allowed downlink buffered packets per MG-VM.

The no form of this command reverts to the default value (48000 packets).

NOTE:

- This command applies only to CMG.
- When the total-buffer-pkts limit is reached, any additional DL packets to be buffered will get dropped, but will still trigger the paging call flow.

Parameters

value

specifies the maximum number of allowed downlink buffered packets

Values: 4000 to 2500000000

Default: 48000

5.2.1.2.18 create-procedure-retry

Syntax

create-procedure-retry retry-time *seconds* retry-attempts *attempts* [retry-delay
retry-attempt-msec]

no create-procedure-retry

Context

config>mobile>pdn

Description

This command configures the retry time and the retry attempts for the Create Bearer Request.

The no form of this command reverts to the default, that is apply the call-procedure-retry command to set the retry time and retry attempts.

Default

no create-procedure-retry

Parameters

seconds

specifies the retry time, in seconds

Values: 1 to 20

Default: 1

attempts

specifies the number of retry attempts

Values: 0 to 5

Default: 0 (disabled)

retry-attempt-msec

specifies the retry delay, in milliseconds

Values: 0 to 1000

Default: 0

5.2.1.2.19 default-traffic-hash

Syntax

default-traffic-hash *profile-name*

no default-traffic-hash

Context

config>mobile>pdn

Description

This command is used to specify a default traffic hash profile. The specified profile is applied to an SDF for a bonded session, when it is not explicitly instantiated with a traffic hash profile within a policy rule unit. This applies to any predefined (static) rules including a “any/any” (match-all) rule. The default traffic hash profile needs to be specified prior to bonded-support being enabled for an APN.

The no form of this command reverts to the default.

NOTE:

This command requires a PDN shutdown.

Default

no default-traffic-hash

Parameters

profile-name

specifies a profile name, up to 32 characters

5.2.1.2.20 del-bearer-reactivation-req-cause-pgw-failure

Syntax

[no] del-bearer-reactivation-req-cause-pgw-failure

Context

config>mobile>pdn

Description

This command enables the SGW to include a re-activation request in the Delete Bearer Request message if the PGW fails. The no form of this command reverts to the default where no re-activation request is included in the Delete Bearer Request message.

Default

no del-bearer-reactivation-req-cause-pgw-failure

5.2.1.2.21 delay-nw-procedures

Syntax

delay-nw-procedures *timer-value-msec*

no delay-nw-procedures

Context

config>mobile>pdn

Description

This command specifies the delay-time before the pending network-initiated modification procedure starts after the TAU or handover to 5G. The delay reduces the risk of the request from the SMF/PGW-C being rejected from the AMF because the TAU or handover has not yet completed in the serving node.

The no form of this command reverts to the default.

NOTE:

In some cases, the network-initiated modification procedure must be started right after the TAU or handover between 4G and 5G, or the 5G TAU or handover. This may occur, for example, due to the 5G QoS restoration, or when the temporarily canceled modification is pending for retry.

Default

no delay-nw-procedures

Parameters

timer-value-msec

specifies the delay-time in milliseconds to apply before the network-initiated modification procedure starts after the handover or TAU

Values: 0 to 1000

Default: 0

5.2.1.2.22 disable-hss-init-update-failure-delete

Syntax

```
[no] disable-hss-init-update-failure-delete
```

Context

```
config>mobile>pdn
```

Description

This command disables the 3GPP specified failure handling for the HSS-initiated QoS update. The PDN connection remains active if the MME rejects the Update Bearer Request message. The no form of this command reverts to the default.

Default

no disable-hss-init-update-failure-delete

5.2.1.2.23 dns-client

Syntax

```
dns-client
```

Context

```
config>mobile>pdn
```

Description

This command enables the context to configure the DNS client at the PDN level.

5.2.1.2.24 cache-clear-no-such-name

Syntax

```
[no] cache-clear-no-such-name
```

Context

```
config>mobile>pdn>dns-client
```

Description

This command forces the ePDG to clear a DNS cached entry, if the DNS server replies with the Reply Code: 3 "No Such Name" ON NAPTR, SRV or A/AAAA RESOLUTION. In this case, the ePDG removes the entry (when it pre-exists) and does not store the entry (if the query is for a non pre-existent entry).

The no form of this command reverts to the default DNS response handling.

Default

```
no cache-clear-no-such-name
```

5.2.1.2.25 dns-interface

Syntax

```
dns-interface interface-name [router router-instance]
```

```
no dns-interface
```

Context

config>mobile>pdn>dns-client

Description

This command configures the source interface to use with the DNS profile for DNS lookup on the mobile gateway. If the interface is not configured under the DNS client, the DNS configuration in the Boot Option File (BOF) is used.

The no form of this command reverts to the default DNS configuration in the BOF.

NOTE:

This command requires a PDN shutdown.

Default

no dns-interface

Parameters

interface-name

specifies an interface name, up to 32 characters and must start with a letter

router-instance

specifies the virtual router name or service ID

Values	router-name vprn-svc-id	
–	router-name	Base
–	vprn-svc-id	1 to 2147483647

Default: Base

5.2.1.2.26 dns-profile

Syntax

dns-profile *profile-name*

```
no dns-profile
```

Context

```
config>mobile>pdn>dns-client
```

Description

This command configures a DNS profile used for all DNS lookups on the control plane for the mobile gateway-specific reference point interfaces.

DNS lookups for reference point interfaces that are not specific to gateway functions continue to be done using the default DNS configuration in the Boot Option File (BOF).

The no form of this command reverts to the default DNS lookup configuration in the BOF.

NOTE:

This command requires a PDN shutdown.

Default

```
no dns-profile
```

Parameters

profile-name

specifies the name of the DNS profile, up to 32 characters

5.2.1.2.27 enable-pcscf-low-ttl

Syntax

```
[no] enable-pcscf-low-ttl
```

Context

```
config>mobile>pdn>dns-client
```

Description

This command specifies the refresh interval time (minimum two seconds) when the received DNS TTL is used.

Default

disabled

5.2.1.2.28 refresh-interval

Syntax

```
refresh-interval {pcscf | pgw | apn | all} refresh-interval-sec interval-in-seconds [use-dns-ttl]
```

```
no refresh-interval {pcscf | pgw | apn | all}
```

Context

```
config>mobile>pdn>dns-client
```

Description

This command specifies the DNS refresh interval at the PDN level. Filters support the ability to set a different refresh interval for DNS-based selections (P-CSCF, PGW, and APN), or to set the same refresh interval for all of them together.

An option can also be specified to refresh the DNS repository using the TTL provided in the DNS response for a given P-CSCF/PGW/APN server FQDN. The following restrictions apply:

- TTL based DNS refresh is supported for P-CSCF/PGW/APN FQDNs
- The shortest refresh time the PGW will support for P-CSCF FQDNs, is 30 seconds. The shortest refresh time that the ePDG supports for PGW/APN selection, is 300 seconds. For the PGW/APN if the received TTL<300 seconds, the system defaults to 300 seconds.
- A maximum of 100 P-CSCF FQDNs will be refreshed at 30 seconds. If the number of P-CSCF FQDNs is above 100, the PGW will use the configured refresh time (the minimum is 60 minutes).

The no form of this command reverts to the default.

Default

no refresh-interval

Parameters

pcscf

specifies the refresh interval for the dynamically learned P-CSCF server FQDN from AAA server over s6b interface

pgw

specifies the refresh level for the PGW

apn

specifies the refresh level for the APN

all

specifies the refresh level for all types of DNS-based selection. The minimum allowed configured value is 300 seconds.

interval-in-seconds

specifies the refresh interval time in seconds

Values: 300 to 86400

Default: 21600

use-dns-ttl

specifies the received DNS TTL

For the P-CSCF, if the received TTL<30 seconds, the system defaults to 30 seconds. For the PGW/APN if the received TTL<300 seconds, the system defaults to 300 seconds

5.2.1.2.29 topon-match-first

Syntax

[no] topon-match-first

Context

config>mobile>pdn>dns-client

Description

This command forces the ePDG to first run the topological matching algorithm and then, perform the A/AAAA resolution.

The no form of this command reverts to the default ePDG topological match logic.

Default

no topon-match-first

5.2.1.2.30 ttl-zero

Syntax

[no] ttl-zero

Context

```
config>mobile>pdn>dns-client
```

Description

This command allows the gateway not to cache the DNS provided answers, if the DNS provided with value TTL=0 (zero).

The no form of this command reverts to the default handling of the value of the DNS provided TTL=0, that rounds up to 300 seconds.

NOTICE:

Nokia recommends using the `ttl-zero` command only for lab testing activities, as the activation in live deployments leads to DNS signaling overload.

Default

```
no ttl-zero
```

5.2.1.2.31 dnai-map

Syntax

```
dnai-map entry-id {[plmn-list plmn-list-name] [mnvo] [incoming-apn-list apn-list-name] }  
mapped-apn mapped-apn
```

```
no dnai-map entry-id
```

Context

```
config>mobile>pdn
```

Description

This command configures an internal APN that is selected based on any one or more of the PLMN list, the incoming APN list, and mvno (for MVNO subscribers). The PLMN list contains one or more IMSI PLMN IDs (MCC+MNC) applicable to the operator.

The no form of this command deletes the DNAI mapping.

NOTE:

- The DNAI map that is configured with the lowest *entry-id* has precedence over multiple matching entries. For example, dnai-map 1 takes precedence over dnai-map 2. This allows the operator to choose the matching order by defining them in the preferred order of application.
- The PLMN list and APN list are defined in the `config>mobile>profile>list` context prior to applying this configuration.
- You can modify the PLMN list without shutting down the gateway.
- The idle timeout and session timeout are defined in the APN context.

Parameters

entry-id

specifies the entry ID for the DNAI map

Values: 1 to 100

plmn-list-name

specifies the PLMN list name for an operator, up to 32 characters, and is comprised of one or more MCC+MNC values applicable to the operator

mvno

keyword that specifies to map the incoming session to the mapped APN for MVNO subscribers

apn-list-name

specifies an APN list name, up to 32 characters, for matching the requested/received APN

mapped-apn

specifies the mapped-APN name, up to 80 characters, for LBO or MVNO sessions

5.2.1.2.32 dns-error-mapping-profile

Syntax

```
dns-error-mapping-profile profile-name
```

```
no dns-error-mapping-profile
```

Context

```
config>mobile>pdn
```

Description

This command allows the configuration of a specific DNS error mapping profile (already configured using the `config>mobile>profile>dns-error-mapping-profile` command) on the PDN.

The `no` form of this command removes the profile from the PDN and deactivates the functionality.

Default

no dns-error-mapping-profile

Parameters

profile-name

specifies the name of the error mapping profile, up to 32 characters

5.2.1.2.33 dual-connectivity

Syntax

[no] dual-connectivity

Context

config>mobile>pdn

Description

This command enables dual connectivity. When dual connectivity is enabled, you can use two different eNodeB peers in the Modify Bearer Request or Modify Access Bearers Request message.

Default

no dual-connectivity

5.2.1.2.34 dual-connectivity-5g

Syntax

[no] dual-connectivity-5g

Context

config>mobile>pdn

Description

This command enables dual connectivity in 5G. When dual connectivity is enabled, you can use two different gNB peers in the same PDU session.

Default

no dual-connectivity-5g

5.2.1.2.35 enable-sgw-c-partitioning

Syntax

[no] enable-sgw-c-partitioning

Context

config>mobile>pdn

Description

This command enables SGW-C partitioning at the PDN level to support UE relocation to an SGW-U that is associated with the same combined SGW-C/PGW-C. This applies for CMG CUPS deployments.

The CMG supports SGW-C partitioning by assigning one of multiple S11-C addresses per SGW partition that is treated as a legacy SGW by the MME. This supports the scenario, for example, where the combined SGW-C/PGW-C is centrally deployed to cover multiple service areas, while each SGW-U is locally deployed to cover a specific service area with an eNodeB connected to the SGW-U.

The SGW-C partition (S11 interface) covers only one service area, so the partition changes whenever an SGW-U relocation takes place. When a UE moves across the service area, a TAU or HO with the SGW relocation procedure is triggered, and the MME uses TAC-based DNS query to select a new SGW-C partition (S11-C address). After receiving a Create Session Request message, the SGW-C selects the new SGW-U based on the TAC list.

The no form of this command reverts to the default (no SGW-C partitioning).

Default

no enable-sgw-c-partitioning

5.2.1.2.36 epc-node

Syntax

epc-node *name*

no epc-node

Context

config>mobile>pdn

Description

This command configures the EPC node name.

The no form of this command removes the name from the configuration.

**NOTE:**

This command requires a PDN shutdown.

Default

no epc-node

Parameters

name

specifies the EPC node name, up to 31 characters

Syntax: <MCC>.<MNC>.<SGW | PGW | ePDG | TWAG>.<Region string>.<Group Id>.<Node Id>

5.2.1.2.37 epdg-5gs-compatibility

Syntax

[no] epdg-5gs-compatibility [rel-17 {enable | disable}]

Context

config>mobile>pdn

Description

This command configures the ePDG compatibility interworking with 5GS. When the epdg-5gs-compatibility command is specified, the ePDG functions according to the 3GPP pre-Rel-17 specification (processes and sends only the 5GSIWKI GTPv2 flag). When the rel-17 enable is configured, the ePDG functions according to the 3GPP Rel-17 specification (processes and sends the 5GSIWKI, 5GCNRI, and 5GCNRS GTPv2 flags).

**NOTE:**

Only pre-Rel-17 or Rel-17 configuration can be active at any time.

The no form of this command disables the ePDG compatibility interworking with 5GS.

Default

no epdg-5gs-compatibility

Parameters

rel-17 enable

specifies to enable the Rel-17 3GPP support for 5GS interworking

rel-17 disable

specifies to disable the Rel-17 3GPP support for 5GS interworking

5.2.1.2.38 exclude-error-indication-extension-header

Syntax

[no] exclude-error-indication-extension-header

Context

config>mobile>pdn

Description

This command includes or excludes the GTP extension headers from the GTPv1 Error Indication message.

Default

no exclude-error-indication-extension-header

5.2.1.2.39 fwd-gtpu-echo-req-to-mg

Syntax

[no] fwd-gtpu-echo-req-to-mg

Context

config>mobile>pdn

Description

This command forwards the GTP-U Echo Requests for distribution across the MG groups to improve the GTP-U Echo Response performance in LB-less CMG UP function deployments. The GTP-U Echo requests are forwarded and handled by the OAM or CPM.

The no form of this command does not distribute the GTP-U Echo Requests across the MG groups in LB-less CMG UP function deployments.

Default

no fwd-gtpu-echo-req-to-mg

5.2.1.2.40 gtpc-init-msg-src-ip-validation-bypass

Syntax

[no] gtpc-init-msg-src-ip-validation-bypass

Context

config>mobile>pdn

Description

This command enables the CMG to decouple GTP path validation process from the source IP address used in the incoming message. This allows the CMG receiving peer to successfully process an incoming message, whose source IP address is not used or known before, but holds a valid FTEID ID. The no form of this command reverts to the default.

NOTE:

The described functionality only applies to S2b interface and is about the PGW or PGW-C/SMF to ePDG GTPv2 messages.

Default

no gtpc-init-msg-src-ip-validation-bypass

5.2.1.2.41 gtpu-drop-echo-threshold

Syntax

gtpu-drop-echo-threshold queue-depth-threshold *outstanding-echo-requests* queue-threshold-sustain-time *sustain-interval* backoff-time *backoff-time*

no gtpu-drop-echo-threshold

Context

config>mobile>pdn

Description

This command configures CMG to drop the GTP-U Echo Request messages based on the thresholds of the system queue and sustain time.

The system goes into drop state when the system queue reaches the configured depth threshold, and the requests have persisted for the configured sustain time interval. An alarm and log event are generated. The system comes out of the drop state when the configured backoff time interval expires. An alarm and log event are generated.

The no form of this command does not drop the GTP-U Echo Requests.

Default

no gtpu-drop-echo-threshold

Parameters

outstanding-echo-requests

specifies the depth of the queue based on the number of the outstanding Echo Requests; when this limit is reached along with the sustain time interval, all the following GTP-U Echo Requests are dropped

Values: 2000 to 6000

Default: 0

sustain-interval

specifies the sustain time interval limit, in seconds, during which the number of outstanding GTP-U Echo Requests remain more than the depth threshold (configured with the queue-depth-threshold command) for the system to go into drop state, and all following GTP-U Echo Requests are dropped

Values: 0 to 120

Default: 0

backoff-time

specifies the backoff timer value, in seconds; this is the time interval after which the system comes out of the drop state and continues to process the GTP-U Echo Requests

Values: 0 to 600

Default: 0

5.2.1.2.42 gtpu-path-failure

Syntax

```
gtpu-path-failure ref-point ref-point action
no gtpu-path-failure ref-point ref-point
```

Context

```
config>mobile>pdn
```

Description

This command enables path management actions per GTP-U reference point.

The no form of this command disables the path management action for the specific reference point.

Default

```
no gtpu-path-failure
```

Parameters

- ref-point***
specifies the reference point type
Values: s1u | s4u | s5u | s8u | s12 | gnu | gpu
- action***
specifies the action taken upon path failure

Values	release-on-path-failure	specifies to release the S1u or S12 interface tunnels, that is, the UE goes into an IDLE state; after the release of the tunnels, the next downlink packet triggers paging
–	delete-on-path-failure	specifies to delete sessions or PDP contexts; available for the S4, S5, S8, Gn, and Gp interfaces

5.2.1.2.43 gx-before-aaa

Syntax

```
[no] gx-before-aaa
```

Context

```
config>mobile>pdn
```

Description

This command provides an alternative call flow where the initial Gx transaction happens before the AAA/RADIUS. This also means that the initial transaction does not include the IP address allocated for the UE, if the external dynamic allocation methods (RADIUS, LNS, and DHCP) are used. In these cases, the PCRF is notified about the allocated IP address via a separate transaction.

The no form of this command reverts to the default.

**NOTE:**

This command requires a PDN shutdown.

Default

```
no gx-before-aaa
```

5.2.1.2.44 ho-apn-lookup

Syntax

```
ho-apn-lookup {imsi-based-oi | ni-only}
```

```
no ho-apn-lookup
```

Context

```
config>mobile>pdn
```

Description

This command modifies the default design of the APN look up for HI=1 calls. The command allows the PGW/PGW-C to use the MCC+MNC information, extracted from the network-provided IMSI, in order to retrieve the OI and construct the full APN-NI+OI or make use of only the APN NI.

The no form of this command disables the construction of APN-NI+OI based on IMSI PLMN or the APN NI only approach.

Default

no ho-apn-lookup

Parameters

imsi-based-oi

specifies that the PGW/PGW-C replaces the incoming APN OI with the PLMN from IMSI to lookup for the already established call

ni-only

specifies the PGW/PGW-C uses only the incoming APN NI (ignore the OI) to lookup for the already established call

5.2.1.2.45 home-plmn-list

Syntax

home-plmn-list *list-name*

no home-plmn-list

Context

config>mobile>pdn

Description

This command configures the home Public Land Mobile Network (PLMN) list. This is used in comparing the newly acquired public land mobile network information with the roaming public mobile network table where roaming time is reduced by selectively registering a PLMN location only in a base station with a roaming function.

NOTE:

- This command requires a PDN shutdown.
- When you configure the nnrf-nfm client under the config>mobile>pdn>sba-service-realm context, this command accepts a PLMN list with a maximum of 32 entries.

Parameters

list-name

specifies the PLMN list name, up to 32 characters

5.2.1.2.46 i-upf-selection

Syntax

```
[no] i-upf-selection
```

Context

```
config>mobile>pdn
```

Description

This command enables the I-UPF selection as follows:

- the I-UPF is inserted when the anchor UPF cannot serve the TAI
- the I-UPF is removed when it cannot serve the current TAI and the anchor UPF can serve the TAI
- the I-UPF is changed when the anchor UPF and the current I-UPF cannot serve the TAI

The no command disables the I-UPF selection.

5.2.1.2.47 ims-emps-priority

Syntax

```
ims-emps-priority cp-dscp-marking [value] up-uplink qci-policy-name up-downlink qci-policy-name
```

```
ims-emps-priority
```

```
no ims-emps-priority
```

Context

```
config>mobile>pdn
```

Description

This command enables or disables the IMS eMPS priority. When enabled, the PCRF upgrades the PDN session and its bearers with eMPS priority or approves the PDN session with eMPS priority during the initial attach. This gives the PDN sessions/bearers a higher precedence against being throttled when the gateway is in an overload condition.

Optionally, this command also configures a specific DSCP transport marking value for eMPS sessions. When configured, any eMPS session packets on the transport are marked with the DSCP values specified for the CP DSCP marking on the S5-C and S11 reference points, and the DSCP value specified for the UP uplink and UP downlink on the S1-U, S5-U, and SGi reference points.

**NOTE:**

This command requires a PDN shutdown.

Default

ims-emps-priority

Parameters

value

specifies the IP DSCP/TOS value used for eMPS sessions

Values: 0 to 63

Default: 44

qci-policy-name

specifies the QCI policy name, configured in the config>mobile>profile>policy-options>qci-policy context, used for the uplink direction; up to 32 characters

up-downlink qci-policy-name

specifies the QCI policy name, configured in the config>mobile>profile>policy-options>qci-policy context, used for the downlink direction; up to 32 characters

5.2.1.2.48 imsi-plmn-list

Syntax

```
imsi-plmn-list list-name
```

```
no imsi-plmn-list
```

Context

```
config>mobile>pdn
```

Description

This command configures an IMSI PLMN list. The IMSI PLMN list defines the MNC length for certain operators not addressed by the ITU specifications.

**NOTE:**

- If a PLMN list is configured under the `home-plmn-list` command, it must not be configured under the `imsi-plmn-list` command (and the other way around) or any other application type, because changes on the fly are not supported for the `home-plmn-list` command. Therefore, if the same PLMN list is used for different application types then a change in the PLMN list will affect all.
- IMSI PLMN lists must be consistent across PDN instances; if not, list merging is applied.
- PLMN lists must be defined before the gateway goes live and should not be modified often. Modifying a PLMN list is allowed without shutting down the gateway. The affected sessions are terminated in the next Diameter transaction.

The no form of this command removes the list name from the configuration.

Parameters

list-name

specifies the PLMN list name, up to 32 characters

5.2.1.2.49 instance-type

Syntax

`instance-type instance-type-value`

`no instance-type`

Context

`config>mobile>pdn`

Description

This command configures the PDN instance as a 3GPP Control and User Plane Separation (CUPS) function.

The no form of this command will remove the instance from being configured as a CUPS instance.

**NOTICE:**

This command must not be executed on a live system. To change the instance type, use the shutdown command in the `config>mobile>pdn` context and then the `no shutdown` command under the same context to apply the change.

NOTE:

- This command must be configured prior to configuring any reference point interfaces.
- This command requires a PDN shutdown.

Default

no instance-type

Parameters

instance-type-value

specifies the function (control or user plane) of the gateway

Values	control	specifies the PDN instance as control plane function
–	user	specifies the PDN instance as user plane function

5.2.1.2.50 ipsmg-group

Syntax

ipsmg-group *ipsmg-group-id*
no ipsmg-group

Context

config>mobile>pdn

Description

This command associates an IPsec MG group with the ePDG.

NOTE:

This command requires a PDN shutdown.

Parameters

ipsmg-group-id

specifies the ID of the IPsec MG group to associate with the ePDG

Values: 1 to 8

5.2.1.2.51 mg-group-call-failure-rate

Syntax

```
mg-group-call-failure-rate call-failure-rate rate-percentage [monitor-time timer]
```

```
no mg-group-call-failure-rate
```

Context

```
config>mobile>pdn
```

Description

This command activates the monitoring of the call-failure-rate per MG group. If the call-failure-rate exceeds the configured value, and for time equal to monitor-time-before-action, the system proceeds with a switchover of the MG group. After the switchover, if the new active pod/node continues to report the same call-failure-rate figures, the MG group is set on a suspend status, and is not selected for new call requests.

After the MG group is instructed to switch over or suspend because of the call failure rate, a new alarm is generated that is cleared when the switchover or suspend operation is completed.

When the MG group is set on suspend state, a new critical alarm is generated. If all MG groups face call-failure-rate, all MG groups can be set under the suspend state. The new functionality does not support interworking with scale-in. The functionality is applicable to SMF and PGW-C type of gateways.

The no form of this command sets the call-failure-rate to value 0 (disabled).

NOTE:

- On a 1:1 MG group deployment scheme, if the standby card (node/pod) is not in hot standby status, the system performs a reboot on the failing card. After the reboot, if the issue persists, the system performs a card suspend according to the configured parameters of the rate percentage and the monitoring time.
- When an MG group is on suspend state, then this group can still be selected for new sessions of existing UEs that already have their sessions on the suspended group. This can lead to abnormal functionality for the new sessions. Therefore, Nokia recommends to use the `clear` commands to remove all sessions from the suspended group so that any new session is established over a non-suspended MG group.

Parameters

rate-percentage

specifies the call failure rate percentage

Values: 10 to 100

Default: 0

timer

specifies the time, in minutes, during which the system, when the failure rate is triggered, monitors continuously the call failure rate before generating the alarm

Values: 1 to 15

Default: 5

5.2.1.2.52 non3gpp-pdn-connection-rejection-with-ip

Syntax

```
non3gpp-pdn-connection-rejection-with-ip
```

Context

```
config>mobile>pdn
```

Description

This command enables the context to configure the ePDG to reject specific handover error case scenarios with SWu error code `pdn_connection_rejection` with an IP address included in the notification data field.

Default

disabled

5.2.1.2.53 handover-no-mip6-agent-info

Syntax

```
[no] handover-no-mip6-agent-info
```

Context

```
config>mobile>pdn>non3gpp-pdn-connection-rejection-with-ip
```

Description

This command rejects the handover when the ePDG does not receive the IP address with the MIP6 agent information or is missing the MIP6 agent information.

Default

no handover-no-mip6-agent-info

5.2.1.2.54 pgw-handover-response-cc64

Syntax

[no] pgw-handover - response-cc64

Context

config>mobile>pdn>non3gpp-pdn-connection-rejection-with-ip

Description

This command rejects the handover when the ePDG receives a cause code 64 on its S2b interface.

NOTE:

This command requires a PDN shutdown.

Default

no pgw-handover-response-cc64

5.2.1.2.55 nsmf-congestion-control

Syntax

[no] nsmf-congestion-control

Context

config>mobile>pdn

Description

This command enables the context to configure the Nsmf congestion control.

Default

no nsmf-congestion-control

5.2.1.2.56 enable-nsmf-congestion-control

Syntax

[no] enable-nsmf-congestion-control

Context

config>mobile>pdn>nsmf-congestion-control

Description

This command configures (when the max-activations per second threshold is reached) the SMF for any (non-emergency) subsequent Nsmf_PDUSession_SmContextCreateData or Nsmf_PDUSession_SmContextUpdateData to reject the request with HTTP 429 response including the error attribute/ProblemDetails set to NF_CONGESTION_RISK. If the HTTP header field Retry-After (in seconds) is also configured, this field will also be included in the HTTP 429 response.

The no form of this command disables the Nsmf NF congestion control toward the AMF.

Default

no enable-nsmf-congestion-control

5.2.1.2.57 max-activations

Syntax

max-activations *max-activations*

no max-activations

Context

config>mobile>pdn>nsmf-congestion-control

Description

This command configures the threshold of the maximum number of PDU connections or the maximum number of PDU activations per second for this DNN. The threshold is used for the Nsmf DNN NF congestion overload control. An alarm can be enabled or disabled to be sent when the maximum number of connections or the maximum number of activations is reached.

The no form of this command reverts to the default (disabled).

Default

no max-activations

Parameters

max-activations

specifies the maximum number of PDU activations per second

Values: 0 to 5000

Default: 0 (disabled)

5.2.1.2.58 retry-after-timer

Syntax

retry-after-timer *seconds*

no retry-after-timer

Context

config>mobile>pdn>nsmf-congestion-control

Description

This command configures the Retry-After field in the HTTP header of the 429 error respond when the max-activations threshold has been reached.

The no form of this command reverts to the default (disabled).

Default

no retry-after-timer

Parameters

seconds

specifies the retry timer in seconds

Values: 2 to 36000

Default: 0 (disabled)

5.2.1.2.59 nsmf-overload-control

Syntax

[no] nsmf-overload-control

Context

config>mobile>pdn

Description

This command enables the context to configure the Nsmf overload control.

Default

no nsmf-overload-control

5.2.1.2.60 enable-nsmf-overload-control

Syntax

[no] enable-nsmf-overload-control

Context

config>mobile>pdn>nsmf-overload-control

Description

This command configures the handling of node-level overload control toward the AMF.

This command configures (when the node-level overload threshold has been reached) an SNMP alarm to be triggered, and any (non-emergency) subsequent Nsmf_PDUSession_CreateSMContext with a PDU Session Establishment Create Request is rejected with an HTTP 503 response including the error attribute/ProblemDetails set to NF_CONGESTION. If the HTTP header field Retry-After (in seconds) is also configured, this field will also be included in the HTTP 503 response.

The no form of this command disables the handling of the Nsmf NF overload control toward the AMF.

Default

no enable-nsmf-overload-control

5.2.1.2.61 overload-threshold

Syntax

```
overload-threshold threshold-value  
no overload-threshold
```

Context

```
config>mobile>pdn>nsmf-overload-control
```

Description

This command configures the overload threshold value.

The no form of this command reverts to the default.

Default

no overload-threshold

Parameters

threshold-value

specifies the overload threshold value as a percent and when reached it triggers the Nsmf overload

Values: 50 to 97

Default: 92

5.2.1.2.62 retry-after-timer

Syntax

```
retry-after-timer seconds  
no retry-after-timer
```

Context

```
config>mobile>pdn>nsmf-overload-control
```

Description

This command configures the Retry-After field in the HTTP header of the 503 error respond when the node-level overload threshold has been reached.

The no form of this command reverts to the default (disabled).

Default

no retry-after-timer

Parameters

seconds

specifies the retry timer in seconds

Values: 2 to 36000

Default: 0 (disabled)

5.2.1.2.63 nswo-capable

Syntax

[no] nswo-capable

Context

config>mobile>pdn

Description

This command configures the system to run in Non-Seamless WLAN Offload (NSWO) mode.

NOTE:

This command requires a PDN shutdown.

Default

no nswo-capable

5.2.1.2.64 oi-override-mapping

Syntax

oi-override-mapping *list-name*

no oi-override-mapping

Context

```
config>mobile>pdn
```

Description

This command enables the ePDG to use the configured list of mapping pairs, between subscriber's PLMN ID (MCC/MNC) and PLMN ID replacement (MCC/MNC), to derive the Operator Identifier (OI) that will be used for constructing both the PGW DNS FQDN and the APN IE for the CSR toward the PGW. The list with the mapping pairs is configured in the `config>mobile>profile>list>oi-override-mapping` command. The `no` form of this command removes the override profile.

Parameters

list-name

specifies the list name, up to 32 characters

5.2.1.2.65 overload-control

Syntax

```
overload-control
```

Context

```
config>mobile>pdn
```

Description

This command enables the context to configure overload parameters used in GTP-C overload conditions.

5.2.1.2.66 cpu-sampling-interval

Syntax

```
cpu-sampling-interval [overload overload-interval] [overload-state-change ovrld-state-change-intvl] [no-overload no-overload-interval]  
no cpu-sampling-interval
```

Context

```
config>mobile>pdn>overload-control
```

Description

This command configures the CPU sampling interval window for the gateway node when the node state changes from:

- no overload to overload
- overload to different overload conditions (minor, major, and critical state)
- overload to no overload

The no form of this command returns the CPU sampling interval values to the default.

Parameters

overload-interval

specifies the CPU sampling period, in seconds, when transitioning from no overload to overload state

Values: 2 to 20

Default: 10

ovrld-state-change-intrvl

specifies the CPU sampling period, in seconds, when transitioning from overload to another overload state

Values: 2 to 20

Default: 2

no-overload-interval

specifies the CPU sampling period, in seconds, when transitioning from overload to no overload state

Values: 2 to 20

Default: 10

5.2.1.2.67 thresholds

Syntax

thresholds

Context

config>mobile>pdn>overload-control

Description

This command enables the context to configure the minor, major, and critical GTP-C overload thresholds.

**NOTE:**

The thresholds configured under this command are applicable for both the GTP-C and PFCP overload behaviors.

5.2.1.2.68 critical

Syntax

`critical threshold-value`

`no critical`

Context

`config>mobile>pdn>overload-control>thresholds`

Description

This command configures the threshold for the critical GTP-C overload level. For example, when the critical *threshold-value* is configured with value 97, the gateway reaches the critical GTP-C overload level when the gateway performance is between the configured major *threshold-value* and 97.

The no form of this command reverts to the default.

Default

no critical

Parameters

threshold-value

specifies the threshold value for the critical GTP-C overload level

Values: 50 to 97

Default: 97

5.2.1.2.69 major

Syntax

`major threshold-value`

`no major`

Context

config>mobile>pdn>overload-control>thresholds

Description

This command configures the threshold for the major GTP-C overload level. For example, when the major *threshold-value* is configured with value 92, the gateway reaches the major GTP-C overload level when the gateway performance is between the configured minor *threshold-value* and 92.

The no form of this command reverts to the default.

Default

no major

Parameters

threshold-value

specifies the threshold value for the major GTP-C overload level

Values: 50 to 97

Default: 92

5.2.1.2.70 minor

Syntax

minor *threshold-value*

no minor

Context

config>mobile>pdn>overload-control>thresholds

Description

This command configures the threshold for the minor GTP-C overload level. For example, when the minor *threshold-value* is configured with value 89, the gateway reaches the minor GTP-C overload level when the gateway performance is between 89 and the configured major *threshold-value*.

The no form of this command reverts to the default.

Default

no minor

Parameters

threshold-value

specifies the threshold for the minor GTP-C overload level

Values: 50 to 97

Default: 89

5.2.1.2.71 override-profile

Syntax

[no] override-profile *override-profile-id*

Context

config>mobile>pdn

Description

This command configures a non-default, group-specific reference point interface override profile for GTP-U redirection.

The no form of this command removes the override profile.

NOTE:

This command applies only to CMG.

Default

no override-profile

Parameters

override-profile-id

specifies the profile ID to configure MG group-specific reference point interfaces

Values: 1 to 32

5.2.1.2.72 override

Syntax

[no] override ref-point-type *ref-point-type* *ref-point-name* to override with *ref-point-name* to override with

override ref-point-type *ref-point-type* router *router-instance* to override interface-name to override with *router-instance* to override with interface-name to override with

no override ref-point-type *ref-point-type* router *router-instance* to override interface-name to override

Context

config>mobile>pdn>override-profile

Description

This command configures a non-default, group-specific reference point interface for each reference point interface type in an override profile.

The no form of this command removes the reference point specific interface from the override profile.

NOTE:

This command applies only to CMG.

Default

no override ref-point-type *ref-point-type* *ref-point-name* to override with *ref-point-name* to override with

no override ref-point-type *ref-point-type* router *router-instance* to override interface-name to override

Parameters

ref-point-type

specifies the reference point interface type for the override profile

Values: s11 | s12 | s1u | s4 | s5 | s8 | gn | gp | s2a-gtp | s2b | n3 | n9 | radius

ref-point-name to override

specifies the reference point that is overridden, up to 32 characters

ref-point-name-to override with

specifies the reference point used to override with, up to 32 characters

router-instance to override

specifies the router instance that is overridden

Values	router-name service-id	
–	router-name	Base
–	service-id	1 to 2147483647

Default: Base

router-instance to override with
specifies the router instance used to override with

Values	router-name service-id	
–	router-name	Base
–	service-id	1 to 2147483647

Default: Base

interface-name to override
specifies the interface name to override, up to 32 characters (must start with a letter)

interface-name to override with
specifies the interface name used to override with, up to 32 characters (must start with a letter)

5.2.1.2.73 pcf-pcrf-based-pcscf-allocation

Syntax

[no] pcf-pcrf-based-pcscf-allocation

Context

config>mobile>pdn

Description

This command enables the context to configure specific P-CSCF addresses to be sent to the UE, based on the PCRF/PCF peer that the PGW-C/SMF has communicated with.

The no form of this command deactivates the functionality and removes all entries.

5.2.1.2.74 entry

Syntax

```
entry entry-id apn apn-name {diameter-peer profile-name | nf-id uuid} {{pcscf-srvr-v4-group pcscf-group [secondary-pcscf-srvr-v4-group pcscf-group] [tertiary-pcscf-srvr-v4-group pcscf-group]} | {pcscf-srvr-v6-group pcscf-group [secondary-pcscf-srvr-v6-group pcscf-group] [tertiary-pcscf-srvr-v6-group pcscf-group]}}
```

```
no entry entry-id
```

Context

```
config>mobile>pdn>pcf-pcrf-based-pcscf-allocation
```

Description

This command configures specific P-CSCF addresses to be sent to the UE, based on the PCRF/PCF peer that the PGW-C/SMF has communicated with. Also, the command allows the creation of entries for these P-CSCF addresses. Each entry has one APN and per APN, there can be one Diameter Peer or NF ID entry.

One pcscf-srvr-v4-group and/or one pcscf-srvr-v6-group can be assigned in every Diameter Peer or NF ID, along with their optional secondary and tertiary groups. The P-CSCF server groups must be defined under the profile context, prior to associating it with a Diameter Peer or NF ID.

The no form of this command removes a specific entry ID configuration item.

Parameters

entry-id

specifies the entry ID for the PCF/PCRF based P-CSCF allocation

Values: 1 to 128

apn-name

specifies the APN name for matching the requested/received APN, up to 80 characters

profile-name

specifies the Diameter peer profile name, up to 32 characters

uuid

specifies the NF instance ID in UUIDv4 canonical textual representation

Values: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxxxx - [0..F]H

pcscf-group

specifies the name of the v4 or v6 P-CSCF server groups (primary, secondary, tertiary), up to 32 characters

5.2.1.2.75 pcmd

Syntax

[no] pcmd profile *profile-name*

Context

config>mobile>pdn

Description

This command configures a PCMD profile for the PDN (specified by the *gw-id*) which enables sending generated PCMD records.

The configured profile in this command is by default applied in all MG groups for this gw-id unless, one, more or all groups that have a different profile configured in the context config>mobile>system>group>pcmd.

The no form of this command clears the PCMD configuration and disables the ability to generate extended PCMD records (if enabled for the profile report type parameter) and streaming of PCMD records. Supported gateway types include SGW, PGW/GGSN, combined SGW/PGW/GGSN, and ePDG.

Default

no pcmd profile

Parameters

profile-name

specifies the PCMD profile for the PDN, up to 32 characters. The profile is configured in the config>mobile>profile>pcmd context.

5.2.1.2.76 pcscf-recovery

Syntax

[no] pcscf-recovery [*dns-cache-interval*] [*pco-reselection*]

Context

```
config>mobile>pdn
```

Description

This command enables the `pcscf-recovery` feature whereby the PGW will allocate a new set of P-CSCF addresses to the UE upon receiving the P-CSCF Restoration Required indication from the MME or SGW.

The PGW will choose the new set of P-CSCF addresses from the P-CSCF group. If the P-CSCF group uses an FQDN to configure the P-CSCF, the PGW will consult the DNS cache to determine the list.

By default, the DNS cache will respect the TTL given by the DNS server. However, if the DNS cache interval is specified, the PGW will use this time instead of that returned by DNS.

Default

no PCSCF recovery

Parameters

dns-cache-interval

specifies the time of the DNS cache interval, in seconds, instead of the time returned by DNS

Values: 10 to 3600

Default: 0

pco-reselection

specifies whether the P-CSCF Re-selection value must be used from Protocol Configuration Options (PCO)

If the keyword is used, the PGW uses the `pco-reselection` support from the PCO container. If the keyword is not used, the PGW assumes the `pco-reselection` support for UE

5.2.1.2.77 *pco-option*

Syntax

```
pco-option
```

Context

```
config>mobile>pdn
```

```
config>mobile>pdn>apn
```

Description

This command enables the context to configure UE PCO options.

5.2.1.2.78 max-allocated-pcscf-addresses

Syntax

```
max-allocated-pcscf-addresses number  
no max-allocated-pcscf-addresses
```

Context

```
config>mobile>pdn>pco-option
```

Description

This command sets the maximum number of P-CSCF addresses that will be included in the Protocol Configuration Options. The actual number of P-CSCF addresses included will depend on the number of addresses listed explicitly in the pcscf-group or resolved from DNS using the FQDN. In other words, if the list contains less than the number specified by this command the PCO will allocate only the number of addresses in the list. If the list contains more than max-allocated-addresses, the system will load-balance the allocation of addresses from the list.

Parameters

number

specifies the maximum number of addresses sent to the PCO

Values: 1 to 3

Default: 1

5.2.1.2.79 pfcf-node-id-type

Syntax

```
pfcf-node-id-type {fqdn | ip} [ip-type {ipv4 | ipv6}]  
no pfcf-node-id-type
```

Context

```
config>mobile>pdn
```

Description

This command configures the PFCF node ID as an FQDN or IPv4/IPv6 address type.

The no form of this command specifies to use the default node ID type for the Sx/N4 interface.

**NOTE:**

This command requires a PDN shutdown.

Parameters

fqdn

specifies the PFCP node ID as an FQDN type and the FQDN to be sent is the one configured under the `config>mobile>pdn>epc-node` command

ip

specifies the PFCP node ID as an IP address type and the IP address to be sent is the one configured for the Sx/N4 interface

Default: fqdn

ipv4

specifies to use the IPv4 address for the PFCP node ID when dual stack is configured on the Sx-N4 reference point interface

ipv6

specifies to use the IPv6 address for the PFCP node ID when dual stack is configured on the Sx-N4 reference point interface

Default: ipv4

**NOTE:**

If dual stack is configured on the Sx-N4 reference point interface and the `pfc-node-id-type` is set with IP address, then the IPv4 or IPv6 address must also be configured.

**NOTICE:**

- The `pfc-node-id-type` command must not be executed on a live system.
- Use the shutdown command in the `config>mobile>pdn` context before changing the node ID type for the Sx/N4 interface. Use the `no shutdown` command under the same context to apply the change.

5.2.1.2.80 pfc-cp-router-adv

Syntax

[no] `pfc-cp-router-adv` [`application-id` *application-id-name*]

Context

```
config>mobile>pdn
```

Description

This command enables handling of ICMPv6 RS/RA and NS/NA messages on the CP function.

When the application ID option is configured, this command configures the CP function to instruct the UP function to use a predefined policy-rule-unit-name with SDF filters to detect ICMPv6 RS/RA and NS/NA messages, and DHCPv6 messages for APNs configured with DHCP service enabled. The application ID sent in the Create PDR > PDI > Application IE defines the policy-rule-unit-name.

When the application ID option is used, this command configures the application ID on the UP function. The UP function associates the application ID with the policy-rule-unit-name and the predefined SDFs/flow-descriptions that define how to detect ICMPv6 RS/NS (and DHCPv6) messages. See also the flow-description command in the config>mobile>profile>policy-options>policy-rule-unit context.

The no form of this command reverts to not handling any ICMPv6 RS/RA, NS/NA and DHCP messages directly on the CP function via the UP function.

NOTE:

- This functionality also uses the interface realm configured in the config>mobile>pdn>sx-n4>interface>gtp-u context, a PFCP-u tunnel reattempt timer configured in the config>mobile>profile>pfcpc>pfcpc-profile>pfcpc-u-tunnel context, and the maximum and minimum advertisement intervals configured in the config>mobile>pdn>apn>router-advertisements context.
- For systems using ICR, this functionality requires data synchronization between the master and the slave nodes in the MC-mobile redundancy. This is configured using the mc-complete-ue-sync command in the config>redundancy>multi-chassis>peer>mc-mobile context.
- When the application ID option is not used, this command should not be enabled on the UP function.

Default

```
no pfcpc-cp-router-adv
```

5.2.1.2.81 reattach-timeout

Syntax

```
reattach-timeout timeout
```

```
no reattach-timeout
```

Context

config>mobile>pdn

Description

This command defines the timeout for the reattach call flow. If the call flow is aborted, Cause code 94 is used in the Create Session Response message.

The no form of this command reverts the timeout to the default.

Default

no reattach-timeout

Parameters

timeout

specifies the value for the reattach call flow, in seconds

Values: 4 to 20

Default: 20

5.2.1.2.82 relax-msb-check-on-path-management-messages

Syntax

[no] relax-msb-check-on-path-management-messages

Context

config>mobile>pdn

Description

This command relaxes the check of the Most Significant Bit (MSB) of the Sequence Number (SN) field in the GTP-C header for path management messages. Even if the mobile gateway receives a GTP Echo Request with the MSB set to 1, the request is not discarded and the connection is kept alive.

NOTE:

This command is only applicable to GTPv2-C and not GTPv1.

Default

no relax-msb-check-on-path-management-messages

5.2.1.2.83 reserve-default-gateway-address

Syntax

[no] reserve-default-gateway-address

Context

config>mobile>pdn

Description

This command enables the reserved default gateway IP address option. When enabled for the TWAG, the address pool manager will reserve a single IP address for each prefix in the IP local pools from which it allocates IP addresses. The reserved IP address for a prefix is sent as the default gateway address for all sessions with IP addresses allocated from that prefix. The default gateway address for each prefix is automatically set to the last IP address in the prefix (except for the x.y.z.255 IP address). For example, for local pool IP address 10.1.0.0/16, the default gateway IP address will be 10.1.255.254.

**NOTE:**

This command requires a PDN shutdown.

Default

no reserve-default-gateway-address

5.2.1.2.84 seamless-wlan-handover

Syntax

[no] seamless-wlan-handover

Context

config>mobile>pdn

config>mobile>pdn>apn

Description

This command enables seamless handover of a UE that is connected to the PGW/GGSN via a WLAN gateway (for example, WiFi access) and moving over to 2G/3G access. Handover between WiFi and 2G/3G access will

be seamless only when the PDN connection over both access interfaces is established to the same PGW/GGSN node.

If this command is configured to the default at the APN level, the value configured for the gateway instance level is inherited.

If this command is disabled, the UE is re-attached on the PGW/GGSN during the handover from WiFi to 2G/3G access.

**NOTE:**

This command requires a PDN shutdown.

Default

seamless-wlan-handover

5.2.1.2.85 send-mbr-for-bbai

Syntax

```
[no] send-mbr-for-bbai
```

Context

```
config>mobile>pdn
```

Description

This command configures the ePDG to send a modify bearer request if the UE local IP address or UE UDP port changes. This is related to the Broadband Access Interworking (BBAI) function described by 3GPP.

The no form of this command specifies that the ePDG will not send a modify bearer request if the UE local IP address or UE UDP port changes.

Default

no send-mbr-for-bbai

5.2.1.2.86 send-mbr-for-bbai-emergency

Syntax

```
[no] send-mbr-for-bbai-emergency
```

Context

```
config>mobile>pdn
```

Description

This command configures the ePDG to send a modify bearer request for an emergency call if the UE local IP address, the UE UDP port, or the WLAN location information changes.

The no form of this command specifies that the ePDG does not send a modify bearer request for emergency calls, if the UE local IP address, the UE UDP port, or the WLAN location information changes.

NOTE:

This command requires a PDN shutdown.

Default

```
send-mbr-for-bbai-emergency
```

5.2.1.2.87 serving-node-for-combo-sessions

Syntax

```
serving-node-for-combo-sessions {mme | sgw}
```

```
no serving-node-for-combo-sessions
```

Context

```
config>mobile>pdn
```

Description

This command selects the IP address that the PGW sends as the serving node IP address to various interfaces for combined SGW/PGW sessions.

The no form of this command reverts to the default (that is, using the existing behavior of sending the MME IP address as the serving node).

NOTE:

This command can be re-configured at any time. When the IP address is changed, the next message sent out to the peer will reflect the changed address.

Default

no serving-node-for-combo-sessions

Parameters

mme

the PGW sends the MME IP address

sgw

the PGW sends the SGW IP address

Default: mme

5.2.1.2.88 session-deletion-rate

Syntax

session-deletion-rate *session-deletion-rate*

no session-deletion-rate

Context

config>mobile>pdn

Description

This command sets the maximum rate at which sessions are deleted from each MSCP group when a massive session deletion is triggered from CLI or automatically from the gateway. The configured session deletion rate is treated by the system as the maximum rate to be applied, not as the enforced rate for the session deletion.

The no form of this command reverts to the default.

Parameters

session-deletion-rate

specifies the number of sessions that are deleted per second from each MSCP group, and is treated as the maximum rate to be applied, not as the enforced rate for the session deletion

Values: 2 to 2048

Default: 512

5.2.1.2.89 session-restoration-rate

Syntax

```
session-restoration-rate session-restoration-rate  
no session-restoration-rate
```

Context

```
config>mobile>pdn
```

Description

This command sets the restoration rate of sessions per MSCP group per second when the system initiates session restoration to another PGW-C/SMF. The configured session restoration rate is the maximum rate that the mobile gateway applies and not the enforced rate for the session restoration.

The no form of this command reverts to the default.

Parameters

session-restoration-rate

specifies the maximum number of sessions that are restored per second from each MSCP group

Values: 2 to 2048

Default: 512

5.2.1.2.90 slices

Syntax

```
slices
```

Context

```
config>mobile>pdn
```

Description

This command enables the context to configure a slice list or a slice instance list that the SMF or the UPF supports.

5.2.1.2.91 slice-instance-list

Syntax

```
slice-instance-list list-name  
no slice-instance-list
```

Context

```
config>mobile>pdn>slices
```

Description

This command configures the slice instances that the SMF or the UPF supports.

The no form of this command reverts to the default.

Default

```
no slice-instance-list
```

Parameters

list-name

specifies the name of the slice instance list, up to 32 characters; the slice instance list is configured using the config>mobile>profile>list>slice-instance-list command

5.2.1.2.92 slice-list

Syntax

```
slice-list list-name  
no slice-list
```

Context

```
config>mobile>pdn>slices
```

Description

This command configures the slices that the SMF or the UPF supports.

The no form of this command reverts to the default.

Default

no slice-list

Parameters

list-name

specifies the name of the slice list, up to 32 characters; the slice list is configured using the `config>mobile>profile>list>slice-list` command

5.2.1.2.93 supported-vendor

Syntax

supported-vendor {custom-1 | custom-2 | custom-3}

no supported-vendor

Context

config>mobile>pdn

Description

This command configures the vendor number for which vendor-specific customizations are supported. Each number represents a specific customer.

The no form of this command reverts to the default.

NOTE:

This command requires a PDN shutdown.

Parameters

custom-1

specifies the customer-1 customer

custom-2

specifies the customer-2 customer

custom-3

specifies the customer-3 customer

Default: no customer

5.2.1.2.94 suspend

Syntax

[no] suspend

Context

config>mobile>pdn

Description

This command sets the gateway to a suspended state. While in a suspended state, the gateway rejects new sessions from being established, while continuing to serve existing sessions. In general, CSReq with zero-TEID are rejected.

All session management and mobility management procedures are served normally for existing UEs on the PGW. CSReq with zero-TEID and HI are accepted on the PGW.

No new sessions are accepted on the ePDG. For more information, refer to section *Gateway Suspend State*, in the *7750 SR MG and CMG Configuration Guide*.

All session management procedures on the SGW are served. CSReq with zero-TEID and HI are rejected on the SGW.

The no form of this command removes the gateway instance from the suspended state.

Default

no suspend

5.2.1.2.95 transit-sub

Syntax

transit-sub

Context

config>mobile>pdn

config>mobile>pdn>apn

Description

This command enables the context to create transit subscribers.

5.2.1.2.96 attach-response-wait-timer

Syntax

```
attach-response-wait-timer seconds  
no attach-response-wait-timer
```

Context

```
config>mobile>pdn>transit-sub  
config>mobile>pdn>apn>transit-sub
```

Description

This command configures the response wait time from the RADIUS server to create the subscriber context. If no response is received from the RADIUS server before the wait time expires, the subscriber context creation is put on hold.

NOTE:

This command requires a PDN shutdown, when used in the config>mobile>pdn>transit-sub context.

Default

```
no attach-response-wait-timer
```

Parameters

seconds

specifies the response wait time, in seconds

Values: 3 to 60

Default: 10

5.2.1.2.97 attach-retry-hold-timer

Syntax

```
attach-retry-hold-timer seconds  
no attach-retry-hold-timer
```

Context

```
config>mobile>pdn>transit-sub
```

```
config>mobile>pdn>apn>transit-sub
```

Description

This command configures the hold time before a subscriber context for a source IP address is initiated again after an initial failure.

NOTE:

This command requires a PDN shutdown, when used in the `config>mobile>pdn>transit-sub` context.

Default

no attach-retry-hold-timer

Parameters

seconds

specifies the hold time, in seconds

Values: 1 to 300

Default: 30 (disabled)

5.2.1.2.98 data-triggered

Syntax

```
[no] data-triggered
```

Context

```
config>mobile>pdn>transit-sub
```

```
config>mobile>pdn>apn>transit-sub
```

Description

This command enables the creation of transit subscribers using data trigger.

NOTE:

This command requires a PDN shutdown, when used in the `config>mobile>pdn>transit-sub` context.

Default

no data-triggered

5.2.1.2.99 twag-samog-radius-accounting

Syntax

`twag-samog-radius-accounting radius-group`

`no twag-samog-radius-accounting`

Context

`config>mobile>pdn`

Description

This command enables RADIUS accounting, using a specific RADIUS group, in TWAG SaMOG mode.

NOTE:

This command requires a PDN shutdown.

Default

no twag-samog-radius-accounting

Parameters

radius-group

specifies the name of a RADIUS group

5.2.1.2.100 ue-cleanup-on-delete

Syntax

`ue-cleanup-on-delete {enable | disable}`

`no ue-cleanup-on-delete`

Context

config>mobile>pdn

Description

This command enables or disables the cleanup of all the UE sessions when a delete request is received for any session for that UE. The cleanup of the UE sessions must be enabled while performing in-service migration to CUPS architecture so that overload during CUPS migration can be avoided.

The no form of this command reverts to the default (disable).

Default

no ue-cleanup-on-delete

Parameters

enable

enables the cleanup of UE sessions

disable

disables the cleanup of UE sessions

Default: disable

5.2.1.2.101 umts-qos-policy

Syntax

umts-qos-policy *umts-qos-policy*

no umts-qos-policy

Context

config>mobile>pdn

Description

This command specifies the name of Universal Mobile Telecommunications System (UMTS) Quality of Service (QoS) Policy on this Access Point Name (APN).

NOTE:

This command requires a PDN shutdown.

Parameters

umts-qos-policy

specifies the UMTS QoS policy on this APN, up to 32 characters

5.2.1.2.102 up-function-feature-options

Syntax

up-function-feature-options

Context

config>mobile>pdn

Description

This command enables the context to configure the bits in the UP Function Features IE. The UP function sends the UP Function Features IE in the PFCP association setup and update procedures.

5.2.1.2.103 exclude-adpdp

Syntax

[no] exclude-adpdp

Context

config>mobile>pdn>up-function-feature-options

Description

This command clears the ADPDP bit (7/2) in the UP Function Features IE (not set). Use this command in interoperability case scenarios where the CP function does not expect that the ADPDP bit in the UP Function Features IE is set.

The no form of this command reverts the ADPDP bit to the default (set).

NOTE:

- Regardless of the value of this bit, the Nokia UP function supports ADPDP.
- In a non-interoperability case (that is, when connected to the Nokia CP function), the ADPDP bit is set (no exclude-adpdp).

Default

no exclude-adpdp

5.2.1.2.104 exclude-dlbd

Syntax

[no] exclude-dlbd

Context

config>mobile>pdn>up-function-feature-options

Description

This command clears the DLBD bit (5/3) in the UP Function Features IE (not set). Use this command in interoperability case scenarios where the CP function does not expect that the DLBD bit in the UP Function Features IE is set.

The no form of this command reverts the DLBD bit to the default (set).

NOTE:

- Regardless of the value of this bit, the Nokia UP function supports DLBD.
- In a non-interoperability case (that is, when connected to the Nokia CP function), the DLBD bit is set (no exclude-dlbd).

Default

no exclude-dlbd

5.2.1.2.105 exclude-dpdra

Syntax

[no] exclude-dpdra

Context

config>mobile>pdn>up-function-feature-options

Description

This command clears the DPDRA bit (7/1) in the UP Function Features IE (not set). Use this command in interoperability case scenarios where the CP function does not expect that the DPDRA bit in the UP Function Features IE is set.

The no form of this command reverts the DPDRA bit to the default (set).

NOTE:

- Regardless of the value of this bit, the Nokia UP function supports DPDRA.
- In a non-interoperability case (that is, when connected to the Nokia CP function), the DPDRA bit is set (no exclude-dpdra).

Default

no exclude-dpdra

5.2.1.2.106 exclude-frrt

Syntax

[no] exclude-frrt

Context

config>mobile>pdn>up-function-feature-options

Description

This command clears the FRRT bit (6/6) in the UP Function Features IE (not set). Use this command in interoperability case scenarios where the CP function does not expect that the FRRT bit in the UP Function Features IE is set.

The no form of this command reverts the FRRT bit to the default (set).

NOTE:

- Regardless of the value of this bit, the Nokia UP function supports FRRT.
- In a non-interoperability case (that is, when connected to the Nokia CP function) with Framed Routing enabled in the CP function, the FRRT bit is set (no exclude-frrt). If the FRRT bit is not set, the Nokia CP function with Framed Routing enabled does not use Framed Routing toward the UP function.

Default

no exclude-frrt

5.2.1.2.107 exclude-heeu

Syntax

[no] exclude-heeu

Context

config>mobile>pdn>up-function-feature-options

Description

This command clears the HEEU bit (5/7) in the UP Function Features IE (not set). Use this command in interoperability case scenarios where the CP function does not expect that the HEEU bit in the UP Function Features IE is set.

The no form of this command reverts the HEEU bit to the default (set).

NOTE:

- Regardless of the value of this bit, the Nokia UP function supports HEEU.
- In a non-interoperability case (that is, when connected to the Nokia CP function), the HEEU bit is set (no exclude-heeu).

Default

no exclude-heeu

5.2.1.2.108 exclude-pdiu

Syntax

[no] exclude-pdiu

Context

config>mobile>pdn>up-function-feature-options

Description

This command clears the PDIU bit (6/2) in the UP Function Features IE (not set). Use this command in interoperability case scenarios where the CP function does not expect that the PDIU bit in the UP Function Features IE is set.

The no form of this command reverts the PDIU bit to the default (set).

NOTE:

- Regardless of the value of this bit, the Nokia UP function supports PDIU.
- In a non-interoperability case (that is, when connected to the Nokia CP function) with PDI optimized signaling enabled in the CP function, the PDIU bit is set (no exclude-pdiu). If the PDIU bit is not set, the Nokia CP function with PDI optimized signaling enabled does not use PDI optimized signaling toward the UP function.

Default

no exclude-pdiu

5.2.1.2.109 exclude-ueip

Syntax

[no] exclude-ueip

Context

config>mobile>pdn>up-function-feature-options

Description

This command clears the UEIP bit (7/3) in the UP Function Features IE (not set). Use this command in interoperability case scenarios where the CP function does not expect that the UEIP bit in the UP Function Features IE is set.

The no form of this command reverts the UEIP bit to the default (set).

Default

no exclude-ueip

5.2.1.2.110 up-peer-list

Syntax

```
up-peer-list list-name  
no up-peer-list
```

Context

```
config>mobile>pdn
```

Description

This command associates a UP peer selection list to the specific CP.

The no form of this command removes the association.

**NOTE:**

- This parameter is only used when the gateway is configured as a CP function using the `mobile>config>pdn>instance-type` command.
- This command requires a PDN shutdown.

Parameters

list-name

specifies the list name, up to 32 characters

5.2.1.2.111 up-selection

Syntax

```
up-selection
```

Context

```
config>mobile>pdn
```

Description

This command enables the context to configure a UP selection profile on the CP network instance.

5.2.1.2.112 pgw-ggsn-u-client-profile

Syntax

```
pgw-ggsn-u-client-profile client-profile-name  
no pgw-ggsn-u-client-profile
```

Context

```
config>mobile>pdn>up-selection
```

Description

This command configures the PGW-U and GGSN-U selection policy. The client profile is applied for PGW-U and GGSN-U node selection on the CP.

The no form of this command removes the node selection policy for PGW-U and GGSN-U.

Parameters

client-profile-name

specifies the client profile name, up to 32 characters

5.2.1.2.113 sgw-u-client-profile

Syntax

```
sgw-u-client-profile client-profile-name  
no sgw-u-client-profile
```

Context

```
config>mobile>pdn>up-selection
```

Description

This command configures the SGW-U selection policy. The client profile is applied for SGW-U node selection on the CP.

The no form of this command removes the node selection policy for SGW-U.

Parameters

client-profile-name

specifies the client profile name, up to 32 characters

5.2.1.2.114 update-bearer-request-for-mvno

Syntax

```
update-bearer-request-for-mvno {enable | disable}  
no update-bearer-request-for-mvno
```

Context

```
config>mobile>pdn
```

Description

This command enables or disables handling the bearer modification with the bearer QoS update functionality that is initiated from an MVNO PGW. This command requires supported-vendor customizations, that is, the command applies only when the *custom-2* parameter is enabled in the config>mobile>pdn>supported-vendor context.

The no form of this command disables the functionality.

Parameters

enable

specifies that an Update Bearer Request message from an MVNO PGW is transparently forwarded to the MME

disable

specifies that an Update Bearer Request message from an MVNO PGW is rejected
Default: disable

5.2.1.2.115 upf-acct-profile

Syntax

```
upf-acct-profile profile-id  
no upf-acct-profile
```

Context

```
config>mobile>pdn
```

Description

This command configures a CUPS UP function PDN gateway with the specified UP function profile. If a profile is also configured in the APN context, the profile under the APN takes precedence.

The no form of this command removes the profile from the PDN configuration.

Parameters

profile-id

specifies the profile ID of the UP function account, configured in the config>mobile>profile>charging context

Values: 0 to 255

Default: 0

5.2.1.2.116 url-encryption

Syntax

```
url-encryption {aes-cbc-128} passphrase string [hash | hash2]
```

```
no url-encryption
```

Context

```
config>mobile>pdn
```

Description

This command enables URL encryption for the UP function PDN gateway in 4G CUPS deployments. It also specifies the AES CBC 128 encryption type and optional passphrase to encrypt fields in the URL sent back to the UE for 302 redirect. This is used only when the URL is specified by the OCS.

NOTE:

The URL encryption configuration depends on the HTTP traffic redirection scenarios:

- for Gy charging response FUI Action Redirect:
 - in CUPS scenarios, URL encryption is based on the url-encryption command (configured for the UP PDN) in the config>mobile>pdn context
 - in non-CUPS scenarios, URL encryption is based on the url-encryption command in the config>mobile>profile>dcca context
- for Gy charging response with FUI Action Restrict and a filter ID PRB, URL encryption is based on the http-redirect and encryption options in the config>mobile>profile>policy-

options>action-rule-unit>gy-filter-id-action context, in CUPS and non-CUPS scenarios

- for Gx policy-rule based redirection, URL encryption is based on the http-redirect and encryption options in the config>mobile>profile>policy-options>policy-rule-unit>flow-gate-status context, in CUPS and non-CUPS scenarios

The no form of this command reverts to the default (disabled).

Default

no url-encryption

Parameters

aes-cbc-128

specifies AES CBC 128-bit encryption

string

encryption passphrase string, up to 64 characters

hash

specifies that the key is entered in an encrypted form

hash2

specifies that the key is entered in a more complex encrypted form

5.2.1.2.117 user-plane-sync-for-delete-bearer

Syntax

[no] user-plane-sync-for-delete-bearer

Context

config>mobile>pdn

Description

This command configures the control plane to wait for the user plane acknowledgment (de-programming the cross connect) prior to sending a delete bearer response for a UE-initiated bearer termination. For network-initiated bearer termination, the delete bearer signaling message and user plane cross connect deprogramming occur in parallel.

The no form of this command reverts to the default (disabled).

Default

no user-plane-sync-for-delete-bearer

5.2.1.2.118 vsmf-profile

Syntax

vsmf-profile *profile-name*

no vsmf-profile

Context

config>mobile>pdn

config>mobile>pdn>apn

Description

This command associates a V-SMF profile to the APN for LBO. The V-SMF profile under the PDN context is used in home-routed roaming.

The no form of this command removes the V-SMF profile association.

Parameters

profile-name

specifies a V-SMF profile name, up to 32 characters

5.2.1.2.119 wlan-emergency

Syntax

wlan-emergency *profile-name*

no wlan-emergency

Context

config>mobile>pdn

Description

This command assigns a unique wlan-emergency profile under a specific PDN and activates the emergency call function support on the ePDG.

The no form of this command removes the wlan-emergency profile from a specific PDN container and deactivates the emergency call support function from ePDG.

**NOTE:**

The no form of this command requires a PDN shutdown.

Parameters

profile-name

specifies a profile name, up to 32 characters

5.2.1.2.120 wps-profile

Syntax

wps-profile *profile-name*

no wps-profile

Context

config>mobile>pdn

Description

This command enables the Multimedia Priority Service (MPS) or Wireless Priority Service (WPS) configured using the wps-profile command under the config>mobile>profile context.

The no form of this command disables the WPS profile.

**NOTICE:**

You must not configure both the config>mobile>pdn>wps-profile and the config>mobile>pdn>ims-emps-priority commands. The CMG eMPS can be configured either as WPS (4G and 5G) or as eMPS (4G only).

The ims-emps-priority is enabled by default. Therefore, to enable the wps-profile, you must first disable the ims-emps-priority.

**NOTE:**

The WPS statistics and KPIs are displayed as eMPS sessions.

Parameters

profile-name

specifies the WPS profile name, up to 32 characters

5.2.1.3 APN PDN command descriptions

5.2.1.3.1 aa-divert-per-bearer-qci-list

Syntax

aa-divert-per-bearer-qci-list *qci-list*

no aa-divert-per-bearer-qci-list

Context

config>mobile>pdn>apn

Description

This command enables bearer traffic diversion to AA according to the bearer's QCI. When the QCI value of the bearer matches to a QCI value in the list, all bearer traffic is diverted to AA. When more than one bearer per session is diverted to AA, only one bearer can have AA rules installed.

The QCI list is configured in the config>mobile>profile>list>qci-list context. If there are no QCI values configured in the list, the default behavior applies, where only one bearer can be diverted to AA.

The no form of this command allows only one bearer to be diverted to AA.

Default

no aa-divert-per-bearer-qci-list

Parameters

qci-list

specifies the QCI list name, up to 32 characters

5.2.1.3.2 access-type

Syntax

[no] access-type *access-type*

Context

config>mobile>pdn>apn

Description

This command is used to specify a Radio Access Type (RAT), under an APN context, to associate a QoS profile for the specified RAT.

The no form of this command removes the specified access type.

Parameters

access-type

specifies the access type

Values: eutran | wlan | eutran-nb-iot | ehrrpd | utran | geran | gan | hspa-e

5.2.1.3.3 default-qos-profile

Syntax

default-qos-profile *profile-name*

no default-qos-profile

Context

config>mobile>pdn>apn>access-type

Description

This command is used to associate a QoS profile for the RAT specified for the access - type command. The specified QoS profile is applied to a session that goes into Assume Positive mode.

NOTE:

The specified QoS profile can also be applied when the PCC is disabled (for example, when the PCRF is not deployed).

The no form of this command removes the associated QoS profile for this access type.

Parameters

profile-name

specifies the name of the default QoS profile, configured under the

config>mobile>profile>qos-profile context, up to 32 characters

5.2.1.3.4 accounting

Syntax

```
accounting type radius username {imsi | msisdn | pco | pco-no-apn | imsi-apn | msisdn-  
apn} server-group server-group [suppress-imsi]  
  
no accounting
```

Context

```
config>mobile>pdn>apn
```

Description

This command configures the accounting type username and server group.

Parameters

type

specifies the accounting type used for accounting from an AAA server

Values	radius	specifies that the RADIUS accounting type is used for accounting from an AAA server
--------	--------	---

user-name

specifies the username used in accounting requests sent to an AAA server

Values	imsi	sets the username attribute to the IMSI
–	msisdn	sets the username attribute to the MSISDN
–	pco	sets the username attribute to the value received in the PCO
–	pco-no-apn	sets the username attribute to the value received in the PCO, but with special logic to include only the username part from the username@APN format;

this parameter is used together with the virtual APN selection based on the PCO feature, although there is no direct dependency. The parameter works only when the APN that exists in the PCO username (user@APN) is the current APN under which RADIUS accounting is performed

- | | | |
|---|------------|---|
| – | imsi-apn | sets the username attribute to the IMSI@APN |
| – | msisdn-apn | sets the username attribute to the MSISDN@APN |

Default: imsi

server-group

specifies the name of a RADIUS group or Diameter group

suppress-imsi

specifies that the 3GPP-IMSI attribute is not included

NOTE:

RADIUS accounting can be enabled or disabled on the fly (without service impact). The enabling and disabling can be combined with new or different values for server-group/user-name and so on, on the fly without shutdown. The new or changed values will only take effect for the new sessions. Old sessions should still use accounting as per the old parameters. Accounting enabled with new parameters does not disable the accounting for the old parameters since the it is still enabled under the APN (only the values have changed.)

When the accounting is disabled under the APN, the mobile gateway stops to send accounting messages (interims/stops). Re-enabling the accounting will only affect new sessions. The system still continues not to send accounting messages for old sessions. The only exception is in cases where there are no interim messages during disabling and enabling the accounting.

5.2.1.3.5 duplicate-server-group

Syntax

[no] duplicate-server-group *group-name*

Context

config>mobile>pdn>apn>accounting

Description

This command names a server group that is used for duplicate accounting. The PGW/GGSN sends the Accounting-Requests (Start, Stop, and Interim) separately to each duplicate server group, one message per group.

NOTE:

- This command requires an APN shutdown.
- Multiple duplicate server groups may be configured (up to 7).

Parameters

group-name

specifies the unique name of this duplicate RADIUS accounting server group, up to 32 characters

5.2.1.3.6 selective-radius-accounting

Syntax

[no] selective-radius-accounting

Context

config>mobile>pdn>apn>accounting

Description

This command enables selective RADIUS accounting. When enabled RADIUS accounting will only start for a UE if traffic from the UE is detected destined for any of the configured destination IP addresses.

NOTE:

When selective radius accounting is enabled the local charging-rule-unit and policy-rule-unit commands must also be configured under the config>mobile>profile>policy-options context.

5.2.1.3.7 accounting-priority

Syntax

```
accounting-priority profile-name  
no accounting-priority
```

Context

```
config>mobile>pdn>apn
```

Description

This command specifies the accounting priority profile used for this APN.

The no form of this command removes this configuration.

Default

```
no accounting-priority
```

Parameters

profile-name

specifies an existing accounting priority profile name, up to 32 characters

5.2.1.3.8 acct-fixed

Syntax

```
acct-fixed user-name long-description-string  
no acct-fixed
```

Context

```
config>mobile>pdn>apn
```

Description

This command configures the username when accounting is fixed.

The no form of this command removes this configuration.

Parameters

long-description-string

specifies the username, up to 32 characters

5.2.1.3.9 aggr-rate-dl

Syntax

```
aggr-rate-dl aggregate-rate-downlink  
no aggr-rate-dl
```

Context

```
config>mobile>pdn>apn
```

Description

This command configures the APN aggregate downlink rate.

The no form of this command removes the rate from the configuration.

Parameters

aggregate-rate-downlink

specifies the APN aggregate downlink rate in kb/s

Values: 0 to 25000000

Default: 0

5.2.1.3.10 aggr-rate-ul

Syntax

```
aggr-rate-ul aggregate-rate-uplink  
no aggr-rate-ul
```

Context

```
config>mobile>pdn>apn
```

Description

This command configures the APN aggregate uplink rate.

The no form of this command removes the rate from the configuration.

Parameters

aggregate-rate-uplink

specifies the APN aggregate uplink rate in kb/s

Values: 0 to 250000000

Default: 0

5.2.1.3.11 allow-always-on

Syntax

[no] allow-always-on

Context

config>mobile>pdn>apn

Description

This command enables always-on PDU sessions in the APN/DNN. When enabled, the SMF accepts the request for an always-on PDU session in the PDU session establishment request message.

The no form of this command reverts to the default (disabled).

Default

no allow-always-on

5.2.1.3.12 allow-dangling-rule-ded-bearer

Syntax

[no] allow-dangling-rule-ded-bearer

Context

config>mobile>pdn>apn

Description

This command enables dedicated bearers to be created for dynamic rules that are left dangling with a previous QCI/ARP, as a result of default bearer QCI/ARP modification. QCI/ARP changes of a default bearer with wildcard QCI/ARP PRB are supported. QCI/ARP modifications can be a result of handovers including 3G/4G, Wi-Fi/LTE, and so on, initiated by the PCRF, triggered as result of a handover with an MB command,

or initiated by the HSS. If dynamic rules end up with a previous QCI/ARP as a result of the QCI/ARP change, the PCRF is notified that these rules have been removed.

The no form of this command reverts to the default.

Default

no allow-dangling-rule-ded-bearer

5.2.1.3.13 allow-emergency

Syntax

```
allow-emergency [emergency-profile profile-name]  
no allow-emergency
```

Context

```
config>mobile>pdn>apn
```

Description

This command configures the APN as an emergency APN. This allows emergency PDN sessions to be established in this APN. The optional emergency profile is used to define additional parameters for the emergency calls.

The no form of this command reverts to the default.

Default

no allow-emergency

Parameters

profile-name

specifies an existing emergency profile name, up to 32 characters

5.2.1.3.14 allow-wlan-ho-no-context

Syntax

```
[no] allow-wlan-ho-no-context
```

Context

```
config>mobile>pdn>apn
```

Description

This command enables the PGW functionality to handle an S2a/S2b Handover Attach Request (HI=1), that does not exist at all, as a new attach instead of rejecting the request.

Default

```
no allow-wlan-ho-no-context
```

5.2.1.3.15 ambr-policing

Syntax

```
ambr-policing {dl-only | ul-and-dl | none}  
no ambr-policing
```

Context

```
config>mobile>pdn>apn
```

Description

This command specifies the type of AMBR policing to be enforced for this APN. By default, only downlink APN-AMBR policing is performed on the PGW/GGSN. For APNs that require both uplink and downlink policing, the `ul-and-dl` option should be specified. If there is no need for APN-AMBR policing (for example, policing is performed downstream at a TDF), the `none` option should be specified.

The no form of this command reverts to the default.

Parameters

dl-only

specifies that only downlink APN-AMBR policing is performed

ul-and-dl

specifies that both uplink and downlink APN-AMBR policing is performed

none

specifies that no APN-AMBR policing is performed

Default: dl-only

5.2.1.3.16 apn-load-control

Syntax

```
[no] apn-load-control
```

Context

```
config>mobile>pdn>apn
```

Description

This command enables the APN Load Control Information (LCI) IE to be sent to the consumer nodes when the `gtp-pdn-threshold` command is also configured. When enabled, the current resource utilization of `gtp-pdn-threshold max-connection` or `gtp-pdn-threshold max-activations` command is reported to the LCI IE piggy-packed in the messages sent to the MME.

**NOTE:**

- The GTP-C APN load control is only reported over GTPv2-C based on TS29.274.
- This command requires the node-level load control to be enabled in the context `config>mobile>pdn>gtp-load-control`.

5.2.1.3.17 apn-network-id

Syntax

```
apn-network-id type {real [include-radius-auth | include-radius-pre-auth] [apn-ni-only [application application-name [application-name ... (up to 8 max)]]] | public apn-name apn-name}
```

```
no apn-network-id
```

Context

```
config>mobile>pdn>apn
```

Description

This command specifies whether the real, public APN name, or virtual APN (if applicable) is sent as the value for the following:

- Called-Station-ID AVP of Gy and Gx Diameter messages and RADIUS accounting/authentication/pre-authentication messages
- Service-Selection AVP of S6b Diameter messages

- Called-Number AVP of L2TP ICRQ control message used for L2TP session establishment or the APN Network Identifier (APN NI) for Ga interfaces

When this command is not configured, the default value sent is the APN to which the user is attached.

For 5GC and 4G/5G interworking, this command allows to specify DNN NI-only included over N7/Npcf, N40/Nchf and N10/Nudm, using the command filter type `real`, `apn-ni-only` and application-name `n7`, `n40` and `n10`.

The no form of this command reverts to the default.

Default

no apn-network-id

Parameters

type

specifies the APN type

Values	real	uses the real APN from the GTP request or uses the DNN from the Nsmf_PDUSession service request
–	public	uses the APN name configured for apn-name

NOTE:

The public value does not apply to S6b Diameter messages.

include-radius-auth

specifies that the configuration is also applied to RADIUS authentication (applied by default to all other applications except RADIUS pre-authentication)

include-radius-pre-auth

specifies that the configuration is also applied to RADIUS pre-authentication

apn-ni-only

specifies that only the APN NI will be included in the Called-Station-ID AVP and for 5G that only DNN NI is included in the DDN data type over N7/Npcf or N40/Nchf or N10/Nudm

application-name

specifies up to five application names

Values	gy	specifies that the APN NI is included in the Called-Station-ID AVP for Gy applications
–	gx	specifies that the APN NI is included in the Called-Station-ID AVP for Gx applications
–	radius-acct	specifies that the APN NI is included in the Called-Station-ID AVP for RADIUS accounting
–	radius-auth	specifies that the APN NI is included in the Called-Station-ID AVP for RADIUS authentication
–	radius-pre-auth	specifies that the APN NI is included in the Called-Station-ID AVP for RADIUS pre-authentication
–	n7	specifies that only DNN NI is included in the Npcf_SMPolicyControl service requests sent to the PCF
–	n40	specifies that only DDN NI is included in the Nchf_ConvergedCharging service requests sent to the CHF
–	n10	specifies that only DNN NI is included in the Nudm_SubscriberDataManagement service request and in Nudm_UEContextManagement service requests sent to the UDM

apn-name

specifies the APN name is used when `public` is selected for `apn-network-id` type, up to 80 characters

5.2.1.3.18 apn-overload-control**Syntax**

`[no] apn-overload-control`

Context

`config>mobile>pdn>apn`

Description

This command enables the APN Overload Control Information (OCI) IE to be sent to the consumer nodes when the `gtp-pdn-threshold` command is also configured. When enabled and the value set by `gtp-pdn-threshold max-connection` or `gtp-pdn-threshold max-activations` command is reached, in a subsequent Create Session Request, the PGW rejects the request, responds with a Create Session Response with Cause Code APN Congestion (113), and includes the OCI IE.

NOTE:

- The GTP-C APN Overload control is only reported over GTPv2-C based on TS29.274.
- This command requires the node-level overload control to be enabled in the context config>mobile>pdn>gtp-overload-control.

Default

no apn-overload-control

5.2.1.3.19 overload-reduction

Syntax

```
overload-reduction overload-reduction  
no overload-reduction
```

Context

```
config>mobile>pdn>apn>apn-overload-control
```

Description

This command sets the percentage of the traffic reduction.

The no form of this command reverts to the default.

Parameters

overload-reduction

specifies the percentage of the traffic reduction

Values: 5 to 100

Default: 30

5.2.1.3.20 overload-threshold

Syntax

```
overload-threshold overload-threshold  
no overload-threshold
```

Context

```
config>mobile>pdn>apn>apn-overload-control
```

Description

This command sets the threshold percentage of the configured gtp-pdn-threshold for which the GTP-C OCI overload reduction will be triggered according to the configured overload-reduction value.

The no form of this command reverts to the default.

NOTE:

The overload threshold will rescale the GTP-C APN LCI IE load-metric when the overload-threshold is set to a value less than 100.

For example, if the value is set to 100000 and the value is set to 90%, from 0 to 90000 PDN connections represents the APN GTP-C LCI IE load-metric of 0 to 100%. When there are more than 90000 PDN connections, the APN GTP-C OCI IE with its critical configured traffic reduction value is sent.

Parameters

overload-threshold

specifies the percentage of the overload threshold

Values: 80 to 100

Default: 90

5.2.1.3.21 validity-time

Syntax

```
validity-time validity-time  
no validity-time
```

Context

```
config>mobile>pdn>apn>apn-overload-control
```

Description

This command specifies the length of time that the reported overload should be in effect.

The no form of this command reverts to the default.

Parameters

validity-time

specifies the time, in seconds

Values: 10 to 86400

Default: 600

5.2.1.3.22 apn-rate-control

Syntax

```
apn-rate-control profile-name
```

```
no apn-rate-control
```

Context

```
config>mobile>pdn>apn
```

Description

This command enables or disables the APN rate control.

The no form of this command disables the APN rate control.

Default

```
no apn-rate-control
```

Parameters

profile-name

specifies the name of the profile, up to 32 characters

5.2.1.3.23 apn-type

Syntax

```
apn-type small
no apn-type
```

Context

```
config>mobile>pdn>apn
```

Description

This command specifies how the APN/DNN UE sessions are load-balanced across available CP MG groups. It provides the option to assign all APN/DNN UE sessions to only one CP MG group by defining an APN/DNN as type small, that serves only few UE sessions instead of spreading APN/DNN UE sessions across all available CP MG groups. Session bouncing is avoided and performance is improved. Existing sessions must be manually deleted for an APN/DNN that is set to type small from regular.

The no form of this command reverts to the default (disabled).

Default

```
no apn-type
```

Parameters

```
small
    specifies the type of the APN as small
```

5.2.1.3.24 application-id-mvi-policy

Syntax

```
[no] application-id-mvi-policy
```

Context

```
config>mobile>pdn>apn
```

Description

This command configures the UP function to look for the Create PDR > PDI > Application-ID IE instead of the Create PDR > Activate Predefined Rules IE/Deactivate Predefined Rules IE to find the policy-option/policy-rule configured under the APN.

The no form of this command reverts back to the Create PDR > Activate Predefined Rules IE/Deactivate Predefined Rules IE.

**NOTE:**

- This command is not applicable to non-CUPS deployments.
- This configuration must only be done on the UP function.

Default

no application-id-mvi-policy

5.2.1.3.25 auth-fixed**Syntax**

```
auth-fixed user-name long-description-string password password [hash | hash2]  
no auth-fixed
```

Context

```
config>mobile>pdn>apn
```

Description

This command configures the username and password when authentication is fixed.

Default

no auth-fixed

Parameters***long-description-string***

specifies the username used in access requests sent to a AAA server when the authorized username is set to fixed, up to 32 characters

password

specifies the password used to authenticate requests sent to a AAA server when the username is set to fixed, up to 32 characters

hash

specifies the key is entered in an encrypted form

If the hash parameter is not used, the key is assumed to be in a non-encrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the hash parameter specified.

hash2

specifies the key is entered in a more complex encrypted form

If the hash2 parameter is not used, the less encrypted hash form is assumed.

5.2.1.3.26 authentication

Syntax

```
authentication type {radius server-group group-name | diameter pri-dia-peer-
profile name sec-dia-peer-profile name} [user-name {imsi | msisdn | pco | fixed | apn |
pco-no-apn | imsi-apn | msisdn-apn}] [suppress-imsi] [pco-password] [password password
password-type {fixed | default} [hash | hash2]]

no authentication
```

Context

config>mobile>pdn>apn

Description

This command configures the RADIUS or Diameter authentication for the APN. RADIUS servers are identified by the server group. Diameter servers are identified by primary and secondary peers.

Parameters

type

specifies the authentication type used for authentication from an AAA server

Values	radius	specifies that the RADIUS authentication type is used for authentication from an AAA server
–	diameter	specifies that the Diameter authentication type is used for authentication from an AAA server

group-name

specifies the name of a radius-group

name

specifies the name of the primary Diameter peer profile that contains the peer IP address

sec-dia-peer-profile name

specifies the name of the secondary Diameter peer profile that contains the peer IP address

user-name

specifies the username used in access requests sent to a AAA server

Values	imsi	sets the User-Name attribute to the IMSI
–	msisdn	sets the User-Name attribute to the MSISDN
–	pco	sets the User-Name attribute to the value received in the PCO
–	fixed	use the name specified by the auth-fixed command
–	apn	sets the User-Name attribute to the APN
–	pco-no-apn	sets the User-Name attribute to the value received in the PCO, but with special logic to include only the username part from the username@APN format; this parameter is used together with the virtual APN selection based on the PCO feature, although there is no direct dependency. The parameter works only when the APN that exists in the PCO username (user@APN) is the current APN under which RADIUS accounting is performed
–	imsi-apn	sets the User-Name attribute to the IMSI@APN
–	msisdn-apn	sets the User-Name attribute to the MSISDN@APN

Default: imsi

suppress-imsi

specifies that the 3GPP-IMSI attribute is not included

Default: disabled

pco-password

specifies to set the password to the value received in the GTP PCO

password

specifies the PAP password used in access requests sent to a RADIUS server, up to 32 characters; up to 54 characters are supported for a hash password and up to 96 characters for a hash2 password

password-type

specifies the password type

Values	fixed	fixed password for overriding the PCO content or providing password with the IMSI, MSISDN or APN username (with PAP)
–	default	default password to be used together with the IMSI, MSISDN or APN username, and when missing from the PCO (with PAP)

NOTE:

If the hash and hash2 parameters are not used for the password, the key is assumed to be in a non-encrypted clear text form. For security purposes, all keys are automatically stored in an encrypted hash form in the configuration. The information saves and uses the configuration defined in the system>security>hash-control context.

hash

specifies that the key is entered in an encrypted form

hash2

specifies that the key is entered in a more complex encrypted form

5.2.1.3.27 bitrate-roundup

Syntax

[no] bitrate-roundup

Context

config>mobile>pdn>apn

Description

This command enables the gateway to send the PCRF provided QoS values rounded up according to NAS specification (24.301) to the LTE access (SGW/MME). The gateway internally keeps using the PCRF provided values.

The no form of this command reverts to the default (disabled).

Default

no bitrate-roundup

5.2.1.3.28 block-list

Syntax

block-list

Context

config>mobile>pdn>apn

Description

This command enables the context to create block-list entries.

5.2.1.3.29 entry

Syntax

entry *entry-id* group *group* pdn-type *pdn-type*

no entry *entry-id*

Context

config>mobile>pdn>apn>block-list

Description

This command creates a new block list entry for a specific group and for a specific PDN type on the configured APN.

The no form of this command deletes a created block list entry.

Parameters

entry-id

specifies a unique entry ID

Values: 1 to 64

group

specifies the mobile gateway group ID

Values	1 to 15	–
–	all	when this value is used, the block list entry blocks all new sessions in all groups for the specified PDN type

pdn-type

specifies the PDN type on the configured APN

This value is ignored for rejecting new sessions when the gateway is configured as a GW-U instance. This means that all sessions are rejected irrespectively of the configured value. However, the value is significant for dropping of user plane traffic and avoiding charging on blocked resources. It must be configured accordingly.

Values: ipv4 | ipv6

5.2.1.3.30 call-sequence

Syntax

```
call-sequence {pfcf-first | local-upf-sel-before-auth}
no call-sequence
```

Context

```
config>mobile>pdn>apn
```

Description

This command specifies the required call-flow sequence for the session.

The no form of this command disables the alternative call-flow sequence and reverts to the legacy order: aaa-auth, up-slc, gx, radius-acct, chr, pfcf.

Parameters

pfcp-first

specifies the order: aaa-auth, up-slc, pfcp, gx, radius-acct, chr

local-upf-sel-before-auth

specifies the order: up-slc, aaa-auth, pfcp, gx, radius-acct, chr

5.2.1.3.31 cm-idle-timeout

Syntax

`cm-idle-timeout cm-idle-timeout`

`no cm-idle-timeout`

Context

`config>mobile>pdn>apn`

Description

This command specifies the time a PDU session is allowed to remain idle before being deleted by the SMF.

Parameters

cm-idle-timeout

specifies the time in seconds a PDU session is allowed to remain idle before being deleted by the SMF

Values	0 5 to 2592000	emergency APN
–	0 60 to 2592000	APN

Default: 0

5.2.1.3.32 converged-interface-support

Syntax

`converged-interface-support`

Context

```
config>mobile>pdn>apn
```

Description

This command enables the context to configure the 5G SBI interface support for UEs without 5GS NAS support.

5.2.1.3.33 converged-n10

Syntax

```
converged-n10 {enable | disable | inherit | 5gcnri}
```

```
no converged-n10
```

Context

```
config>mobile>pdn>apn>converged-interface-support
```

Description

This command enables or disables the use of the 5G service-based N10 interface by the PGW-C/SMF for the UEs without 5GS NAS support. When enabled, the PGW-C/SMF uses the 5G service-based N10 interface for the UEs without 5GS NAS support.

When set to `enable` or `disable`, the system overrides the PDN-level configuration. When set to `inherit`, the system inherits the configuration from the PDN level. When set to `5gcnri` (5GC Not Restricted Indication), the N10 interface is enabled for the UEs without 5GS NAS support but the access to the 5GC is not restricted by the user subscription.

The `no` form of this command reverts to the default (`inherit`).

Parameters

enable

enables the use of the 5G service-based N10 interface by the PGW-C/SMF for the UEs without 5GS NAS support

disable

disables the use of the 5G service-based N10 interface by the PGW-C/SMF for the UEs without 5GS NAS support

inherit

specifies that the behavior for this APN is inherited from the PDN-level configuration

Default: `inherit`

5gcnri

enables the use of the 5G service-based N10 interface by the PGW-C/SMF for the UEs without 5GS NAS support but the access to the 5GC is not restricted by the user subscription

5.2.1.3.34 converged-n40

Syntax

```
converged-n40 {enable | disable | inherit}
no converged-n40
```

Context

```
config>mobile>pdn>apn>converged-interface-support
```

Description

This command enables or disables the use of the 5G service-based N40 interface by the PGW-C/SMF for the UEs without 5GS NAS support. When enabled, the PGW-C/SMF uses the 5G service-based N40 interface for the UEs without 5GS NAS support.

When set to `enable` or `disable`, the system overrides the PDN-level configuration. When set to `inherit`, the system inherits the configuration from the PDN level.

The `no` form of this command reverts to the default (`inherit`).

Parameters

enable

enables the use of the 5G service-based N40 interface by the PGW-C/SMF for the UEs without 5GS NAS support

disable

disables the use of the 5G service-based N40 interface by the PGW-C/SMF for the UEs without 5GS NAS support

inherit

specifies that the behavior for this APN is inherited from the PDN-level configuration
Default: `inherit`

5.2.1.3.35 converged-n40-gngp

Syntax

```
converged-n40-gngp {enable | disable | inherit}
```

```
no converged-n40-gngp
```

Context

```
config>mobile>pdn>apn>converged-interface-support
```

Description

This command enables or disables the use of the 5G service-based N40 interface by the PGW-C/SMF for the UEs in case of 2G/3G access. When enabled, the PGW-C/SMF uses the 5G service-based N40 interface for the UEs in case of 2G/3G access.

When set to `enable` or `disable`, the system overrides the PDN-level configuration. When set to `inherit`, the system inherits the configuration from the PDN level.

The `no` form of this command reverts to the default (`inherit`).

Parameters

`enable`

enables the use of the 5G service-based N40 interface by the PGW-C/SMF for the UEs in case of 2G/3G access

`disable`

disables the use of the 5G service-based N40 interface by the PGW-C/SMF for the UEs in case of 2G/3G access

`inherit`

specifies that the behavior for this APN is inherited from the PDN-level configuration
Default: `inherit`

5.2.1.3.36 converged-n7

Syntax

```
converged-n7 {enable | disable | inherit}  
no converged-n7
```

Context

```
config>mobile>pdn>apn>converged-interface-support
```

Description

This command enables or disables the use of the 5G service-based N7 interface by the PGW-C/SMF for the UEs without 5GS NAS support. When enabled, the PGW-C/SMF uses the 5G service-based N7 interface for the UEs without 5GS NAS support.

When set to `enable` or `disable`, the system overrides the PDN-level configuration. When set to `inherit`, the system inherits the configuration from the PDN level.

The no form of this command reverts to the default (`inherit`).

Parameters

`enable`

enables the use of the 5G service-based N7 interface by the PGW-C/SMF for the UEs without 5GS NAS support

`disable`

disables the use of the 5G service-based N7 interface by the PGW-C/SMF for the UEs without 5GS NAS support

`inherit`

specifies that the behavior for this APN is inherited from the PDN-level configuration

Default: `inherit`

5.2.1.3.37 converged-n7-gngp

Syntax

```
converged-n7-gngp {enable | disable | inherit}
```

```
no converged-n7-gngp
```

Context

```
config>mobile>pdn>apn>converged-interface-support
```

Description

This command enables or disables the use of the 5G service-based N7 interface by the PGW-C/SMF for the UEs in case of 2G/3G access. When enabled, the PGW-C/SMF uses the 5G service-based N7 interface for the UEs in case of 2G/3G access.

When set to `enable` or `disable`, the system overrides the PDN-level configuration. When set to `inherit`, the system inherits the configuration from the PDN level.

The no form of this command reverts to the default (`inherit`).

Parameters

enable

enables the use of the 5G service-based N7 interface by the PGW-C/SMF for the UEs in case of 2G/3G access

disable

disables the use of the 5G service-based N7 interface by the PGW-C/SMF for the UEs in case of 2G/3G access

inherit

specifies that the behavior for this APN is inherited from the PDN-level configuration

Default: inherit

5.2.1.3.38 dedicated-bearer-create-retry-count

Syntax

`dedicated-bearer-create-retry-count count`

`no dedicated-bearer-create-retry-count`

Context

`config>mobile>pdn>apn`

Description

This command is used to specify a dedicated bearer creation retry count. After the specified number of retries, the dedicated bearer creation is abandoned until the next active application period (subsequent to an application stop). It applies to AA rules installed with QCI/ARP that are different from the default bearer, in which case the mute-notification is enabled. When the application is detected, a dedicated bearer is created without further interaction with PCRF.

The no form of this command reverts to the default.

Parameters

count

specifies the number of times the dedicated bearer creation is retried upon failure

Values: 0 to 10

Default: 0

5.2.1.3.39 dedicated-bearer-create-retry-wait-timer

Syntax

```
dedicated-bearer-create-retry-wait-timer wait-timer  
no dedicated-bearer-create-retry-wait-timer
```

Context

```
config>mobile>pdn>apn
```

Description

This command specifies a dedicated bearer creation retry timer. Upon dedicated bearer creation failure for this application, the gateway waits the specified amount of time before retrying. It applies to AA rules installed with QCI/ARP that are different from the default bearer and then the mute-notification is enabled. When the application is detected, a dedicated bearer is created without further interaction with PCRF.

The no form of this command reverts to the default.

Parameters

wait-timer

specifies the time the gateway waits before retrying in minutes

Values: 0 to 60

Default: 0

5.2.1.3.40 dedicated-bearer-idle-timeout-profile

Syntax

```
dedicated-bearer-idle-timeout-profile profile-name  
no dedicated-bearer-idle-timeout
```

Context

```
config>mobile>pdn>apn
```

Description

This command configures the dedicated bearer idle-timeout profile for the APN.

Default

no dedicated-bearer-idle-timeout-profile

Parameters

profile-name

specifies the name of the dedicated bearer idle timeout profile, up to 32 characters

5.2.1.3.41 default-cc-group

Syntax

default-cc-group {rtr | uc | pp}

no default-cc-group

Context

config>mobile>pdn>apn

Description

This command specifies the default CC group to be used when a PCRF does not provide the CC group subscriber type for a subscriber PDN session. This command can also be used when Gx is not deployed or used. The no form of this command removes the configuration.

Parameters

rtr

specifies the service type as real-time report

uc

specifies the service type as usage control

pp

specifies the service type as prepaid

5.2.1.3.42 default-qos-5g-profile

Syntax

default-qos-5g-profile *profile-name*

no default-qos-5g-profile

Context

```
config>mobile>pdn>apn
```

Description

This command specifies the default 5G QoS profile. The profile must be configured if continued action is possible when the UDM rejects the retrieval of DNN subscription data. If a default 5G QoS profile is not defined, the PDU session activation fails without the DNN subscription data.

If the default 5G QoS profile is changed, the new profile is used only for new PDU sessions.

The no form of this command removes the default 5G QoS profile from the DNN.

Parameters

profile-name

specifies the name of the default 5G QoS profile, up to 32 characters

5.2.1.3.43 default-qos-application-modify

Syntax

```
default-qos-application-modify
```

Context

```
config>mobile>pdn>apn
```

Description

This command enables the context to configure QoS parameters required in case the application triggers the default bearer QoS update. The functionality is activated with the `modify-qos-default-bearer` command.

5.2.1.3.44 apn-ambr-attr

Syntax

```
apn-ambr-attr
```

Context

```
config>mobile>pdn>apn>default-qos-application-modify
```

Description

This command enables the context to configure APN Aggregate Maximum Bit-Rate (AMBR) attributes. It is used in case the application traffic triggers the default bearer QoS update.

5.2.1.3.45 **aggr-rate**

Syntax

```
aggr-rate downlink-rate downlink-rate uplink-rate uplink-rate  
no aggr-rate
```

Context

```
config>mobile>pdn>apn>default-qos-application-modify>apn-ambr-attr
```

Description

This command specifies the downlink and uplink rate for APN-AMBR. It is used if the application traffic triggers the default bearer QoS update.

The no form of this command removes the configured uplink and downlink rates.

If no apn-ambr-attr values are defined, the apn-ambr-attr values are not modified from the default bearer's previous values.

Default

no aggr-rate

Parameters

downlink-rate

specifies the downlink APN-AMBR in kb/s

Values: 0 to 25000000

uplink-rate

specifies the uplink APN-AMBR in kb/s

Values: 0 to 25000000

5.2.1.3.46 **arp**

Syntax

```
arp arp-value
```

```
no arp
```

Context

```
config>mobile>pdn>apn>default-qos-application-modify
```

Description

This command sets the ARP value required if the application traffic triggers the default bearer QoS update.

The no form of this command removes the configured ARP value.

If no ARP value is defined, the ARP is not modified from the default bearer's previous value.

Default

```
no arp
```

Parameters

arp-value

specifies the value of the ARP

Values: 1 to 15

5.2.1.3.47 qci

Syntax

```
qci qci-value
```

```
no qci
```

Context

```
config>mobile>pdn>apn>default-qos-application-modify
```

Description

This command sets the QCI value required if the application traffic triggers the default bearer QoS update.

The no form of this command reverts to the default.

If no QCI value is defined, the QCI is not modified from the default bearer's previous value.

Default

```
no qci
```

Parameters

qci-value

specifies the value of the QCI

Values: 1 to 9 | 65 | 66 | 69 | 70 | 128 to 254

5.2.1.3.48 qos-holding-time

Syntax

qos-holding-time *value*

no qos-holding-time

Context

config>mobile>pdn>apn>default-qos-application-modify

Description

This command sets the timeout for application traffic to trigger the QoS update back to the default QoS, if no usage is detected during this configured time.

The no form of this command reverts to the default.

If no value is configured, qos-holding-time uses a default value of 10 minutes.

Default

no qos-holding-time

Parameters

value

specifies the value, in minutes

Values: 1 to 60

Default: 10

5.2.1.3.49 retry-wait-timer

Syntax

retry-wait-timer *value*

no retry-wait-timer

Context

```
config>mobile>pdn>apn>default-qos-application-modify
```

Description

This command sets the time the gateway waits before retrying to update the default bearer QoS.

The no form of this command removes the configured value of the retry wait timer.

If no value is configured, the `retry-wait-timer` uses a default value of 1 minute.

Default

no `retry-wait-timer`

Parameters

value

specifies the value of `retry-wait-timer` in minutes

Values: 1 to 60

Default: 1

5.2.1.3.50 del-bearer-no-reactivation-req-cause

Syntax

```
del-bearer-no-reactivation-req-cause [idle-timeout]
```

```
no del-bearer-no-reactivation-req-cause
```

Context

```
config>mobile>pdn>apn
```

Description

This command configures the PGW to include the indication that the PDN reconnection to this APN is not allowed in the Delete Bearer Request message. The command overrides the `del-bearer-reactivation-req-cause` command.

The no form of this command reverts to the default behavior that uses the cause value: PDN connection inactivity timer expires (11).

Default

no `del-bearer-no-reactivation-req-cause`

Parameters

idle-timeout

specifies that the PDN reconnection to this APN disallowed cause value, is used if the PDN connection is released due to the `idle-timeout` command; this command is configured under the `config>mobile>pdn>apn` context

5.2.1.3.51 del-bearer-activation-req-cause

Syntax

```
del-bearer-activation-req-cause {[fh-session-continue] [session-timeout] [pdn-connection-clear] [pcscf-restoration] [all]}
```

```
no del-bearer-activation-req-cause
```

Context

```
config>mobile>pdn>apn
```

Description

This command enables the PGW to include a reactivation request in the delete bearer request that is sent to the UE for the specified scenarios.

The `no` form of this command reverts to the default behavior where no cause IE is included in the delete bearer request.

Default

```
no del-bearer-activation-req-cause
```

Parameters

fh-session-continue

specifies that a re-activation request is included in the Delete Bearer Request that is sent to the UE, when a Gy CCFH session continue timer expires

session-timeout

specifies that a re-activation request is included in the Delete Bearer Request/PDU Session Release Command message that are sent to the UE, when a session timeout expires (configured under the `config>mobile>pdn>apn` context)

pdn-connection-clear

specifies that a re-activation request is included in the Delete Bearer Request message that is sent to the UE, when the PDN connection is cleared, or if the session was cleared due to internal audit mechanism

pcscf-restoration

specifies that a re-activation request is used when the Delete Bearer Request message is triggered by the P-CSCF restoration

all

specifies the reactivation-requested cause code to be included, whenever the PGW deletes the PDN connection whether triggered externally (Gx, S6b, Gy, and so on) or internally via timeout or management intervention

5.2.1.3.52 delay-tolerant-connection-suspension

Syntax

`delay-tolerant-connection-suspension delay-tolerant-connection-suspension`
`no delay-tolerant-connection-suspension`

Context

`config>mobile>pdn>apn`

Description

This command is used to control the delay tolerant connection functionality in the PGW. If enabled, the PGW suspends the create/update procedures the MME/SGSN rejects, due to power saving. The command defines the maximum duration of the procedure suspension, but the MME/SGSN may resume the network initiated procedures before the configured time.

Parameters***delay-tolerant-connection-suspension***

specifies the maximum suspension time for delay tolerant procedure, in seconds

Values: 0 to 1000

Default: 0

5.2.1.3.53 delete-adc-dedicated-bearer-on-idle-timeout-only

Syntax

`[no] delete-adc-dedicated-bearer-on-idle-timeout-only`

Context

`config>mobile>pdn>apn`

Description

This command enables the deletion of the ADC dedicated bearer on idle timeout. When this command is enabled, a dedicated bearer created as a result of an AA application detection is terminated only when the dedicated bearer idle timeout expiration is reached (configured using the `config>mobile>pdn>apn>dedicated-bearer-idle-timeout-profile` command). The no form of this command reverts to the default (disabled; the gateway initiated dedicated bearer is terminated when an application STOP is detected).

Default

no delete-adc-dedicated-bearer-on-idle-timeout-only

5.2.1.3.54 destination-realm-gx

Syntax

`destination-realm-gx name`

`no destination-realm-gx`

Context

`config>mobile>pdn>apn`

Description

This command configures an APN-specific destination realm to use in the Gx interface. If configured, it overrides the destination realm configured in the `config>mobile>profile>diameter-peer` context.

If no value is configured, the destination-realm configured in the `diameter-peer` is used.

The no form of this command reverts to the default.

Default

no destination-realm-gx

Parameters

name

specifies the destination realm name, up to 80 characters

5.2.1.3.55 dhcp-profile

Syntax

```
dhcp-profile name  
no dhcp-profile
```

Context

```
config>mobile>pdn>apn
```

Description

This command configures the DHCP profile for the session.

The no form of this command removes the configuration.

Default

```
no dhcp-profile
```

Parameters

name

specifies the DHCP profile name, up to 32 characters

5.2.1.3.56 dhcpv4-server

Syntax

```
dhcpv4-server profile-name  
no dhcpv4-server
```

Context

```
config>mobile>pdn>apn
```

Description

This command configures the Dynamic Host Configuration Protocol version 4 (DHCPv4) server profile for this Access Point Name (APN).

The no form of this command removes the profile name from the configuration.

Parameters

profile-name

specifies the profile name, up to 32 characters

5.2.1.3.57 dhcpv4-server-group

Syntax

dhcpv4-server-group *profile-name*

no dhcpv4-server-group

Context

config>mobile>pdn>apn

Description

This command configures the DHCPv4 server group from which an IPv4 address would be allocated.

The no form of this command removes the profile name from the configuration.

Parameters

profile-name

specifies the profile name, up to 32 characters

5.2.1.3.58 dhcpv6-server-group

Syntax

dhcpv6-server-group *profile-name*

no dhcpv6-server-group

Context

config>mobile>pdn>apn

Description

This command configures the DHCPv6 server group from which an IPv6 address would be allocated.

The no form of this command removes the profile name from the configuration.

Default

no dhcpv6-server-group

Parameters

profile-name

specifies the profile name, up to 32 characters

5.2.1.3.59 dhcpv6-service

Syntax

dhcpv6-service [enable | disable]

no dhcpv6-service

Context

config>mobile>pdn>apn

Description

This command enables or disables the DHCPv6 service that provides DNSv6 addresses to the UE. When enabled, the PGW advertises this capability by setting the 'O' flag in the IPv6 router advertisements messages. PGW advertises this capability by setting the 'O' flag in the IPv6 router advertisements messages. This allows the UE to use the DHCPv6 service to obtain the DNSv6 addresses; the PGW processes the DHCPv6 Request message, and builds the DHCPv6 Reply message with the DNSv6 addresses toward the UE. When used in CUPS deployment, the command is only configured on the CP function, and the DHCPv6 service is handled on the CP function. Therefore, the CP function installs additional PFCP rules between the CP and UP function, and the PFCP sessions. These rules handle how the UP function detects, forwards, and tunnels the ICMPv6 RS/RA and DHCPv6 messages between the UE and the CP function for processing on the CP function.

The no form of this command removes the service.

Default

no dhcpv6-service

Parameters

enable

specifies that the DHCPv6 service is enabled

disable

specifies that the DHCPv6 service is disabled

5.2.1.3.60 disable-bearer-bind-verification

Syntax

```
[no] disable-bearer-bind-verification
```

Context

```
config>mobile>pdn>apn
```

Description

This command disables bearer binding verification for uplink traffic for a PDN session. By default, bearer binding verification is enabled as standard behavior.

This APN level command disables uplink bearer binding verification for the entire session. The command `disable-bearer-bind-verification` at the `policy-rule-base` level disables uplink bearer binding verification for the bearer on which the `policy-rule-base` is installed.

The no form of this command reverts to the default.

Default

no disable-bearer-bind-verification (uplink bearer binding verification is enabled)

5.2.1.3.61 disable-frame-route

Syntax

```
[no] disable-frame-route
```

Context

```
config>mobile>pdn>apn
```

Description

This command disables the support of Framed Routing on the specified APN/DNN.

The no form of this command reverts to the default (enabled).

5.2.1.3.62 disable-gbr-policing-qci

Syntax

```
[no] disable-gbr-policing-qci qci qci [arp arp-value]
```

Context

```
config>mobile>pdn>apn
```

Description

This command disables the GBR policing QCI.

Parameters

qci

specifies the QCI value

Values: 1 to 9 | 65 | 66 | 69 | 70 | 128 to 254 | *-wildcard

arp-value

specifies the ARP value

Values: 1 to 15 | *-wildcard

5.2.1.3.63 dnn-overload-control

Syntax

```
[no] dnn-overload-control
```

Context

```
config>mobile>pdn>apn
```

Description

This command enables the DNN overload control when the value set by the `nsmf-dnn-threshold max-pdu-connections` or the `nsmf-pdn-threshold max-pdu-activations` command is reached. The SMF in subsequent `Nsmf_PDUSession_CreateSMContext` with a PDU Session Establishment Create Request rejects the request and responds with HTTP 503 including the error attribute/ProblemDetails set to DNN_CONGESTION, the `n1SmMsg` set to PDU SESSION ESTABLISHMENT REJECT, and the N1 back-off timer set as configured. If the HTTP header field Retry-After (in seconds) is also configured, this field will also be included in the HTTP 503 response.

The `no` form of the command disables the DNN overload control.

Default

no dnn-overload-control

5.2.1.3.64 n1-back-off-timer

Syntax

n1-back-off-timer *minutes*

no n1-back-off-timer

Context

config>mobile>pdn>apn>dnn-overload-control

Description

This command configures the N1 back-off timer (GPRS timer 3) in the n1SmMsg of the PDU Session Establishment Reject message.

The no form of this command reverts to the default.

Default

no n1-back-off-timer

Parameters

minutes

specifies the n1SmMsg back-off timer (GPRS timer 3) in minutes

Values: 0 to 120

Default: 1

5.2.1.3.65 retry-after-timer

Syntax

retry-after-timer *seconds*

no retry-after-timer

Context

config>mobile>pdn>apn>dnn-overload-control

Description

This command configures the Retry-After field in the HTTP header of the 503 error respond when the DNN-level overload threshold has been reached.

The no form of this command reverts to the default (disabled).

Default

no retry-after-timer

Parameters

seconds

specifies the retry timer in seconds

Values: 2 to 36000

Default: 0 (disabled)

5.2.1.3.66 dns-redirect-server

Syntax

dns-redirect-server *profile-name*

no dns-redirect-server

Context

config>mobile>pdn>apn

Description

This command specifies the dns-redirect server profile associated for this APN.

Default

no dns-redirect-server

Parameters

profile-name

specifies the DNS redirect profile name, up to 32 characters

5.2.1.3.67 dns-snooping

Syntax

```
dns-snooping [dns-server-list addr-list] [snoop-all]  
no dns-snooping
```

Context

```
config>mobile>pdn>apn
```

Description

This command enables DNS snooping for the APN. When enabled, the UE DNS traffic is analyzed (DNS responses from validated DNS servers are snooped) and the IP addresses sent by the DNS server are stored to the mobile gateway. Any future traffic to these IP addresses, matches the corresponding policy rule filters with the domain names according to the lookup from the local storage.

DNS snooping can be configured to snoop all responses, using the `snoop-all` keyword, or responses from a DNS server IP address list (including the DNS servers defined in APN PCO), using the `dns-server-list` keyword. If no parameter is specified, DNS responses are snooped from the DNS servers defined in APN PCO.

The `no` form of this command disables DNS snooping.

Default

```
no dns-snooping
```

Parameters

addr-list

specifies the IP address list name of the DNS server, up to 32 characters; enables APN PCO and DNS server list DNS snooping (the *addr-list* is configured using the `config>mobile>profile>addr-list` command)

snoop-all

specifies to snoop all DNS queries

5.2.1.3.68 dns-snooping-forward-to-aa

Syntax

```
[no] dns-snooping-forward-to-aa
```

Context

config>mobile>pdn>apn

Description

This command enables forwarding of DNS traffic to AA when the dns-snooping command is enabled in the config>mobile>pdn>apn context.

The no form of this command disables forwarding traffic to AA when DNS snooping is enabled.

Default

no dns-snooping-forward-to-aa

5.2.1.3.69 dynamic-rule-policing

Syntax

dynamic-rule-policing qci *qci* [arp *arp-value*] [direction *direction*] [group *group*]

no dynamic-rule-policing qci *qci* [arp *arp-value*]

Context

config>mobile>pdn>apn

Description

This command enables policing per SDF for dynamic policy rules for GBR and non-GBR bearers and applies to LTE and 5G. If not configured, the MBR values sent in the non-GBR bearers dynamic policy rules are ignored.

The no form of this command disables the policing for new bearers or modification of the existing bearers.

NOTE:

- The CMG maximum number of policers is 8 million. The number of policers cannot be changed.
- In UPF, the ARP value must always be a wildcard.

Default

no dynamic-rule-policing

Parameters

qci

specifies the QCI value
Values: 1 to 255 | *-wildcard

arp-value

specifies the ARP value
Values: 1 to 15 | *-wildcard

direction

specifies the direction of the flow

Values	dl	specifies the downlink direction
–	bidir	specifies both uplink and downlink direction

Default: dl

group

specifies the level at which the rule is policed
Values: sdf
Default: sdf

5.2.1.3.70 dynamic-rule-to-internal-rule-map

Syntax

dynamic-rule-to-internal-rule-map *profile-name*
no dynamic-rule-to-internal-rule-map

Context

config>mobile>pdn>apn

Description

This command configures the APN to derive an internal static rule to use for flow classification. This rule facilitates using the CAM for PCC flows that are not specified as a 5-tuple when sent from the PCRF. Some applications such as Rich Chat Service (RCS) and Push To Talk (PTT) use dedicated application servers, in which case the remote IP/port information pertains to the dedicated servers.

Based on this information, an internal static rule is derived that applies across different chat sessions for all UEs. The flow description of the specified mapping profile is used to derive the internal static

rule. The mapping profile must be configured in the context `config>mobile>profile>policy-options>dynamic-rule-to-internal-rule-map` prior to associating it with the APN.

The no form of this command reverts to the default.

Default

no dynamic-rule-to-internal-rule-map

Parameters

profile-name

specifies the mapping profile of the flow description, up to 32 characters

5.2.1.3.71 enable-global-pcc-precedence

Syntax

[no] enable-global-pcc-precedence

Context

config>mobile>pdn>apn

Description

This command allows the user to use the precedence value of the policy rule to match the traffic against all installed rules, regardless of whether the rules are diverted to AA or not.

If enable-global-pcc-precedence is not configured, all policy rules handled by AA are given higher precedence (matched first) over non-AA rules.

If enable-global-pcc-precedence is configured, policy rule precedence is applied regardless of whether the policy rule is diverted to AA or not. If more than one rule with the same flow description is installed, traffic will match the policy rule according to the precedence.

The no form of this command reverts to the default (not configured).

Default

no enable-global-pcc-precedence

5.2.1.3.72 enable-gx-session-recovery

Syntax

[no] enable-gx-session-recovery

Context

```
config>mobile>pdn>apn
```

Description

This command enables Gx session discovery and recovery for the APN.

The no form of this command reverts to the default (disabled).

Default

no enable-gx-session-recovery

5.2.1.3.73 ethernet-action-dl

Syntax

```
ethernet-action-dl action action-type [n3-c-vlan vlan]  
no ethernet-action-dl
```

Context

```
config>mobile>pdn>apn
```

Description

This command specifies the action that must be applied on the DL frames.

The no form of this command reverts to the default.

Parameters

action-type

Values	pop	specifies that single un-tagging is applied on the DL frames
–	pop-pop	specifies that double un-tagging is applied on the DL frames
–	swap	specifies that single C-VLAN swapping is applied on the DL frames; the <i>n3-c-vlan</i> value must be provided

	–	swap-pop	specifies that C-VLAN swapping and single S-VLAN un-tagging is applied on the DL frames
	Default: pop		
vlan			
	Values: 0 to 4094		

5.2.1.3.74 ethernet-action-up

Syntax

```
ethernet-action-up action action-type tag-value tag-value  
no ethernet-action-up
```

Context

```
config>mobile>pdn>apn
```

Description

This command specifies the action that must be applied on the UL frames. The required VLAN tagging per action must be specified.

The no form of this command reverts to the default.

Parameters

<i>action-type</i>		
	Values	
	push	specifies that single tagging is applied on the UL frames
	–	
	push-push	specifies that double tagging is applied on the UL frames
	–	
	swap	specifies that single C-VLAN tagging is applied on the UL frames

	–	swap-push	specifies that single C-VLAN swapping and single S-VLAN tagging is applied on the UL frames
Default: push			
tag-value			
	Values	n7-c-vlan	specifies that C-VLAN single tagging is applied on the UL frames
	–	n7-s-vlan	specifies that S-VLAN single tagging is applied on the UL frames
	–	n7-c-vlan-s-vlan	specifies that C-VLAN and S-VLAN double tagging is applied on the UL frames
Default: none			

5.2.1.3.75 ethernet-service-type

Syntax

```
ethernet-service-type service-type
no ethernet-service-type
```

Context

```
config>mobile>pdn>apn
```

Description

This command specifies the ethernet service type of an ethernet PDU session. You can configure either eline or elan as a service type.

The no form of this command reverts to the default.

Parameters

service-type

Values	eline	specifies that eline (P2P service with no MAC learning) ethernet service is supported by this APN
–	elan	specifies that elan (P2M service with MAC learning) ethernet service is supported by this APN

Default: eline

5.2.1.3.76 firewall-rules

Syntax

```
firewall-rules
```

Context

```
config>mobile>pdn>apn
```

Description

This command enables the context to configure the firewall policy rules and firewall rules.

5.2.1.3.77 abort

Syntax

```
abort
```

Context

```
config>mobile>pdn>apn>firewall-rules
```

Description

This command ends the current policy editing session that begins when using the `config>mobile>pdn>apn>firewall-rules>begin` command, and discards any policy changes made during the editing session.

5.2.1.3.78 begin

Syntax

begin

Context

config>mobile>pdn>apn>firewall-rules

Description

This command begins a policy editing session. Changes made during the editing session apply when the config>mobile>pdn>apn>firewall-rules>commit command is used. The editing session continues until either the config>mobile>pdn>apn>firewall-rules>abort or the config>mobile>pdn>apn>firewall-rules>commit command is used, or until a control complex reset takes place. Editing sessions are not interrupted by high-availability activity switches or CLI session terminations, such as ending a Telnet session.

5.2.1.3.79 commit

Syntax

commit

Context

config>mobile>pdn>apn>firewall-rules

Description

This command saves the changes made during the current policy editing session (using the config>mobile>pdn>apn>firewall-rules>begin command). Any policy changes made during the editing session apply only when they are committed. If changes are successfully committed without errors detected during the commit or cross-reference verification against the existing policy configuration, the editing session will also be closed.

5.2.1.3.80 diff

Syntax

diff

Context

config>mobile>pdn>apn>firewall-rules

Description

This command displays the changes that were not committed during a policy editing session (changes made with the config>mobile>pdn>apn>firewall-rules>begin and config>mobile>pdn>apn>firewall-rules>commit commands).

5.2.1.3.81 policy-rule

Syntax

[no] policy-rule *policy-rule-name*

Context

config>mobile>pdn>apn>firewall-rules

Description

This command configures under the APN the firewall policy rules that are applied to PDN sessions locally by the gateway. The policy rules must be configured under the config>mobile>profile>policy-options>policy-rule context before they are applied under this CLI context.

Parameters

policy-rule-name

specifies the policy rule name, up to 64 characters

5.2.1.3.82 policy-rule-base

Syntax

[no] policy-rule-base *base-policy-name*

Context

config>mobile>pdn>apn>firewall-rules

Description

This command configures under the APN the firewall policy-rule bases that are applied locally to the PDN sessions by the gateway. The policy-rule bases must be configured under the

config>mobile>profile>policy-options>policy-rule-base context before they are applied under this CLI context.

Parameters

base-policy-name

specifies the name of the policy-rule base, up to 64 characters

5.2.1.3.83 flow-inactivity-timeout

Syntax

flow-inactivity-timeout *inactivity-timeout*

no flow-inactivity-timeout

Context

config>mobile>pdn>apn

Description

This command configures the flow inactivity timeout timer for AA offloaded flows. If no activity is detected during the configured time, the AA offloaded flow is deleted by the mobile gateway.

The no form of this command reverts to the default.

Parameters

inactivity-timeout

specifies the value, in seconds, of the inactivity timeout timer

Values: 60 to 600

Default: 60

5.2.1.3.84 fqdn-dns-redirect-server

Syntax

fqdn-dns-redirect-server *dns-server-name*

no fqdn-dns-redirect-server

Context

config>mobile>pdn>apn

Description

This command associates the specified DNS redirect server profile to this APN for FQDN DNS redirect.

Default

no fqdn-dns-redirect-server

Parameters

dns-server-name

specifies the name of the DNS server, up to 32 characters

5.2.1.3.85 fqdn-group

Syntax

fqdn-group *fqdn-group-name*

no fqdn-group

Context

config>mobile>pdn>apn

Description

This command associates the specified FQDN group to the APN. The FQDN group is configured in the profile context with a list of URLs. The URL list is resolved to a set of IP addresses (periodically refreshed) using the DNS server configured under the PCO for the APN. Multiple FQDN groups can be configured under an APN.

The no form of this command reverts to the default (removes the specified FQDN group from the APN configuration).

Parameters

fqdn-group-name

specifies the name of the FQDN group, up to 32 characters

5.2.1.3.86 gbr-policing-direction

Syntax

gbr-policing-direction qci *qci*[arp *arp-value*] {none | dl | bidir}

```
no gbr-policing-direction qci qci [arp arp-value]
```

Context

```
config>mobile>pdn>apn
```

Description

This command configures the policing that is performed in the APN for GBR dedicated bearers based on direction. The bandwidth of the GBR dedicated bearers is performed based on the aggregate of the MBR/GBR values defined in all dynamic rules bound to the bearer.

The no form of this command removes the configured policing of the GBR dedicated bearers in the APN.

Default

```
no gbr-policing-direction qci qci [arp arp-value]
```

Parameters

qci

specifies the QCI value

Values: 1 to 255 | *-wildcard

arp-value

specifies the optional ARP value

Values: 1 to 15 | *-wildcard

none

specifies no direction

dl

specifies downlink direction

bidir

specifies bidirectional direction

Default: dl

5.2.1.3.87 gtp-pdn-threshold

Syntax

```
gtp-pdn-threshold max-activations max-activations [alarm]
```

```
gtp-pdn-threshold max-connections max-connections [alarm]
```

```
no gtp-pdn-threshold
```

Context

```
config>mobile>pdn>apn
```

Description

This command configures the threshold of the maximum number of GTP-based PDN connections or the maximum number of GTP-based PDN activations per second for this APN. It is used for PGW APN-level congestion control (PGW Back-off timer or GTP-C Load and Overload).

An alarm can be enabled or disabled to be sent when the maximum number of connections or the maximum number of activations is reached.

NOTE:

This command must not be enabled when the `max-pdn-connection` command is enabled in the `conf>mobile>pdn>apn` context.

Default

```
no gtp-pdn-threshold
```

Parameters

max-activations

specifies the maximum number of PDN activations per second

Values: 0 to 5000 activations per second

Default: 0 (disabled)

max-connections

specifies the maximum number of PDN connections

Values: 1 to 20000000 connections

Default: 0

alarm

specifies if an alarm will be sent when the maximum number of connections or the maximum number of activations is reached

5.2.1.3.88 gtpu-source-port-dist

Syntax

```
[no] gtpu-source-port-dist
```

Context

```
config>mobile>pdn>apn
```

Description

This command enables a dynamic UDP source port in the range 57344 to 57599 that is used for all egress GTP-U packets on a flow basis.

The no form of this command reverts to the default (disabled).

Default

```
no gtpu-source-port-dist
```

NOTE:

When enabled, the `gtpu-source-port-dist` command takes precedence at the APN level over the `use-fixed-udp-src-port` command configured in the `config>mobile>system` context.

5.2.1.3.89 guard-timer

Syntax

```
guard-timer guard-timer
```

```
no guard-timer
```

Context

```
config>mobile>pdn>apn
```

Description

This command enables the configuration of a session setup timer on the PGW. If the session setup is delayed due to non response from the peering nodes for an extended duration (AAA/RADIUS, PCRF, OCS/OFCs), the session state is cleaned up and the response is sent with a failure cause code. This command applies to real APN.

Default

```
no guard-timer
```

Parameters

guard-timer

specifies the session setup time, in seconds

Values: 4 to 120

Default: 0 (disabled)

5.2.1.3.90 **gx**

Syntax

gx

Context

config>mobile>pdn>apn

Description

This command configures the Gx attributes for the APN.

5.2.1.3.91 **gtp-precedence-mapping**

Syntax

gtp-precedence-mapping {no-override | standard-algorithm | VoLTE-algorithm}

no gtp-precedence-mapping

Context

config>mobile>pdn>apn>gx

Description

This command configures the precedence mapping algorithm that maps the Gx PCC rule precedence to the (GTP) TFT precedence. The standard algorithm overrides the algorithm applied when the custom-1 option is selected for applicable CLI commands used for a specific operator. The VoLTE-algorithm specifies VoLTE precedence mapping.

The no form of this command reverts to the default (no-override).

Parameters

no-override | standard-algorithm | VoLTE-algorithm

specifies the GTP precedence mapping type

Default: no-override

5.2.1.3.92 include-rat-when-received

Syntax

```
[no] include-rat-when-received
```

Context

```
config>mobile>pdn>apn>gx
```

Description

This command enables the including of a RAT type AVP in the CCR-U to the PCRF if the message is due to any GTP signaling that includes the RAT type IE.

By default, a RAT type AVP is reported to the PCRF only in the CCR-I, and only when a RAT change event is detected.

The no form of this command reverts to the default (disabled).

Default

```
no include-rat-when-received
```

5.2.1.3.93 ho-failure-release-pdusession

Syntax

```
ho-failure-release-pdusession [enable | disable]  
no ho-failure-release-pdusession
```

Context

```
config>mobile>pdn>apn
```

Description

This command defines the policy when a handover fails in the RAN. When enabled, the SMF releases the PDU session after handover failure. If disabled, the SMF releases the user plane of the PDU session without releasing the whole PDU session.

Parameters

enable

specifies that the SMF releases the PDU session after a handover failure

disable

specifies that the SMF releases the user plane after a handover failure

Default: enabled

5.2.1.3.94 ho-wrong-pdn-ip-stale-session-deletion

Syntax

ho-wrong-pdn-ip-stale-session-deletion [enable | disable]

no ho-wrong-pdn-ip-stale-session-deletion

Context

config>mobile>pdn>apn

Description

This configuration defines the policy when a handover fails in the RAN. When the feature is enabled, the SMF will release the PDU session after handover failure. If the feature is disabled, the SMF will release the user plane of the PDU session without releasing the whole PDU session.

Parameters**enable**

specifies that the PGW deletes the stale session

disable

specifies that the PGW does not delete the stale session

Default: enable

5.2.1.3.95 hybrid-access

Syntax

hybrid-access

Context

config>mobile>pdn>apn

Description

This command enables the context to configure hybrid access parameters.

5.2.1.3.96 bonding-support

Syntax

[no] bonding-support

Context

config>mobile>pdn>apn>hybrid-access

Description

This command enables bonding support for the APN.

The no form of this command reverts to the default.

Default

no bonding-support

5.2.1.3.97 link-switch

Syntax

link-switch

Context

config>mobile>pdn>apn>hybrid-access

Description

This command enables the context to configure link switch parameters.

5.2.1.3.98 mode

Syntax

mode

Context

config>mobile>pdn>apn>hb-acc>lnk-sw

Description

This command enables the context to configure link switch mode parameters.

5.2.1.3.99 uplink-traffic

Syntax

```
uplink-traffic
```

Context

```
config>mobile>pdn>apn>hb-acc>lnk-sw>mode
```

Description

This command enables the context to configure uplink traffic parameters.

5.2.1.3.100 hysteresis

Syntax

```
hysteresis time
```

```
no hysteresis
```

Context

```
config>mobile>pdn>apn>hb-acc>lnk-sw>mode>uplink-traffic
```

Description

This command specifies the time that the uplink traffic detection waits before selecting another UE in the multiple UE session, after a new UE has just been detected and selected.

The no form of this command reverts to the default.

Default

no hysteresis

Parameters

time

specifies the hysteresis time, in milliseconds

Values: 200 to 2000

Default: 500

5.2.1.3.101 monitoring-key

Syntax

`monitoring-key monitoring-key-profile-name`

`no monitoring-key`

Context

`config>mobile>pdn>apn>hybrid-access`

Description

This command specifies a monitoring key profile for the hybrid access. The monitoring key profile is configured in the policy options usage monitoring information context; see the `usage-monitoring-info` command.

The `no` form of this command removes the specified monitoring key profile.

Parameters

monitoring-key-profile-name

specifies the profile name, up to a 32 characters

5.2.1.3.102 idle-timeout

Syntax

`idle-timeout idle-timeout`

`no idle-timeout`

Context

`config>mobile>pdn>apn`

Description

This command configures the length of time a PDP context is allowed to be idle before it is removed by the PGW. The `idle-timeout` value itself belongs to the PDN connection. The `idle-timeout` is applied per PDN context. If there is data traffic on any of the bearers (default or dedicated), the `idle-timeout` is reset.

If there is no traffic on any of the bearers and the timer expires, all bearers are removed for that PDN context. High idle timeout values are relevant for those scenarios where the APN is reserved for machine-type communication where the UE may remain idle for an extended period of time.

The idle timer is reset if the PGW receives any PDU corresponding to the PDP context (uplink or downlink). This includes GTP-U PDUs. The idle timeout is changed without a PDN shutdown and the change affects new sessions only.

The no form of this command reverts to the default.

Default

no idle-timeout

Parameters

idle-timeout

specifies the amount of time, in seconds, a bearer must be idle before it is released

Values	0 5 to 2592000 (emergency APN)
--------	----------------------------------

–	0 60 to 2592000 (normal APN)
---	--------------------------------

Default: 0 (disabled)

5.2.1.3.103 idle-timer-direction-downlink

Syntax

[no] idle-timer-direction-downlink

Context

config>mobile>pdn>apn

Description

This command enables the idle timer to monitor the downlink traffic.

The `idle-timer-direction-uplink` and the `idle-timer-direction-downlink` commands allow the following combinations:

- when the `idle-timer-direction-downlink` and the `idle-timer-direction-uplink` commands are enabled, both downlink and uplink traffic are monitored

- when the `idle-timer-direction-downlink` command is disabled, and the `idle-timer-direction-uplink` command is enabled, only the uplink traffic is monitored
- when the `idle-timer-direction-uplink` command is disabled, and the `idle-timer-direction-downlink` command is enabled, only the downlink traffic is monitored
- when the `idle-timer-direction-downlink` command and the `idle-timer-direction-uplink` commands are disabled, both downlink and uplink traffic are monitored

The no form of this command reverts to the default action (disabled).

**NOTE:**

In CUPS deployments, Nokia recommends to avoid using the `idle-timer-direction-downlink` or the `idle-timer-direction-uplink` command on high-scale APNs because separate uplink and downlink SDF filters are used in the Create PDRs over PFCP/Sx-N4 instead of bidirectional SDF filters.

Default

`no idle-timer-direction-downlink`

5.2.1.3.104 `idle-timer-direction-uplink`

Syntax

`[no] idle-timer-direction-uplink`

Context

`config>mobile>pdn>apn`

Description

This command enables the idle timer to monitor the uplink traffic.

The `idle-timer-direction-uplink` and the `idle-timer-direction-downlink` commands allow the following combinations:

- when the `idle-timer-direction-downlink` and the `idle-timer-direction-uplink` commands are enabled, both downlink and uplink traffic are monitored
- when the `idle-timer-direction-downlink` command is disabled, and the `idle-timer-direction-uplink` command is enabled, only the uplink traffic is monitored
- when the `idle-timer-direction-uplink` command is disabled, and the `idle-timer-direction-downlink` command is enabled, only the downlink traffic is monitored
- when the `idle-timer-direction-downlink` and the `idle-timer-direction-uplink` commands are disabled, both downlink and uplink traffic are monitored

The no form of this command reverts to the default action (disabled).

**NOTE:**

In CUPS deployments, Nokia recommends to avoid using the `idle-timer-direction-downlink` or the `idle-timer-direction-uplink` command on high-scale APNs because separate uplink and downlink SDF filters are used in the Create PDRs over PFCP/Sx-N4 instead of bidirectional SDF filters.

Default

no idle-timer-direction-uplink

5.2.1.3.105 ignore-up-ip-allocation

Syntax

[no] ignore-up-ip-allocation

Context

config>mobile>pdn>apn

Description

This command ignores the UP-based IP address allocation configuration on the UP peer and instructs the system to perform CP-based IP address allocation.

The no form of this command reverts to the default (disabled).

Default

no ignore-up-ip-allocation

5.2.1.3.106 ip-alloc-allow-local

Syntax

[no] ip-alloc-allow-local

Context

config>mobile>pdn>apn

Description

This command enables the allocation of a PDN IP address from a local pool when an AAA server provides only one PDN IP address in response to a request for a PDN IPv4v6 address. For an HSS-assigned static address, if only one PDN IP address is provided via GTP signaling, the missing PDN IP address is assigned from the local pool.

The no form of this command reverts to the default (disabled).

NOTE:

The mobile gateway must accept the IP address received from the AAA server before the secondary IP address is allocated.

Default

no ip-alloc-allow-local

5.2.1.3.107 ip-alloc-extended-hss-allocation

Syntax

[no] ip-alloc-extended-hss-allocation

Context

config>mobile>pdn>apn

Description

This command enables validation of the external IP addresses provided via GTP against the remote IP pools configured in the APN. The session is rejected if the static IPv4 address/IPv6 prefix provided does not match the remote IP pools configured in the APN. The cause of rejection is "User Authentication Failure (92)".

The no form of this command reverts to the default (disabled).

Default

no ip-alloc-extended-hss-allocation

5.2.1.3.108 ip-alloc-extended-radius-allocation

Syntax

[no] ip-alloc-extended-radius-allocation

Context

config>mobile>pdn>apn

Description

This command specifies the following extended logic for handling UE IP address allocation-related parameters in the Accept-Accept response message from the RADIUS server.

- If the Access-Accept message contains 255.255.255.254 or 255.255.255.255 in the Framed-IP-Address, or the Framed-IP-Address is missing from the Accept-Accept message, the system allocates an IPv4 address for the UE from any of the IPv4 pools associated with the APN. This choice is available when an IPv4 address is allocated for the IPv4 or dual stack session. By default, the session activation fails for this case.
- If the Access-Accept message contains the directed broadcast IP address of any of the IPv4 subnets associated with the APN, the system allocates the IPv4 address for the UE from this subnet. The directed broadcast IP address of a subnet is the last IP address of the subnet. The directed broadcast IP address of the subnet is never allocated to the UE. For example, if the subnet of an IP address pool is 192.168.1.128/25, the directed broadcast IP address is 192.168.1.255. This choice is available when an IPv4 address is allocated for the IPv4 or dual stack session. By default, the system allocates the directed broadcast IP address to the UE for this case.
- In a few special cases, the session is rejected and the GTP cause is set to User Authentication Failure (92), including:
 - the IPv4/IPv6 address is outside the range of the configured remote IP pools; by default, a separate /32 address or /64 prefix would be allocated in this case
 - the IPv4 address is a subnet network address
 - the IPv4/IPv6 address value contains all zeros
 - the same IPv4/v6 address would be assigned for different sessions (rejected by default, only cause code changes)

The no form of this command reverts to the default.

Default

no ip-alloc-extended-radius-allocation

5.2.1.3.109 ip-alloc-method

Syntax

```
ip-alloc-method {local-pool | hss-static | aaa | dhcp-client | dhcp-relay} [{local-pool | hss-static | aaa | dhcp-client | dhcp-relay}...(up to 4 max)]  
no ip-alloc-method
```

Context

```
config>mobile>pdn>apn
```

Description

This command specifies the IP address allocation scheme used by APN for assigning IP addresses to UE.

NOTE:

- In the current release, dhcp-relay is not supported.
- ip-alloc-method can be changed without PDN or APN shutdown

The no form of this command reverts to the default.

Parameters

local-pool

specifies that the UE is assigned by a IP address defined in the local-pool under VPRN

hss-static

specifies the static IP address assigned by HSS to MME and conveyed to PGW during Create Session Request

aaa

specifies that the UE IP address is allocated using RADIUS/DIAMETER server using the framed-ip and framed-pool-name

dhcp-client

specifies that the UE IP address is allocated using DHCP

dhcp-relay

reserved value, not supported in the current release

Default: local-pool

5.2.1.3.110 ip-alloc-priority-order

Syntax

```
ip-alloc-priority-order hss-static  
no ip-alloc-priority-order
```

Context

```
config>mobile>pdn>apn
```

Description

This command specifies the priority order in which the UE IP address allocation methods are evaluated.

The no form of this command removes the configuration, meaning that the UE IP address allocation is done using the default order.

Default

```
no ip-alloc-priority-order
```

Parameters

hss-static

specifies that the HLR/HSS-provided static IP address is used if included in the GTP Create PDP Context Request/Create Session Request message, and this APN will also allow dynamic IP address allocation methods which would be otherwise preferred over the static IP

5.2.1.3.111 ip-allocation-trace

Syntax

```
[no] ip-allocation-trace
```

Context

```
config>mobile>pdn>apn
```

Description

This command enables syslog reporting when an IP address is allocated or released for the PDN connection.

The no form of this command reverts to the default behavior (reporting disabled).

Default

no ip-allocation-trace

5.2.1.3.112 ip-pool-exhaust-back-off-timer

Syntax

`ip-pool-exhaust-back-off-timer timer-value`

`no ip-pool-exhaust-back-off-timer`

Context

config>mobile>pdn>apn

Description

This command enables the PGW/PGW-C+SMF/SMF to provide a Back-Off timer IE to the MME (PGW/PGW-C) or a GPRS timer 3, NAS level message, to the 5G UE (SMF) whenever the PGW/PGW-C+SMF/SMF rejects a PDN/PDU session cause of IP pool exhaustion.

The command is available only to the real APN/DNN configuration context, not the virtual APN/DNN. The logic applies to both real and any associated virtual APN/DNN.

If a real APN/DNN, on which the `ip-pool-exhaust-back-off-timer` is enabled, has more than one virtual APNs/DNNs configured and the IP address pool exhaustion takes place on any of the associated virtual APNs/DNNs, the CMG includes the PGW Back-Off Time IE or GPRS timer 3 in the response to the MME/AMF.

NOTE:

- The PGW Back-Off Time IE is only reported over the GTPv2-C based on 3GPP TS 29.274. The GPRS timer 3 is included on the N11 interface message response from the SMF to AMF, and is delivered directly to the UE.
- When the `ip-pool-exhaust-back-off-timer` is active, for any session setup rejection due to IP address pool exhaustion, the PGW rejects the session with GTPv2 cause code 113 “APN Congestion”. For N11 interface message response from SMF to AMF, the “5GSM cause” value sent to the UE is the “Insufficient resources”.

Default

no ip-pool-exhaust-back-off-timer

Parameters

timer-value

specifies the time during which the MME or 5G UE should refrain from sending subsequent PDN/PDU connection establishment requests to the PGW/PGW-C or SMF for the specific IP pool exhausted APN/DNN use case, for services other than service users and emergency services, in minutes

Values: 1 to 120

Default: 1

5.2.1.3.113 kpi-kci

Syntax

```
kpi-kci
```

Context

```
config>mobile>pdn>apn
```

Description

This command enables a context to configure KPI-KCI parameters per APN. A configuration change using this command requires the APN to be in a shutdown state.

5.2.1.3.114 arp-traffic-stats

Syntax

```
arp-traffic-stats [inherit | enable | disable]
```

```
no arp-traffic-stats
```

Context

```
config>mobile>pdn>apn>kpi-kci
```

Description

This command enables the generation of per ARP (Allocation and Retention Policy) and per QCI Traffic KPI-KCI statistics at the APN. The per ARP and per QCI statistics are collected by KPIBearerTrafficQciArpCP-ISA, KPIBearerManagementQciArpCP-ISA, and KCIBearerManagementQciArpCP-ISA modules. The respective counter module must also be configured in an accounting policy linked to this PDN under the config>mobile>pdn>kpi-kci>accounting-policy context.

If the APN level configuration is explicitly set, it overrides the PDN-level configuration. If not, it inherits the configuration from the PDN level.

The no form of this command reverts to the default.

Parameters

inherit

specifies that the behavior for this APN is inherited from the PDN-level configuration

enable

enables the generation of per ARP traffic statistics

disable

disables the generation of per ARP traffic statistics

Default: inherit

5.2.1.3.115 enhanced-traffic-stats

Syntax

```
enhanced-traffic-stats [inherit | enable | disable]
```

```
no enhanced-traffic-stats
```

Context

```
config>mobile>pdn>apn>kpi-kci
```

Description

This command enables the generation of an enhanced set of statistics at the APN level. When enabled, all traffic statistics are generated for all sessions on this APN.

The respective counter modules containing these counters must also be configured in the accounting policy linked to this PDN, for these counters to be generated.

For more information about which KPI Bearer Traffic modules this configuration applies to, refer to the section of user plane statistics in the *CMG KPI-KCI Counters Guide*.

The no form of this command reverts to the default.

Parameters

inherit

specifies that the behavior for this APN is inherited from the PDN-level configuration

enable

enables the enhanced generation of the traffic statistics

disable

disables the enhanced generation of the traffic statistics

Default: inherit

5.2.1.3.116 qci-apn-stats

Syntax

`qci-apn-stats list-name`

`no qci-apn-stats`

Context

`config>mobile>pdn>apn>kpi-kci`

Description

This command specifies the QCI statistics profile name under the APN. The QCI values in this list are accounted for this APN in the per APN, per QCI statistics.

**NOTE:**

When you configure a QCI list under the `qci-apn-stats` context, the wildcard value is not allowed to be configured in the QCI list. Doing so, an error indicating the same is displayed.

The no form of this command reverts to the default.

Default

`no qci-apn-stats`

Parameters***list-name***

specifies the name of the QCI list profile (configured in the `config>mobile>profile>list>qci-list` context), up to 32 characters

5.2.1.3.117 sgw-apn-stats

Syntax

`[no] sgw-apn-stats`

Context

```
config>mobile>pdn>apn>kpi-kci
```

Description

This command defines that this APN will be accounted in the per APN stats on the SGW. The respective counter modules (KCIBearerManagementSgwApn, KPIBearerManagementSgwApn, KPIBearerTrafficSgwApn) must also be configured in the accounting policy linked to this PDN for the per APN statistics to get generated on the gateway.

The no form of this command disables this APN from being measured in the per APN statistics on the gateway.

Deletion of the APN configuration from the gateway also disables the APN from being measured in the per APN statistics.

NOTE:

The available ePDG KPI/KCI per APN statistics are the following:

- VS.sessionActivationsSuccess
- VS.sessionActvFCC92UsrAuthFailed
- VS.sessionActivationsFailure
- VS.sessionActvFCC68ServNotSuprt
- VS.sessionActvFCC72SystemFailure
- VS.sessionActvFCC73NoRsources
- VS.sessionActvFCC78MissOrUkwnApn
- VS.sessionActvFCC83PrfPdnTypNoSprt
- VS.nwInitDedBearerActvSuccess
- VS.nwInitDedBearerActvFailure

Default

```
no sgw-apn-stats
```

5.2.1.3.118 ldn

Syntax

```
ldn
```

Context

```
config>mobile>pdn>apn
```

Description

This command enables the context to configure the LADN configuration. The context is not required when the LADN is not enabled in the APN.

5.2.1.3.119 enable-ladn

Syntax

```
[no] enable-ladn
```

Context

```
config>mobile>pdn>apn>ladn
```

Description

This command enables the LADN in the APN or the DNN.

The no form of this command disables the LADN in the APN or the DNN.

5.2.1.3.120 on-ue-move-outside-ladn

Syntax

```
on-ue-move-outside-ladn {release-pdu | release-up}
```

```
no on-ue-move-outside-ladn
```

Context

```
config>mobile>pdn>apn>ladn
```

Description

This command configures the PDU session action when the UE moves outside the LADN.

The no form of this command reverts to the default action.

Parameters

release-pdu

specifies that the PDU session is released

release-up

specifies that the UP of the PDU session is suspended

Default: release-pdu

5.2.1.3.121 max-ambr-policer

Syntax

[no] max-ambr-policer

Context

config>mobile>pdn>apn

Description

This command enables the AMBR policer rate to be internally set to a maximum value for this APN. This value overrides the negotiated APN-AMBR for the subscriber's IP-CAN session. The no form of this command reverts to the default (disabled).

When enabled, this command overrides all other APN-AMBR values, either locally configured or obtained from the PCRF.

Default

no max-ambr-policer

5.2.1.3.122 max-pdn-connection

Syntax

max-pdn-connection *max-pdn-connections* {alarm | enforce]

no max-pdn-connection

Context

config>mobile>pdn>apn

Description

This command configures the maximum number of PDN connections for this APN on the gateway, and enables or disables alarms to be sent when the maximum PDN connections are reached or configures send alarms and to not accept any new PDN connections when the *max-pdn-connections* value has been

reached. When the configured maximum number is reached, an alarm event is raised at the end of the pulling interval.

The no form of this command disables and removes the maximum connection limit and disables sending alarm even when the *max-pdn-connections* value is reached.

**NOTE:**

In CUPS deployment, the command is applicable only for the SMF.

Default

Alarm event will be sent when max-pdn-connections limit has been reached.

Parameters

max-pdn-connections

specifies the maximum number of PDN connections

Values: 0 to 20000000

Default: 0

alarm

specifies sending an alarm even when max-pdn-connections has been reached

enforce

specifies sending an alarm and not accept any new PDN connections when max-pdn-connections has been reached

5.2.1.3.123 max-session-attach

Syntax

```
max-session-attach max-attach-limit [alarm] [include-emergency]
```

```
no max-session-attach
```

Context

```
config>mobile>pdn>apn
```

Description

This command configures the threshold of the maximum number of GTP-based attach requests per second. The limit is applied to the new PDN (GTPv2) and PDP (GTPv1) session attach requests received. By default, the emergency attach requests are excluded from the threshold. When this command is enabled, the *alarm* keyword specifies to raise an alarm when the maximum number of attaches is reached.

The no form of this command reverts to the default (no limit is applied to the number of attach requests).

**NOTE:**

This command cannot be enabled when APN overload is enabled for the APN.

Default

no max-session-attach

Parameters***max-attach-limit***

specifies the maximum number of attach requests per second

Values: 0 to 100000

Default: 0

alarm

specifies to raise an alarm when the maximum number of attach requests per second is reached

Default: disabled

include-emergency

specifies to include the emergency attach requests to the threshold

Default: disabled

5.2.1.3.124 min-pdn-connection

Syntax

min-pdn-connection *min-pdn-connections*

no min-pdn-connection

Context

config>mobile>pdn>apn

Description

This command configures the minimum number of PDN connections that can be allocated on the gateway for this APN.

The no form of this command removes PDN connections allocated to this APN.

Parameters

min-pdn-connections

specifies the minimum number of PDN connections

Values: 0 to 20000000

Default: 0

5.2.1.3.125 multi-ue-bonding

Syntax

[no] multi-ue-bonding

Context

config>mobile>pdn>apn

Description

This command enables multiple UE session bonding support. This requires the Framed-Route attribute assigned by the RADIUS server to be set. When enabled, the PGW allows up to three individual UEs to be programmed with the same Framed-Route attribute information, making them routable on the SGi interface.

The PGW forwards uplink traffic from any of the UEs on the SGi interface. The downlink traffic received on the SGi interface, for any of the Framed-routes, the PGW forwards it on the UE that was last detected to send uplink traffic to.

The no form of this command disables multiple UE session bonding support.

Default

no multi-ue-bonding

5.2.1.3.126 namf-profile

Syntax

namf-profile *profile-name*

no namf-profile

Context

config>mobile>pdn>apn

```
config>mobile>pdn>sba-client-services>amf-client>namf-comm  
config>mobile>pdn>sba-client-services>amf-client>namf-evt
```

Description

This command associates an AMF profile (configured using the `config>mobile>profile>namf-profile` command) for defining the failure handling policy when the AMF services are used.

The `no` form of this command removes the AMF profile association.

Parameters

profile-name

specifies a profile name, up to 32 characters

5.2.1.3.127 nemo-ha

Syntax

```
nemo-ha {enable | disable}  
no nemo-ha
```

Context

```
config>mobile>pdn>apn
```

Description

This command enables Network Mobility (NEMO) support for this APN.

The `no` form of this command disables nemo.

Default

```
no nemo-ha
```

Parameters

enable

enables the Network Mobility (NEMO) support for the APN

disable

disables the Network Mobility (NEMO) support for the APN

5.2.1.3.128 non-ip-pdn

Syntax

```
non-ip-pdn
```

Context

```
config>mobile>pdn>apn
```

Description

This command enables the context for non-IP PDN tunneling over SGi.

5.2.1.3.129 udp-tunnel-group

Syntax

```
udp-tunnel-group tunnel-group-name
```

```
no udp-tunnel-group
```

Context

```
config>mobile>pdn>apn>udp-tunnel-group>non-ip-pdn
```

Description

This command associates the non-IP PDN type with a UDP tunnel group.

The no form of this command removes the association.

Parameters

tunnel-group-name

the name of a profile that contains UDP tunnel group configuration, up to 32 characters

5.2.1.3.130 nsmf-dnn-threshold

Syntax

```
nsmf-dnn-threshold max-pdu-activations max-pdu-activations [alarm]
```

```
nsmf-dnn-threshold max-pdu-connections max-pdu-connections [alarm]
```

```
no nsmf-dnn-threshold
```

Context

config>mobile>pdn>apn

Description

This command configures the threshold of the maximum number of PDU connections or the maximum number of PDU activations per second for this DNN. The threshold is used for the Nsmf DNN NF congestion overload control. An alarm can be enabled to be sent when the maximum number of connections or the maximum number of activations is reached.

The no form of this command removes the configuration.

Parameters

max-pdu-activations

specifies the maximum number of PDN activations per second

Values: 0 to 5000 (activations per second)

Default: 0 (disabled)

max-pdu-connections

specifies the maximum number of PDN connections

Values: 1 to 20000000

Default: 0

alarm

specifies whether an alarm will be sent when the maximum number of activations or the maximum number of connections is reached

5.2.1.3.131 nsmf-profile

Syntax

nsmf-profile *profile-name*

no nsmf-profile

Context

config>mobile>pdn>apn

config>mobile>pdn>sba-client-services>smf-client>nsmf-pdusession

Description

This command associates an SMF profile. The SMF profile defines the failure handling policy when the SMF services are used.

The no form of this command removes the SMF profile association.

Parameters

profile-name

specifies the profile name, up to 32 characters

5.2.1.3.132 optimize-gbr

Syntax

[no] optimize-gbr

Context

config>mobile>pdn>apn

Description

This command enables the GBR optimization capability. Normally, the GBR and MBR are calculated by the PGW based on the active and installed rules for that bearer, without taking into account scenarios such as Call Hold. In this scenario, the potential exists for a subscriber to put the call on hold and later add a second call into conference. The subscriber requires only the predefined amount of bandwidth for this. However, certain active rules with flow-status set to disabled may still be included in the GBR/MBR calculations, resulting in excess bandwidth on the RAN. If optimize-gbr is enabled, the PGW calculates the GBR and MBR while taking into account previously allocated RAN resources and disabled flows. At any given time, allocated RAN resources do not drop below previously allocated resources.

The no form of this command disables the GBR optimization capability.

Default

no optimize-gbr

5.2.1.3.133 origin-realm-per-application

Syntax

origin-realm-per-application

Context

```
config>mobile>pdn>apn
```

Description

This command enables the context to configure the origin realm per Diameter application.

5.2.1.3.134 realm-gx

Syntax

```
realm-gx realm-gx  
no realm-gx
```

Context

```
config>mobile>pdn>apn>origin-realm-per-application
```

Description

This command configures the originating realm or domain name of a Diameter node running the Gx application.

If the origin realm is configured at the Diameter peer level using the `config>mobile>profile>diameter-peer` command, the configuration of this command is ignored.

The no form of this command removes the name from the configuration. By default (not configured), the origin realm is selected according to the origin realm configuration at the PDN, or at the Diameter level.

Parameters

realm-gx

specifies the originating host name, up to 80 characters

5.2.1.3.135 realm-gy

Syntax

```
realm-gy realm-gy  
no realm-gy
```

Context

```
config>mobile>pdn>apn>origin-realm-per-application
```

Description

This command configures the originating realm or domain name of a Diameter node running the Gy application.

If the origin realm is configured at the Diameter peer level using the `config>mobile>profile>diameter-peer` command, the configuration of this command is ignored.

The no form of this command removes the name from the configuration. By default (not configured), the origin realm is selected according to the origin realm configuration at the PDN level, or at the Diameter level.

Parameters

realm-gy

specifies the originating host name, up to 80 characters

5.2.1.3.136 realm-rf

Syntax

`realm-rf realm-rf`

`no realm-rf`

Context

`config>mobile>pdn>apn>origin-realm-per-application`

Description

This command configures the originating realm or domain name of a Diameter node running the Rf application.

If the origin realm is configured at the Diameter peer level using the `config>mobile>profile>diameter-peer` command, the configuration of this command is ignored.

The no form of this command removes the name from the configuration. By default (not configured), the origin realm is selected according to the origin realm configuration at the PDN level, or at the Diameter level.

Parameters

realm-rf

specifies the originating host name, up to 80 characters

5.2.1.3.137 realm-s6b

Syntax

```
realm-s6b realm-s6b  
no realm-s6b
```

Context

```
config>mobile>pdn>apn>origin-realm-per-application
```

Description

This command configures the originating realm or domain name of a Diameter node running the S6b application.

If the origin realm is configured at the Diameter peer level using the `config>mobile>profile>diameter-peer` command, the configuration of this command is ignored.

The `no` form of this command removes the name from the configuration. By default (not configured), the origin realm is selected according to the origin realm configuration at the PDN level, or at the Diameter level.

Parameters

realm-s6b

specifies the originating host name, up to 80 characters

5.2.1.3.138 realm-sd

Syntax

```
realm-sd realm-sd  
no realm-sd
```

Context

```
config>mobile>pdn>apn>origin-realm-per-application
```

Description

This command configures the originating realm or domain name of a Diameter node running the Sd application.

If the origin realm is configured at the Diameter peer level using the `config>mobile>profile>diameter-peer` command, the configuration of this command is ignored.

The no form of this command removes the name from the configuration. By default (not configured), the origin realm is selected according to the origin realm configuration at the PDN level, or at the Diameter level.

Parameters

realm-sd

specifies the originating host name, up to 80 characters

5.2.1.3.139 realm-swm

Syntax

```
realm-swm realm-swm
```

```
no realm-swm
```

Context

```
config>mobile>pdn>apn>origin-realm-per-application
```

Description

This command configures the originating realm or domain name of a Diameter node running the Swm application.

If the origin realm is configured at the Diameter peer level using the config>mobile>profile>diameter-peer command, the configuration of this command is ignored.

The no form of this command removes the name from the configuration. By default (not configured), the origin realm is selected according to the origin realm configuration at the PDN level, or at the Diameter level.

Parameters

realm-swm

specifies the originating host name, up to 80 characters

5.2.1.3.140 overload-back-off

Syntax

```
overload-back-off-timer
```

Context

```
config>mobile>pdn>apn
```

Description

This command enables the context to configure the overload back-off timer settings.

5.2.1.3.141 exclude-arp-list

Syntax

```
exclude-arp-list arp-list
```

```
no exclude-arp-list
```

Context

```
config>mobile>pdn>apn>overload-back-off
```

Description

This command associates an ARP list (configured using the `config>mobile>profile>list>arp-list` command) with ARP values for which the PGW will still accept Create Session Requests (csreq), even when the thresholds configured using the `gtp-pdn-threshold`, `max-connection`, or `gtp-pdn-threshold max-activations` commands are reached.

For example, an APN is configured with thresholds using the `gtp-pdn-threshold` and `max-connection`, or the `max-activations` commands and the `exclude-arp-list` command is configured with ARP values of 6 and 7.

When the configured thresholds are reached:

- in any subsequent Create Session Request with an ARP value of 6 or 7, the PGW accepts the request
- in any subsequent Create Session Request with any ARP value other than 6 or 7, the PGW rejects the request, responds with a Create Session Response with Cause Code APN Congestion (113), and includes the PGW Back-off timer IE

The no form of this command reverts to the default value (no ARP values are excluded).

Default

```
no exclude-arp-list
```

Parameters

arp-list

specifies the name of the ARP list; up to 32 characters

5.2.1.3.142 overload-back-off-timer

Syntax

```
overload-back-off-timer overload-back-off-timer  
no overload-back-off-timer
```

Context

```
config>mobile>pdn>apn>overload-back-off
```

Description

This command enables the PGW Back-Off timer IE to be sent when a `gtp-pdn-threshold` value is also configured. When enabled and the configured values of `gtp-pdn-threshold`, `max-connection`, or `gtp-pdn-threshold max-activations` are reached, in a subsequent Create Session Request, the PGW rejects the request, responds with a Create Session Response with Cause Code APN Congestion (113), and includes the PGW Back-off timer IE.

**NOTE:**

The PGW Back-Off timer is only reported over GTPv2-C based on 3GPP TS 29.274.

Default

```
no overload-back-off-timer
```

Parameters

overload-back-off-timer

specifies the time in minutes during which the MME should refrain from sending subsequent PDN connection establishment requests to the PGW for the congested APN, for services other than service users and emergency services

Values: 1 to 120

Default: 0 (disabled)

5.2.1.3.143 overload-control-profile

Syntax

```
overload-control-profile profile-name  
no overload-control-profile
```

Context

config>mobile>pdn>apn

Description

This command specifies the overload control profile that is used in the APN.

The no form of this command reverts to the default (no profile).

Default

no overload-control-profile

Parameters

profile-name

specifies the name of the profile, up to 32 characters

5.2.1.3.144 paging-bearer-binding

Syntax

[no] paging-bearer-binding

Context

config>mobile>pdn>apn

Description

This command enables bearer binding during paging for a combined SGW and PGW session. If bearer binding during paging is disabled and bearer binding fails, the default bearer context is included in DDN.

NOTE:

Dynamic change is supported and shutdown of the gateway is not required.

Default

no paging-bearer-binding

5.2.1.3.145 pcf-discovery

Syntax

pcf-discovery

Context

config>mobile>pdn>apn

Description

This command enables the context to configure APN-specific options for PCF discovery.

5.2.1.3.146 serving-scope

Syntax

serving-scope *value*

no serving-scope

Context

config>mobile>pdn>apn>pcf-discovery

Description

This command enables and configures the use of serving scope in the query criteria when the SMF discovers the PCF using the NRF.

The no form of this command reverts to the default (serving scope is not used in the query criteria).

Default

no serving-scope

Parameters

value

specifies the serving scope value to use in the query criteria, up to 32 characters

5.2.1.3.147 pdn-alloc-type

Syntax

```
pdn-alloc-type allocation-type
no pdn-alloc-type
```

Context

```
config>mobile>pdn>apn
```

Description

This command specifies whether the User Equipment (UE) gets the IP address by RAN signaling or from its DHCP client functionality after the default bearer is established.

The no form of this command removes the allocation type from the configuration.

Default

```
no pdn-alloc-type
```

Parameters

allocation-type
specifies the allocation type

Values	ietf	specifies that the UE gets the IP address by the DHCP client functionality after the default bearer is established
–	ran-signaling	specifies that the UE gets the IP address by RAN signaling

Default: ran-signaling

5.2.1.3.148 pdn-type

Syntax

```
pdn-type {ipv4 | ipv6 | ipv4v6 | non-ip | ethernet} [{ipv4 | ipv6 | ipv4v6 | non-ip |  
ethernet}... (up to 4 max)]  
  
no pdn-type
```

Context

```
config>mobile>pdn>apn
```

Description

This command specifies the Packet Data Network (PDN) type. The PGW does not support a combination of static and dynamic addressing for PDN type IPv4v6. If the PGW receives a Create Session Request for PDP Type IPv4v6 and:

- there is a single IPv4 address in the PDN Address Allocation (PAA) IE, the PGW accepts and sets the PDN type to IPv4

or

- there is a single IPv6 address in the PAA IE, the PGW accepts and sets the PDN type to IPv6

or

- there are both an IPv4 and an IPv6 address in the PAA IE, the PGW accepts and leaves the PDN type as IPv4v6

The PGW rejects requests for one static and one dynamic address when using PDN type IPv4v6.

The no form of this command reverts to the default.

Parameters

ipv4

specifies that IPv4 PDN sessions are supported by this APN

ipv6

specifies that IPv6 PDN sessions are supported by this APN

ipv4v6

specifies that IPv4v6 PDN sessions are supported by this APN

non-ip

specifies that non-IP PDN sessions are supported by this APN

ethernet

specifies that ethernet PDU sessions are supported by this APN. This pdn-type cannot be configured along with the other pdn-types

Default: ipv4

5.2.1.3.149 pdn-type-conversion

Syntax

[no] pdn-type-conversion

Context

config>mobile>pdn>apn

Description

This command allows the PGW to create a session if the requested PDN type is dual stack, and either IPv4 or IPv6 is blocked on a specific APN and MG group. To perform the session creation, the IP allocation method must be able to allocate a single stack.

The no form of this command signifies that the PDN type fallback is not allowed.

Default

pdn-type-conversion

5.2.1.3.150 pdn-type-preferred-ipv6

Syntax

[no] pdn-type-preferred-ipv6

Context

config>mobile>pdn>apn

Description

This commands forces the use of an IPv6 address for the PDN connection when there is a UE-requested dual stack IPv4v6 address PDN type and the APN supports only IPv4 and IPv6 addresses.

The no form of this command reverts to the default.

Default

no pdn-type-preferred-ipv6

5.2.1.3.151 pfcp-translate-tx

Syntax

pfcp-translate-tx *profile-name*

no pfcp-translate-tx

Context

config>mobile>pdn>apn

Description

This commands associates a PFCP translation profile (configured in the config>mobile>profile>pfcp>pfcp-translate-profile context) for sending opaque values from the CP to the UP per APN.

The no form of this command removes the profile association.

Parameters

profile-name

specifies the name of the profile, up to 32 characters

5.2.1.3.152 pfcp-user-plane-inactivity

Syntax

pfcp-user-plane-inactivity *up-inactivity-timer*

no pfcp-user-plane-inactivity

Context

config>mobile>pdn>apn

Description

This command configures user plane inactivity detection and reporting for N4 (5GC) sessions, including the time period to monitor for user inactivity. When enabled, the CP function provisions the User Plane Inactivity Timer IE, which instructs the UP function to monitor the user plane activity for the established

PFCP session, and reports when no user plane packets are received for the time period exceeding the duration specified by this command.

If the CP function receives a PFCP Session Report with a User Plane Inactivity Report, it initiates a deactivation of the UP connection (for example, a data radio bearer and N3 tunnel) for the established PDU session. If the PDU session goes into idle, or a PDU session handover to a 4G PDN session occurs, the CP function stops the user plane inactivity timer on the UP function. The timer restarts only if the PDU session is reactivated, or another handover to a PDU session occurs.

The no form of this command disables the timer and stops including the User Plane Inactivity Timer IE in the PFCP Session Establishment and PFCP Session Modification Requests.

For more information about the supported IEs and messages, refer to the *7750 SR MG and CMG PFCP (Sx and N4) Interface Description*.

**NOTE:**

The PFCP user plane inactivity timer is only used for N4 (5GC) sessions.

Default

no pfcp-user-plane-inactivity

Parameters

up-inactivity-timer

specifies the user plane inactivity time to be monitored by the UP function, in seconds

Values: 5 to 360

Default: 0 (user plane inactivity detection and reporting is stopped)

5.2.1.3.153 policy-on-the-fly

Syntax

policy-on-the-fly {new-sessions | existing-sessions [reactivate-if-fail]}

no policy-on-the-fly

Context

config>mobile>pdn>apn

Description

This command specifies whether modifications to predefined policy rules on the gateway will be applied to new PDN sessions only or to both new and existing sessions, without terminating the existing session. If a

conflict occurs when existing session is specified, the policy is rolled back, unless the option `reactivate-if-fail` is also specified. When `reactivate-if-fail` is specified, the session will terminate with a “reactivation required” cause code and the updated policy will be applied upon reattachment.

This functionality supports the ability to modify a policy that is referenced under an APN or installed on a UE without removing it from the APN or UE session. It applies to policies configured in the following contexts:

- `config>mobile>profile>policy-options`
 - `charging-rule-unit`
 - `policy-rule`
 - `policy-rule-base`
 - `policy-rule-unit`
- `config>mobile>pdn>apn>static-local-pcc`
 - `policy-rule`
 - `policy-rule-base`

If a modification fails toward the UE, the PDN session will terminate with a “reactivation-required” cause code. Also, references to profiles within a policy rule unit can change, but the contents of those profiles cannot change.

The no form of this command reverts to the default.

Parameters

new-sessions

specifies that policy updates apply to new sessions only

existing-sessions

specifies that policy updates will be applied to both new and existing sessions

reactivate-if-fail

optionally specified when `existing-sessions` is also specified, to indicate that in the case of a conflict, the existing session will be terminated with a “reactivation required” cause code and policy updates will be applied upon reattachment

Default: existing sessions (new and existing sessions with policy rollback in case of conflict)

5.2.1.3.154 ppi-mapping-profile

Syntax

`ppi-mapping-profile` *profile-name*

`no ppi-mapping-profile`

Context

config>mobile>pdn>apn

Description

This command references a PPI mapping profile, configured under config>mobile>profile>ppi-mapping-profile, to the APN. It is used to define the PPI when the SMF initiates paging in the AMF.

The no form of this command reverts to the default (if no PPI mapping profile is defined, the PPI IE is not passed to the AMF).

Default

no ppi-mapping-profile

Parameters

profile-name

specifies the PPI profile name, up to 32 characters

5.2.1.3.155 ppp-regeneration

Syntax

[no] ppp-regeneration

Context

config>mobile>pdn>apn

Description

This command enables PPP regeneration on behalf of the sessions that terminate on this APN. This command must be present if LT2P (config>service>vprn>l2tp" or (config>router>l2tp) is also configured for the APN or RADIUS is configured to send L2TP tunnel attributes in Access-Accept for this APN. With ppp-regeneration enabled only PPP regeneration-based traffic is allowed on this APN.

The no form of this command reverts to the default.

Default

no ppp-regeneration

5.2.1.3.156 exclude-dns-server-option

Syntax

[no] exclude-dns-server-option

Context

config>mobile>pdn>apn>ppp-regeneration

Description

This command includes or excludes requesting the primary and secondary DNS IP address configuration option from the LNS in the PPP IPCP negotiation.

For CUPS/5GC deployments, this command on the CP function includes or excludes requesting in the PFCP Session Establishment Request to the UP function the primary and secondary DNS IP address configuration option from the LNS in the PPP IPCP negotiation.

NOTE:

This command is not applicable on the UP function.

Default

no exclude-dns-server-option

5.2.1.3.157 exclude-nbns-server-option

Syntax

[no] exclude-nbns-server-option

Context

config>mobile>pdn>apn>ppp-regeneration

Description

This command includes or excludes requesting the primary and secondary NBNS IP address configuration option from the LNS in the PPP IPCP negotiation.

For CUPS/5GC deployments, this command on the CP function includes or excludes requesting in the PFCP Session Establishment Request to the UP function the primary and secondary NBNS IP address configuration option from the LNS in the PPP IPCP negotiation.

**NOTE:**

This command is not applicable on the UP function.

Default

no exclude-nbns-server-option

5.2.1.3.158 icrq-calling-number-type

Syntax

```
icrq-calling-number-type icrq-avp-identity  
no icrq-calling-number-type
```

Context

```
config>mobile>pdn>apn>ppp-regeneration
```

Description

This command specifies the value that will be sent in the ICRQ Calling-Number AVP as the subscriber identity for the LNS. The Calling-Number can be configured to include either the IMSI or the MSISDN, as received in the corresponding GTP-C Create Session Request/PDP Context Request from the UE.

For CUPS/5GC deployments, the ICRQ Calling-Number AVP included is either the IMSI or the MSISDN in the User ID IE that the UP function receives in the PFCP Session Establishment Request.

**NOTE:**

- If the Create Session Request/PDP Context request does not include the IMSI/MSISDN, the anonymous is populated in the Calling-Number AVP and sent to the LNS.
- For CUPS/5GC if the PFCP Session Establishment Req does not include the IMSI/MSISDN, the anonymous is populated in the Calling-Number AVP and sent to the LNS.
- This command is not applicable on the CP function of CUPS/5GC deployments.

The no form of this command reverts to the default.

Parameters***icrq-avp-identity***

specifies the value to include in the ICRQ Calling-Number AVP

Values	msisdn	sets the Calling-Number to include the MSISDN
–	imsi	sets the Calling-Number to include the IMSI

Default: msisdn

5.2.1.3.159 include-hss-static-ip

Syntax

```
[no] include-hss-static-ip
```

Context

```
config>mobile>pdn>apn>ppp-regeneration
```

Description

This command includes or excludes the static UE IP address, if assigned by the HSS, to the LNS. When enabled, the GGSN/PGW will send the IPCP Configuration Request message with the HSS-assigned static UE IP address to the LNS. When disabled (default), the GGSN/PGW will always send 0.0.0.0 in the IPCP configuration request to the LNS.

For CUPS/5GC deployments, this command on the CP function includes or excludes the static UE IP address, if assigned by the HSS, to the PFCP Session Establishment Request to the UP function. When enabled, the CP function requests the HSS-assigned static UE IP address to the LNS in the PPP IPCP negotiation.

NOTE:

This command is not applicable on the UP function.

Default

```
no include-hss-static-ip
```

5.2.1.3.160 l2tp-group

Syntax

```
l2tp-group tunnel-group-name
```

```
no l2tp-group
```

Context

```
config>mobile>pdn>apn>ppp-regeneration
```

Description

This command specifies the L2TP group name that is to be associated with the APN. Therefore, the *tunnel-group-name* configured here must match one of the *l2tp-group-name* that has been configured in the `config>service>vprn>l2tp>group` context.

In case of dynamic L2TP tunnel and session setup using RADIUS only single *l2tp-group* is required and is used by the mobile gateway LAC function as a template to pick up any needed information missing from the received tunnel attributes from RADIUS.

In case of preconfigured/static configured L2TP tunnels, there can be 1 or more *l2tp-group-name* (one per LNS peer) configured in case of several LNSs connected under the same APN.

NOTE:

This command is not applicable on the CP function of CUPS/5GC deployments.

The no form of this command reverts to the default.

Parameters

tunnel-group-name

specifies the name of the L2TP tunnel group

5.2.1.3.161 lcp-confreq-attributes

Syntax

```
lcp-confreq-attributes {include | exclude} [mru-size] [auth-type auth-type]
```

```
no lcp-confreq-attributes
```

Context

```
config>mobile>pdn>apn>ppp-regeneration
```

Description

This command includes or excludes the Last Sent LCP Confreq and Last Received LCP Confreq attributes in the L2TP ICCN message to the LNS in case of CHAP authentication and optionally, in case of PAP authentication.

**NOTE:**

This command is not applicable on the CP function of CUPS/5GC deployments.

Parameters**include**

configures to include the LCP ConFreq attributes in the L2TP ICCN message sent by the GGSN/PGW

exclude

configures to exclude the LCP ConFreq attributes in the L2TP ICCN message sent by the GGSN/PGW

Default: include

mru-size

configures the MRU size in bytes sent in the Last Sent LCP Confreq and the Last Received LCP Confreq attributes

Values: 512 to 4096

Default: 1500

auth-type

configures to send the LCP Confreq attributes only in cases of CHAP authentication or for both PAP and CHAP authentication

Values: chap-only | both

5.2.1.3.162 mobile-router

Syntax

[no] mobile-router

Context

config>mobile>pdn>apn>ppp-regeneration

Description

This command specifies if mobile routers are allowed or not.

When the command `mobile-router` is enabled, the anti-spoofing for L2TP/PPP-regeneration sessions is disabled and the PGW/GGSN, PGW-U/GGSN-U/UPF does not verify the source IPv4 address of uplink packets or the destination IPv4 address of downlink packets arriving over the L2TP session. This allows the UEs to act as mobile routers and forward any IP host traffic over the L2TP session to the LNS. This also

allows the LNS to forward packets to the IP host (other than UE) over the L2TP session/GTP tunnel toward the UE.

When the command `mobile-router` is disabled, the anti-spoofing for L2TP/PPP-regeneration sessions is enabled, the PGW/GGSN, PGW-U/GGSN-U/UPF will only forward uplink IP packets with the source IPv4 address assigned to the UE and downlink IP packets with destination IPv4 address assigned to the UE. Any other uplink or downlink packets are dropped and not sent over the L2TP session to the LNS. Similarly, any other downlink packets are dropped and not sent over the GTP tunnel toward the UE.

The no form of this command reverts to the default.

**NOTE:**

- Enabling or disabling this command will take effect on any new attach after the command has been executed.
- This command is not applicable on the CP function of CUPS/5GC deployments.

Default

no mobile-router

5.2.1.3.163 router

Syntax

`router router-instance`

`no router`

Context

`config>mobile>pdn>apn>ppp-regeneration`

Description

This command specifies the router instance that is to be associated with the APN. The router instance configured here must match one of the VPRN IDs that has been configured under `config>service>vprn`. One router instance can be configured per APN.

The no form of this command reverts to the default.

**NOTE:**

This command is not applicable on the CP function of CUPS/5GC deployments.

Parameters

router-instance

specifies the router instance VPRN ID

Values: 1 to 2147483647

5.2.1.3.164 rx-connect-speed

Syntax

rx-connect-speed *rx-connect-speed*

no rx-connect-speed

Context

config>mobile>pdn>apn>ppp-regeneration

Description

This command configures the L2TP receive connection speed value that will be included in the optional ICCN Rx Connect Speed AVP (38).

The no form of this command specifies not to send the ICCN Rx Connect Speed AVP.

NOTE:

- The L2TP receive connection speed is configured independently of the APN-AMBR value.
- This command is not applicable on the CP function of CUPS/5GC deployments.

Default

no rx-connect-speed

Parameters

rx-connect-speed

specifies the L2TP receive connection speed, in b/s

Values: 0 to 4200000000

5.2.1.3.165 tx-connect-speed

Syntax

```
tx-connect-speed tx-connect-speed  
no tx-connect-speed
```

Context

```
config>mobile>pdn>apn>ppp-regeneration
```

Description

This command configures the L2TP transmit connection speed value that will be included in the mandatory ICCN Rx Connect Speed AVP (24).

The no form of this command reverts to the default.

**NOTE:**

- The L2TP receive connection speed is configured independently of the APN-AMBR value.
- This command is not applicable on the CP function of CUPS/5GC deployments.

Parameters

tx-connect-speed

specifies the L2TP transmit connection speed, in b/s

Values: 0 to 4200000000

Default: 0

5.2.1.3.166 user-name

Syntax

```
user-name {[msisdn | misisdn-no-apn | imsi-no-apn | imsi] [password password password-  
type {fixed | default}] | pco [allow-pco-missing]]  
no user-name
```

Context

```
config>mobile>pdn>apn>ppp-regeneration
```

Description

This command specifies the username.

When the `user - name` command is set to `pco`, both PAP and CHAP authentication methods are supported. The authentication method, username, and password/challenge are all based on the received PCO IE parameters in the received Create-Session-Request/PDP-Context-Request or in the PDU Session Request. For CUPS/5GC deployments, the CP function includes this information in the L2TP User Info IE in the PFCP Session Establishment Request to the UP function.

When the `allow-pco-missing` keyword is set, any Create Session Request or PDP Context Request received without the PCO IE parameters, or with empty username and password/challenge, are issued with an L2TP ICCN set with Proxy Auth Type 'No Authentication' and Last Sent LCP CONFREQ without Authentication Protocol. Therefore, PPP LCP Config with PPP PAP Auth is supported even when the username and password credentials are missing.

Furthermore, when the `allow-pco-missing` keyword is set and a Create-Session-Request/PDP-Context-Request is received with PCO Auth having an empty username and a non-empty password or a non-empty username and an empty password, an L2TP ICCN is issued with Proxy Auth Type "PAP" (3) and Last Sent LCP CONFREQ with PAP.

When the `user - name` command is set to `msisdn` or `imsi`, both PAP and CHAP authentication methods are supported. The authentication method and password/challenge are based on the received PCO IE parameters, and the username is MSISDN@APN, MSISDN or IMSI@APN or IMSI in the received Create-Session-Request/PDP-Context-Request or PDU Session Request. Any username in the received PCO IE is ignored in this case. In CUPS/5GC deployments, the CP function includes this information in the L2TP User Info IE in the PFCP Session Establishment Request to the UP function.

When the `user - name` command is set to `msisdn` or `imsi` together with a local password and the `password - type` is set to `fixed`, the PAP authentication method is supported. The username in this case is MSISDN@APN, MSISDN, IMSI@APN or IMSI in the received Create-Session-Request/PDP-Context-Request and the password is local configured as `fixed`. Any PCO Auth IE containers in the received Create-Session-Request/PDP-Context-Request is ignored. In CUPS/5GC deployments, the CP function includes this information in the L2TP User info IE in the PFCP Session Establishment Request to the UP function.

When the `user - name` command is set to `msisdn` or `imsi` together with a local password with `password - type` configured as `default`, the username is MSISDN@APN, MSISDN, IMSI or IMSI@APN in the received Create-Session-Request/PDP-Context-Request. The default password will only be used in case the PCO Auth IE containers is missing or the password/challenge is missing from the PCO Auth IE from the received Create-Session-Request/PDP-Context-Request. In this case, the L2TP/PPP will be sent as PAP authentications, based on the username and the default password. When the PCO Auth IE containers is included in the received Create-Session-Request/PDP-Context-Request, the L2TP/PPP regeneration will be sent as PAP or CHAP authentication, based on the configured username and the PCO Auth IE containers and default password are not used. In CUPS/5GC deployments, the CP function includes this information in the L2TP User info IE in the PFCP Session Establishment Request to the UP function.

The no form of this command reverts to the default.

NOTE:

This command is not applicable on the UP function.

Parameters

msisdn

sets the username attribute to the MSISDN, combining the MSISDN and APN received in the PDP Context Request (default value)

msisdn-no-apn

sets the username attribute to the MSISDN received in the Create Session Request/PDP Context Request

imsi-no-apn

sets the username attribute to the IMSI as received in the Create Session Request/PDP Context Request

imsi

sets the username attribute to the IMSI@APN, combining the IMSI and the APN as received in the Create Session Request/PDP Context Request

password

configures a local password to be used in the PAP Authentication, up to 32 characters

password-type

specifies the type of password

Values	fixed	configures the local password as fixed type
–	default	configures the local password as default type

pco

specifies that the username is sent as received in the PDP Context Request PCO IE

allow-pco-missing

specifies to allow handling when the PCO Auth is missing, or the username and password credentials are missing or are empty

5.2.1.3.167 supported-vendor

Syntax

supported-vendor *custom-1*

no supported-vendor

Context

```
config>mobile>pdn>apn>ppp-regeneration
```

Description

This command configures the use of Nokia vendor IEs or custom-1 vendor IEs for L2TP/PPP regeneration in CUPS/5GC deployments over the PFCP/Sx-N4 interface.

The no form of this command reverts to the use of Nokia L2TP/PPP vendor IEs.

NOTE:

This command is not applicable on the UP function. Thus, the UP function can dynamically handle both cases of L2TP supported vendor IEs.

Default

no supported-vendor

Parameters

custom-1

specifies to use the custom-1 L2TP/PPP vendor IEs

5.2.1.3.168 pre-auth

Syntax

```
pre-auth type {radius [server-group server-group] [user-name user-name] [suppress-  
imsi] [pco-password] [password password password-type {fixed | default} [hash | hash2]] |  
diameter}
```

```
no pre-auth
```

Context

```
config>mobile>pdn>apn
```

Description

This command configures the pre-authentication type used to support Virtual APNs. Either RADIUS (AAA) or Diameter (Gx) can be used to acquire the new virtual APN.

For Diameter, the peer selection follows the regular Gx configuration for the current APN.

The no form of this command removes the pre-authentication from the configuration.

Parameters

type

specifies the authentication type used for pre-authentication

Values	radius	specifies to use RADIUS
–	diameter	specifies to use Diameter

Default: radius

server-group

specifies a server group name, up to 32 characters

user-name

specifies the user name used in access requests sent to an AAA server

Values: imsi | msisdn | pco | fixed

Default: imsi

suppress-imsi

specifies that the 3GPP-IMSI attribute is not included, applicable for RADIUS

pco-password

specifies to set the password to the value received in the GTP PCO

password

specifies the PAP password used in access requests sent to a RADIUS server, up to 32 characters; up to 54 characters are supported for a hash password and up to 96 characters for a hash2 password

password-type

specifies the password type

Values	fixed	fixed password for overriding the PCO content or providing password with the IMSI, MSISDN or APN username (with PAP)
–	default	default password to be used together with the IMSI, MSISDN or APN username, and when missing from the PCO (with PAP)

**NOTE:**

If the hash and hash2 parameters are not used for the password, the key is assumed to be in a non-encrypted clear text form. For security purposes, all keys are automatically stored in an encrypted hash form in the configuration. The information saves and uses the configuration defined in the `system>security>hash-control` context.

hash

specifies that the key is entered in an encrypted form

hash2

specifies that the key is entered in a more complex encrypted form

5.2.1.3.169 pre-auth-fixed

Syntax

`pre-auth-fixed user-name long-description-string password long-description-string [hash | hash2]`

`no pre-auth`

Context

`config>mobile>pdn>apn`

Description

This command configures the username and password for pre-authorization.

Parameters***long-description-string***

specifies the user name used in access requests sent to a AAA server when the authorized username is set to fixed, up to 32 characters

password long-description-string

specifies the password used to authenticate requests sent to a AAA server when the user name is set to fixed, up to 32 characters

hash

specifies the key is entered in an encrypted form. If the hash parameter is not used, the key is assumed to be in a non-encrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the hash parameter specified.

hash2

specifies the key is entered in a more complex encrypted form

If the hash2 parameter is not used, the less encrypted hash form is assumed

5.2.1.3.170 **preserve-volte**

Syntax

```
[no] preserve-volte
```

Context

```
config>mobile>pdn>apn
```

Description

This command preserves VoLTE traffic either when the PCRF is restarted and its origin ID is increased or when PCRF connectivity is lost and is not restored before the connection failure timer expires. VoLTE sessions are preserved until a DL packet is detected on the IMS signaling bearer (default bearer).

The no form of this command disables the behavior.

5.2.1.3.171 **qci-policy**

Syntax

```
qci-policy {qci-policy-name | uplink qci-policy-name [downlink qci-policy-name] | downlink  
qci-policy-name [uplink qci-policy-name]}
```

```
no qci-policy
```

Context

```
config>mobile>pdn>apn
```

Description

This command configures the QoS Class Identifier (QCI) policy profile name for uplink or downlink direction.

The no form of this command removes the policy name from the configuration.

NOTE:

This command requires an APN shutdown.

Default

no qci-policy

Parameters

qci-policy-name

specifies the QCI policy name

uplink *qci-policy-name*

specifies the QCI policy name for the uplink direction, up to 32 characters

downlink *qci-policy-name*

specifies the QCI policy name for the downlink direction, up to 32 characters

5.2.1.3.172 qfi-mapping-profile

Syntax

qfi-mapping-profile *profile-name*

no qfi-mapping-profile

Context

config>mobile>pdn>apn

Description

This command associates a QoS flow binding profile with the DDN for 5G systems. The profile needs to be created first before associating it for the specified DDN. QoS parameters specified within the profile are used for QoS flow binding. Profiles specified at the DDN level takes precedence over the one that is specified at the PDN level. When this optional profile is not configured, QFI is generated dynamically (in the range 1 to 64) using 5QI/ARP as default.

The no form of this command removes the profile name from the configuration.

Parameters

profile-name

specifies the QFI profile name, up to 32 characters

5.2.1.3.173 radius-accounting-on-off

Syntax

```
radius-accounting-on-off
```

Context

```
config>mobile>pdn>apn
```

Description

This command enables the context for controlling RADIUS accounting ON and OFF messaging.

NOTE:

- This command requires that RADIUS accounting is enabled.
- The command is possible to be changed on the fly but it will take effect only when APN is shutdown/no shutdown.

The commands in this context are effective only if the `config>mobile>pdn>radius>accounting-on-off - level` command is set to value `apn`.

5.2.1.3.174 include-duplicate-servers

Syntax

```
[no] include-duplicate-servers
```

Context

```
config>mobile>pdn>apn>radius-accounting-on-off
```

Description

This command configures the PGW/GGSN to send the RADIUS Accounting ON/OFF messages to the duplicate accounting servers too. The RADIUS Accounting ON/OFF messages are sent to the duplicate accounting servers only after a successful Acct-ON response has been received by the primary/secondary server. By default, these messages are not sent to the duplicate accounting servers.

The no form of this command reverts to the default.

Default

```
no include-duplicate-servers
```

5.2.1.3.175 messages-sent

Syntax

messages-sent {none | on | on-off}

no messages-sent

Context

config>mobile>pdn>apn>radius-accounting-on-off

Description

This command configures the PGW/GGSN sending of ON/OFF RADIUS Accounting messages per APN. The ON/OFF messages are optional and ON/OFF messaging must be explicitly enabled.

This command is effective only if the config>mobile>pdn>radius>accounting-on-off-level command is set to value apn.

The no form of this command reverts to the default.

Parameters

none

Accounting-ON or Accounting-OFF messages are not sent

on

only Accounting-ON messages are sent when the access point becomes active

on-off

both Accounting-ON and Accounting-OFF messages are sent

Default: none

5.2.1.3.176 wait-for-ack

Syntax

[no] wait-for-ack

Context

config>mobile>pdn>apn>radius-accounting-on-off

Description

This command configures the PGW/GGSN to wait for a response to Accounting-ON message from any server it has been sent to before allowing attaches to this APN. When this parameter is enabled, the system keeps on retrying infinitely by continuously sending Accounting-ON messages.

This command is effective only if the `config>mobile>pdn>radius>accounting-on-off-level` command is set to value `apn`.

The no form of this command reverts to the default.

Default

no wait-for-ack

5.2.1.3.177 radius-auth-cache

Syntax

[no] radius-auth-cache

Context

config>mobile>pdn>apn

Description

This command enables targeted bouncing to the MG group that serves the AAA-allocated IP pool(s). For dual-stack sessions, the session bouncing is performed to the respective MG group that has fragments/micronets/IP addresses for the provided IPv4 and IPv6 pools. After session bouncing, no separate RADIUS Authentication procedure is triggered by the new selected MG group, but the new MG group continues only with RADIUS Accounting (if configured on the used APN). The Acct-Session-ID AVP can be different across the authentication and accounting functions; this must be accepted by the customer AAA server.

The no form of this command reverts to the default.

Default

no radius-auth-cache

5.2.1.3.178 radius-case-sensitive-called-station-id

Syntax

[no] radius-case-sensitive-called-station-id

Context

config>mobile>pdn>apn

Description

This command specifies whether the Access Point Name (APN) is treated in a case sensitive manner in RADIUS.

The no form of this command reverts to the default.

Default

no radius-case-sensitive-called-station-id

5.2.1.3.179 radius-nas-identifier

Syntax

radius-nas-identifier *identifier-name*

no radius-nas-identifier

Context

config>mobile>pdn>apn

Description

This command specifies the NAS-Identifier to be used toward the RADIUS server. If not configured, the current v4 address of the interface defined in the radius-group is used.

The no form of this command reverts to the default.

Default

no radius-nas-identifier

Parameters

identifier-name

specifies the RADIUS NAS-Identifier, up to 32 characters

5.2.1.3.180 radius-nas-ip-address

Syntax

```
radius-nas-ip-address ipv4-address  
no radius-nas-ip-address
```

Context

```
config>mobile>pdn>apn
```

Description

This command configures the NAS-IP-Address that is used toward the RADIUS server. If an NAS-IP-Address is not configured, the current IPv4 address of the interface defined in the config>mobile>profile>radius-group context is used, or the MG group-specific IP address defined for the CMG LB-less architecture.

The no form of this command reverts to the default (RADIUS NAS-IP-Address disabled).

Default

```
no radius-nas-ip-address
```

Parameters

ipv4-address

specifies the RADIUS NAS-IP-Address

The special 0.0.0.0 address is not allowed because it is not a normal address.

Values: ipv4-address — a.b.c.d

5.2.1.3.181 reactivation-requested

Syntax

```
[no] reactivation-requested
```

Context

```
config>mobile>pdn>apn
```

Description

If this command is present, the PGW will send GTP-C cause #8 "reactivation requested" in Delete Bearer Request messages to disconnect the PDN. This cause code should be included for any case that the PGW deletes the PDN connection whether triggered externally (Gx, S6b, Gy, and so on) or internally via timeout or management intervention.

The no form of this command means the PGW sends the default cause code for the procedure.

Default

no reactivation-requested

5.2.1.3.182 redirect

Syntax

```
redirect mobile-all [external-nexthopv4 ipv4-address] | [external-nexthopv6 ipv6-address]  
no redirect
```

Context

```
config>mobile>pdn>apn
```

Description

This command configures the system to redirect all upstream mobile traffic toward the configured next-hops within this APN.

The no form of this command disables redirection.

Default

no redirect

Parameters

mobile-all

enables redirection

ipv4-address

specifies an IPv4 address to redirect traffic

ipv6-address

specifies an IPv6 address to redirect traffic

5.2.1.3.183 reject-foreign-subscribers

Syntax

```
[no] reject-foreign-subscribers
```

Context

```
config>mobile>pdn>apn
```

Description

When this command is enabled, the GGSN rejects Create PDP Context Requests for all foreign subscribers. A foreign subscriber is one whose PLMN ID (IMSI) does not match one of the GGSN PLMN IDs. When enabled, subscribers that are not in the home PLMN are rejected.

Default

```
no reject-foreign-subscribers
```

5.2.1.3.184 report-serving-node-supplied-cc-radius

Syntax

```
report-serving-node-supplied-cc-radius {enable | disable}  
no report-serving-node-supplied-cc-radius
```

Context

```
config>mobile>pdn>apn
```

Description

This command enables or disables the reporting of the serving node supplied charging characteristics value per APN. When enabled, the charging characteristics value received from the serving node is reported within the 3GPP-Charging-Characteristics AVP of RADIUS messages. When disabled, the internally used charging characteristics value is reported.

The no form of this command defines that the charging characteristics value from the charging profile is reported.

Default

```
report-serving-node-supplied-cc-radius enable
```

Parameters

enable

sets the reporting of the charging characteristics value received from the serving node

disable

sets the reporting of the charging characteristics value defined in the charging profile

5.2.1.3.185 report-serving-node-supplied-cc-s6b

Syntax

```
report-serving-node-supplied-cc-s6b {enable | disable}
```

```
no report-serving-node-supplied-cc-s6b
```

Context

```
config>mobile>pdn>apn
```

Description

This command enables or disables the reporting of the serving node supplied charging characteristics value reported per APN. When enabled, the charging characteristics value received from the serving node is reported within the 3GPP-Charging-Characteristics AVP of S6b messages. When disabled, the internally used charging characteristics value is reported.

The no form of this command defines that the charging characteristics value from the charging profile is reported.

Default

```
report-serving-node-supplied-cc-s6b enable
```

Parameters

enable

sets the reporting of the charging characteristics value received from the serving node

disable

sets the reporting of the charging characteristics value defined in the charging profile

5.2.1.3.186 restriction

Syntax

```
restriction {any | public1 | public2 | private1 | private2}  
no restriction
```

Context

```
config>mobile>pdn>apn
```

Description

This command specifies the level of restriction imposed on Evolved Packet System (EPS) bearer contexts created to the associated Access Point Name (APN). The value of this object is used to determine, on a per User Equipment (UE) basis, whether it is allowed to establish EPS bearers to other APNs.

The no form of this command reverts to the default.

Default

no restriction

Parameters

any | public1 | public2 | private1 | private2

specifies the level of restriction imposed on EPS bearer contexts created to the associated APN

5.2.1.3.187 roaming-handover

Syntax

```
roaming-handover
```

Context

```
config>mobile>pdn>apn
```

Description

This command enables the context to configure the supported features for the roaming handover.

5.2.1.3.188 **lte-qos-ambr**

Syntax

```
lte-qos-ambr downlink-rate downlink-rate uplink-rate uplink-rate  
no lte-qos-ambr
```

Context

```
config>mobile>pdn>apn>roaming-handover
```

Description

This command specifies the downlink and uplink APN-AMBR for roaming handovers to the LTE. If the APN-AMBR is specified, the PGW will initiate the APN-AMBR update after a RAT change from the UTRAN/GERAN to E-UTRAN and the UE is roaming (the S8 interface is used). If the MME sends the APN-AMBR in the Modify Bearer Command before the PGW has sent the Update Bearer Request, the PGW will send the Update Bearer Request as a reply to the Modify Bearer Command, using the APN-ABMR of the Update Bearer Request specified by this configuration. The configuration is allowed only if no PCRF is specified for the APN.

The no form of this command disables the APN-AMBR update.

Default

```
no lte-qos-ambr
```

Parameters

downlink-rate

specifies the downlink APN-AMBR in kb/s

Values: 1 to 1000000

uplink-rate

specifies the uplink APN-AMBR in kb/s

Values: 1 to 1000000

5.2.1.3.189 **lte-qos-black-list**

Syntax

```
lte-qos-black-list plmn-list-name  
no lte-qos-black-list
```

Context

config>mobile>pdn>apn>roaming-handover

Description

This command specifies the VPLMNs where the APN-ABMR update is disabled. There is no need to include HPLMN in the list, because the APN-AMBR update is never executed in the HPLMN.

Parameters

plmn-list-name

specifies the PLMN list name, up to 32 characters

5.2.1.3.190 lte-qos-delay

Syntax

lte-qos-delay *delay*

no lte-qos-delay

Context

config>mobile>pdn>apn>roaming-handover

Description

This command sets a delay before the PGW sends an Update Bearer Request based on the lte-qos-ambr.

The no form of this command reverts to the default.

Parameters

delay

specifies the delay, in seconds

Values: 0 to 5

Default: 0

5.2.1.3.191 router

Syntax

[no] router *router-instance*

Context

config>mobile>pdn>apn

Description

This command specifies the router to which this Access Point Name (APN) belongs. All subscribers belonging to this APN are mapped to this virtual router instance and therefore they all access the common services. Multiple router instances can be configured per APN for CMG LB-less architecture only.

The no form of this command reverts to the default.

Parameters

router-instance
specifies the router instance

Values	router-name service-id	
–	router-name	Base
–	service-id	1 to 2147483647

Default: Base

5.2.1.3.192 ip-local-pool

Syntax

[no] ip-local-pool *pool-name*

Context

config>mobile>pdn>apn>router
config>mobile>pdn>apn>router>tai-lai-list

Description

In the APN router context, this command configures an IP address pool in the Access Point Name (APN). In the TAI LAI list context, this command associates the IP address pool with the specified TAI LAI profile list.

A maximum of 8 IP pools can be configured for each APN.

The no form of this command removes the pool name from the configuration.

Parameters

pool-name

specifies a pool name, up to 32 characters

5.2.1.3.193 tai-lai-list

Syntax

[no] tai-lai-list *tai-lai-list-name*

Context

config>mobile>pdn>apn>router

Description

This command associates a Tracking Area Identity (TAI) or Location Area Identity (LAI) profile list in the APN.

The no form of this command removes the list from the configuration.

Parameters

tai-lai-list-name

specifies the name of a TAI or LAI profile list, up to 32 characters

5.2.1.3.194 router-advertisements

Syntax

router-advertisements

Context

config>mobile>pdn>apn

Description

This command enables the context to configure the IPv6 Stateless Address Auto Configuration (SLAAC) router advertisement parameters for PGW/GGSN.

5.2.1.3.195 max-advertisement-interval

Syntax

```
max-advertisement-interval seconds
no max-advertisement-interval
```

Context

```
config>mobile>pdn>apn>router-advertisements
```

Description

This command specifies the maximum time allowed between sending unsolicited multicast Router Advertisements as defined in 3GPP TS 29.061 and RFC 4861.

The no form of this command removes the configuration.

Parameters

seconds

specifies the maximum time, in seconds

Values	0 4 to 21600	–
–	The 0 value means that periodic sending is disabled.	–

Default: 21600

5.2.1.3.196 min-advertisement-interval

Syntax

```
min-advertisement-interval seconds
no min-advertisement-interval
```

Context

```
config>mobile>pdn>apn>router-advertisements
```

Description

This command specifies the minimum time allowed between sending unsolicited multicast Router Advertisements as defined in 3GPP TS 29.061 and RFC 4861.

The no form of this command removes the configuration.

NOTE:

The min-advertisement-interval value must not be greater than 0.75 times the max-advertisement-interval value.

Parameters

seconds

specifies the minimum time, in seconds

Values	0 3 to 16200	–
–	The 0 value means that periodic sending is disabled.	–

Default: 16200

5.2.1.3.197 rulebase-selection

Syntax

rulebase-selection

Context

config>mobile>pdn>apn

Description

This command enables the context for configuring priorities for the rulebase selection.

5.2.1.3.198 allow-rulebase

Syntax

```
allow-rulebase {gy-gx-aaa-local | gx-gy-aaa-local}  
no allow-rulebase
```

Context

```
config>mobile>pdn>apn
```

Description

This command configures the priorities for the rulebase selection. If not enabled, the default priorities are used.

Parameters

gy-gx-aaa-local

specifies that Gy has higher priority in setting the rulebase than Gx, Gx has higher priority than RADIUS, and RADIUS has higher priority than local configuration

gx-gy-aaa-local

specifies that Gx has higher priority in setting the rulebase than Gy, Gy has higher priority than RADIUS, and RADIUS has higher priority than local configuration

5.2.1.3.199 selected-dnn

Syntax

```
selected-dnn {real | virtual | amf-selected}  
no selected-dnn
```

Context

```
config>mobile>pdn>apn
```

Description

This command configures the DNN type in the PDU SESSION ESTABLISHMENT ACCEPT message.

The no form of this command reverts to the default.

Parameters

real

specifies to pass the real DNN in the DNN

virtual

specifies to pass the virtual DNN in the DNN; if the virtual DNN is not selected, the real DNN is passed in the DNN

NOTE:

To send the virtual DNN, execute the command in the virtual APN configuration.

amf-selected

specifies to pass the DNN selected by the AMF in the DNN; if the AMF does not select the DNN, the real DNN is passed in the DNN

Default: amf-selected

5.2.1.3.200 selection-mode

Syntax

```
selection-mode {subscribed-apn | ms-provided-apn | network-provided-apn}
[({subscribed-apn | ms-provided-apn | network-provided-apn}... (up to 3 max))]

no selection-mode
```

Context

```
config>mobile>pdn>apn
```

Description

This command ensures that the Mobile Station's (MS) subscription can use the APN. The setting specified for selection-mode is only examined during the processing of the APN contained in the Create Request and must match the corresponding setting on the SGSN/MME. If the two settings are not identical, the PGW/GGSN rejects the session with the cause code Cause: Service not supported (68).

The no form of this command returns the default.

Parameters

subscribed-apn

specifies that subscribed verified selection is allowed

ms-provided-apn

specifies that Mobile Station (MS) provided APN selection is allowed

network-provided-apn

specifies that network provided APN selection is allowed

Default: subscribed-apn

5.2.1.3.201 session-timeout

Syntax

`session-timeout session-timeout`

`no session-timeout`

Context

`config>mobile>pdn>apn`

Description

This command configures the absolute length of time that a PDN connection may exist before it is removed by the mobile gateway. The session timeout applies to all PDP/bearer contexts for the PDN connection simultaneously. Therefore, all PDP/ bearer contexts are removed upon reaching the session timeout. Also, it is supported in 5G. When the session-timeout expires, PDU session release procedure is initiated by the SMF. The session timeout is changed without a PDN shutdown and the change affects new sessions only.

When a session is created, it is added to a bucket that is determined by the window size and the configured session timeout value. The window size of the bucket is 300 seconds, this means, the session can be removed at any time within this time interval. The time interval starts at the time that is a multiple of the 300-seconds window size that is closer to the configured session timeout value. For example, if the configured session timeout is 1900 seconds, the session can be removed after 1800 seconds.

Default

`no session-timeout`

Parameters

session-timeout

specifies the timeout value, in seconds, of a session

Values: 0 (disabled), 1800 to 4294967295

Default: 86400

5.2.1.3.202 shutdown-back-off-timer

Syntax

```
shutdown-back-off-timer timer-value  
no shutdown-back-off-timer
```

Context

```
config>mobile>pdn>apn
```

Description

This command configures the back-off timer IE. When configured and the APN is in shutdown state, the PGW responds to new create session requests with cause code APN Congestion (113 for GTPv2 and 229 for GTPv1 messages) and includes the configured value of the back-off timer IE.

This configuration has the precedence over cause code configuration (configured using the `config>mobile>profile>gtp>gtpv2-session-rejection-cause` command) for a profile linked to a reference point.

The no form of this command disables this behavior.

Default

```
no shutdown-back-off-timer
```

Parameters

timer-value

specifies the timer value, in minutes

Values: 1 to 360

5.2.1.3.203 slices

Syntax

```
slices
```

Context

```
config>mobile>pdn>apn
```

Description

This command enters the context to configure slices for the APN.

5.2.1.3.204 default-slice

Syntax

```
default-slice slice-name [slice-list slice-list-name]  
no default-slice
```

Context

```
config>mobile>pdn>apn>slices
```

Description

This command configures the default slice of this APN/DNN. When the combined PGW-C/SMF cannot retrieve the UE subscribed S-NSSAIs from the UDM, the SMF fallback occurs to use the locally configured default S-NSSAI for this APN/DNN.

The no form of this command removes the default slice configuration from the APN.

Default

no default-slice

Parameters

slice-name

specifies the name of the slice, up to 32 characters

The slice name must be configured first to the slice-list for this APN/DNN

slice-list-name

specifies the name of the slice list that the slice name is configured, up to 32 characters

Nokia recommends configuring the *slice-list-name* to ensure unambiguous default slice configuration. If omitted, the default slice SST and SD are read from the first slice list that contains a slice with the given slice name.

5.2.1.3.205 slice-list

Syntax

```
slice-list list-name
```

```
no slice-list
```

Context

```
config>mobile>pdn>apn>slices
```

Description

This command configures the list of slices or a single slice for this APN/DNN. This configuration marks this APN as specific to this slice list. Registration to NRF includes the APN under the configured slices.

When set to `no slice-list`, the `slice-list` configured at the PDN level, applies to this APN.

The `no` form of this command reverts to the default.

Default

```
no slice-list
```

Parameters

list-name

Specifies the name of the slice list, up to 32 characters. The slice list is configured using the `config>mobile>profile>list>slice-list` command.

5.2.1.3.206 udm-based-slice-selection

Syntax

```
udm-based-slice-selection {enable | disable}
```

```
no udm-based-slice-selection
```

Context

```
config>mobile>pdn>apn>slices
```

Description

When a PDN connection is activated in the PGW-C, the PGW-C may need to select an S-NSSAI for the PDN connection when 5G interworking is enabled, or when the converged interfaces to other 5G NFs require that an S-NSSAI is defined. By default, the PGW-C uses the local slice configuration under the APN to select the S-NSSAI.

This command enables the UDM based S-NSSAI selection for the PGW-C. The PGW-C retrieves the subscription data of the UE from the UDM when the N10 interface is enabled. The returned subscription data from the UDM indicates which S-NSSAIs are subscribed in the APN, and the PGW selects the first S-NSSAI for the PDN connection.

The no form of this command reverts to the default.

Default

disable

Parameters

enable

enables the use of UDM subscription data in the S-NSSAI selection

disable

disables the use of UDM subscription data in the S-NSSAI selection

5.2.1.3.207 ssc

Syntax

ssc

Context

config>mobile>pdn>apn

Description

This command enables the context to configure Session and Service Continuity (SSC).

5.2.1.3.208 allowed-ssc-modes

Syntax

allowed-ssc-modes {ssc-1 | ssc-2 | ssc-3} [{ssc-1 | ssc-2 | ssc-3}... (up to 3 max)]

no allowed-ssc-modes

Context

config>mobile>pdn>apn>ssc

Description

This command controls the Data Network Name (DNN) supported SSC modes. It further restricts the supported SSC modes from the UDM subscription data but does not override them.

The no form of this command specifies that no SSC mode is allowed.

Default

no allowed-ssc-modes

Parameters

ssc-1

specifies that SSC mode 1 is allowed

ssc-2

specifies that SSC mode 2 is allowed

ssc-3

specifies that SSC mode 3 is allowed

5.2.1.3.209 pdu-session-address-lifetime

Syntax

pdu-session-address-lifetime *lifetime*

no pdu-session-address-lifetime

Context

config>mobile>pdn>apn>ssc

Description

This command configures the time duration that the network maintains the PDU session. The configured value is also communicated to the UE in the corresponding PCO container.

Default

no pdu-session-address-lifetime

Parameters

lifetime

specifies the value, in seconds, that the network maintains the PDU session

Values: 0 to 600

Default: 300

5.2.1.3.210 pdu-session-reactivation-trigger

Syntax

```
pdu-session-reactivation-trigger trigger
no pdu-session-reactivation-trigger
```

Context

```
config>mobile>pdn>apn>ssc
```

Description

This command defines the PDU session reactivation triggers.
The no form of this command reverts to the default.

Parameters

trigger
specifies the session reactivation trigger

Values	no-voice-call	specifies that no IMS voice calls QoS-flow (5QI=1) are active in the PDU session
–	idle	specifies the condition where the UPF indicated user inactivity
–	immediately	specifies PDU session reactivation procedure starts immediately after the handover procedure is completed

Default: immediately

5.2.1.3.211 pfcf-user-plane-inactivity-iupf-case

Syntax

```
pfcf-user-plane-inactivity-iupf-case up-inactivity-timer
no pfcf-user-plane-inactivity-iupf-case
```

Context

```
config>mobile>pdn>apn>ssc
```

Description

This command configures the User Plane inactivity detection and reporting for N4 (5GC) sessions (A-SMF to A-UPF), including the time period to monitor for user inactivity in the UL-CL/I-UPF use case.

The no form of this command disables the timer and stops including the user plane inactivity timer IE in the PFCP session establishment and PFCP session modification requests.

Default

```
no pfcp-user-plane-inactivity-iupf-case
```

Parameters

up-inactivity-timer

specifies the User Plane inactivity time monitored by the UP function, in seconds

Values: 5 to 360

Default: 0 (no user plane inactivity detection and reporting)

5.2.1.3.212 reject-not-allowed-ssc-mode

Syntax

```
[no] reject-not-allowed-ssc-mode
```

Context

```
config>mobile>pdn>apn>ssc
```

Description

This command configures the SMF to reject a new PDU session request if the SSC mode is incompatible with the allowed SSC modes.

The no form of this command configures the SMF to set the SSC mode to the default, if the requested SSC mode is not allowed.

Default

```
no reject-not-allowed-ssc-mode
```

5.2.1.3.213 upf-reselection

Syntax

```
upf-reselection [ssc-1-option] [ssc-2 ssc-2-option] [ssc-3 ssc-3-option]
no upf-reselection
```

Context

```
config>mobile>pdn>apn>ssc
```

Description

This command enables the UPF reselection.

The no form of this command disables the UPF reselection for active PDU sessions. The UPF is selected only during the PDU session activation time when there is no selective traffic offloading, that is using an UL-CL or BP.

Default

```
no upf-reselection
```

Parameters

ssc-1-option
specifies the SSC mode 1 configuration option

Values	disabled	specifies that the UPF reselection is disabled
–	location	specifies that the UPF reselection is completed when there is a location change and the new location cannot be served by the serving UPF
–	load	specifies that the UPF reselection is done when the load in the serving UPF reaches a predefined threshold, that is, 90%
–	i-smf	specifies that the UPF reselection is done when there is an I-SMF inserted that is located at a province different from the A-SMF

Default: disabled

ssc-2-option

specifies the SSC mode 2 configuration option

Values	disabled	specifies that the UPF reselection is disabled
–	location	specifies that the UPF reselection is completed when there is a location change and the new location cannot be served by the serving UPF
–	load	specifies that the UPF reselection is done when the load in the serving UPF reaches a predefined threshold, that is, 90%
–	i-smf	specifies that the UPF reselection is done when there is an I-SMF inserted that is located at a province different from the A-SMF

Default: disabled

ssc-3-option

specifies the SSC mode 3 configuration option

Values	disabled	specifies that the UPF reselection is disabled
–	location	specifies that the UPF reselection is completed when there is a location change and the new location cannot be served by the serving UPF
–	load	specifies that the UPF reselection is done when the load in the serving UPF reaches a predefined threshold, that is, 90%
–	i-smf	specifies that the UPF reselection is done when there is an I-SMF inserted that is located at a province different from the A-SMF

Default: disabled

5.2.1.3.214 uuid-mask-length

Syntax

uuid-mask-length *length*

no uuid-mask-length

Context

config>mobile>pdn>apn>ssc

Description

This command configures the mask length of the node part (six octets) of the UUID that is under comparison.

The no form of this command removes the configuration.

Default

no uuid-mask-length

Parameters

length

specifies the length, in bits

Values: 8 to 48

Default: 0

5.2.1.3.215 static-local-pcc

Syntax

static-local-pcc

Context

config>mobile>pdn>apn

Description

This command enables the context to configure static local policy rules and rule bases for the PDN. Whereas predefined rules locally configured on the gateway are activated and deactivated for a PDN session by the PCRF referencing the rule name and/or rule base name, the static policy rules locally configured on the gateway are activated and deactivated by the PCEF (gateway) for a PDN session. The PCRF is unaware of these static local policies.

The following assumptions apply.

- A static policy applied for a PDN session that is under PCRF control is applicable to the default bearer only.
- Static policy rules locally instantiated by the PCEF (gateway) are never communicated to the PCRF (for example, in a charging rule report).
- The Override Control feature applies to predefined and static rules.

5.2.1.3.216 abort

Syntax

```
abort
```

Context

```
config>mobile>pdn>apn>static-local-pcc
```

Description

This command ends the current policy editing session entered via the `begin` command and discards changes that have been made to policies during the editing session.

5.2.1.3.217 begin

Syntax

```
begin
```

Context

```
config>mobile>pdn>apn>static-local-pcc
```

Description

This command begins a policy editing session. Modifications done during the editing session will take effect when the `commit` command is issued. The editing session continues until either an `abort` or `commit`

command is issued, or a control complex reset takes place. Editing sessions are not interrupted by high-availability activity switches or CLI session terminations, such as closing a Telnet session.

5.2.1.3.218 **commit**

Syntax

```
commit
```

Context

```
config>mobile>pdn>apn>static-local-pcc
```

Description

This command saves changes made during the current policy editing session (see the `begin` command). Policy changes made during the editing session take effect only when they are committed. If the changes are successfully committed, with no errors detected during the commit or cross-reference verification against the existing policy configuration, the editing session will also be closed.

5.2.1.3.219 **dedicated-bearers**

Syntax

```
dedicated-bearers
```

Context

```
config>mobile>pdn>apn>static-local-pcc
```

Description

This command configures static rules and rule bases for the creation of dedicated bearers.

NOTE:

There can be a maximum of 10 static policy items per session, so the number of dedicated bearers triggered based on feature ADC Extended to Static PCC and VoIP Optimization is limited. One Layer 3/ Layer 4 data-driven rule is considered as a rule with two static policy items when data-driven dedicated bearer is active due to that rule. Local immediate dedicated bearer triggering rule is considered as a rule with one static policy item.

5.2.1.3.220 default-bearer-qci

Syntax

```
[no] default-bearer-qci qci qci arp arp-value
```

Context

```
config>mobile>pdn>apn>static-local-pcc>dedicated-bearers
```

Description

This command enables the configuration of static rules and rule bases that will create dedicated bearers for the configured default bearer QCI-ARP.

The no form of this command removes the configuration.

Parameters

qci

specifies the value of the QCI

Values: 1 to 9 | 65 | 66 | 69 | 70 | 128 to 254 | * (wildcard)

arp-value

specifies the value of the ARP

Values: 1 to 15 | * (wildcard)

5.2.1.3.221 policy-rule

Syntax

```
[no] policy-rule policy-rule-name
```

Context

```
config>mobile>pdn>apn>static-local-pcc>dedicated-bearers>default-bearer-qci
```

Description

This command configures the static local policy rules under the APN that are applied to PDN sessions locally by the gateway. These policy rules can create dedicated bearers when installed in a default bearer of the configured QCI-ARP.

The PCRF is not aware of the static policy that is applied for a PDN session.

By default, the system supports modifications to policies that are referenced under an APN or installed on a UE (via a PCRF or APN configuration), without having to remove them from the APN or the UE session. Changes are applied to existing sessions based on the APN policy-on-the-fly configuration.

The no form of this command disables the policy rule.

Parameters

policy-rule-name

specifies the name of the policy rule, up to 64 characters

5.2.1.3.222 policy-rule-base

Syntax

[no] policy-rule-base *policy-rule-base-name*

Context

config>mobile>pdn>apn>static-local-pcc>dedicated-bearers>default-bearer-qci

Description

This command configures the static local policy rule bases under the APN that are applied to PDN sessions locally by the gateway. These policy rule bases can create dedicated bearers when installed in a default bearer of the configured QCI-ARP.

The PCRF is not aware of the static policy that is applied for a PDN session.

By default, the system supports modifications to policies that are referenced under an APN or installed on a UE (via a PCRF or APN configuration), without having to remove them from the APN or the UE session. Changes will be applied to existing sessions based on the APN policy-on-the-fly configuration.

The no form of this command disables the policy rule.

Parameters

policy-rule-base-name

specifies the name of the policy rule base, up to 64 characters

5.2.1.3.223 diff

Syntax

diff

Context

```
config>mobile>pdn>apn>static-local-pcc
```

Description

This command shows the uncommitted changes made during a policy editing session (see the `begin` and `commit` commands).

5.2.1.3.224 policy-rule

Syntax

```
[no] policy-rule policy-rule-name
```

Context

```
config>mobile>pdn>apn>static-local-pcc
```

Description

This command configures static local policy rules under the APN that are applied to PDN sessions locally by the gateway. The PCRF is not aware of the static policy that is applied for a PDN session.

By default, the system supports modifications to policies that are referenced under an APN or installed on a UE (via PCRF or APN configuration), without having to remove them from the APN or the UE session. Changes will be applied to existing sessions based on the `policy-on-the-fly` configuration.

The `no` form of this command disables the policy rule.

Parameters

policy-rule-name

specifies the name of the policy rule, up to 64 characters

5.2.1.3.225 policy-rule-base

Syntax

```
[no] policy-rule-base policy-rule-base-name
```

Context

```
config>mobile>pdn>apn>static-local-pcc
```

Description

This command configures static local policy rule bases under an APN that are applied to PDN sessions locally by the gateway. The PCRF is not aware of the static policy that is applied for a PDN session.

By default, the system supports modifications to policies that are referenced under an APN or installed on a UE (via PCRF or APN configuration), without having to remove them from the APN or the UE session. Changes will be applied to existing sessions based on the APN *policy-on-the-fly* configuration.

The no form of this command disables the policy rule base.

Parameters

policy-rule-base-name

specifies the name of the policy rule base, up to 64 characters

5.2.1.3.226 static-predefined-pcc

Syntax

```
static-predefined-pcc
```

Context

```
config>mobile>pdn>apn
```

Description

This command enables the context to configure static policy parameters for PDN.

5.2.1.3.227 default-policy-rule-base

Syntax

```
[no] default-policy-rule-base base-policy-name
```

Context

```
config>mobile>pdn>apn>static-predefined-pcc
```

Description

This command configures policy-rule-bases to the APN in case PCRF is not in use.

Parameters

base-policy-name

specifies the name of the policy rule base, up to 64 characters

5.2.1.3.228 default-qci

Syntax

```
default-qci qci [arp arp-value]
```

```
no default-qci
```

Context

```
config>mobile>pdn>apn>static-predefined-pcc
```

Description

This command configures QCI and ARP override for default bearer/primary PDP context in case PCRF is not in use.

Parameters

qci

specifies the QCI value

Values: 1 to 64 | 67 to 255

NOTE:

Nokia recommends setting only non-GBR QCI values.

arp-value

specifies the ARP value

Values: 1 to 15

Default: matches all ARP values

5.2.1.3.229 steering

Syntax

```
steering
```

Context

```
config>mobile>pdn>apn
```

Description

This command enables the context to configure steering parameters.

5.2.1.3.230 default-gw-addr-ipv4

Syntax

```
default-gw-addr-ipv4 ip-address
```

```
no default-gw-addr-ipv4
```

Context

```
config>mobile>pdn>apn>steering>gw-signaling-addr
```

Description

This command configures the default IPv4 address of the default PGW/GGSN on a standalone SSG, in case no matching signaling interface address is configured. The PGW/GGSN address is used for forwarding downlink traffic based on the gateway signaling address received on the Sd interface.

The no form of this command reverts to the default.

Default

```
no default-gw-addr-ipv4
```

Parameters

ip-address

specifies the IPv4 IP address for the default PGW/GGSN

5.2.1.3.231 default-gw-addr-ipv6

Syntax

```
default-gw-addr-ipv6 ip-address
```

```
no default-gw-addr-ipv6
```

Context

```
config>mobile>pdn>apn>steering>gw-signaling-addr
```

Description

This command configures the default IPv6 address of the default PGW/GGSN on a standalone SSG, in case no matching signaling interface address is configured. The PGW/GGSN address is used for forwarding downlink traffic based on the gateway signaling address received on the Sd interface.

The no form of this command reverts to the default.

Default

```
no default-gw-addr-ipv6
```

Parameters

ip-address

specifies the IPv6 IP address for the default PGW/GGSN

5.2.1.3.232 gw-signaling-addr

Syntax

```
[no] gw-signaling-addr addr-list-name
```

Context

```
config>mobile>pdn>apn>steering
```

Description

This command configures a list of IP addresses on a standalone SSG to match the signaling interface addresses on the PGW/GGSN, for example, S5, S8, Gn, Gp, S2a, S2b, and so on. The PGW/GGSN signaling interface address is received on the standalone SSG via the Sd interface from the PCRF. The signaling interface address is used on the standalone SSG for selection of the PGW/GGSN for downlink traffic received for a UE that is assigned a static IP address.

The no form of this command reverts to the default.

Parameters

addr-list-name

specifies a list of IPv4 or IPv6 addresses to define a IP match list that can be used across features that require IP address list

5.2.1.3.233 gw-addr-ipv4

Syntax

```
gw-addr-ipv4 ip-address  
no gw-addr-ipv4
```

Context

```
config>mobile>pdn>apn>steering>tw-signaling-addr
```

Description

This command configures the IPv4 address of a PGW/GGSN on a standalone SSG. The PGW/GGSN address is used for forwarding downlink traffic based on the gateway signaling address received on the Sd interface.

The no form of this command reverts to the default.

Default

```
no gw-addr-ipv4
```

Parameters

ip-address

specifies the IPv4 address of a PGW/GGSN on standalone SSG

5.2.1.3.234 gw-addr-ipv6

Syntax

```
gw-addr-ipv6 ip-address  
no gw-addr-ipv6
```

Context

```
config>mobile>pdn>apn>steering>tw-signaling-addr
```

Description

This command configures the IPv6 address of a PGW/GGSN on a standalone SSG. The PGW/GGSN address is used for forwarding downlink traffic based on the gateway signaling address received on the Sd interface.

The no form of this command reverts to the default.

Default

no gw-addr-ipv6

Parameters

ip-address

specifies the IPv4 address of a PGW/GGSN on standalone SSG

5.2.1.3.235 subscriber-mapping-profile

Syntax

subscriber-mapping-profile *profile-name*

no subscriber-mapping-profile

Context

config>mobile>pdn>apn

Description

This command indicates the subscriber mapping profile used in this access point when SSG is deployed as a Multi-Path TCP (MP-TCP) Hybrid Access Gateway (HAG). If not configured with this command, the subscriber mapping profile name configured in the context config>mobile>profile>sub-id-mapping will be used.

Whether the subscriber context is created via RADIUS or PCRF needs to be specified with the transit-sub command in the config>service>vprn>ip-local-pool context.

The no form of this command reverts to the default (not used).

Parameters

profile-name

specifies the name of the subscriber mapping profile, up to 32 characters

5.2.1.3.236 svc-steering

Syntax

svc-steering

Context

```
config>mobile>pdn>apn
```

Description

This command configures service steering.

5.2.1.3.237 default-steering-profile

Syntax

```
default-steering-profile profile-name  
no default-steering-profile
```

Context

```
config>mobile>pdn>apn>svc-steering
```

Description

This command specifies a steering profile at the APN level. If all SDF's within an APN are steered to the same service chain, the steering profile at the APN level suffices. Alternately, different SDFs can be steered to different service chains by associating a steering profile at the SDF level (which overrides the APN level).

The no form of this command removes the associated steering profile for this APN.

Parameters

profile-name

specifies the name of the steering profile, up to 32 characters

5.2.1.3.238 transport-byte-collection

Syntax

```
transport-byte-collection
```

Context

```
config>mobile>pdn>apn
```

Description

This command configures the collection of transported bytes and, or packets for a specific IMSI and, or MSISDN.

NOTE:

- Up to 256 sessions (IMSI/MSISDN) per APN can be configured.
- The show commands work only when the feature is enabled and the session is up (before detach).
- In CUPS, CLI is configured in the PGW-C/SMF and statistics are collected from the PGW-U/UPF by a proprietary PFCP IE. Therefore, both PGW-C/SMF and PGW-U/UPF must be Nokia components.
- The feature does not work if the session has no charging and there is no acctmgr event configured, or in the case of light AcctMgr PDN case. However, the feature works with one rule with no charging, where the acctmgr event is configured.
- There is no persistence of data (DL/UL packets/bytes) after a IOM failover. The persistent data is in the internal table with the keys. If the feature is enabled and configured for an IMSI/MSISDN, a card/shelf failover occurs. In this case, the show command displays zero data. If the call is still attached, packet/bytes for any new traffic will be displayed after the failover.
- You must not track the same device with different identifiers. Non-deterministic behavior occurs when you invoke the `configure mobile-gateway pdn apn IMSI` and `configure mobile-gateway pdn apn MSISDN` commands back-to-back for the same IMSI/MSISDN pair.
- The feature is not supported when a duplicate MSISDN feature is enabled while invoking this feature. This can result in non-deterministic behavior.
- This feature must not be used together with the `collect-display-stats` command.

5.2.1.3.239 imsi

Syntax

```
imsi imsi [static-rule static-rule] [dynamic-rule dynamic-rule]
```

```
no imsi imsi
```

Context

```
config>mobile>pdn>apn>transport-byte-collection
```

Description

This command enables the collection of transport bytes/packets for a specific IMSI.

Default

no imsi

Parameters

imsi

specifies the IMSI, up to 15 digits

static-rule

specifies if the collection is enabled for static policy rules

Values: configured, all, none

Default: all

dynamic-rule

specifies if the collection is enabled for dynamic policy rules

Values: all, none

Default: all

5.2.1.3.240 msisdn

Syntax

`msisdn msisdn [static-rule static-rule] [dynamic-rule dynamic-rule]`

`no msisdn msisdn`

Context

config>mobile>pdn>apn>transport-byte-collection

Description

This command enables the collection of transport bytes/packets for a specific MSISDN.

Default

no msisdn

Parameters

msisdn

specifies the MSISDN, up to 15 digits

static-rule

specifies if the collection is enabled for static policy rules

Values: configured | all | none

Default: all

dynamic-rule

specifies if the collection is enabled for dynamic policy rules

Values: all | none

Default: all

5.2.1.3.241 twag-radius-acct-feed

Syntax

[no] twag-radius-acct-feed

Context

config>mobile>pdn>apn

Description

This command specifies for TWAG open SSID if the radius accounting information feed is to be used to inform the radius server when a new UE accesses (issuing DHCP request). The no form means HTTP header enrichment is used instead in the HTTP redirect to the captive portal.

Default

no twag-radius-acct-feed

5.2.1.3.242 udm-ctrl-radius-auth

Syntax

[no] udm-ctrl-radius-auth

Context

config>mobile>pdn>apn

Description

This command enables or disables the UDM-controlled RADIUS authentication. When disabled, the existing implementation applies, that is, the secondaryAuth attribute is ignored from the UDM, and local policies at the SMF are followed. When enabled, the command checks the secondaryAuth attribute from the UDM and proceeds accordingly, that is, if set as true, RADIUS authentication is required, but if set as false, RADIUS

authentication is not required. If absent, a secondary authentication is not required by the subscription, but it can be required by local policies at the SMF.

The no form of this command reverts to the default.

Default

no udm-ctrl-radius-auth

5.2.1.3.243 udm-sdm-disabled

Syntax

```
udm-sdm-disabled {lte | non-3gpp | eps}
no udm-sdm-disabled
```

Context

```
config>mobile>pdn>apn
```

Description

This command disables the Nudm_SubscriberDataManagement service in the APN/DNN. If there is access type change, the service remains disabled even if the service is allowed when the session is created in the new access type. If the service is disabled, the local configuration is used to define the session management subscription.

The no form of this command removes this configuration.

Parameters

lte

the Nudm_SubscriberDataManagement service is disabled if the session is created from MME

non-3gpp

the Nudm_SubscriberDataManagement service is disabled if the session is created from ePDG

eps

the Nudm_SubscriberDataManagement service is disabled if the session is created from MME or ePDG

5.2.1.3.244 udm-sdm-profile

Syntax

```
udm-sdm-profile profile-name  
no udm-sdm-profile
```

Context

```
config>mobile>pdn>apn
```

Description

This command specifies the UDM SDM profile for the Nudm_SubscriberDataManagement service.

The no form of this command removes the profile. If no profile is defined in the APN, the profile under the config>mobile>pdn>sba-client-services>udm-client>nudm-sdm context is used.

Parameters

profile-name

specifies the UDM SDM profile, up to 32 characters

5.2.1.3.245 udm-uecm-disabled

Syntax

```
[no] udm-uecm-disabled
```

Context

```
config>mobile>pdn>apn
```

Description

This command disables the Nudm_UEContextManagement service in the APN/DNN.

The no form of this command enables the Nudm_UEContextManagement service in the APN/DNN.

5.2.1.3.246 udm-uecm-profile

Syntax

```
udm-uecm-profile profile-name
```

```
no udm-uecm-profile
```

Context

```
config>mobile>pdn>apn
```

Description

This command specifies the UDM UECM profile for the Nudm_UEContextManagement service.

The no form of this command removes the profile. If no profile is defined in the APN, the profile under the config>mobile>pdn>sba-client-services>udm-client>nudm-uecm context is used.

Parameters

profile-name

specifies the UDM UECM profile, up to 32 characters

5.2.1.3.247 umts-qos-policy

Syntax

```
umts-qos-policy umts-qos-policy
```

```
no umts-qos-policy
```

Context

```
config>mobile>pdn>apn
```

Description

This command configures the name of Universal Mobile Telecommunications System (UMTS) Quality of Service (QoS) policy.

The no form of this command removes the policy name from the configuration.

Parameters

umts-qos-policy

specifies a UMTS QoS policy, up to 32 characters

5.2.1.3.248 up-security-policy

Syntax

```
up-security-policy profile-name  
no up-security-policy
```

Context

```
config>mobile>pdn  
config>mobile>pdn>apn
```

Description

This command configures the UP confidentiality protection policy. The configuration defines the policy when it is not configured by the UDM or when overriding the UDM policy has been enabled. If no policy is configured under the APN, the policy configured under the PDN is used.

NOTE:

The configuration is not applied in the V-SMF. The V-SMF uses the V-SMF profile to configure the policies.

The no form of this command disables the UP confidentiality protection policy.

Parameters

profile-name

specifies the name of the UP security policy profile, up to 32 characters

5.2.1.3.249 upf-acct-profile

Syntax

```
upf-acct-profile profile-id  
upf-acct-profile inherit  
no upf-acct-profile
```

Context

```
config>mobile>pdn>apn
```

Description

This command configures the specified UP function profile at the APN level. The profile configured for the APN takes precedence over the profile configured at the PDN level.

The no form of this command removes the profile from the APN configuration.

Parameters

profile-id

specifies a profile ID for the UP function account, configured in the config>mobile>profile>charging context

Values: 0 to 255

Default: 0

inherit

specifies the profile is inherited from the PDN level

5.2.1.3.250 upf-sel-before-auth

Syntax

[no] upf-sel-before-auth

Context

config>mobile>pdn>apn

Description

This command enables or disables the UPF selection before the RADIUS authentication.

Default

no upf-sel-before-auth

5.2.1.3.251 upf-selection

Syntax

upf-selection

Context

config>mobile>pdn>apn

Description

This command enables the context to configure UPF selection options.

5.2.1.3.252 dnn

Syntax

```
dnn type type [apn-ni-only]
no dnn
```

Context

```
config>mobile>pdn>apn>upf-selection
```

Description

This command specifies how the DNN is used in the UPF discovery query and provides the option to use one of the three DNN types (*real*, *virtual*, or *public*) in the DNN query parameter. The *apn-ni-only* option is configurable only when DNN type *real* is used.

When the type *real* is configured, the APN-NI and OI are used in the DNN query parameter; for example, ...\$dnn=internet.mncYYY.mccZZZ.gprs&....

When the type *real apn-ni-only* is configured, only the NI is used in the DNN query parameter; for example, ...\$dnn=internet&...

The *no* form of this command reverts to the default.

Parameters

type

specifies to use *real*, *virtual*, or *public* DNN in the UPF discovery query

Values: *real* | *virtual* | *public*

Default: *real*

apn-ni-only

specifies to use only the APN network identifier (APN-NI) in the UPF selection query

5.2.1.3.253 virtual-apn

Syntax

```
virtual-apn apn-name
no virtual-apn
```

Context

config>mobile>pdn>apn

Description

This command configures a static mapping from the APN received in the GTP create request message to the configured virtual APN.

Default

no virtual-apn

Parameters

apn-name

specifies an APN name, up to 80 characters

5.2.1.3.254 virtual-apn-based-on-pco

Syntax

virtual-apn-based-on-pco [default-apn *apn-name*]

no virtual-apn-based-on-pco

Context

config>mobile>pdn>apn

Description

This command enables a PCO-based virtual APN selection mechanism. When enabled, the system searches the APN and username, to be used in RADIUS messaging, information from the PCO in the GTP Create Session Request or Create PDP Context Request. The format of the PCO must be username@APN.

When the username is not available or is an empty string, a fallback APN is not used even if configured. The fallback APN is only used when a username either from CHAP or PAP is available, but does not contain a valid format username (that is, character @ is missing or exists but is followed by an empty string).

The no form of this command removes the configuration.

Default

no virtual-apn-based-on-pco

Parameters

apn-name

specifies an APN name to be used when this feature is enabled and the PCO does not contain a valid APN, up to 80 characters

5.2.1.3.255 virtual-apn-list

Syntax

```
[no] virtual-apn-list apn-list
```

Context

```
config>mobile>pdn>apn
```

Description

This command is used to associate a list of virtual APNs with a real APN.

The no form of this command removes the list of virtual APNs associated with a real APN.

Parameters

apn-list

specifies an APN list name, up to 32 characters

5.2.1.3.256 wait-accounting

Syntax

```
[no] wait-accounting
```

Context

```
config>mobile>pdn>apn
```

Description

This command configures the PGW/GGSN to wait for an accounting response before sending a GTP response. The PGW/GGSN is waiting for a RADIUS accounting-response and does not apply if RADIUS accounting is not enabled.

Default

no wait-accounting

NOTE:

If the wait-accounting command is disabled after the acct-start is sent out but before the response is received from the AAA mobile gateway, it conforms to its existing behavior and rejects the session.

5.2.1.4 APN PCF PDN command descriptions

5.2.1.4.1 pcf-selection

Syntax

pcf-selection

Context

config>mobile>pdn>apn

Description

This command enables the context to configure PCF selection options.

5.2.1.4.2 dnn

Syntax

dnn type *type* [apn-ni-only]

no dnn

Context

config>mobile>pdn>apn>pcf-selection

Description

This command specifies how the DNN is used in the PCF discovery query and provides the option to use one of the three DNN types (real, virtual, or public) in the DNN query parameter. The apn-ni-only option is configurable only when DNN type real is used.

When the type `real` is configured, the APN-NI and OI are used in the DNN query parameter; for example, `...&dnn=internet.mncYYY.mccZZZ.gprs&...`

When the type `real apn-ni-only` is configured, only the NI is used in the DNN query parameter; for example, `...&dnn=internet&...`

The no form of this command reverts to the default.

Parameters

type

specifies to use real, virtual, or public DNN in the PCF discovery query

Values: `real | virtual | public`

Default: `real`

apn-ni-only

specifies to use only the APN network identifier (APN-NI) in the PCF selection query

5.2.1.4.3 `exclude-gpsi`

Syntax

```
[no] exclude-gpsi
```

Context

```
config>mobile>pdn>apn>pcf-selection
```

Description

This command specifies whether GPSI is used or not in the query criteria when the SMF discovers the PCF using the NRF.

The no form of this command configures that GPSI is used in the query criteria.

Default

```
no exclude-gpsi
```

5.2.1.4.4 `exclude-snssais`

Syntax

```
exclude-snssais {enable | disable | inherit}
```

```
no exclude-snssais
```

Context

config>mobile>pdn>apn>pcf-selection

Description

This command specifies whether S-NSSAIs are used or not in the query criteria when the SMF discovers the PCF using the NRF.

The no form of this command reverts to the default.

Parameters

enable

specifies to use S-NSSAIs in the query criteria

disable

specifies not to use S-NSSAIs in the query criteria

inherit

specifies to inherit the PDN-level configuration

Default: inherit

5.2.1.4.5 exclude-supi

Syntax

[no] exclude-supi

Context

config>mobile>pdn>apn>pcf-selection

Description

This command specifies whether SUPI is used or not in the query criteria when the SMF discovers the PCF using the NRF.

The no form of this command configures that SUPI is used in the query criteria.

Default

no exclude-supi

5.2.1.4.6 pd-alloc-method

Syntax

```
pd-alloc-method {none | aaa}  
no pd-alloc-method
```

Context

```
config>mobile>pdn>apn
```

Description

This command enables and specifies the allocation scheme that the APN uses to assign the IPv6 prefix delegation to the UE/CPE after establishing the PDN connection.

The no form of this command reverts to the default.

Default

```
no pd-alloc-method
```

Parameters

aaa

specifies that the IPv6 delegated prefix is assigned using the RADIUS authentication server

none

disables the IPv6 prefix delegation

Default: none

5.2.1.4.7 nf-id-list

Syntax

```
nf-id-list list-name  
no nf-id-list
```

Context

```
config>mobile>pdn>apn>pcf-selection
```

Description

This command specifies an NF ID list for PCF selection.

The no form of this command removes the NF ID list from the configuration.

Default

no nf-id-list

Parameters

list-name

specifies the NF ID list name, up to 32 characters

5.2.1.4.8 npcfc-profile

Syntax

npcfc-profile *profile-name*

no npcfc-profile

Context

config>mobile>pdn>apn>pcfc-selection

Description

This command specifies an NPCFC profile for the PCFC selection at the APN.

The no form of this command removes the NPCFC profile from the configuration.

Default

no npcfc-profile

Parameters

profile-name

specifies the NPCFC profile name, up to 32 characters

5.2.1.4.9 pcfc-id

Syntax

pcfc-id {use-as-target | ignore}

no pcfc-id

Context

config>mobile>pdn>apn>pcf-selection

Description

This command configures the use of the PCF NF instance ID that the SMF receives from the AMF during the SM Context Create request for the PCF discovery. The PCF UUID can be either configured to be included in the query criteria when discovering the PCF, or it can be ignored.

The no form of this command reverts to default (the PCF NF instance ID is not selected in the configuration).

Default

no pcf-id

Parameters

use-as-target

specifies that the PCF UUID is used as the target NF instance ID

The AMF-received PCF ID is included in the discovery (that is, the received matching list only has this PCF ID or none); in case of fall back to static PCF selection, the SMF looks for that exact PCF ID in the local configuration and if it exists, uses it, if not, it fails

ignore

specifies to exclude the PCF UUID from the query

The SMF does not use the received PCF ID from the AMF in any selection logic (that is, not included in the discovery query and not used when looking for static PCF); the SMF chooses any appropriate PCF ID in those sets

Default: use-as-target

5.2.1.5 selection-type

Syntax

selection-type {imsi | msisdn | imei} {prefix | full-id | suffix}

no selection-type

Context

config>mobile>pdn>apn>pcf-selection

Description

This command specifies the PCF selection criteria which can be based on an IMSI, MSISDN, or IMEI range.

When you select the `full-id` or `prefix` option, enter a *start-id* for each user - range entry. The *end-id* is optional and is copied from the *start-id* entry, if not provided.

When you select the `suffix` option, you must enter a suffix digit.

If the IMSI/MSISDN/IMEI for a specific UE does not match any of the configured entries, the selection of the PCF follows the existing selection criteria.

The `no` form of this command removes the selection type for the user - range from the configuration.

Default

no selection-type

Parameters

imsi

specifies an IMSI range for the PCF selection

msisdn

specifies an MSISDN range for the PCF selection

imei

specifies an IMEI range for the PCF selection

prefix

specifies that the mapping is based on a prefix for the start and end identifiers for the user - range command

- for an IMSI range, the identifiers must be 5 to 15 characters long
- for an MSISDN range, the identifiers must be 4 to 15 characters long
- for an IMEI range, the identifiers must be 4 to 8 characters long

full-id

specifies that the mapping is based on a full identifier for the start and end identifiers for the user - range command

- for an IMSI range, the identifiers must be 10 to 15 characters long
- for an MSISDN range, the identifiers must be 9 to 15 characters long
- for an IMEI range, the identifiers must be 15 to 16 characters long

suffix

specifies an integer that selects the end digit for the user - range.

Default: full-id

5.2.1.6 user-range

Syntax

```
user-range user-range-name {start-id [end-id] | suffix} nf-id-list list-name
```

Context

```
config>mobile>pdn>apn>pcf-selection
```

Description

This command configures the peer user ranges. You can configure up to 32 user range entries.

The no form of this command removes the peer user ranges from the configuration.

Default

no user-range

Parameters

user-range-name

selects the name for the user range, up to 32 characters

start-id

selects the start identifier for the user range, from 4 to 16 characters; the number of characters depends on the selection type (prefix or full-id) and on the PCF selection (IMSI, MSISDN, or IMEI)

end-id

selects the end identifier for the user range, from 4 to 16 characters; the number of characters depends on the selection type (prefix or full-id) and on the PCF selection (IMSI, MSISDN, or IMEI)

suffix

specifies an integer that selects the end digit for the user - range; when you select the suffix option, the *start-id* and *end-id* are not used. In case of IMEI/IMEISV, the suffix matching is based on the last digit of the SNR.

Values: 0 to 9

list-name

specifies the PCF NF ID list name, up to 32 characters

5.2.1.7 APN PCO PDN command descriptions

5.2.1.7.1 pco-option

Syntax

pco-option

Context

config>mobile>pdn

config>mobile>pdn>apn

Description

This command enables the context to configure UE PCO options.

5.2.1.7.2 closest-v4-epdg-group

Syntax

[no] c losest -v4-epdg-group *profile-name*

Context

config>mobile>pdn>apn>pco

Description

This command configures the closest IPv4 ePDG group. For the closest IPv4 ePDG group, the command should list the list names configured under config>mobile>profile>epdg-group. If an administrator tries to assign a list name that contains IPv6 IP addresses, an error will be returned. Assigning an IP list activates the functionality. Round-Robin selection of IP addresses from the list should exist when provided to UE.

Parameters

profile-name

specifies the profile name, up to 32 characters

5.2.1.7.3 closest-v6-epdg-group

Syntax

```
[no] c losest -v6 -epdg -group profile-name
```

Context

```
config>mobile>pdn>apn>pco
```

Description

This command configures the closest IPv6 ePDG group. For the closest IPv6 ePDG group, the command should list the list names configured under config>mobile>profile>epdg-group. If an administrator tries to assign a list name that contains IPv4 IP addresses, an error will be returned. Assigning an IP address list activates the functionality. Round-Robin selection of IP addresses from the list must exist when provided to UE.

Parameters

profile-name

specifies the profile name, up to 32 characters

5.2.1.7.4 dns-server-ipv4

Syntax

```
dns-server-ipv4
```

Context

```
config>mobile>pdn>apn>pco
```

Description

This command configures the IPv4 address of the DNS server used by a User Equipment (UE) to resolve domain names to IP addresses.

5.2.1.7.5 primary

Syntax

```
primary ip-address
```

```
no primary
```

Context

```
config>mobile>pdn>apn>pco>dnsv4
```

Description

This command specifies the IPv4 address of the primary DNS server used by a User Equipment (UE) to resolve domain names to IP addresses.

Parameters

ip-address

specifies the IPv4 address

5.2.1.7.6 secondary

Syntax

```
secondary ip-address
```

```
no secondary
```

Context

```
config>mobile>pdn>apn>pco>dnsv4
```

Description

This command specifies the IPv4 address of the secondary DNS server used by a UE to resolve domain names to IP addresses.

Parameters

ip-address

specifies the IPv4 address

5.2.1.7.7 dns-server-ipv6

Syntax

```
dns-server-ipv6
```

Context

```
config>mobile>pdn>apn>pco
```

Description

This command specifies the IPv6 address of the DNS server used by a User Equipment (UE) to resolve domain names to IPv6 addresses.

5.2.1.7.8 primary

Syntax

`primary ipv6-address`

`no primary`

Context

`config>mobile>pdn>apn>pco>dnsv6`

Description

This command specifies the IPv6 address of the primary DNS server used by a User Equipment (UE) to resolve domain names to IP addresses.

The no form of this command removes the IP address from the configuration.

Parameters

ipv6-address

specifies the IPv6 address

5.2.1.7.9 secondary

Syntax

`secondary ipv6-address`

`no secondary`

Context

`config>mobile>pdn>apn>pco>dnsv6`

Description

This command specifies the IPv6 address of the secondary DNS server used by a User Equipment (UE) to resolve domain names to IP addresses.

The no form of this command removes the IP address from the configuration.

Parameters

ipv6-address

specifies the IPv6 address

5.2.1.7.10 link-mtu

Syntax

link-mtu *octets*

no link-mtu

Context

config>mobile>pdn>apn>pco

Description

This command causes the PGW/GGSN to send the IPv4 link MTU in the Protocol Configuration Options when a new PDN connection is created. This command also sets the MTU to be sent in the IPv6 router advertisement. If the link MTU is set to 0 (default) the MTU is not sent in the PCO or the router advertisement.

This functionality is also applicable to non-IP PDN connections with a minimum value of 128 octets for the link MTU. For IP PDN type connections the minimum link MTU value is 64 octets.

The no form of this command reverts to the default.

Parameters

octets

specifies the maximum number of addresses sent to the PCO or RA

Values: 0 | 64 to 65535

Default: 0 (MTU not sent)

5.2.1.7.11 nbns-srvr-ipv4

Syntax

nbns-srvr-ipv4

Context

config>mobile>pdn>apn>pco

Description

This command enables the context to configure IPv4 NBNS server parameters.

5.2.1.7.12 primary

Syntax

primary ip-address

no primary

Context

config>mobile>pdn>apn>pco>nbnsrv4

Description

This command specifies the IPv4 address of the primary NetBIOS Name Service (NBNS) server used by Microsoft NetBIOS clients to reach NetBIOS servers.

The no form of this command removes the IP address from the configuration.

Parameters

ip-address

specifies the IPv4 address of the NBNS server

5.2.1.7.13 secondary

Syntax

secondary ip-address

no secondary

Context

config>mobile>pdn>apn>pco>nbnsrv4

Description

This command specifies the IPv4 address of the secondary NetBIOS Name Service (NBNS) server used by Microsoft NetBIOS clients to reach netBIOS servers.

The no form of this command removes the IP address from the configuration.

Parameters

ip-address

specifies the IPv4 address of the NBNS server

5.2.1.7.14 nbns-srvr-ipv6

Syntax

```
nbns-srvr-ipv6
```

Context

```
config>mobile>pdn>apn>pco
```

Description

This command enables the context to configure IPv6 NBNS server parameters.

5.2.1.7.15 primary

Syntax

```
primary ipv6-address
```

```
no primary
```

Context

```
config>mobile>pdn>apn>pco>nbns6
```

Description

This command configures the primary IPv4 NBNS address.

The no form of this command removes the IP address from the configuration.

Parameters

ipv6-address

specifies the IPv6 address of the NBNS server

5.2.1.7.16 secondary

Syntax

```
secondary ipv6-address  
no secondary
```

Context

```
config>mobile>pdn>apn>pco>nbns6
```

Description

This command configures the secondary IPv6 NBNS address.

The no form of this command removes the IP address from the configuration.

Parameters

ipv6-address
specifies the IPv6 address of the NBNS server

5.2.1.7.17 operator-pco

Syntax

```
operator-pco custom-1  
no operator-pco
```

Context

```
config>mobile>pdn>apn>pco
```

Description

This command is used to enable the operator specific PCO container to be sent back to the UE.

The no form of this command reverts to the default.

Default

```
no operator-pco
```

Parameters

custom-1

specifies a PCO container for an operator

5.2.1.7.18 **pcscf-srvr-ipv4**

Syntax

```
pcscf-srvr-ipv4 pcscf-server-ipv4  
no pcscf-srvr-ipv4
```

Context

```
config>mobile>pdn>apn>pco
```

Description

This command configures the Proxy Call Session Control Function (P-CSCF) server IPv4 address.

The no form of this command removes the IP address from the configuration.

Parameters

pcscf-server-ipv4

specifies the IPv4 address of the P-CSCF server

5.2.1.7.19 **pcscf-srvr-ipv6**

Syntax

```
pcscf-srvr-ipv6 pcscf-server-ipv6  
no pcscf-srvr-ipv6
```

Context

```
config>mobile>pdn>apn>pco
```

Description

This command configures the Proxy Call Session Control Function (P-CSCF) server IPv6 address.

The no form of this command removes the IP address from the configuration.

Parameters

pcscf-server-ipv6

specifies the IPv6 address of the P-CSCF server

5.2.1.7.20 **pcscf-srvr-v4-group**

Syntax

```
pcscf-srvr-v4-group pcscf-group [secondary pcscf-group] [tertiary pcscf-group]  
no pcscf-srvr-v4-group
```

Context

```
config>mobile>pdn>apn>pco  
config>mobile>pdn>apn>pco>ue-location>tai-lai-list
```

Description

This command associates a v4 P-CSCF server group to an APN. The P-CSCF server groups must be defined under the profile context, prior to associating it with an APN. Command `pcscf-srvr-v4-group` is mutually exclusive with the `pcscf-srvr-ipv4` command under the PCO context.

The `no` form of this command removes the v4 P-CSCF server groups association with this APN.

Parameters

pcscf-group

specifies the name of the primary P-CSCF server group, up to 31 characters

secondary *pcscf-group*

specifies the secondary P-CSCF server group

tertiary *pcscf-group*

specifies the tertiary P-CSCF server group

5.2.1.7.21 **pcscf-srvr-v6-group**

Syntax

```
pcscf-srvr-v6-group pcscf-group [secondary pcscf-group] [tertiary pcscf-group]  
no pcscf-srvr-v6-group
```

Context

```
config>mobile>pdn>apn>pco  
config>mobile>pdn>apn>pco>ue-location>tai-lai-list
```

Description

This command associates a v6 P-CSCF server group to an APN. The P-CSCF server groups must be defined under the profile context, prior to associating it with an APN. Command `pcscf-srvr-v6-group` is mutually exclusive with the `pcscf-srvr-ipv6` command under the `pco` context.

The `no` form of this command removes the v6 P-CSCF server groups association with this APN.

Parameters

pcscf-group

specifies the name of the primary P-CSCF server group, up to 31 characters

secondary pcscf-group

specifies the secondary P-CSCF server group

tertiary pcscf-group

specifies the tertiary P-CSCF server group

5.2.1.722 preferred-dns-address-type

Syntax

`preferred-dns-address-type type type`

`no preferred-dns-address-type`

Context

`config>mobile>pdn>apn>pco`

Description

This command controls the DNS addresses sent to the UE in the PCO/APCO. In the default behavior, the UE requests are followed, but if IPv4 is preferred, the PGW/GGSN does not return an IPv6 DNS server address to the UE in PCO/APCO if the UE already has an IPv4 session to the same APN using IPv4 DNS server or if the UE is creating an IPv4v6 session. Instead, an IPv4 DNS server address is returned to UE.

The `no` form of this command disables the functionality.

The DNS addresses must be available, either locally configured or acquired from external source, for this feature to work.

Parameters

type

specifies the DNS addresses sent to the UE

Values	none	the system follows the UE requests
–	IPv4	the system prefers IPv4 DNS addresses

5.2.1.7.23 selection-type

Syntax

```
selection-type {imsi | msisdn | imei} {prefix | full-id | suffix}  
no selection-type
```

Context

```
config>mobile>pdn>apn>pco
```

Description

This command specifies the P-CSCF selection criteria which can be based on an IMSI, MSISDN, or IMEI range.

When you select the `full-id` option, enter a *start-id* and *end-id* for each user - range entry (when you select the `prefix` option, the *end-id* is optional).

When you select the `suffix` option, you must enter a suffix digit.

If the IMSI/MSISDN/IMEI for a specific UE does not match any of the configured entries, the selection of the P-CSCF follows the existing selection criteria at PDN level.

The `no` form of this command removes the selection type for the user - range from the configuration.

Default

```
no selection-type
```

Parameters

imsi

specifies an IMSI range for the P-CSCF selection

msisdn

specifies an MSISDN range for the P-CSCF selection

imei

specifies an IMEI range for the P-CSCF selection

prefix

specifies that the mapping is based on an IMSI, MSISDN, or IMEI prefix; up to 11 digits

full-id

specifies that the mapping is based on a full identifier for the start and end identifiers for the user - range command; the *start-id* and *end-id* must be full identifiers. For IMSI, the identifier must be 5 to 15 digits long. For MSISDN, the identifier must be 4 to 15 digits long.

suffix

specifies an integer that selects the end digit for the user - range.

Default: full-id

5.2.1.7.24 ue-location

Syntax

```
ue-location
```

Context

```
config>mobile>pdn>apn>pco
```

Description

This command enables the context to configure the allocation of P-CSCF addresses based on the UE location.

5.2.1.7.25 tai-lai-list

Syntax

```
tai-lai-list list-id tai-lai-list-name
```

```
no tai-lai-list list-id
```

Context

```
config>mobile>pdn>apn>pco>ue-location
```

Description

This command associates a Tracking Area Identity (TAI) or Location Area Identity (LAI) profile list to the UE's location for this APN.

The no form of this command removes the specified `tai-lai-list` from this configuration.

Parameters

list-id

specifies the static list ID; used only as a configuration reference

Values: 1 to 255

tai-lai-list-name

specifies the name of a TAI/LAI list profile, up to 32 characters

5.2.1.8 user-range

Syntax

```
user-range user-range-name {start-id [end-id] | suffix} pcscf-srvr-v4-group pcscf-group
[secondary-pcscf-srvr-v4-group pcscf-group] [tertiary-pcscf-srvr-v4-group pcscf-group]
pcscf-srvr-v6-group pcscf-group [secondary-pcscf-srvr-v6-group pcscf-group]
[tertiary-pcscf-srvr-v6-group pcscf-group]
```

```
no user-range user-range-name
```

Context

```
config>mobile>pdn>apn>pco
```

Description

This command configures the P-CSCF IP addresses sent to the UE, based on the IMSI, MSISDN, or IMEI mapping to the associated P-CSCF IP addresses.

You can assign one P-CSCF IPv4 server group and one P-CSCF IPv6 server group to every *user-range*, along with their optional secondary and tertiary groups. You must define the P-CSCF server groups under the profile context, before associating them with a *user-range*.

When you select the *prefix* option, you must enter an IMSI, MSISDN, or IMEI prefix up to 11 digits. For IMSI, the prefix length is from MCC+MNC to 11 digits. For MSISDN, the prefix length is from CC + NDC to 11 digits. For IMEI, the prefix length is from 4 to 11 digits.

When you select the *full-id* option, the *start-id* and *end-id* must be full identifiers.

A maximum of 32 entries per PLMN are supported and the ranges must not overlap.

When you select the *suffix* option, you must enter a 1-digit suffix.

The *no* form of this command removes the *user-range* configuration.

Default

```
no user-range
```

Parameters

user-range-name

selects the user range range, up to 32 characters

start-id

specifies the start identifier for the user range, 4 to 16 characters long

end-id

specifies the end identifier for the user range, 4 to 16 characters long

suffix

specifies an integer that selects the end digit for the user range. When you select the `suffix` option, the `start-id` and `end-id` are not used.

Values: 0 to 9

pcscf-group

specifies the name of the primary IPv4 P-CSCF server group, up to 32 characters

secondary-pcscf-srvr-v4-group pcscf-group

specifies the name of the secondary IPv4 P-CSCF server group, up to 32 characters

tertiary-pcscf-srvr-v4-group pcscf-group

specifies the name of the tertiary IPv4 P-CSCF server group, up to 32 characters

pcscf-group

specifies the name of the primary IPv6 P-CSCF server group, up to 32 characters

secondary-pcscf-srvr-v6-group pcscf-group

specifies the name of the secondary IPv6 P-CSCF server group, up to 32 characters

tertiary-pcscf-srvr-v6-group pcscf-group

specifies the name of the tertiary IPv6 P-CSCF server group, up to 32 characters

5.2.1.9 APN PCRF PDN command descriptions

5.2.1.9.1 pcrf-selection

Syntax

`pcrf-selection`

Context

`config>mobile>pdn>apn`

Description

This command configures Policy and Charging Rules Function (PCRF).

5.2.1.9.2 diameter-peer-group-list

Syntax

```
diameter-peer-group-list list-name  
no diameter-peer-group-list
```

Context

```
config>mobile>pdn>apn>pcrf
```

Description

This command associates a Diameter peer group list. It contains a list of Diameter peer groups. Each group is a set of a primary / secondary pair. The `diameter-peer-group-list` command can be used for PCRF/OCS selection based on the priority of the peer group.

Parameters

list-name

name of the Diameter peer group list, up to 32 characters

5.2.1.9.3 dynamic-pcc

Syntax

```
dynamic-pcc [fh-session {fh-session enable | disable}] [fh-3xxx {fh-3xxx enable |  
disable}] [fh-4xxx {fh-4xxx enable | disable}] [gx-profile gx-profile-name] [sd-profile  
sd-profile-name]  
no dynamic-pcc
```

Context

```
config>mobile>pdn>apn>pcrf
```

Description

This command enables dynamic Policy Control (PCC). When specified, the Gx or Sd profile is applied for this APN. All PDN sessions set up to this APN receive the treatment and behavior as per the specified profile.

The `no` form of this command disables the dynamic PCC interface (Gx or Sd) and removes the association of the specified Gx or Sd profile for this APN.

The Gx or Sd profile is specified as an option within the `dynamic-pcc` command and overrides the other `fh-session`, `fh-3xxx` & `fh-4xxx` control options, if specified. The operator should refrain from specifying both.

To prevent conflict between the Gx or Sd profile that can be specified at the PDN level (see `gx-profile`), and the `fh-session`, `fh-3xxx` and `fh-4xxx` control options within `dynamic-pcc`, it is recommended that the profile be specified at the APN level. This avoids possible conflict due to inheritance and overriding at the APN.

Parameters

fh-session

configures the failure handling session (on response from PCRF)

fh-3xxx

configures failure handling for 3xxx result code from PCRF

fh-4xxx

configures failure handling for 4xxx result code from PCRF

enable

allows new calls to go through upon PCRF failure

disable

blocks new calls from going through upon PCRF failure

gx-profile-name

configures the Gx profile name, up to 32 characters

The profile is configured in the mobile gateway Gx profile context; for more information, see [Gx profile command descriptions](#).

sd-profile-name

configures the Sd profile name, up to 32 characters

The profile is configured in the mobile gateway Sd profile context; for more information, see [Sd profile command descriptions](#).

5.2.1.9.4 pcc-disable-per-rat

Syntax

```
pcc-disable-per-rat [UTRAN] [GERAN] [WLAN] [GAN] [HSPA-Evolution] [EUTRAN] [Virtual]
[EUTRAN-NB-IoT]
```

```
no pcc-disable-per-rat
```

Context

config>mobile>pdn>apn>pcrf

Description

This command configures a set of RAT types which are not allowed to be under the control of the PCRF. The values are inherited from the `pcc-disable-per-rat` command under the `config>mobile>profile>charging>pgw-charging>pcrf-selection` context.

For example, if a charging profile disables the WLAN access, and the APN disables 2G and 3G access types, the UE using the configured charging profile will not be under the PCRF's control for WLAN, 2G, and 3G access. However, if a UE uses the same access point but a different charging profile, 2G and 3G access will not be allowed under the PCRF control.

If this command is not configured (no RAT types configured), all the RAT types are allowed under the PCRF's control when dynamic PCC is enabled for the session.

The no form of this command reverts to the default (not configured).

Parameters

UTRAN

keyword that specifies that UTRAN is not allowed to be under the control of the PCRF

GERAN

keyword that specifies that GERAN is not allowed to be under the control of the PCRF

WLAN

keyword that specifies that WLAN is not allowed to be under the control of the PCRF

GAN

keyword that specifies that GAN is not allowed to be under the control of the PCRF

HSPA-Evolution

keyword that specifies that HSPA-Evolution is not allowed to be under the control of the PCRF

EUTRAN

keyword that specifies that EUTRAN is not allowed to be under the control of the PCRF

Virtual

keyword that specifies that Virtual is not allowed to be under the control of the PCRF

EUTRAN-NB-IoT

keyword that specifies that EUTRAN-NB-IoT is not allowed to be under the control of the PCRF

5.2.1.9.5 pcc-disable-per-rat-timer

Syntax

```
pcc-disable-per-rat-timer pcc-disable-per-rat-timer  
no pcc-disable-per-rat-timer
```

Context

```
config>mobile>pdn>apn>pcrf
```

Description

This command configures the timer which is started when the UE moves into a RAT type which is not allowed under PCRF control. For RAT types configured at the charging profile level, the equivalent timer of the charging profile is used instead.

The no form of this command reverts to the default (not configured).

Parameters

pcc-disable-per-rat-timer

sets the timer, in seconds

Values: 0 to 7200

Default: 0 (tears down the PCRF control as soon as the RAT type change occurs)

5.2.1.9.6 primary-diameter-peer

Syntax

```
primary-diameter-peer profile-name  
no primary-diameter-peer
```

Context

```
config>mobile>pdn>apn>pcrf-selection
```

Description

This command configures the primary Diameter peer profile for the APN.

Default

For online charging over APN, a default primary OCS needs to be specified.

Parameters

profile-name

specifies the name of the Diameter profile associated with the primary OCS, up to 32 characters

5.2.1.9.7 secondary-diameter-peer

Syntax

secondary-diameter-peer *profile-name*

no secondary-diameter-peer

Context

config>mobile>pdn>apn>pcrf

Description

This command configures the secondary Diameter peer profile for the APN.

Default

For online charging over APN, a default secondary OCS needs to be specified.

Parameters

profile-name

specifies the name of the Diameter profile associated with the secondary OCS, up to 32 characters

5.2.1.9.8 selection-type

Syntax

selection-type {prefix | full-id | suffix}

no selection-type

Context

config>mobile>pdn>apn>pcrf

Description

This command configures the selection type for the peer user ranges.

The no form of this command removes the selection type for the user - range configuration.

Default

no selection-type

Parameters

prefix

specifies the prefix for the user range

full-id

specifies the full identifier for the user range

suffix

specifies an integer that selects the end digit for the user range.

Default: full-id

5.2.1.9.9 suppress-ccr-with-no-qos-negotiation

Syntax

[no] suppress-ccr-with-no-qos-negotiation

Context

config>mobile>pdn>apn>pcrf

Description

This command defines whether the CCR-U is sent to inform the PCRF about the QoS change received in the update of the PDP context request which also contained a No Qos negotiation indication.

Default

no suppress-ccr-with-no-qos-negotiation

5.2.1.10 user-range

Syntax

```
user-range user-range-name type {imsi | msisdn | imei} {start-id [end-id] | suffix} diameter-  
peer-group-list list-name
```

```
no user-range user-range-name
```

Context

```
config>mobile>pdn>apn>pcrf
```

Description

This command configures the peer user ranges. You can configure up to 32 user range entries.

The no form of this command removes the peer user ranges from the configuration.

Default

```
no user-range
```

Parameters

user-range-name

selects the user range name, up to 32 characters

imsi | msisdn | imei

selects the type of the user range

start-id

selects the start identifier for the user range, from 4 to 16 characters; when you select the prefix option:

- for an IMSI range, the start identifier must be 5 to 15 characters long
- for an MSISDN range, the start identifier must be 4 to 15 characters long
- for an IMEI range, the start identifier must be 4 to 8 characters long

when you select the full-id option:

- for an IMSI range, the start identifier must be 10 to 15 characters long
- for an MSISDN range, the start identifier must be 9 to 15 characters long
- for an IMEI range, the start identifier must be 15 to 16 characters long

end-id

selects the end identifier for the user range, from 4 to 16 characters; when you select the prefix option:

- for an IMSI range, the end identifier must be 5 to 15 characters long
- for an MSISDN range, the end identifier must be 4 to 15 characters long
- for an IMEI range, the end identifier must be 4 to 8 characters long

when you select the `full-id` option:

- for an IMSI range, the end identifier must be 10 to 15 characters long
- for an MSISDN range, the end identifier must be 9 to 15 characters long
- for an IMEI range, the end identifier must be 15 to 16 characters long

suffix

specifies an integer that selects the end digit for the user - range; when you select the `suffix` option, the *start-id* and *end-id* are not used. In case of IMEI/IMEISV, the suffix matching is based on the last digit of the SNR.

Values: 0 to 9

list-name

selects the Diameter peer group list name, up to 32 characters

5.2.1.11 Bearer traffic PDN command descriptions

5.2.1.11.1 bearer-traffic

Syntax

```
bearer-traffic
```

Context

```
config>mobile>pdn
```

Description

This command enables the context to configure bearer traffic parameters.

5.2.1.11.2 gtp-u

Syntax

```
gtp-u
```

Context

config>mobile>pdn>bearer

Description

This command configures gtp-u bearer-traffic.

NOTE:

This command requires a PDN shutdown.

5.2.1.11.3 sequence-number

Syntax

[no] sequence-number

Context

config>mobile>pdn>bearer>gtp-u

Description

This command specifies whether to ignore the sequence number in the GPRS Tunneling Protocol-User plane (GTP-U) header.

When enabled, GTP-U packets are reassembled based on the sequence number and complete packets are forwarded onto S5 interface. If this command is disabled, the sequence number is ignored and complete packets are forwarded onto S5 interface.

NOTE:

This command requires a PDN shutdown.

5.2.1.11.4 udp-checksum

Syntax

[no] udp-checksum

Context

config>mobile>pdn>bearer>gtp-u

Description

This command specifies whether or not to validate the UDP checksum of GPRS Tunneling Protocol-User plane (GTP-U) packets.

If the value of this object is set to enabled, the UDP checksum of the received GTP-U packets is verified and the packets which fail checksum verification are rejected.

If the value of this object is set to disabled, the UDP checksum of the received GTP-U packets is not verified.

The no form of this command disables the verification of the UDP checksum of the received GTP-U packets.

NOTE:

This command requires a PDN shutdown.

5.2.1.11.5 mss-adjust

Syntax

mss-adjust *segment-size*

no mss-adjust

Context

config>mobile>pdn>bearer

Description

This command configures the TCP maximum segment size (MSS) value to set in TCP SYN message for new user traffic sessions that have an MSS value larger than the configured value. The TCP MSS value is adjusted in both directions of flow.

The no form of this command sets MSS adjust to the default, that is no change in the MSS value.

For this command to work without diverting traffic to the AA, the Policy Rule Unit (PRU) must be configured to match protocol 6 (TCP), using the config>mobile>profile>policy-options>policy-rule-unit>flow-description>match>protocol 6 command.

Default

no mss-adjust

Parameters

segment-size

specifies the value to compare and set the TCP MSS for user traffic

Values: 0 | 160 to 10240

Default: 0 (no change)

5.2.1.11.6 non-3gpp-mss-adjust

Syntax

non-3gpp-mss-adjust *mss-value*

no non-3gpp-mss-adjust

Context

config>mobile>pdn>bearer

Description

This command configures the TCP maximum segment size (MSS) value to set in the TCP SYN message for new user traffic sessions that have an MSS value larger than the configured value. The TCP MSS value is adjusted in both directions of flow.

The no form of this command sets MSS adjust to the default, that is no change in the MSS value.

NOTE:

This command is applicable to non-3GPP type of gateway deployment.

Default

no non-3gpp-mss-adjust

Parameters

mss-value

specifies the value to compare and set the TCP MSS for user traffic

Values: 0 | 160 to 10240

Default: 0

5.2.1.12 Cloud database PDN command descriptions

5.2.1.12.1 cdbx

Syntax

`cdbx`

Context

`config>mobile>pdn`

Description

This command enables the context to configure cloud database profile parameters.

5.2.1.12.2 cloud-db-profile

Syntax

`cloud-db-profile profile-name`

`no cloud-db-profile`

Context

`config>mobile>pdn>cdbx`

Description

This command associates a cloud database profile to use as an interface to an external database.

The no form of this command removes the association.

Parameters

profile-name

specifies the profile name, up to 32 characters

5.2.1.12.3 interface

Syntax

`interface [router router-instance] interface-name`

no interface

Context

config>mobile>pdn>cdbx

Description

This command configures a local interface to use for communication with an external database.
The no form of this command removes the local interface association.

Parameters

router-instance

specifies the virtual router name or service ID

Values	router-name service-id	
–	router-name	Base
–	service-id	1 to 2147483647

Default: Base

interface-name

specifies an interface name, up to 32 characters and must start with a letter

5.2.1.12.4 mss

Syntax

mss *mss-value*
no mss

Context

config>mobile>pdn>cdbx

Description

This command configures the MSS size of the packets that the MG-VM forwards to the DB-VM. Nokia recommends increasing the MSS size based on the capabilities of the MTU interface.

NOTE:

- If no MSS value is specified, the default MSS size (1460) is used (derived from the default MTU-40).
- For an MTU value of 9000 bytes, the maximum CDBX MSS value is 8704 bytes for VNF deployments and 8448 bytes for CNF deployments.

Parameters

mss-value

specifies the MSS size

Values: 1460 to 8960

Default: 1460 (disabled)

5.2.1.13 Charging PDN command descriptions

5.2.1.13.1 charging

Syntax

charging

Context

config>mobile>pdn

config>mobile>pdn>apn

Description

This command enables the context to configure charging related profile parameters for the Packet Data Network (PDN) Gateway (PGW) or the Serving Gateway (SGW).

5.2.1.13.2 bill-shock-prevention

Syntax

```
[no] bill-shock-prevention
```

Context

```
config>mobile>pdn>charging
```

Description

This command enables or disables the Bill Shock Prevention (BSP) mechanism. When this command is enabled, the criteria precedence for selecting a charging profile is altered. The roaming status is used as a first priority and the HSS/MME supplied Charging Characteristics (CC) follows. The UE mobility causing a roaming status change will trigger the PDN connection deactivation procedure.

The no form of this command reverts to the default (the HSS/MME supplied CC is used as a first priority).

Default

```
no bill-shock-prevention
```

5.2.1.13.3 cc-ignore

Syntax

```
cc-ignore {home | visiting | roaming | any} [inherit | enable | disable]
```

```
no cc-ignore [home | visiting | roaming | any]
```

Context

```
config>mobile>pdn>apn>charging
```

```
config>mobile>pdn>charging
```

Description

This command configures the charging characteristics for Packet Data Network (PDN) Gateway (PGW) and Serving Gateway (SGW). The selected option ignores the HSS/MME-supplied charging characteristics for home, visiting, roaming scenarios or unconditionally (if “any” is selected), for this APN. Corresponding default profile is selected when the received charging characteristics are ignored.

The no form of this command removes the option from the configuration.

Parameters

home | visiting | roaming | any

indicates whether the charging characteristics received from the MME/HSS are to be ignored for home subscribers, visiting subscribers (local break-out), roamers (home-routed) or unconditionally (any)

inherit

specifies that the charging profile information is inherited

enable

specifies that the charging profile information is enabled

disable

specifies that the charging profile information is disabled

5.2.1.13.4 cc-reject

Syntax

[no] cc-reject

Context

config>mobile>pdn>charging

Description

This command enables or disables the rejection of the charging characteristics supplied by the HSS or the MME for a subscriber.

The no form of this command reverts to the corresponding default charging profile.

Default

no cc-reject

5.2.1.13.5 cc-reject

Syntax

cc-reject [inherit | enable | disable]

no cc-reject

Context

config>mobile>pdn>apn>charging

Description

This command specifies to reject HSS or MME supplied charging characteristics for a subscriber. The corresponding default charging profile is selected when the value of this object is disabled.

Default

By default, values are inherited from PDN level.

Parameters

inherit

specifies that the charging profile information is inherited

enable

specifies that the charging profile information is enabled

disable

specifies that the charging profile information is disabled

5.2.1.13.6 cdr-avp-options-profile

Syntax

cdr-avp-options-profile *cdr-avr-options-profile-id*
no cdr-avp-options-profile

Context

config>mobile>pdn>apn>charging

config>mobile>pdn>charging

Description

This command specifies the profile applicable to Ga CDR or Rf ACR content.

Parameters

cdr-avr-options-profile-id

indicates the profile number

Values: 1 to 255

5.2.1.13.7 cdr-file-separation

Syntax

```
[no] cdr-file-separation
```

Context

```
config>mobile>pdn>charging
```

Description

This command allows the generation of two separate CDR files, one with the SGW CDRs and the other with the PGW CDRs.

When enabled, the node ID used in the filename of the SGW CDRs is taken from the `sgw-node-id` specified in the same context. The node ID used in the filename of the PGW CDRs is taken from the `node-id` specified in the same context.

When disabled, by default CMG generates a single CDR file which contains both the SGW and PGW CDRs. The node ID used in the filename is taken from the `node-id` specified in the same context.

Default

```
no cdr-file-separation
```

5.2.1.13.8 cdr-transfer

Syntax

```
cdr-transfer {ga | bp}
```

```
no cdr-transfer
```

Context

```
config>mobile>pdn>charging
```

Description

This command allows the operator to choose the CDR delivery method using either the Ga interface (GTP prime) or the Bp interface (FTP/SFTP).

The no form of this command reverts to the default.

**NOTE:**

This command requires a PDN shutdown.

Parameters

ga

sets the delivery method using Ga interface (GTP')

bp

sets the delivery method using Bp interface (FTP/SFTP)

Default: ga

5.2.1.13.9 cdr-type

Syntax

```
cdr-type {pgwCdr | gCdr | egCdr}
```

```
no cdr-type
```

Context

```
config>mobile>pdn>charging
```

Description

This command determines what type of CDRs are generated by the system. Some cdr-avp-options are not compatible with all CDR types. For example, the ListofServiceData IE must only appear in eG-CDRs or PGW-CDRs since it is used for flow-based charging

**NOTE:**

This command requires a PDN shutdown.

Parameters

pgwCdr

generates PGW-CDRs

gCdr

generates G-CDRs

egCdr

generates eG-CDRs

Default: pgwCdr

5.2.1.13.10 charging-prof

Syntax

```
charging-prof {home | visiting | roaming | any} charging-prof-id  
charging-prof {home | visiting | roaming | any} [inherit]  
no charging-prof [home | visiting | roaming | any]
```

Context

```
config>mobile>pdn>apn>charging  
config>mobile>pdn>charging
```

Description

This command configures a charging profile to be used with a specific type of user. A charging profile can specify a type of user (home, visiting {local-breakout}, roaming {home-routed}), for this APN. If configured, this profile takes precedence over (overrides) the default profile specified at the gateway level.

The no form of this command reverts to the default.

Default

By default, values are inherited from PDN level.

Parameters

home | visiting | roaming | any

Indicates whether the charging profile is to be associated with home subscribers, visiting subscribers (local break-out) or roamers (home-routed).

charging-prof-id

specifies the charging profile ID number

Values: 0 to 255

inherit

specifies that the charging profile information is inherited

5.2.1.13.11 dcca-profile

Syntax

`dcca-profile profile-name`

Context

`config>mobile>pdn>apn>charging`

Description

This command configures the DCCA profile to be used for the primary and secondary OCS at the charging profile level.

Parameters

profile-name

specifies a DCCA profile name associated with the primary and secondary OCS, up to 32 characters

5.2.1.13.12 diameter-peer-group-list

Syntax

`diameter-peer-group-list list-name`

`no diameter-peer-group-list`

Context

`config>mobile>pdn>apn>charging`

Description

This command associates a Diameter peer group list. It contains a list of Diameter peer groups. Each group is a set of a primary and, or secondary pair. The `diameter-peer-group-list` command can be used for PCRF/OCS selection based on the priority of the peer group.

Parameters

list-name

specifies the name of the Diameter peer group list, up to 32 characters

5.2.1.13.13 enable-nchf-charging

Syntax

[no] enable-nchf-charging

Context

config>mobile>pdn>charging

Description

This command enables Nchf charging for the SMF for 5G-capable UEs only. The UE is assigned an SMF charging profile and an Nchf session is created toward the CHF. If this option is not enabled, the UE is assigned a PGW charging profile, and legacy charging interfaces are used for the session (Ga, Bp, Gy).

The no form of this command reverts to the default (disabled).

Default

no enable-nchf-charging

5.2.1.13.14 gtp-prime-group

Syntax

gtp-prime-group [*gtp-prime-group*]

Context

config>mobile>pdn>apn>charging

Description

This command displays GTP prime group information for the primary and secondary OCS at the charging profile level.

Parameters

gtp-prime-group

specifies the GTP prime group profile name, up to 32 characters

5.2.1.13.15 incomplete-signaling

Syntax

incomplete-signaling

Context

config>mobile>pdn>apn>charging

Description

This command enables the context to configure the incomplete-signaling functionality. It includes the configuration parameters for charging of the incomplete-signaling traffic. This functionality is available for PGW, SMF and UPF.

5.2.1.13.16 charging-method

Syntax

charging-method {online | offline | both / none}

Context

config>mobile>pdn>apn>charging>incomplete-signaling

Description

This command configures the charging method to be used for the incomplete-signaling functionality.

Parameters

online

incomplete-signaling is reported to online charging

offline

incomplete-signaling is reported to offline charging

both

incomplete-signaling is reported to both offline and online charging systems

none

incomplete-signaling is not reported to charging interfaces

Default: offline

5.2.1.13.17 rating-group

Syntax

rating-group *rating-group*

Context

config>mobile>pdn>apn>charging>incomplete-signaling

Description

This command configures the rating group to be used for the incomplete-signaling functionality.

Parameters

rating-group

specifies the rating group which is used for the incomplete-signaling functionality

Values: 0 to 4294967295

5.2.1.13.18 service-id

Syntax

service-id *service-id*

Context

config>mobile>pdn>apn>charging>incomplete-signaling

Description

This command configures the service identifier to be used for the incomplete-signaling functionality.

Parameters

service-id

specifies the service identifier which is used for the incomplete-signaling functionality

Values: 0 to 4294967295

5.2.1.13.19 **urr-id**

Syntax

`urr-id urr-id`

Context

`config>mobile>pdn>apn>charging>incomplete-signaling`

Description

This command configures the Usage-Reporting-Rule-Identifier (urr-id) to be used for the incomplete-signaling functionality.

Parameters

urr-id

specifies the urr-id which is used for the incomplete-signaling functionality

Values: 1 to 30000

5.2.1.13.20 **nchf**

Syntax

`nchf`

Context

`config>mobile>pdn>apn>charging`

Description

This command enables the context to configure the charging function selection.

5.2.1.13.21 **chf-selection**

Syntax

`chf-selection`

Context

`config>mobile>pdn>apn>charging>nchf`

Description

This command enables the context to configure the charging function selection.

5.2.13.22 chf-profile

Syntax

```
chf-profile profile-name  
no chf-profile
```

Context

```
config>mobile>pdn>apn>charging>nchf>chf-selection
```

Description

This command associates a charging function profile to be used by the charging function. The charging function profile is configured using the config>mobile>profile>charging>smf-charging>chf-selection>chf-profile command.

Parameters

profile-name

specifies the profile name, up to 32 characters

5.2.13.23 nf-id-list

Syntax

```
nf-id-list list-name  
no nf-id-list
```

Context

```
config>mobile>pdn>apn>charging>nchf>chf-selection
```

Description

This command associates a CHF ID list with the charging function. The CHF ID list is configured using the config>mobile>profile>list>nf-id-list command.

Parameters

list-name

specifies the list name, up to 32 characters

5.2.1.13.24 nchf-charging

Syntax

nchf-charging {enable | disable | inherit}

no nchf-charging

Context

config>mobile>pdn>apn>charging>nchf

Description

This command configures the LTE legacy charging at the APN level. When the nchf-charging is disabled (the LTE legacy charging is enabled), the 5G UEs and LTE UEs with 5GS subscription that attach to the SMF and PGW-C use the LTE legacy charging interfaces (Gy, Ga, Bp). By default (nchf-charging enabled), such sessions use the Nchf interface for charging.

Parameters

enable

specifies to enable the Nchf charging

disable

specifies to disable the Nchf charging and applies the SMF legacy charging

inherit

specifies that the Nchf charging inherits its configuration from the PDN configuration

Default: inherit

5.2.1.13.25 charging-prof-selection-range

Syntax

charging-prof-selection-range

Context

config>mobile>pdn>charging

Description

This command enables the context to configure the charging profile selection range.

5.2.13.26 selection-type

Syntax

```
selection-type imsi{prefix | full-id}
```

```
no selection-type
```

Context

```
config>mobile>pdn>charging>charging-prof-selection-range
```

Description

This command configures the charging profile selection criteria based on IMSI range.

If the IMSI for a UE does not match any of the configured entries, the selection of the charging profile falls back to other charging profile selection methods (for example charging characteristics, roaming status, PDN level configuration and so on).

The no form of this command removes the selection type for the user - range command.

Parameters

imsi

specifies the IMSI range for the charging profile selection, 5 to 15 digits

prefix

specifies that the mapping is based on the IMSI prefix, up to 11 digits

NOTE:

When you select the **prefix** option, the end-id is optional.

full-id

specifies that the mapping is based on a full identifier for the start and end identifiers of the user - range command, 10 to 15 characters.

For IMSI, the identifier length must be 10 to 15 digits.

NOTE:

When you select the `full-id` option, you must configure the `start-ue-id` and `end-ue-id` parameters for each entry of the `user-range` command (the `start-ue-id` and `end-ue-id` values must be full identifiers).

5.2.13.27 `user-range`

Syntax

```
user-range user-range-name {start-ue-id [end-ue-id]} gw-type {sgw} charging-prof-id value  
no user-range
```

Context

```
config>mobile>pdn>charging>charging-prof-selection-range
```

Description

This command selects an SGW charging profile based on IMSI range. Up to 32 user ranges are supported.

The no form of this command removes the selected *user-range-name*.

Parameters

user-range-name

specifies the user range name, up to 32 characters

start-id

specifies the start identifier for the user range, 5 to 15 characters

end-id

specifies the end identifier for the user range, 5 to 15 characters

sgw

specifies that the selection method is valid for the SGW charging profile

charging-prof-id

specifies the charging profile number

Values: 0 to 255

5.2.13.28 `multiple-pa`

Syntax

```
[no] multiple-pa
```

Context

config>mobile>pdn>charging

Description

This command enables support for the multiple PRA feature for both online and offline charging.

The no form of this command reverts to the default (disabled).

Default

no multiple-pra

5.2.1.13.29 node-id

Syntax

node-id *node-id*

no node-id

Context

config>mobile>pdn>charging

Description

This command specifies an operator configurable identifier for the node which is used over the Rf reference point or the Ga reference point.

The specified node ID is used as a prefix to the names of the files that are created when storing CCR, CDR or ACR charging records. The CDR file name convention has following structure: *<NodeID>_<RC>.<date>_<time>*. The node ID is used as a prefix as shown. The MSCP group ID is also added as suffix to the node ID, if configured, to specify the instance that produces the CDR file. RC is the running count, that increases by one for each new file. For Rf ACR charging records, the file name starts with gw *<gw-id>* as the node ID, if the node ID is not configured. For Gy CCR charging records, the file name always starts with AP-ASO and prefixed with the node ID, if configured. For example, if the node ID is configured as NOKIA-SAEGW01, the names of CDR files are in the form NOKIA-SAEGW01-AP-ASO-RC.*date-time*.

The node ID can be changed without a PDN shutdown, and this affects existing sessions. After the node ID changes, the above files are closed and new files are created using the new node ID as prefix. Also, in Gy interface, the new node ID is added to the corresponding AVP in CCR-U and CCR-T messages.

When a node identifier is used in Charging Data Records (CDRs) sent through a Ga reference point, only the first 18 characters are used.

The no form of this command removes the node identifier from the configuration.

Parameters

node-id

specifies the node identifier, up to 20 characters

5.2.1.13.30 pgw-node-id

Syntax

`pgw-node-id` *pgw-node-id*

`no` `pgw-node-id`

Context

`config>mobile>pdn>charging`

Description

This command specifies an operator configurable identifier for the PGW function, which is used over the Rf, Ga, or Gy reference point for charging records from the PGW. When a node identifier is used in Charging Data Records (CDR) sent through a Ga reference point, only the first 18 characters are used.

When configured, the PGW node ID overrides the node ID configured under `config>mobile>pdn>charging>node-id` for charging records from the PGW.

The `no` form of this command removes the PGW node identifier from the configuration.

Parameters

pgw-node-id

specifies the node identifier for the PGW functionality, up to 20 characters

5.2.1.13.31 plmn-chrg-profile-map

Syntax

`plmn-chrg-profile-map` `plmn-list-name` *list-name* `incoming-cc-value` *cc-value*
`charging-profile-id` *charging-profile-id*

`no` `plmn-chrg-profile-map` `plmn-list-name` *list-name* [`incoming-cc-value` *cc-value*]

Context

`config>mobile>pdn>charging`

`config>mobile>pdn>apn>charging`

Description

This command specifies the charging profiles on a per operator basis. The operator is identified using the PLMN identifier (MCC+MNC). The charging characteristics IE selects a locally configured profile on the gateway. Each of the bits B0 to B15 of a charging characteristics IE corresponds to a specific behavior for that operator and therefore, a corresponding charging profile. Each PLMN has a maximum of up to 16 charging profiles. A maximum of 254 PLMNs is supported.

The no form of this command deletes the mapping for the specified PLMN, when specifying the `plmn-list-name` parameter. If only the `plmn-list-name` parameter is specified, all entries are deleted. If the CC value is also specified, that specific entry is deleted.

NOTE:

For charging profile selection, if a matching PLMN corresponding to the received mobile's MCC+MNC is not found, the appropriate Home/Visiting/Roaming default profile is applied.

Parameters

list-name

specifies the PLMN list name for an operator; it comprises of one or more MCC+MNC values applicable to operator

cc-value

specifies the charging profile behavior identifier; it corresponds to the value of the Charging Characteristics IE received from HSS

charging-profile-id

specifies the charging profile number (configured using the `config>mobile>profile>charging` command)

5.2.1.13.32 pri-cdf-dia-peer

Syntax

```
pri-cdf-dia-peer profile-name
no pri-cdf-dia-peer
```

Context

```
config>mobile>pdn>apn>charging
```

Description

This command provides the primary CDF peer profile information for this APN. If no CDF is specified in the charging profile, the one specified at the APN level is applicable.

The no form of this command removes the profile name from the configuration.

Parameters

profile-name

specifies the profile name, up to 32 characters

5.2.1.13.33 pri-ocs-dia-peer

Syntax

```
pri-ocs-dia-peer profile-name
```

Context

```
config>mobile>pdn>apn>charging
```

Description

This command provides the primary OCS peer profile information.

Parameters

profile-name

specifies the profile name, up to 32 characters

5.2.1.13.34 sec-cdf-dia-peer

Syntax

```
sec-cdf-dia-peer profile-name
```

```
no sec-cdf-dia-peer
```

Context

```
config>mobile>pdn>apn>charging
```

Description

This command provides secondary CDF peer profile information for this APN. If no secondary CDF is specified in the charging profile, the one specified at the APN level is applicable.

Parameters

profile-name

specifies the profile name, up to 32 characters

5.2.1.13.35 sec-ocs-dia-peer

Syntax

```
sec-ocs-dia-peer profile-name
```

```
no sec-ocs-dia-peer
```

Context

```
config>mobile>pdn>apn>charging
```

Description

This command provides secondary OCS peer profile information for this APN. If no secondary OCS is specified in the charging profile, the one specified at the APN level is applicable.

Parameters

profile-name

specifies the profile name, up to 32 characters

5.2.1.13.36 remove-3gpp-headers

Syntax

```
[no] remove-3gpp-headers
```

Context

```
config>mobile>pdn>charging
```

Description

This command, when enabled, excludes the CDR file headers and the CDR headers (as defined in 3GPP TS 32.297) from the CDR files. In this case, the CDR files include only a list of ASN.1 encoded CDRs.

When disabled (default), the CDR files are generated according to 3GPP TS 32.297, with CDR file headers and CDR headers, followed by ASN.1 encoded CDRs.

Default

no remove-3gpp-headers

5.2.13.37 **sgw-node-id**

Syntax

sgw-node-id *sgw-node-id*

no sgw-node-id

Context

config>mobile>pdn>charging

Description

This command specifies an operator configurable identifier for the SGW function, which is used over the Rf reference point or the Ga reference point for charging records from the SGW. When a node identifier is used in Charging Data Records (CDR) sent through a Ga reference point, only the first 18 characters are used.

When configured, the SGW node ID overrides the node ID configured under config>mobile>pdn>charging>node-id for charging records from the SGW.

The no form of this command removes the SGW node identifier from the configuration.

Parameters

sgw-node-id

specifies the node identifier for the SGW functionality, up to 20 characters

5.2.13.38 **supported-vendor**

Syntax

supported-vendor *custom-2*

no supported-vendor

Context

config>mobile>pdn>charging

Description

This command configures the vendor number for which vendor-specific customizations are supported. Each option represents a specific customer.

The no form of this command reverts to the default.

Default

no supported-vendor

Parameters

custom-2

specifies a customer number

5.2.13.39 tariff-time-change-gw-local-tz

Syntax

```
tariff-time-change-gw-local-tz {enable | disable}
```

```
no tariff-time-change-gw-local-tz
```

Context

```
config>mobile>pdn>charging
```

Description

This command facilitates using the gateway local time zone (instead of the UE local time zone) for tariff time change event trigger for offline charging.

The no form of the command reverts to default (disable).

Parameters

enable

specifies to use the gateway local time zone

disable

specifies to use the UE local time zone

Default: disable

5.2.13.40 time-limit-enh

Syntax

[no] time-limit-enh

Context

config>mobile>pdn>charging

Description

This command forces time limit CDRs to have the duration of the configured time threshold configured using the time-limit command under the config>mobile>profile>charging>pgw-charging>off-line>partial-record-closure-trigger context. When enabled, time-based CDR generation takes place at the configured time after any previous CDR or after the PDN creation.

When disabled, time-based CDRs are generated at the configured minutes after the previous time-based CDR or after the PDN creation; therefore, a time-based CDR may have a smaller duration than the configured time threshold when there was one or more non-time-based CDRs generated before it.

Default

no time-limit-enh

5.2.13.41 use-last-known-uli

Syntax

[no] use-last-known-uli

Context

config>mobile>pdn>charging

Description

This command configures the PGW to use the last known ULI in updates toward online charging, offline charging, and RADIUS accounting.

The no form of this command disables the use of the ULI in updates toward online charging, offline charging, and RADIUS accounting.

Default

no use-last-known-uli

5.2.1.13.42 volume-limit-enh

Syntax

[no] volume-limit-enh

Context

config>mobile>pdn>charging

Description

This command facilitates custom volume-limit partial record enhancement for a customer. When enabled, a partial record is closed at the specified volume-limit.

Partial CDRs closed as a result of other triggers do not exceed the specified volume limit. Excess usage counts are carried over to the next container / reporting interval.

The no form of this command reverts to the default (disabled). This command applies to Ga, Bp, and Rf.

Default

no volume-limit-enh

5.2.1.14 Ga/Gn/Gp/Gx/Gy interface PDN command descriptions

5.2.1.14.1 ga

Syntax

ga

Context

config>mobile>pdn

Description

This command enables the context to configure Ga parameters.

5.2.14.2 data-record-format-version

Syntax

```
data-record-format-version string  
no data-record-format-version
```

Context

```
config>mobile>pdn>ga
```

Description

This command configures the Release and Version Identifier parts of the Data Record Format IE. Together they are the version of TS 32.298 that is used to create the CDR.

The Data Record Format Version defaults to the baseline release of TS 32.298 that is supported by the 7750 SR MG and CMG, but the operator can override the version with this command.

The contents of the CDRs are not affected by this command. Instead the individual IEs included in CDRs may be managed using the `cdr -avp -options` and related commands. The operator should ensure that the Data Record Format Version and the CDR AVP Options profile are configured to be consistent with each other.

Parameters

string

specifies the data record format version. The string must in the "xx.yy" format where xx is the release identifier and yy is the version identifier as shown on the cover sheet of TS 32.298. "xx" must be a number from 4 to 16 because the encoding offers only 4 bits. "yy" must be a number from 0 to 30. The system applies the encoding described in TS 32.295. (In other words, the system adds 1 to the version identifier.)

Values: xx.yy

xx [4 to 16]

yy [0 to 30]

5.2.14.3 gtp-prime-group

Syntax

```
gtp-prime-group gtp-prime-group  
no gtp-prime-group
```

Context

config>mobile>pdn>ga

Description

This command specifies the GTP prime group name.

NOTE:

This command requires a PDN shutdown.

Parameters

gtp-prime-group

specifies the GTP prime group name, up to 32 characters

5.2.1.14.4 interface-gtp-prime

Syntax

interface-gtp-prime [router *router-instance*] *interface-name*

no interface-gtp-prime

Context

config>mobile>pdn>ga

Description

This command specifies the local interface used for the GA reference point.

NOTE:

This command requires a PDN shutdown.

Parameters

router-instance

specifies the router instances

Values	router-name service-id	
–	router-name	Base
–	service-id	1 to 2147483647

Default: Base

interface-name

specifies the name of the local interface, up to 32 characters and must start with a letter

5.2.1.14.5 **gn**

Syntax

gn [*sig-ref-point-name*] [group-specific]

no gn [*sig-ref-point-name*]

Context

config>mobile>pdn

Description

This command configures the Gn parameters on all Gn interfaces, or for a specific Gn interface.

NOTE:

This command requires a PDN shutdown, unless the group-specific parameter is specified.

Parameters

sig-ref-point-name

specifies the Gn interface name, up to 32 characters

group-specific

specifies an MG group-specific reference point interface for GTP-U redirection; it is used when associating the reference point interface with an MG system group via an override profile and applies only to CMG

5.2.14.6 gp

Syntax

```
gp [sig-ref-point-name] [group-specific]  
no gp [sig-ref-point-name]
```

Context

```
config>mobile>pdn
```

Description

This command configures Gp parameters on all Gp interfaces, or for a specific Gp interface.

NOTE:

This command requires a PDN shutdown, unless the `group-specific` parameter is specified.

Parameters

sig-ref-point-name

specifies the Gp interface name, up to 32 characters

group-specific

specifies an MG group-specific reference point interface for GTP-U redirection; it is used when associating the reference point interface with an MG system group via an override profile and applies only to CMG

5.2.14.7 interface

Syntax

```
interface
```

Context

```
config>mobile>pdn>gn  
config>mobile>pdn>gp
```

Description

This command configures GTP-C and GTP-U parameters.

NOTE:

This command requires a PDN shutdown.

5.2.1.14.8 gtp-c

Syntax

```
gtp-c [router router-instance] interface-name [interface-realm interface-realm]  
no gtp-c
```

Context

```
config>mobile>pdn>gn>interface  
config>mobile>pdn>gp>interface
```

Description

This command configures the GTP-C profile parameters for the Gn or Gp interface.

NOTE:

This command requires a PDN shutdown.

Parameters

router-instance

specifies the virtual router name or service ID

Values	router-name service-id	
–	router-name	Base
–	service-id	1 to 2147483647

Default: Base

interface-name

specifies an interface name up to 32 characters, which must start with a letter

interface-realm

specifies a realm name, up to 32 characters

**NOTE:**

Only the following characters are permitted:

- alphabetic characters (A-Z and a-z)
- digits (0-9)
- hyphen (-)
- dot (.)

5.2.14.9 gtp-u**Syntax**

```
gtp-u [router router-instance] interface-name [interface-realm interface-realm]  
no gtp-u
```

Context

```
config>mobile>pdn>gn>interface
```

```
config>mobile>pdn>gp>interface
```

Description

This command configures the GTP-U profile parameters for the Gn or Gp interface.

**NOTE:**

This command requires a PDN shutdown.

Parameters***router-instance***

specifies the virtual router name or service ID

Values	router-name service-id
--------	--------------------------

–	router-name	Base
–	service-id	1 to 2147483647

Default: Base

interface-name

specifies an interface name up to 32 characters, which must start with a letter

interface-realm

specifies a realm name, up to 32 characters

NOTE:

- alphabetic characters (A-Z and a-z)
- digits (0-9)
- hyphen (-)
- dot (.)

5.2.14.10 peer-list

Syntax

```
peer-list list-name
```

```
no peer-list
```

Context

```
config>mobile>pdn>gn
```

```
config>mobile>pdn>gp
```

Description

This command configures the peer list name. The list consists of remote GTP peers where each GTP peer is identified by its IP address or subnet. If a matching GTP peer is found in the list, the additional GTP peer configuration can define attributes of the GTP peer (for example, a PLMN ID in case the remote GTP peer does not provide this information over GTP), and can either disable or enable the GTP path management for a specific GTP peer. The peer list can also define similar default configuration for those GTP peers which are not explicitly listed.

The no form of this command removes the list name from the configuration.

**NOTE:**

This command requires a PDN shutdown.

Default

no trusted-peer-list

Parameters***list-name***

specifies the list name, up to 32 characters

5.2.1.14.11 signaling

Syntax

signaling

Context

config>mobile>pdn>gn

config>mobile>pdn>gp

Description

This command enables the context to configure signaling parameters.

**NOTE:**

This command requires a PDN shutdown.

5.2.1.14.12 gtp-c

Syntax

gtp-c

Context

config>mobile>pdn>gn>signaling

```
config>mobile>pdn>gp
```

Description

This command specifies the GPRS Tunneling Protocol-Control plane (GTP-C) profile name. The GTP-C profile provides GTP-C signaling related configuration.

NOTE:

This command requires a PDN shutdown.

5.2.1.14.13 profile

Syntax

```
profile profile-name
```

```
no profile
```

Context

```
config>mobile>pdn>gn>signaling>gtp-c
```

```
config>mobile>pdn>gp>signaling>gtp-c
```

Description

This command specifies the GTP-C profile name.

The no form of this command removes the profile name from the configuration.

NOTE:

This command requires a PDN shutdown.

Default

```
no profile
```

Parameters

profile-name

specifies the GPRS Tunneling Protocol-Control plane (GTP-C) profile name

5.2.1.14.14 gtp-u

Syntax

```
gtp-u
```

Context

```
config>mobile>pdn>gn>signaling
```

```
config>mobile>pdn>gp>signaling
```

Description

This command configures the context to configure GTP-U-related parameters.

GTP-U is a IP-based tunneling protocol that permits many tunnels between each set of end points. When used in the UMTS, each subscriber can have one or more tunnel, one for each PDP context they have active. Separate tunnels are possible for specific connections with different QoS requirements.

The separate tunnels are identified by a Tunnel Endpoint Identifier (TEID) in the GTP-U messages, which is generally a dynamically allocated random number. If the number is encrypted quality then it provides some security against certain attacks. Even so, the requirement of the 3GPP standard is that all GTP traffic, including user data should be sent within secure private networks, not directly connected to the Internet.

**NOTE:**

This command requires a PDN shutdown.

5.2.1.14.15 gtpu-keep-alive

Syntax

```
[no] gtpu-keep-alive
```

Context

```
config>mobile>pdn>gn>signaling>gtp-u
```

```
config>mobile>pdn>gp>signaling>gtp-u
```

```
config>mobile>pdn>s4>signaling>gtp-u
```

```
config>mobile>pdn>s5>signaling>gtp-u
```

```
config>mobile>pdn>s8>signaling>gtp-u
```

Description

This command enables the GTP-U echo on the reference point. To send GTP-U echoes, a non-zero keep-alive value must also be configured in the `gtp-profile` command configured in the same context.

The no form of this command reverts to the default (GTP-U path management disabled).

Default

no gtpu-keep-alive

5.2.1.14.16 profile

Syntax

`profile profile-name`

`no profile`

Context

`config>mobile>pdn>gn>signaling>gtp-u`

`config>mobile>pdn>gp>signaling>gtp-u`

Description

This command specifies the GPRS Tunneling Protocol-User plane (GTP-U) profile name. The GTP-U profile provides GTP-U signaling related configuration.

The no form of this command removes the profile name from the configuration.

NOTE:

This command requires a PDN shutdown.

Parameters

profile-name

specifies the GPRS Tunneling Protocol-User plane (GTP-U) profile name

5.2.1.14.17 qci-policy

Syntax

```
qci-policy {qci-policy-name | uplink qci-policy-name [downlink qci-policy-name] | downlink  
qci-policy-name [uplink qci-policy-name]}  
  
no qci-policy
```

Context

```
config>mobile>pdn
```

Description

This command specifies the QoS Class Identifier (QCI) policy profile name for uplink and downlink directions.

QCI policies configured can be applied to both uplink and downlink bearer traffic or separate QCI policies can be configured in both uplink and downlink directions.

The no form of this command removes the policy name from the configuration.

Default

```
no qci-policy
```

Parameters

qci-policy-name

specifies a QCI policy name, up to 32 characters

uplink *qci-policy-name*

specifies the QCI policy profile name for uplink direction

downlink *qci-policy-name*

specifies the QCI policy profile name for downlink direction

5.2.1.14.18 qfi-mapping-profile

Syntax

```
qfi-mapping-profile profile-name  
  
no qfi-mapping-profile
```

Context

config>mobile>pdn

Description

This command associates an optional QoS flow binding profile for the PDN. The profile must be created first before associating it for the PDN. The QoS parameters specified within the profile are used for QoS flow binding. When this optional profile is not configured, QFI is generated dynamically (in the range 1 to 64) using 5QI/ARP as default.

The no form of this command removes the profile name from the configuration.

Parameters

profile-name

specifies the QFI profile name, up to 32 characters

5.2.1.14.19 gx

Syntax

gx

Context

config>mobile>pdn

Description

This command enables the context to configure GX signaling. Gx provides transfer of (QoS) policy and charging rules from PCRF to Policy and Charging Enforcement Function (PCEF) in the PGW. The Gx reference point enables a PCRF to have dynamic control over the PCC behavior at a PCEF. The Gx reference point enables the signaling of PCC decision, which governs the PCC behavior, and it supports the following functions:

- Request for PCC decision from PCEF to PCRF
- Provision of PCC decision from PCRF to PCEF
- Negotiation of IP-CAN bearer establishment mode (UE-only or UE/NW)
- Termination of Gx session (corresponding to an IP-CAN session) by PCEF or PCRF

5.2.14.20 active-usage

Syntax

```
active-usage {disable | enable} active-threshold threshold-value  
no active-usage
```

Context

```
config>mobile>pdn>gx
```

Description

This command provides the option to enable active-usage for time-consumption, for time-based usage monitoring. When enabled, the applicable activity-threshold is to be specified.

activity-threshold parameter defines an average data rate under which the subscriber-host is considered silent. As long as the effective rate of the application-usage (for a monitoring-key instance) will not exceed the rate defined by *activity-threshold*, given subscriber host will be considered silent and its corresponding quota will not be used. As long as the application-usage (for a monitoring-key instance) will exceed the rate, the corresponding time-quota will be consumed (in terms of time).

The no form of this command reverts to the default (disabled).

Parameters

disable

disables active usage for time consumption

enable

enables active usage for time consumption

threshold-value

specifies the threshold value

Values: 0 to 100000000

Default: 0

5.2.14.21 alt-peer-rar

Syntax

```
[no] alt-peer-rar
```

Context

```
config>mobile>pdn>gx
```

Description

This command enables the gateway to accept RAR messages from a PCRF other than the primary or secondary PCRF. When this command is enabled, a RAA message will be sent back to the peer that initiated the RAR. The IP-CAN session will continue to use the primary or secondary PCRF for the Gx session (that is, any CCR-U or CCR-T for the session will be sent to the destination peer that the last CCA was received from. The no form of this command reverts to the default (disabled).

Default

no alt-peer-rar

5.2.1.14.22 connection-failure-timer

Syntax

```
connection-failure-timer value  
no connection-failure-timer
```

Context

```
config>mobile>pdn>gx
```

Description

This command configures the time in seconds that the gateway waits after the connectivity failure is detected. When the timer expires, the preserve-volte command is applied, if enabled on the directly connected Diameter peer.

Parameters

value

specifies the time, in seconds
Values: 1 to 300
Default: 5

5.2.1.14.23 doic

Syntax

```
doic
```

Context

```
config>mobile>pdn>gx  
config>mobile>pdn>s6b  
config>mobile>pdn>sd  
config>mobile>pdn>sta  
config>mobile>pdn>swm
```

Description

This command enables the context to configure the Diameter Overload Indication Conveyance (DOIC) interface parameters.

5.2.1.14.24 diameter-overload-control

Syntax

```
[no] diameter-overload-control
```

Context

```
config>mobile>pdn>gx>doic  
config>mobile>pdn>s6b>doic  
config>mobile>pdn>sd>doic  
config>mobile>pdn>sta>doic  
config>mobile>pdn>swm>doic
```

Description

This command enables the Diameter Overload Indication Conveyance (DOIC) on the Diameter interface. When enabled, the PGW acts as the reactive node with capability announcement and overload action handling based on RFC 7683.

With Diameter overload enabled, the OC-Support-Features AVP grouped AVP is always sent with the OC-Feature-Vector AVP set to 0x000000000000000010 (OLR_DEFAULT_ALGO).

The no form of this command reverts to the default.

NOTE:

Initial Diameter requests are always realm-based routed. This means that in case of a host-level Diameter overload with multiple hosts associated with the reference point peer, the Diameter client will

not throttle any initial Diameter request until OC-OLR has been received from all the associated hosts to the reference point peer.

Default

no diameter-overload-control

5.2.1.14.25 dra-diameter-too-busy

Syntax

```
dra-diameter-too-busy [re-router-timer minute-value]  
no dra-diameter-too-busy
```

Context

```
config>mobile>pdn>gx
```

Description

This command configures the DRA overload handling based on receiving the result code Diameter_Too_Busy (3004), when the system is configured with Primary and Secondary DRA.

When enabled, and the PGW receives result code Diameter_Too_Busy from the DRA peer, the PGW reroutes all Diameter requests to the secondary DRA for the duration of the reroute timer. Any Diameter respond messages with result code Diameter_too_Busy from the remote PCRF server are not rerouted over the other DRA peer and follow failure handling with either continue (bypass), retry/terminate, or terminate as configured in the Gx profile.

The no form of this command reverts to the default (disabled).

Default

no dra-diameter-too-busy

Parameters

minute-value

specifies the time period, in minutes, that all subsequent Diameter messages are routed to the alternative DRA peer

Values: 1 to 30

Default: 5

5.2.14.26 **gx-avp-options-profile**

Syntax

```
gx-avp-options-profile profile-number  
no gx-avp-options-profile
```

Context

```
config>mobile>pdn>gx
```

Description

This command specifies the applicable Gx AVP options profile.

Parameters

profile-number

specifies the profile number

Values: 1 to 255

5.2.14.27 **gx-profile**

Syntax

```
gx-profile profile-name  
no gx-profile
```

Context

```
config>mobile>pdn>gx
```

Description

This command specifies a (default) Gx profile at the PDN level. If specified, the APN level Gx profile overrides the PDN level profile; see the `dynamic-pcc gx-profile` option. If no profile is specified at the APN level, the profile specified at the PDN level is inherited.

The no form of this command removes the association of the specified profile at the PDN level.

Parameters

profile-name

specifies the name of the Gx profile, up to 32 characters. The Gx profile is configured in the mobile gateway Gx profile context; see [Gx Profile command descriptions](#) for information.

5.2.14.28 interface

Syntax

```
interface
```

Context

```
config>mobile>pdn>gx
```

Description

This command enables the context to configure Diameter interface parameters

**NOTE:**

This command requires a PDN shutdown.

5.2.14.29 diameter

Syntax

```
diameter [router router-instance] interface-name
```

```
no diameter
```

Context

```
config>mobile>pdn>gx>if
```

Description

This command configures Diameter interface parameters. This command configures the virtual router in which the Diameter connections will be established by this Diameter policy.

The no form of this command removes the parameter from the configuration.

**NOTE:**

This command requires a PDN shutdown.

Parameters

router-instance

specifies the virtual router name or service ID

Values	router-name service-id	
–	router-name	Base
–	service-id	1 to 2147483647

Default: Base

interface-name

specifies an interface name, up to 32 characters

5.2.1.14.30 multi-homing

Syntax

multi-homing
no multi-homing

Context

config>mobile>pdn>gx>if
config>mobile>pdn>gy>if
config>mobile>pdn>rf>if
config>mobile>pdn>s6b>if

Description

This command enables multi-homing from the local peer. When multi-homing is enabled, a secondary Diameter interface can also be specified.

The no form of this command reverts to the default (disabled).

NOTE:

- Current multi-homing support requires primary and secondary interfaces to be in the same VPRN.

- This command requires a PDN shutdown.

Default

no multi-homing

5.2.1.14.31 diameter

Syntax

```
diameter [router router-instance] secondary-interface-name  
no diameter
```

Context

```
config>mobile>pdn>gx>if>multi-homing  
config>mobile>pdn>gy>if>multi-homing  
config>mobile>pdn>rf>if>multi-homing  
config>mobile>pdn>s6b>if>multi-homing
```

Description

This command configures Diameter secondary interface parameters and the virtual router in which the Diameter connection will be established by this Diameter policy.

The no form of this command removes the parameter from the configuration.

NOTE:

- Current multi-homing support requires primary and secondary interfaces to be in the same VPRN.
- This command requires a PDN shutdown.

Parameters

router-instance

specifies the virtual router name or service ID

Values	router-name service-id
--------	--------------------------

–	router-name	Base
–	service-id	1 to 2147483647

Default: Base

secondary-interface-name

specifies an interface name up to 32 characters

5.2.1.14.32 origin-host

Syntax

```
origin-host name  
no origin-host
```

Context

```
config>mobile>pdn>gx  
config>mobile>pdn>gy  
config>mobile>pdn>rf  
config>mobile>pdn>s6b  
config>mobile>pdn>sd  
config>mobile>pdn>sta  
config>mobile>pdn>swm
```

Description

This command specifies the originating host name used in the interface. The configured value is prepended with an MSCPxx prefix (where xx is the group ID of the redundant pair) and thus, the resulting origin host is unique for each redundant pair of ISM-MG cards or per MG-VM in CMG.

For example, for a single ISM-MG redundant pair in the chassis, if the configured origin host is `gx-7750mg.ipd-nokia.com`, the origin host sent over the connection is `mscp01.gx-7750mg.nokia.com`.

If no value is defined, the origin host parameter configured in the context `config>mobile>pdn>signaling>diameter>origin-host` is used instead.

The no form of this command reverts to the default (no value defined).

**NOTE:**

- The configured Gy origin host name cannot be removed if the `limit-session-id-length` command is enabled.
- This command requires a PDN shutdown.

Parameters

name

specifies the origin host name, up to 80 characters. If the `limit-session-id-length` command is enabled, the origin host name value must be up to 53 characters.

5.2.1.14.33 pcrf-selection

Syntax

```
pcrf-selection
```

Context

```
config>mobile>pdn>gx
```

Description

This command enables the context to configure Policy and Charging Rules Function (PCRF) selection parameters.

**NOTE:**

This command requires a PDN shutdown.

5.2.1.14.34 diameter-peer-group-list

Syntax

```
diameter-peer-group-list list-name
```

```
no diameter-peer-group-list
```

Context

```
config>mobile>pdn>gx>pcrf
```

```
config>mobile>pdn>gy
```

Description

This command associates a Diameter peer group list. It contains a list of Diameter peer groups. Each group is a set of a primary / secondary pair. The `diameter-peer-group-list` command can be used for PCRF/OCS selection based on the priority of the peer group.

Before associating the list, it must be created first using command `diameter-peer-group-list` under context `config>mobile>profile`.

NOTE:

This command requires a PDN shutdown, when used in the `config>mobile>pdn>gy` context.

Parameters

list-name

specifies the name of the Diameter peer group list (up to 32 characters)

5.2.1.14.35 primary-diameter-peer

Syntax

```
primary-diameter-peer profile-name
```

```
no primary-diameter-peer
```

Context

```
config>mobile>pdn>gx>pcrf
```

Description

This command configures default primary Diameter peer profile parameters.

The `no` form of this command removes the profile name from the configuration.

NOTE:

This command requires a PDN shutdown.

Default

```
no primary-diameter-peer
```

Parameters

profile-name

specifies a Diameter profile name, up to 32 characters

5.2.1.14.36 secondary-diameter-peer

Syntax

secondary-diameter-peer *profile-name*

no secondary-diameter-peer

Context

config>mobile>pdn>gx>pcrf

Description

This command configures default secondary Diameter peer profile parameters.

The no form of this command removes the profile name from the configuration.

NOTE:

This command requires a PDN shutdown.

Default

no secondary-diameter-peer

Parameters

profile-name

specifies a Diameter profile name, up to 32 characters

5.2.1.14.37 selection-priority

Syntax

selection-priority {imsi | msisdn | imei} [{imsi | msisdn | imei}... (up to 3 max)]

no selection-priority

Context

```
config>mobile>pdn>gx>pcrf
```

Description

This command configures the selection priority for the user-range of the peers.

The no form of this command removes the selection priority for the user-range from the configuration.

Default

no selection-priority

Parameters

imsi | msisdn | imei

selects the first (or second or third) selection for the user-range

Default: imsi msisdn imei

5.2.1.14.38 selection-type

Syntax

```
selection-type {prefix | full-id | suffix}
```

```
no selection-type
```

Context

```
config>mobile>pdn>gx>pcrf
```

Description

This command configures the selection type for the peer user ranges.

The no form of this command removes the selection type for the user - range configuration.

Default

no selection-type

Parameters

prefix

selects the prefix for the user range

full-id

selects the full identifier for the user range

suffix

specifies an integer that selects the end digit for the user range.

Default: full-id

5.2.1.14.39 user-range

Syntax

```
user-range user-range-name type {imsi | msisdn | imei} {start-id [end-id] | suffix} {primary-  
pcrf profile-name [secondary-pcrf profile-name] | diameter-peer-group-list list-name}  
  
no user-range user-range-name
```

Context

```
config>mobile>pdn>gx>pcrf
```

Description

This command configures the peer user ranges. You can configure up to 32 user range entries.

The no form of this command removes the peer user ranges from the configuration.

Default

```
no user-range
```

Parameters

user-range-name

selects the user range name, up to 32 characters

imsi | msisdn | imei

selects the type of the user range

start-id

selects the start identifier for the user range, 4 to 16 characters long; when you select the prefix option:

- for an IMSI range, the start identifier must be 5 to 15 characters long
- for an MSISDN range, the start identifier must be 4 to 15 characters long
- for an IMEI range, the start identifier must be 4 to 8 characters long

when you select the full-id option:

- for an IMSI range, the start identifier must be 10 to 15 characters long

- for an MSISDN range, the start identifier must be 9 to 15 characters long
- for an IMEI range, the start identifier must be 15 to 16 characters long

end-id

selects the end identifier for the user range, 4 to 16 characters long; when you select the *prefix* option:

- for an IMSI range, the end identifier must be 5 to 15 characters long
- for an MSISDN range, the end identifier must be 4 to 15 characters long
- for an IMEI range, the end identifier must be 4 to 8 characters long

when you select the *full-id* option:

- for an IMSI range, the end identifier must be 10 to 15 characters long
- for an MSISDN range, the end identifier must be 9 to 15 characters long
- for an IMEI range, the end identifier must be 15 to 16 characters long

suffix

specifies an integer that selects the end digit for the user range; when you select the *suffix* option, the *start-id* and *end-id* are not used. In case of IMEI/IMEISV, the suffix matching is based on the last digit of the SNR.

Values: 0 to 9

profile-name

selects the name for the primary PCRF profile, up to 32 characters

secondary-pcrf profile-name

selects the name for the secondary PCRF profile, up to 32 characters

list-name

selects the name of the Diameter peer group list, up to 32 characters

5.2.1.14.40 **retry-count**

Syntax

retry-count *value*

no retry-count

Context

config>mobile>pdn>gx

Description

This command configures the number of times the same message is re-tried before declaring a failed attempt.

The no form of this command removes the value from the configuration.

Default

no retry-count

Parameters

value

specifies the number of times the same message is re-tried before declaring a failed attempt

Values: 0 to 8

Default: 3

5.2.1.14.41 send-called-station-id

Syntax

send-called-station-id *format*

send-called-station-id

Context

config>mobile>pdn>gx

Description

This command configures the Gx Called-Station-Id AVP in the CCR-I toward the PCRF in a case-sensitive manner. This affects real APN, virtual APN, NI-only, public APN, and so on.

The no form of this command reverts to the default value (none); no change in the case format of the APN.

Default

no send-called-station-id

Parameters

format

specifies the case of the APN in the Called-Station-Id AVP

Values	none	specifies that the APN case remains unchanged
–	lower-case	specifies to implement APN in lower-case
–	upper-case	specifies to implement APN in upper-case
–	original-case	specifies to implement APN in original-case

Default: none

5.2.1.14.42 single-diameter-host

Syntax

```
[no] single-diameter-host
```

Context

```
config>mobile>pdn>gx
```

```
config>mobile>pdn>gy
```

```
config>mobile>pdn>s6b
```

Description

This command specifies whether the Diameter interface of the mobile gateway is seen by the Diameter server as a single Diameter client or as multiple Diameter clients. When enabled, the respective interface is seen as a single Diameter host by any Diameter server. When disabled, the respective interface is seen as one Diameter client per MG-ISM node.

The no form of this command reverts to the default (disabled).

NOTE:

This command requires a PDN shutdown, when used in the config>mobile>pdn>gy context.

Default

```
no single-diameter-host
```

5.2.1.14.43 supported-vendor

Syntax

```
supported-vendor {custom-1 | custom-2 | custom-3}
no supported-vendor
```

Context

```
config>mobile>pdn>gx
```

Description

This command configures the vendor number for which vendor-specific customizations are supported. Each number represents a specific customer.

The no form of this command reverts to the default.

Default

no supported-vendor (for example, enhancements related to custom-1 do not apply)

Parameters

custom-1

specifies the custom-1 customer

custom-2

specifies the custom-2 customer

custom-3

specifies the custom-3 customer

Default: no customer

5.2.1.14.44 suppress-ccr-t-unknown-session

Syntax

```
[no] suppress-ccr-t-unknown-session
```

Context

```
config>mobile>pdn>gy
```

Description

This command is used to suppress CCR-T messages sent from the gateway for unknown sessions. When the gateway receives a CCA (I/U) message and the session context is not found, the gateway normally sends a CCR-T message to the OCS. This command suppresses the CCR-T messages from being sent.

The no form of this command reverts to the default (disabled).

Default

no suppress-ccr-t-unknown-session

5.2.1.14.45 tdf-info

Syntax

tdf-info

Context

config>mobile>pdn>gx

Description

This command configures the TDF information.

5.2.1.14.46 tdf-ipv4

Syntax

tdf-ipv4 *ip-address*

no tdf-ipv4

Context

config>mobile>pdn>gx>tdf-info

Description

This command is used to configure a TDF IPv4 address. This information is sent by the PGW to PCRF over the Gx interface. Either the IP address or the realm and host should be configured.

Parameters

ip-address

specifies the IPv4 address of a TDF

Values: a.b.c.d

5.2.1.14.47 tdf-ipv6

Syntax

```
tdf-ipv6 ip-address
```

```
no tdf-ipv6
```

Context

```
config>mobile>pdn>gx>tdf-info
```

Description

This command is used to configure a TDF IPv6 address. This information is sent by the PGW to PCRF over the Gx interface. Either the IP address or the realm and host must be configured.

Parameters

ip-address

specifies the IPv6 address of a TDF, up to 64 characters

5.2.1.14.48 tdf-realm

Syntax

```
tdf-realm realm-name tdf-host host-name
```

```
no tdf-realm
```

Context

```
config>mobile>pdn>gx>tdf-info
```

Description

This command is used to configure a TDF realm and host. This information is sent by the PGW to PCRF over Gx interface. Either the IP address or the realm and host should be configured.

Parameters

realm-name

specifies the TDF realm, up to 80 characters

host-name

specifies the TDF host name, up to 80 characters

5.2.1.14.49 transaction-timer

Syntax

transaction-timer {[*value*] | [timeout-msec *value*]}

no transaction-timer

Context

config>mobile>pdn>gx

Description

This command sets maximum amount of time the node waits for a Diameter peer to respond before trying another. The value can be expressed in seconds or milliseconds. Setting the timer in milliseconds provides better timeout granularity.

The transaction timer configured by transaction-timer in the config>mobile>profile>gx>message context overrides the time specified for transaction-timer.

The no form of this command removes the configuration.

Parameters

value

specifies the maximum amount of time, in seconds, the node waits for a Diameter peer to respond before trying another peer

Values: 1 to 180 (increments in 1 s)

Default: 5

timeout-msec *value*

specifies the maximum amount of time, in milliseconds, the node waits for a Diameter peer to respond before trying another peer

Values: 1000 to 180000 (increments of 100 ms)

Default: 5000

5.2.14.50 usu-options-over-quota-traffic-handling

Syntax

```
usu-options-over-quota-traffic-handling {allow | discard}  
no usu-options-over-quota-traffic-handling
```

Context

```
config>mobile>pdn>gx
```

Description

This command specifies the option to allow or discard the traffic for the service, while waiting for the PCRF to grant more quota. It is only effective if the Gx usage monitoring is currently active.

The no form of this command reverts to the default setting.

Parameters

allow

specifies that traffic can flow through while waiting for new granted quota from the PCRF

discard

specifies that traffic is discarded while waiting for new granted quota from the PCRF

Default: allow

5.2.14.51 usu-options-reporting-threshold

Syntax

```
usu-options-reporting-threshold percentage  
no usu-options-reporting-threshold
```

Context

```
config>mobile>pdn>gx
```

Description

This command specifies when the usage report based on volume threshold is sent to the PCRF for Gx usage monitoring. When the accumulated usage reaches the percentage of the granted service units (GSU), the report is triggered. By default, there is no threshold set, meaning that the report is triggered when the accumulated usage reaches the GSU.

The no form of this command removes this configuration.

Parameters

percentage

specifies the percentage of the GSU that is used as the local threshold for triggering the reporting

Values: 70 to 95

5.2.1.14.52 **usu-options-suppress-excess-quota**

Syntax

[no] usu-options-suppress-excess-quota

Context

config>mobile>pdn>gx

Description

This command suppresses reporting of the Used Service Units (USU) which exceed the previously Granted Service Units (GSU) for the Gx usage monitoring.

This applies when:

- usage monitoring is explicitly disabled by the PCRF
- an IP-CAN session is terminated
- all the PCC rules associated with a monitoring key are removed or deactivated

The no form of this command removes this configuration.

Default

usu-options-suppress-excess-quota

5.2.1.14.53 **gy**

Syntax

gy

Context

config>mobile>pdn

Description

This command enables the context to configure Online Charging (GY) parameters.

5.2.1.14.54 alt-peer-rar-asr

Syntax

[no] alt-peer-rar-asr

Context

config>mobile>pdn>gy

Description

This command enables the Gateway to accept RAR and/or ASR messages from an alternate peer (other than the Primary and Secondary).

When enabled, a RAR message or ASA message as the case may be will be sent back to the peer that initiated the RAR or ASR respectively. The IP-CAN session will continue to use the Primary and Secondary for the Gy session (i.e., any CCR-U or CCR-T for the session will be sent to the destination peer the last CCA was received from).

The no form of this command reverts to the default (disabled).

5.2.1.14.55 dcca-profile

Syntax

dcca-profile *profile-name*

no dcca-profile

Context

config>mobile>pdn>apn>charging

config>mobile>pdn>gy

Description

This command configures the Diameter Credit Control Application (DCCA) profile to be used for the primary and secondary OCS at the charging profile level.

**NOTE:**

This command requires a PDN shutdown, when used in the `config>mobile>pdn>gy` context.

Default

For online charging over Gy, a default DCCA profile needs to be specified.

Parameters

profile-name

specifies a DCCA profile name associated with the primary and secondary OCS, up to 32 characters

5.2.1.14.56 dia-routing-table

Syntax

```
dia-routing-table host-index supported-host fqdn port port transport {tcp | sctp} realm  
dest-realm diameter-peer-group-list peer-list  
  
no dia-routing-table [host-index]
```

Context

`config>mobile>pdn>gy`

Description

This command configures a table with entries that associate the host with a destination realm, to be used toward the selected Diameter peer; for example, DRA. The PCRF-specified Primary-Event-Charging-Function-Name FQDN value (mapped to the supported-host, port, and transport parameters) can use the associated destination realm toward the Diameter peer. The no form of this command deletes a Diameter table entry (if *host-index* is also specified) or the Diameter table.

Default

`no dia-routing-table`

Parameters

host-index

specifies the host index number

Values: 1 to 512

fqdn

specifies the FQDN for the supported host, up to 255 characters

port

specifies the port

Values: 1 to 65535

tcp | sctp

specifies the transport used for the Diameter signaling

dest-realm

specifies the destination realm, up to 80 characters

peer-list

specifies a Diameter peer group list that has been configured in the context

configure>mobile>profile>list>diameter-peer-group-list, up to 32 characters

5.2.1.14.57 diameter-session

Syntax

```
diameter-session {pdn-level | bearer-level}
```

```
no diameter-session
```

Context

```
config>mobile>pdn>gy
```

Description

This command configures the Diameter session.

NOTE:

This command requires a PDN shutdown.

Default

For online charging over Gy, a default DCCA profile needs to be specified.

Parameters

pdn-level

specifies a Diameter session on the PDN level

bearer-level

specifies a Diameter session on the bearer level

5.2.14.58 **exclude-dest-host-pcrf-selected-server**

Syntax

```
[no] exclude-dest-host-pcrf-selected-server
```

Context

```
config>mobile>pdn>gy
```

Description

This command excludes the destination host from the CCR-I for an OCS server that is selected by the PCRF. In this scenario, the DRA selects the appropriate OCS server host based on the destination realm. The no form of this command includes the destination host in the CCR-I (default).

Default

```
no exclude-dest-host-pcrf-selected-server
```

5.2.14.59 **interface**

Syntax

```
interface
```

Context

```
config>mobile>pdn>gy
```

Description

This command enables the context configure a Gy interface.

5.2.14.60 diameter

Syntax

```
diameter [router router-instance] interface-name  
no diameter
```

Context

```
config>mobile>pdn>gy>interface
```

Description

This command specifies Diameter interface parameters.

**NOTE:**

This command requires a PDN shutdown.

Parameters

router-instance

specifies the virtual router instance

Values	router-name service-id	
–	router-name	Base
–	service-id	1 to 2147483647

interface-name

Specifies the interface on which to receive broadcast packets, up to 32 characters; if the string contains special characters (#, \$, spaces), the entire string must be enclosed within double quotes

5.2.14.61 limit-session-id-length

Syntax

```
[no] limit-session-id-length
```

Context

```
config>mobile>pdn>gy
```

Description

This command limits the length of the Session-Id AVP to 80 characters in the Gy messages sent by the PGW/GGSN. This is done by limiting the Gy application origin host name to 53 characters.

This command can only be used when a Gy application origin host name is configured. If the configured Gy application origin host name is more than 53 characters, it must be reconfigured before using this command.

Default

no limit-session-id-length

5.2.1.14.62 ocs-selection

Syntax

```
ocs-selection
```

Context

```
config>mobile>pdn>gy
```

Description

This command configures the Online Charging System (OCS) selection parameters.

5.2.1.14.63 selection-type

Syntax

```
selection-type {imsi | msisdn} {prefix | full-id | suffix}
```

```
no selection-type
```

Context

```
config>mobile>pdn>gy>ocs-selection
```

Description

This command specifies the OCS selection criteria which can be based on an IMSI or MSISDN range.

When you select the `full-id` option, enter a *start-id* and *end-id* for each user - range entry (when you select the `prefix` option, the *end-id* is optional).

When you select the `suffix` option, you must enter a suffix digit.

If the IMSI/MSISDN for a specific UE does not match any of the configured entries, the selection of OCS and DCCA profile follows the existing selection criteria (that is, APN, charging profile, PGW, and so on).

The no form of this command removes the selection type for the user - range.

Default

no selection-type

Parameters

imsi

specifies an IMSI range for the OCS selection

msisdn

specifies an MSISDN range for the OCS selection

prefix

specifies that the mapping is based on an IMSI or MSISDN prefix; up to 11 digits

full-id

specifies that the mapping is based on a full identifier for the start and end identifiers, for the user - range command. When you select the `full-id` option, the *start-id* and *end-id* must be full identifiers. For IMSI, the full identifier is 10 to 15 digits long and for MSISDN, 4 to 15 digits long.

suffix

specifies an integer that selects the end digit for the user range.

5.2.1.14.64 user-range

Syntax

```
user-range user-range-name {start-id [end-id] | suffix} {primary-ocs profile-name [secondary-ocs profile-name] | diameter-peer-group-list list-name} [dcca-profile profile-name]
```

Context

```
config>mobile>pdn>gy>ocs-selection
```

Description

This command specifies an IMSI or MSISDN mapping to the associated primary and secondary OCS peers. The specified DCCA profile applies to the configured primary and secondary OCS peers.

When you select the `prefix` option, enter an IMSI or MSISDN prefix up to 11 digits. For IMSI, the prefix length is from MCC+MNC to 11 digits and you can enter from 5 to 11 digits. For MSISDN, the prefix length is from CC + NDC to 11 digits and you can enter from 4 to 11 digits.

When you select the `full-id` option, the `start-id` and `end-id` must be full identifiers.

A maximum of up to 32 entries per PLMN are supported and the ranges must not overlap.

When you select the `suffix` option, you must enter a 1-digit suffix.

When the IMSI/MSISDN does not match any of the configured ranges, the primary and secondary OCS at the PDN gateway level, when configured, are used by default.

The no form of this command removes the user - range configuration.

**NOTE:**

The no form of this command requires a PDN shutdown.

Parameters

user-range-name

specifies the user range range, up to 32 characters

start-id

specifies the start identifier (IMSI or MSISDN) of the range; for IMSI, the subscriber's IMSI or IMSI prefix; for MSISDN, the subscriber's MSISDN or MSISDN prefix

end-id

specifies the end identifier (IMSI or MSISDN) of the range; for IMSI, the subscriber's IMSI or IMSI prefix; for MSISDN, the subscriber's MSISDN or MSISDN prefix

suffix

specifies an integer that selects the end digit for the user range; when you select the `suffix` option, the `start-id` and `end-id` are not used.

Values: 0 to 9

profile-name

specifies the OCS peer profile name, up to 32 characters

secondary-ocs profile-name

specifies the DCCA profile name associated with the OCS peers, up to 32 characters

list-name

specifies the Diameter peer group list name, up to 32 characters

5.2.14.65 outage

Syntax

outage

Context

config>mobile>pdn>gy

Description

This command enables the context to configure parameters for an outage scenario.

5.2.14.66 file-params

Syntax

file-params

Context

config>mobile>pdn>gy>outage

Description

This command provides the required context for detailed configuration of outage file parameters.

5.2.14.67 closure-rec-number

Syntax

closure-rec-number *closure-rec-number*

no closure-rec-number

Context

config>mobile>pdn>gy>outage>file-params

Description

This command specifies a limit for the number of CCRs that are stored in a file. The file is closed when it reaches the specified limit.

The no form of this command reverts to the default.

Parameters

closure-rec-number

specifies the maximum number of CCR messages to fit in a file

Values: 100 to 75000

Default: 50000

5.2.1.14.68 closure-size

Syntax

`closure-size closure-size`

`no closure-size`

Context

`config>mobile>pdn>gy>outage>file-params`

Description

This command specifies a maximum size for the file. The file is closed when it reaches the specified limit.

The no form of this command returns the setting to the default.

Parameters

closure-size

specifies the file closure size in megabytes

Values: 1 to 100

Default: 50

5.2.1.14.69 closure-time

Syntax

`closure-time closure-time`

`no closure-time`

Context

config>mobile>pdn>gy>outage>file-params

Description

This command specifies a file closure time in hours. The file is closed after the specified time limit is reached.

The no form of this command returns the setting to the default.

Parameters

closure-time

specifies the file closure time, in hours

Values: 1 to 24

Default: 1

5.2.1.14.70 *obsolete-time*

Syntax

obsolete-time obsolete-time

no *obsolete-time*

Context

config>mobile>pdn>gy>outage>file-params

Description

This command specifies a file duration, in days, after which the file is deleted from the primary or secondary directory.

The no form of this command reverts to the default.

Parameters

obsolete-time

specifies the duration, in days, after which the file is deemed obsolete and deleted

Values: 1 to 31

Default: 7

5.2.14.71 location

Syntax

```
location {cf1 | cf2}
```

Context

```
config>mobile>pdn>gy>outage
```

Description

This command specifies the primary compact flash that will be used for CCR storage. The options are cf1 or cf2; cf3 is reserved. If cf1 is chosen as the primary location, cf2 becomes the alternate compact flash that CCR messages will be written to when the primary is full, in the event of an outage.

Parameters

cf1 | cf2

specifies the primary compact flash to used for CCR storage

5.2.14.72 limit

Syntax

```
limit limit
```

```
no limit
```

Context

```
config>mobile>pdn>gy>outage>location
```

Description

This command specifies a limit, in megabytes, to the amount of memory that the compact flash can use for CCR storage.

The no form of this command reverts to the default.

Default

no limit

Parameters

limit

specifies the limit for the compact flash in megabytes

5.2.14.73 primary

Syntax

[no] primary

Context

config>mobile>pdn>gy>outage>location

Description

This command configures the compact flash specified in the config>mobile>pdn>gy>gy>outage>location command as the primary compact flash. The compact flash that is not specified in the location command becomes the secondary compact flash.

The no form of this command reverts to the default.

Default

cf1 is the primary compact flash; cf2 is the secondary compact flash

5.2.14.74 primary-diameter-peer

Syntax

primary-diameter-peer *profile-name*

no primary-diameter-peer

Context

config>mobile>pdn>gy

Description

This command configures the Diameter peer profile to be used for the primary Online Charging System (OCS) at the gateway level.

NOTE:

This command requires a PDN shutdown.

Default

For online charging over Gy, a default primary OCS needs to be specified.

Parameters

profile-name

specifies the name of the Diameter profile associated with the primary OCS, up to 32 characters

5.2.1.14.75 secondary-diameter-peer

Syntax

`secondary-diameter-peer profile-name`

`no secondary-diameter-peer`

Context

`config>mobile>pdn>gy`

Description

This command configures the Diameter peer profile to be used for the secondary Online Charging System (OCS) at the gateway level.

NOTE:

This command requires a PDN shutdown.

Default

For online charging over Gy, a default secondary OCS needs to be specified.

Parameters

profile-name

specifies the name of the Diameter profile associated with the secondary OCS, up to 32 characters

5.2.14.76 session-id-format

Syntax

```
session-id-format {type1 | type2}  
no session-id-format
```

Context

```
config>mobile>pdn>gy
```

Description

This command configures specific sections of the Session-Id AVP in the Gy messages that are sent from the PGW/GGSN to be recognized by the customer billing system (OCS). To apply changes to these sections, when the *type1* option is selected, the session creation time (Unix Time) is added in the second field (high 32 bits) in decimal format, the internal Diameter key in the third field while the optional fourth field is completely removed. If the `limit-session-id-length` functionality is enabled, this command cannot be used. A warning is displayed for the user to disable the `limit-session-id-length` before configuring the `session-id-format` command.

When the *type2* option is selected, the session creation time (in hex format) is added in the end of the session ID.

NOTE:

The *type2* parameter requires that the following command is enabled: `configure mobile-gateway profile dcca supported-vendor custom-1`.

Parameters

type1

specifies the format of the Session-Id AVP

type2

specifies a custom format of the Session-Id AVP

5.2.14.77 sig-rate-limit-profile

Syntax

```
sig-rate-limit-profile profile-name  
no sig-rate-limit-profile
```

Context

```
config>mobile>pdn>gy
```

Description

This command associates a rate limiting profile to be applied on the Gy interface. The same limit applies to all Diameter peers for this application. The profile must be configured first (using the command `sig-rate-limit-profile` in context `config>mobile>profile`) before being referenced by this command.

The `no` form of this command removes the association of the specified profile for the Gy interface.

Parameters

profile-name

specifies the name of the rate limiting profile, up to 32 characters

5.2.1.15 GTP load and overload control PDN command descriptions

5.2.1.15.1 gtp-load-control

Syntax

```
gtp-load-control
```

Context

```
config>mobile>pdn
```

Description

This command enables the context to configure GTP load control parameters.

5.2.1.15.2 enable-gtp-load-control

Syntax

```
[no] enable-gtp-load-control
```

Context

```
config>mobile>pdn>gtp-load-control
```

Description

This command enables GTP load control.

NOTE:

- When enabling the APN-level GTP-C load control, this command must also be configured.
- This command requires a PDN shutdown.

5.2.1.15.3 load-change-trigger

Syntax

load-change-trigger *percent*

no load-change-trigger

Context

config>mobile>pdn>gtp-load-control

Description

This command configures the load change value which will trigger a new load control update.

NOTE:

This command requires a PDN shutdown.

Parameters

percent

specifies the load change value percentage, from 5 to 20, in increments of 5

Values: 5 | 10 | 15 | 20

Default: 5

5.2.1.15.4 nth-message

Syntax

nth-message *number*

no nth-message

Context

config>mobile>pdn>gtp-load-control

Description

This command configures the message interval for sending load control information.

Parameters

number

specifies the interval to be used to include load control information

Values: 1 to 1000

Default: 50

5.2.1.15.5 gtp-overload-control

Syntax

gtp-overload-control

Context

config>mobile>pdn

Description

This command configures GTP overload control parameters.

5.2.1.15.6 enable-gtp-overload-control

Syntax

[no] enable-gtp-overload-control

Context

config>mobile>pdn>gtp-overload-control

Description

This command enables GTP overload control.

**NOTE:**

When enabling the APN-level GTP-C overload control, this command must also be configured.

5.2.1.15.7 gtp-120-oci

Syntax

```
[no] gtp-120-oci
```

Context

```
config>mobile>pdn>gtp-overload-control
```

Description

This command allows the ePDG to treat a PGW that provides the GTPv2 error code 120, as if the PGW is in an overload condition.

The no form of this command disables the PGW treatment.

Default

```
no gtp-120-oci
```

5.2.1.15.8 gtp-73-120-reduction-metric

Syntax

```
gtp-73-120-reduction-metric metric
```

```
no gtp-73-120-reduction-metric
```

Context

```
config>mobile>pdn>gtp-overload-control
```

Description

This command allows to set the overload reduction metric value that the ePDG applies for the PGW, providing the GTP error code 73 or 120. This command is valid only if the config>mobile>pdn>gtp-overload-control-gtp73-oci or gtp-120-oci is enabled.

The no form of this command reverts to the default.

**NOTE:**

This command is by default active, with a default value of 50% reduction metric. This ensures that the reduction metric is applied when the `gtp-73-oci` or `gtp-120-oci` is enabled.

Default

`no gtp-73-120-reduction-metric`

Parameters***metric***

specifies the percentage of the overload reduction metric that is applied

Values: 10 to 100 (in steps of 10)

Default: 50

5.2.1.15.9 gtp-73-oci**Syntax**

`[no] gtp-73-oci`

Context

`config>mobile>pdn>gtp-overload-control`

Description

This command allows the ePDG to treat a PGW that provides GTPv2 error code 73, as if the PGW is in an overload condition.

The `no` form of this command disables the PGW treatment.

Default

`no gtp-73-oci`

5.2.1.15.10 local-throttling**Syntax**

`local-throttling`

Context

```
config>mobile>pdn>gtp-overload-control
```

Description

This command configures the throttling (rejection) parameters of the call flows that add further load on the gateway when the gateway is in GTP-C overload.

5.2.1.15.11 critical

Syntax

```
critical
```

Context

```
config>mobile>pdn>gtp-overload-control>local-throttling
```

Description

This command enables the context to configure the parameters in the GTP-C critical overload state.

5.2.1.15.12 drop-only

Syntax

```
drop-only drop-type
```

```
no drop-only
```

Context

```
config>mobile>pdn>gtp-overload-control>local-throttling>critical
```

```
config>mobile>pdn>gtp-overload-control>local-throttling>major
```

```
config>mobile>pdn>gtp-overload-control>local-throttling>minor
```

Description

This command configures the type of GTP-C messages that should be throttled (rejected) if call flows add additional load when the gateway is already in different types of GTP-C overload levels.

Only the CSREQ with the *drop-type* option is supported. When the drop-only command is configured with the *drop-type* option csreq enabled, the Create Session Responses (CSResp) include the GTP-C cause-code: 73: No Resource Available

For example, if the gateway is in major overload, the major throttling percent is set to 60%, and the drop-only command is configured with the *drop-type* option csreq enabled, the gateway rejects six out of ten incoming Create Session Requests (CSREQs).

When the *drop-type* option is not configured, or the no drop-only command is configured, the gateway reverts to the default behavior, which is throttling the internal pre-mix of message types. For more details, refer to table *GTP-C Overload Condition and PGW Throttling Actions*, in the *CMG Configuration Guide*

**NOTE:**

The command is enabled only when local-overload-throttling is enabled and the throttling percentage value is set to non-zero.

Default

no drop-only

Parameters

drop-type

specifies the type of GTP-C message that is throttled during a GTP-C overload

Values: csreq (supported message type)

Default: no drop-only

5.2.1.15.13 exclude-arp-list

Syntax

```
exclude-arp-list list-name
```

```
no exclude-arp-list
```

Context

```
config>mobile>pdn>gtp-overload-control>local-throttling>critical
```

```
config>mobile>pdn>gtp-overload-control>local-throttling>major
```

```
config>mobile>pdn>gtp-overload-control>local-throttling>minor
```

Description

This command configures the ARP list to be used for excluding throttling of certain Create Session Requests (csreq) when the gateway is in different types of GTP-C overload levels.

For example, if the gateway is in major overload, the major throttling percent is set to 60%, the drop-only command is set with the option *csreq* enabled, and the list name includes ARP=6, 7, the gateway rejects six out of ten incoming CSREQs except those ARPs with values 6 and 7.

The no form of this command reverts to the default.

**NOTE:**

This command requires that the drop-only command with the *csreq* enabled is configured.

Default

no exclude-arp-list

Parameters

list-name

specifies the name of the ARP list; up to 32 characters

5.2.1.15.14 throttling-percent

Syntax

throttling-percent *percent-value*

no throttling-percent

Context

config>mobile>pdn>gtp-overload-control>local-throttling>critical

Description

This command configures the percentage of traffic that should be throttled (rejected) due to the call flows that add further load on the gateway when the gateway is in critical GTP-C overload level. For example, if the gateway is in critical overload and the critical throttling-value is set to 90%, the gateway rejects nine out of ten call flows.

The no form of this command disables the throttling of call flows when the gateway is in GTP-C critical overload.

**NOTE:**

This command takes effect when the local-overload-throttling command is enabled.

Default

no throttling-percent

Parameters

percent-value

specifies the percentage of the traffic that should be throttled when the gateway is in the critical GTP-C overload level

Values: 0 to 100

Default: 90

5.2.1.15.15 local-overload-throttling

Syntax

```
local-overload-throttling {enable | disable}
```

```
no local-overload-throttling
```

Context

```
config>mobile>pdn>gtp-overload-control>local-throttling
```

Description

This command configures the throttling (reject) of call flows that add extra load on the gateway when the gateway is in GTP-C overload state. When enabled, the gateway throttles (reject) more signaling loads based on the configured percentage of the minor, major and critical reduction values.

To set the throttling percentage for the minor, major and critical GTP overload levels, other commands must be configured in the context:

CLI Syntax: configure mobile-gateway pdn *gtp-overload-control local-throttling*

The no form of this command reverts to the default value, which enables throttling.

NOTE:

To enable the `local-overload-throttling` command, the `gtp-overload-control` command must also be enabled using the `enable-gtp-overload-control` command.

Parameters

enable | disable

enables or disables the parameters for local overload throttling

Default: enable

5.2.1.15.16 major

Syntax

major

Context

config>mobile>pdn>gtp-overload-control>local-throttling

Description

This command enables the context to configure the parameters for the major GTP-C overload level.

5.2.1.15.17 throttling-percent

Syntax

throttling-percent *percent-value*

no throttling-percent

Context

config>mobile>pdn>gtp-overload-control>local-throttling>major

Description

This command configures the percentage of the traffic that should be throttled (rejected) due to the call flows that add further load on the gateway when the gateway is in major GTP-C overload level. For example, if the gateway is in major overload and the major throttling-value is set to 60%, the gateway rejects six out of ten call flows.

The no form of this command reverts to the default.

NOTE:

This command requires that the local-overload-throttling command is enabled.

Default

no throttling-percent

Parameters

percent-value

specifies the percentage of the traffic that should be throttled when the gateway is in the major GTP-C overload level

Values: 0 to 100

Default: 60

5.2.1.15.18 minor

Syntax

minor

Context

config>mobile>pdn>gtp-overload-control>local-throttling

Description

This command enables the context to configure the parameters for the minor GTP-C overload level.

5.2.1.15.19 throttling-percent

Syntax

throttling-percent *percent-value*

no throttling-percent

Context

config>mobile>pdn>gtp-overload-control>local-throttling>minor

Description

This command configures the percentage of the traffic that should be throttled (rejected) due to the call flows that add further load on the gateway when the gateway is in minor GTP-C overload level. For example, if the gateway is in minor overload and the minor throttling-value is set to 30%, the gateway rejects three out of ten call flows.

The no form of this command disables to the default.

NOTE:

This command requires that the `local-overload-throttling` command is enabled.

Default

no throttling-percent

Parameters

percent-value

specifies the percentage of the traffic that should be throttled when the gateway is in the minor GTP-C overload level

Values: 0 to 100

Default: 0

5.2.1.15.20 throttling-alarms

Syntax

`throttling-alarms {enable | disable}`

`no throttling alarms`

Context

`config>mobile>pdn>gtp-overload-control>local-throttling`

Description

This command configures the throttling alarms. The alarms are raised when the first message is throttled (rejected) because of the call flows that add extra load on the gateway when the gateway is in GTP-C overload state. The alarms are cleared 30 seconds after the throttling (rejection) of the last message.

The no form of this command reverts to the default.

NOTE:

To enable throttling alarms, the commands must be configured as follows:

- the `local-overload-throttling` command must be enabled
- the `throttling-percent` command must be set in non-zero value
- the `drop-only` command with the `CSREQ` option must be configured under the contexts:
 - `config>mobile>pdn>gtp-overload-control>local-throttling>critical`
 - `config>mobile>pdn>gtp-overload-control>local-throttling>major`

```
– config>mobile>pdn>gtp-overload-control>local-throttling>minor
```

Once raised, the alarm will be cleared despite the state (enable/disable) of the throttling alarms CLI.

Default

no throttling-alarms

Parameters

enable | disable

enables or disables the parameters for throttling alarms

Default: disable

5.2.1.15.21 overload-control-only-on-new-sessions

Syntax

```
[no] overload-control-only-on-new-sessions
```

Context

```
config>mobile>pdn>gtp-overload-control
```

Description

This command allows to apply the overload control actions only for new sessions, leaving the existing sessions unaffected.

The no form of this command reverts to the default.

Default

no overload-control-only-on-new-sessions

5.2.1.15.22 overload-reduction

Syntax

```
overload-reduction
```

Context

```
config>mobile>pdn>gtp-overload-control
```

Description

This command configures the percentage of the traffic reduction requested for different GTP overload levels.

5.2.1.15.23 critical

Syntax

```
critical reduction-value
```

```
no critical
```

Context

```
config>mobile>pdn>gtp-overload-control>overload-reduction
```

Description

This command enables the context to configure the parameters for the critical GTP-C overload level.

The no form of this command reverts to the default.

Default

```
no critical
```

Parameters

reduction-value

specifies the traffic reduction percentage for critical overload

Values: 20 to 100

Default: 90

5.2.1.15.24 major

Syntax

```
major reduction-value
```

```
no major
```

Context

```
config>mobile>pdn>gtp-overload-control>overload-reduction
```

Description

This command configures the percentage of traffic reduction requested for major overload.

The no form of this command reverts to the default.

Default

no major

Parameters

reduction-value

specifies the traffic reduction percentage for major overload

Values: 20 to 100

Default: 60

5.2.1.15.25 minor

Syntax

```
minor reduction-value
```

```
no minor
```

Context

```
config>mobile>pdn>gtp-overload-control>overload-reduction
```

Description

This command configures the percentage of traffic reduction requested for minor overload.

The no form of this command reverts to the default.

Default

no minor

Parameters

reduction-value

specifies the traffic reduction percentage for minor overload

Values: 20 to 100

Default: 30

5.2.1.15.26 s8

Syntax

[no] s8

Context

config>mobile>pdn>gtp-overload-control

Description

This command configures whether to report overload information on S8.

Default

no s8

5.2.1.15.27 validity-time

Syntax

validity-time *value*

no validity-time

Context

config>mobile>pdn>gtp-overload-control

Description

This command configures the length of the time for the reported overload to be in effect.

Parameters

value

specifies the length of time, in seconds, for the overload to be in effect

Values: 10 to 86400

Default: 600

5.2.15.28 validity-time-extra-time

Syntax

```
validity-time-extra-time time
```

```
no validity-time-extra-time
```

Context

```
config>mobile>pdn>gtp-overload-control
```

Description

This command allows the ePDG to add an extra safeguard time on top of every PGW Overload Period of Validity Timer value provided.

The no form of this command disables this extra time.

Parameters

time

specifies the additional time in seconds that is added on top of PGW provided Overload Period of Validity Timer

Values: 30 to 3600

Default: 30

5.2.15.29 pdn-threshold

Syntax

```
pdn-threshold
```

Context

```
config>mobile>pdn
```

Description

This command enables the context to configure GTP threshold parameters.

5.2.1.15.30 max-s11-attach

Syntax

```
max-s11-attach max-attach-limit [alarm] [include-emergency]  
no max-s11-attach
```

Context

```
config>mobile>pdn>pdn-threshold
```

Description

This command configures the threshold of the maximum number of GTP-based attach requests per second. The limit is applied only on the attach requests received over S11. If enabled or disabled, an alarm is raised when the maximum number of attaches is reached. Emergency attach requests are excluded by default from the threshold, but it is also possible to apply the attach limit to emergency attach request.

The no form of this command reverts to the default where no limit is applied to the number of attach requests.

Parameters

max-attach-limit

specifies the number of attach requests per second over S11

Values: 0 to 5000

Default: 0 (disabled)

alarm

specifies if an alarm is sent when the maximum number of attach requests is reached

include-emergency

specifies the emergency attach requests to the threshold

5.2.1.16 KPI-KCI PDN command descriptions

5.2.1.16.1 kpi-kci

Syntax

```
kpi-kci
```

Context

config>mobile>pdn

config>mobile>pdn>apn

Description

This command enables the context to configure KPI-KCI parameters.

5.2.1.16.2 mass-deactivation

Syntax

mass-deactivation

Context

config>mobile>pdn

Description

This command enables the context to configure the mass deactivation parameters.

5.2.1.16.3 qci

Syntax

qci *qci-value* [arp-pl *arp-pl-value*] session-delete-priority *priority-value*

no qci *qci-value* [arp-pl *arp-pl-value*]

Context

config>mobile>pdn>mass-deactivation

Description

This command assigns a priority value for the QCI or QCI/ARP. If mass deactivation of the bearers is configured, the highest priority bearers are deactivated first.

If no priority value is configured for a specific QCI, normal priority is set for the QCI. If no priority value is configured for a specific QCI/ARP, the configuration for the QCI value is also set to the QCI/ARP. In this case, if there is no configuration, normal priority is set, as well.

The no form of this command removes the entry from the configuration, and sets the priority to the default value (normal).

Parameters

qci-value

specifies the QCI value

Values: 1 to 255

arp-pl-value

specifies the value for the ARP priority level

Values: 1 to 15

priority-value

specifies the priority for mass deactivation

Values	normal	lowest priority
–	medium	third highest priority
–	high	second highest priority
–	critical	highest priority

Default: normal

5.2.1.16.4 qci-drop-stat

Syntax

qci-drop-stat *list-name*
no qci-drop-stat

Context

config>mobile>pdn>apn>kpi-kci

Description

This command specifies the QoS Class Identifier (QCI) drop stat profile name.

The no form of this command reverts to the default.

Default

no qci-drop-stat

Parameters

list-name

specifies the name of the QCI list profile

5.2.1.16.5 accounting-policy

Syntax

accounting-policy *acct-policy-id*

no accounting-policy

Context

config>mobile>pdn>kpi-kci

Description

This command creates the accounting policy context.

The no form of this command removes the accounting policy association from the configuration.

Parameters

acct-policy-id

Enter the accounting *policy-id* as configured in the config>log>accounting-policy context.

Values: 1 to 99

5.2.1.16.6 arp-traffic-stats

Syntax

[no] arp-traffic-stats

Context

config>mobile>pdn>kpi-kci>accounting-policy

Description

This command enables the generation of per ARP (Allocation and Retention Policy) and per QCI Traffic KPI-KCI statistics. The per ARP and per QCI statistics are collected by KPIBearerTrafficQciArpCP-ISA, KPIBearerManagementQciArpCP-ISA, and KCIBearerManagementQciArpCP-ISA modules.

The respective counter module must also be configured in an accounting policy linked to this PDN under the `config>mobile>pdn>kpi-kci>accounting-policy` context.

If the `arp-traffic-stats` command is not configured, the KPI-KCI modules will not be collected even if the record is configured in the `accounting-policy` command.

The `no` form of this command disables the generation of per ARP traffic statistics.

Default

`no arp-traffic-stats`

5.2.16.7 collect-stats

Syntax

`[no] collect-stats`

Context

`config>mobile>pdn>kpi-kci>accounting-policy`

Description

This command enables accounting and statistical data collection.

The `no` form of this command disables accounting and statistical data collection.

Default

`collect-stats`

5.2.16.8 enhanced-traffic-stats

Syntax

`[no] enhanced-traffic-stats`

Context

`config>mobile>pdn>kpi-kci>accounting-policy`

Description

This command enables the generation of an enhanced set of statistics at the APN level. When enabled, all traffic statistics are generated for all sessions on the gateway, independently of the charging function. When this command is not enabled, the traffic statistics are accounted only for sessions that are being charged.

The respective counter modules containing these counters must also be configured in the accounting policy linked to this PDN, for these counters to be generated.

For more information about which KPI Bearer Traffic modules this configuration applies to, refer to the section on user plane statistics in the *CMG KPI-KCI Counters Guide*.

The no form of this command disables the generation of enhanced traffic statistics.

Default

no enhanced-traffic-stats

5.2.1.16.9 ipv4-ipv6-stats

Syntax

[no] ipv4-ipv6-stats

Context

config>mobile>pdn>kpi-kci>accounting-policy

Description

This command enables the separation of traffic volume statistics into IPv4 and IPv6. The counters having IPv6 in the name are populated. If this configuration is disabled, the IPv6 counters are not populated. This affects KPIBearerTrafficApnCP-ISA and KPIBearerTrafficMSMPGW counters.

Enabling the separation of traffic statistics into IPv4 and IPv6 means that traffic volumes are handled separately for IPv4 and IPv6 for every bearer of dual stack sessions in the system. The SDF usage is doubled for these sessions.

This is a PDN-level global configuration and changing it requires the PDN to be in a shutdown state. In 4G-CUPS, this configuration must be done in the User Plane gateway, which measures the separated IPv4/IPv6 traffic volumes.

The no form of this command reverts to the default.

Default

no ipv4-ipv6-stats

5.2.1.16.10 peer-traffic-stats

Syntax

```
peer-traffic-stats peer-ip-list list-name  
no peer-traffic-stats
```

Context

```
config>mobile>pdn>kpi-kci>accounting-policy
```

Description

This command enables the generation of per peer traffic statistics and configures the peer list for the peers to be accounted. The peer list is configured as a list of Control Plane IP addresses.

The no form of this command reverts to the default.

Default

```
no peer-traffic-stats
```

Parameters

list-name

specifies the name of the IP address list (configured in the context config>mobile>profile>list>ip-address-list) that contains the peer addresses, up to 32 characters

5.2.1.16.11 plmn-id-stats

Syntax

```
plmn-id-stats plmn-list-name  
no plmn-id-stats
```

Context

```
config>mobile>pdn>kpi-kci>accounting-policy
```

Description

This command enables the generation of per PLMN-ID statistics for the PLMN IDs that are included in the PLMN-ID list created in the config>mobile>profile>list>plmn context. The respective counter

modules must also be configured in the accounting policy linked to this PDN for the per PLMN-ID statistics generation.

The no form of this command disables the generation of per PLMN-ID statistics.

Default

no plmn-id-stats

Parameters

plmn-list-name

specifies the name of the PLMN-ID list

5.2.1.16.12 sgw-only

Syntax

[no] sgw-only

Context

config>mobile>pdn>kpi-kci>accounting-policy

Description

This command restricts the KPI/KCI collection to SGW statistics only. If only SGW statistics are enabled, the KPI/KCI is identified as an SGW instance.

The no form of this command removes the restriction for the KPI/KCI to collect only SGW statistics.

Default

no sgw-only

5.2.1.17 N2 interface PDN command descriptions

5.2.1.17.1 n2

Syntax

[no] n2 [*sig-ref-point-name*]

Context

config>mobile>pdn

Description

This command configures the N2 reference point name.

Parameters

sig-ref-point-name

specifies an N2 reference point name, up to 32 characters

5.2.1.17.2 interface

Syntax

interface [router *router-instance*] *interface-name*

no interface

Context

config>mobile>pdn>n2

Description

This command configures the N2 interface and the virtual router in which the N2 connections are established by this policy.

NOTE:

This command requires a PDN shutdown.

Parameters

interface-name

specifies an interface name, up to 32 characters (must start with a letter)

router-instance

specifies the virtual router name or service ID

Values

router-name | service-id

–	router-name	Base
–	service-id	1 to 2147483647

Default: Base

5.2.1.17.3 n2-peer-profile

Syntax

[no] n2-peer-profile *profile-name*

Context

config>mobile>pdn>n2

Description

This command specifies the N2 peer profile for the N2 reference point of the N3IWF interface. You can configure up to ten N2 peer profiles (the N2 peer profile is configured using the config>mobile>profile>n2-peer context). The AMF selection logic (N2-peer selection) is based on matching the configured PLMN list (of the N2-peer under the config>mobile>profile>n2-peer>plmn-list command) with the UE-provided selected PLMN list value.

To provide load sharing amongst multiple servers, you can configure multiple peer IDs. If multiple peer IDs are specified, and the system has more than one matching peer IDs, based on the configured PLMN list, the system uses round-robin selection to choose a peer group for each new N2 session.

NOTE:

This command requires a PDN shutdown.

Parameters

profile-name

specifies the name of an existing N2 peer profile, up to 32 characters

5.2.1.17.4 n3iwf-unique-id

Syntax

```
n3iwf-unique-id unique-id  
no n3iwf-unique-id
```

Context

```
config>mobile>pdn>n2
```

Description

This command configures the unique N3IWF identity value.

The no form of this command reverts to default value.

**NOTE:**

This value is used for the "N3IWF Id" generation which is part of the "Global N3IWF Id". When there are more than one N3IWF deployed in the network, each deployed N3IWF must have a different n3iwf-unique-id value.

Parameters

unique-id

specifies the unique ID of the N3IWF

Values: 1 to 64

Default: 1

5.2.1.17.5 supported-ta-item

Syntax

```
supported-ta-item
```

Context

```
config>mobile>pdn>n2
```

Description

This command enables the context to configure the supported TA for the N2 interface.

5.2.1.17.6 tac

Syntax

```
tac tac-value broadcast-plmn-list broadcast-plmn-list-name  
no tac tac-value
```

Context

config>mobile>pdn>n2>supported-ta-item

Description

This command configures the supported TAC (Tracking Area Code) and its associated broadcast PLMN list for the N2 interface.

The no form of this command removes the specified TAC along with its associated broadcast PLMN list.

NOTE:

- According to 3GPP, the N3IWF is allowed to have a single TAI (TAI=TAC+PLMN) configured.
- The no tac command is used for removing the configured values and adding new ones. If a TAC and its associated broadcast PLMN list profile is removed without adding new ones, this can potentially lead to system instability.

Parameters

tac-value

specifies a TAC value, 6-digit hexadecimal number

broadcast-plmn-list-name

specifies the name of an existing broadcast PLMN list profile, up to 32 characters

5.2.1.18 N3 interface PDN command descriptions

5.2.1.18.1 n3

Syntax

```
n3 [sig-ref-point-name] [group-specific]  
no n3 [sig-ref-point-name]
```

Context

config>mobile>pdn

Description

This command configures the N3 reference point name. The N3 interface provides UP tunneling between two UPFs and is based on the GTP protocol.

NOTE:

This command requires a PDN shutdown, unless the `group-specific` parameter is specified.

Parameters

sig-ref-point-name

specifies an N3 reference point name, up to 32 characters

group-specific

specifies an MG group-specific reference point interface for GTP-U redirection, which is used when the reference point interface is associated with an MG system group through an override profile, and applies only to CMG

5.2.1.18.2 dual-stack-uplane-pref

Syntax

dual-stack-uplane-pref {ipv4 | ipv6}

no dual-stack-uplane-pref

Context

config>mobile>pdn>n3

Description

This command specifies the preference in a dual stack when both IPv4 and IPv6 addresses are configured for the reference point interface.

NOTE:

This command requires a PDN shutdown.

Parameters

ipv4

specifies the IPv4 address family

ipv6

specifies the IPv6 address family

Default: ipv6

5.2.1.18.3 interface

Syntax

interface

Context

config>mobile>pdn>n3

Description

The command enables the context to configure the N3 interface.

NOTE:

This command requires a PDN shutdown.

5.2.1.18.4 gtp-u

Syntax

gtp-u *interface-name* [router *router-name*] [interface-realm *n3-realm-name*]

no gtp-u

Context

config>mobile>pdn>n3>if

Description

This command configures the GTP-U profile parameters for the N3 interface.

The no form of this command removes the parameter from the configuration.

NOTE:

This command requires a PDN shutdown.

Parameters

interface-name

specifies an interface name, up to 32 characters, that must start with a letter

router-name

specifies the virtual router name or service ID

Values	router-name service-id	
–	router-name	Base
–	service-id	1 to 2147483647

Default: Base

n3-realm-name

specifies the associated realm name for the virtual router instance and the N3 interface, up to 32 characters

NOTE:

Only the following characters are permitted:

- alphabetic characters (A-Z and a-z)
- digits (0-9)
- hyphen (-)
- dot (.)

The UP function uses the interface realm name to identify the correct router instance and N3 interface to use, based on the Network-Instance IE in the PFCP interface rules during the PFCP session establishment/modification process. The realm name must be unique for a given virtual routing instance.

NOTE:

This parameter is only used when the gateway is configured as a UP function using the `mobile>config>pdn>instance-type` command.

5.2.18.5 signaling

Syntax

```
signaling
```

Context

```
config>mobile>pdn>n3
```

Description

This command enables the context to configure signaling for the N3 interface.

NOTE:

This command requires a PDN shutdown.

5.2.18.6 gtp-u

Syntax

```
gtp-u
```

Context

```
config>mobile>pdn>n3>signaling
```

Description

This command enables the context to configure GTP-U for the N3 signaling interface.

NOTE:

This command requires a PDN shutdown.

5.2.1.18.7 profile

Syntax

```
profile profile-name  
no profile
```

Context

```
config>mobile>pdn>n3>signaling>gtp-u
```

Description

This command configures the GTP-U profile name for the N3 signaling interface.

The no form of this command removes the profile name from the configuration.

**NOTE:**

This command requires a PDN shutdown.

Default

no profile

Parameters

profile-name

specifies the GTP-U profile name, up to 32 characters

5.2.1.19 N9 interface PDN command descriptions

5.2.1.19.1 n9

Syntax

```
n9 [sig-ref-point-name] [group-specific]  
no n9 [sig-ref-point-name]
```

Context

```
config>mobile>pdn
```

Description

This command configures the N9 reference point name. The N9 interface provides UP tunneling between two UPFs and is based on the GTP protocol.

**NOTE:**

This command requires a PDN shutdown, unless the `group-specific` parameter is specified.

Parameters

sig-ref-point-name

specifies an N9 reference point name, up to 32 characters

group-specific

specifies an MG group-specific reference point interface for GTP-U redirection; it is used when associating the reference point interface with an MG system group via an override profile and applies only to CMG

5.2.1.19.2 dual-stack-uplane-pref

Syntax

```
dual-stack-uplane-pref {ipv4 | ipv6}
```

```
no dual-stack-uplane-pref
```

Context

```
config>mobile>pdn>n9
```

Description

This command specifies the preference in a dual stack when both IPv4 and IPv6 addresses are configured for the reference point interface.

**NOTE:**

This command requires a PDN shutdown.

Parameters

ipv4

specifies to use the IPv4 address family

ipv6

specifies to use the IPv6 address family

Default: ipv6

5.2.1.19.3 interface

Syntax

interface

Context

config>mobile>pdn>n9

Description

The command enables the context to configure the N9 interface.

NOTE:

This command requires a PDN shutdown.

5.2.1.19.4 gtp-u

Syntax

gtp-u *interface-name* [router *router-instance*] [interface-realm *n9-realm-name*]

no gtp-u

Context

config>mobile>pdn>n9>if

Description

This command configures the GTP-U profile parameters for the N9 interface.

The no form of this command removes the parameter from the configuration.

NOTE:

This command requires a PDN shutdown.

Parameters

- interface-name**
specifies an interface name, up to 32 characters
- router-instance**
specifies the virtual router name or service ID

Values	router-name service-id	
–	router-name	Base
–	service-id	1 to 2147483647

Default: Base

- n9-realm-name**
specifies the associated realm name for the virtual router instance and the N9 interface, up to 32 characters

NOTE:

Only the following characters are permitted:

- alphabetic characters (A-Z and a-z)
- digits (0-9)
- hyphen (-)
- dot (.)

The UP function uses the interface realm name to identify the correct router instance and N9 interface to use, based on the Network-Instance IE in the PFCP interface rules during the PFCP session establishment/modification process. The realm name must be unique for a given virtual routing instance.

NOTE:

This parameter is only used when the gateway is configured as a UP function using the `mobile>config>pdn>instance-type` command.

5.2.1.19.5 signaling

Syntax

signaling

Context

config>mobile>pdn>n9

Description

This command enables the context to configure signaling for the N9 interface.

**NOTE:**

This command requires a PDN shutdown.

5.2.1.19.6 gtp-u

Syntax

gtp-u

Context

config>mobile>pdn>n9>signaling

Description

This command enables the context to configure GTP-U for the N9 signaling interface.

**NOTE:**

This command requires a PDN shutdown.

5.2.1.19.7 profile

Syntax

profile *profile-name*

no profile

Context

```
config>mobile>pdn>n9>signaling>gtp-u
```

Description

This command configures the GTP-U profile name for the N9 signaling interface.

The no form of this command removes the profile name from the configuration.

NOTE:

This command requires a PDN shutdown.

Default

no profile

Parameters

profile-name

specifies the GTP-U profile name, up to 32 characters

5.2.1.20 Network trace command descriptions

5.2.1.20.1 network-trace

Syntax

```
network-trace
```

Context

```
config>mobile>pdn
```

Description

This command enables the context to configure the network trace client service.

5.2.1.20.2 instance

Syntax

```
[no] instance instance-name
```

Context

config>mobile>pdn>network-trace

Description

This command configures a network trace client service instance. Only one instance is supported.

The no form of this command removes the instance from the configuration.

Parameters

instance-name

specifies the instance name, up to 32 characters

5.2.1.20.3 interface

Syntax

interface *interface-name* [router *router-name*]

no interface

Context

config>mobile>pdn>network-trace>instance

Description

This command configures the interface in which the connection to the Packet Broker router is established for the specific instance.

The no form of this command reverts to the default.

Parameters

interface-name

specifies an existing interface name, up to 32 characters (must start with a letter)

router-name

specifies the router instance

Values router-name | service-id

–	router-name	Base
–	service-id	1 to 2147483647

Default: Base

5.2.1.20.4 network-trace-profile

Syntax

network-trace-profile *profile-name*

no network-trace-profile

Context

config>mobile>pdn>network-trace>instance

Description

This command associates a network trace profile, configured using the config>mobile>profile>network-trace-profile context, with the network trace client service.

The no form of this command removes the network trace profile from the configuration.

Parameters

profile-name

specifies the name of the network trace profile, up to 32 characters

5.2.1.20.5 shutdown

Syntax

[no] shutdown

Context

config>mobile>pdn>network-trace>instance

Description

This command administratively disables the instance of the network trace client service.

The no form of this command administratively enables the network trace client service instance.

5.2.1.20.6 tapping-interface

Syntax

```
[no] tapping-interface [all | sba | non-sba]
```

Context

```
config>mobile>pdn>network-trace>instance
```

Description

This command configures the interfaces that are tapped by the network trace client service

The no form of this command reverts to the default value.

Default

```
tapping-interface all
```

5.2.1.21 NF profile attributes PDN command descriptions

5.2.1.21.1 nf-profile-attributes

Syntax

```
nf-profile-attributes [bsf]
```

Context

```
config>mobile>pdn
```

Description

This command enables the context to configure NF profile attributes for SMF and BSF, or for UPF, according to the CMG deployment.

When bsf is specified, the command enables the context to configure attributes for the Binding Support Function (BSF) that is collocated with the SMF under the same gateway instance. If bsf is not specified, the

NF profile used for the BSF registration uses the same values as those defined for SMF, with the following exceptions:

NFInstanceID	A different NFInstanceID is generated
NFServices array	Populated with the configured BSF related services

**NOTE:**

The context to configure BSF attributes is enabled only when the gateway is configured as an SMF.

Parameters

bsf

specifies to enable the context to configure BSF attributes

5.2.1.21.2 capacity

Syntax

`capacity {factor | total} capacity-value`

`no capacity`

Context

`config>mobile>pdn>nf-profile-attributes`

Description

This command configures the capacity value that is used in the NF profile during NF registration and in the NF update to the NRF. If not configured, the capacity attribute is not populated.

The no form of this command reverts to the default.

Default

`no capacity`

Parameters

capacity-value

specifies the capacity value

Values: 0 to 65535

factor

specifies that the capacity value is the capacity of a single CMG component, such as a VM, and is calculated by multiplying the given value with the number of active CMG components

total

specifies that the capacity value is the total capacity of the NF instance

5.2.1.21.3 exclude-ip-endpoints

Syntax

[no] exclude-ip-endpoints

Context

config>mobile>pdn>nf-profile-attributes

Description

This command configures that the IP endpoints are not registered to the NRF in the NFProfile. To exclude the IP endpoints from the registration, an FQDN must be configured in the same context or in the sba-server-services context per server service.

The no form of this command specifies that IP endpoints are registered.

Default

no exclude-ip-endpoints

5.2.1.21.4 fqdn

Syntax

fqdn *fqdn*

no fqdn

Context

config>mobile>pdn>nf-profile-attributes

Description

This command configures the FQDN of the SMF that is used in the NF profile during NF registration and in the NF update to the NRF. If not configured, the FQDN attribute is not populated.

The no form of this command reverts to the default.

Default

no fqdn

Parameters

fqdn

specifies the SMF FQDN string, up to 255 characters

5.2.1.21.5 inter-plmn-fqdn

Syntax

inter-plmn-fqdn *fqdn*

no inter-plmn-fqdn

Context

config>mobile>pdn>nf-profile-attributes

Description

This command configures the inter-PLMN FQDN of the SMF that is used in the NF profile during NF registration and in the NF update to the NRF. If not configured, the inter-PLMN FQDN attribute is not populated.

The no form of this command disables the usage of inter-PLMN FQDN in the SMF registration to the NRF.

Default

no fqdn

Parameters

fqdn

specifies the SMF inter-PLMN FQDN string, up to 255 characters

5.2.1.21.6 locality

Syntax

locality *locality*

```
no locality
```

Context

```
config>mobile>pdn>nf-profile-attributes
```

Description

This command configures the locality that the SMF registers to the NRF. The locality can be a geographical description, data-center location, and so on. The no form of this command removes the configured locality.

Parameters

locality

a string that specifies the arbitrarily-defined location, such as the data center location or geographic location, up to 64 characters

5.2.1.21.7 nf-instance-id

Syntax

```
nf-instance-id uuid  
no nf-instance-id
```

Context

```
config>mobile>pdn>nf-profile-attributes
```

Description

This command configures the UUID of the SMF, UPF, or BSF instance. The UUID is registered to the NRF in the NFProfile as the NFInstanceId.

NOTE:

The newly configured UUID is used in the next NFRegister procedure only after an NFDeregister operation.

Default

An auto-generated value is used if this command is not configured.

Parameters

uuid

specifies the NF instance ID in UUIDv4 canonical textual representation

Values: xxxxxxxx-xxxx-4xxx-xxxx-xxxxxxxxxxxx

x: [0..F]H

5.2.1.21.8 priority

Syntax

`priority priority-value`

`no priority`

Context

`config>mobile>pdn>nf-profile-attributes`

Description

This command configures the priority value that is used in the NF profile during NF registration and in the NF update to the NRF. If not configured, the priority attribute is not populated.

The no form of this command reverts to the default.

Default

`no priority`

Parameters

priority-value

an integer that specifies the priority

Values: 0 to 65535

5.2.1.21.9 scp-domain

Syntax

`scp-domain domain-name`

`no scp-domain`

Context

config>mobile>pdn>nf-profile-attributes

Description

This command configures an SCP domain that is used in the NF profile during NF registration and in the NF update to the NRF. If not configured, the SCP domain attribute is not populated.

The no form of this command reverts to the default.

Default

no scp-domain

Parameters

domain-name

specifies the SCP domain name, up to 32 characters

5.2.1.21.10 smf-serving-area-list

Syntax

smf-serving-area-list *list-name*

no smf-serving-area-list

Context

config>mobile>pdn>nf-profile-attributes

Description

For the SMF, this command configures the SMF serving area associations to TAI lists. The associations are used to map TAI values to an SMF serving area for UPF discovery.

For the UPF, this command configures the SMF serving areas supported by the UPF. This list is registered to the NRF in the UPF NFProfile.

The no form of this command reverts to the default.

Default

no smf-serving-area-list

Parameters

list-name

specifies the name of the list

5.2.1.21.11 tai-list

Syntax

```
tai-list list-name
```

```
no tai-list
```

Context

```
config>mobile>pdn>nf-profile-attributes
```

Description

This command configures the TAI list or TAI range list that the SMF supports and registers to the NRF. If no configuration is added, the SMF supports all TAIs.

The no form of this command removes the configured list.

Parameters

list-name

specifies the name of the referenced TAI list, up to 32 characters; the TAI list names are configured under config>mobile>profile>tai-lai-list

5.2.1.21.12 vsmf-indication

Syntax

```
vsmf-indication {true | false | disabled}
```

```
no vsmf-indication
```

Context

```
config>mobile>pdn>nf-profile-attributes
```

Description

This command controls usage of vsmfSupportInd in the SMF registration to the NRF. The no form of this command reverts to the default.

Default

disabled

Parameters

true

vsmfSupportInd is set to 'true'

false

vsmfSupportInd is set to 'false'

disabled

vsmfSupportInd is not included in the SMF registration data

5.2.1.22 NWu interface PDN command descriptions

5.2.1.22.1 nwu

Syntax

[no] nwu [*sig-ref-point-name*]

Context

config>mobile>pdn

Description

This command configures the NWu reference point name. The system supports up to 16 NWu interfaces.

NOTE:

- This command requires a PDN shutdown.
- This command is not supported in the current release.

Parameters

sig-ref-point-name

specifies an NWu reference point name, up to 32 characters

5.2.1.22.2 interface

Syntax

```
interface [router router-instance] interface-name  
no interface
```

Context

```
config>mobile>pdn>nwu
```

Description

The command configures the interface of the NWu reference point.

NOTE:

This command is not supported in the current release.

Parameters

interface-name

specifies an interface name, up to 32 characters (must start with a letter)

router-instance

specifies the virtual router name or service ID

Values	router-name service-id	
–	router-name	Base
–	service-id	1 to 2147483647

Default: Base

5.2.1.22.3 ipsec-profile

Syntax

```
ipsec-profile profile-name
```

```
no ipsec-profile
```

Context

```
config>mobile>pdn>nwu
```

Description

This command configures the IPSec profile for this reference point.

The no form of this command removes the profile name from the configuration.

NOTE:

- This command requires a PDN shutdown.
- This command is not supported in the current release.

Parameters

profile-name

specifies the profile name, up to 32 characters

5.2.1.23 PFCP load and overload PDN command descriptions

5.2.1.23.1 pfcp-load-control

Syntax

```
pfcp-load-control
```

Context

```
config>mobile>pdn
```

Description

This command enables the context to configure PFCP load control.

5.2.1.23.2 enable-pfcp-load-control

Syntax

```
[no] enable-pfcp-load-control
```

Context

```
config>mobile>pdn>pfcf-load-control
```

Description

This command enables PFCF load control information handling. PFCF load control enables the UP function to send its load information to the CP function, which the CP function can then use to adaptively balance the PFCF session load across the UP functions, according to their effective load. Load control does not trigger overload mitigation actions, even if the UP function reports a high load.

The no form of this command reverts to the default (disabled).

Default

```
no enable-pfcf-load-control
```

5.2.1.23.3 load-change-trigger

Syntax

```
load-change-trigger percentage-value
```

```
no load-change-trigger
```

Context

```
config>mobile>pdn>pfcf-load-control
```

Description

This command configures the load change value that triggers a new load control update.

The no form of this command reverts to the default.

Parameters

percentage-value

specifies the load change value to trigger a new load control update, in increments of 5

Values: 5 | 10 | 15 | 20

Default: 5

5.2.1.23.4 nth-message-report

Syntax

```
nth-message-report nth-message-value  
no nth-message-report
```

Context

```
config>mobile>pdn>pfcf-load-control
```

Description

This command configures the number of messages between which a PFCF load control report message is sent, regardless of a load change or not.

The no form of this command reverts to the default.

Parameters

nth-message-value

specifies the number of messages between sending a PFCF load control report message

Values: 1 to 1000

Default: 50

5.2.1.23.5 pfcf-overload-control

Syntax

```
pfcf-overload-control
```

Context

```
config>mobile>pdn
```

Description

This command enables the context to configure PFCF overload control.

5.2.1.23.6 arp-to-message-priority-list

Syntax

```
arp-to-message-priority-list list-name  
no arp-to-message-priority-list
```

Context

```
config>mobile>pdn>pfcf-overload-control
```

Description

This command enables an ARP list that will be used on the CP function to set an MP flag and the message-priority in the PFCP message header of the PFCP Session Establishment request, the PFCP Session Modification request, and the PFCP Session Deletion request. The MP flag and the message-priority are based on the ARP value that is received in the corresponding GTP-C PDN session request, or the latest ARP value received from the PCRF message exchange.

The no form of this command disables the CP function from setting an MP Flag and the message-priority based on an ARP list.

Default

```
no arp-to-message-priority-list
```

Parameters

list-name

specifies the name of the ARP list; up to 32 characters

5.2.1.23.7 enable-pfcf-overload-control

Syntax

```
[no] enable-pfcf-overload-control
```

Context

```
config>mobile>pdn>pfcf-overload-control
```

Description

This command enables PFCP overload control information handling. PFCP overload control enables a UP function that is becoming or is already overloaded to gracefully reduce its incoming signaling load by

instructing the CP function to reduce sending traffic according to the provided overload information. A UP function is in overload when it operates over its capacity, which results in diminished performance (including impacts to handling of incoming and outgoing traffic).

Default

no enable-pfcp-load-control

5.2.1.23.8 critical

Syntax

```
critical-reduction percentage-value  
no critical-reduction
```

Context

```
config>mobile>pdn>pfcp-overload-control
```

Description

This command configures the percentage of traffic reduction for critical overload requests.

The no form of this command reverts to the default.

Parameters

percentage-value

specifies the percentage of traffic reduction for critical overload requests

Values: 20 to 100

Default: 90

5.2.1.23.9 major

Syntax

```
major percentage-value  
no major
```

Context

```
config>mobile>pdn>pfcp-overload-control
```

Description

This command configures the percentage of traffic reduction for major overload requests.

The no form of this command reverts to the default.

Parameters

percentage-value

specifies the percentage of traffic reduction for major overload requests

Values: 20 to 100

Default: 60

5.2.1.23.10 minor

Syntax

minor *percentage-value*

no minor

Context

config>mobile>pdn>pfcf-overload-control

Description

This command configures the percentage of traffic reduction for minor overload requests.

The no form of this command reverts to the default.

Parameters

percentage-value

specifies the percentage of traffic reduction for minor overload requests

Values: 20 to 100

Default: 30

5.2.1.23.11 validity-time

Syntax

validity-time *value*

no validity-time

Context

```
config>mobile>pdn>pfcf-overload-control
```

Description

This command configures the duration of time for which the reported overload will be in effect.

The no form of this command reverts to the default.

Parameters

value

specifies the duration of time for which the reported overload will be in effect, in seconds

Values: 10 to 86400

Default: 600

5.2.1.24 PGW selection PDN command descriptions

5.2.1.24.1 pgw-selection

Syntax

```
pgw-selection
```

Context

```
config>mobile>pdn
```

Description

This command enables the context to configure PGW selection PDN commands.

NOTE:

This command requires a PDN shutdown.

5.2.1.24.2 dns-options

Syntax

```
dns-options
```

Context

```
config>mobile>pdn>pgw-selection
```

Description

This command enables the context to configure DNS option commands.

NOTE:

This command requires a PDN shutdown.

5.2.1.24.3 a-aaaa-pgw-discovery

Syntax

```
[no] a-aaaa-pgw-discovery
```

Context

```
config>mobile>pdn>pgw-selection>dns-options
```

Description

This command specifies that when ePDG is using the MIP6-Info-agent, the ePDG discovers the PGW by using A or AAAA DNS type of query.

NOTE:

This command requires a PDN shutdown.

Default

```
no a-aaaa-pgw-discovery
```

5.2.1.24.4 apn-based-initial-attach

Syntax

```
[no] apn-based-initial-attach
```

Context

```
config>mobile>pdn>pgw-selection>dns-options
```

Description

This command specifies that on initial attach requests, the ePDG will always discover the PGW by performing a DNS query based on the APN provided by the UE (in this case, the ePDG ignores the AAA-provided PGW data through the MIP6-Agent-Info AVP). If the ePDG already has the APN name resolved toward a specific PGW in its DNS cache memory, the ePDG does not perform a new APN-based DNS query. NAPTR is used for this query.

NOTE:

- This command requires a PDN shutdown.
- When the `dns-results-preferred` command is not enabled, the ePDG attempts, as priority, to resolve the UE-provided APN based on the local APN configuration and its associated PGW selection candidate list. If this fails, the ePDG falls back to the DNS resolution method.

Default

no apn-based-initial-attach

5.2.1.24.5 epdg-fqdn

Syntax

`epdg-fqdn epdg-fqdn-string`

`no epdg-fqdn`

Context

`config>mobile>pdn>pgw-selection`

Description

This command sets the FQDNs assigned to the ePDG. Up to three ePDG FQDNs can be configured. If this command is present, the ePDG matches the configured FQDNs against the PGW candidate FQDNs to find the topologically closest PGW.

The ePDG tries to find the best match between primary, secondary, and tertiary configured ePDG FQDNs on a per longest match logic. If the primary ePDG FQDN has the same or better match (longer match) than the secondary and tertiary, the ePDG selects the corresponding PGW, using the primary configured FQDN. If multiple primary matches are equivalent, a round-robin logic is used across them to load-balance between the equivalent gateways.

The no form of this command removes the ePDG FQDN. The system chooses the PGW without considering the FQDN matching.

**NOTE:**

The ePDG always keeps the second longest matching DNS results, to be used as a fallback mechanism, in case the first longest matching results have failed to provide a successful session setup (PGW no response), when the second or third `epdg-fqdn` is configured by the operator.

Default

no `epdg-fqdn`

Parameters***epdg-fqdn-string***

specifies the ePDG FQDN string, up to 256 characters

5.2.1.24.6 `epdg-fqdn-secondary`**Syntax**

`epdg-fqdn-secondary epdg-fqdn-string`

no `epdg-fqdn`

Context

config>mobile>pdn>pgw-selection

Description

This command sets the secondary FQDN assigned to the ePDG. If this command is present, the ePDG matches this FQDN against the PGW candidate FQDNs to find the topologically closest PGW.

The primary ePDG FQDNs must already be configured before the secondary ePDG FQDN. If the secondary ePDG FQDN has a better match than the primary, and/or tertiary ePDG FQDN, the ePDG should select the corresponding PGW using secondary configured FQDN. If multiple secondary matches are equivalent, a round-robin is used across them to load-balance between the equivalent gateways.

The no form of this command removes the secondary ePDG FQDN. The system chooses the PGW without considering the FQDN matching.

**NOTE:**

The ePDG always keeps the second longest matching DNS results, to be used as a fallback mechanism, in case the first longest matching results have failed to provide a successful session setup (PGW no response), when the second or third `epdg-fqdn` is configured by the operator.

Default

no epdg-fqdn-secondary

Parameters

epdg-fqdn-string

specifies the ePDG secondary FQDN string, up to 256 characters

5.2.1.24.7 epdg-fqdn-tertiary

Syntax

epdg-fqdn-tertiary *epdg-fqdn-string*

no epdg-fqdn

Context

config>mobile>pdn>pgw-selection

Description

This command sets the tertiary FQDN assigned to the ePDG. If this command is present, the ePDG matches this FQDN against the PGW candidate FQDNs to find the topologically closest PGW.

The primary and secondary ePDG FQDNs must already be configured before the tertiary ePDG FQDN. If the tertiary ePDG FQDN has a better match than the primary, and the secondary ePDG FQDN, the ePDG should select the corresponding PGW using tertiary configured FQDN. If multiple tertiary matches are equivalent, a round-robin is used across them to load-balance between the equivalent gateways.

The no form of this command removes the tertiary ePDG FQDN. The system chooses the PGW without considering the FQDN matching.

NOTE:

The ePDG always keeps the second longest matching DNS results, to be used as a fallback mechanism, in case the first longest matching results have failed to provide a successful session setup (PGW no response), when the second or third epdg-fqdn is configured by the operator.

Default

no epdg-fqdn-tertiary

Parameters

epdg-fqdn-string

specifies the ePDG tertiary FQDN string, up to 256 characters

5.2.1.24.8 pgw-reselection-isolation

Syntax

```
pgw-reselection-isolation cause-code cc[isolation-time time]  
no pgw-reselection-isolation cause-code cc
```

Context

```
config>mobile>pdn>pgw-selection
```

Description

This command configures a specific "Rejection in a Response/triggered message" (3GPP TS 29.274) GTPv2 cause code that triggers the PGW/SMF reselection. Optionally, this command isolates (not used during the PGW selection process) the specific gateway responding with the specific cause code within a time ranging from 1 to 120 minutes.

Up to 16 entries can be configured in the system for a PDN gateway.

The no form of this command either totally disables the re-selection and isolation functionality, or removes a specific cause code from the configuration.

Default

```
no pgw-reselection-isolation
```

Parameters

cc

specifies a GTPv2 Rejection in a Response/triggered message cause code

Values: 64 to 239

time

specifies the isolation time, in minutes

Values: 1 to 120

Default: 5

5.2.1.24.9 twag-fqdn

Syntax

```
twag-fqdn string  
no twag-fqdn
```

Context

```
config>mobile>pdn>pgw-selection
```

Description

This command sets the FQDN assigned to the TWAG. If this command is present, the TWAG will match this FQDN against PGW candidate FQDNs to find the topologically closest PGW.

The no form of this command removes the TWAG FQDN. The system will choose the PGW without considering FQDN matching.

Default

```
no twag-fqdn
```

Parameters

string

specifies the TWAG FQDN, up to 256 characters

5.2.1.24.10 apn

Syntax

```
[no] apn apn-name
```

Context

```
config>mobile>pdn>pgw-selection
```

Description

This command creates a container for PGW selection information pertaining to a particular APN. The APN should be comprised of the APN-NI + APN-OI. The configured APN will be matched against the APN after the optional APN-OI replacement has been performed.

The no form of this command removes the APN configuration.

Parameters

apn-name

the name of the APN

5.2.1.24.11 pgw-selection-candidate-list

Syntax

```
pgw-selection-candidate-list list-name  
no pgw-selection-candidate-list
```

Context

```
config>mobile>pdn>pgw-selection>apn
```

Description

This command names the profile of a set of PGW candidates for this APN.

The no form of this command removes the list.

Parameters

list-name

the name of the pgw-selection-candidate-list profile

5.2.1.24.12 dns-results-preferred

Syntax

```
[no] dns-results-preferred
```

Context

```
config>mobile>pdn>pgw-selection>apn
```

Description

This command causes the system to prefer DNS resolved PGW candidates over static PGW candidates configured for the APN. PGW candidates configured with the PGW FQDN shall be considered as static candidates.

The no form of this command means that the system will prefer static PGW candidates over candidates resolved for the APN by DNS.

Default

no dns-results-preferred

5.2.1.24.13 topology-match-disable

Syntax

[no] topology-match-disable

Context

config>mobile>pdn>pgw-selection>apn

Description

This command configures the system to not perform FQDN-based topological matching for this particular APN.

The no form of this command means the system will prefer the best topological match with the epdg-fqdn and twag-fqdn. The system will match against only candidates specified by FQDN.

Default

no topology-match-disable

5.2.1.24.14 profile

Syntax

profile *profile-name*

no profile

Context

config>mobile>pdn>signaling>mipv4

Description

This command specifies the MIPv4 profile name. The profile provides signaling related configuration.

The no form of this command removes the profile name from the configuration.

Parameters

profile-name

specifies the MIPv4 profile name, up to 32 characters

5.2.1.25 PI interface PDN command descriptions

5.2.1.25.1 pi

Syntax

```
[no] pi [sig-ref-point-name]
```

Context

```
config>mobile>pdn
```

Description

This command configures parameters on all Pi interfaces, or for a specific Pi interface.

NOTE:

This command requires a PDN shutdown.

Parameters

sig-ref-point-name

specifies the Pi reference point name, up to 32 characters

5.2.1.25.2 interface

Syntax

```
interface
```

Context

```
config>mobile>pdn>pi
```

Description

This command enables the context to configure a Pi interface.

NOTE:

This command requires a PDN shutdown.

5.2.1.25.3 mipv4

Syntax

```
mipv4 [router router-instance] interface-name
no mipv4
```

Context

```
config>mobile>pdn>pi>interface
config>mobile>pdn>pi>signaling
```

Description

This command configures the mobile IPv4 (MIPv4) interface or signaling interface for Pi.
The no form of this command reverts to the default.

NOTE:

This command requires a PDN shutdown.

Default

```
no mipv4
```

Parameters

router-instance

specifies the router name or service ID

Values	router-name service-id	
–	router-name	Base
–	service-id	1 to 2147483647

Default: Base

interface-name

specifies the interface on which to receive broadcast packets; if the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes, up to 32 characters

5.2.1.25.4 ip-in-ip-tunnel

Syntax

```
ip-in-ip-tunnel router-instance  
no ip-in-ip-tunnel
```

Context

```
config>mobile>pdn>pi>interface>mipv4
```

Description

This command is used to specify whether the IP-in-IP tunneling is used and the router ID is to be bound.

NOTE:

This command requires a PDN shutdown.

Default

```
no ip-in-ip-tunnel
```

Parameters

router-instance

specifies the virtual router name or service ID

Values	router-name service-id	
–	router-name	Base
–	service-id	1 to 2147483647

Default: Base

5.2.1.25.5 peer-list

Syntax

```
peer-list list-name  
no peer-list
```

Context

```
config>mobile>pdn>pi
```

Description

This command specifies the peer-list with the APN tied to this pi reference-point-name.

The no form of this command removes the peer-list from the configuration.

NOTE:

This command requires a PDN shutdown.

Default

```
no peer-list
```

Parameters

list-name

specifies a peer list name, up to 32 characters

5.2.1.25.6 signaling

Syntax

```
signaling
```

Context

```
config>mobile>pdn>pi
```

Description

This command enables the context to configure signaling parameters.

**NOTE:**

This command requires a PDN shutdown.

5.2.1.25.7 fa-ha-peer-list

Syntax

`fa-ha-peer-list peer-list-name`

`no fa-ha-peer-list`

Context

`config>mobile>pdn>pi>signaling>mipv4`

Description

This command specifies the fa-ha peer list name associated to this pi reference-point.

The no form of this command removes the fa-ha peer name from the configuration of this PI reference-point-name.

**NOTE:**

This command requires a PDN shutdown.

Default

`no fa-ha-peer-list`

Parameters

peer-list-name

specifies a fa-ha-peer-list name, up to 32 characters

5.2.1.25.8 profile

Syntax

```
profile profile-name  
no profile
```

Context

```
config>mobile>pdn>signaling>mipv4
```

Description

This command specifies the MIPv4 profile name. The profile provides signaling related configuration. The no form of this command removes the profile name from the configuration.

**NOTE:**

This command requires a PDN shutdown.

Parameters

profile-name

specifies the MIPv4 profile name, up to 32 characters

5.2.1.26 RADIUS PDN command descriptions

5.2.1.26.1 radius

Syntax

```
radius
```

Context

```
config>mobile>pdn
```

Description

This command enables the context to configure RADIUS parameters.

5.2.1.26.2 accounting-on-off-level

Syntax

```
accounting-on-off-level {system | apn}  
no accounting-on-off-level
```

Context

```
config>mobile>pdn>radius
```

Description

This command configures the RADIUS Accounting ON and OFF messaging to work on a per system or per APN level. With the per APN level alternative, the support must be separately configured per APN in the config>mobile>pdn>apn configuration context.

The no form of this command reverts to the default.

Parameters

system

single ON and OFF message is sent per system

apn

sending of ON and OFF messages is configurable per APN

Default: system

5.2.1.26.3 delete-session-acct-interim-exh

Syntax

```
[no] delete-session-acct-interim-exh
```

Context

```
config>mobile>pdn>radius
```

Description

This command enables the support of session deletion when the configurable amount of accounting interim retries are exhausted.

The no form of this command disables the support of session deletion upon exhaustion of accounting interim messages.

Default

no delete-session-acct-interim-exh

5.2.1.26.4 interface

Syntax

```
interface [router router-instance] interface-name
no interface
```

Context

config>mobile>pdn>radius

Description

This command configures a RADIUS interface.

NOTE:

This command requires a PDN shutdown.

Parameters

router-instance

specifies the router instance or service ID

Values	router-name service-id	
–	router-name	Base
–	service-id	1 to 2147483647

Default: Base

interface-name

specifies the interface which is used for this PDN gateway in case the RADIUS group interface is not configured; if the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes, up to 32 character, must start with a letter

5.2.1.26.5 radius-accounting-on-off

Syntax

```
radius-accounting-on-off
```

Context

```
config>mobile>pdn>radius
```

Description

This command enables the context for controlling RADIUS accounting ON and OFF messaging on system level (pdn shut or cold restart).

5.2.1.26.6 messages-sent

Syntax

```
messages-sent {none | on | on-off}
```

```
no messages-sent
```

Context

```
config>mobile>pdn>radius>rad-accounting-on-off
```

Description

This command configures the PGW/GGSN sending ON/OFF RADIUS accounting messages on system level. The ON/OFF messages are sent by default.

The no form of this command reverts to the default.

Parameters

none

accounting ON or accounting OFF messages are not sent

on

only accounting ON messages are sent

on-off

both accounting ON and accounting OFF messages are sent

Default: on-off

5.2.1.26.7 radius-disconnect

Syntax

[no] radius-disconnect

Context

config>mobile>pdn>radius

Description

This command enables the support of RADIUS-initiated disconnect. When not present, the PGW/GGSN counts but otherwise ignore disconnect messages.

The no form of this command disables the RADIUS-initiated disconnect.

NOTE:

This command requires a PDN shutdown.

Default

no radius-disconnect

5.2.1.26.8 rel-16-rat-type

Syntax

[no] rel-16-rat-type

Context

config>mobile>pdn>radius

Description

This command enables or disables the 3GPP Release 16 RAT-type value in the RADIUS RAT-type attribute.

The no form of this command reverts to the default.

Default

no rel-16-rat-type

5.2.1.27 RF interface PDN command descriptions

5.2.1.27.1 rf

Syntax

```
rf
```

Context

```
config>mobile>pdn
```

Description

This command enables the context to configure RF.

5.2.1.27.2 acct-interim-interval

Syntax

```
acct-interim-interval acct-interim-interval  
no acct-interim-interval
```

Context

```
config>mobile>pdn>rf
```

Description

This command configures the accounting interim interval.

Parameters

acct-interim-interval

specifies the accounting interim interval, in minutes, to send interim accounting information to the CDF

Values: 1 to 1440

Default: 30

5.2.1.27.3 acct-level

Syntax

```
acct-level {pdn-level | qci-level}
no acct-level
```

Context

```
config>mobile>pdn>rf
```

Description

This command specifies whether PDN-level accounting or QCI-level accounting is applicable. When PDN-level accounting is specified, Diameter charging sessions to the CDF are setup on a per PDN connection basis. When QCI-level accounting is specified, Diameter charging sessions to the CDF are setup on a per bearer basis.

The no form of this command reverts to the default.

NOTE:

This command requires a PDN shutdown.

Parameters

pdn-level

specifies that Diameter charging sessions to the Charging Data Function (CDF) are set up on a per PDN connection basis

qci-level

specifies that Diameter charging sessions to the Charging Data Function (CDF) are set up on a per bearer basis

Default: qci-level

5.2.1.27.4 charging-group-id

Syntax

```
[no] charging-group-id
```

Context

```
config>mobile>pdn>rf
```

Description

This command enables the inclusion of Charging-Group-ID AVP in Accounting Requests (ACR) messages.

The no form of this command disables the command.

NOTE:

This command requires a PDN shutdown.

5.2.1.27.5 interface

Syntax

```
interface
```

Context

```
config>mobile>pdn>rf
```

Description

This command enables the context to configure interface Diameter parameters.

NOTE:

This command requires a PDN shutdown.

5.2.1.27.6 diameter

Syntax

```
diameter [router router-instance] interface-name
```

```
no diameter
```

Context

```
config>mobile>pdn>rf>if
```

Description

This command configures Diameter information parameters.

The no form of this command removes the parameters from the configuration.

NOTE:

This command requires a PDN shutdown.

Default

no diameter

Parameters

router-instance

specifies the virtual router name or service ID

Values	router-name service-id	
–	router-name	Base
–	service-id	1 to 2147483647

Default: Base

interface-name

specifies an interface name, up to 32 characters

5.2.1.27.7 operator-string

Syntax

operator-string *operator-string*
no operator-string

Context

config>mobile>pdn>rf

Description

This command configures the string to be included in operator-string AVP (non-standard) of an Accounting Requests (ACR) message.

The no form of this command removes the operator string from the configuration.

**NOTE:**

This command requires a PDN shutdown.

Default

no operator-string

Parameters***operator-string***

specifies the operator-string AVP of an ACR message

5.2.1.27.8 outage

Syntax

outage

Context

config>mobile>pdn>rf

Description

This command enables the context to configure parameters for an outage scenario.

**NOTE:**

This command requires a PDN shutdown.

5.2.1.27.9 acr-file-and-record-hdr-rel-id-ext

Syntax

[no] acr-file-and-record-hdr-rel-id-ext

Context

config>mobile>pdn>rf>outage

Description

This command is used to enable including the Release Identifier Extension field in the Accounting Requests (ACR) file header and record header (similar to how it is included in the CDR file header and header format as specified by 3GPP TS 32.297 - CDR File Format and Transfer). This command is applicable to the Diameter Rf interface.

The no form of this command reverts to the default.

NOTE:

This command requires a PDN shutdown.

Default

no acr-file-and-record-hdr-rel-id-ext

5.2.1.27.10 file-params

Syntax

file-params

Context

config>mobile>pdn>rf>outage

Description

This command provides the required context for detailed configuration of the outage file parameters.

NOTE:

This command requires a PDN shutdown.

5.2.1.27.11 closure-rec-num

Syntax

closure-rec-num *closure-rec-num*

no closure-rec-num

Context

```
config>mobile>pdn>rf>outage>file
```

```
config>mobile>profile>gtp-prime-group>cdr-storage>file
```

Description

This command specifies an operator configurable limit for the number of ACRs that are stored in a file. The file is closed after the specified limit is reached.

NOTE:

This command requires a PDN shutdown, when used in the `config>mobile>pdn>rf>outage>file-params` context.

Parameters

closure-rec-num

specifies the maximum number of ACR messages to fit in a file

Values: 100 to 75000

Default: 50000

5.2.1.27.12 closure-size

Syntax

```
closure-size closure-size
```

```
no closure-size
```

Context

```
config>mobile>pdn>rf>outage>file
```

```
config>mobile>profile>gtp-prime-group>cdr-storage>file
```

Description

This command specifies an operator configurable limit for the number of ACRs that are stored in a file. The file is closed after the specified limit is reached.

NOTE:

This command requires a PDN shutdown, when used in the `config>mobile>pdn>rf>outage>file-params` context.

Parameters

closure-size

specifies the file closure size limit in megabytes

Values: 1 to 100

Default: 50

5.2.1.27.13 closure-time

Syntax

`closure-time closure-time`

`no closure-time`

Context

`config>mobile>pdn>rf>outage>file`

`config>mobile>profile>gtp-prime-group>cdr-storage>file`

Description

This command specifies an operator configurable file closure size limit.

NOTE:

This command requires a PDN shutdown, when used in the `config>mobile>pdn>rf>outage>file-params` context.

Parameters

closure-time

specifies the file closure-time field, in hours

Values: 1 to 24

Default: 1

5.2.1.27.14 extension

Syntax

```
extension extension  
no extension
```

Context

```
config>mobile>pdn>rf>outage>file  
config>mobile>profile>gtp-prime-group>cdr-storage>file
```

Description

This command specifies an operator configurable file extension field that is used in the filename.

**NOTE:**

This command requires a PDN shutdown, when used in the config>mobile>pdn>rf>outage>file-params context.

Default

no extension

Parameters

extension

specifies the file extension field, up to 8 characters

5.2.1.27.15 obsolete-time

Syntax

```
obsolete-time obsolete-time  
no obsolete-time
```

Context

```
config>mobile>pdn>rf>outage>file  
config>mobile>profile>gtp-prime-group>cdr-storage>file
```

Description

This command specifies an operator configurable file duration, in days, after which the file is deleted.

NOTE:

This command requires a PDN shutdown, when used in the `config>mobile>pdn>rf>outage>file` context.

Parameters

obsolete-time

specifies the duration after which the file is deemed obsolete and deleted, in days

Values: 1 to 31

Default: 7

5.2.1.27.16 private-info

Syntax

```
private-info private-info
```

```
no private-info
```

Context

```
config>mobile>pdn>rf>outage>file
```

```
config>mobile>profile>gtp-prime-group>cdr-storage>file
```

Description

This command specifies an operator-configurable file private information field that is used in the filename.

NOTE:

This command requires a PDN shutdown, when used in the `config>mobile>pdn>rf>outage>file` context.

Default

no private-info

Parameters

private-info

specifies a private information field, up to 32 characters

5.2.1.27.17 location

Syntax

```
location location
```

Context

```
config>mobile>pdn>rf>outage
```

```
config>mobile>profile>gtp-prime-group>cdr-storage
```

Description

This command specifies the compact flash to which the ACRs are written.

NOTE:

This command requires a PDN shutdown, when used in the config>mobile>pdn>rf>outage context.

Parameters

location

Specifies the compact flash destination for ACRs

You can choose to write to cf1 or cf2 (cf3 is reserved). If cf1 is chosen as primary, cf2 becomes the alternate compact flash that ACR messages will be written to when the primary is full, in the event of an outage.

Values: cf1|cf2

5.2.1.27.18 limit

Syntax

```
limit limit
```

```
no limit
```

Context

```
config>mobile>pdn>rf>outage>location
```

```
config>mobile>profile>gtp-prime-group>cdr-storage>location
```

Description

This command specifies a limit for the amount of memory that can be used for ACR storage.

NOTE:

This command requires a PDN shutdown, when used in the `config>mobile>pdn>rf>outage>location` context.

Parameters

limit

specifies the limit for the compact flash

5.2.1.27.19 primary

Syntax

```
[no] primary
```

Context

```
config>mobile>pdn>rf>outage>location
```

```
config>mobile>profile>gtp-prime-group>cdr-storage>location
```

Description

This command indicates if the compact flash specified in the `location` command is the primary compact flash.

NOTE:

This command requires a PDN shutdown, when used in the `config>mobile>pdn>rf>outage>location` context.

5.2.1.27.20 primary-diameter-peer

Syntax

```
primary-diameter-peer profile-name  
no primary-diameter-peer
```

Context

```
config>mobile>pdn>rf
```

Description

This command configures the Diameter peer profile to be used for the primary Charging Data Function (CDF) at the Gateway level.

The no form of this command removes the profile name from the configuration.

NOTE:

This command requires a PDN shutdown.

Default

```
no primary-diameter-peer
```

Parameters

profile-name

specifies the Diameter peer profile to be used for the primary CDF at the gateway level, up to 32 characters

5.2.1.27.21 retry-count

Syntax

```
retry-count retry-count  
no retry-count
```

Context

```
config>mobile>pdn>rf
```

Description

This command configures the retry count for ACR messages. An ACR message will be retransmitted for the number of times specified, when an ACA is not received from the CDF server.

The no form of this command reverts to the default.

Parameters

retry-count

specifies the retry count for Accounting Requests (ACR) messages

An Accounting Requests (ACR) message is retransmitted for the number of times specified, when an Accounting Answers (ACA) is not received from the Charging Data Function (CDF) server.

Values: 0 to 8

Default: 3

5.2.1.27.22 secondary-diameter-peer

Syntax

`secondary-diameter-peer profile-name`

`no secondary-diameter-peer`

Context

`config>mobile>pdn>rf`

Description

This command configures the Diameter peer profile to be used for the secondary Charging Data Function (CDF) at the Gateway level.

The no form of this command removes the profile name from the configuration.

NOTE:

This command requires a PDN shutdown.

Default

`no secondary-diameter-peer`

Parameters

profile-name

specifies the Diameter peer profile to be used for the primary CDF at the gateway level, up to 32 characters

5.2.1.27.23 supported-vendor

Syntax

```
supported-vendor custom-1  
no supported-vendor
```

Context

```
config>mobile>pdn>rf
```

Description

This command enables the specified supported vendor.

NOTE:

This command requires a PDN shutdown.

Default

```
no supported-vendor
```

Parameters

custom-1

specifies the customer number

5.2.1.27.24 transaction-timer

Syntax

```
transaction-timer {[value] | [timeout-msec value]}  
no transaction-timer
```

Context

config>mobile>pdn>rf

Description

This command configures the application transaction timer for Accounting Requests (ACR) and Accounting Answers (ACA). The value can be expressed in seconds or milliseconds. Setting the timer in milliseconds provides better timeout granularity.

The no form of this command removes the configuration.

Parameters

value

specifies the maximum amount of time, in seconds, the node waits for a peer to respond before trying another peer

Values: 1 to 180 (increments of one second)

Default: 5

timeout-msec value

specifies the maximum amount of time, in milliseconds, the node waits for a peer to respond before trying another peer

Values: 1000 to 180000 (increments of 100 ms)

Default: 5000

5.2.1.28 S1-U interface PDN command descriptions

5.2.1.28.1 s1-u

Syntax

s1-u [*sig-ref-point-name*] [group-specific]

no s1-u [*sig-ref-point-name*]

Context

config>mobile>pdn

Description

This command configures the s1-u reference point name.

**NOTE:**

This command requires a PDN shutdown, unless the `group-specific` parameter is specified.

Parameters

sig-ref-point-name

specifies a signaling reference point name up to 32 characters

At least one S1-u interface must be configured on the gateway to allow peering with eNB nodes. A single S1-u interface configured on the gateway can form peering with multiple eNB nodes. Optionally, multiple S1-u interfaces can be configured on the gateway. If a signaling reference point name is not specified, the default instance of the S1-u interface is created.

Each S1-u interface must be associated with an S11 interface, configured using the `config>mobile>pdn>s11>if>gtp-c` command. If no S1-u interface is provided during S11 configuration, the S11 interface is associated with the default S1-u interface.

The S1-u interface is bound to an S11 interface to form a signaling group. For example, the default instance of the S1-u interface will be selected and assigned a TEID on receiving a Create Session Request over the default instance of an S11 interface.

group-specific

specifies an MG group-specific reference point interface for GTP-U redirection; it is used when associating the reference point interface with an MG system group via an override profile and applies only to CMG

5.2.1.28.2 dual-stack-uplane-pref

Syntax

```
dual-stack-uplane-pref {ipv4 | ipv6}
```

```
no dual-stack-uplane-pref
```

Context

```
config>mobile>pdn>s1-u
```

Description

The command specifies the preference in a dual stack when both IPv4 and IPv6 addresses are configured for the reference point interface.

**NOTE:**

This command requires a PDN shutdown.

Default

Use the same IP version as the control plane

5.2.1.28.3 interface

Syntax

```
interface
```

Context

```
config>mobile>pdn>s1-u
```

Description

The command enables the context to configure the s1-u interface.

NOTE:

This command requires a PDN shutdown.

5.2.1.28.4 gtp-u

Syntax

```
gtp-u [router router-instance] interface-name [interface-realm s1-u-realm-name]
```

```
no gtp-u
```

Context

```
config>mobile>pdn>s1-u>if
```

Description

This command configures the GTP-U profile parameters for the S1-U interface.

The no form of this command removes the parameter from the configuration.

NOTE:

This command requires a PDN shutdown.

Parameters

router-instance

specifies the virtual router name or service ID

Values	router-name service-id	
–	router-name	Base
–	service-id	1 to 2147483647

Default: Base

interface-name

specifies an interface name, up to 32 characters

s1-u-realm-name

specifies the associated realm name for the virtual router instance and the S1-U interface, up to 32 characters

NOTE:

Only the following characters are permitted:

- alphabetic characters (A-Z and a-z)
- digits (0-9)
- hyphen (-)
- dot (.)

The user plane function uses the interface realm name to identify the correct router instance and S1-U interface to use, based on the Network-Instance IE in the PFCP interface rules during the PFCP session establishment/modification process. The realm name must be unique for a given virtual routing instance.

NOTE:

This parameter is only used when the gateway is configured as a UP function using the `mobile>config>pdn>instance - type` command.

5.2.1.28.5 signaling

Syntax

signaling

Context

config>mobile>pdn>s1-u

Description

This command enables the context to configure signaling for the S1-U interface.

NOTE:

This command requires a PDN shutdown.

5.2.1.28.6 gtp-u

Syntax

gtp-u

Context

config>mobile>pdn>s1-u>signaling

Description

This command enables the context to configure GTP-U for the S1-U signaling interface.

NOTE:

This command requires a PDN shutdown.

5.2.1.28.7 profile

Syntax

profile *profile-name*

```
no profile
```

Context

```
config>mobile>pdn>s1-u>signaling>gtp-u
```

Description

This command configures the GTP-U profile name for the S1-u signaling interface.

The no form of this command removes the profile name from the configuration.

NOTE:

This command requires a PDN shutdown.

Default

```
no profile
```

Parameters

profile-name

specifies the GTP-U profile name, up to 32 characters

5.2.1.29 S11 interface PDN command descriptions

5.2.1.29.1 s11

Syntax

```
s11 [sig-ref-point-name] [group-specific]
```

```
no s11 [sig-ref-point-name]
```

Context

```
config>mobile>pdn
```

Description

This command configures the s11 reference point name.

NOTE:

This command requires a PDN shutdown, unless the `group-specific` parameter is specified.

Parameters

sig-ref-point-name

specifies a signaling reference point name up to 32 characters

At least one S11 interface must be configured on the gateway to allow peering with MME. A single S11 interface configured on the gateway can form peering with multiple MME nodes. Optionally, multiple S11 interfaces can be configured on the SGW. If a signaling reference point name is not specified, the default instance of S11 interface is created.

Each S11 interface must be associated with an S1-u interface, configured using the `config>mobile>pdn>s11>if>gtp-c` command. If no S1-u interface is provided during the S11 interface configuration, the S11 interface is associated with the default S1-u interface.

The S1-u interface is bound to an A11 interface to form a signaling group. For example, the default instance of the S1-u interface will be selected and assigned TEID on receiving a Create Session Request over the default instance of the S11 interface.

group-specific

specifies an MG group-specific reference point interface for GTP-U redirection; it is used when associating the reference point interface with an MG system group via an override profile and applies only to CMG

5.2.1.29.2 interface

Syntax

`interface`

Context

`config>mobile>pdn>s11`

Description

This command enables the context to configure the s11 interface.

NOTE:

This command requires a PDN shutdown.

5.2.1.29.3 gtp-c

Syntax

```
gtp-c [router router-instance] interface-name [s1-u binding-ref-pt-name] [interface-realm
s11-u-realm-name] [s1u-interface-realm binding-realm-name]

no gtp-c
```

Context

```
config>mobile>pdn>s11>if
```

Description

This command configures the GTP-C profile parameters for the S11 interface.

NOTE:

This command requires a PDN shutdown.

Parameters

router-instance

specifies the virtual router name or service ID

Values	router-name service-id	
–	router-name	Base
–	service-id	1 to 2147483647

Default: Base

interface-name

specifies an interface name up to 32 characters, which must start with a letter

binding-ref-point-name

specifies an S1-u interface signaling reference point name to bind, up to 32 characters

s11-u-realm-name

specifies the associated realm name for the virtual routing instance that has the S11/S1 GTP-U interface on the user plane function, up to 32 characters

**NOTE:**

Only the following characters are permitted:

- alphabetic characters (A-Z and a-z)
- digits (0-9)
- hyphen (-)
- dot (.)

The realm name must be unique for a given virtual routing instance on the user plane and is communicated in the Network-Instance IE part of the PFCP interface session establishment/modification process.

**NOTE:**

This parameter is only used when the gateway is configured as a CP function using the `mobile>config>pdn>instance-type` command.

binding-realm-name

specifies the associated realm name for the S1-U interface, up to 32 characters; relevant if the S1-U and the S11-U use different network realms

5.2.1.29.4 gtp-u

Syntax

```
gtp-u [router router-instance] interface-name [interface-realm s11-realm-name]  
no gtp-u
```

Context

```
config>mobile>pdn>s11>if
```

Description

This command configures the GTP-U profile parameters for the S11 interface.

**NOTE:**

This command requires a PDN shutdown.

Parameters

router-instance

specifies the virtual router name or service ID

Values	router-name service-id	
–	router-name	Base
–	service-id	1 to 2147483647

Default: Base

interface-name

specifies an interface name up to 32 characters, which must start with a letter

s11-realm-name

specifies the associated realm name for the virtual routing instance and the S11-U interface, up to 32 characters

NOTE:

Only the following characters are permitted:

- alphabetic characters (A-Z and a-z)
- digits (0-9)
- hyphen (-)
- dot (.)

The user plane function uses the interface realm name to identify the correct router instance and S11-U interface to use, based on the Network-Instance IE in the PFCP interface rules during the PFCP interface session establishment/modification process. The realm name must be unique for a given virtual routing instance.

NOTE:

This parameter is only used when the gateway is configured as a UP function using the `mobile>config>pdn>instance-type` command.

5.2.1.29.5 mme-group

Syntax

[no] mme-group *MME-group-id*

Context

config>mobile>pdn>s11

Description

This command disables or enables MME groups for the S11 reference point. There cannot be multiple MME groups which have any similarities in a peer list under the same S11 reference point.

NOTE:

This command requires a PDN shutdown.

Default

no mme-group

Parameters

MME-group-id

specifies the group name identifier

Values: 1 to 65535

5.2.1.29.6 signaling

Syntax

signaling

Context

config>mobile>pdn>s11

Description

This command enables the context to configure signaling for the S11 interface.

**NOTE:**

This command requires a PDN shutdown.

5.2.1.29.7 gtp-c

Syntax

```
gtp-c
```

Context

```
config>mobile>pdn>s11>signaling
```

Description

This command enables the context to configure GTP-C signaling for the S11 signaling interface.

**NOTE:**

This command requires a PDN shutdown.

5.2.1.29.8 ddn-damp-timer

Syntax

```
ddn-damp-timer ddn-damp-timer
```

```
no ddn-damp-timer
```

Context

```
config>mobile>pdn>s11>signaling>gtp-c
```

Description

This command configures the DDN dampening timer interval.

The no form of this command removes the dampening timer from the configuration.

**NOTE:**

This command requires a PDN shutdown.

Parameters

ddn-damp-timer

specifies a dampening timer interval, in seconds

Values: 0 | 10 to 3600

Default: 0

5.2.1.29.9 ddn-extended-buffering-time

Syntax

`ddn-extended-buffering-time ddn-extended-buffering-time`

`no ddn-extended-buffering-time`

Context

`config>mobile>pdn>s11>signaling>gtp-c`

Description

This command defines the maximum time for the extended buffering. If the value received from the MME is less than the configured value, the value received from the MME is used, otherwise the configured value defines how long the extended buffering is applied. If the maximum time is 0, the extended buffering is not supported. Buffering will last always at least 30 seconds.

The no form of this command removes the extended buffering timer from the configuration.

NOTE:

This command requires a PDN shutdown for a CMG operating in LB-less mode. In an LB-mode CMG, PDN shutdown is not required. You can change the value of the `ddn-extended-buffering-time` command before the DDN Ack is received and the new configured value is used.

Parameters

ddn-extended-buffering-time

specifies the maximum time for extended buffering, in seconds

Values: 0 | 30 to 86400

Default: 0

5.2.1.29.10 **ddn-throttling-arp-threshold**

Syntax

```
ddn-throttling-arp-threshold ddn-throttling-arp-threshold  
no ddn-throttling-arp-threshold
```

Context

```
config>mobile>pdn>s11>signaling>gtp-c
```

Description

This command configures the DDN ARP threshold.

The no form of this command removes the ARP threshold from the configuration.

NOTE:

This command requires a PDN shutdown.

Default

```
no ddn-throttling-arp
```

Parameters

ddn-throttling-arp-threshold

specifies a DDN ARP threshold

Values: 0 to 15

5.2.1.29.11 **iot-restoration-time**

Syntax

```
iot-restoration-time time  
no iot-restoration-time
```

Context

```
config>mobile>pdn>s11>signaling>gtp-c
```

Description

This command configures the restoration time limit that the SGW waits before it deletes the UE context for cellular IoT UEs only. When the time limit is set to a non-zero value, the command enables the MME restoration procedures for IoT UEs.

The timer starts when a failure in the S11 interface is detected. When the timer expires, the data and control plane resources are cleaned up for IoT UEs without an active S11 interface.

NOTE:

- The S11 interface path management is configured using the `config>mobile>pdn>s11>signaling>gtp-c>restoration-time` command.
- The GTP-C restoration time must be set to a non-zero value for the `iot-restoration-time` command to take effect.
- This command requires a PDN shutdown.

Parameters

time

specifies the value, in seconds, for the IoT restoration-time limit

Values: 3601 to 1116000

Default: 0

5.2.1.29.12 legacy-create-idft-response-encoding

Syntax

```
[no] legacy-create-idft-response-encoding
```

Context

```
config>mobile>pdn>s11>signaling>gtp-c
```

```
config>mobile>pdn>s4>signaling>gtp-c
```

Description

This command enables the legacy encoding of the Create Indirect Data Forwarding Tunnel Response where the F-TEID instances 0, 1, and 2 will use interface type values 1, 3, and 16 respectively.

The no form of this command selects the default encoding where the interface type value 23 is used for all instances of the F-TEID.

**NOTE:**

This command requires a PDN shutdown.

Default

no legacy-create-idft-response-encoding

5.2.1.29.13 profile

Syntax

profile *profile-name*

no profile

Context

config>mobile>pdn>s11>signaling>gtp-c

Description

This command specifies the GTP-C signaling profile name for the s11 signaling interface. The GTP-C profile provides GTP-C signaling related configuration

The no form of this command removes the profile name from the configuration.

**NOTE:**

This command requires a PDN shutdown.

Default

no profile

Parameters***profile-name***

specifies a profile name, up to 32 characters

5.2.1.29.14 restoration-time

Syntax

```
restoration-time time [qci value]  
no restoration-time
```

Context

```
config>mobile>pdn>s11>signaling>gtp-c  
config>mobile>pdn>s4>signaling>gtp-c
```

Description

This command specifies the restoration time limit that the SGW waits before it deletes the UE context. A non-zero value of this option enables MME/SGSN restoration procedures. The timer will trigger cleanup of resources for all active UEs that have no active S11/S4 interface. The timer will initiate after the failure of the S11/S4 interface is detected. When the timer expires, the data and control plane resources will be cleaned up for UEs without an active S11/S4 interface, and the SGW will cleanup remaining UEs that are in an idle state and do not have an active S11/S4 interface.

The optional QCI value must be applied only when the default bearers that have a matching QCI value, are eligible for restoration. If the list is not defined, all bearers are eligible for the restoration.

NOTE:

This command requires a PDN shutdown.

Parameters

time

specifies the restoration time limit value

Values: 0 to 3600

Default: 0

value

specifies the QCI value for the default bearers when restoration time is enabled

Values: 1 to 255

5.2.1.29.15 ue-inactivity-timer

Syntax

```
ue-inactivity-timer minutes  
no ue-inactivity-timer
```

Context

```
config>mobile>pdn>s11>signaling>gtp-c
```

Description

This command configures a timer to detect active status of UE after path management session on S11 reference point to a peer restarts without the peering node restarting. If the UE is idle for configured time after the path management session has restarted then the SGW will delete the PDN connection. This is done to remove stale sessions that may not be valid as they have moved to alternate SGW during SGW restoration procedure executed on MME.

The no form of this command disables UE inactivity timer configuration.

**NOTE:**

This command requires a PDN shutdown.

Parameters

minutes

specifies time interval, in minutes

Values: 0 | 30 to 2880

Default: 0

5.2.1.30 S12 interface PDN command descriptions

5.2.1.30.1 s12

Syntax

```
s12 [sig-ref-point-name] [group-specific]  
no s12 [sig-ref-point-name]
```

Context

```
config>mobile>pdn
```

Description

This command configures the reference point name for the s12 interface.

NOTE:

This command requires a PDN shutdown, unless the `group-specific` parameter is specified.

Parameters

sig-ref-point-name

specifies a signaling reference point name up to 32 characters

At least one S12 interface must be configured on the gateway to allow peering with RNC nodes. A single S12 interface configured on the gateway can form peering with multiple RNC nodes. Optionally, multiple S12 interfaces can be configured on the gateway. If a signaling reference point name is not provided, the default instance of the S12 interface is created.

Each S12 interface must be associated with an S4 interface, configured using the `config>mobile>pdn>s4>if>gtp-c` command. If no S12 interface is provided during the S4 interface configuration, the S4 interface is associated with the default S12 interface. The S12 interface is bound to an S4 interface to form a signaling group. For example, the default instance of the S12 interface will be selected and assigned TEID on receiving a Create Session Request over the default instance of the S4 interface.

group-specific

specifies an MG group-specific reference point interface for GTP-U redirection; it is used when associating the reference point interface with an MG system group via an override profile and applies only to CMG

5.2.1.30.2 dual-stack-uplane-pref

Syntax

```
dual-stack-uplane-pref {ipv4 | ipv6}
```

```
no dual-stack-uplane-pref
```

Context

```
config>mobile>pdn>s12
```

Description

The command specifies the preference in a dual stack when both IPv4 and IPv6 addresses are configured for the reference point interface.

**NOTE:**

This command requires a PDN shutdown.

Default

The same IP version as the control plane.

5.2.1.30.3 interface

Syntax

interface

Context

config>mobile>pdn>s12

Description

The command enables the context to configure the s12 interface.

**NOTE:**

This command requires a PDN shutdown.

5.2.1.30.4 gtp-u

Syntax

gtp-u [router *router-instance*] *interface-name* [interface-*realm* *realm-name*]

no gtp-u

Context

config>mobile>pdn>s12>if

Description

This command configures the GTP-U profile parameters for the S12 interface.

The no form of this command removes the parameter from the configuration.

NOTE:

This command requires a PDN shutdown.

Parameters

router-instance

specifies the router instance, up to 32 characters

interface-name

specifies an interface name, up to 32 characters

realm-name

specifies the associated realm name for the virtual routing instance and the S12-U interface, up to 32 characters

NOTE:

Only the following characters are permitted:

- alphabetic characters (A-Z and a-z)
- digits (0-9)
- hyphen (-)
- dot (.)

The user plane function uses the interface realm name to identify the correct router instance and S12-U interface to use, based on the Network-Instance IE in PFCP Rules during the PFCP interface session establishment/modification process. The realm name must be unique for a given virtual routing instance.

NOTE:

This parameter is only used when the gateway is configured as a UP function using the `mobile>config>pdn>instance-type` command.

5.2.1.30.5 signaling

Syntax

signaling

Context

config>mobile>pdn>s12

Description

This command enables the context to configure signaling for the s12 interface.

**NOTE:**

This command requires a PDN shutdown.

5.2.1.30.6 gtp-u

Syntax

gtp-u

Context

config>mobile>pdn>s12>signaling

Description

This command enables the context to configure GTP-U signaling for the s12 signaling interface.

**NOTE:**

This command requires a PDN shutdown.

5.2.1.30.7 profile

Syntax

profile *profile-name*

no profile

Context

```
config>mobile>pdn>s12>signaling>gtp-u
```

Description

This command specifies the GTP-U profile name for the s12 signaling interface. The GTP-U profile provides GTP-U signaling related configuration.

The no form of this command removes the profile name from the configuration.

NOTE:

This command requires a PDN shutdown.

Default

no profile

Parameters

profile-name

specifies a profile name, up to 32 characters

5.2.1.31 S2a and S2b interface PDN command descriptions

5.2.1.31.1 s2a

Syntax

```
s2a [ref-point-name] [group-specific]
```

```
no s2a [ref-point-name]
```

Context

```
config>mobile>pdn
```

Description

This command configures S2a interface parameters. The S2a GTP parameter provides tunneling and tunnel management between the TWAG and the PGW. The S2a PMIPv6 parameter provides tunneling between the eHRPD and the PGW.

**NOTE:**

- This keyword applies only to CMG and is supported for S2a GTP and not S2a PMIP.
- This command requires a PDN shutdown, unless the `group-specific` parameter is specified.

Parameters

ref-point-name

specifies a signaling reference point name, up to 32 characters

group-specific

specifies an MG group-specific reference point interface for GTP-U redirection; it is used when associating the reference point interface with an MG system group via an override profile

5.2.1.31.2 s2b

Syntax

s2b [*ref-point-name*] [*group-specific*]

no s2b [*ref-point-name*]

Context

config>mobile>pdn

Description

This command configures S2b interface parameters. The S2b parameters provide user plane tunneling and tunnel management between the EPDG and the PGW.

**NOTE:**

This command requires a PDN shutdown, unless the `group-specific` parameter is specified.

Parameters

ref-point-name

specifies a signaling reference point name, up to 32 characters

group-specific

specifies an MG group-specific reference point interface for GTP-U redirection. This is used when associating the reference-point interface with an MG system group via an override profile. This keyword applies to CMG systems only.

5.2.1.31.3 dual-stack-cplane-pref

Syntax

```
dual-stack-cplane-pref {ipv4 | ipv6}
no dual-stack-cplane-pref
```

Context

```
config>mobile>pdn>s2a
config>mobile>pdn>s2b
```

Description

This command sets the dual stack Cplane preference.

NOTE:

This command requires a PDN shutdown.

Parameters

ipv4

specifies the IPv4 address family

ipv6

specifies the IPv6 address family

Default: ipv6

5.2.1.31.4 dual-stack-uplane-pref

Syntax

```
dual-stack-uplane-pref {ipv4 | ipv6 | use-cplane}
no dual-stack-uplane-pref
```

Context

```
config>mobile>pdn>s2a
```

```
config>mobile>pdn>s2b
```

Description

This command specifies the preference in a dual stack when both IPv4 and IPv6 addresses are configured for the reference point interface.

NOTE:

This command requires a PDN shutdown.

Parameters

ipv4

specifies to use the IPv4 address family

ipv6

specifies to use the IPv6 address family

use-cplane

specifies the same IP version as the control plane

Default: use-cplane

5.2.1.31.5 interface

Syntax

```
interface
```

Context

```
config>mobile>pdn>s2a
```

```
config>mobile>pdn>s2b
```

Description

This command enables the context to configure S2a or S2b signaling.

NOTE:

This command requires a PDN shutdown.

5.2.1.31.6 gtp-c

Syntax

```
gtp-c [router router-instance] interface-name [interface-realm realm-name]  
no gtp-c
```

Context

```
config>mobile>pdn>s2a>if  
config>mobile>pdn>s2b>if
```

Description

This command configures the GTP-C profile parameters for the S2a or S2b interfaces.

NOTE:

This command requires a PDN shutdown.

Parameters

router-instance

specifies the router name or service ID

Values	router-name service-id	
–	router-name	Base
–	service-id	1 to 2147483647

Default: Base

interface-name

specifies the interface name, up to 32 characters

realm-name

specifies the associated realm name for the virtual routing instance that has the S2a or S2b GTP-U interface on the user plane function, up to 32 characters

**NOTE:**

Only the following characters are permitted:

- alphabetic characters (A-Z and a-z)
- digits (0-9)
- hyphen (-)
- dot (.)

The realm name must be unique for a given virtual routing instance on the user plane and is communicated in the Network-Instance IE part of the PFCP interface session establishment/modification process.

**NOTE:**

This parameter is only used when the gateway is configured as a CP function using the `mobile>config>pdn>instance-type` command.

5.2.1.31.7 gtp-u

Syntax

```
gtp-u [router router-instance] interface-name  
gtp-u [router router-instance] interface-name [interface-realm realm-name]  
no gtp-u
```

Context

```
config>mobile>pdn>s2a>if  
config>mobile>pdn>s2b>if
```

Description

This command configures the GTP-U profile parameters for the S2a or S2b interface.

**NOTE:**

This command requires a PDN shutdown.

Parameters

router-instance

specifies the router name or service ID

Values	router-name service-id	
–	router-name	Base
–	service-id	1 to 2147483647

Default: Base

interface-name

specifies the interface name, up to 32 characters

realm-name

specifies the associated realm name for the virtual routing instance and the S2a-U or S2b-U interface, up to 32 characters

NOTE:

Only the following characters are permitted:

- alphabetic characters (A-Z and a-z)
- digits (0-9)
- hyphen (-)
- dot (.)

The user plane function uses the interface realm name to identify the correct router instance and S2a-U or S2b-U interface to use, based on the Network-Instance IE in the PFCP interface rules during the PFCP session establishment/modification process. The realm name must be unique for a given virtual routing instance.

NOTE:

This parameter is only used when the gateway is configured as a UP function using the `mobile>config>pdn>instance-type` command.

5.2.1.31.8 pmipv6

Syntax

```
pmipv6 interface-name [router router-instance]
no pmipv6
```

Context

```
config>mobile>pdn>s2a>if
```

Description

This command configures the interface that is used to send and receive PMIPv6 messages. If this interface belongs to a VPRN other than the master instance, the command must include the VPRN name (interface names have VPRN scope).

NOTE:

This command requires a PDN shutdown.

Parameters

router-instance

specifies the router name or service ID

Values	router-name service-id	
–	router-name	Base
–	service-id	1 to 2147483647

Default: Base

interface-name

specifies the interface name, up to 32 characters

5.2.1.31.9 match

Syntax

```
match
```

Context

```
config>mobile>pdn>s2a
```

```
config>mobile>pdn>s2b
```

Description

This command enables the context to configure a match list for the reference point.

**NOTE:**

This command requires a PDN shutdown.

5.2.1.31.10 apn-list

Syntax

```
apn-list list-name
```

```
no apn-list
```

Context

```
config>mobile>pdn>s2a>match
```

```
config>mobile>pdn>s2b>match
```

Description

This command specifies an APN list instance to be used for the match criteria. The APN list is configured in the config>mobile>profile>list context.

The no form of this command disables the APN list matching.

**NOTE:**

This command requires a PDN shutdown.

Parameters

list-name

specifies the name of this APN list instance

5.2.1.31.11 plmn-id-list

Syntax

```
plmn-id-list list-name
```

```
no plmn-id-list
```

Context

```
config>mobile>pdn>s2a>match
```

```
config>mobile>pdn>s2b>match
```

Description

This command configures a Public Land Mobile Network (PLMN) list for S2a-GTP and S2b.

NOTE:

- For S2a GTP, the `plmn-id-list` command is only configurable under a non-default S2a interface (that is, s2a "<some name>").
- This command requires a PDN shutdown.

Parameters

list-name

specifies the name of the PLMN list

5.2.1.31.12 pgw-set-support

Syntax

```
[no] pgw-set-support
```

Context

```
config>mobile>pdn>s2b
```

Description

This command configures the support of "PGW Set Support" call flows as specified in 3GPP TS 23.007.

The no form of this command disables the ePDG support for PGW-C/SMF set.

NOTE:

In the current release, when the `pgw-set-support` command is enabled, the ePDG initiates the PDN connection session restoration procedure

Default

`no pgw-set-support`

5.2.1.31.13 signaling

Syntax

`signaling`

Context

`config>mobile>pdn>s2a`

`config>mobile>pdn>s2b`

Description

This command enables the context to configure signaling for an S2a or S2b interface.

NOTE:

This command requires a PDN shutdown.

5.2.1.31.14 gtp-c

Syntax

`gtp-c`

Context

`config>mobile>pdn>s2a>signaling`

```
config>mobile>pdn>s2b>signaling
```

Description

This command enables the context to configure GTP-C signaling for an S2a or S2b interface.

NOTE:

This command requires a PDN shutdown.

5.2.1.31.15 gtp-u

Syntax

```
gtp-u
```

Context

```
config>mobile>pdn>s2a>signaling
```

```
config>mobile>pdn>s2b>signaling
```

Description

This command enables the context to configure GTP-U signaling for an S2a or S2b interface.

NOTE:

This command requires a PDN shutdown.

5.2.1.31.16 pmipv6

Syntax

```
pmipv6
```

Context

```
config>mobile>pdn>s2a>signaling
```

```
config>mobile>pdn>s2b>signaling
```

Description

This command configures PMIPv6 signaling for an S2a or S2b interface.

NOTE:

This command requires a PDN shutdown.

5.2.1.31.17 profile

Syntax

`profile profile-name`

`no profile`

Context

`config>mobile>pdn>s2a>signaling>gtp-c`

`config>mobile>pdn>s2a>signaling>gtp-u`

`config>mobile>pdn>s2b>signaling>gtp-c`

`config>mobile>pdn>s2b>signaling>gtp-u`

`config>mobile>pdn>s2a>signaling>pmipv6`

Description

This command specifies the profile name to associate with the gateway. For PMIPv6, this command applies a PMIPv6 profile for the interface.

The no form of this command removes the profile name from the configuration.

NOTE:

This command requires a PDN shutdown.

Default

no profile

Parameters

profile-name

specifies a profile name, up to 32 characters

5.2.1.31.18 s2b-error-mapping-profile

Syntax

```
s2b-error-mapping-profile profile-name  
no s2b-error-mapping-profile
```

Context

```
config>mobile>pdn
```

Description

This command creates an S2b error mapping profile.

Parameters

profile-name

specifies a profile name, up to 32 characters

5.2.1.32 S4 interface PDN command descriptions

5.2.1.32.1 s4

Syntax

```
s4 [sig-ref-point-name] [group-specific]  
no s4 [sig-ref-point-name]
```

Context

```
config>mobile>pdn
```

Description

This command configures S4 signaling.

NOTE:

This command requires a PDN shutdown, unless the `group-specific` parameter is specified.

Parameters

sig-ref-point-name

Specifies a signaling reference point name up to 32 characters. At least one S4 interface must be configured on the gateway to allow peering with SGSN nodes. A single S4 interface configured on the gateway can form peering with multiple SGSN nodes. Optionally, multiple S4 interfaces can be configured on the gateway. If a signaling reference point name is not provided, the default instance of S4 interface is created.

The user plane related to an S4 interface can be handled by the S4-u or S12 interface. An S12 interface can be bound to an S4 interface to form a signaling group. If no S12 is provided during the S4 interface configuration, the S4 interface is associated with the default S12 interface for the scenarios where the user plane is handled by the S12 interface. For example, the default instance of the S12 interface will be selected and assigned a TEID on receiving a Create Session Request over the default instance of the S4 interface and direct tunnel is requested in Create Session Request.

group-specific

specifies an MG group-specific reference point interface for GTP-U redirection; it is used when associating the reference point interface with an MG system group via an override profile and applies only to CMG

5.2.1.32.2 interface

Syntax

```
interface
```

Context

```
config>mobile>pdn>s4
```

Description

This command enables the context to configure the S4 interface.

NOTE:

This command requires a PDN shutdown.

5.2.1.32.3 gtp-c

Syntax

```
gtp-c [router router-instance] interface-name [s12 binding-ref-pt-name] [interface-realm s4-  
realm-name]
```

```
no gtp-c
```

Context

```
config>mobile>pdn>s4>if
```

Description

This command configures the GTP-C profile parameters for an S4 interface.

**NOTE:**

This command requires a PDN shutdown.

Parameters

router-instance

specifies the router instance, up to 32 characters

interface-name

specifies an interface name, up to 32 characters

binding-ref-point-name

specifies the name of the s12 binding reference point, up to 32 characters

s4-realm-name

specifies the associated realm name for the virtual routing instance that has the S12 GTP-U interface on the user plane function, up to 32 characters

**NOTE:**

Only the following characters are permitted:

- alphabetic characters (A-Z and a-z)
- digits (0-9)
- hyphen (-)
- dot (.)

The realm name must be unique for a given virtual routing instance on the user plane and is communicated in the Network-Instance IE part of the PFCP interface session establishment/modification process.

**NOTE:**

This parameter is only used when the gateway is configured as a CP function using the `mobile>config>pdn>instance-type` command.

5.2.1.32.4 gtp-u

Syntax

```
gtp-u [router router-instance] interface-name [interface-realm realm-name]
```

```
no gtp-u
```

Context

```
config>mobile>pdn>s4>if
```

Description

This command configures the GTP-U profile parameters for an S4 interface.

**NOTE:**

This command requires a PDN shutdown.

Parameters

router-instance

specifies the router instance, up to 32 characters

interface-name

specifies an interface name, up to 32 characters

realm-name

specifies the associated realm name for the virtual routing instance and the S4-U interface, up to 32 characters

**NOTE:**

Only the following characters are permitted:

- alphabetic characters (A-Z and a-z)
- digits (0-9)
- hyphen (-)
- dot (.)

The UP function uses the interface realm name to identify the correct router instance and S4-U interface to use, based on the Network-Instance IE in the PFCP interface rules during the PFCP session establishment/modification process. The realm name must be unique for a given virtual routing instance.

**NOTE:**

This parameter is only used when the gateway is configured as a UP function using the `mobile>config>pdn>instance - type` command.

5.2.1.32.5 peer-list

Syntax

```
peer-list list-name  
no peer-list
```

Context

```
cconfig>mobile>pdn>s4
```

Description

This command configures the trusted peer list name. The list includes peer IPv4 or IPv6 address that are trusted. Separate trusted peer lists for eNodeBs, MMEs, and PGWs can be created for trusted peering. If no trusted-peer list has been defined on a given protocol, the protocol will accept messages from any peer. Conversely, when a trusted-peer list is defined, only messages from peers in the given list will be accepted. The operator can add new peers to a trusted-peer list at any time.

The no form of this command removes the list name from the configuration.

**NOTE:**

This command requires a PDN shutdown.

Default

```
no peer-list
```

Parameters

list-name

specifies the list name, up to 32 characters

5.2.1.32.6 signaling

Syntax

signaling

Context

config>mobile>pdn>s4

Description

This command enables the context to configure signaling for an S4 interface.

NOTE:

This command requires a PDN shutdown.

5.2.1.32.7 gtp-c

Syntax

gtp-c

Context

config>mobile>pdn>s4>signaling

Description

This command enables the context to configure GTP-C signaling for the s4 interface.

NOTE:

This command requires a PDN shutdown.

5.2.1.32.8 **ddn-damp-timer**

Syntax

```
ddn-damp-timer ddn-damp-timer  
no ddn-damp-timer
```

Context

```
config>mobile>pdn>s4>signaling>gtp-c
```

Description

This command configures the DDN dampening timer interval.

The no form of this command removes the dampening timer from the configuration.

NOTE:

This command requires a PDN shutdown.

Parameters

ddn-damp-timer

specifies a dampening timer interval, in seconds

Values: 0 | 10 to 3600

Default: 0

5.2.1.32.9 **ddn-extended-buffering-time**

Syntax

```
ddn-extended-buffering-time ddn-extended-buffering-time  
no ddn-extended-buffering-time
```

Context

```
config>mobile>pdn>s4>signaling>gtp-c
```

Description

This command defines the maximum time for the extended buffering. If the value received from the SGSN is less than the configured value, the value received from the SGSN is used, otherwise the configured value

defines how long the extended buffering is applied. If the maximum time is 0, the extended buffering is not supported. Buffering will last always at least 30 seconds.

**NOTE:**

This command requires a PDN shutdown.

Parameters

ddn-extended-buffering-time

specifies the maximum time for extended buffering, in seconds

Values: 0 | 30 to 86400

Default: 0

5.2.1.32.10 ddn-throttling-arp-threshold

Syntax

`ddn-throttling-arp-threshold ddn-throttling-arp-threshold`

`no ddn-throttling-arp-threshold`

Context

`config>mobile>pdn>s4>signaling>gtp-c`

Description

This command configures the DDN ARP threshold.

The no form of this command removes the ARP threshold from the configuration.

**NOTE:**

This command requires a PDN shutdown.

Default

`no ddn-throttling-arp`

Parameters

ddn-throttling-arp-threshold

specifies a DDN ARP threshold

Values: 0 to 15

5.2.1.32.11 gtp-u

Syntax

```
gtp-u
```

Context

```
config>mobile>pdn>s4>signaling
```

Description

This command enables the context to configure GTP-U signaling for the S4 interface.

NOTE:

This command requires a PDN shutdown.

5.2.1.32.12 delete-on-error-indication

Syntax

```
[no] delete-on-error-indication
```

Context

```
config>mobile>pdn>s4>signaling>gtp-u
```

Description

This configuration enables the deletion of the bearers when the error indication is received.

The no form of this command sets the default action, which is to release the user plane and send downlink data notification.

Default

```
no delete-on-error-indication
```

5.2.1.32.13 profile

Syntax

```
profile profile-name  
no profile
```

Context

```
config>mobile>pdn>s4>signaling>gtp-c  
config>mobile>pdn>s4>signaling>gtp-u
```

Description

This command specifies either the GTP-C or GTP-U profile name. For example, for GTP-C, this command applies a GTP-C profile for the interface. The profiles provide signaling related configuration.

The no form of this command removes the profile name from the configuration.

**NOTE:**

This command requires a PDN shutdown.

Default

no profile

Parameters

profile-name

specifies a profile name, up to 32 characters

5.2.1.32.14 sgsn-group

Syntax

```
[no] sgsn-group SGSN-group-id
```

Context

```
config>mobile>pdn>s4
```

Description

This command enables or disables the SGSN groups for the S4 interface. Multiple SGSN groups must not have any similarities in a peer list under the same S4 interface.

Parameters

SGSN-group-id

specifies the group name ID

Values: 1 to 65535

5.2.1.33 S5 and S8 interface PDN command descriptions

5.2.1.33.1 s5

Syntax

s5 [*sig-ref-point-name*] [group-specific]

no s5 [*sig-ref-point-name*]

Context

config>mobile>pdn

Description

This command enables the context to configure the S5 interface. S5 provides user plane tunneling and tunnel management between the SGW and the PGW. It is used for SGW relocation due to UE mobility and if the SGW needs to connect to a non-collocated PGW for the required PDN connectivity. The S5 is based on GTP protocol. The PMIP variant of the S5 interface is described in TS 23.402. Redundancy support on S5 reference points must be taken into account.

NOTE:

This command requires a PDN shutdown, unless the *group-specific* parameter is specified.

Parameters

sig-ref-point-name

specifies the S5 interface name, up to 32 characters

group-specific

specifies an MG group-specific reference point interface for GTP-U redirection; it is used when associating the reference-point interface with an MG system group via an override profile and applies only to CMG

5.2.1.33.2 s8

Syntax

```
s8 [sig-ref-point-name] [group-specific]
```

```
no s8 [sig-ref-point-name]
```

Context

```
config>mobile>pdn
```

Description

This command enables the context to configure the S8 interface. The S8 interface provides user plane tunneling and tunnel management between the SGW and the PGW.

NOTE:

This command requires a PDN shutdown, unless the `group-specific` parameter is specified.

Parameters

sig-ref-point-name

specifies the S8 interface name, up to 32 characters

group-specific

specifies an MG group-specific reference point interface for GTP-U redirection; it is used when associating the reference point interface with an MG system group via an override profile and applies only to CMG

5.2.1.33.3 dual-stack-cplane-pref

Syntax

```
dual-stack-cplane-pref {ipv4 | ipv6}
```

```
no dual-stack-cplane-pref
```

Context

config>mobile>pdn>s5

config>mobile>pdn>s8

Description

This command specifies the dual stack cplane preference.

NOTE:

This command requires a PDN shutdown.

Parameters

ipv4

specifies the IPv4 address family

ipv6

specifies the IPv4 address family

Default: ipv6

5.2.1.33.4 dual-stack-uplane-pref

Syntax

dual-stack-uplane-pref {ipv4 | ipv6}

no dual-stack-uplane-pref

Context

config>mobile>pdn>s5

config>mobile>pdn>s8

Description

The command specifies the preference in a dual stack when both IPv4 and IPv6 addresses are configured for the reference point interface.

NOTE:

This command requires a PDN shutdown.

Default

The same IP version as the control plane.

Parameters

ipv4

specifies the IPv4 address family

ipv6

specifies the IPv4 address family

5.2.1.33.5 interface

Syntax

```
interface
```

Context

```
config>mobile>pdn>s5
```

```
config>mobile>pdn>s8
```

Description

The command enables the context to configure interface parameters.

NOTE:

This command requires a PDN shutdown.

5.2.1.33.6 gtp-c

Syntax

```
gtp-c [router router-instance] interface-name [interface-realm realm-name]
```

```
no gtp-c
```

Context

```
config>mobile>pdn>s5>if
```

```
config>mobile>pdn>s8>if
```

Description

This command configures the GTP-C profile parameters for an S5 or S8 interface.

The no form of this command removes the parameter from the configuration.

NOTE:

This command requires a PDN shutdown.

Parameters

router-instance

specifies the virtual router name or service ID

Values	router-name service-id	
–	router-name	Base
–	service-id	1 to 2147483647

Default: Base

interface-name

specifies an interface name, up to 32 characters

realm-name

specifies the associated realm name for the virtual routing instance that has the S5/S8 GTP-U interface on the user plane function, up to 32 characters

NOTE:

Only the following characters are permitted:

- alphabetic characters (A-Z and a-z)
- digits (0-9)
- hyphen (-)
- dot (.)

The realm name must be unique for a given virtual routing instance on the user plane and is communicated in the Network-Instance IE part of the PFCP interface session establishment/modification process.

**NOTE:**

This parameter is only used when the gateway is configured as a CP function using the `mobile>config>pdn>instance-type` command.

5.2.1.33.7 gtp-u

Syntax

```
gtp-u [router router-instance] interface-name  
gtp-u [router router-instance] interface-name [interface-realm realm-name]  
no gtp-u
```

Context

```
config>mobile>pdn>s5>if  
config>mobile>pdn>s8>if
```

Description

This command configures GTP-U interface parameters.

The no form of this command removes the parameter from the configuration.

**NOTE:**

This command requires a PDN shutdown.

Parameters

router-instance

specifies the virtual router name or service ID

Values	router-name service-id	
–	router-name	Base
–	service-id	1 to 2147483647

Default: Base

interface-name

specifies an interface name, up to 32 characters

realm-name

specifies the associated realm name for the virtual routing instance and the S5-U/S8-U interface, up to 32 characters

**NOTE:**

Only the following characters are permitted:

- alphabetic characters (A-Z and a-z)
- digits (0-9)
- hyphen (-)
- dot (.)

The user plane function uses the interface realm name to identify the correct router instance and the S5-U/S8-U interface to use, based on the Network-Instance IE in the PFCP interface rules during the PFCP interface session establishment/modification process. The realm name must be unique for a given virtual routing instance.

**NOTE:**

This parameter is only used when the gateway is configured as a UP function using the `mobile>config>pdn>instance-type` command.

5.2.1.33.8 match

Syntax

match

Context

config>mobile>pdn>s5

config>mobile>pdn>s8

Description

This command enables the context to configure a match list for the reference point.

**NOTE:**

This command requires a PDN shutdown.

5.2.1.33.9 apn-list

Syntax

`apn-list list-name`

`no apn-list`

Context

`config>mobile>pdn>s5`

Description

This command specifies an APN list to be used for the match criteria. The APN list is configured in the mobile-gateway profile list context.

The no form of this command disables the APN list matching.

**NOTE:**

This command requires a PDN shutdown.

Parameters

list-name

specifies a name for this APN list instance, up to 32 characters

5.2.1.33.10 plmn-id-list

Syntax

`plmn-id-list list-name`

`no plmn-id-list`

Context

`config>mobile>pdn>s8`

Description

This command configures a Public Land Mobile Network (PLMN) list for the reference point.

**NOTE:**

This command requires a PDN shutdown.

Parameters

list-name

specifies the name of the PLMN list, up to 32 characters

5.2.1.33.11 peer-list

Syntax

```
peer-list list-name
```

```
no peer-list
```

Context

```
config>mobile>pdn>s5
```

```
config>mobile>pdn>s8
```

Description

This command configures the trusted peer list name. The list includes peer IPv4 or IPv6 address that are trusted. Separate trusted peer-list of eNBs, MMEs, and PGWs can be created for trusted peering. If no trusted-peer list has been defined on a given protocol, the protocol will accept messages from any peer. Conversely, when a trusted-peer list is defined, only messages from peers in the given list will be accepted. The operator should be able to add new peers to a trusted-peer list at any time

The no form of this command removes the list name from the configuration.

**NOTE:**

This command requires a PDN shutdown.

Default

no peer-list

Parameters

list-name

specifies the list name, up to 32 characters

5.2.1.33.12 send-end-marker

Syntax

[no] send-end-marker

Context

config>mobile>pdn>s5

config>mobile>pdn>s8

Description

This command enables or disables sending of an end marker from the PGW in the S5/S8 interface if there is an SGW change. This command should not be enabled if all SGWs in the S5/S8 interface are not supporting the end marker from the PGW.

NOTE:

This command requires a PDN shutdown.

Default

no send-end-marker

5.2.1.33.13 signaling

Syntax

signaling

Context

config>mobile>pdn>s5

config>mobile>pdn>s8

Description

This command enables the context to configure signaling for an S5 or an S8 interface.

NOTE:

This command requires a PDN shutdown.

5.2.1.33.14 gtp-c

Syntax

gtp-c

Context

config>mobile>pdn>s5>signaling

config>mobile>pdn>s8>signaling

Description

This command enables the context to configure GTP-C signaling for an S5 or an S8 signaling interface.

NOTE:

This command requires a PDN shutdown.

5.2.1.33.15 enhanced-sgw-restoration

Syntax

enhanced-sgw-restoration *restoration-time*

no enhanced-sgw-restoration

Context

config>mobile>pdn>s5>signaling>gtp-c

config>mobile>pdn>s8>signaling>gtp-c

Description

This command enables enhanced SGW restoration based on the optional option in TS23.007, called restoration of PDN connections after an SGW failure. This procedure makes it possible to restore PDN connections affected by an SGW failure with or without a restart. Setting the *restoration-time* parameter to 0 removes the configuration.

**NOTE:**

This command requires a PDN shutdown, when used in the `config>mobile>pdn>s5>signaling>gtp-c` context.

Parameters

restoration-time

specifies the length of time in seconds that the PGW will maintain the PDN connections and be ready to restore them by having the MME select either a new SGW or the same SGW (restart)

Values: 0 | 300 to 3600

Default: 0

5.2.1.33.16 pause-charging

Syntax

`pause-charging`

Context

`config>mobile>pdn>s5>signaling>gtp-c`

`config>mobile>pdn>s8>signaling>gtp-c`

Description

This command enables the context to configure pause of charging on the gateway.

**NOTE:**

This command requires a PDN shutdown.

5.2.1.33.17 data-threshold

Syntax

```
data-threshold packets  
no data-threshold
```

Context

```
config>mobile>pdn>s5>signaling>gtp-c>pause-charging  
config>mobile>pdn>s8>signaling>gtp-c>pause-charging
```

Description

This command configures the data threshold (number of packets) per UE that the SGW uses to trigger pause of charging on the PGW. The no form of this command disables the threshold-based pause charging.

NOTE:

This command requires a PDN shutdown.

Parameters

packets

specifies the data threshold in packets, where the total buffer size on MSCP per UE is 12 packets and the trigger is on 9th

Values: 0 (disabled) 9 packets

Default: 0

5.2.1.33.18 data-threshold-hold-time

Syntax

```
data-threshold-hold-time seconds  
no data-threshold-hold-time
```

Context

```
config>mobile>pdn>s5>signaling>gtp-c>pause-charging  
config>mobile>pdn>s8>signaling>gtp-c>pause-charging
```

Description

This command configures the number of seconds to wait before sending a pause of charging message to the PGW after packet drop is observed. Pause charging can lead to excessive signaling if drops are observed across many UEs. The hold timer start and stop records can be viewed for the gateway using the `show mobile-gateway PDN statistics` command. The `no` form of command disables the hold timer for initiating pause charging.

**NOTE:**

This command requires a PDN shutdown.

Parameters

seconds

specifies the wait time, in seconds

Values: 10 to 60 (0 disabled)

Default: 10

5.2.1.33.19 pgw-pause-charging

Syntax

```
pgw-pause-charging {enable | disable}
```

Context

```
config>mobile>pdn>s5>signaling>gtp-c>pause-charging
```

```
config>mobile>pdn>s8>signaling>gtp-c>pause-charging
```

Description

This command enables or disables pause of charging on the PGW when excessive downlink traffic is dropped because the UE is unreachable.

If a pause of charging indication is received from the SGW, the PGW stops accounting traffic to avoid charging packets that are dropped on SGW. If pause of charging is disabled on the PGW, the PDN Pause Support Indication flag in the Indication IE is set to 0 to indicate to the SGW that the PGW does not support pause of charging for PDN. The SGW will not generate further pause of charging messages toward PGW.

**NOTE:**

This command requires a PDN shutdown.

Parameters

enable

keyword to enable pause of charging on the PGW

disable

keyword to disable pause of charging on the PGW

Default: enable

5.2.1.33.20 radio-loss

Syntax

```
radio-loss {enable | disable}
```

Context

```
config>mobile>pdn>s5>signaling>gtp-c>pause-charging
```

```
config>mobile>pdn>s8>signaling>gtp-c>pause-charging
```

Description

This command enables support for pause of charging when there is an abnormal loss of radio resource.

NOTE:

This command requires a PDN shutdown.

Parameters

enable

keyword to enable support for pause of charging due to abnormal loss of radio resource

disable

keyword to disable support for pause of charging due to abnormal loss of radio resource

Default: enable

5.2.1.33.21 profile

Syntax

```
profile profile-name
```

```
no profile
```

Context

```
config>mobile>pdn>s5>signaling>gtp-c
config>mobile>pdn>s5>signaling>gtp-u
config>mobile>pdn>s8>signaling>gtp-c
config>mobile>pdn>s8>signaling>gtp-u
```

Description

This command specifies the profile name. For example, in the GTP-C context, this command applies a GTP-C profile for the interface. The profiles provide signaling related configuration.

The no form of this command removes the profile name from the configuration.

NOTE:

This command requires a PDN shutdown.

Default

no profile

Parameters

profile-name

specifies a profile name, up to 32 characters

5.2.1.33.22 gtp-u

Syntax

```
gtp-u
```

Context

```
config>mobile>pdn>s5
config>mobile>pdn>s8
```

Description

This command enables the context to configure interface parameters for GTP-U signaling for an s5 or s8 interface.

**NOTE:**

This command requires a PDN shutdown.

5.2.1.34 S6b interface PDN command descriptions

5.2.1.34.1 s6b

Syntax

s6b

Context

config>mobile>pdn

Description

This command enables the context to configure an s6b interface.

5.2.1.34.2 alt-peer-rar-asr

Syntax

[no] alt-peer-rar-asr

Context

config>mobile>pdn>s6b

Description

This command enables the gateway to accept RAR or ASR messages from an AAA other than the primary or secondary AAA. When this command is enabled, an RAA message is sent back to the peer that initiated the RAR. The IP-CAN session will continue to use the primary or secondary AAA for the S6b session (that is, any AAR-U or STR for the session will be sent to the destination peer that the last AAA was received from).

The no form of this command reverts to the default.

Default

no alt-peer-rar-asr

5.2.1.34.3 application-id

Syntax

```
application-id value  
no application-id
```

Context

```
config>mobile>pdn>s6b
```

Description

This command configures the Auth-Application-ID that will be sent in each message over S6b interface.

**NOTE:**

This command requires a PDN shutdown.

Parameters

value

specifies the application ID number
Default: 16777272
Values: 0 to 4294967295

5.2.1.34.4 auth-mode

Syntax

```
auth-mode [enable-non3gpp-only | enable-all]  
no auth-mode
```

Context

```
config>mobile>pdn>s6b
```

Description

This command configures the authorization mode of S6b for non-3GPP only or for all the sessions.

**NOTE:**

This command requires a PDN shutdown.

Parameters**enable-non3gpp-only**

S6b with authorization mode per TS29.273

enable-all

S6b with authorization mode per TS29.273 and TS29.061

Default: enable-non3gpp-only

5.2.1.34.5 interface

Syntax

interface

Context

config>mobile>pdn>s6b

Description

This command enables the context to configure the Diameter parameters for the interface.

**NOTE:**

This command requires a PDN shutdown.

5.2.1.34.6 diameter

Syntax

diameter [router *router-instance*] *interface-name*

no diameter

Context

config>mobile>pdn>s6b>interface

Description

This command configures the Diameter parameters for the interface.

NOTE:

This command requires a PDN shutdown.

Parameters

router-instance

specifies the router instance

Values	router-name service-id	
–	router-name	Base
–	service-id	1 to 2147483647

Default: Base

interface-name

specifies an existing interface name, up to 32 characters

5.2.1.34.7 node-identifier-list

Syntax

```
node-identifier-list list-name  
no node-identifier-list
```

Context

```
config>mobile>pdn>s6b
```

Description

This command configures the PGW to use the AAA node identifier received from the ePDG in CSRequest to connect to the same AAA that the ePDG has used for the UE/subscriber authentication and authorization.The no form of this command removes the association to the configured list and disables the functionality.

Parameters

list-name

specifies the list, configured using the `configure>mobile-gateway>profile>list>aaa-host-realm` command, that includes all the hosts and realms correlated to the `diameter-peer-group-list` command, up to 32 characters.

5.2.1.34.8 peer-group

Syntax

`peer-group group-id pri-dia-peer-profile profile-name sec-dia-peer-profile profile-name`

`no peer-group`

Context

`config>mobile>pdn>s6b`

Description

This command configures the list peer groups of primary Diameter and secondary peers for the S6b interface configured on the gateway level.

NOTE:

This command requires a PDN shutdown.

Parameters

profile-name

specifies the name of the primary Diameter peer profile, up to 32 characters

`sec-dia-peer-profile profile-name`

specifies the name of the primary Diameter peer profile, up to 32 characters

5.2.1.34.9 relax-aar-dest-realm

Syntax

`[no] relax-aar-dest-realm`

Context

config>mobile>pdn>s6b

Description

This command enables the S6b AA-Answer message to contain a different origin realm value than the one that PGW used as Destination Realm in the AA-Request message.

NOTE:

This command is only for lab testing activities.

The no form of this command disables this functionality.

Default

no relax-aar-dest-realm

5.2.1.34.10 retry-count

Syntax

retry-count *value*

no retry-count

Context

config>mobile>pdn>s6b

Description

This command specifies the number of times the system will retry to send an s6b message before declaring a failed attempt.

Parameters

value

specifies the number of times the system will retry

Values: 0 to 8

Default: 3

5.2.1.34.11 s6b-profile

Syntax

```
s6b-profile name  
no s6b-profile
```

Context

```
config>mobile>pdn>s6b
```

Description

This command specifies the s6b profile to associate with this mobile gateway.

Parameters

name
specifies the s6b profile name, up to 32 characters

5.2.1.34.12 subscription-id-override

Syntax

```
[no] subscription-id-override
```

Context

```
config>mobile>pdn>s6b
```

Description

When the S6b supported-vendor is set to custom-1, the PGW will use the Subscription-Id as the MSISDN for eHRPD attach/handover cases. This command causes the PGW to use Subscription-Id as the MSISDN for all attach types including LTE and WLAN. This command must only be used with supported-vendor custom-1.

The no form of this command returns to the default, which uses the GTP provided MSISDN.

Default

GTP provided MSISDN

5.2.1.34.13 supported-vendor

Syntax

```
supported-vendor custom-1
no supported-vendor
```

Context

```
config>mobile>pdn>s6b
```

Description

This command enables the specified supported vendor.

NOTE:

This command requires a PDN shutdown.

Default

```
no supported-vendor
```

Parameters

```
custom-1
    specifies the custom-1 customer
```

5.2.1.34.14 transaction-timer

Syntax

```
transaction-timer {[value] | [timeout-msec value]}
no transaction-timer
```

Context

```
config>mobile>pdn>s6b
```

Description

This command sets the maximum amount of time the node waits for a Diameter peer to respond before trying another peer. The value can be expressed in seconds or milliseconds. Setting the timer in milliseconds provides better timeout granularity.

The no form of this command removes the configuration.

Parameters

value

specifies the maximum amount of time, in seconds, the node waits for a Diameter peer to respond before trying another peer

Values: 1 to 180 (increments of one second)

Default: 5

timeout-msec value

specifies the maximum amount of time, in milliseconds, the node waits for a Diameter peer to respond before trying another peer

Values: 1000 to 180000 (increments of 100 ms)

Default: 5000

5.2.1.34.15 username-leading-digit

Syntax

```
username-leading-digit [digit]
```

```
no username-leading-digit
```

Context

```
config>mobile>pdn>s6b
```

Description

This command configures a leading digit in the User-Name AVP in the AA Request messages, when IMSI is used as username in the root NAI.

The no form of this command removes the leading digit from the User-Name AVP in the AA Request messages.

Default

```
no username-leading-digit
```

Parameters

digit

specifies the leading digit

Values: 0 to 9

5.2.1.35 SBA client services PDN command descriptions

5.2.1.35.1 sba-client-services

Syntax

```
sba-client-services
```

Context

```
config>mobile>pdn
```

Description

This command enables the context to configure the client-side options of CMG when the SMF uses SBA services as an NF consumer.

5.2.1.35.2 addressing-priority

Syntax

```
addressing-priority [fqdn | ip-endpoint | ip-endpoint-fallback]  
no addressing-priority
```

Context

```
config>mobile>pdn>sba-client-services
```

Description

This command configures the addressing method used for accessing the discovered services of peer NF producers when the discovered NFProfiles contain both FQDN and IP endpoints.

The no form of this command reverts to the default (IP endpoint).

Parameters

fqdn

specifies to use the FQDN, if present; if not, the IP endpoint is used

ip-endpoint

specifies to always use the IP endpoint

ip-endpoint-fallback

specifies to use the FQDN, if present; if not, the IP endpoint is used

If the FQDN is used and the resolved IP address is not accessible, the IP endpoint is used as a fallback

Default: ip-endpoint

5.2.1.35.3 amf-client

Syntax

```
amf-client
```

Context

```
config>mobile>pdn>sba-client-services
```

Description

This command enables the context to configure the SMF client-side options when the SMF uses AMF services.

5.2.1.35.4 namf-comm

Syntax

```
[no] namf-comm service-instance
```

Context

```
config>mobile>pdn>sba-client-services>amf-client
```

Description

This command configures an instance of the Namf_Communication service. At least one service instance must be configured to allow peering with the AMF.

The no form of this command removes the service instance from the configuration.

Parameters

service-instance

specifies the service instance name, up to 32 characters

5.2.1.35.5 callback-type-preference

Syntax

```
callback-type-preference type  
no callback-type-preference
```

Context

```
config>mobile>pdn>sba-client-services>amf-client>namf-comm  
config>mobile>pdn>sba-client-services>amf-client>namf-evts  
config>mobile>pdn>sba-client-services>nrf-client>nnrf-nfm  
config>mobile>pdn>sba-client-services>pcf-client>npcf-smpolicycontrol  
config>mobile>pdn>sba-client-services>smf-client>nsmf-pdusession  
config>mobile>pdn>sba-client-services>udm-client>nudm-sdm  
config>mobile>pdn>sba-client-services>udm-client>nudm-uecm
```

Description

This command defines the URI host type used in the callback URI.

The no form of this command reverts to the default.

Parameters

type

specifies the type of the URI host that contains an IPv4 or an IPv6 address

Values: ipv4 | ipv6

Default: ipv4

5.2.1.35.6 fqdn

Syntax

```
fqdn fqdn-sni-string  
no fqdn
```

Context

```
config>mobile>pdn>sba-client-services
```

```
config>mobile>pdn>sba-client-services>amf-client>namf-comm
config>mobile>pdn>sba-client-services>amf-client>namf-evts
config>mobile>pdn>sba-client-services>chf-client>nchf-convergedcharging
config>mobile>pdn>sba-client-services>nrf-client>nnrf-disc
config>mobile>pdn>sba-client-services>nrf-client>nnrf-nfm
config>mobile>pdn>sba-client-services>nrf-client>nnrf-oauth2
config>mobile>pdn>sba-client-services>nrf-client>nnrf-oauth2
config>mobile>pdn>sba-client-services>pcf-client>npcf-smpolicycontrol
config>mobile>pdn>sba-client-services>scp-client>scp-service
config>mobile>pdn>sba-client-services>sepp-client>sepp
config>mobile>pdn>sba-client-services>smf-client>nsmf-pdusession
config>mobile>pdn>sba-client-services>udm-client>nudm-sdm
config>mobile>pdn>sba-client-services>udm-client>nudm-uecm
```

Description

This command configures the FQDN which is used by CMG/SMF, when acting as a client in the TLS connections during notification requests from the NF producers. It is used by the producers as the SNI FQDN in the TLS connection, when these send notifications. A single FQDN can be configured for all client services in the `config>mobile>pdn>sba-client-services` context or per client service instance.

The `no` form of this command removes the FQDN from the configuration.

Parameters

fqdn-sni-string

specifies the FQDN name string, up to 255 characters

5.2.1.35.7 http2-profile

Syntax

```
http2-profile http2-profile-name
no http2-profile
```

Context

```
config>mobile>pdn>sba-client-services>amf-client>namf-comm
```

Description

This command associates an HTTP/2 profile, configured using the `config>mobile>profile>http2` command, to the Namf_Communication services.

The `no` form of this command removes the HTTP/2 profile from the configuration.

Parameters

http2-profile-name

specifies the name of the HTTP/2 profile, up to 32 characters

5.2.1.35.8 interface

Syntax

```
interface interface-name [router router-instance]
no interface
```

Context

```
config>mobile>pdn>sba-client-services>amf-client>namf-comm
config>mobile>pdn>sba-client-services>amf-client>namf-evts
config>mobile>pdn>sba-client-services>chf-client>nchf-convergedcharging
config>mobile>pdn>sba-client-services>nrf-client>nnrf-disc
config>mobile>pdn>sba-client-services>nrf-client>nnrf-nfm
config>mobile>pdn>sba-client-services>nrf-client>nnrf-oauth2
config>mobile>pdn>sba-client-services>pcf-client>npcf-smpolicycontrol
config>mobile>pdn>sba-client-services>scp-client>scp-service
config>mobile>pdn>sba-client-services>sepp-client>sepp
config>mobile>pdn>sba-client-services>smf-client>nsmf-pdusession
config>mobile>pdn>sba-client-services>udm-client>nudm-sdm
config>mobile>pdn>sba-client-services>udm-client>nudm-uecm
```

Description

This command configures the interface in which the HTTP/2 connections are established.

The `no` form of this command removes the interface from the configuration.

Parameters

- interface-name**
specifies an existing interface name and must start with a letter, up to 32 characters
- router-instance**
specifies the router instance

Values	router-name service-id	
–	router-name	Base
–	service-id	1 to 2147483647

Default: Base

5.2.1.35.9 mode

Syntax

- mode *mode*
- no mode

Context

- config>mobile>pdn>sba-client-services>amf-client>namf-comm
- config>mobile>pdn>sba-client-services>amf-client>namf-evts
- config>mobile>pdn>sba-client-services>chf-client>nchf-convergedcharging
- config>mobile>pdn>sba-client-services>pcf-client>npcf-smpolicycontrol
- config>mobile>pdn>sba-client-services>smf-client>nsmf-pdusession
- config>mobile>pdn>sba-client-services>udm-client>nudm-sdm
- config>mobile>pdn>sba-client-services>udm-client>nudm-uecm

Description

This command configures the used communication mode.

NOTE:

If the configuration is changed, the new requests use the new communication mode. The ongoing requests are processed according to the communication mode that was used when the request was transmitted.

Parameters

mode

specifies the communication mode

Values	direct	specifies that direct communication is used
–	indirect	specifies that indirect communication without delegated discovery is used
–	delegate	specifies that indirect communication with delegated discovery is enabled

Default: direct

5.2.1.35.10 n1-profile

Syntax

n1-profile *profile-name*

no n1-profile

Context

config>mobile>pdn>sba-client-services>amf-client>namf-comm

Description

This command associates an N1 profile with the service instance. The N1 profile is configured using the config>mobile>profile>n1-profile command.

Parameters

profile-name

specifies the name of the N1 profile, up to 32 characters

5.2.1.35.11 nf-id-list

Syntax

```
nf-id-list list-name  
no nf-id-list
```

Context

```
config>mobile>pdn>sba-client-services>amf-client>namf-comm  
config>mobile>pdn>sba-client-services>amf-client>namf-evts  
config>mobile>pdn>sba-client-services>chf-client>nchf-convergedcharging  
config>mobile>pdn>sba-client-services>nrf-client>nnrf-disc  
config>mobile>pdn>sba-client-services>nrf-client>nnrf-nfm  
config>mobile>pdn>sba-client-services>nrf-client>nnrf-oauth2  
config>mobile>pdn>sba-client-services>sepp-client>sepp  
config>mobile>pdn>sba-client-services>pcf-client>npcf-smpolicycontrol  
config>mobile>pdn>sba-client-services>scp-client>scp-service  
config>mobile>pdn>sba-client-services>smf-client>nsmf-pdusession  
config>mobile>pdn>sba-client-services>udm-client>nudm-sdm  
config>mobile>pdn>sba-client-services>udm-client>nudm-uecm
```

Description

This command defines the remote NF ID list to use, if the NRF is not used for the service discovery. The NF ID list is configured using the `config>mobile>profile>list>nf-id-list` command.

Parameters

list-name

specifies the list name, up to 32 characters

5.2.1.35.12 oauth2-profile

Syntax

```
oauth2-profile profile-name  
no oauth2-profile
```

Context

```
config>mobile>pdn>sba-client-services>amf-client>namf-comm  
config>mobile>pdn>sba-client-services>amf-client>namf-evts  
config>mobile>pdn>sba-client-services>chf-client>nchf-convergedcharging  
config>mobile>pdn>sba-client-services>pcf-client>npcf-smpolicycontrol  
config>mobile>pdn>sba-client-services>smf-client>nsmf-pdusession  
config>mobile>pdn>sba-client-services>udm-client>nudm-sdm  
config>mobile>pdn>sba-client-services>udm-client>nudm-uecm
```

Description

This command configures OAuth2.0 authorization for the requests sent to the specified service instance and defines the profile with OAuth2.0 behavioral aspects for the client side. A default profile can be configured.

When OAuth2.0 is configured, the SMF or BSF uses access tokens in the requests sent. If the SMF/BSF does not possess an access token, it initiates an access token GET request toward the NRF to get a new access token before making a service request.

The no form of this command disables the OAuth2.0 authorization in the specified client context.

Default

```
no oauth2-profile
```

Parameters

profile-name
specifies the client profile name, up to 32 characters

5.2.1.35.13 paging-damp-timer

Syntax

```
paging-damp-timer paging-damp-timer
```

```
no paging-damp-timer
```

Context

```
config>mobile>pdn>sba-client-services>amf-client>namf-comm
```

Description

This command defines the delay before the SMF initiates paging if the latest paging attempt failed.

The no form of this command reverts to the default value.

Parameters

paging-damp-timer

specifies the dampening interval, in seconds

Values: 0 to 3600

Default: 0 (disabled)

5.2.1.35.14 plmn-list

Syntax

```
plmn-list list-name
```

```
no plmn-list
```

Context

```
config>mobile>pdn>sba-client-services>sepp-client>sepp
```

Description

This command configures a PLMN list for SEPP selection.

The no form of the command removes the PLMN list from the configuration.

Default

```
no plmn-list
```

Parameters

list-name

specifies the PLMN list name, up to 32 characters

5.2.1.35.15 service-interface

Syntax

```
service-interface ip-address | fqdn-name [port port] [scheme scheme]  
no service-interface
```

Context

```
config>mobile>pdn>sba-client-services>amf-client>namf-comm  
config>mobile>pdn>sba-client-services>amf-client>namf-evts  
config>mobile>pdn>sba-client-services>chf-client>nchf-convergedcharging  
config>mobile>pdn>sba-client-services>nrf-client>nnrf-disc  
config>mobile>pdn>sba-client-services>nrf-client>nnrf-nfm  
config>mobile>pdn>sba-client-services>nrf-client>nnrf-oauth2  
config>mobile>pdn>sba-client-services>pcf-client>npcf-smpolicycontrol  
config>mobile>pdn>sba-client-services>sepp-client>sepp  
config>mobile>pdn>sba-client-services>scp-client>scp-service  
config>mobile>pdn>sba-client-services>smf-client>nsmf-pdusession  
config>mobile>pdn>sba-client-services>udm-client>nudm-sdm  
config>mobile>pdn>sba-client-services>udm-client>nudm-uecm  
config>mobile>pdn>sba-server-services>nbsf-management  
config>mobile>pdn>sba-server-services>nsmf-event-exposure  
config>mobile>pdn>sba-server-services>nsmf-pdusession
```

Description

This command configures the service routing interface, in the default Linux routing stack, using K8s CITM and, or NGINX HTTP/2 connections and Istio gateway load balancing.

**NOTE:**

When you configure this command in a context, the corresponding interface command under this context is not available.

Parameters

ip-address | *fqdn-name*

specifies the IP address and the FQDN name, up to 128 characters

port

specifies the port number

Values: 1 to 65535

Default: 80

scheme

specifies the use of HTTP or HTTPS (TLS)

Values: http | https

Default: http

5.2.1.35.16 immediate-report

Syntax

```
immediate-report [skip-get]
```

```
no immediate-report
```

Context

```
config>mobile>pdn>sba-client-services>udm-client>nudm-sdm>supported-features
```

Description

This command enables the optional feature of the nudm-sdm service to request an immediate report when a subscription is created in the UDM. You can use the optional `skip-get` parameter to skip the GET request when the PDU session is established.

The no form of this command reverts to default (disabled).

Default

```
no immediate-report
```

Parameters

skip-get

keyword that specifies that no GET request is sent when the PDU session is established

5.2.1.35.17 udm-sdm-profile

Syntax

```
udm-sdm-profile profile-name  
no udm-sdm-profile
```

Context

```
config>mobile>pdn>sba-client-services>udm-client>nudm-sdm
```

Description

This command associates a UDM SDM profile (configured in the config>mobile>profile>udm-sdm-profile context) for the Nudm_SubscriberDataManagement service.

The no form of this command removes the profile from the Nudm_SubscriberDataManagement service.

Default

```
no no udm-sdm-profile
```

Parameters

profile-name

specifies the profile name, up to 32 characters

5.2.1.35.18 udm-uecm-profile

Syntax

```
udm-uecm-profile profile-name  
no udm-uecm-profile
```

Context

```
config>mobile>pdn>sba-client-services>udm-client>nudm-uecm
```

Description

This command associates a UDM SDM profile (configured in the config>mobile>profile>udm-uecm-profile context) for the Nudm_UEContextManagement service.

The no form of this command removes the profile from the Nudm_UEContextManagement service.

Default

no no udm-uecm-profile

Parameters

profile-name

specifies the profile name, up to 32 characters

5.2.1.35.19 namf-evts

Syntax

[no] namf-evts *service-instance*

Context

config>mobile>pdn>sba-client-services>amf-client

Description

This command configures an instance of the Namf_EventExposure service. At least one service instance must be configured to enable usage of the AMF event exposure service.

The no form of this command removes the service instance from the configuration.

Parameters

service-instance

specifies the service instance name, up to 32 characters

5.2.1.35.20 http2-profile

Syntax

http2-profile *http2-profile-name*

no http2-profile

Context

config>mobile>pdn>sba-client-services>amf-client>namf-evts

Description

This command associates an HTTP/2 profile, configured using the `config>mobile>profile>http2` command, to the `Namf_EventExposure` service.

The `no` form of this command removes the HTTP/2 profile from the configuration.

Parameters

http2-profile-name

specifies the name of the HTTP/2 profile, up to 32 characters

5.2.1.35.21 chf-client

Syntax

```
chf-client
```

Context

```
config>mobile>pdn>sba-client-services
```

Description

This command enables the context to configure the SMF client-side options when the SMF uses CHF services.

5.2.1.35.22 nchf-convergedcharging

Syntax

```
[no] nchf-convergedcharging instance-name
```

Context

```
config>mobile>pdn>sba-client-services>chf-client
```

Description

This command configures an instance of the `Nchf_ConvergedCharging` service. At least one service instance must be configured to enable peering with the CHF.

Parameters

instance-name

specifies the service instance name, up to 32 characters

5.2.1.35.23 **alternative-api-version**

Syntax

`api-version version`

`no api-version`

Context

`config>mobile>pdn>sba-client-services>chf-client>nchf-convergedcharging`

Description

This command specifies the used major API version of the nchf-convergedcharging service if the CHF does not support the preferred major API version (defined by the `api-version` command) but supports the other possible major API versions.

The no form of this command reverts to the default where no alternative API version is defined.

Default

no alternative-api-version

Parameters

version

specifies the major API version

Values: 0 to 255

Default: 0 (no alternative API version is defined)

5.2.1.35.24 **api-version**

Syntax

`api-version version [minor minor] [patch patch]`

`no api-version`

Context

`config>mobile>pdn>sba-client-services>chf-client>nchf-convergedcharging`

Description

This command specifies the API version of the remote CHF peer. It is relevant in cases where the related API supports multiple major versions, or the minor and patch versions have impact to the API usage. By default, version 3 (release 16) is used.

The no form of this command reverts to the default value.

Default

no api-version

Parameters

version

specifies the major API version

Values: 0 to 255

Default: 0 (highest supported API version)

minor

specifies the minor API version

Values: 0 to 255

Default: 0

patch

specifies the patch API version

Values: 0 to 255

Default: 0

5.2.1.35.25 http2-profile

Syntax

http2-profile *http2-profile-name*

no http2-profile

Context

config>mobile>pdn>sba-client-services>chf-client>nchf-convergedcharging

Description

This command associates an HTTP/2 profile, configured using the config>mobile>profile>http2 command, to the Nchf_ConvergedCharging service.

The no form of this command removes the HTTP/2 profile from the configuration.

Parameters

http2-profile-name

specifies the name of the HTTP/2 profile, up to 32 characters

5.2.1.35.26 converged-interface-support

Syntax

```
converged-interface-support
```

Context

```
config>mobile>pdn>sba-client-services
```

Description

This command enables the context to configure the 5G SBI interface support for UEs without 5GS NAS support.

5.2.1.35.27 converged-n10

Syntax

```
converged-n10 {enable | disable | 5gcnri}
```

```
no converged-n10
```

Context

```
config>mobile>pdn>sba-client-services>converged-interface-support
```

Description

This command configures the use of the 5G service-based N10 interface by the PGW-C/SMF for the UEs without 5GS NAS support. When set to *5gcnri* (5GC Not Restricted Indication), the N10 interface is enabled for the UEs without 5GS NAS support but the access to the 5GC is not restricted by the user subscription.

The no form of this command reverts to the default (*disable*).

Parameters

enable

enables the use of the 5G service-based N10 interface by the PGW-C/SMF for the UEs without 5GS NAS support

disable

disables the use of the 5G service-based N10 interface by the PGW-C/SMF for the UEs without 5GS NAS support

Default: disable

5gcnri

enables the use of the 5G service-based N10 interface by the PGW-C/SMF for the UEs without 5GS NAS support but the access to the 5GC is not restricted by the user subscription

5.2.1.35.28 converged-n40

Syntax

converged-n40 {enable | disable}

no converged-n40

Context

config>mobile>pdn>sba-client-services>converged-interface-support

Description

This command configures the use of the 5G service-based N40 interface by the PGW-C/SMF for the UEs without 5GS NAS support.

The no form of this command reverts to the default (disable).

Parameters

enable

enables the use of the 5G service-based N40 interface by the PGW-C/SMF for the UEs without 5GS NAS support

disable

disables the use of the 5G service-based N40 interface by the PGW-C/SMF for the UEs without 5GS NAS support

Default: disable

5.2.1.35.29 converged-n40-gngp

Syntax

```
converged-n40-gngp {enable | disable}  
no converged-n40-gngp
```

Context

```
config>mobile>pdn>sba-client-services>converged-interface-support
```

Description

This command configures the use of the 5G service-based N40 interface by the PGW-C/SMF for the UEs in case of 2G/3G access. When enabled, the PGW-C/SMF uses the 5G service-based N40 interface for the UEs in case of 2G/3G access.

The no form of this command reverts to the default (disable).

Parameters

enable

enables the use of the 5G service-based N40 interface by the PGW-C/SMF for the UEs in case of 2G/3G access

disable

disables the use of the 5G service-based N40 interface by the PGW-C/SMF for the UEs in case of 2G/3G access

Default: disable

5.2.1.35.30 converged-n7

Syntax

```
converged-n7 {enable | disable}  
no converged-n7
```

Context

```
config>mobile>pdn>sba-client-services>converged-interface-support
```

Description

This command configures the use of the 5G service-based N7 interface by the PGW-C/SMF for the UEs without 5GS NAS support.

The no form of this command reverts to the default (disable).

Parameters

enable

enables the use of the 5G service-based N7 interface by the PGW-C/SMF for the UEs without 5GS NAS support

disable

disables the use of the 5G service-based N7 interface by the PGW-C/SMF for the UEs without 5GS NAS support

Default: disable

5.2.1.35.31 converged-n7-gngp

Syntax

```
converged-n7-gngp {enable | disable}
```

```
no converged-n7-gngp
```

Context

```
config>mobile>pdn>sba-client-services>converged-interface-support
```

Description

This command configures the use of the 5G service-based N7 interface by the PGW-C/SMF for the UEs in case of 2G/3G access. When enabled, the PGW-C/SMF uses the 5G service-based N7 interface for the UEs in case of 2G/3G access.

The no form of this command reverts to the default (disable).

Parameters

enable

enables the use of the 5G service-based N7 interface by the PGW-C/SMF for the UEs in case of 2G/3G access

disable

disables the use of the 5G service-based N7 interface by the PGW-C/SMF for the UEs in case of 2G/3G access

Default: disable

5.2.1.35.32 pdu-session-id-base

Syntax

```
pdu-session-id-base value  
no pdu-session-id-base
```

Context

```
config>mobile>pdn>sba-client-services>converged-interface-support
```

Description

This command specifies the PDU session ID base value to be used for the PDU session ID generated by the PGW-C/SMF when it uses the 5G service-based interfaces for the UEs without 5GS NAS support.

When the value is set to 0, the system defines the PDU session ID base value.

The no form of this command reverts to the default.

NOTE:

This command must be used for troubleshooting purposes only and it is recommended to let the system define the PDU session ID base value.

Parameters

value

specifies the value of the PDU session ID base

Values: 0 to 95

Default: 0

5.2.1.35.33 http2-profile

Syntax

```
http2-profile http2-profile-name  
no http2-profile
```

Context

```
config>mobile>pdn>sba-client-services
```

Description

This command associates an HTTP/2 profile, configured using the `config>mobile>profile>http2` command, to all SBA client services.

The no form of this command removes the HTTP/2 profile from the configuration.

Parameters

http2-profile-name

specifies the name of the HTTP/2 profile, up to 32 characters

5.2.1.35.34 nrf-client

Syntax

```
nrf-client
```

Context

```
config>mobile>pdn>sba-client-services
```

Description

This command enables the context to configure the SMF or UPF client-side options when the SMF or UPF uses NRF services.

5.2.1.35.35 nnrf-disc

Syntax

```
[no] nnrf-disc service-instance
```

Context

```
config>mobile>pdn>sba-client-services>nrf-client
```

Description

This command configures an instance of the Nnrf_NFDiscovery service.

Parameters

service-instance

specifies the service instance name, up to 32 characters

5.2.1.35.36 blocklist-duration

Syntax

```
blocklist-duration seconds  
no blocklist-duration
```

Context

```
config>mobile>pdn>sba-client-services>nrf-client>nnrf-disc
```

Description

This command configures the blocklist duration of NRF peers for the Nnrf_NFDDiscovery service operation. When an NRF peer is blocklisted, CMG attempts to reconnect to this NRF peer after the configured time expires.

NOTICE:

When the duration of the block list timer is configured with high values and all NRF peers are blocklisted, for example as a result of a short connectivity outage, there will not be any peers available until the blocklist timer expires. Nokia recommends to configure low values for the blocklist timer.

The no form of this command reverts to the default value.

Parameters

seconds

specifies the time, in seconds, between successive retries

Values: 0 to 3600

Default: 5

5.2.1.35.37 chf-selection-options

Syntax

```
chf-selection-options
```

Context

```
config>mobile>pdn>sba-client-services>nrf-client>nnrf-disc
```

Description

This command enables the context to configure the CHF selection options via the NRF.

5.2.1.35.38 **exclude-gpsi**

Syntax

```
[no] exclude-gpsi [vsmf-only]
```

Context

```
config>mobile>pdn>sba-client-services>nrf-client>nnrf-disc>chf-selection-options
```

Description

This command excludes GPSI from the NRF query for the CHF discovery.

The `vsmf-only` optional parameter excludes the GPSI only if the V-SMF is performing the discovery.

The `no` form of this command includes the GPSI in the CHF selection query.

Default

`no exclude-gpsi`

Parameters

vsmf-only

the V-SMF excludes the GPSI from the discovery

5.2.1.35.39 **exclude-supi**

Syntax

```
[no] exclude-supi [vsmf-only]
```

Context

```
config>mobile>pdn>sba-client-services>nrf-client>nnrf-disc>chf-selection-options
```

Description

This command excludes SUPI from the NRF query for the CHF discovery.

The `vsmf-only` optional parameter excludes the SUPI only if the V-SMF is performing the discovery.

The no form of this command includes the SUPI in the CHF selection query.

Default

no exclude-supi

Parameters

vsmf-only

the V-SMF excludes the SUPI from the discovery

5.2.1.35.40 include-preferred-api-version

Syntax

[no] include-preferred-api-version

Context

config>mobile>pdn>sba-client-services>nrf-client>nnrf-disc>chf-selection-options

config>mobile>pdn>sba-client-services>nrf-client>nnrf-disc>udm-selection-options

Description

This command enables the preferred-api-version query parameter in the NF discovery.

The no form of this command reverts to the default where the preferred-api-version query parameter is not used in the NF discovery.

Default

no include-preferred-api-version

5.2.1.35.41 exclude-snssais

Syntax

[no] exclude-snssais

Context

config>mobile>pdn>sba-client-services>nrf-client>nnrf-disc

Description

This command excludes the SNSSAI list from the query parameter lists in the NF discovery request. The no form of this command reverts to the default (the SNSSAI list is included in the NF discovery request).

Default

no exclude-snssais

5.2.1.35.42 http2-profile

Syntax

http2-profile *http2-profile-name*

no http2-profile

Context

config>mobile>pdn>sba-client-services>nrf-client>nnrf-disc

Description

This command associates an HTTP/2 profile, configured using the config>mobile>profile>http2 command, to the Nnrf_NFDiscovery service.

The no form of this command removes the HTTP/2 profile from the configuration.

Parameters

http2-profile-name

specifies the name of the HTTP/2 profile, up to 32 characters

5.2.1.35.43 mode

Syntax

mode *mode*

no mode

Context

config>mobile>pdn>sba-client-services>nrf-client>nnrf-disc

config>mobile>pdn>sba-client-services>nrf-client>nnrf-nfm

config>mobile>pdn>sba-server-services>nsmf-event-exposure

Description

This command configures the used communication mode.

NOTE:

If the configuration is changed, the new requests use the new communication mode. The ongoing requests are processed according to the communication mode used when the request was transmitted.

Parameters

mode

specifies the communication mode

Values	direct	direct communication is used
–	indirect	indirect communication without delegated discovery is used

Default: direct

5.2.1.35.44 nrf-cache-interval

Syntax

nrf-cache-interval *value*
nrf-cache-interval use-nrf-validity-period
no nrf-cache-interval

Context

config>mobile>pdn>sba-client-services>nrf-client>nnrf-disc

Description

This command configures the NRF discovery results validity period.

The no form of this command reverts to the default.

Default

nrf-cache-interval use-nrf-validity-period

Parameters

value

specifies the validity period, in hours

Values: 0 to 24

use-nrf-validity-period

specifies to use the validity period provided in the NRF discovery response

Default: use-nrf-validity-period

5.2.1.35.45 suppress-discovery

Syntax

[no] suppress-discovery {amf | chf | pcf | udm}

Context

config>mobile>pdn>sba-client-services>nrf-client>nnrf-disc

Description

This command configures an NF type to use the locally-configured NF ID lists for selecting a peer instead of using the NRF.

This configuration applies only to client services for which the mode command is configured with the `direct` option. For client services with the mode command set to `indirect` or `delegate`, the suppress discovery configuration is ignored.

The `no` form of this command configures that discovery via the NRF is used.

Parameters

amf

specifies that the AMF uses the NF ID lists for selecting a peer

chf

specifies that the CHF uses the NF ID lists for selecting a peer

pcf

specifies that the PCF uses the NF ID lists for selecting a peer

udm

specifies that the UDM uses the NF ID lists for selecting a peer

5.2.1.35.46 udm-selection-options

Syntax

```
udm-selection-options
```

Context

```
config>mobile>pdn>sba-client-services>nrf-client>nnrf-disc
```

Description

This command enables the context to configure UDM-specific discovery and selection options.

5.2.1.35.47 exclude-group-id

Syntax

```
[no] exclude-group-id [vsmf-only]
```

Context

```
config>mobile>pdn>sba-client-services>nrf-client>nnrf-disc>udm-selection-options
```

Description

This command excludes the group ID from the query parameter lists in the UDM discovery request. The no form of this command reverts to the default (group ID is included in the UDM discovery request).

The vsmf-only optional parameter excludes the group ID only if the V-SMF is performing the discovery.

Default

```
no exclude-group-id
```

Parameters

vsmf-only

the V-SMF excludes the group ID from the discovery

5.2.1.35.48 **exclude-supi**

Syntax

[no] exclude-supi [vsmf-only]

Context

config>mobile>pdn>sba-client-services>nrf-client>nnrf-disc>udm-selection-options

Description

This command excludes the SUPI from the query parameter lists in the UDM discovery request. The no form of this command reverts to the default (SUPI is included in the UDM discovery request).

The vsmf-only optional parameter excludes the SUPI only if the V-SMF is performing the discovery.

Default

no exclude-supi

Parameters

vsmf-only

the V-SMF excludes the SUPI from the discovery

5.2.1.35.49 **use-locality**

Syntax

[no] use-locality

Context

config>mobile>pdn>sba-client-services>nrf-client>nnrf-disc

Description

This command configures the discovery requests for PCF, UDM, and CHF peers to use the preferred locality. The no form of this command reverts to the default (preferred locality is not used in the discovery).

NOTE:

The NRF may adjust the priorities in the NF profiles when the preferred locality is used. The local cache contains the adjusted priorities that have been received by the NRF. If this configuration changes, Nokia recommends flushing the cache.

Default

no use-locality

5.2.1.35.50 nnrf-nfm

Syntax

[no] nnrf-disc *service-instance*

Context

config>mobile>pdn>sba-client-services>nrf-client

Description

This command configures an instance of the Nnrf_NFManagement service.

Parameters

service-instance

specifies the service instance name, up to 32 characters

5.2.1.35.51 blocklist-duration

Syntax

blocklist-duration *seconds*

no blocklist-duration

Context

config>mobile>pdn>sba-client-services>nrf-client>nnrf-nfm

Description

This command configures the blocklist duration of NRF peers for the Nnrf_NFManagement service operation. When an NRF peer is block-listed, CMG attempts to reconnect to this NRF peer after the configured time expires.

**NOTICE:**

When the duration of the blocklist timer is configured with high values and all NRF peers are blocklisted, for example as a result of a short connectivity outage, there will not be any peers available until the blocklist timer expires. Nokia recommends to configure low values for the blocklist timer.

The no form of this command reverts to the default value.

Parameters***seconds***

specifies the time, in seconds, between successive retries

Values: 0 to 3600

Default: 60

5.2.1.35.52 heartbeat-nrf-blocklist**Syntax**

```
heartbeat-nrf-blocklist retry retry-count wait-timer seconds
```

```
no heartbeat-nrf-blocklist
```

Context

```
config>mobile>pdn>sba-client-services>nrf-client>nnrf-nfm
```

Description

This command configures the heartbeat operation blocklist algorithm of NRF peers for the Nnrf_nfm service operations.

The retry keyword specifies the number of times a heartbeat is resent, when there is no response from the peer, after the timer configured using the wait-timer keyword expires.

The retry counter is also applied when specific HTTP error codes are received in the heartbeat response from the NRF. In this case, the new heartbeat is sent immediately after the response is received without waiting for the configured wait timer to expire.

For more information about the use of this command, refer to the section *NRF Failover and Multiple NRF Usage* of the *7750 SR MG and CMG 5G System Architecture and Configuration Guide*.

The no form of this command reverts to the default values.

Parameters***retry-count***

specifies the number of heartbeat retries

Values: 0 to 10

Default: 3

seconds

specifies the time, in seconds, between successive heartbeat retries

Values: 1 to 10

Default: 2

5.2.1.35.53 http2-profile

Syntax

`http2-profile http2-profile-name`

`no http2-profile`

Context

`config>mobile>pdn>sba-client-services>nrf-client>nnrf-nfm`

Description

This command associates an HTTP/2 profile, configured using the `config>mobile>profile>http2` command, to the Nnrf_NFManagement service.

The `no` form of this command removes the HTTP/2 profile from the configuration.

Parameters

http2-profile-name

specifies the name of the HTTP/2 profile, up to 32 characters

5.2.1.35.54 nfm-nrf-blocklist

Syntax

`nfm-nrf-blocklist retry retry-count wait-timer seconds`

`no nfm-nrf-blocklist`

Context

`config>mobile>pdn>sba-client-services>nrf-client>nnrf-nfm`

Description

This command configures the blocklist algorithm of NRF peers for the Nnrf_nfm service operations except the heartbeat.

The `retry` keyword specifies the number of times a request is resent, when there is no response from the peer, after the timer configured using the `wait - timer` keyword expires.

The retry counter is also applied when specific HTTP error codes are received in the heartbeat response from the NRF. In this case, a new request is sent immediately after the response is received without waiting for the configured wait timer to expire.

For more information about the use of this command, refer to the section *NRF Failover and Multiple NRF Usage* of the *CMG 5G System Architecture and Configuration Guide*.

The no form of this command reverts to the default values.

Parameters

retry-count

specifies the number of heartbeat retries

Values: 0 to 10

Default: 3

seconds

specifies the time, in seconds, between successive heartbeat retries

Values: 1 to 10

Default: 2

5.2.1.35.55 nnrf-oauth2

Syntax

```
[no] nnrf-oauth2 service-instance
```

Context

```
config>mobile>pdn>sba-client-services>nrf-client
```

Description

This command configures an instance of the Nnrf_AccessToken service. One service instance must be configured if OAuth2.0 is configured to be used when using other NF peer services.

The no form of this command removes the specified service instance from the configuration.

Parameters

service-instance

specifies the service instance name, up to 32 characters

5.2.1.35.56 http2-profile

Syntax

```
http2-profile http2-profile-name
```

```
no http2-profile
```

Context

```
config>mobile>pdn>sba-client-services>nrf-client>nnrf-oauth2
```

Description

This command associates an HTTP/2 profile, configured using the `config>mobile>profile>http2` command, to the `Nnrf_AccessToken` service.

The `no` form of this command removes the HTTP/2 profile from the configuration.

Parameters

http2-profile-name

specifies the name of the HTTP/2 profile, up to 32 characters

5.2.1.35.57 pcf-client

Syntax

```
pcf-client
```

Context

```
config>mobile>pdn>sba-client-services
```

Description

This command enables the context to configure the SMF client-side options when the SMF uses PCF services.

5.2.1.35.58 npcf-smpolicycontrol

Syntax

[no] npcf-smpolicycontrol *service-instance*

Context

config>mobile>pdn>sba-client-services>pcf-client

Description

This command configures an instance of the Npcf_SMPolicyControl service. At least one service instance must be configured to enable peering with the PCF.

Parameters

service-instance

specifies the service instance name, up to 32 characters

5.2.1.35.59 http2-profile

Syntax

http2-profile *http2-profile-name*

no http2-profile

Context

config>mobile>pdn>sba-client-services>pcf-client>npcf-smpolicycontrol

Description

This command associates an HTTP/2 profile, configured using the config>mobile>profile>http2 command, to the Npcf_SMPolicyControl service.

The no form of this command removes the HTTP/2 profile from the configuration.

Parameters

http2-profile-name

specifies the name of the HTTP/2 profile, up to 32 characters

5.2.1.35.60 npcf-profile

Syntax

```
npcf-profile profile-name  
no npcf-profile
```

Context

```
config>mobile>pdn>sba-client-services>pcf-client>npcf-smpolicycontrol
```

Description

This command configures a PCF profile for the PCF.

Parameters

profile-name
specifies the profile name, up to 32 characters

5.2.1.35.61 scp-client

Syntax

```
scp-client
```

Context

```
config>mobile>pdn>sba-client-services
```

Description

This command enables the context to configure the SCP options for indirect communication with or without delegated discovery.

5.2.1.35.62 scp-service

Syntax

```
[no] scp-service service-instance
```

Context

```
config>mobile>pdn>sba-client-services>scp-client
```

Description

This command configures an instance of the SCP client service. At least one service instance must be configured to allow peering with the SCP.

Parameters

service-instance

specifies the service instance name, up to 32 characters

5.2.1.35.63 block-duration

Syntax

block-duration *value*

no block-duration

Context

config>mobile>pdn>sba-client-services>scp-client>scp-service

Description

This command specifies the period that SCP remains blocked. If SCP is blocked, the SMF does not send requests to the SCP. If all SCPs are blocked, the SMF starts using direct communication.

Parameters

value

specifies the block duration, in seconds

Values: 0 to 3600

Default: 5

5.2.1.35.64 default-failure-action

Syntax

default-failure-action *failure-action*

no default-failure-action

Context

config>mobile>pdn>sba-client-services>scp-client>scp-service

Description

This command configures the default failure handling if the peer SCP rejects the request. The action is applied if the response from the peer SCP contains a Server header which indicates that SCP rejected the request.

Retransmissions and fail actions are controlled by the client service settings. For example, if the nudm-sdm request is sent via SCP, the nudm-sdm settings define the retransmissions and action, if the configured SCP failure action is `fail`.

The no form of this command reverts to the default action.

Parameters

failure-action

specifies the failure action

Values:

block

SCP is blocked and no requests are sent via the SCP. An alarm is raised if the SCP is blocked. The `block-duration` command specifies the duration that the SCP is blocked. Retransmission is allowed.

retry

Retransmission is allowed, and it may be performed via the same SCP.

failover

Retransmission is allowed, and it is performed via a different SCP.

fail

The related service operation fails, and the respective client service failure action defines failure action.

mode-fallback-a

There is fallback to a direct communication mode where the NF discovery is done from the local configuration. Any possible retransmissions use the new model. The `block-duration` command defines the duration that the new communication mode is used.

mode-fallback-b

There is fallback to a direct communication mode where the NF discovery is done with the NRF. Any possible retransmissions use the new model. The `block-duration` command defines the duration that the new communication mode is used.

Default: mode-fallback-a

5.2.1.35.65 fh-no-response

Syntax

```
fh-no-response failure-action
no fh-no-response
```

Context

```
config>mobile>pdn>sba-client-services>scp-client>scp-service
```

Description

This command configures the failure action if no response is received from the SCP.

Parameters

failure-action

specifies the failure action

Values:

block

SCP is blocked and no requests are sent via the SCP. An alarm is raised if the SCP is blocked. The `block-duration` command specifies how long the SCP is blocked. Retransmission is allowed.

retry

Retransmission is allowed, and it is performed via the same SCP.

failover

Retransmission is allowed, and it is performed via a different SCP.

The retransmissions are controlled by client service settings, for example, if a `nudm-request` is sent via the SCP, the `nudm-sdm` settings define the retransmissions.

Default: `retry`

5.2.1.35.66 http-status-code

Syntax

```
http-status-code [status-code status-code-value [application-error app-error-code] ]
failure-action

no http-status-code [status-code status-code-value [application-error app-error-code] ]
```

Context

config>mobile>pdn>sba-client-services>scp-client>scp-service

Description

This command specifies the failure action, if the SCP rejects the request. If an HTTP status code or application error is defined, the failure action is used only if the rejection uses a matching of HTTP status code and application error. If the command does not include an HTTP status code and application error, the defined failure action applies to any rejection.

The no form of this command removes the failure action and reverts to the default action (mode-fallback-a).

Parameters

status-code-value

specifies the three-digit status code value

Values: 300 to 599

app-error-code

specifies the application error code, up to 64 characters

failure-action

specifies the failure action

Values:

block

SCP is blocked and no requests are sent via the SCP. An alarm is raised if the SCP is blocked. The `block-duration` command specifies the period that the SCP remains blocked. Retransmission is allowed.

retry

retransmission is allowed, and it is performed via the same SCP

failover

retransmission is allowed, and it is performed via a different SCP

fail

the related service operation fails, and the respective client service failure action specifies the failure action

mode-fallback-a

a fallback to a direct communication mode is done where the NF discovery is performed from the local configuration. Possible retransmissions use the new model. The `block-duration` command specifies how long the new communication mode is used.

mode-fallback-b

a fallback to a direct communication mode is done where the NF discovery is performed through the NRF. Possible retransmissions use the new model. The `block-duration` command specifies how long the new communication mode is used.

Default: `mode-fallback-a`

5.2.1.35.67 `http2-profile`

Syntax

```
http2-profile http2-profile-name  
no http2-profile
```

Context

```
config>mobile>pdn>sba-client-services>scp-client>scp-service
```

Description

This command associates an HTTP/2 profile, configured using the `config>mobile>profile>http2` command, to the SCP client service.

The `no` form of this command removes the HTTP/2 profile from the configuration.

Parameters

http2-profile-name

specifies the name of the HTTP/2 profile, up to 32 characters

5.2.1.35.68 `mode-fallback`

Syntax

```
mode-fallback new-model  
no mode-fallback
```

Context

```
config>mobile>pdn>sba-client-services>scp-client>scp-service
```

Description

This command specifies the communication model to be used if there are no available SCPs or all the available SCPs are blocked.

The no form of this command reverts to the default.

Parameters

new-model

specifies the new communication model

Values:

a

fallback to direct communication mode with NF producer and NF discovery performed without NRF, using local configuration

b

fallback to direct communication mode with NF producer and NF discovery performed with NRF

Default: a

5.2.1.35.69 scp-domain

Syntax

scp-domain *domain-name*

no scp-domain

Context

config>mobile>pdn>sba-client-services>scp-client

Description

This command configures an SCP domain for the SCP client service.

The no form of this command reverts to the default.

Default

no scp-domain

Parameters

domain-name

specifies the SCP domain name, up to 32 characters

5.2.1.35.70 sepp-client

Syntax

`sepp-client`

Context

`config>mobile>pdn>sba-client-services`

Description

This command enables the context to configure the SEPP options for communication with NFs in another PLMN.

5.2.1.35.71 sepp

Syntax

`[no] sepp service-instance`

Context

`config>mobile>pdn>sba-client-services>sepp-client`

Description

This command configures a service instance to be used with SEPP. At least one service instance must be configured to enable peering with the SEPP.

If multiple SEPP instances are configured, only one of them can be defined without a PLMN list. If a PLMN list is defined, the SEPP instance can be used only if the remote PLMN is found in the specified PLMN list. The SEPP instance without a PLMN list is used in cases where a remote PLMN is not found from the PLMN lists of other SEPP instances.

NOTE:

This command requires a PDN shutdown only when an HTTP/2 profile is configured with TLS enabled.

Parameters

service-instance

specifies the service instance name, up to 32 characters

5.2.1.35.72 http2-profile

Syntax

```
http2-profile http2-profile-name  
no http2-profile
```

Context

```
config>mobile>pdn>sba-client-services>sepp-client>sepp
```

Description

This command associates an HTTP/2 profile, configured using the `config>mobile>profile>http2` command, to the SEPP client service.

The `no` form of this command removes the HTTP/2 profile from the configuration.

Parameters

http2-profile-name

specifies the name of the HTTP/2 profile, up to 32 characters

5.2.1.35.73 smf-client

Syntax

```
smf-client
```

Context

```
config>mobile>pdn>sba-client-services
```

Description

This command enables the context to configure the SMF client-side options when the SMF uses services of another SMF.

5.2.1.35.74 nsmf-pdusession

Syntax

```
[no] nudm-sdm service-instance
```

Context

```
config>mobile>pdn>sba-client-services>smf-client
```

Description

This command configures an instance of the Nsmf-pdusession service. At least one service instance must be configured to allow peering with the SMF.

Parameters

service-instance

specifies the service instance name, up to 32 characters

5.2.1.35.75 api-prefix

Syntax

```
api-prefix string
```

```
no api-prefix
```

Context

```
config>mobile>pdn>sba-client-services>smf-client>nsmf-pdusession
```

```
config>mobile>pdn>sba-server-services>smf-client>nsmf-pdusession
```

Description

This command configures the API prefix for the service that defines the optional path segment in the API root.

Parameters

string

specifies the API prefix, up to 32 characters

5.2.1.35.76 http2-profile

Syntax

```
http2-profile http2-profile-name
```

```
no http2-profile
```

Context

```
config>mobile>pdn>smf-client-services>nsmf-pdusession
```

Description

This command associates an HTTP/2 profile, configured using the `config>mobile>profile>http2` command, to the `Nsmf_pdusession` client service.

The `no` form of this command removes the HTTP/2 profile from the configuration.

Parameters

http2-profile-name

specifies the name of the HTTP/2 profile, up to 32 characters

5.2.1.35.77 supported-features

Syntax

```
supported-features
```

Context

```
config>mobile>pdn>sba-client-services>smf-client>nsmf-pdusession
```

```
config>mobile>pdn>sba-server-services>smf-client>nsmf-pdusession
```

```
config>mobile>pdn>sba-client-services>udm-client>nudm-sdm
```

Description

This command enables the context to configure the supported features of the service.

5.2.1.35.78 dtssa

Syntax

```
[no] dtssa
```

Context

```
config>mobile>pdn>sba-client-services>smf-client>nsmf-pdusession>supported-features
```

```
config>mobile>pdn>sba-server-services>smf-client>nsmf-pdusession>supported-features
```

Description

This command enables the optional DTSSA feature in the SMF PDU session service. The DTSSA feature must be enabled when deploying an I-SMF.

The no form of this command disables the DTSSA feature.

5.2.1.35.79 transaction-timer

Syntax

```
transaction-timer value  
no transaction-timer
```

Context

```
config>mobile>pdn>sba-client-services>smf-client>nsmf-pdusession  
config>mobile>pdn>sba-server-services>smf-client>nsmf-pdusession
```

Description

This command configures the time that the SMF waits for a response from the remote SMF.

The no form of this commands reverts to the default.

Parameters

value

specifies the time, in milliseconds
Values: 1000 to 20000 (in increments of 100)
Default: 5000

5.2.1.35.80 version

Syntax

```
version major [minor minor] [patch patch]  
no version
```

Context

```
config>mobile>pdn>sba-client-services>smf-client>nsmf-pdusession  
config>mobile>pdn>sba-server-services>smf-client>nsmf-pdusession
```

Description

This command configures the API version of the service. If the version is not defined, the used version is the one based on the latest fully supported API version.

The API version consists of three numbers:

1. major
2. minor
3. patch

Default

If no version is defined, version 1.0.2 is used.

Parameters

major

specifies the major version

Values: 1 to 255

Default: 1

minor

specifies the minor version

Values: 0 to 255

Default: 0

patch

specifies the patch version

Values: 0 to 255

Default: 2

5.2.1.35.81 udm-client

Syntax

```
udm-client
```

Context

```
config>mobile>pdn>sba-client-services
```

Description

This command enables the context to configure the SMF client-side options when the SMF uses UDM services.

5.2.1.35.82 nudm-sdm

Syntax

[no] nudm-sdm *service-instance*

Context

config>mobile>pdn>sba-client-services>udm-client

Description

This command configures an instance of the Nudm_SubscriberDataManagement service. At least one service instance must be configured to allow the SMF to get session management subscription data from the UDM.

Parameters

service-instance

specifies the service instance name, up to 32 characters

5.2.1.35.83 api-version

Syntax

api-version *version*

no api-version

Context

config>mobile>pdn>sba-client-services>udm-client>nudm-sdm

Description

This command specifies the major API version of the nudm-sdm service. The SMF prefers those nudm-sdm service instances with matching major version number.

The no form of this command reverts to the default where the SMF does not use the major API version to select the nudm-sdm service instances.

Default

no api-version

Parameters

version

specifies the major API version

Values: 0 to 255

Default: 0 (the SMF can use any major API version)

5.2.1.35.84 explicit-unsubscribe

Syntax

explicit-unsubscribe [expiry-time *expiry-time*] [renew-on-expiry]

no explicit-unsubscribe

Context

config>mobile>pdn>sba-client-services>udm-client>nudm-sdm

Description

This command sets the implicit unsubscribe attribute to the value false when a subscription is created in the UDM. The SMF sets the implicit unsubscribe attribute to the value true by default.

The optional *expiry-time* parameter defines the proposed expiry time of the subscription. The UDM may override the proposed expiry time when it creates the subscription.

When the optional *renew-on-expiry* parameter is configured, the SMF renews the subscription after it has expired and the PDU is still active. When the parameter is not configured, the SMF releases the PDU session after the subscription has expired.

The no form of this command reverts to the default.

Default

no explicit-unsubscribe

Parameters

expiry-time

specifies the suggested expiry time in seconds

Values: 1800 to 4294967295

Default: 4294967295

renew-on-expiry

specifies that the SMF must renew the subscription after it has expired and the PDU is still active

5.2.1.35.85 http2-profile

Syntax

`http2-profile http2-profile-name`

`no http2-profile`

Context

`config>mobile>pdn>sba-client-services>udm-client>nudm-sdm`

Description

This command associates an HTTP/2 profile, configured using the `config>mobile>profile>http2` command, to the Nudm_SubscriberDataManagement service.

The `no` form of this command removes the HTTP/2 profile from the configuration.

Parameters

http2-profile-name

specifies the name of the HTTP/2 profile, up to 32 characters

5.2.1.35.86 nudm-uecm

Syntax

`[no] nudm-uecm service-instance`

Context

`config>mobile>pdn>sba-client-services>udm-client`

Description

This command configures an instance of the Nudm_UEContextManagement service. At least one service instance must be configured to allow the SMF to register PDU sessions in the UDM.

Parameters

service-instance

specifies the service instance name, up to 32 characters

5.2.1.35.87 http2-profile

Syntax

http2-profile *http2-profile-name*

no http2-profile

Context

config>mobile>pdn>sba-client-services>udm-client>nudm-uecm

Description

This command associates an HTTP/2 profile, configured using the config>mobile>profile>http2 command, to the Nudm_UEContextManagement service.

The no form of this command removes the HTTP/2 profile from the configuration.

Parameters

http2-profile-name

specifies the name of the HTTP/2 profile, up to 32 characters

5.2.1.35.88 user-agent-header

Syntax

user-agent-header [user-agent *user-agent*]

no user-agent-header

Context

config>mobile>pdn>sba-client-services

config>mobile>pdn>sba-server-services

Description

This command enables the User-Agent header in outgoing SBI requests. The value of the header is defined with the *user-agent* parameter.

The no form of this command reverts to the default value.

Default

no user-agent-header (the User-Agent is not used in the outgoing SBI requests)

Parameters

user-agent

specifies the value of the header, up to 64 characters: the User-Agent value must always start with "SMF".

Default: SMF-*<NF instance ID>*

5.2.1.35.89 sbi-correlation-info-header

Syntax

[no] sbi-correlation-info-header

Context

config>mobile>pdn>sba-client-services

config>mobile>pdn>sba-server-services

Description

This command enables the 3gpp-Sbi-Correlation-Info header in the outgoing SBI messages.

The no form of this command reverts to the default value.

Default

no sbi-correlation-info-header (the 3gpp-Sbi-Correlation-Info-header header is not used in the outgoing SBI messages)

5.2.1.35.90 sbi-load-control

Syntax

sbi-load-control

Context

```
config>mobile>pdn>sba-server-services
```

Description

This command enables the context to configure the node-level SBI load control over the N11 and N16 interfaces.

5.2.1.35.91 enable

Syntax

```
[no] enable
```

Context

```
config>mobile>pdn>sba-server-services>sbi-load-control
```

Description

This command enables the load control support based on the LCI header.

The no form of this command removes the LCI header load control support.

Default

```
no enable
```

5.2.1.35.92 load-change-trigger

Syntax

```
load-change-trigger percent
```

```
no load-change-trigger
```

Context

```
config>mobile>pdn>sba-server-services>sbi-load-control
```

Description

This command configures the load change value which triggers a new load control update transmitted via the 3gpp-Sbi-Lci header.

The no form of this command configures the load change value to the default value (5).

Parameters

percent

specifies the percentage load change value

Values: 5 | 10 | 15 | 20

Default: 5

5.2.1.35.93 nth-message

Syntax

`nth-message number`

`no nth-message`

Context

`config>mobile>pdn>sba-server-services>sbi-load-control`

Description

This command configures the message interval for sending load control information via the 3gpp-Sbi-Lci header.

The no form of this command configures the message interval to the default value (50).

Parameters

number

specifies the interval used for including load control information

Values: 1 to 1000

Default: 50

5.2.1.35.94 sbi-nf-peer-info-header

Syntax

`sbi-nf-peer-info-header [scp] [sepp] [srvinst]`

`no sbi-nf-peer-info-header`

Context

`config>mobile>pdn>sba-client-services`

```
config>mobile>pdn>sba-server-services
```

Description

This command enables the 3gpp-Sbi-NF-Peer-Info header in the outgoing SBI messages. The header contains the NF instance ID of the SMF and the NF instance ID of the peer NF, if available.

The no form of this command reverts to the default value.

Default

no sbi-nf-peer-info-header (the 3gpp-Sbi-NF-Peer-Info header is not used in the outgoing SBI messages)

Parameters

scp

Enables the inclusion of the dstscp parameter in the 3gpp-Sbi-NF-Peer-Info of outgoing SBI messages to the SCP if the following conditions are true:

- the request is sent to the SCP and the FQDN of the SCP, if known
- the request associated with the sent response includes the scrscp parameter in the 3gpp-Sbi-Nf-Peer-Info header

sepp

Enables the inclusion of the dstsepp parameter in the 3gpp-Sbi-NF-Peer-Info header of outgoing SBI messages to the SEPP if the following conditions are true:

- the request is sent to the SEPP and the FQDN of the SEPP, if known
- the request associated with the sent response includes the scrsepp parameter in the 3gpp-Sbi-Nf-Peer-Info header

srvinst

Enables the inclusion of the srcservinst and dstservinst parameters in the 3gpp-Sbi-NF-Peer-Info header of outgoing SBI messages. The header contains the service instance value, if known.

5.2.1.35.95 sbi-overload-control

Syntax

```
sbi-overload-control
```

Context

```
config>mobile>pdn>sba-server-services
```

Description

This command enables the context to configure the node-level SBI overload control over the N11 and N16 interfaces.

5.2.1.35.96 enable

Syntax

[no] enable

Context

config>mobile>pdn>sba-server-services>sbi-overload-control

Description

This command enables the overload control support based on the OCI header.

The no form of this command removes the OCI header overload control support.

NOTE:

When you configure both the `sbi-overload-control` and `nsmf-overload-control` commands, the `minor`, `major`, and `critical` commands in the `config>mobile>pdn>nsmf-overload-control>overload-threshold` context must have a configured value higher than the `minor`, `major`, and `critical` commands in the `config>mobile>pdn>overload-control>thresholds` context used for SBI overload control.

Default

no enable

5.2.1.35.97 overload-reduction

Syntax

overload-reduction

Context

config>mobile>pdn>sba-server-services>sbi-overload-control

Description

This command enables the context to configure the percentage of the traffic reduction requested and transmitted over the N11 or N16 interface.

5.2.1.35.98 critical

Syntax

`critical percent`

`no critical`

Context

`config>mobile>pdn>sba-server-services>sbi-overload-control>overload-reduction`

Description

This command configures the traffic reduction percentage for the critical overload level of the N11 or N16 interface.

The no form of this command reverts to the default value (90).

Default

`no critical`

Parameters

percent

specifies the percentage of the traffic reduction

Values: 20 to 100

Default: 90

5.2.1.35.99 major

Syntax

`major percent`

`no major`

Context

config>mobile>pdn>sba-server-services>sbi-overload-control>overload-reduction

Description

This command configures the traffic reduction percentage for the major overload level of the N11 or N16 interface.

The no form of this command reverts to the default value (60).

Default

no major

Parameters

percent

specifies the percentage of the traffic reduction

Values: 20 to 100

Default: 60

5.2.1.35.100 minor

Syntax

minor *percent*

no minor

Context

config>mobile>pdn>sba-server-services>sbi-overload-control>overload-reduction

Description

This command configures the traffic reduction percentage for the minor overload level of the N11 or N16 interface.

The no form of this command reverts to the default value (30).

Default

no minor

Parameters

percent

specifies the percentage of the traffic reduction

Values: 20 to 100

Default: 30

5.2.1.35.101 *validity-time*

Syntax

`validity-time validity-time`

`no validity-time`

Context

`config>mobile>pdn>sba-server-services>sbi-overload-control`

Description

This command configures the length of the time for the reported overload to be in effect.

Parameters

validity-time

specifies the length of time, in seconds, for the overload to be in effect

Values: 10 to 86400

Default: 600

5.2.1.36 SBA server services PDN command descriptions

5.2.1.36.1 *sba-server-services*

Syntax

`sba-server-services`

Context

`config>mobile>pdn`

Description

This command enables the context to configure the server-side options provided by CMG as the NF producer.

5.2.1.36.2 fqdn

Syntax

`fqdn fqdn-sni-string`

`no fqdn`

Context

`config>mobile>pdn>sba-server-services`

Description

This command configures an FQDN which is used by all SBA server services.

The no form of this command removes the FQDN from the configuration.

v

5.2.1.36.3 http2-profile

Syntax

`http2-profile http2-profile-name`

`no http2-profile`

Context

`config>mobile>pdn>sba-server-services`

Description

This command associates an HTTP/2 profile, configured using the `config>mobile>profile>http2` command, to all SBA server services.

The no form of this command removes the HTTP/2 profile from the configuration.

Parameters

http2-profile-name

specifies the name of the HTTP/2 profile, up to 32 characters

5.2.1.36.4 nbsf-management

Syntax

```
[no] nbsf-management service-instance
```

Context

```
config>mobile>pdn>sba-server-services
```

Description

This command configures a service instance of the Nbsf_Management service. At least one service instance must be configured to allow other NFs to access the BSF services.

The no form of this command removes the service instance from the configuration.

Parameters

service-instance

specifies the service instance name, up to 32 characters

5.2.1.36.5 allowed-nf-domains-list

Syntax

```
allowed-nf-domains-list list-name  
no allowed-nf-domains-list
```

Context

```
config>mobile>pdn>sba-server-services>nbsf-management  
config>mobile>pdn>sba-server-services>nsmf-event-exposure  
config>mobile>pdn>sba-server-services>nsmf-pdusession
```

Description

This command configures the allowed NF domains per NF service instance. The allowed NF domain list is configured using the config>mobile>profile>list>allowed-nf-domains-list command.

These domains are used in the NFProfile during registration to the NRF. The configured values of the list are also used for static authorization that allows, or not, serving requests from the indicated NF domains.

The no form of this command reverts to the default value.

Default

no allowed-nf-domains-list

Parameters

list-name

specifies the allowed NF domain list name, up to 32 characters

5.2.1.36.6 allowed-nf-types

Syntax

allowed-nf-types {pcf | nef | af | dra}

no allowed-nf-types [pcf | nef | af | dra]

Context

config>mobile>pdn>sba-server-services>nbsf-management

Description

This command configures the allowed NF types per NF service instance. The NF types are used in the NFProfile in the registration to the NRF. The configured values are also used for static authorization that allows, or not, serving requests from the indicated NF types.

The no form of this command removes the specified values from the configuration.

Default

no allowed-nf-types

Parameters

pcf

specifies the PCF NF

nef

specifies the NEF NF

af

specifies the AF NF

dra

specifies the DRA NF

5.2.1.36.7 allowed-plmns

Syntax

```
allowed-plmns list-name  
no allowed-plmns
```

Context

```
config>mobile>pdn>sba-server-services>nbsf-management
```

Description

This command associates a PLMN list (configured under the `config>mobile>profile>list>plmn` context) to configure the discovery of the Nbsf_Management session service based on the PLMN of the NF performing the discovery. If the PLMN list is defined, the Nbsf_Management session is discoverable only from the PLMNs included in the list. If the PLMN list is not defined, the Nbsf_Management session service is discoverable from any PLMN.

The no form of this command removes the association of the PLMN list.

NOTE:

When you configure the nnrf-nfm client under the `config>mobile>pdn>sba-service-realm` context, this command accepts a PLMN list with a maximum of 32 entries.

Parameters

list-name

specifies the PLMN list name, up to 32 characters

5.2.1.36.8 fqdn

Syntax

```
fqdn fqdn-sni-string  
no fqdn
```

Context

```
config>mobile>pdn>sba-server-services>nbsf-management
```

Description

This command configures an FQDN which is used by the Nbsf_management server service.

The no form of this command removes the FQDN from the configuration.

Parameters

fqdn-sni-string

specifies the FQDN name string, up to 255 characters

5.2.1.36.9 http2-profile

Syntax

`http2-profile http2-profile-name`

`no http2-profile`

Context

`config>mobile>pdn>sba-server-services>nbsf-management`

Description

This command associates an HTTP/2 profile, configured using the `config>mobile>profile>http2` command, to the Nbsf_management server service.

The no form of this command removes the HTTP/2 profile from the configuration.

Parameters

http2-profile-name

specifies the name of the HTTP/2 profile, up to 32 characters

5.2.1.36.10 interface

Syntax

`interface interface-name [router router-instance] [port port-number]`

`no interface`

Context

`config>mobile>pdn>sba-server-services>nbsf-management`

```
config>mobile>pdn>sba-server-services>nsmf-event-exposure
config>mobile>pdn>sba-server-services>nsmf-pdusession
```

Description

This command configures the interface in which the HTTP/2 connections are established.
The no form of this command removes the interface from the configuration.

Parameters

interface-name

specifies an existing interface name and must start with a letter, up to 32 characters

router-instance

specifies the router instance

Values	router-name service-id	
–	router-name	Base
–	service-id	1 to 2147483647

Default: Base

port-number

specifies the port number
Values: 1 to 65535
Default: 80

5.2.1.36.11 oauth2-profile

Syntax

```
oauth2-profile profile-name
no oauth2-profile
```

Context

```
config>mobile>pdn>sba-server-services>nbsf-management
```

```
config>mobile>pdn>sba-server-services>nsmf-event-exposure  
config>mobile>pdn>sba-server-services>nsmf-pdusession
```

Description

This command configures OAuth2.0 authorization for the requests received in the specified service instance and defines the profile with OAuth2.0 behavioral aspects for the server side. A default profile can be configured.

When OAuth2.0 is configured, the SMF or BSF looks for an access token in the received requests and validates the token before serving the request.

The no form of this command disables the OAuth2.0 authorization in the specified server context.

Default

no oauth2-profile

Parameters

profile-name

specifies the server profile name, up to 32 characters

5.2.1.36.12 nsmf-event-exposure

Syntax

```
[no] nsmf-event-exposure service-instance
```

Context

```
config>mobile>pdn>sba-server-services
```

Description

This command configures a service instance of the Nsmf_EventExposure service. At least one service instance must be configured to allow peering with AMF.

The no form of this command removes the service instance from the configuration.

Parameters

service-name

specifies the service instance name, up to 32 characters

5.2.1.36.13 allowed-nf-types

Syntax

```
[no] allowed-nf-types {pcf | nef | af | amf | udm | dccf | nwdaf}
```

Context

```
config>mobile>pdn>sba-server-services>nsmf-event-exposure
```

Description

This command configures the allowed NF types per NF service instance. The NF types are used in the NFProfile in the registration to the NRF. The configured values are also used for static authorization that allows, or not, serving requests from the indicated NF types.

The no form of this command removes the specified values from the configuration.

Default

no allowed-nf-types

Parameters

pcf

specifies the PCF NF

nef

specifies the NEF NF

af

specifies the AF NF

amf

specifies the AMF NF

udm

specifies the UDM NF

dccf

specifies the DCCF NF

nwdaf

specifies the NWDAF NF

5.2.1.36.14 allowed-plmns

Syntax

```
allowed-plmns list-name  
no allowed-plmns
```

Context

```
config>mobile>pdn>sba-server-services>nsmf-event-exposure
```

Description

This command configures the discovery of the SMF event exposure service based on the PLMN of the NF performing the discovery. If the PLMN list is defined, the SMF event exposure is discoverable only from the PLMNs included in the list. If the PLMN list is not defined, the SMF event exposure is discoverable from any PLMN.

The no form of this command removes the allowed PLMN list from the configuration.

NOTE:

When you configure the nnrf-nfm client under the config>mobile>pdn>sba-service-realm context, this command accepts a PLMN list with a maximum of 32 entries.

Parameters

list-name

specifies the PLMN list name, up to 32 characters

5.2.1.36.15 allowed-slices

Syntax

```
allowed-slices list-name  
no allowed-slices
```

Context

```
config>mobile>pdn>sba-server-services>nsmf-event-exposure
```

Description

This command configures the discovery of the SMF event exposure service based on the S-NSSAI of the NF performing the discovery. If the slice list is defined, the SMF event exposure is discoverable only from the S-NSSAIs included in the list. If slice list is not defined, the SMF event exposure is discoverable from any S-NSSAI.

The no form of this command removes the allowed slice list from the configuration.

Parameters

list-name

specifies the slice list name, up to 32 characters

5.2.1.36.16 default-subscription-timeout

Syntax

```
default-subscription-timeout subscription-timeout
```

```
no default-subscription-timeout
```

Context

```
config>mobile>pdn>sba-server-services>nsmf-event-exposure
```

Description

This command configures the maximum duration of the SMF event exposure subscription.

The no form of this command reverts to the default subscription timeout value.

Parameters

subscription-timeout

specifies the maximum duration of the SMF event exposure subscription, in seconds

Values: 60 to 4294967295

Default: 84600

5.2.1.36.17 fqdn

Syntax

```
fqdn fqdn-sni-string
```

```
no fqdn
```

Context

```
config>mobile>pdn>sba-server-services>nsmf-event-exposure
```

Description

This command configures an FQDN that is used by the Nsmf_EventExposure server service.

The no form of this command removes the FQDN from the configuration.

Parameters

fqdn-sni-string

specifies the FQDN name string, up to 255 characters

5.2.1.36.18 http2-profile

Syntax

```
http2-profile http2-profile-name
```

```
no http2-profile
```

Context

```
config>mobile>pdn>sba-server-services>nsmf-event-exposure
```

Description

This command associates an HTTP/2 profile to the Nsmf_EventExposure server service. The HTTP/2 profile is configured using the config>mobile>profile>http2 command.

The no form of this command removes the HTTP/2 profile from the configuration.

Parameters

http2-profile-name

specifies the name of the HTTP/2 profile, up to 32 characters

5.2.1.36.19 nsmf-profile

Syntax

```
nsmf-profile profile-name
```

```
no nsmf-profile
```

Context

config>mobile>sba-server-services>nsmf-event-exposure

Description

This command adds a link to an SMF profile. Also, the command defines the failure handling policy when the SMF services are used.

The profile configured under an APN defines the failure handling in the nsmf-pdusession service for those PDU sessions which use the corresponding APN/DNN. If no profile is defined under an APN, the failure handling is defined by the SMF profile under the nsmf-pdusession service.

The no form of this command removes the link to the SMF profile.

Parameters

profile-name

specifies a profile name, up to 32 characters

5.2.1.36.20 supported-features

Syntax

supported-features

Context

config>mobile>pdn>sba-server-services>nsmf-event-exposure

Description

This command enables the context to configure the supported features of the service.

5.2.1.36.21 communication-failure

Syntax

[no] communication-failure

Context

config>mobile>pdn>sba-server-services>nsmf-event-exposure>supported-features

Description

This command enables the optional CommunicationFailure feature. The feature must be enabled if the NF consumers of the SMF subscribe to receive notifications about communication failures.

The no form of this command disables the feature.

NOTE:

This command is not supported in the current release.

5.2.1.36.22 ene-na

Syntax

[no] ene-na

Context

config>mobile>pdn>sba-server-services>nsmf-event-exposure>supported-features

Description

This command enables the optional EneNA feature. The feature must be enabled if the NF consumers of the SMF subscribe to receive notifications about RAT changes.

The no form of this command disables the feature.

5.2.1.36.23 pdu-session-status

Syntax

[no] pdu-session-status

Context

config>mobile>pdn>sba-server-services>nsmf-event-exposure>supported-features

Description

This command enables the optional PduSessionStatus feature. The feature must be enabled if the NF consumers of the SMF subscribe to receive notifications about PDU session establishment.

The no form of this command disables the feature.

5.2.1.36.24 qfi-allocation

Syntax

[no] qfi-allocation

Context

config>mobile>pdn>sba-server-services>nsmf-event-exposure>supported-features

Description

This command enables the optional QfiAllocation feature. The feature must be enabled if the NF consumers of the SMF subscribe to receive notifications about QFI allocation.

The no form of this command disables the feature.

NOTE:

This command is not supported in the current release.

5.2.1.36.25 nsmf-pdusession

Syntax

[no] nsmf-pdusession *service-name*

Context

config>mobile>pdn>sba-server-services

Description

This command configures a service instance of the Nsmf_PDUSession service. At least one service instance must be configured to allow peering with AMF.

The no form of this command removes the service instance from the configuration.

Parameters

service-name

specifies the service instance name, up to 32 characters

5.2.1.36.26 allowed-nf-types

Syntax

```
[no] allowed-nf-types {amf | smf}
```

Context

```
config>mobile>pdn>sba-server-services>nsmf-pdusession
```

Description

This command configures the allowed NF types per NF service instance. The NF types are used in the NFProfile in the registration to NRF. The configured values are also used for static authorization that allows or not serving requests from the indicated NF types.

The no form of this command removes the specified values from the configuration.

Default

```
no allowed-nf-domains-list
```

Parameters

amf

specifies the AMF NF

smf

specifies the SMF NF

5.2.1.36.27 allowed-plmns

Syntax

```
allowed-plmns list-name
```

```
no allowed-plmns
```

Context

```
config>mobile>pdn>sba-server-services>nsmf-pdusession
```

Description

This command associates a PLMN list (configured under the config>mobile>profile>list>plmn context) to configure the discovery of the SMF PDU session service based on the PLMN of the NF performing the discovery. If the PLMN list is defined, the SMF PDU session is discoverable only from the

PLMNs included in the list. If the PLMN list is not defined, the SMF PDU session service is discoverable from any PLMN.

The no form of this command removes the association of the PLMN list.

**NOTE:**

When you configure the nnrf-nfm client under the `config>mobile>pdn>sba-service-realm` context, this command accepts a PLMN list with a maximum of 32 entries.

Parameters

list-name

specifies the PLMN list name, up to 32 characters

5.2.1.36.28 fqdn

Syntax

`fqdn fqdn-sni-string`

`no fqdn`

Context

`config>mobile>pdn>sba-server-services>nsmf-pdusession`

Description

This command configures an FQDN which is used by the Nsmf_pdusession server service.

The no form of this command removes the FQDN from the configuration.

Parameters

fqdn-sni-string

specifies the FQDN name string, up to 255 characters

5.2.1.36.29 http2-profile

Syntax

`http2-profile http2-profile-name`

`no http2-profile`

Context

```
config>mobile>pdn>sba-server-services>nsmf-pdusession
```

Description

This command associates an HTTP/2 profile, configured using the `config>mobile>profile>http2` command, to the `Nsmf_pdusession` server service.

The `no` form of this command removes the HTTP/2 profile from the configuration.

Parameters

http2-profile-name

specifies the name of the HTTP/2 profile, up to 32 characters

5.2.1.36.30 indirect-forwarding-timeout

Syntax

```
indirect-forwarding-timeout indirect-forwarding-timeout  
no indirect-forwarding-timeout
```

Context

```
config>mobile>pdn>sba-server-services>nsmf-pdusession
```

Description

This command defines the maximum duration for the indirect data forwarding tunnel during the handovers. The SMF releases the indirect data forwarding tunnel after the timer expires.

The `no` form of this command reverts to the default (disabled).

Default

```
no indirect-forwarding-timeout
```

Parameters

indirect-forwarding-timeout

specifies the maximum duration for the indirect data forwarding tunnel, in milliseconds

Values: 100 to 5000

Default: 2000

5.2.1.36.31 n3-interface-realm

Syntax

```
n3-interface-realm realm-name  
no n3-interface-realm
```

Context

```
config>mobile>pdn>sba-server-services>nsmf-pdusession
```

Description

This command configures the network instance of the N3 reference point.

Parameters

realm-name

specifies the realm name, up to 32 characters

NOTE:

Only the following characters are permitted:

- alphabetic characters (A-Z and a-z)
- digits (0-9)
- hyphen (-)
- dot (.)

5.2.1.36.32 n9-interface-realm

Syntax

```
n9-interface-realm realm-name  
no n9-interface-realm
```

Context

```
config>mobile>pdn>sba-server-services>nsmf-pdusession
```

Description

This command defines the network instance of the N9 reference point.

Parameters

realm-name

specifies the realm name, up to 32 characters

NOTE:

Only the following characters are permitted:

- alphabetic characters (A-Z and a-z)
- digits (0-9)
- hyphen (-)
- dot (.)

5.2.1.36.33 n9-roaming-interface-realm

Syntax

n9-roaming-interface-realm *realm-name*

no n9-roaming-interface-realm

Context

config>mobile>pdn>sba-server-services>nsmf-pdusession

Description

This command defines the network instance of the inter-PLMN N9 reference point.

The no form of this command reverts to the default.

Default

n9-roaming-interface-realm

Parameters

realm-name

specifies the realm name, up to 32 characters

NOTE:

The following characters are permitted:

- alphabetic characters (A-Z and a-z)
- digits (0-9)
- hyphen (-)
- dot (.)

5.2.1.36.34 s5-ref-point

Syntax

```
s5-ref-point sig-ref-point-name  
no s5-ref-point
```

Context

```
config>mobile>pdn>sba-server-services>nsmf-pdusession
```

Description

This command configures the S5 reference point associated with this Nsmf_PDUSession service instance. The configuration is required for EPS interworking to define the S5 reference point used when there is handover from 5GS to EPS.

Parameters

sig-ref-point-name

specifies the reference point name, up to 32 characters

5.2.1.36.35 s8-ref-point

Syntax

```
s8-ref-point sig-ref-point-name  
no s8-ref-point
```

Context

```
config>mobile>pdn>sba-server-services>nsmf-pdusession
```

Description

This command configures the S8 reference point associated with this Nsmf_PDUSession service instance. The configuration is required for EPS interworking to define the S8 reference point used when there is handover from 5GS to EPS with home-routed roaming.

Parameters

sig-ref-point-name

specifies the reference point name, up to 32 characters

5.2.1.36.36 aasn

Syntax

[no] aasn

Context

config>mobile>pdn>sba-server-services>nsmf-pdusession>supported-features

Description

This command enables the optional AASN feature in the SMF PDU session service. The no form of this command disables the AASN feature.

5.2.1.37 SBA service realm PDN command descriptions

5.2.1.37.1 sba-service-realm

Syntax

[no] sba-service-realm *service-realm*

Context

config>mobile>pdn

Description

This command configures an SBA service realm on the SMF and the UPF. The service realm binds the server and client service instances.

The no form of this command removes the specified service realm from the configuration.

Parameters

service-realm

specifies the service realm name, up to 32 characters

5.2.1.37.2 client-service

Syntax

client-service *service-name* service-instance *service-instance* [priority *value*]

no client-service *service-name* service-instance *service-instance*

Context

config>mobile>pdn>sba-service-realm

Description

This command configures a client-side service instance on the SMF or the UPF under the service realm.

The no form of this command removes the specified client-side service instance from the configuration.

Parameters

service-name

specifies the client-side service name

Values: namf-comm | namf-evts | npcf-smpolicycontrol | nudm-sdm | nudm-uecm | nnrf-nfm
| nnrf-disc | nchf-convergedcharging | nsmf-pdusession | nnrf-oauth2 | scp | sepp

service-instance

specifies the service instance, up to 32 characters

value

specifies the priority value for the client service selection

Values: 1 to 10

Default: 1

5.2.1.37.3 server-service

Syntax

[no] server-service *service-name* service-instance *service-instance*

Context

config>mobile>pdn>sba-service-realm

Description

This command configures a server-side service instance on the SMF under the service realm.

The no form of this command removes the specified server-side service instance from the configuration.

Parameters

service-name

specifies the server side service name

Values: nsmf-pdusession | nbsf-management | nsmf-event-exposure

service-instance

specifies the service instance, up to 32 characters

5.2.1.38 Sd PDN command descriptions

5.2.1.38.1 sd

Syntax

sd

Context

config>mobile>pdn

Description

This command enables the context to configure the Sd interface.

5.2.1.38.2 diameter-redirect

Syntax

[no] diameter-redirect

Context

config>mobile>pdn>sd

Description

This command is used to enable base Diameter redirection for this interface. The no form of this command reverts to the default.

Default

no diameter-redirect

5.2.1.38.3 interface

Syntax

interface

Context

config>mobile>pdn>sd

Description

This command enables the context to configure Diameter interface parameters.

NOTE:

This command requires a PDN shutdown.

5.2.1.38.4 diameter

Syntax

diameter [router *router-instance*] *interface-name*

no diameter

Context

config>mobile>pdn>sd>interface

Description

This command configures Diameter interface parameters. It is used to configure the virtual router in which the Diameter connections will be established by this Diameter policy.

The no form of this command removes the parameter from the configuration.

NOTE:

This command requires a PDN shutdown.

Parameters

router-instance

specifies the virtual router name or service id

Values	router-name service-id	
–	router-name	Base
–	service-id	1 to 2147483647

Default: Base

interface-name

specifies the interface name, up to 32 characters and must start with a letter

5.2.1.38.5 multi-homing

Syntax

multi-homing
no multi-homing

Context

config>mobile>pdn>sd>interface

Description

This command enables multi-homing from a local peer. When multi-homing is enabled, a secondary Diameter interface can also be specified.

The no form of this command reverts to the default (disabled).

NOTE:

- Current multi-homing support requires primary and secondary interfaces to be in the same VPRN.
- This command requires a PDN shutdown.

Default

no multi-homing

5.2.1.38.6 diameter

Syntax

diameter [*router router-instance*] *secondary-interface-name*
no diameter

Context

config>mobile>pdn>sd>interface>multi-homing

Description

This command configures the Diameter secondary interface parameters and the virtual router in which the Diameter connections will be established by this Diameter policy.

The no form of this command removes the parameter from the configuration.

NOTE:

- Current multi-homing support requires primary and secondary interfaces to be in the same VPRN.
- This command requires a PDN shutdown.

Parameters

router-instance

specifies the virtual router name or service id

Values	router-name service-id	
–	router-name	Base
–	service-id	1 to 2147483647

Default: Base

secondary-interface-name

specifies the interface name, up to 32 characters and must start with a letter

5.2.1.38.7 peer-group

Syntax

peer-group *peer-group-id* primary-pcrf *profile-name* [secondary-pcrf *profile-name*]

no peer-group *peer-group-id*

Context

config>mobile>pdn>sd

Description

This command configures a list of peer groups of primary and secondary Diameter peers for the Sd interface.

NOTE:

This command requires a PDN shutdown.

Parameters

peer-group-id

specifies the peer group ID

Values: 1 to 10

profile-name

specifies the primary and secondary Diameter peer profile names, up to 32 characters

5.2.1.38.8 retry-count

Syntax

retry-count *value*

no retry-count

Context

config>mobile>pdn>sd

Description

This command configures the number of times the same message is re-tried before declaring a failed attempt.

The no form of this command reverts to the default. A value of 0 also disables retry.

Parameters

value

specifies the number of times the same message is re-tried before declaring a failed attempt

Values: 0 to 8

Default: 3

5.2.1.38.9 sd-profile

Syntax

[no] sd-profile *profile-name*

Context

config>mobile>pdn>sd

Description

This commands configures the Sd profile.

Parameters

profile-name

specifies the profile name for the Sd profile

5.2.1.38.10 transaction-timer

Syntax

transaction-timer *value*

no transaction-timer

Context

config>mobile>pdn>sd

Description

This command sets the maximum amount of time the node waits for a Diameter peer to respond before trying another.

The no form of this command reverts to the default.

Parameters

value

specifies the maximum amount of time, in seconds, the node waits for a Diameter peer to respond before trying another peer

Values: 1 to 180

Default: 5

5.2.1.39 Signaling PDN command descriptions

5.2.1.39.1 signaling

Syntax

signaling

Context

config>mobile>pdn

Description

This command enables the context to configure signaling.

NOTE:

- Reference Point PDN configuration for a specific interface has a higher priority than the signaling PDN configuration; for example, S1-u, S11, S12, S2a, S2b, S4, S5, and so on.
- This command requires a PDN shutdown.

5.2.1.39.2 diameter

Syntax

```
diameter
```

Context

```
config>mobile>pdn>signaling
```

Description

This command enables the context to configure Diameter signaling.

**NOTE:**

This command requires a PDN shutdown.

5.2.1.39.3 mip6-agent-info

Syntax

```
mip6-agent-info {use-fqdn fqdn use-realm realm | use-sig-ip-addr}  
no mip6-agent-info
```

Context

```
config>mobile>pdn>signaling>diameter
```

Description

This command specifies whether the S6b interface uses the FQDN or IP address of the signaling endpoint.

This command is also used to define the pgwFQDN attribute of the NF profile used when SMF registers to the NRF. The SMF pgwFQDN is configured using the `use-fqdn` option and specifying the FQDN value.

The `no` form of this command removes the configuration.

**NOTE:**

This command requires a PDN shutdown.

Parameters

fqdn

specifies the FQDN value

realm

specifies the realm value

use-sig-ip-addr

specifies use of the signaling IP address

5.2.1.39.4 origin-host

Syntax

origin-host *name*

no origin-host

Context

config>mobile>pdn>signaling>diameter

Description

This command specifies the originating host name of a Diameter node. The originating host information is sent in requests to a Diameter peer. The Origin-Host is unique for each redundant pair of ISM-MG cards. The configured Origin-Host is pre-pended with a mscpxx when the Diameter connection is established from the MSCP. (xx = the group-id of the redundant pair).

For example, for a single ISM-MG redundant pair in the chassis, if the configured origin-host is "7750mg.ipd-nok.com", the origin-host sent over the Diameter connection is "mscp01.7750mg.ipd-nok.com"

The no form of this command removes the name from the configuration.

NOTE:

This command requires a PDN shutdown.

Parameters

name

specifies the originating host name, up to 80 characters

5.2.1.39.5 origin-realm

Syntax

```
origin-realm name  
no origin-realm
```

Context

```
config>mobile>pdn>signaling>diameter
```

Description

This command specifies the originating realm or domain name of a Diameter node. The originating realm is included in messages exchanged with a Diameter peer.

The no form of this command removes the name from the configuration.

NOTE:

This command requires a PDN shutdown.

Parameters

name

specifies the originating host name, up to 80 characters

5.2.1.39.6 profile

Syntax

```
profile profile-name  
no profile
```

Context

```
config>mobile>pdn>signaling>diameter
```

Description

This command specifies the Diameter profile name. The Diameter profile provides Diameter connection related information.

The no form of this command reverts to the default.

**NOTE:**

This command requires a PDN shutdown.

Default

no profile

5.2.1.39.7 gtp-c**Syntax**

gtp-c

Context

config>mobile>pdn>signaling

Description

This command specifies the GPRS Tunneling Protocol-Control plane (GTP-C) profile name. The GTP-C profile provides GTP-C signaling related configuration.

**NOTE:**

This command requires a PDN shutdown.

5.2.1.39.8 profile**Syntax**

profile *profile-name*

no profile

Context

config>mobile>pdn>signaling>gtp-c

Description

This command specifies the GTP-C profile name.

The no form of this command removes the profile name from the configuration.

**NOTE:**

This command requires a PDN shutdown.

Default

no profile

Parameters***profile-name***

specifies the GTP-C profile name

5.2.1.39.9 gtp-u**Syntax**

gtp-u

Context

config>mobile>pdn>signaling

Description

This command configures the context to configure GTP-U-related parameters.

GTP-U is a IP-based tunneling protocol that permits many tunnels between each set of end points. When used in the UMTS, each subscriber can have one or more tunnel, one for each PDP context they have active. Separate tunnels are possible for specific connections with different QoS requirements.

The separate tunnels are identified by a Tunnel Endpoint Identifier (TEID) in the GTP-U messages, which is generally a dynamically allocated random number. If the number is encrypted quality then it provides some security against certain attacks. Even so, the requirement of the 3GPP standard is that all GTP traffic, including user data should be sent within secure private networks, not directly connected to the Internet.

**NOTE:**

This command requires a PDN shutdown.

5.2.1.39.10 profile

Syntax

```
profile profile-name  
no profile
```

Context

```
config>mobile>pdn>signaling>gtp-u
```

Description

This command specifies the GTP-U profile name. The GTP-U profile provides GTP-U signaling related configuration.

The no form of this command removes the profile name from the configuration.

NOTE:

This command requires a PDN shutdown.

Parameters

profile-name
specifies the GTP-U profile name

5.2.1.39.11 interface

Syntax

```
interface [router router-instance] interface-name  
no interface
```

Context

```
config>mobile>pdn>signaling
```

Description

This command specifies the virtual router to which the default signaling interface belongs.

The no form of this command removes the router instance or interface name from the configuration.

NOTE:

This command requires a PDN shutdown.

Parameters

router-instance

specifies the router instance

Values	router-name service-id	
–	router-name	Base
–	service-id	1 to 2147483647

Default: Base

interface-name

specifies an existing interface name, up to 32 characters

5.2.1.39.12 mipv4

Syntax

mipv4
no mipv4

Context

config>mobile>pdn>signaling

Description

This command configures to enable/disable SCTP multi-homing for Diameter signaling interfaces.
The no form of this command sets the value to the default.

NOTE:

This command requires a PDN shutdown.

Default

no mipv4

5.2.1.39.13 profile

Syntax

`profile profile-name`

`no profile`

Context

`config>mobile>pdn>signaling>mipv4`

Description

This command specifies the MIPv4 profile name. The profile provides signaling related configuration.

The no form of this command removes the profile name from the configuration.

NOTE:

This command requires a PDN shutdown.

Parameters

profile-name

specifies the MIPv4 profile name

5.2.1.39.14 multi-homing

Syntax

`[no] multi-homing`

Context

`config>mobile>pdn>signaling`

Description

This command configures to enable/disable SCTP multi-homing for Diameter signaling interfaces.

The no form of this command sets the value to default.

NOTE:

- Current multi-homing support requires primary and secondary interfaces to be in the same VPRN.
- This command requires a PDN shutdown.

Default

no multi-homing

5.2.1.39.15 interface

Syntax

interface [router *router-instance*] *interface-name*
no interface

Context

config>mobile>pdn>signaling>multi-homing

Description

This command configures Diameter secondary interface parameters and the virtual router in which the Diameter connections will be established.

The no form of this command removes the parameter from the configuration.

NOTE:

This command requires a PDN shutdown.

Parameters

router-instance

specifies the router instance

Values	router-name service-id		
–	router-name	Base	

– service-id 1 to 2147483647

Default: Base

interface-name

specifies an existing interface name, up to 32 characters and must start with a letter

5.2.1.40 STa PDN command descriptions

5.2.1.40.1 sta

Syntax

sta

Context

config>mobile>pdn

Description

This command enables the context to configure STa.

5.2.1.40.2 diameter-peer-group-list

Syntax

diameter-peer-group-list *group-list-name*

no diameter-peer-group-list

Context

config>mobile>pdn>sta

Description

This command configures the Diameter group to be used for Diameter based EAP Authentication.

NOTE:

- RADIUS or Diameter can be configured for the STa reference point interface, but they cannot be configured at the same time.
- This command requires a PDN shutdown.

Parameters

group-list-name

specifies the name of a Diameter group up to 32 characters maximum

5.2.1.40.3 interface

Syntax

interface

Context

config>mobile>pdn>sta

Description

This command enables the context to configure interface parameters.

NOTE:

This command requires a PDN shutdown.

5.2.1.40.4 diameter

Syntax

diameter [router *router-instance*] *interface-name*

no diameter

Context

config>mobile>pdn>sta>interface

Description

This command configures the interface to be used for STa.

The no form of this command removes the parameter from the configuration.

**NOTE:**

This command requires a PDN shutdown.

Parameters

router-instance

specifies the name of a router instance

Values	router-name service-id	
–	router-name	Base
–	service-id	1 to 2147483647

Default: Base

interface-name

specifies an existing interface name, up to 32 characters

5.2.1.40.5 multi-homing

Syntax

[no] multi-homing

Context

config>mobile>pdn>sta>interface

Description

This command enables and disables multi-homing for the interface. When multi-homing is enabled, a secondary Diameter interface can also be specified.

The no form of this command reverts to the default.

**NOTE:**

- Current multi-homing support requires primary and secondary interfaces to be in the same VPRN.

- This command requires a PDN shutdown.

Default

no multi-homing

5.2.1.40.6 diameter

Syntax

```
diameter [router router-instance] secondary-interface-name  
no diameter
```

Context

```
config>mobile>pdn>sta>interface>multi-homing
```

Description

This command configures Diameter secondary interface parameters and the virtual router in which the Diameter connection will be established by this Diameter policy.

The no form of this command removes the parameter from the configuration.

NOTE:

- Current multi-homing support requires primary and secondary interfaces to be in the same VPRN.
- This command requires a PDN shutdown.

Parameters

router-instance

specifies the virtual router name or service ID

Values	router-name service-id	
–	router-name	Base
–	service-id	1 to 2147483647

Default: Base

secondary-interface-name

specifies an interface name, up to 32 characters maximum

5.2.1.40.7 radius-server-group

Syntax

radius-server-group *radius-group*

no radius-server-group

Context

config>mobile>pdn>sta>

Description

This command configures the RADIUS group to be used for RADIUS based EAP Authentication.

NOTE:

- RADIUS or Diameter can be configured for the STa reference point interface, but they cannot be configured at the same time.
- This command requires a PDN shutdown.

Parameters

radius-group

specifies the name of a RADIUS group, up to 32 characters maximum

5.2.1.40.8 retry-count

Syntax

retry-count *value*

no retry-count

Context

config>mobile>pdn>sta>

Description

This is the number of times the system will retry to send an STa message before declaring a failed attempt.

The no form of this command reverts to the default.

Parameters

value

specifies the number of retries

Values: 0 to 8

Default: 3

5.2.1.40.9 sta-profile

Syntax

```
sta-profile profile-name
```

```
no sta-profile
```

Context

```
config>mobile>pdn>sta
```

Description

This command specifies an STa profile name to associate with the gateway.

The no form of this command removes the profile name from the configuration.

Parameters

profile-name

specifies an STa profile name, up to 32 characters maximum

5.2.1.40.10 transaction-timer

Syntax

```
transaction-timer value
```

```
no transaction-timer
```

Context

config>mobile>pdn>sta

Description

This command sets the maximum amount of time in seconds that the node waits for the STa peer to respond to an STa message.

The no form of this command reverts to the default.

Parameters

value

time in seconds

Values: 1 to 180

Default: 5

5.2.1.41 SWm PDN command descriptions

5.2.1.41.1 swm

Syntax

swm

Context

config>mobile>pdn

Description

This command enables the context to configure SWm parameters.

5.2.1.41.2 aar-call-flow

Syntax

[no] aar-call-flow

Context

config>mobile>pdn>swm

Description

This command enables support of the ePDG-initiated AAR Diameter message toward AAA/DRA.

The no form of this command disables support of the ePDG-initiated AAR Diameter message toward AAA/DRA.

The ePDG can initiate an AAR message if the ePDG detects a change of the outer IP address in the UE (MOBIKE), to update the new UE IP address toward the AAA and also to retrieve the latest WLAN location information (when applicable).

Default

no aar-call-flow

5.2.1.41.3 activate-aaa-failure-indication

Syntax

```
activate-aaa-failure-indication {enable | disable}
```

```
no activate-aaa-failure-indication
```

Context

```
config>mobile>pdn>swm
```

Description

This command enables or disables the AAA failure indication feature.

When this command is enabled, the AAA-Failure-Indication AVP specified by the SWm profile command `swm-avp-options` is automatically set to the Include value.

When this command is disabled, the AAA-Failure-Indication AVP specified by the SWm profile command `swm-avp-options` is automatically set to the Exclude value.

The no form of this command disables the functionality and sets the AAA-Failure-Indication AVP specified by the SWm profile command `swm-avp-options` to the Exclude value.

Default

no activate-aaa-failure-indication

Parameters

enable

the AAA-Failure-Indication AVP specified by the SWm profile command `swm-avp-options` is automatically set to the Include value

disable

the AAA-Failure-Indication AVP specified by the SWm profile command `swm-avp-options` is automatically set to the Exclude value

5.2.1.41.4 alt-peer-rar-asr

Syntax

[no] `alt-peer-rar-asr`

Context

`config>mobile>pdn>swm`

Description

This command enables the gateway to accept RAR and/or ASR messages from an alternate peer (other than the primary and the secondary). When enabled, an RAA message or an ASA message, will be sent back to the peer that initiated the RAR or the ASR respectively. The IP-CAN session will continue to use the primary and the secondary for the SWm session (for example, any STR or AAR for the session will be sent to the destination peer from which the last DEA was received).

The no form of this command reverts to the default.

Default

`no alt-peer-rar-asr`

5.2.1.41.5 dia-routing-table

Syntax

`dia-routing-table` *idi-realm-id* *idi-realm-string* `diameter-peer-group-list` *list-name*
`no dia-routing-table` *idi-realm-id*

Context

`config>mobile>pdn>swm`

Description

This command configures the correlation of specific IDi realms with destination Diameter servers.

**NOTE:**

The AAA servers assigned under `diameter-peer-group-list` follow the same rules for Destination-Realm AVP creation as those described for the AAA Destination-Realm AVP CLI.

Default

`no dia-routing-table`

Parameters***idi-realm-id***

specifies the index number

Values: 1 to 512

idi-realm-string

specifies the IDi realm, up to 255 characters

list-name

specifies an existing Diameter peer group list, up to 32 characters

5.2.1.41.6 swm-error-mapping-profile

Syntax

`swm-error-mapping-profile profile-name`

`no swm-error-mapping-profile`

Context

`config>mobile>pdn`

Description

This command creates an SWm error mapping profile.

Parameters***profile-name***

specifies a profile name, up to 32 characters

5.2.1.41.7 interface

Syntax

```
swm
```

Context

```
config>mobile>pdn>swm
```

Description

This command enables the context to configure SWm interface parameters.

**NOTE:**

This command requires a PDN shutdown.

5.2.1.41.8 diameter

Syntax

```
diameter [router router-instance] interface-name
```

```
no diameter
```

Context

```
config>mobile>pdn>swm>interface
```

```
config>mobile>pdn>swm>interface>multi-homing
```

Description

This command configures the Diameter interface for the SWm interface or the secondary Diameter interface for multi-homing and the virtual router in which the Diameter connections will be established by this Diameter policy.

**NOTE:**

- Current multi-homing support requires primary and secondary interfaces to be in the same VPRN.
- This command requires a PDN shutdown.

Parameters

router-instance
specifies the router instance

Values	router-name service-id	
–	router-name	Base
–	service-id	1 to 2147483647

Default: Base

interface-name
specifies an existing interface name, up to 32 characters and must start with a letter

5.2.1.41.9 multi-homing

Syntax

[no] multi-homing

Context

config>mobile>pdn>swm>interface

Description

This command enables multi-homing for the interface. When multi-homing is enabled, a secondary Diameter interface can also be specified.

The no form of this command reverts to the default (disabled).

NOTE:

- Current multi-homing support requires primary and secondary interfaces to be in the same VPRN.
- This command requires a PDN shutdown.

Default

no multi-homing

5.2.1.41.10 diameter

Syntax

```
diameter [router router-instance] secondary-interface-name  
no diameter
```

Context

```
config>mobile>pdn>swm>interface>multi-homing
```

Description

This command configures the Diameter secondary interface parameters and the virtual router in which the Diameter connections will be established by this Diameter policy.

The no form of this command removes the parameter from the configuration.

NOTE:

- Current multi-homing support requires primary and secondary interfaces to be in the same VPRN.
- This command requires a PDN shutdown.

Parameters

router-instance

specifies the virtual router name or service id

Values	router-name service-id	
–	router-name	Base
–	service-id	1 to 2147483647

Default: Base

secondary-interface-name

specifies the interface name, up to 32 characters and must start with a letter

5.2.1.41.11 peer-group

Syntax

```
peer-group group-id primary-diameter-peer profile-name [secondary-diameter-peer  
profile-name] [priority priority-value]
```

```
no peer-group group-id
```

Context

```
config>mobile>pdn>swm
```

Description

This command specifies the list of Diameter peer groups to create a set of primary and secondary peers for the SWm reference point for the ePDG. A peer-group may be a pair of AAA servers which are specified in primary and secondary order, so the primary server is normally used and the secondary server is used in case the primary fails. The peer group specified for the SWm reference point is limited to a primary Diameter peer profile and secondary Diameter peer profile, which in turn each refer to a single AAA server. For information about Diameter peer profiles, see [Sig Rate Limit Profile Command Hierarchy](#).

To provide load sharing amongst multiple servers, the operator can configure multiple peer groups. If multiple peer groups are specified, the system will use round-robin selection to choose a peer group for each new SWm session.

Each peer group can also be associated with a priority, to enable the ePDG to choose servers from a higher-priority peer group first and failover to peer groups with a lower priority.

NOTE:

This command requires a PDN shutdown.

Parameters

group-id

specifies the ID of the peer group

Values: 1 to 10

profile-name

specifies the name of an existing primary Diameter peer profile, up to 32 characters

For information about Diameter peer profiles, see [Sig Rate Limit Profile Command Hierarchy](#).

secondary-diameter-peer *profile-name*

specifies the name of an exiting secondary Diameter peer profile, up to 32 characters

priority-value

specifies the priority for the peer group

The ePDG will choose servers from a higher-priority peer group first and will failover to peer groups with a lower priority.

Values: 1 to 10 (highest is 1, lowest is 10)

Default: 10

5.2.1.41.12 **retry-count**

Syntax

`retry-count count`

`no retry-count`

Context

`config>mobile>pdn>swm`

Description

This command specifies the number of times the system will retry to send an SWm message before declaring a failed attempt.

Parameters

count

specifies the number of attempt, as an integer

Values: 0 to 8

Default: 3

5.2.1.41.13 **swm-profile**

Syntax

`swm-profile swm-profile-name`

`no swm-profile`

Context

`config>mobile>pdn>swm`

Description

This command specifies an SWm profile name to associate with the gateway.

The no form of this command removes the profile name from the configuration.

Default

no swm-profile

Parameters

swm-profile-name

specifies the profile name, up to 32 characters

5.2.1.41.14 transaction timer

Syntax

transaction-timer *value*

no transaction-timer

Context

config>mobile>pdn>swm

Description

This command sets maximum amount of time the node waits for the SWm peer to respond to an SWm message before reattempting the transaction. The value is expressed in seconds.

The no form of this command removes the configuration.

Parameters

value

specifies the maximum amount of time, in seconds, the node waits for a peer to respond before trying another peer

Values: 1 to 180 (increments in 1 s)

Default: 5

5.2.1.41.15 swm-error-mapping-profile

Syntax

```
swm-error-mapping-profile profile-name  
no swm-error-mapping-profile
```

Context

```
config>mobile>pdn
```

Description

This command creates an SWm error mapping profile.

Parameters

profile-name

specifies a profile name, up to 32 characters

5.2.1.42 SWu PDN command descriptions

5.2.1.42.1 swu

Syntax

```
swu [sig-ref-point-name]
```

Context

```
config>mobile>pdn
```

Description

This command enables the context to configure SWu interface parameters.

The system supports up to 16 SWu interfaces.

NOTE:

This command requires a PDN shutdown.

Parameters

sig-ref-point-name
specifies the name to be associated with this reference point, up to 32 characters

5.2.1.42.2 interface

Syntax

```
interface [router router-instance] interface-name  
no interface
```

Context

```
config>mobile>pdn>swu
```

Description

This command configures the interface to be used with the SWu reference point.

NOTE:

This command requires a PDN shutdown.

Parameters

router-instance
specifies the router instance

Values	router-name service-id	
–	router-name	Base
–	service-id	1 to 2147483647

Default: Base

interface-name
specifies an existing interface name, up to 32 characters

5.2.1.42.3 ipsec-profile

Syntax

```
[no] ipsec-profile profile-name
```

Context

```
config>mobile>pdn>swu
```

Description

This command sets the ipsec-profile to be used for this reference point.

NOTE:

This command requires a PDN shutdown.

Parameters

profile-name

specifies the name of the profile, up to 32 characters

5.2.1.42.4 swu-ipsec-lockout

Syntax

```
swu-ipsec-lockout
```

Context

```
config>mobile>pdn
```

Description

This command enables the context to configure IPsec authentication lockout functionality for the ePDG.

5.2.1.42.5 backoff-timer

Syntax

```
backoff-timer [timer-value timer-value] [timer-unit timer-unit]
```

```
no backoff-timer
```

Context

config>mobile>pdn>swu-ipsec-lockout

Description

This command specifies the value for the backoff timer that the ePDG can send to the UE along with the IKE error code.

The no form of this command deactivates the backoff timer from the IPsec client lockout functionality.

Default

no backoff-timer

Parameter

timer-value

specifies the value of the backoff timer

Values: 0 to 31

Default: 5

timer-unit

specifies the unit of the timer value unit

Values	deact	specifies that the timer is deactivated
–	2-s	specifies that the timer is incremented in multiples of 2 seconds
–	30-s	specifies that the timer is incremented in multiples of 30 seconds
–	1-min	specifies that the timer is incremented in multiples of 1 minute
–	10-min	specifies that the timer is incremented in multiples of 10 minutes
–	1-h	specifies that the timer is incremented in multiples of 1 hour

–	10-h	specifies that the timer is incremented in multiples of 10 hours
–	320-h	specifies that the timer is incremented in multiples of 320 hours

Default: 1-min

NOTE:

- A value of 0 indicates that the UE may retry the authentication procedure to an ePDG from the same PLMN.
- A value of deactivated indicates that the UE should not retry the authentication procedure to the same ePDG until it is switched off or the UICC containing the USIM is removed.

5.2.1.42.6 configuration

Syntax

```
configuration count count time time lockout lockout-time
no configuration
```

Context

```
config>mobile>pdn>swu-ipsec-lockout
```

Description

This command specifies the number of permitted authentication attempts, the authentication time period, and the lockout time period to be applied when the IPsec lockout functionality is enabled for the ePDG.

The no form of this command reverts to the default.

Default

no configuration

Parameters

count

mandatory parameter that specifies the maximum number of failed authentication attempts that are permitted for the specified authentication time period

Values: 1 to 64

Default: 3

time

mandatory parameter that specifies the period of time in minutes, during which the number of failed authentication attempts (specified by count) can be made before the user is locked-out

Values: 1 to 60

Default: 5

lockout-time

mandatory parameter that specifies the period of time in minutes, that the user will be locked-out from further authentication attempts

Values: 1 to 1440

Default: 10

5.2.1.42.7 function

Syntax

```
function {enable /disable}
```

```
no function
```

Context

```
config>mobile>pdn>swu-ipsec-lockout
```

Description

This command enables and disables the configured IPsec lockout functionality for the ePDG.

The no form of this command reverts to the default.

Default

no function

Parameters

enable

enables the IPsec lockout functionality for the ePDG

disable

disables the IPsec lockout functionality for the ePDG

Default: disable

5.2.1.42.8 swu-throttling

Syntax

```
swu-throttling [level{best-effort | minimal | medium | aggressive}]  
no swu-throttling
```

Context

```
config>mobile>pdn
```

Description

This command allows for the activation/deactivation of `swu-throttling` and the configuration of the throttling level functionality on the ePDG.

Parameters

level

allows for the configuration of the throttling level once `swu-throttling` is enabled

Values	best-effort	allows the IKE to drop IKE messages from the queue when there is 100% IKE Load and there is a delay of > 1500ms Best-effort only drops IKE messages from the queue
—		—
—	minimal	allows IKE tasks to stay under a heavy load for a longer period before entering a higher congestion level and thus allows higher latency for unprocessed messages
—	medium	allows IKE tasks to compromise between the IKE load and the latency monitored in the system

–	aggressive	allows the IKE to progress to a higher congestion level even before reaching 0% IKE idle time and tries to minimize unprocessed message latency to the lowest amount possible
---	------------	---

Default: best effort

5.2.1.43 SWw PDN command descriptions

5.2.1.43.1 sww

Syntax

[no] sww [*ref-point-name*]

Context

config>mobile>pdn

Description

This command configures SWw interface parameters. The sig-ref-point-name is used to configure multiple SWw interfaces for the TWAG.

The system will support up to 16 SWw interfaces.

NOTE:

This command requires a PDN shutdown.

Parameters

ref-point-name

specifies a name to associate with this reference point

5.2.1.43.2 interface

Syntax

interface

Context

```
config>mobile>pdn>sww
```

Description

This command enables the context to configure SWw interface parameters.

NOTE:

This command requires a PDN shutdown.

5.2.1.43.3 sww-acct

Syntax

```
sww-acct [router router-instance] interface-name port port secret secret [hash | hash2]  
no sww-acct
```

Context

```
config>mobile>pdn>sww>interface
```

Description

This command configures the interface to be used for SWw RADIUS accounting signaling toward the WLAN APs.

NOTE:

This command requires a PDN shutdown.

Parameters

router-instance

specifies the name of a router instance

Values	router-name service-id	
–	router-name	Base

– service-id 1 to 2147483647

Default: base

interface-name

specifies an existing interface name that must start with a letter, up to 32 characters

port

specifies the UDP port

Values: 1 to 65535

secret

specifies the shared secret key to be used with the WLAN AP

hash | hash2

specifies if the key is entered in an encrypted form

If the hash parameter is not used, the key is assumed to be in a non-encrypted, clear text form. For security, all keys are stored in an encrypted format.

5.2.1.43.4 sww-auth

Syntax

```
sww-auth [router router-instance] interface-name port port secret secret [hash | hash2]
```

```
no sww-auth
```

Context

```
config>mobile>pdn>sww>interface
```

Description

This command configures the interface to be used for SWw RADIUS authentication signaling toward the WLAN APs.

NOTE:

This command requires a PDN shutdown.

Parameters

router-instance

specifies the name of a router instance

Values	router-name service-id	
–	router-name	Base
–	service-id	1 to 2147483647

Default: base

interface-name

specifies an existing interface name that must start with a letter, up to 32 characters

port

specifies the UDP port

Values: 1 to 65535

secret

specifies the shared secret key to be used with the WLAN AP

hash | hash2

specifies if the key is entered in an encrypted form

If the hash parameter is not used, the key is assumed to be in a non-encrypted, clear text form. For security, all keys are stored in an encrypted format.

5.2.1.43.5 sww-coa

Syntax

```
sww-coa [router router-instance] interface-name port port secret secret [hash | hash2]  
no sww-coa
```

Context

```
config>mobile>pdn>sww>interface
```

Description

This command configures RADIUS CoA to be accepted when portal-based authentication (open SSID) is associated with the configured SWw reference point.

NOTE:

This command requires a PDN shutdown.

Parameters

router-instance

specifies the name of a router-instance

Values	router-name service-id	
–	router-name	Base
–	service-id	1 to 2147483647

Default: base

interface-name

specifies an existing interface name that must start with a letter, up to 32 characters

port

specifies the UDP port

Values: 1 to 65535

secret

specifies the shared secret key to be used with the RADIUS CoA server

hash | hash2

specifies if the key is entered in an encrypted form. If the hash parameter is not used, the key is assumed to be in a non-encrypted, clear text form. For security, all keys are stored in an encrypted format.

5.2.1.43.6 sww-rad-disconnect

Syntax

```
sww-rad-disconnect secret secret [hash | hash2]
no sww-rad-disconnect
```

Context

```
config>mobile>pdn>sww>interface
```

Description

This command specifies if the RADIUS disconnect will be sent to WiFi WLAN APs / WLCs, when a UE is disconnected on TWAG.

NOTE:

This command requires a PDN shutdown.

Default

```
no sww-rad-disconnect
```

Parameters

secret

specifies the shared secret key to be used with the WLAN AP

hash | hash2

specifies if the key is entered in an encrypted form

If the hash parameter is not used, the key is assumed to be in a non-encrypted, clear text form. For security, all keys are stored in an encrypted format.

5.2.1.43.7 sww-tunnel

Syntax

```
sww-tunnel [router router-instance] interface-name [connect-method connect-method]
```

```
no sww-tunnel
```

Context

```
config>mobile>pdn>sww>interface
```

Description

This command configures the SWw tunnel interface.

NOTE:

This command requires a PDN shutdown.

Parameters

router-instance

specifies the name of a router-instance

Values	router-name service-id	
–	router-name	Base
–	service-id	1 to 2147483647

Default: base

interface-name

specifies an existing interface name that must start with a letter, up to 32 characters

connect-method

specifies the connection method used on the SWw interface

Values	gre-tunnel	specifies that each AP/WLC is connected over a L2overGRE tunnel (soft GRE)
–	l2-access	specifies that each AP/WLC is directly connected on an L2 aggregated network

Default: gre-tunnel

NOTE:

- The L2-access requires one-to-one mapping between VPRN and the SWw reference point. For the L2-access method only one SWw reference point is allowed to be configured to the VPRN that holds the physical interface configuration under context config>service>vprn>interface toward the WLAN APs/L2 switch.
- For L2-access, the VLAN ID must be unique across all the physical ports/ interfaces configured under context config>service>vprn>interface

toward the WLAN APs/WLCs. For the L2-access method, each configured physical interface configured under context config>service>vprn must use different VLAN IDs.

- This command requires a PDN shutdown.

5.2.1.43.8 signaling

Syntax

signaling

Context

config>mobile>pdn>sww

Description

This command enables the context to configure signaling interface parameters.

NOTE:

This command requires a PDN shutdown.

5.2.1.43.9 sww-radius-profile

Syntax

sww-radius-profile *profile-name*

no sww-radius-profile

Context

config>mobile>pdn>sww>signaling

Description

This command specifies the SWw RADIUS profile tied to this SWw reference point name. The no form of this command removes the profile name from the configuration.

NOTE:

This command requires a PDN shutdown.

Default

no sww-radius-profile

Parameters

profile-name

specifies a profile name, up to 32 characters

5.2.1.43.10 sww-tunnel-profile

Syntax

sww-tunnel-profile *profile-name*

no sww-tunnel-profile

Context

config>mobile>pdn>sww>signaling

Description

This command specifies the SWW tunnel profile tied to this SWw reference point name. The no form of this command removes the profile name from the configuration.

NOTE:

This command requires a PDN shutdown.

Default

no sww-tunnel-profile

Parameters

profile-name

specifies a profile name, up to 32 characters

5.2.1.44 Sx-N4 PDN command descriptions

5.2.1.44.1 sx-n4

Syntax

[no] sx-n4 [*ref-point-name*]

Context

config>mobile>pdn

Description

This command enables the context to configure the Sx/N4 interface parameters.

NOTE:

This command requires a PDN shutdown.

Parameters

ref-point-name

specifies a name to associate with this reference point, up to 32 characters

5.2.1.44.2 enforced-pfcp-association-list

Syntax

[no] enforced-pfcp-association-list

Context

config>mobile>pdn>sx-n4

Description

This command enables the PFCP to accept only PFCP association setup from a peer that is configured in the PFCP association list (using the *pfcp-association-list* command).

The no form of this command reverts to the default, which accepts and dynamically adds PFCP association requests from a peer that is not configured in the PFCP association list.

Default

no enforced-pfcp-association-list

5.2.1.44.3 interface

Syntax

```
interface
```

Context

```
config>mobile>pdn>sx-n4
```

Description

This command enables the context to configure GTP-U and Packet Forwarding Control Protocol (PFCP) parameters for the Sx/N4 interface.

**NOTE:**

This command requires a PDN shutdown.

5.2.1.44.4 gtp-u

Syntax

```
gtp-u [router router-instance] interface-name [interface-realm realm-name]
```

```
no gtp-u
```

Context

```
config>mobile>pdn>sx-n4>if
```

Description

This command configures the GTP-U profile parameters for the PFCP (Sx/N4) interface.

The no form of this command removes the parameters from the configuration.

**NOTE:**

This command requires a PDN shutdown.

Parameters

router-instance

specifies the router instance, up to 32 characters

interface-name

specifies an interface name, up to 32 characters

realm-name

specifies the associated realm name of the network instance that has the PFCP GTP-U interface on the UP function, and is communicated in the Network-Instance IE part of the PFCP Session Establishment/Modification process

NOTE:

Only the following characters are permitted:

- alphabetic characters (A-Z and a-z)
- digits (0-9)
- hyphen (-)
- dot (.)

5.2.1.44.5 pfcf

Syntax

`pfcf [router router-instance] interface-name`

`no pfcf`

Context

`config>mobile>pdn>sx-n4>if`

Description

This command configures the Packet Forwarding Control Plane (PFCP) profile parameters for the Sx/N4 interface.

The no form of this command removes the parameter from the configuration.

NOTE:

This command requires a PDN shutdown.

Parameters

router-instance

specifies the router instance, up to 32 characters

interface-name

specifies an interface name, up to 32 characters

5.2.1.44.6 pfcf-association-list

Syntax

pfcf-association-list *list-name*

no pfcf-association-list

Context

config>mobile>pdn>sx-n4

Description

This command links the PFCF association peer list to the PDN (configured as CP or UP function using the mobile>config>pdn>instance-type command).

If the gateway is configured as a CP function, the command links the PFCF association peer list of the UP function peers that are to be associated with this Sx/N4 interface.

If the gateway is configured as a UP function, the command links the PFCF association peer list of the CP function peers that are to be associated with this Sx/N4 interface.

NOTE:

- If sessions exist on any peers in the specified PFCF association peer list, you must shutdown the PDN before removing or replacing the list.
- You can modify an existing PFCF association peer list on the fly (without a shutdown), to add or remove peers that do not have any sessions.

Parameters

list-name

specifies the name of the PFCF association peer list defined in the config>mobile>profile>pfcf context, up to 32 characters

5.2.1.44.7 signaling

Syntax

signaling

Context

config>mobile>pdn>sx-n4

Description

This command enables the context to configure the signaling parameters of the Sx/N4 interface.

**NOTE:**

This command requires a PDN shutdown.

5.2.1.44.8 pfcp

Syntax

pfcp

Context

config>mobile>pdn>sx-n4>signaling

Description

This command enables the context to configure PFCP signaling parameters.

**NOTE:**

This command requires a PDN shutdown.

5.2.1.44.9 profile

Syntax

profile *profile-name*

no profile

Context

```
config>mobile>pdn>sx-n4>signaling>pfcf
```

Description

This command configures the PFCF profile for use in the Sx/N4 interface.

The no form of this command removes the association.

NOTE:

This command requires a PDN shutdown.

Default

no profile

Parameters

profile-name

specifies a policy base profile name, up to 32 characters

5.2.1.45 T6c PDN command descriptions

5.2.1.45.1 t6c

Syntax

```
[no] t6c [ref-point-name]
```

Context

```
config>mobile>pdn
```

Description

This command enables the context to configure the T6c interface, which is the reference point between the PGW (PCEF) and the SCEF.

The no form of this command removes the reference point.

NOTE:

This command requires a PDN shutdown.

Parameters

ref-point-name

specifies a reference point name, up to 32 characters

5.2.1.45.2 http-port

Syntax

`http-port port-number`

`no http-port`

Context

`config>mobile>pdn>t6c`

Description

This command configures the HTTP port number for incoming requests.

NOTE:

This command requires a PDN shutdown.

Parameters

port-number

specifies the port number

Values: 80 | 8080

Default: 80

5.2.1.45.3 interface

Syntax

`interface interface-name [router router-instance]`

`no interface`

Context

`config>mobile>pdn>t6c`

Description

This command configures the virtual router in which the HTTP connections are accepted by this T6c reference point.

NOTE:

This command requires a PDN shutdown.

Parameters

interface-name

specifies an interface name that must start with a letter, up to 32 characters

router-instance

specifies the virtual router name or the service ID

Values	router-name service-id	
–	router-name	Base
–	service-id	1 to 2147483647

Default: Base

5.2.1.45.4 t6c-profile

Syntax

t6c-profile *profile-name*
no t6c-profile

Context

config>mobile>pdn>t6c

Description

This command associates the T6c profile (created in the config>mobile>profile>t6c context) with the T6c interface.

**NOTE:**

This command requires a PDN shutdown.

Parameters

profile-name

specifies the profile name, up to 32 characters

5.2.1.45.5 uri

Syntax

`uri uri-name`

`no uri`

Context

`config>mobile>pdn>t6c`

Description

This command configures the URI for the T6c reference point.

**NOTE:**

This command requires a PDN shutdown.

Parameters

uri-name

specifies the http://hostname/path (URI), up to 180 characters; the http://hostname is optional

Default: `http://localhost/epcpcc/QoS/v1/queryPCRF`

5.2.1.46 Threshold PDN command descriptions

5.2.1.46.1 thresholds

Syntax

thresholds

Context

config>mobile>pdn

Description

This command enables the context to configure monitoring thresholds.

5.2.1.46.2 bearer-cf-failure

Syntax

[no] bearer-cf-failure

Context

config>mobile>pdn>thresholds

Description

This command configures thresholds for bearer call flow failure.

5.2.1.46.3 bearer-cf-success

Syntax

[no] bearer-cf-success

Context

config>mobile>pdn>thresholds

Description

This command configures thresholds for bearer call flow successes.

5.2.1.46.4 bearer-mgmt-limit

Syntax

```
[no] bearer-mgmt-limit
```

Context

```
config>mobile>pdn>thresholds
```

Description

The command is used to configure the objects under the bearer-mgmt-limit for the complete gateway instance.

The high and low threshold values are absolute and configured in the group are checked during the end of each polling-interval. If the measured object thresholds are crossed then trap/alarm is raised at the end of the polling interval.

5.2.1.46.5 bearer-traffic

Syntax

```
[no] bearer-traffic
```

Context

```
config>mobile>pdn>thresholds
```

Description

This command configures thresholds for the bearer traffic.

The no form of this command disables the bearer traffic.

5.2.1.46.6 dl-buff-utilization-threshold

Syntax

```
dl-buff-utilization-threshold threshold  
no dl-buff-utilization-threshold
```

Context

```
config>mobile>pdn>thresholds
```

Description

This command configures the threshold for the downlink buffer utilization alarm. The `tmnxMobGwDlBufUtilAlarm` alarm is raised when the downlink buffer utilization (packets or memory) grows beyond the configured threshold value. The alarm is cleared when the downlink buffer utilization (packets or memory) falls below the configured threshold value.

The threshold can be changed on the fly, which may result in a notification generated for clearing or raising of the alarm.

The no form of this command reverts to the default. It disables downlink buffer utilization monitoring.

Default

no dl-buff-utilization-threshold

Parameters

threshold

specifies the threshold value, as a percentage

Values: 1 to 100

5.2.1.46.7 path-mgmt

Syntax

[no] path-mgmt

Context

config>mobile>pdn>thresholds

Description

This command configures thresholds for path management

The no form of this command disables path management.

5.2.1.46.8 pdn-connections

Syntax

[no] pdn-connections

Context

config>mobile>pdn>thresholds

Description

This command configures the threshold for the sum of all PDN connections from all the APNs with max-pdn-connection and/or min-pdn-connections admission control configured on the system.

The no form of this command disables connection limits.

5.2.1.46.9 counter

Syntax

counter *counter-name* high-threshold *high-threshold* [low-threshold *low-threshold*]

no counter *counter-name*

Context

config>mobile>pdn>threshold>bearer-cf-failure

Description

This command configures the high and low thresholds for each object.

The no form of this command removes the objects from the thresholds configuration.

Parameters

counter-name

specifies keywords for bearer call flow failure objects

Values: sgw-attach | attach | sgw-ded-br | ded-br | inter-sgw-rel | idle-user-paging | intra-inter-sgw-rel | srv-req

high-threshold

specifies the high threshold value

Values: 1 to 100%. Depending on the counter, the threshold value may be an absolute value or a percentage rate.

low-threshold

specifies the low threshold value

Values: 1 to 100%. Depending on the counter, the threshold value may be an absolute value or a percentage rate.

5.2.1.46.10 counter

Syntax

```
counter counter-name high-threshold high-threshold [low-threshold low-threshold]  
no counter counter-name
```

Context

```
config>mobile>pdn>threshold>bearer-cf-success
```

Description

This command configures the high and low thresholds for each object.

The no form of this command removes the objects from the thresholds configuration.

Parameters

counter-name

specifies keywords for bearer call flow success objects

Values: sgw-attach | attach | sgw-ded-br | ded-br | inter-sgw-rel | srv-req | intra-sgw-rel |
sgw-inter-sgw-rel | inter-sgw-idle-rel

high-threshold

specifies the high threshold value

Values: Depending on the counter, the threshold value may be an absolute value or a percentage rate.

low-threshold

specifies the low threshold value

Values: Depending on the counter, the threshold value may be an absolute value or a percentage rate.

5.2.1.46.11 counter

Syntax

```
counter counter-name high-threshold high-threshold [low-threshold low-threshold]  
no counter counter-name
```

Context

```
config>mobile>pdn>threshold>bearer-mgmt-limit
```

Description

This command configures the high and low thresholds for each object.

The no form of this command removes the objects from the thresholds configuration.

Parameters

counter-name

specifies keywords for bearer management limit objects

Values: sgw-br | br | sgw-def-br | def-br | sgw-ded-br | ded-br | ue | act-br | ue-paged

high-threshold

specifies the high threshold value

Values: Depending on the counter, the threshold value may be an absolute value or a percentage rate.

low-threshold

specifies the low threshold value

Values: Depending on the counter, the threshold value may be an absolute value or a percentage rate.

5.2.1.46.12 counter

Syntax

```
counter counter-name high-threshold high-threshold [low-threshold low-threshold]
```

```
no counter counter-name
```

Context

```
config>mobile>pdn>threshold>bearer-traffic
```

Description

This command configures the high and low thresholds for each object.

The no form of this command removes the objects from the thresholds configuration.

Parameters

counter-name

specifies keywords for bearer traffic objects

Values: uplink | downlink | s5-to-sgi | sgi-to-s5 | s8-to-sgi | sgi-to-s8 | gn-to-sgi | sgi-to-gn | gp-to-sgi | sgi-to-gp | s2b-to-sgi | sgi-to-s2b | s2a-to-sgi | sgi-to-s2a | s1u-to-sgi | sgi-to-s1u | s1u-to-s5 | s5-to-s1u | s1u-to-s8 | s8-to-s1u

high-threshold

specifies the high threshold value, delta Mbytes

Values: 1 to 20000000

Depending on the counter, the threshold value may be an absolute value or a percentage rate.

low-threshold

specifies the low threshold value, delta Mbytes

Values: 1 to 20000000

Depending on the counter, the threshold value may be an absolute value or a percentage rate.

5.2.1.46.13 counter

Syntax

```
counter counter-name high-threshold high-threshold [low-threshold low-threshold]
no counter counter-name
```

Context

```
config>mobile>pdn>threshold>path-mgmt
```

Description

This command configures the high and low thresholds for each object.

The no form of this command removes the objects from the thresholds configuration.

Parameters

counter-name

specifies keywords for bearer path management objects

Values: 5-path-fails5-restart | s5-noresp | s5-peers | s8-peers | gx-path-fail | rf-path-fail | s11-path-fail | s11-restart | s11-noresp | s11-peers | s1-u-peers

high-threshold

specifies the high threshold value

Values: Depending on the counter, the threshold value may be an absolute value or a percentage rate.

low-threshold

specifies the low threshold value

Values: Depending on the counter, the threshold value may be an absolute value or a percentage rate.

5.2.1.46.14 counter**Syntax**

```
counter counter-name high-threshold threshold [low-threshold threshold]
```

```
no counter counter-name
```

Context

```
config>mobile>pdn>threshold>pdn-connections
```

Description

This command configures the high and low thresholds of the max-pdn-connections and min-pdn-connections commands.

The no form of this command removes the objects from the thresholds configuration.

Parameters***counter-name***

specifies keywords for PDN connection limits objects

Values: max-pdn-connections | min-pdn-connections | serving-maxpdn-connections | serving-min-pdn-connections

high-threshold

specifies the high threshold value, in percentage rate

Values: 1 to 20000000

The threshold value is a percentage rate.

low-threshold

specifies the low threshold value, in percentage rate

Values: 1 to 20000000

The threshold value is a percentage rate.

5.2.1.46.15 interval

Syntax

`interval minutes`

Context

`config>mobile>pdn>threshold>bearer-cf-failure`
`config>mobile>pdn>threshold>bearer-cf-success`
`config>mobile>pdn>threshold>bearer-mgmt-limit`
`config>mobile>pdn>threshold>bearer-traffic`
`config>mobile>pdn>threshold>path-mgmt`
`config>mobile>pdn>threshold>pdn-connections`

Description

This command configures a common polling-interval for all objects under the group.

Parameters

minutes

specifies the interval

Values: 5 to 60

Default: 5

5.2.1.46.16 shutdown

Syntax

`[no] shutdown`

Context

`config>mobile>pdn>threshold>bearer-cf-failure`
`config>mobile>pdn>threshold>bearer-cf-success`
`config>mobile>pdn>threshold>bearer-mgmt-limit`
`config>mobile>pdn>threshold>bearer-traffic`
`config>mobile>pdn>threshold>path-mgmt`

```
config>mobile>pdn>threshold>pdn-connections
```

Description

This command administratively disables an entity (admin state down). When disabled, an entity does not change, reset, or remove any configuration settings or statistics. The operational state of the entity is disabled as well as the operational state of any entities contained within. Many entities must be shut down before they may be deleted.

Many entities must be explicitly enabled (admin state up) using the `no shutdown` command.

NOTE:

The shutdown command at the APN level only affects new sessions, meaning that operational state of APN related to existing sessions will remain enabled while administrative state will be disabled. The gateway still forwards user traffic for the remaining sessions.

The `no` form of this command administratively enables an entity.

5.2.1.47 Virtual APN selection PDN command descriptions

5.2.1.47.1 virtual-apn-selection

Syntax

```
[no] virtual-apn-selection
```

Context

```
config>mobile>pdn
```

```
config>mobile>pdn>apn
```

Description

This command configures the virtual APN selection criteria.

5.2.1.47.2 no-match-action

Syntax

```
no-match-action action [virtual-apn virtual-apn-name]
```

```
no no-match-action
```

Context

```
config>mobile>pdn>virtual-apn-selection
config>mobile>pdn>apn>virtual-apn-selection
```

Description

This command configures the action in cases where any defined user-range did not match.
The no form of this command reverts to the default.

Default

```
no no-match-action
```

Parameters

action

specifies the action

Values	continue	the session creation can be continued based on the real APN
–	reject	the session creation is rejected

Default: continue

virtual-apn-name

specifies the name for the virtual APN, up to 80 characters; only applicable when the *action* parameter is set to continue

5.2.1.47.3 pco-fallback

Syntax

```
pco-fallback user-name user-name
no pco-fallback
```

Context

```
config>mobile>pdn>virtual-apn-selection
```

```
config>mobile>pdn>apn
```

Description

This command configures the information used as the username in the pre-authentication and authentication requests when this information is expected to be received but it is missing from the PCO/APCO IE.

The no form of this command reverts to the default.

Default

no pco-fallback

Parameters

user-name

specifies the username

Values: msisdn | imsi | apn | fixed

NOTE:

The *fixed* option defines the use of the user-name that is specified by the *auth-fixed* command, as the fallback username used in the access requests when the username is expected to be received but it is missing from the PCO and, or APCO IE.

5.2.1.47.4 pco-fallback-acct

Syntax

```
pco-fallback-acct user-name user-name
```

```
no pco-fallback-acct
```

Context

```
config>mobile>pdn>apn
```

Description

This command configures the information used as the username in the accounting requests when this information is expected to be received but it is missing from the PCO and, or APCO IE.

The no form of this command reverts to the default.

**NOTE:**

This command requires an APN shutdown/no shutdown for change to take effect.

Default

no pco-fallback-acct

Parameters***user-name***

specifies the username

Values: msisdn | imsi | apn | fixed

5.2.1.47.5 prefer-pdn**Syntax**

[no] prefer-pdn

Context

config>mobile>pdn>apn>virtual-apn-selection

Description

This command specifies how the virtual APN selection configuration is evaluated. It only affects on the real APN and it is ignored for an APN used as a virtual APN for the new session.

By default, if `virtual-apn-selection` criteria are configured in the APN context (real APN in the Create Session Request), only those are evaluated. In case not configured at all, the PDN level `virtual-apn-selection` criteria are evaluated, meaning that the APN level configuration has priority.

When this command is enabled and `virtual-apn-selection` criteria are configured in the PDN context, they are evaluated first. In addition, if the `virtual-apn-selection` is configured in the final (real or virtual) APN, the APN level configuration may also be evaluated if the PDN level virtual APN selection criteria evaluation did not result in a match and the `no-match-action` is set to `continue`.

The no form of this command reverts to the default.

Default

no prefer-pdn

5.2.1.47.6 selection-prio

Syntax

```
selection-prio UE type [UE type ... up to 10 max]  
no selection-prio
```

Context

```
config>mobile>pdn>virtual-apn-selection  
config>mobile>pdn>apn>virtual-apn-selection
```

Description

This command configures the priority for selecting the criteria as configured under command `user-range`. Therefore, if more than one user range is defined that would match the same UE, the `selection-prio` command sets the priority for each and how the selection is processed. The priority between all the criteria used in the `user-range` has to be explicitly set.

The `no` form of this command removes the selection priority for the `user-range` command from the configuration.

Default

no selection-prio

Parameters

UE type

selects the first, second, third, fourth, fifth, sixth, seventh, eighth, ninth, and tenth selection for the `user-range` command

Values: `imsi` | `msisdn` | `imei` | `roaming-status` | `cc` | `imeisv-tacsv` | `serving-node-plmn` | `pdn-type` | `rat-type` | `ue-location`

Default: `imsi` (1st) | `msisdn` (2nd) | `imei` (3rd) | `roaming-status` (4th) | `cc` (5th) | `imeisv-tacsv` (6th) | `serving-node-plmn` (7th) | `pdn-type` (8th) | `rat-type` (9th) | `ue-location` (10th)

5.2.1.47.7 selection-type

Syntax

```
selection-type {prefix | full-id}  
no selection-type
```

Context

```
config>mobile>pdn>virtual-apn-selection
config>mobile>pdn>apn>virtual-apn-selection
```

Description

This command specifies that the mapping is based on prefix or full identifier being specified for the start and end identifier, for the user - range command.

The no form of this command removes the selection type for user-range from the configuration.

Parameters

prefix

specifies that the mapping is based on IMSI or MSISDN prefix (an IMSI or MSISDN prefix of up to 11 digits can be specified)

full-id

specifies that the mapping is based on a full identifier
Default: full-id

5.2.1.47.8 user-range

Syntax

```
user-range user-range-name type {[imsi | msisdn | imei-tac] start-ue-id [end-ue-id] |
[roaming-status roaming-status-type] | [cc start-cc start-cc-id [end-cc end-cc-id]] |
[imeisv-tacsvn start-ue-id [end-ue-id] svn svn-value] | [serving-node-plmn list-name] |
[pdn-type ipv4 | ipv6 | ipv4v6] | [rat-type rat-type-list-name] | [ue-location ue-
location-list-name]} {virtual-apn virtual-apn-name | {[append-string suffix] [pre-auth-type
{radius server-group server-group-name [user-name {imsi | msisdn | pco | fixed}] [pco-
password] [password password password-type {fixed | default} [hash | hash2]] | diameter}
[suppress-imsi] ]}}
```

```
no user-range user-range-name
```

Context

```
config>mobile>pdn>virtual-apn-selection
config>mobile>pdn>apn>virtual-apn-selection
```

Description

This command specifies an IMSI, MSISDN, IMEI-Type Allocation Code (TAC), IMEISV-TAC + Software Version Number (SVN), roaming status, Charging Characteristics (CC), serving node PLMN, PDN type, RAT type or UE location mapping to the associated virtual APN.

A combination of two matching criteria is supported. The criteria can be any type of {imsi | msisdn | imei-tac | imeisv-tacsvn}, roaming-status, cc, serving-node-plmn, pdn-type, rat-type, or ue-location. Only one type of {imsi | imei-tac | msisdn | imeisv-tacsvn} can be combined with the other types. The serving-node-plmn criterion can only be combined with pdn-type, rat-type, or ue-location. Both rat-type or ue-location criteria cannot be combined with imei-tac or imeisv-tacsvn.

When the `prefix` option is specified for the `selection-type` command, an IMSI or MSISDN prefix can be specified, up to 15 digits. For IMSI, a minimum of MCC+MNC and up to 15 digits can be specified. Therefore, you can specify from 5 to 15 digits. For MSISDN, a minimum of CC + NDC and up to 15 digits can be specified. Therefore, you can specify 4 to 15 digits.

For IMEI-TAC, the TAC part of the IMEI or IMEISV can be configured with up to eight digits. When the `prefix` option is specified for the `selection-type` command, you can specify from four to eight digits. The `prefix` option has no effect on the `roaming-status`, `cc`, `serving-node-plmn`, `pdn-type`, `rat-type`, or the `ue-location`.

For the `imeisv-tacsvn` keyword, the TAC and SVN parts of the IMEISV are configured using 10 digits, TAC (8 digits) + SVN (2 digits).

When the `full-id` option is specified for the `selection-type` command, the `start-ue-id` and `end-ue-id` must be full identifiers.

The two octet CC values are given in decimal format; for example:

- CC 0x0800 is given as 2048
- CC 0x0400 is given as 1024
- CC 0x0200 is given as 512
- CC 0x0100 is given as 256

NOTE:

The `user-range` command must have at least one of the following options defined: `append-string`, `virtual-apn`, or `pre-auth-type`.

The `no` form of this command removes the configured user range specified by the user range name.

Default

`no user-range`

Parameters

user-range-name

selects the name for the user range, up to 32 characters

type

selects the type of the user range

Values: imsi | msisdn | imei-tac | roaming-status | cc | imeisv-tacsv | serving-node-plmn |
pdn-type | rat-type | ue-location

start-ue-id

selects the start identifier for the user range, 4 to 15 characters

end-ue-id

selects the end identifier for the user range, 4 to 15 characters

roaming-status-type

specifies the roaming status type

Values: roaming | visiting, home

start-cc-id

specifies that the start value is charging characteristics

Values: 1 to 65535

end-cc-id

specifies that the end value is charging characteristics

Values: 1 to 65535

list-name

specifies the serving node PLMN ID which is used for virtual APN selection, up to 32 characters

pdn-type

specifies the PDN type

Values: ipv4 | ipv6 | ipv4v6

rat-type-list-name

specifies the RAT-Type list name that is used for the virtual APN selection, up to 32 characters

ue-location-list-name

specifies the UE location (TAC/RAC) list that is used for the virtual APN selection, up to 32 characters

virtual-apn-name

specifies the name for the virtual APN, up to 80 characters

It cannot be specified with either `append-string` or `pre-auth-type`.

suffix

used in the `config>mobile>pdn` context to add a suffix to the APN

This suffix is taken into account in the virtual APN selection and can co-exist with `pre-auth-type`. If the `pre-auth-type` is not defined, this is only supported in the `config>mobile>pdn` context. If the combined real APN and suffix exceeds the total supported character length for the APN string, the session creation fails.

pre-auth-type

triggers a pre-authentication used to support virtual APNs

Values	radius	specifies that the RADIUS authentication type is used for authentication from an AAA server
–	diameter	specifies that the Diameter authentication type is used for authentication from an AAA server

server-group-name

specifies the name of a RADIUS group, up to 32 characters

user-name

specifies the username used in access requests sent to a AAA server

Values	imsi	sets the User-Name attribute to the IMSI
–	msisdn	sets the User-Name attribute to the MSISDN
–	pco	sets the User-Name attribute to the value received in the PCO
–	fixed	use the name specified by the <code>pre-auth-fixed</code> command

suppress-imsi

specifies that the 3GPP-IMSI attribute is not included

pco-password

specifies to set the password to the value received in the GTP PCO

password

specifies the PAP password used in access requests sent to a RADIUS server, up to 32 characters; up to 54 characters are supported for a hash password and up to 96 characters for a hash2 password

password-type

specifies the password type

Values	fixed	fixed password for overriding the PCO content or providing password with the IMSI, MSISDN or APN username (with PAP)
–	default	default password to be used together with the IMSI, MSISDN or APN username, and when missing from the PCO (with PAP)

NOTE:

If the hash and hash2 parameters are not used for the password, the key is assumed to be in a non-encrypted clear text form. For security purposes, all keys are automatically stored in an encrypted hash form in the configuration. The information saves and uses the configuration defined in the `system>security>hash-control` context.

hash

specifies that key is entered in an encrypted form

hash2

specifies that the key is entered in a more complex encrypted form

svn-value

specifies the SVN

Values: 00 to 99

5.2.2 PDN show command descriptions

5.2.2.1 pdn

Syntax

pdn

Context

apn apn-name transport-statistics [imsi imsi | msisdn msisdn]

```

Context

show>mobile>pdn

Description

This command displays APN information, including statistics on the types of PDN sessions by access protocol and PDN type. APN statistics are tracked for real and virtual PDN connections. The virtual APN capability allows the PGW to change the APN from the one received via GTP-C (the "real" APN) to one that is used locally (the "virtual" APN). However a PDN session only counts statistics for the virtual APN to which it has been mapped. Furthermore an APN may be real for some PDN sessions and virtual for other PDNs. To track the usage of real APNs even though they are being mapped to a smaller set of virtual APNs, the PGW keeps statistics for the number of PDN connections that use the APN as a real APN. All other counters in the output are incremented only for those PDNs that use the APN as a virtual APN.

Parameters

apn-name

specifies the APN name

statistics

specifies aggregated statistics

summary

specifies summarized aggregated statistics

group-number

specifies the group number

Values: 1 to 8

delete-session-statistics

specifies delete session statistics

gw-id

specifies the gateway identifier number

Values: 1 to 8

attach-failure-statistics

specifies attach failure statistics

dns-redirect-statistics

specifies DNS redirect statistics

fqdn-group

specifies resolved IP addresses and expiry information

gy-ap-statistics

specifies Gy AP statistics

gx-ap-statistics

specifies Gx Assume Positive (AP) statistics

call-flow-stats

specifies the call flow statistics per APN

detail

specifies detailed APN configuration

pcscf-statistics

specifies P-CSCF statistics

override-statistics

specifies APN override statistics

l2tp

specifies L2TP statistics

transport-statistics

specifies transport-byte-collection statistics per APN

imsi

specifies the IMSI, up to 15 digits

msisdn

specifies the MSISDN, up to 15 digits

Output

The following output examples show APN Statistics.

- [Example output APN configuration](#)

Table 16: Show APN configuration output fields

Label	Description
APN Name	The name of the APN being viewed
APN Admin State	The APN administrative state
Gateway	The gateway ID
APN Type	The option that sets the APN/DNN type as small
CP MG-Grp-Id	The MG group that serves UE sessions assigned to a small type APN/DNN
Reactivation Requested	The option to send GTP-C cause #8 "reactivation requested" in Delete Bearer Request messages to disconnect the PDN
Selection Mode	The specified selection mode
Del Br React Rq Cause	The option to enable the PGW to include a reactivation request in the delete bearer request that is sent to the UE for the specified scenarios

Table 16: Show APN configuration output fields (continued)

Label	Description
Del Br No React Rq Cause	The option to enable the PGW to include an indication in the delete bearer request that the PDN reconnection to this APN is not allowed
Idle Timeout (sec)	The length of time, in seconds, a PDP context is allowed to be idle before it is removed by the PGW
Session Timeout (sec)	The length of time, in seconds, that a PDN connection may exist before it is removed by the mobile gateway
Idle Timer Dir Uplink	The idle timer which monitors the uplink traffic
Idle Timer Dir Downlink	The idle timer which monitors the downlink traffic
Cm idle timeout	The length of time, in seconds, a session is allowed to be idle before it is deleted by the SMF
Call sequence	The call-flow sequence for the session
Max PDN Connections	The maximum number of PDN connections for this APN on the gateway
Max PDN Conn Action	The option to send alarms when the maximum PDN connections are reached or to send alarms, but to not accept any new PDN connections when the maximum PDN connections are reached
Min PDN Connections	The minimum number of PDN connections for this APN on the gateway
Reject Foreign Subs	The option to reject Create PDP Context Requests for all foreign subscribers
Guard Timer (sec)	The length of time, in seconds, of the session setup timer on the PGW

Table 16: Show APN configuration output fields (continued)

Label	Description
Restriction	The level of restriction imposed on EPS bearer contexts created to the associated APN
Emergency Profile	The emergency profile name
Allow Emergency	The option to specify the APN as an emergency APN
NEMO HA	The option to enable NEMO support for this APN
HO Wr PDN IP Stl Ses Del	The stale session deletion behavior when the PGW rejects an HO (HI=1) CSReq that is received on the S2a/S2b interfaces with an incorrect PDN IP address
Allow WLAN HO No Ctx	The option to enable the PGW functionality to handle an S2a/S2b Handover Attach Request (HI=1) as a new attach
Seamless WLAN HO	The option to enable seamless handover of a UE that is connected to the PGW/GGSN via a WLAN gateway and moving over to 2G/3G access
Allow Dangling Rule Ded Br	The option to enable dedicated bearers to be created for dynamic rules that are left dangling with a previous QCI/ARP
Paging Br Binding	The option to enable bearer binding during paging for a combined SGW and PGW session
APN Load Control	The option to enable the APN Load Control Information (LCI) IE to be sent to the consumer nodes
Ovrld Back-Off Tmr (min)	The length of time, in minutes, of the PGW back-off timer IE
Exclude-ARP-list	The ARP list excluded from being rejected by the P-GW back-off timer IE

Table 16: Show APN configuration output fields (continued)

Label	Description
Shut Back-Off Tmr (min)	The configured back-off timer IE value sent in the Create Session Response together with the cause code APN Congestion, when the APN is in shutdown state
APN Overload Control	The option to enable the APN Overload Control Information (OCI) IE to be sent to the consumer nodes
PCO Fallback	The option to enable the use of the locally configured username information when this information is missing from the PCO/APCO IE
PCO Fallback acct.	The option to enable the use of the locally configured username in the accounting requests when this information is missing from the PCO/APCO IE
Dedicated Bearer	The Dedicated Bearer context
Crt Rtr Count	The number of retries before the dedicated bearer creation is abandoned until the next active application period
Crt Rtr Wait Tmr (min)	The length of time, in minutes, the gateway will wait before retrying dedicated bearer creation
GTP PDN Threshold	The GTP PDN Threshold context
Max Connections	The maximum number of PDN connections
Max Actv (act/sec)	The maximum number of PDN activations per second
Alarm	The option to send an alarm when the maximum number of connections is reached, or when the maximum number of activations is reached
APN Network ID	The specified APN network ID

Table 16: Show APN configuration output fields (continued)

Label	Description
Hybrid Access	The Hybrid Access context
Bonding Support	The option to enable bonding support for the APN
KPI KCI	The KPI KCI context
ARP Traffic Stats	The option to enable the generation of per ARP traffic statistics
SGW APN Stats	The option to enable this APN to be measured in the per APN statistics on the SGW
Enh Traffic Stats	The option to enable the generation of enhanced traffic statistics for this APN
QCI APN Stats	The option to specify the QoS Class Identifier drop statistics profile name
Number of entries	The number of entries retrieved
PCO Fallback	The fallback APN when the PCO does not contain a valid APN string
Include Radius Auth	The option to apply the APN network ID configuration to RADIUS authentication
Include Rad Pre Auth	—
Primary	The IPv4 address of the primary DNS server
Secondary	The IPv4 address of the secondary DNS server
Multi UE Session	The option to enable Multi UE Session support
PAA Overwrite	—

Table 16: Show APN configuration output fields (continued)

Label	Description
PCO Options	The PCO Options context
Pref DNS Addr Type	The specified DNS addresses sent to the UE
Link MTU (octets)	The maximum number of addresses sent to the PCO or RA
Operator PCO	The option to enable the operator specific PCO container to be sent back to the UE
PFCP Translate Tx Prof	Status of the PFCP translation profile (enabled/disabled) for sending opaque values from the CP to the UP
PFCP UP Inactivity	Status of the UP inactivity timer (enabled/disabled), used for 5GC N4 sessions only
UP Inactivity Timer	Time configured for the PFCP UP inactivity timer
DHCPv6-service	Status of DHCPv6 service configuration (enabled or disabled)
PPI Mapping Profile	The name of the PPI mapping profile

Table 17: Show APN detailed configuration output fields

Label	Description
Virtual APN	The Virtual APN context
Pre Auth	The pre-authentication type
Username	The user name used in access requests
Password Type	The password type
Supress Imsi	The option to include the 3GPP-IMSI attribute
Pre Auth Fixed	The Pre Auth Fixed context
Username	The user name for pre-authorization
Virtual APN based on PCO	The option to enable the PCO-based virtual APN selection mechanism

Table 17: Show APN detailed configuration output fields (continued)

Label	Description
Virtual APN selection	The Virtual APN selection context
Selection Type	The specified selection type
Prefer PDN	—
Selection Priority	The specified priority for selecting criteria under the user - range command
No Match Action	The action in cases where any defined user-range does not match
IP Allocation	The IP Allocation context
PDN Type	The PDN type
PDN Type Prefer IPv6	—
PDN Alloc Type	The PDN allocation type
IP Alloc Method	The specified IP address allocation scheme
Allow Local	The option to enable the allocation of a PDN IP address from a local pool
Extended Rad Alloc	The option to enable the handling of UE IP address allocation-related parameters in the Accept-Accept response message from the RADIUS server
Priority Order	The specified priority order in which the UE IP address allocation methods are evaluated
Frame Route	The option for Framed Routing support
Router	The router name

Table 17: Show APN detailed configuration output fields (continued)

Label	Description
MG-Group	The MG group associated with this APN
Router Advertisements	The Router Advertisements context
Min Adv Interval (sec)	The minimum length of time, in seconds, allowed between sending unsolicited multicast Router Advertisements
Max Adv Interval (sec)	The maximum length of time, in seconds, allowed between sending unsolicited multicast Router Advertisements
Authentication	The Authentication context
Auth	The authentication type being used
Username	The user name used in access requests sent to an AAA server
Password Type	The password type
Supress Imsi	The option to include the 3GPP-IMSI attribute
Auth Fixed	The Auth Fixed context
Username	The user name used in access requests sent to an AAA server when the authorized username is set to fixed
L2TP	The L2TP context
PPP Regeneration	The option to enable PPP regeneration on behalf of the sessions that terminate on this APN
Router	The router instance associated with the APN
Username	The username

Table 17: Show APN detailed configuration output fields (continued)

Label	Description
Password Type	The password type
ICRQ Call Num Type	The value that will be sent in the ICRQ Calling Number AVP as the subscriber identity for the LNS
Mobile Router	The option to enable mobile routers
DNS Server Opt	The option to include requesting the Primary and Secondary DNS address configuration option from the LNS in the PPP IPCP negotiation
NBNS Server Opt	The option to include requesting the Primary and Secondary NBNS address configuration option from the LNS in the PPP IPCP negotiation
Rx Connect Speed (bps)	The L2TP receive connection speed in b/s
Tx Connect Speed (bps)	The L2TP transmit connection speed in b/s
LCP Conf Req Attr	The option to include the Last Sent LCP Confreq and Last Received LCP Confreq attributes in the L2TP ICCN message to the LNS
Auth Type	The authentication type used when sending the LCP Confreq attributes
MRU Size	The MRU size, in bytes, sent in the LCP Confreq attributes
HSS Static IP	The option to include the HLR/HSS-provided static IP address in the GTP Create PDP Context Request/Create Session Request message
Accounting	The Accounting context
Accounting Type	The accounting type being used

Table 17: Show APN detailed configuration output fields (continued)

Label	Description
Username	The username
Suppress Imsi	The option to include the 3GPP-IMSI attribute
Selective Rad Acct	The option to enable selective RADIUS accounting
Radius Accounting On-Off	The Radius Accounting On-Off context
Messages Sent	The option to send ON/OFF RADIUS Accounting messages per APN
Wait for ACK	The option to enable the PGW/GGSN to wait for a response to Accounting-ON messages before allowing attaches to this APN
Incl Dupl Servers	The option to enable sending the RADIUS Accounting ON/OFF messages to the duplicate accounting servers
Wait Accounting	The option to enable the PGW/GGSN to wait for an accounting response before sending a GTP response
TWAG Radius Acct Feed	The option to enable using the RADIUS accounting feed for TWAG open SSID
Charging	The Charging context
Charging Profile	The Charging Profile context
Home	The option to inherit charging profile information from home subscribers
Visiting	The option to inherit charging profile information from visiting subscribers (local break-out)
Roaming	The option to inherit charging profile information from roamers (home-routed)

Table 17: Show APN detailed configuration output fields (continued)

Label	Description
CC Ignore	The CC Ignore context
Home	The option to enable the capability to ignore charging characteristics received from the MME/HSS for home subscribers
Visiting	The option to enable the capability to ignore charging characteristics received from the MME/HSS for visiting subscribers (local break-out)
Roaming	The option to enable the capability to ignore charging characteristics received from the MME/HSS for roamers (home-routed)
Any	The option to enable the capability to ignore charging characteristics received from the MME/HSS unconditionally
CC Reject	The option to enable the rejection of MME/HSS supplied charging characteristics
PFCP	PFCP Context
PFCP Translate Tx Prof	Status of the PFCP translation profile (enabled/disabled) for sending opaque values from the CP to the UP
PFCP UP Inactivity	Status of the UP inactivity timer (enabled/disabled), used for 5GC N4 sessions only
UP Inactivity Timer	Time configured for the PFCP UP inactivity timer
Policy	The Policy context
AMBR Policing	The type of AMBR policing being enforced for this APN
Max AMBR policer	The option to enable the AMBR policer rate to be set to a maximum value for this APN

Table 17: Show APN detailed configuration output fields (continued)

Label	Description
Gx Session Recovery	The option to enable Gx session discover and recovery for the APN
Bearer Bind Verification	The option to enable bearer binding verification for uplink traffic for a PDN session
Firewall Rules	The option to enable firewall rules
Policy Rule	Policy rule for this APN
Policy Rule Base	Policy rule base for this APN
Optimize GBR	The option to enable the GBR optimization capability
Bitrate Roundup	The option to enable the gateway to send the PCRF provided QoS values rounded up according to NAS specification (24. 301) to the LTE access (SGW/MME)
TWAG Unauth Sub Gx	The option to enable Gx interface support for unauthenticated subscribers in TWAG
Global PCC Precedence	The option to enable global PCC precedence for policy rules
Default CC Group	The default CC group used when a PCRF does not provide the CC group subscriber type for a subscriber PDN session
Delay Tol Con Susp (sec)	The maximum suspension time for the delay tolerant procedure, in seconds
PCRF Selection	The PCRF Selection context
PCC Dis RAT Tmr (sec)	The length of time, in seconds, before PCRF control is removed

Table 17: Show APN detailed configuration output fields (continued)

Label	Description
Sup CCR No QoS Neg	The option to enable sending the CCR-U to inform the PCRF about the QoS change received in the update of the PDP context request which also contained a No QoS negotiation indication
PCC Disable Per RAT	The RAT type that is not allowed to be under the control of the PCRF
Dynamic PCC	The option to enable dynamic PCC
FH Session	The option to enable the failure handling session
FH 3xxx	The option to enable failure handling for the 3xxx result code from the PCRF
FH 4xxx	The option to enable failure handling for the 4xxx result code from the PCRF
Redirect	The option to redirect all upstream mobile traffic toward the configured next-hop within this APN
Policy On The Fly	The specified PDN sessions to which modifications will be applied
Reactivate If Failed	The option to enable the termination of the existing session with a “reactivation required” cause code in the case of a conflict
Transit Sub	The Transit Sub context
Att Rsp Wait Tmr (sec)	The response wait time in seconds
Att Rtr Hold Tmr (sec)	The retry hold time in seconds
Data Triggered	The option to enable the creation of transit subscribers using the data trigger
Default QoS Application Modify	The Default QoS Application Modify context

Table 17: Show APN detailed configuration output fields (continued)

Label	Description
APN Ambr Attr	The APN Ambr Attr context
Aggr DL Rate (kbps)	The APN-AMBR downlink rate in kb/s
Aggr UL Rate (kbps)	The APN-AMBR uplink rate in kb/s
ARP	The ARP value
QCI	The QCI value
QoS Hold Time (min)	The length of time, in minutes, for application traffic to trigger the QoS updates back to the default QoS
Retry Wait Timer (min)	The length of time, in minutes, the gateway waits before retrying to update the default bearer QoS
Roaming Handover	The Roaming Handover context
LTE QoS AMBR	The LTE QoS AMBR context
DownLink Rate (kbps)	The APN-AMBR downlink rate in kb/s
UpLink Rate (kbps)	The APN-AMBR uplink rate in kb/s
LTE QoS Delay (sec)	The length of time, in seconds, before the PGW sends an Update Bearer Request
Aggregate Rate	The Aggregate Rate context
Downlink (kbps)	The APN aggregate downlink rate in kb/s
Uplink (kbps)	The APN aggregate uplink rate in kb/s

Table 17: Show APN detailed configuration output fields (continued)

Label	Description
Static Predefined PCC	The Static Predefined PCC context
Default QCI	The QCI value
ARP	The ARP value
Number of Entries	The number of entries being viewed

Example output APN statistics

The following output example shows APN statistics and *Show PDN APN statistics output fields* describes the output fields.

```

Table 18: Show PDN APN statistics output fields

Label	Description
APN Admin State	The APN administrative state
APN Oper State	The APN operational state
APN	The APN name
Homers	The number of home subscribers
Visitors	The number of visiting subscribers
Sess ePDG svrs req	The number of PDN sessions that are requested for the ePDG server address

Table 18: Show PDN APN statistics output fields (continued)

Label	Description
Sess ePDG svrs all*	The number of PDN sessions that the PGW provided for the ePDG server address
Roamers	The number of roaming subscribers
Idle Timeouts	The number of idle timeouts
Session Timeouts	The number of session timeouts
Dedicated Bearers	The number of dedicated bearers
Ipv4 PDN Sessions	The number of IPv4 sessions
Ipv6 PDN Sessions	The number of IPv6 sessions
Ipv4v6 PDN Sessions	The number of IPv4v6 sessions
Non-Ip PDN Sessions	The number of non-IP sessions
Ipv4 PDP Contexts	The number of IPv4 PDP contexts
Ipv6 PDP Contexts	The number of IPv6 PDP contexts
Ipv4v6 PDP Contexts	The number of IPv4v6 PDP contexts
Secondary PDP Cont*	The number of secondary PDP contexts
Ipv4 PMIP Sessions	The number of IPv4 PMIP sessions
Ipv6 PMIP Sessions	The number of IPv6 PMIP sessions
Ipv4v6 PMIP Sessio*	The number of IPv4v6 PMIP sessions

Table 18: Show PDN APN statistics output fields (continued)

Label	Description
Ipv4 S2a Sessions	The number of IPv4 S2a sessions
Ipv6 S2a Sessions	The number of IPv6 S2a sessions
Ipv4v6 S2a Sessions	The number of IPv4v6 S2a sessions
Ipv4 S2b Sessions	The number of IPv4 S2b sessions
Ipv6 S2b Sessions	The number of IPv6 S2b sessions
Ipv4v6 S2b Sessions	The number of IPv4v6 S2b sessions
L2TP Sessions	The number of L2TP sessions
Ipv4 IP Local Pool	The number of IPv4 local pools
Ipv6 IP Local Pool	The number of IPv6 local pools
Ipv4v6 IP Local Po*	The number of IPv4v6 local pools
Ipv4 AAA Sessions	The number of IPv4 AAA sessions
Ipv6 AAA Sessions	The number of IPv6 AAA sessions
Ipv4v6 AAA Sessions	The number of IPv4v6 AAA sessions
Ipv4 HSS Sessions	The number of IPv4 HSS sessions
Ipv6 HSS Sessions	The number of IPv6 HSS sessions
Ipv4v6 HSS Sessions	The number of IPv4v6 HSS sessions
Ipv4 DHCP Sessions	The number of IPv4 DHCP sessions

Table 18: Show PDN APN statistics output fields (continued)

Label	Description
Ipv6 DHCP Sessions	The number of IPv6 DHCP sessions
Ipv4v6 DHCP Sessio*	The number of IPv4v6 DHCP sessions
Ipv4 DHCP-Relay Se*	The number of IPv4 DHCP relay sessions
Bonded IPv4 Sessio*	The number of bonded IPv4 sessions
Bonded IPv6 Sessio*	The number of bonded IPv6 sessions
Bonded IPv4v6 Sess*	The number of bonded IPv4v6 sessions
Pcrf-apn-ambr upda*	—
Redirected Sessions	The number of redirected sessions
Tethered Sessions	The number of tethered sessions
Selective Radius a*	The status of selective RADIUS accounting
HRPD sessions	The number of HRPD sessions
LTE NEMO Sessions	The number of LTE NEMO sessions
eHRPD NEMO Sessions	The number of eHRPD NEMO sessions
HA NEMO Sessions	The number of HA NEMO sessions
NEMO IPv4 Subnets	The number of NEMO IPv4 sessions
Ipv4 Steering Sess*	The number of IPv4 steering sessions
Ipv6 Steering Sess*	The number of IPv6 steering sessions

Table 18: Show PDN APN statistics output fields (continued)

Label	Description
Ipv4v6 Steering Se*	The number of IPv4v6 steering sessions
TWAG Open SSID Ses*	The number of open SSID TWAG sessions
eMPS IMS Sessions	The number of eMPS IMS sessions
eMPS IMS Ad Pri Ses	—
eMPS ded bearers	The number of eMPS dedicated bearers
PDN sessions having a dedicated bearer	The number of PDN sessions having a dedicated bearer
Real APN PDN Sessi*	The number of real APN PDN sessions
Ipv4 PDN Sessions	The number of IPv4 sessions
Ipv6 PDN Sessions	The number of IPv6 sessions
Ipv4v6 PDN Sessions	The number of IPv4v6 sessions
Non-Ip PDN Sessions	The number of non-IP sessions
Dedicated Bearers	The number of dedicated bearers
Ipv4 PDP Contexts	The number of IPv4 PDP contexts
Ipv4v6 PDP Contexts	The number of IPv4v6 PDP contexts
Secondary PDP Cont*	The number of secondary PDP contexts
Ipv4 S2a Sessions	The number of IPv4 S2a sessions

Table 18: Show PDN APN statistics output fields (continued)

Label	Description
Ipv6 S2a Sessions	The number of IPv6 S2a sessions
Ipv4v6 S2a Sessions	The number of IPv4v6 S2a sessions
Ipv4 S2b Sessions	The number of IPv4 S2b sessions
Ipv6 S2b Sessions	The number of IPv6 S2b sessions
Ipv4v6 S2b Sessions	The number of IPv4v6 S2b sessions
APN override triggers	The number of APN override triggers
APN override triggers failed	The number of failed APN override triggers
APN override establishments failed	The number of failed APN override establishments
Restoration Priority Level	—
Num of PDN Connections	The number of PDN connections
Inactivity Timer Sessions Distribution	The distribution of the inactivity timer sessions
TWAG SaMOG Sessions	The number of TWAG SaMOG sessions
TWAG NSWOG Sessions	The number of TWAG NSWOG sessions
Router Solicitation Packets Rx	The number of router solicitation packets received
Router Solicitation Packets Dropped	The number of router solicitation packets dropped

Table 18: Show PDN APN statistics output fields (continued)

Label	Description
Router Advertisement Packets Tx	The number of router solicitation packets transmitted
Neighbor Solicitation Packets Rx	The number of neighbor solicitation packets received
Neighbor Solicitation Packets Droppd	The number of neighbor solicitation packets dropped
Neighbor Advertisement Packets Tx	The number of neighbor solicitation packets transmitted
UL Throughput (Mbps)	The uplink throughput in Mbps; this counter prints the instant throughput as it has been calculated in the latest 10 seconds interval, by sampling the forwarded data volume at the beginning and at the end of the interval
DL Throughput (Mbps)	The downlink throughput in Mbps; this counter prints the instant throughput as it has been calculated in the latest 10 seconds interval, by sampling the forwarded data volume at the beginning and at the end of the interval
Number of cards	The number of cards retrieved

Example output APN statistics for 5G sessions

The following output example shows APN statistics for 5G sessions.

Table 20: Show PDN APN eMPS advance priority call output fields

Label	Description
eMPS IMS Sessions	counts eMPS sessions that happen after regular PDN attach (where no GTP MP-flag is set and ARP value is greater than 2) via Gx: RAR with DRMP and ARP value set to 1, 2, or 3.
eMPS IMS Advance Priority Sessions	counts eMPS Advance priority sessions that happen at PDN attach/detach associated with default bearer where GTP MP-flag is set and ARP value is set to 1 or 2.
eMPS dedicated bearers	counts eMPS dedicated bearers that happen via Gx:RAR with DRMP and ARP value set to 1, 2 or 3.

Example output APN DNS redirect statistics

The following output example shows DNS redirect statistics for the APN and *Show PDN APN DNS redirect statistics output fields* describes the output fields.

```

# show mobile-gateway pdn apn "ipd.nokia.com" dns-redirect status
=====
DNS Redirect Server
=====
Redirect DNS Profile      : <dns-profile-name>
Redirect DNS Address     : 10.10.10.10

```

```

Active Time           : 03/12/2014 18:50:24
DNS Failover          : <No of times switching happened between DNS>

Primary DNS   : 10.10.10.10      State   : active
Secondary DNS : 20.20.20.20      State   : standby

Tx DNS messages : <no of packets transmitted>
Rx DNS messages : <no of Packets Received>

```

```

-----
Active redirect DNS at APN: 1
=====

```

Table 21: Show PDN APN DNS redirect statistics output fields

Label	Description
Redirect DNS Profile	The redirect DNS profile associated with this APN
Redirect DNS Address	The redirect DNS IP address
Active Time	Date and time when the DNS server was first active
DNS Failover	The number of DNS switches
Primary DNS	The IP address of the primary DNS server
Secondary DNS	The IP address of the secondary DNS server
State	The operational state of the DNS server
Tx DNS messages	The number of transmitted DNS packages
Rx DNS messages	The number of received DNS packages
Active redirect DNS at APN	The number of active redirect DNS at APN retrieved

Example output APN FQDN group

The following output example shows FQDN group statistics for the APN and *Show PDN APN FQDN group statistics output fields* describes the output fields.

```
# show mobile-gateway pdn apn "NOK_internal" fqdn-group "NOK_enrichment"
=====
FQDN Group                : NOK_enrichment
=====

Diameter/S6b override establishments failed : 0
-----
Number of cards: 1
=====
```

Table 23: Show PDN APN override statistics output fields

Label	Description
Chassis/Card	The chassis and card number
Gateway	The gateway ID
Static override triggers	The number of static override triggers
Static override triggers failed	The number of failed static override triggers
Static override establishments failed	The number of failed static override establishments
RADIUS override triggers	The number of RADIUS override triggers
RADIUS override triggers failed	The number of failed RADIUS override triggers
RADIUS override establishments failed	The number of failed RADIUS override establishments
Diameter/Gx override triggers	The number of Diameter/Gx override triggers
Diameter/Gx override triggers failed	The number of failed Diameter/Gx override triggers
Diameter/Gx override establishments failed	The number of failed Diameter/Gx override establishments
Diameter/S6b override triggers	The number of Diameter/S6b override triggers
Diameter/S6b override triggers failed	The number of failed Diameter/S6b override triggers
Diameter/S6b override establishments failed	The number of failed Diameter/S6b override establishments

Table 23: Show PDN APN override statistics output fields (continued)

Label	Description
Number of cards	The number of cards retrieved

Example output P-CSCF statistics

The following output example shows P-CSCF statistics for the APN and *Show PDN APN P-CSCF statistics output fields* describes the output fields.

```
# show mobile-gateway pdn apn "ipd.nokia.com" pcscf-statistics
=====
P-CSCF statistics summary
=====
UE-location based IPv4 P-CSCF server selection
Success                : 0
Failed (UE location not known) : 0
Failed (No matching location) : 0
IPv4 server selection
P-CSCF server selection successful : 0
P-CSCF server selection failed    : 0
UE-location based IPv6 P-CSCF server selection
Success                : 0
Failed (UE location not known) : 0
Failed (No matching location) : 0
IPv6 server selection
P-CSCF server selection successful : 0
P-CSCF server selection failed    : 0
=====
```

Table 24: Show PDN APN P-CSCF statistics output fields

Label	Description
UE Location-based IPv4/IPv6 P-CSCF Server Selection	
Success	The number of successful P-CSCF server selections
Failed (UE location not known)	The number of failed server selections because the UE location was unknown
Failed (No matching location)	The number of failed server selections because there was no matching location

Table 24: Show PDN APN P-CSCF statistics output fields (continued)

Label	Description
IPv4/IPv6 Server Selection	
P-CSCF server selection successful	The number of successful P-CSCF server selections (does not include possible UE location-based selection); includes the default selection if a match for UE location was not found
P-CSCF server selection failed	The number of failed P-CSCF server selections

Example output Gx assume positive statistics

The following output example shows Gx Assume Positive statistics and *Show PDN APN Gx assume positive statistics output fields* describes the output fields.

```
# show mobile-gateway pdn apn "ipd.nokia.1.1.com" gx-ap-statistics
=====
Gx Assume Positive Statistics
=====

5.2.2.6 ip-alloc

Syntax

```
ip-alloc
```

Context

```
show>mobile>pdn>apn
```

Description

This command displays the APN IP address allocation configuration.

Output

The following output example shows APN IP address allocation configuration and *Show APN IP address allocation configuration output fields* describes the output fields.

Example output APN IP address allocation configuration

```

# show mobile-gateway pdn apn "internet" ip-alloc
=====
APN Configuration
=====
APN Name          : "internet"
APN Admin State   : down
Gateway           : 1

IP Allocation
=====
PDN Type           : ipv4
PDN Type Prefer IPv6 : Disabled
IP Alloc Method    : local-pool
Allow Local        : Disabled
Priority Order      : none
Extended Hss Alloc : Disabled

PDN Alloc Type     : ran-signaling
PD Alloc Method    : none
Extended Rad Alloc : Disabled
IP Allocation Trace : Enabled

```

```

Router          : "Base"
MG-Group        : none

Router Advertisements
  Min Adv Interval (sec): 16200      Max Adv Interval (sec): 21600

Table 28: Show APN IP address allocation configuration output fields

Label	Description
APN Name	The APN name
APN Admin State	The APN administrative state
Gateway	The gateway ID
IP Allocation	
PDN Type	The PDN IP type
PDN Type Prefer IPv6	The option to force the use of an IPv6 address for the PDN connection when there is a UE-requested dual stack IPv4v6 address PDN type and the APN supports only IPv4 and IPv6 addresses
PDN Alloc Type	The PDN allocation type
PD Alloc Method	The allocation scheme the APN uses to assign the IPv6 prefix delegation to the UE/CPE after the PDN connection
IP Alloc Method	The specified IP address allocation scheme
Allow Local	The option to enable the allocation of a PDN IP address from a local pool

Table 28: Show APN IP address allocation configuration output fields (continued)

Label	Description
Extended Rad Alloc	The option to enable the handling of UE IP address allocation-related parameters in the Accept-Accept response message from the RADIUS server
Priority Order	The specified priority order in which the UE IP address allocation methods are evaluated
IP Allocation Trace	The option to enable syslog reporting when an IP address is allocated or released for the PDN connection
Extended Hss Alloc	The option to validate the external IP addresses provided via GTP against the remote IP pools configured in the APN
Router	The router name
MG-Group	The MG group associated with this APN
Router Advertisements	The Router Advertisements context
Min Adv Interval (sec)	The minimum length of time, in seconds, allowed between sending unsolicited multicast Router Advertisements
Max Adv Interval (sec)	The maximum length of time, in seconds, allowed between sending unsolicited multicast Router Advertisements
SSC	Session and service continuity
PDU Ses Addr Lftm(sec)	Time in seconds for the PDU session address
Number of entries	The number of entries retrieved

5.2.2.7 l2tp

Syntax

l2tp

Context

show>mobile>pdn>apn

Description

This command displays the APN L2TP configuration.

Output

The following output example shows APN L2TP configuration.

Example output APN IP L2TP configuration

```
# show mobile-gateway pdn apn "internet" l2tp

5.2.2.11 apn-overload

Syntax

apn-over load [apn-name]

Context

```
show>mobile>pdn
```

Description

This command displays the APN overload statistics.

Parameters

apn

specifies the APN name, up to 80 characters

Output

The following output example shows APN overload statistics and [Show PDN APN overload output fields](#) describes the output fields.

Example output APN overload statistics

```
# show mobile-gateway pdn apn-overload
=====
APN Load/Overload and PDN-Back-Off timer info summary
=====
APN          : apn.0.1.com

```

Table 29: Show PDN APN overload output fields

Label	Description
APN	The APN name
gtp-thrsh-max-con	The maximum number of PDN connections
gtp-thrsh-max-act	The maximum number of PDN activations per second
pdn-gw-back-off	The status of the PGW Back-Off timer
pdn-gw-back-off-ti*	The time in minutes during which the MME refrains from sending subsequent PDN connection establishment requests to the PGW for the congested APN
pdn-gw-back-off csreq throttling	Shows the count of the csreq drops per ARP value Applies only when the <code>exclude-arp-list</code> command is configured
load-control	The status of the APN Load Control Information (LCI)
overload-control	The status of the APN Overload Control (OCI)
validity-time	The time in seconds that the reported overload should be in effect
overload-reduction	The percentage of the traffic reduction
overload-threshold	The percentage of the overload threshold
current-apn-load	The percentage of the current APN load
current-apn-overlo*	The current APN overload status
Cumulative CSReq D*	The cumulative number of Create Session Requests dropped
Number of APNs	The number of APNs retrieved

5.2.2.12 application-server-stats

Syntax

`application-server-stats [gateway gw-id] [udp-tunnel-group udp-tunnel-group [peer ip-address]]`

Context

`show>mobile>pdn`

Description

This command displays the statistics of the tunnel groups toward the Application Servers (AS) for non-IP PDN types.

Parameters

udp-tunnel-group

specifies a tunnel group

ip-address

specifies a peer within a tunnel group

Values	ipv4-address	a.b.c.d
–	ipv6-address	x:x:x:x:x:x:x (eight 16-bit pieces)
–	–	x:x:x:x:x:d.d.d.d
–	–	x: [0..FFFF]H
–	–	d: [0..255]D

gw-id

specifies the gateway ID

Values: 1 to 8

Output

The following output example shows tunnel group statistics and *Show PDN application server statistics output fields* describes the output fields.

Example output tunnel group statistics

```
# show mobile-gateway pdn application-server-stats
=====
Tunnel group statistics
=====
Tunnel Group           : Tunnel1
-----
Peer address           : 15.1.2.1

Number of tunnel establishments: 3
-----
Peer address           : 15.1.3.1

Number of tunnel establishments: 3
-----
Peer address           : 15.1.4.1

Number of tunnel establishments: 3
-----
Peer address           : 15.1.5.1

Number of tunnel establishments: 3
-----
Number of peer instances      : 4

-----
Number of tunnel groups      : 1
=====
```

Table 30: Show PDN application server statistics output fields

Label	Description
Tunnel Group	The tunnel group name
Peer address	The IP address of the peer within the tunnel group
Number of tunnel establishments	The number of tunnel establishments
Number of peer instances	The number of peer instances

Table 30: Show PDN application server statistics output fields (continued)

Label	Description
Number of tunnel groups	The number of tunnel groups

5.2.2.13 bearer-context

Syntax

```

bearer-context [imsi | imei | msisdn string [bearer bearer-id] [apn name] [gateway gw-id |
group group-number | [card slot-number | vm vm-id]]

bearer-context imsi string [apn name] [bearer bearer-id] [gateway gw-id | group group-
number | [card slot-number | vm vm-id]] [qci qci-value arp arp-value] {control | filter |
bearer-traffic | detail}

bearer-context imsi string bearer bearer-id acct {ga | gy | rf} [detail]

bearer-context mac ieee-address [apn name] [bearer bearer-id] [gateway gw-id | group group-
number | [card slot-number | vm vm-id]] [qci qci-value arp arp-value] [detail]

bearer-context default-session def-session-pgw-ip pgw-ip-address apn name detail
[bearer bearer-id] [gateway gw-id | group group-number | [card slot-number | vm vm-id]] [qci
qci-value arp arp-value]

bearer-context default-session def-session-pgw-ip pgw-ip-address acct {ga | gy | rf}
apn name [bearer bearer-id] [gateway gw-id] [detail]

bearer-context imsi | subscriber-id string [gateway gw-id] bearer bearer-id acct {stats}

bearer-context msisdn string [bearer bearer-id] acct gy [detail]

bearer-context def-pfcp-u-sessions [network-realm network-realm] [pfcp-u-peer-ip]
[gateway gw-id / group group-number | card slot-number | vm vm-id] [apn name]

```

Context

```
show>mobile>pdn
```

Description

This command displays bearer context information.

Parameters

arp-value

specifies the ARP value

Values: 0 to 15

bearer-id

specifies the bearer ID

Values: 5 to 15

control | filter | bearer-traffic

filters detailed show output information

default-session

displays default session statistics

detail

displays detailed information

ga | gy | rf

displays interface type output

group-number

specifies the group number

Values: 1 to 15

gw-id

specifies the gateway ID

Values: 1 to 8

ieee-address

specifies the UE MAC

name

specifies the APN name, up to 100 characters

network-realm

specifies the APN name, up to 100 characters

pgw-ip-address

displays information for the specified PGW IP address

Values	ipv4-address	a.b.c.d
–	ipv6-address	x::x::x::x::x::x (eight 16-bit pieces)

–	–	x:x:x:x:x:d.d.d
–	–	x: [0..FFFF]H
–	–	d: [0..255]D

qci-value

specifies the QCI value

Values: 1 to 9 | 65 | 66 | 69 | 70 | 128 to 254

slot-number

specifies the card slot number (applicable only to 7750 SR MG)

Values: 1 to 10 | A | B

stats

displays statistics information

string

specifies a string, up to 15 characters

subscriber-id string

displays information for the specified subscriber id, up to 256 characters

vm-id

specifies the VM ID (applicable only to CMG)

Values: 1 to 20 | A | B

Output

The following 7750 SR MG output examples show bearer context information.

**NOTE:**

- For the bearer-context accounting statistics, the aggregate counters represent the actual data traffic of the specified bearer on the current active card.
- Depending on the configured node function (UP or CP function), the description and value for some of the output fields differ. These fields, if present, are identified and described at the end of each example output.
- Depending on the configured node function (UP or CP function), the description and value for some of the output fields differ. These fields, if present, are identified and described at the end of each example output.

5.2.2.14 cp-seid

Syntax

```

cp-seid seid [cp-ipv4 ip-address] [cp-ipv6 ipv6-address]
cp-seid seid [cp-ipv4 ip-address] [cp-ipv6 ipv6-address] detail

```

Context

```
show>mobile>pdn>bearer-context
```

Description

This command displays CP session context information related to a specific SEID.

Parameters

seid

specifies the SEID for the CP or UP session context, up to 40 characters

ip-address

specifies the CP function's Sx/N4 reference point IPv4 address

Values: a.b.c.d

ipv6-address

specifies the CP function's Sx/N4 reference point IPv6 address, up to 64 characters

detail

displays detailed information

Output

The following output examples show CP session bearer context information for a SEID.

- [Example output CP session bearer context SEID statistics](#)
- [Example output CP session bearer context SEID detail statistics](#)

Example output CP session bearer context SEID statistics

```
# show mobile-gateway pdn bearer-context cp-seid 0x10100 cp-ipv4 33.33.1.1 cp-

5.2.2.15 def-pfcp-u-sessions

Syntax

```
def-pfcp-u-sessions [network-realm realm-name] [pfcp-u-peer-ip ip-address] [gateway
gw-id] [apn apn-name] [card slot-number] [vm vm-id] [group group-number]
```

Context

```
show>mobile>pdn>bearer-context
```

Description

This command displays the default PFCP-u shared tunnel session information, when PFCP-u (GTP-U) tunnels are configured to handle ICMPv6 RS/RA and NS/NA message exchange between the CP function and the UP function. When only `def - p f c p - u` is specified, results for all default PFCP-u sessions are displayed. The `network - rea lm` option may also be specified to identify the realm name of the network instance that has the PFCP GTP-U interface on the UP function, and is communicated in the Network-Instance IE part of the PFCP Session Establishment/Modification process. The `p f c p - u - p e e r - i p` option can also be used to display information for a specific PFCP-u Peer IP address.

Parameters

realm-name

specifies the realm name of the network instance that has the PFCP GTP-U interface on the UP function, up to 80 characters

ip-address

specifies the PFCP-u peer IP address, up to 64 characters

Values	ipv4-address	a.b.c.d
–	ipv6-address	x:x:x:x:x:x:x (eight 16-bit pieces)
–	–	x:x:x:x:x:d.d.d.d
–	–	x: [0..FFFF]H
–	–	d: [0..255]D

gw-id

specifies the gateway ID

Values: 1 to 8

apn-name

specifies the APN name, up to 80 characters

slot-number

specifies the card slot number (applicable only to 7750 SR MG)

Values: 1 to 20 | A | B

vm-id

specifies the VM ID (applicable only to CMG)

Values: 1 to 20 | A | B

group-number

specifies the group number

Values: 1 to 15

Output

The following output examples show default PFCP-u shared tunnel sessions information for the PDN bearer context and *Show PDN bearer context PFCP-u shared tunnel session output fields* describes the output fields.

- *Example output PDN bearer context default statistics PFCP-u shared tunnel sessions*
- *Example output PDN bearer context network realm statistics PFCP-u shared tunnel sessions*
- *Example output PDN bearer context peer IP address statistics PFCP-u shared tunnel sessions*
- *Example output PDN bearer context network realm and peer IP address statistics PFCP-u shared tunnel sessions*

Example output PDN bearer context default statistics PFCP-u shared tunnel sessions

5.2.2.16 supi

Syntax

```
supi imsi-msisdn
```

```
supi imsi-msisdn {control | filter | bearer-traffic | detail}
```

Context

```
show>mobile>pdn>bearer-context
```

Description

This command displays bearer context information for the specified SUPI for 5G sessions.

Parameters

imsi-msisdn

specifies the SUPI identifier, up to 15 characters

control

specifies the control information filter

filter

specifies the filter information

bearer-traffic

specifies the bearer-traffic information filter

detail

specifies detail information

Output

The following output example shows SUPI information for a specified IMSI-MSISDN in the bearer context and *Show PDN bearer context SUPI detail output fields* describes the output fields.

**NOTE:**

- The `supi` option displays information related to EPS interworking.
- The output supports a limited number of fields for 5G sessions and displays elements applicable for 4G deployments; for example, APN and IMSI, rather than DNN and SUPI.

Example output PDN bearer context SUPI detail statistics (5G sessions)

```

5.2.2.17 ue-ip

Syntax

```
ue-ip ip-address network-instance apn [traffic-endpt-id traffic-endpt-id] detail
[access-type {utran | geran | wlan | gan | hspa | eutran | ehrpd | hrpd | 1xrtt | umb | virtual
eutran-nb-iot}]
```

```
ue-ip ip-address network-instance apn [traffic-endpt-id traffic-endpt-id] detail  
[access-type detail {utran | geran | wlan | gan | hspa | eutran | ehrpd | hrpd | 1xrtt | umb |  
virtual | eutran-nb-iot}]
```

Context

show>mobile>pdn>bearer-context

Description

This command displays bearer context information related to a specific UE IP address.

Parameters

ip-address

specifies the UE IP address

Values		
	ipv4-address	a.b.c.d
–	ipv6-address	x:x:x:x:x:x:x (eight 16-bit pieces)
–	–	x:x:x:x:x:d.d.d.d
–	–	x: [0..FFFF]H
–	–	d: [0..255]D

apn

specifies the APN name associated for the Virtual Router instance on the UP peer where the UE IP address is located and is communicated over Sx/N4 in the Network-Instance IE, up to 80 characters

traffic-endpt-id

specifies the traffic endpoint ID

Values: 0 to 4294967295

detail

displays detailed information

access-type

specifies access type

Output

The following output example shows bearer context information for a specific UE IP address.

Example output bearer context Information for UE IP address

```
# show mobile-gateway pdn bearer-context ue-
ip 2.127.255.0 network instance ipd.nokia.1.2.com

=====
IMSI/IMEI(#)      APN              Bear* Type QCI/ARP  MBR/GBR    SDFs
/MSISDN(^)/MAC(`)
/SubId/SEID(~)
=====
0x10100~          ipd.nokia.1.2.* 5      Def  9/NA     N/A        3
0x10100~          ipd.nokia.1.2.* 6      Ded  3/NA     N/A        3
-----
Number of bearer contexts : 2
-----
# indicates that the corresponding row is IMEI entry.
^ indicates that the corresponding row is MSISDN entry.
` indicates that the corresponding row is MAC entry.
~ indicates that the corresponding row is SEID entry.
-----
* indicates that the corresponding row element may have been truncated.
```

NOTE:

- On the UP function, the SDF count is equal to the number of PDRs for PGW and combined SGW/PGW sessions. For an SGW session, the SDF count is shown as 0
- In the UP function, the ARP value is indicated as N/A (not supported by the PFCP protocol).

5.2.2.18 up-seid

Syntax

```
up-seid seid
```

```
up-seid seid [traffic-endpt-id traffic-endpt-id] detail
```

Context

```
show>mobile>pdn>bearer-context
```

Description

This command displays bearer context information related to a specific Session Endpoint Identifier (SEID) for the UP session context.

Parameters

seid

specifies the Session Endpoint Identifier (SEID) for the CP or UP session context, up to 40 characters

traffic-endpt-id

specifies the traffic endpoint ID

Values: 0 to 4294967295

detail

displays detailed information

Output

The following output example shows detailed UP session bearer context information for a specified SEID.

Example output UP session bearer context detail information for specified SEID

```
# show mobile-gateway pdn bearer-context up-seid 0x10100 detail
=====

=====
```

**NOTE:**

- If a dynamic rule is installed for the session, the CP function only sends the SDF filters to the UP function (not the policy rule name) and the SDF rule name field indicates the PDR ID (UP function). If a static rule is installed for the session, the SDF rule name field indicates the policy rule name in both the CP and UP functions.
- For the CP function, the Rating Group field indicates an internally generated ID for each of the URRs. In the UP function, the Rating Group field is not available.

5.2.2.19 call-flow-stats

Syntax

```
call-flow-stats [gateway gw-id | group group-number | [card slot-number | vm vm-id]] [gw-type sgw | pgw | upf | smf] summary
```

```
call-flow-stats oi-override-mapping [gateway gw-id] [p lmn-mcc mcc-value p lmn-mnc mnc-value]
```

Context

```
show>mobile>pdn
```

Description

This command displays call flow statistics for each card.

When displaying Operator Identifier (OI) mapping statistics, it shows the number of sessions established (initial and handover) as a summary per gateway ID, OI override mapping list, or per subscriber PLMN entry that the ePDG used OI or serving network PLMN replacement from the OI override mapping table.

Parameters

gw-id

specifies the gateway ID

Values: 1 to 8

group-number

specifies the group number

Values: 1 to 8

slot-number

specifies the card slot number (applicable only to 7750 SR MG)

Values: 1 to 10 | A | B

vm-id

specifies the VM ID (applicable only to CMG)

Values: 1 to 20 | A | B

summary

displays summarized information.

mcc-value

specifies an MCC value

mnc value

specifies an MNC value

gw-type

specifies the gateway type

Values: sgw | pgw | upf | smf

Output

The following 7750 SR MG output examples show call flow statistics information.

**NOTE:**

The outputs of a CMG system are identical to the 7750 SR MG outputs except they have some CMG-specific fields displayed instead of hardware components (for example, VM is displayed instead of Card).

- *Example output call flow statistics PDN gateway (active CPM)*
- *Example output call flow statistics PDN gateway (active card of MG group)*
- *Example output call flow statistics PDN gateway (active card slot of MG group)*
- *Example output call flow statistics ePDG/PGW combination gateways*
- *Example output call flow statistics on session management function*
- *Example output call flow statistics on user plane function*
- *Example output call flow statistics on control plane function for 5G sessions*
- *Example output call flow gateway statistics PDN gateway*
- *Example output call flow group statistics PDN gateway*
- *Example output call flow card statistics PDN gateway*
- *Example output call flow summary statistics PDN gateway*
- *Example output PDN gateway call flow card summary statistics*
- *Example output call flow statistics serving gateway*

- [Example output call flow statistics OI override mapping](#)
- [Example output call flow UPF statistics](#)
- [Example output call flow NamfEventExposure service statistics](#)
- [Example output call flow UDM service statistics](#)
- [Example output call flow statistics for 5G sessions](#)

**NOTE:**

Any 4G-related content is not included in the 5G-related outputs.

Example output call flow statistics PDN gateway (active CPM)

This example has been truncated to show only statistics of the active CPM.

5.2.2.20 canary-test

Syntax

```
canary-test gateway gw-id statistics
```

Context

```
show>mobile>pdn
```

Description

This command displays the statistics for a Canary test.

Parameters

gw-id

specifies the gateway ID

Values: 1 to 8

statistics

displays summarized information

Output

The following outputs example shows Canary test information and *Show PDN canary test output fields* describes the output fields.

Example output canary test statistics

```
# show mobile-gateway pdn canary-test gateway 1 statistics
=====

=====				

Table 33: Show PDN canary test output fields

Label	Description
Gateway	The gateway ID
Group	The Canary group
Card	The Canary card

Table 33: Show PDN canary test output fields (continued)

Label	Description
Status	The Canary test status; it can be "Ready", "In-progress", "Done", or "None"
Targets	The configured number of subscribers for the Canary testing
CanaryAttach Attempts	The IMSI/MSISDN based canary attach attempts for the current test; reset to zero for a new Canary test
Grp Specific Attempts	The number of attaches (such as re-attach) routed to the Canary group; reset to zero for a new Canary test (applies only on the SMF)
ACCUM. CanaryAttach	The accumulated number of IMSI/MSISDN based Canary attach attempts; not displayed when zero
ACCUM. GroupSpecific	The accumulated number of attaches (such as re-attach) routed to the Canary group (applies only on the SMF); not displayed when zero
User Range	The user range name
Type	The UE type
Start-id	The start identifier for the user range
End-id	The end identifier for the user range
History Logs	The history log of the performed Canary tests; a maximum number of 15 rows in the output is supported
TimeStamp	The time at which the Canary test ends

5.2.2.21 clear-status

Syntax

```
clear-status [gateway gw-id]
```

Context

```
show>mobile>pdn
```

Description

This command shows the status of the last administrative `clear` command. The user can monitor an ongoing `clear` command using this output.

Parameters

gw-id

specifies the gateway ID

Output

The following outputs are examples of `clear` command status messages and *Show PDN clear status output fields* describes the output fields.

Example output mobile gateway clear status

```
# show mobile-gateway pdn clear-status
=====
Mobile gateway clear status
=====
Gateway                               : 1
Suspended                             : No
Number of Sessions                     : 3547
Num of Sessions having a dedicated bearer : 827

Last administrative sessions clearing stats :
Started                                : 08/15/2017 02:39:28
Finished                               : 08/15/2017 02:40:33
Total Sessions to delete                : 650
Sessions deleted from APN                : 650
Sessions deleted                         : 1454

Ongoing Session Deletions
1.clearing on APN: apn1, Group: 1, PDN-type: ipv4, slow-loop
2.clearing on APN: apn2, Group: 2, PDN-type: ipv4, data-packet-trigger
3.clearing on APN: apn2, Group: 2, PDN-type: ipv4, data-packet-trigger
```

```

-----
no UP-Peer                APN                IP-prefix
-----
1.clearing on UP-Peer: 1.2.3.4, APN: apn4, IPv4-prefix: 10.10.10.1/255
2.clearing on UP-Peer: 1.2.3.5, APN: apn5, IPv6-prefix: 10:10::/128
-----

Number of gateways : 1
-----

Note:"Sessions deleted from APN" is only applicable when both "percentage" and "apn"
are used in the clear command.
=====

```

Table 34: Show PDN clear status output fields

Label	Description
Gateway	The gateway ID
Suspended	Indicates if the clear status is suspended
Number of Sessions	The number of sessions on the gateway
Num of Sessions having a dedicated bearer	The number of sessions with a dedicated bearer on the gateway
Started	Date and time when the the last administrative sessions clearing started
Finished	Date and time when the last administrative sessions clearing was completed; if not, the field is blank
Total Sessions to delete	The total number of sessions targeted for deletion, used only with the percentage option
Sessions deleted from APN	The number of sessions deleted so far from the selected APN, used only with the percentage option
Sessions deleted	The number of sessions deleted so far in the administrative sessions cleaning
Number of gateways	The number of gateways retrieved

5.2.2.22 dnn-overload-control

Syntax

```
dnn-overload-control [dnn-name]
```

Context

```
show>mobile>pdn
```

Description

This command displays the DNN overload control information.

Parameters

dnn-name

specifies the DNN name, up to 80 characters

Output

The following output example shows detailed DNN overload control information for a specified DNN.

Example output DNN overload control information

```
# show mobile-gateway pdn dnn-overload-control dnn1
=====
Nsmf Services DNN Overload information summary
=====
DNN                               : dnn1

```

5.2.2.23 error-indication

Syntax

```
error-indication [gateway gw-id] [router vr-id] [peer src-address] [summary]
```

Context

show>mobile>pdn

Description

This command displays information about error indication messages generated per peer IP address.

Output

The following output examples show error indication messages information and *Show PDN error indication output fields* describes the output fields.

- [Example error indication statistics](#)
- [Example error indication detailed statistics](#)
- [Example error indication summary statistics](#)

Example Error Indication Statistics

5.2.2.24 fixed-subscriber

Syntax

```
fixed-subscriber [subscriber-id] [apn apn-name] [gateway gw-id] [group group-number] [card  
slot-number] [vm vm-id]
```

```
fixed-subscriber subscriber-id detail [apn apn-name] [gateway gw-id] [group group-number]  
[card slot-number] [vm vm-id]
```

Context

```
show>mobile>pdn
```

Description

This command displays subscriber context with single or multiple hosts connected to a fixed network over DSL, residential broadband, or business leased line.

Parameters

subscriber-id

specifies the string value (up to 32 characters) stored in the Subscriber Profile Repository (SPR) that identifies each subscriber in the network. The value is assigned and maintained by individual operators and varies in format.

apn-name

specifies the string value (up to 80 characters) of the APN configured to serve fixed subscribers

detail

specifies to show detailed information

gw-id

specifies the gateway ID

Values: 1 to 8

group-number

specifies the group number

Values: 1 to 8

slot-number

specifies the slot number

Values: 1 to 10 | A | B

vm-id

specifies the VM ID

Values: 1 to 22

Output

The following output examples show fixed subscriber information.

- [Example output fixed subscriber information](#)
- [Example output fixed subscriber detail information](#)

Example output fixed subscriber information

The following output shows fixed subscriber information and [Show PDN fixed subscriber output fields](#) describes the output fields.

```
# show mobile-gateway pdn fixed-subscriber

Policy Rule Name	The name of the policy rule applied

5.2.2.25 gtp-load-overload-control

Syntax

```
gtp-load-overload-control
```

Context

```
show>mobile>pdn
```

Description

This command displays the current overload and load status of the gateway and the configuration for this feature.

Output

The following output example shows GTP-C load and overload information and *Show PDN GTP load and overload control information output fields* describes the output fields.

Example output GTP load and overload control information

```
# show mobile-gateway pdn gtp-load-overload-control
=====
GTP Load and over load control information
=====
Gateway                : 1

Load control           : Disabled
Load change trigger value : 5 %      Nth msg load report update : 50
Overload control       : Enabled
Minor threshold value   : 70 %      Major threshold value       : 85 %
Critical threshold value : 90 %
Minor reduction value    : 30 %      Major reduction value      : 60 %
Critical reduction value : 90 %

local overload throttling : Enabled  throttling alarms           : Disabled

Table 38: Show PDN GTP load and overload control information output fields

Label	Description
Gateway	The gateway ID
Load control	The status of the GTP load control
Load change trigger value	The load change value which will trigger a new load control update
Nth msg load report update	The message interval for sending Load Control Information) LCI
Overload control	The status of the GTP overload control
Minor threshold value	The threshold value of the GTP minor overload control
Major threshold value	The threshold value of the GTP major overload control
Critical threshold value	The threshold value of the GTP critical overload control
local overload throttling	The status of the local overload throttling

Table 38: Show PDN GTP load and overload control information output fields (continued)

Label	Description
Minor local overload throttling value	The throttling percentage when the gateway is in GTP minor overload
Major local overload throttling value	The throttling percentage when the gateway is in GTP major overload
Critical local overload throttling value	The throttling percentage when the gateway is in GTP critical overload
exclude-arp-list	ARP list used to exclude throttling of the CSREQs when the gateway is in different types of GTP-C overload levels
Overload Validity time	The length of time in seconds for the overload to be in effect
Overload reporting over S8	The status of the overload information report on the S8 interface
Minor reduction value	The traffic reduction percentage for minor overload
Major reduction value	The traffic reduction percentage for major overload
Critical reduction value	The traffic reduction percentage for critical overload
CPU sampling interval	The sampling interval
Overload	The CPU sampling period, in seconds, when transitioning from no overload to overload state
Overload state change	The CPU sampling period, in seconds, when transitioning from overload to another overload state
No-overload	The CPU sampling period, in seconds, when transitioning from overload to no overload state
Current load	The percentage of the current GTP load

Table 38: Show PDN GTP load and overload control information output fields (continued)

Label	Description
Current overload state	The status of the current overload state
GTP-73-OCI	The GTPv2 error code 73 is configured to be handled as OCI
GTP-120-OCI	The GTPv2 error code 120 is configured to be handled as OCI
Validity-Time-Extra-time	The additional time on top of the provided PGW Overload Period of Validity Timer
gtp-73-120-reduction-metric	The percentage of overload reduction metric applied for GTPv2 errors 73 and 120 when these are handled as OCI
overload-control-only-on-new*	The overload control actions only for new sessions; existing sessions remain unaffected

**NOTE:**

The `exclude-arp-list` and `drop-only` commands are displayed only when the operator explicitly configures for minor, major or critical local overload throttling the commands: `drop-only csreq` and `exclude-arp-list list-name`.

5.2.2.26 gtp-load-overload-control

Syntax

```
gtp-load-overload-control stats [node-id]
```

Context

```
show>mobile>pdn
```

Description

This command displays the GTP-C load and overload information received from peer nodes. The fields populated in the output vary according to the peer element type. For example, a PGW can receive only

Overload Control Information (OCI) IEs from MME, SGW, and ePDG node types. The load metric field will always be shown as zero in this case. The PGW itself can send out both Load Control Information (LCI) and OCI, so other node types can also show this information when peering with PGWs.

Parameters

stats

keyword used to show aggregated statistics

node-id

specifies the peer node type

Values: MME | SGW | PGW | EPDG

Output

The following output example shows GTP-C load and overload information and *Show PDN load and overload control information statistics output fields* describes the output fields.

Example output GTP overload control statistics

In this example, there are two MMEs and one SGW in overload.

```
# show mobile-gateway pdn gtp-load-overload-control stats

Number of nodes	The number of nodes retrieved

5.2.2.29 local-storage-stats

Syntax

```
local-storage-stats [gtp-prime-group gtp-prime-group] ga
```

Context

```
show>mobile>pdn
```

Description

This command displays statistics for locally stored CDR files in Ga interface.

Parameters

gtp-prime-group

specifies the GTP prime group profile name, up to 32 characters

ga

specifies the Ga interface

Output

The following output example shows CDR file storage statistics for Ga interface.

Example output CDR file storage Ga statistics

```
# show mobile-gateway pdn local-storage-stats ga
=====
PDN Ga local storage
=====
Number of CDR files generated      : 18918
Number of CDRs received           : 18912141

5.2.2.31 nf-peers

Syntax

```
nf-peers nf-type [nf-id uuid] [gateway gw-id] group group-id [instance | aggregate]
```

Context

```
show>mobile>pdn
```

Description

This command displays NF peer statistics.

Parameters

nf-type

specifies the NF type

Values: amf | scp | udm

gw-id

specifies the gateway ID

Values: 1 to 8

nf-id

specifies the UUID of the remote NF

Values: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx (x: [0..F]H)

group-number

specifies the group number

Values: 1 to 15

instance

shows statistics per peer per VM

aggregate

shows aggregated statistics

Output

The following output examples show NF peer statistics and *Show NF peer statistics* describes the output fields.

- *Example output AMF peer statistics*
- *Example output SCP peer statistics*
- *Example output AMF peer instance statistics*
- *Example output SCP peer instance statistics*
- *Example output UDM peer statistics per peer instance*

Example output AMF peer statistics

Example output UDM peer statistics per peer instance

```
# show mobile-gateway pdn nf-peers udm instance

=====
UDM peer statistics per peer instance
=====
NF instance ID : 12345678-9012-3456-7890-123456789011
Gateway Id : 1 VNF/Group Id/VM : 1/1/3
Blocked by signaling failure : <true | false>
Blocked by NRF : <true | false>
```

Block count : 0

Table 41: Show NF peer statistics

Label	Description
AMF peer statistics per peer instance	
NF instance ID	The NF instance ID
Gateway Id	The gateway ID
VNF/Group Id/VM	The VNF, group ID, and VM number
Connection failures	The number of connection failures
Failovers	The number of failovers
Number of peer instances	The number of peer instances
SCP peer statistics per peer instance	
NF instance ID	The NF instance ID
Gateway Id	The gateway ID
VNF/Group Id/VM	The VNF, group ID, and VM number
Blocked	Indicates if SCP is currently blocked
Blocked Count	The number of SCPs blocked
Number of peer instance	The number of peer instances
UDM peer statistics per peer instance	

Table 41: Show NF peer statistics (continued)

Label	Description
Blocked by signalling failure	Indicates if the UDM is currently blocked based on signalling failure
Blocked by NRF	Indicates if the UDM is currently blocked based on NF status notification from NRF
Block count	Indicates how many times the UDM has been blocked due to signalling failure

5.2.2.32 nsmf-event-exposure-subscriptions

Syntax

```
nsmf-event-exposure-subscriptions [supi supi] [gpsi gpsi] [subscription-id  
subscription-id] [pdu-session-id pdu-session-id] [group-id group-id]
```

Context

```
show>mobile>pdn
```

Description

This command displays configuration information or statistics about the Nsmf event exposure function.

NOTE:

This command is not supported in the current release.

Parameters

supi

specifies to show only the subscriptions with a matching SUPI, up to 15 digits

gpsi

specifies to show only the subscriptions with a matching GPSI, up to 15 digits

subscription-id

specifies to show only the subscriptions with a matching subscription ID, up to 31 characters

pdu-session-id

specifies to show only the subscriptions with a matching PDU session ID, up to 255 characters; this filter cannot be used without SUPI or GPSI

group-id

specifies to show only the subscriptions with a matching group ID, up to 20 characters

5.2.2.33 nsmf-overload-control

Syntax

```
nsmf-overload-control stats
```

Context

```
show>mobile>pdn
```

Description

This command displays configuration information or statistics for the Nsmf overload control function.

Parameters

stats

specifies to show aggregated statistics

Output

The following output examples show the Nsmf overload control configuration and statistics respectively.

Example output of the Nsmf overload control configuration

```
# show mobile-gateway pdn nsmf-overload-control
=====
Nsmf Overload control information
=====
Gateway           : 1
Overload control   : Enabled/Disabled
Retry-after-timer  : 300 seconds
Current overload state : none / no-overload / overload
-----
* indicates that the corresponding row element may have been truncated.
```

Example output of the Nsmf overload control statistics

```
# show mobile-gateway pdn nsmf-overload-control stats
=====
Nsmf Overload control statistics
```

```

=====
Last overload report time      : 01/23/2020 01:19:26
Last twenty overload report events:
-----
Time                          UTC                      Overload
-----
10/02/2019                    23:19:17         overload
12/19/2019                    02:34:54         no-overload
01/02/2020                    04:12:13         overload
01/23/2020                    01:19:26         no-overload
-----
Current Nsmf overload         : Yes/No   Traffic reduction value : 20%
Remaining validity time       : 60 sec
Cum PDU Sess Est Req dropped  : 800
-----
Number of nodes : 1
=====

```

5.2.2.34 nwu

Syntax

nwu [*sig-ref-point-name*] [gateway *gw-id*]

Context

show>mobile>pdn

Description

This command displays the NWu configuration information.

NOTE:

This command is not supported in the current release.

Parameters

sig-ref-point-name

specifies the NWu reference point name, up to 32 characters

gw-id

specifies the gateway ID

Values: 1 to 8

Output

Example output of the NWu configuration

The following output example shows the NWu context information and *Show PDN NWu output fields* describes the output fields.

```
# show mobile-gateway pdn nwu

=====
NWu Configuration
=====
Sig Ref Point Name : default
Gateway Id         : 1
Router Instance    : Base
Interface Name      : system
IPsec Profile Name : n3iwfProfile
=====
```

Table 42: Show PDN NWu output fields

Label	Description
Sig Ref Point Name	The name of signaling reference point
Gateway Id	The ID of the gateway
Router Instance	The name of the router instance
Interface Name	The name of the interface
IPsec Profile Name	The name of the IPSec profile

5.2.2.35 path-mgmt-stats

Syntax

```
path-mgmt-stats ref-point-type peer ip-address [port port-number] [gateway gw-id | group
group-number | [card slot-number | vm vm-id]] [instance | aggregate]
```

```
path-mgmt-stats {gn | gnu | gp | gpu} [ref-point ref-point-name] [peer ip-address [port port-number]] [gateway gw-id | group group-number | [card slot-number | vm vm-id]] [instance | aggregate] [active]

path-mgmt-stats {s5 | s5u | s8 | s8u | n9} [ref-point ref-point-name] [peer ip-address [port port-number]] [gateway gw-id | group group-number | card slot-number | vm vm-id]] [instance | aggregate]
```

Context

show>mobile>pdn

Description

This command displays path management statistics.

Parameters

ref-point-type

specifies the interface type

Values: s11 | s1u | s12 | s4 | s5 | s8 | gx | rf | gn | ga | gp | gy | s2a | s2b | s6b | swm | sww | sta | sx-n4 | n3 | n9 | s4u | s5u | s8u | gnu | gpu

ip-address

specifies an existing peer IP address

Values	ipv4-address	a.b.c.d
–	ipv6-address	x:x:x:x:x:x:x (eight 16-bit pieces)
–	–	x:x:x:x:x:d.d.d.d
–	–	x: [0..FFFF]H
–	–	d: [0..255]D
–	fqdn	FQDN

port-number

specifies a port ID

Values: 1 to 65535

slot-number

specifies the card slot number (applicable only to 7750 SR MG)

Values: 1 to 20 | A | B

gw-id

specifies the gateway ID

Values: 1 to 8

group-number

specifies the group number

Values: 1 to 15

vm-id

specifies the VM ID (applicable only to CMG)

Values: 1 to 20 | A | B

keyword

specifies the interface type

Values: s5 | s5u | s8 | s8u | n9 | gn | gnu | gp | gpu

ref-point-name

specifies the reference point name, up to 32 characters

instance

shows routing instance statistics

aggregate

shows aggregated global statistics

active

shows active peer statistics

Output

The following 7750 SR MG output examples show path management statistics and [Show PDN path management statistics common output fields](#) describes the common output fields. Descriptions of reference-point specific fields are also provided in the applicable sections.

**NOTE:**

CMG system outputs may display CMG-specific fields instead of the 7750 SR MG hardware components (for example, VM is displayed instead of Card).

5.2.2.37 pcmd-stats

Syntax

```
pcmd-stats [gateway gw-id | group group-number | card slot-number | vm vm-id]] [gw-type sgw
| pgw] [summary]
```

Context

```
show>mobile>pdn
```

Description

This command displays PCMD statistics for the specified gateway group or card and type.

Parameters

gw-id

specifies the gateway ID

Values: 1 to 8

group-number

specifies the group number

Values: 1 to 15

slot-number

specifies the card slot number (applicable only to 7750 SR MG)

Values	1 to 5	SR7
–	1 to 10	SR12

vm-id

specifies the VM ID (applicable only to CMG)

Values: 1 to 20

sgw

specifies the SGW or PGW gateway type

summary

specifies summarized aggregated statistics

- Success records

Number of session records generated with Procedure Result being success. Those are presented per PCMD profile and per gateway lifetime.

Success records for the gateway lifetime are being counted even when the records is not transmitted, that is no destination configured in the PCMD profile.
- Failure records

Number of session records generated with Procedure Result being failure. Those are presented per pcmd profile and per gateway lifetime.

Failure records for the gateway lifetime are being counted even when the records is not transmitted, that is no destination configured in the PCMD profile.

- **Success extended**
Number of session records generated with extended format.
- **Success limited**
Number of session records generated with standard format, while extended format has been configured, due to CPU threshold exceeded.
- **Total Records**
Total number of records generated. This is presented for both session and data records.
- **Total Bytes**
Total number of bytes transmitted. This is presented for both session and data records.

Output

The following 7750 SR MG output examples show PCMD statistics and *Show PDN PCMD statistics output fields* describes the output fields.

NOTE:

The outputs of a CMG system are identical to the 7750 SR MG outputs except they have some CMG-specific fields displayed instead of hardware components (for example, VM is displayed instead of Card).

- *Example output PCMD statistics*
- *Example output PCMD summary statistics*

Example output PCMD statistics

```

Context

show>mobile>pdn

Description

This command displays the current PDN contexts for each card.

NOTE:

- If the `config>mobile>pdn>allow-duplicate-msisdn` command is enabled, the `show>mobile>pdn>pdn-context>msisdn` command does not show the existing sessions of the specified MSISDN.
- If the `config>mobile>pdn>allow-duplicate-imei` command is enabled, the `show>mobile>pdn>pdn-context>imei` command does not show the existing sessions of the specified IMEI.
- The `eMPS IMS priority session` field is updated from both the MPS and the WPS detected calls; currently, for ePDG this field is updated only by the WPS calls.

Parameters

- gw-id*

specifies the gateway ID

Values: 1 to 8
- name*

specifies the APN name for the context, up to 80 characters
- slot-number*

specifies the card slot number
- group-number*

specifies the group number

Values: 1 to 8
- Idi*

specifies the initiator ID for the IPsec authentication lockout list
- ieee-address*

specifies the UE MAC
- source-ip-address*

specifies the source IP address for the IPsec authentication lockout list

Values	ipv4-address	a.b.c.d
–	ipv6-address	x:x:x:x:x:x:x (eight 16-bit pieces)
–	–	x:x:x:x:x:d.d.d.d
–	–	x: [0..FFFF]H

– – d: [0..255]D

imsi | imei | msisdn *string*

specifies the UE's IMSI or IMEI or MSISDN

subscriber-id

string value, up to 32 characters, stored in the Subscriber Profile Repository (SPR) that identifies each subscriber in the network; the value is assigned and maintained by individual operators and varies in format

acct rf

displays the RF context statistics

acct radius

displays the RADIUS accounting statistics

detail

displays the detailed summary information for the PDN context

epdg-decrypt

displays the decryption keys for both IKE and ESP SAs

gx-usage-monitoring

displays the Gx usage monitoring information for the specified IMSI, IMEI, or MSISDN

Displayed information for each IP-CAN session includes the usage monitoring instances and the list of associated usage monitoring-keys.

ipsec-lockout

displays IPsec lockout statistics for the PDN context

monitoring-key

displays detailed information for the monitoring key instance (scope, GSU, GSU-scope, usage-reported, number of threshold reports and on-demand reports)

When the usage monitoring key scope is at the PCC rule level, the associated PCC rule names are also displayed.

gx-time-of-day-info

displays the Gx Time of Day procedures related information for the specified IMSI for each IP-CAN session including the current Revalidation-Time applicable for the session, Rule-Activation-Time, Rule-Deactivation-Time and the corresponding applicable rules

up-seid *string*

specifies the Session Endpoint Identifier for the UE session context, up to 40 characters

cp-seid *string*

specifies the Session Endpoint Identifier for the CP session context, up to 40 characters

realm-name

specifies the realm name of the network instance that has the PFCP GTP-U interface on the UP function, up to 80 characters

ip-address

specifies the CP function's Sx/N4 reference point IPv4 address

Values: a.b.c.d

ipv6-address

specifies the CP function's Sx/N4 reference point IPv6 address, up to 64 characters

summary

displays summary information for IPsec lockout statistics

field-name

sets for printing the list of UEs together with the selected field

wrap

specifies that the UE IP address column is not truncated and the full IP address is visible by wrapping the output in the next line displays

Output

The following output examples show PDN context information.

**NOTE:**

Depending on the configured node function (UP or CP function), the description and value for some of the output fields differ. These fields, if present, are identified and described at the end of each example output.

- [Example output PDN context statistics](#)
- [Example output PDN context statistics \(CP function\)](#)
- [Example output PDN context statistics detail \(CP function\)](#)
- [Example output PDN context statistics \(UP function\)](#)
- [Example output PDN context statistics on session management function](#)

show>mobile>pdn>pdn-context
```

Description

This command displays CP session context information related to a specific SEID.

Parameters

seid

specifies the SEID for the CP or UP session context, up to 40 characters

ip-address

specifies the CP function's Sx/N4 reference point IPv4 address

Values: a.b.c.d

ipv6-address

specifies the CP function's Sx/N4 reference point IPv6 address, up to 64 characters

detail

displays detailed information

Output

The following output example shows CP session context information for a specified SEID.

- *Example output CP session PDN context information for specified SEID*
- *Example output CP session PDN context detail information for SEID*

Example output CP session PDN context information for specified SEID

5.2.2.40 def-pfcp-u-sessions

Syntax

```
def-pfcp-u-sessions [network-realm realm-name] [pfcp-u-peer-ip ip-address] [gateway  
gw-id] [apn apn-name] [card slot-number] [vm vm-id] [group group-number]
```

Context

```
show>mobile>pdn>pdn-context
```

Description

This command displays the default PFCP-u shared tunnel session information, when PFCP-u (GTP-U) tunnels are configured to handle ICMPv6 RS/RA and NS/NA message exchange between the CP function and the UP function. When only `def-pfcp-u` is specified, results for all default PFCP-u sessions are displayed. The `network-realm` option may also be specified to identify the realm name of the network instance that has the PFCP GTP-U interface on the UP function, and is communicated in the Network-Instance IE part of the PFCP Session Establishment/Modification process. The `pfcp-u-peer-ip` option can also be used to display information for a specific PFCP-u Peer IP address.

Parameters

realm-name

specifies the realm name of the network instance that has the PFCP GTP-U interface on the UP function, up to 80 characters

ip-address

specifies the PFCP-u peer IP address, up to 64 characters

Values	ipv4-address	a.b.c.d
–	ipv6-address	x:x:x:x:x:x:x (eight 16-bit pieces)
–	–	x:x:x:x:x:d.d.d.d
–	–	x: [0..FFFF]H
–	–	d: [0..255]D

gw-id

specifies the gateway ID

Values: 1 to 8

apn-name

specifies the APN name, up to 80 characters

slot-number

specifies the card slot number (applicable only to 7750 SR MG)

Values: 1 to 20 | A | B

vm-id

specifies the VM ID (applicable only to CMG)

Values: 1 to 20 | A | B

group-number

specifies the group number

Values: 1 to 15

Output

The following output example shows default PFCP-u s0hared tunnel sessions information for the PDN bearer context and *Show PDN context PFCP-u shared tunnel sessions output fields* describes the output fields.

- *Example output PDN context default statistics PFCP-u shared tunnel sessions*
- *Example output PDN context network realm statistics PFCP-u shared tunnel sessions*
- *Example output PDN context peer IP address statistics PFCP-u shared tunnel sessions*
- *Example output PDN context network realm and peer IP address statistics PFCP-u shared tunnel sessions*

Example output PDN context default statistics PFCP-u shared tunnel sessions

5.2.2.41 field-name

Syntax

field-name {pcrf-ip | pcrf-dest-host | ue-ip | roaming-status status | s6b-peer-ip | s6b-peer-dest-host | p-cscf-ip | dns-ipv4 | dns-ipv6 | s5-pgw-gtpc-ipv4 | s5-pgw-gtpc-ipv6} [gateway *gw-id*] [apn *apn-name*] [card *slot-number*] [vm *vm-id*] [group *group-number*] [connected-time-gt *connected-time-gt*] [connected-time-leq *connected-time-leq*]

Context

show>mobile>pdn>pdn-context

Description

This command displays the specified fields for printing.

Parameters

pcrf-ip

keyword specifies the PCRF IP address

pcrf-dest-host

keyword specifies the PCRF destination host

ue-ip

keyword specifies the UE IP address

roaming-status

keyword specifies the roaming status

s6b-peer-ip

specifies the peer IP address for the S6B interface

s6b-peer-dest-host

specifies the peer destination host for the S6B interface

p-cscf-ip

specifies the P-CSCF IP address

dns-ipv4

specifies the IPv4 DNS address

dns-ipv6

specifies the IPv6 DNS address

s5-pgw-gtpc-ipv4

specifies the IPv4 address for the S5 PGW GTPC

s5-pgw-gtpc-ipv6

specifies the IPv6 address for the S5 PGW GTPC

gw-id

specifies the gateway ID

Values: 1 to 8

apn-name

specifies the context's APN name

group-number

specifies the group number

Values: 1 to 15

slot-number

specifies the card slot number

Values: 1 to 20 | A | B

vm-id

specifies the VM ID (applicable only to CMG)

Values: 1 to 20 | A | B

connected-time-gt

specifies the connected time "greater than" in seconds, as a criterion for the bearer-contexts (UEs at the PDN-level command)

Values: 1 to 2592000 (30 days)

connected-time-leq

specifies the connected time "less than or equal" in seconds, as a criterion for the bearer-contexts (UEs at the PDN-level command)

Values: 1 to 2592000 (30 days)

Output

The following output examples show information for the PDN context field name.

- *Example output PDN context field name*
- *Example output PDN context field name S6B peer IP*
- *Example output PDN context field name P-CSCF IP*
- *Example output PDN context field name DNS IPv4*
- *Example output PDN context field name S5 PGW GTPC IPv4*
- *Example output PDN context field name S5 PGW GTPC IPv6*

```

5.2.2.42 supi**Syntax**

supi imsi-msisdn

supi imsi-msisdn detail

Context

show>mobile>pdn>pdn-context

Description

This command displays PDN context information for the specified SUPI for 5G sessions.

Parameters

imsi-msisdn

specifies the SUPI identifier, up to 15 characters

detail

specifies detail information

Output

The following output example shows information for the specified SUPI IMSI-MSISDN in the PDN context, and *Show PDN context SUPI detail output fields* describes the output fields.

- *Example output PDN context SUPI detail statistics (5G sessions)*
- *Example output PDN context SUPI detail statistics I-UPF (5G sessions)*
- *Example output PDN context SUPI detail statistics combined ULCL (5G sessions)*
- *Example output PDN context SUPI detail statistics standalone ULCL (5G sessions)*
- *Example output PDN context SUPI detail statistics combined branching point (5G sessions)*
- *Example output PDN context SUPI detail statistics standalone branching point (5G sessions)*

NOTE:

When the `supi` option is used, information related to EPS interworking is displayed; for specific details, see the notes in *Show PDN context SUPI detail output fields*.

Example output PDN context SUPI detail statistics (5G Sessions)

* indicates that the corresponding row element may have been truncated.

Table 52: Show PDN context SUPI detail output fields

Label	Description
SUPI	SUPI identifier
DNN	DNN name
PEI	PEI identifier
GPSI	GPSI identifier
RAT ²	RAT type
Interworking	3G/4G EPS interworking status
Data Session ID	Charging characters received
Ref-point/sig-pr*	Uptime of the bearer
APN restriction	APN restriction

² The RAT type is not supported for EPS interworking information.

Table 52: Show PDN context SUPI detail output fields (continued)

Label	Description
5G Capability	
RQI	RQI status (enabled/disabled)
Multihoming ³	Multihoming status (enabled/disabled)
PDU Session ID	PDU session identifier
PCRF Subscribed PRA	PCRF subscribed PRAs
OCS Subscribed PRA	OCS subscribed PRAs
UL APN AMBR	Uplink APN AMBR
DL APN AMBR	Downlink APN AMBR
Bearer Contexts	Bearer contexts
SDF	SDFs
Primary DNS IPV4 address	Primary DNS IPv4 address
Secondary DNS IPV4 address	Secondary DNS IPv4 address
Primary DNS IPV6 address	Primary DNS IPv6 address
Secondary DNS IPV6 address	Secondary DNS IPv6 address
Pri NBNS IPv4 ad*	Primary NBNS IPv4 address
Sec NBNS IPv4 ad*	Secondary NBNS IPv4 address

³ Only one multihoming IP address is displayed for EPS interworking information, if multihoming is enabled.

Table 52: Show PDN context SUPI detail output fields (continued)

Label	Description
Pri NBNS IPv6 ad*	Primary NBNS IPv6 address
Sec NBNS IPv6 ad*	Secondary NBNS IPv6 address
Charging bearer *	Charging bearer type
UE IPv4 address	UE IPv4 address
UE IPv4 address source	UE IPv4 address source
Charging profile	Charging profile name or number
Interim records *	Number of interim charging records
RF triggers	Number of RF triggers
Framed routes	Number of framed routes
P-CSCF Reselection	P-CSCF reselection status (enabled/disabled)
Override Rating Group	Override rating group status
Override Online Billing Method	Override online billing method status (enabled/disabled)
Override Offline Billing Method	Override offline billing method status (enabled/disabled)
Mo Exception Cou*	Mo exception count
Mo Exception Tim*	Mo exception time
ULI_Timestamp (sec)	ULI timestamp in seconds
SSC Mode	SSC Mode

Table 52: Show PDN context SUPI detail output fields (continued)

Label	Description
N3 state	N3 active state
NSSAI	
SST	Number of SSTs
SD	SD identifier
AMF PCF ID	AMF PCF identifier
Service Based Interface (SBI) Information	
NF Service ⁴	NF service type
NF Role	NF consumer or producer role
NF ID	NF service ID
URI	NF service URI
Service Instance	NF service instance
QoS Information	
QFI	QFI value associated with a static QFI mapping profile
QFI Type	QFI type (dynamic or static)

⁴ The following fields are not supported under SBI services for EPS interworking information.

- NF Service: nsmf-pdusession
- NF Service: namf-comm
- NF Service: namf-evts

Table 52: Show PDN context SUPI detail output fields (continued)

Label	Description
QoS Flow Type	QoS flow type
QoS Profile	
5QI/ARP	QFI generated dynamically using 5QI/ARP as default (in the range 1 to 64)
Priority Level	Priority level in scheduling resources among QoS flows
Avg Window (ms)	Average window (duration over which the guaranteed and maximum bitrate is calculated) for the QFI value within a static QFI mapping profile
Max Bst Vol (bytes)	Maximum burst volume associated with the QFI value within a static QFI mapping profile
QNC	QNC status, for notifications from the NG-RAN when GFBR can no longer be guaranteed during the life of the QoS flow for the SDF (enabled/disabled)
RQI	RQI status (enabled/disabled)
UL MBR	Uplink MBR
DL MBR	Downlink MBR
UL GBR	Uplink GBR
DL GBR	Downlink GBR
User Plane (UP) Information	
UP Type	UP uplink type

Table 52: Show PDN context SUPI detail output fields (continued)

5.2.2.43 ue-ip

Syntax

ue-ip *ip-address* network-instance *network-instance* [access-type {utran | geran | wlan | gan | hspa | eutran | ehrpd | hrpd | 1xrtt | umb | virtual | eutran-nb-iot}]

ue-ip *ip-address* network-instance *network-instance* detail acct stats urr-id *urr-id* [access-type {utran | geran | wlan | gan | hspa | eutran | ehrpd | hrpd | 1xrtt | umb | virtual | eutran-nb-iot}]

ue-ip *ip-address* network-instance *network-instance* detail [access-type {utran | geran | wlan | gan | hspa | eutran | ehrpd | hrpd | 1xrtt | umb | virtual | eutran-nb-iot}]

Context

```
show>mobile>pdn>pdn-context
```

Description

This command displays context information related to a specific UE IP address.

Parameters

ip-address

specifies the UE IP address

Values	ipv4-address	a.b.c.d
–	ipv6-address	x:x:x:x:x:x:x (eight 16-bit pieces)
–	–	x:x:x:x:x:d.d.d.d
–	–	x: [0..FFFF]H
–	–	d: [0..255]D

network-instance

specifies the network instance, up to 80 characters

urr-id

specifies a unique identity for the usage rule report for this session

Values: 0 to 4294967295

detail

displays detailed information

access-type

specifies access type

Output

The following output example shows PDN context information for a specific UE IP address.

Example output PDN context information for specified UE IP address

```
# show mobile-gateway pdn pdn-context ue-ip 2.127.255.0 network-
instance ipd.nokia.1.2.com

Syntax

```
up-seid seid
up-seid seid detail acct stats [urr-id urr-id]
up-seid seid detail
```

Context

```
show>mobile>pdn>pdn-context
```

Description

This command displays context information related to a specific Session Endpoint Identifier for the UP session context.

Parameters

seid

specifies the Session Endpoint Identifier for the CP or UP session context, up to 40 characters

urr-id

specifies a unique identity for the usage rule report for this session

Values: 0 to 4294967295

detail

displays detailed information

Output

The following output examples show UP session context information for a specified Session Endpoint Identifier.

- [Example output session endpoint identifier for UP](#)
- [Example output PDN context session endpoint ID for UP detail](#)
- [Example output PDN context session endpoint ID UP detail acct statistics](#)

5.2.2.45 wrap

Syntax

```
wrap [gateway gw-id] [apn apn-name] [card slot-number] [vm vm-id] [group group-number]
```

Context

```
show>mobile>pdn>pdn-context
```

Description

This command specifies that the UE IP address column is not truncated and the full IP address is visible by wrapping the output in the next line displays.

Parameters

gw-id

specifies the gateway ID

Values: 1 to 8

apn

specifies the context's APN name

group-number

specifies the group number

Values: 1 to 15

slot-number

specifies the card slot number

Values: 1 to 20 | A | B

vm-id

specifies the VM ID (applicable only to CMG)

Values: 1 to 20 | A | B

Output

The following output example shows wrapped output for the UE IP address.

Example output PDN context wrap

```
# show mobile-gateway pdn pdn-context wrap
=====
IMSI/IMEI(#)      APN          Type   Beare*  UE Address (IPv4/IPv6)  Ref-pt/Si*

                  el.1.1.c*              3
-----
```

5.2.2.46 pdu-session

Syntax

pdu-session

pdu-session supi *imsi-msisdn* [detail]

pdu-session supi *imsi-msisdn* acct {*stats* | *nchf*} [detail]

pdu-session ran-ue-ngap-id *ran-ue-ngap-id* [pdu-session-id *pdu-session-id*]

pdu-session ran-ue-ngap-id *ran-ue-ngap-id* detail [pdu-session-id *pdu-session-id*]

```
pdu-session ran-ue-ngap-id ran-ue-ngap-id acct stats [pdu-session-id pdu-session-id
[qfi qfi]]
```

Context

```
show>mobile>pdn
```

Description

This command displays context information related to the PDU session SUPI, RAN-UE-NGAP-ID, and Nchf service.

Parameters

imsi-msisdn

specifies the SUPI identifier, up to 15 characters

detail

specifies detail information

nchf

specifies Nchf information

ran-ue-ngap-id

specifies the identity of the RAN UE NGAP ID

Values: 0 to 2^{32-1} (HEX)

qfi

specifies the QFI identifier

Values: 0 to 63

Output

The following output examples show PDU session information for the specified SUPI ID, RAN-UE-NGAP-ID, and Nchf account. The *Show PDU session Nchf account detail statistics*, *Show PDU session ran-ue-ngap-id detail statistics*, and *Show PDU session ran-ue-ngap-id acct statistics* describe the output fields.

- *Example output PDU session Nchf account statistics*
- *Example output PDU session Nchf account detail statistics*
- *Example output PDU session ran-ue-ngap-id detail statistics*
- *Example output PDU session ran-ue-ngap-id acct statistics*

Example output PDU session Nchf account statistics

```
# show mobile-gateway pdn pdu-session supi 310012001003204 acct nchf

5.2.2.47 plmn-chrg-profile-map

Syntax

```
plmn-chrg-profile-map plmn-list-name list-name [gateway-Id gw-id]
```

Context

```
show>mobile>pdn>charging
```

Description

Displays the configured charging profile map for a specified PLMN list name.

Parameters

list-name

specifies PLMN list name, up to 32 characters

gw-id

specifies the gateway ID

Output

The following output examples show PDN context information and *Show PDN PLMN list charging profile output fields* describes the output fields.

Example output PLMN charging profile map

```
# show mobile-gateway pdn charging plmn-chrg-profile-map plmn-list-name "basicPlmn"

=====
PLMN charging profile map

5.2.2.48 pfcf-load-overload-control

Syntax

```
pfcf-load-overload-control
pfcf-load-overload-control stats
```

Context

```
show>mobile>pdn
```

Description

This command displays PFCF load and overload control configuration information or statistics per UP node for the CP function gateway.

Parameters

stats

keyword to display statistics information

Output

The following output examples show load and overload configuration and statistics per UP node for the CP function gateway and *PFCP load and overload configuration output fields* and *PFCP load and overload statistics output fields* describe the output fields.

- *Example output PFCP load and overload control configuration*
- *Example output PFCP load and overload control statistics*

Example output PFCP load and overload control configuration

```
# show mobile-gateway pdn pfcp-load-overload-control
=====
PFCP load and overload control information
=====

-----
```

Table 57: PFCP load and overload configuration output fields

Label	Description
Gateway	Gateway ID
Load control	Status of the PFCP load control
Load change trigger value	Percentage load change value that will trigger a new load control update

Table 57: PFCP load and overload configuration output fields (continued)

Label	Description
Nth msg load report update	The number of messages between which a PFCP load control report message will be sent, regardless of load change or not
arp-to-message-priority-list	ARP list to be used on the CP Function for setting an MP Flag and the message-priority in the PFCP message header
Overload control	Status of the PFCP load control
Overload validity time	The duration of time for which the reported overload will be in effect
Minor reduction value	Percentage of traffic reduction for minor overload requests
Major reduction value	Percentage of traffic reduction for major overload requests
Critical reduction value	Percentage of traffic reduction for critical overload requests
CPU sampling interval	
Overload	Overload time
Overload state change	Overload state change time
No-overload	No overload time
Current load	Current load state
Current overload state	Current overload state

Example output PFCP load and overload control statistics

```

Table 58: PFCP load and overload statistics output fields

Label	Description
Gateway	Gateway ID
Router	Router ID
Node address	Node IP address
Load metric	Current load level of the sending node as a percentage
Last overload report time	Date and time of most recently reported overload
Current overload	Current overload status
Traffic reduction value	Percentage of the requested traffic reduction value
Remaining validity time	Time remaining of the current configured validity time, during which the overload condition specified by the OCI IE is valid (unless overridden by subsequent new overload control information)
Session Establishment Req dropped	The number of dropped session establishment requests due to the overload control condition

5.2.2.49 pfcp-local-load-control

Syntax

```
pfcp-local-load-control stats
```

Context

```
show>mobile>pdn
```

Description

This command displays configuration information or statistics for local load control for the PFCP UP function.

Parameters

stats

keyword to display statistics information

Output

The following output example shows PFCP local load control statistics for the UP function and [Local load control statistics for PFCP UP function output fields](#) describes the output fields.

Example output local load control statistics for PFCP UP function

```
# show mobile-gateway pdn pfcp-local-load-control stats
=====
UP Function PFCP local load statistics
=====
Last twenty 100% load report events:
  Time                LCI reported          Slot

Table 60: Local overload control statistics for PFCP output fields

Label	Description
Time	Time of the most recent 20 load reports
Overload level	Indicates the overload level
OCI reported	Percentage of the reported overload
Slot	UP function slot or VM
Current PFCP overload	Current overload or not
Traffic reduction value	Percentage of traffic reduction requested by the sender of the OCI request; 0 indicates that the UP function is not in overload
Remaining validity time	Time remaining for this overload condition to be valid

5.2.2.51 pgw-reselection-isolation

Syntax

```
pgw-reselection-isolation
```

Context

```
show>mobile>pdn
```

Description

This command displays the configuration information for the PGW reselection isolation.

Output

The following output example shows the PGW reselection isolation configuration and the *PGW reselection isolation output fields* describes the output fields.

Example output PGW reselection isolation

```
# show mobile-gateway pdn pgw-reselection-isolation
=====
PGW Reselection & Isolation List
=====
CC          PGW/SMF peer          Conf. Isol. Time      Rem. Isol. Time
94          172.65.12.3                10                    4
129         172.65.12.3                120                   45
=====
```

Table 61: PGW reselection isolation output fields

Label	Description
CC	Cause code
PGW/SMF peer	IP address of the peer
Conf. Isol. Time	Configured isolation time
Rem. Isol. Time	Remaining isolation time

5.2.2.52 qos-flow

Syntax

```
qos-flow [qfi qfi] acct acct ran-ue-ngap-id ran-ue-ngap-id pdu-session-id pdu-session-id
qos-flow [dnn dnn]
qos-flow supi supi [dnn dnn]
qos-flow supi supi detail [qfi qfi] [dnn dnn]
```

Context

```
show>mobile>pdn
```

Description

This command displays QoS flow information for the specified SUPI for 5G sessions.

Parameters

acct

specifies the accounting information

Value: stats

ran-ue-ngap-id

specifies the RAN UE NGAP ID

Values: 0 to $2^{32}-1$ (HEX)

pdu-session-id

specifies the PDU session ID

Values: 0 to 255

dnn

specifies the DNN, up to 80 characters

supi

specifies the SUPI identifier, up to 15 characters

detail

specifies detail information

qfi

specifies the QFI identifier

Values: 0 to 63

Output

The following output examples show QoS flow information for a specified SUPI or RAN UE NGAP ID. The *Show PDN QoS flow context SUPI detail output fields* and *Show PDN QoS flow ran-ue-ngap-id detail statistics output fields* describe the output fields.

- *Example output QoS flow SUPI detail statistics (5G sessions)*
- *Example output QoS flow SUPI detail statistics multiple QFIs (5G sessions)*
- *Example output QoS flow ran-ue-ngap-id detail statistics (5G sessions)*

NOTE:

When the `supi` option is used, information related to EPS interworking is displayed; for specific details, see the notes in *Show PDN QoS flow context SUPI detail output fields*.

Example output QoS flow SUPI detail statistics (5G sessions)

5.2.2.53 redirect-policy

Syntax

```
redirect-policy [gateway gw-id] [apn apn]
```

Context

```
show>mobile>pdn
```

Description

This command displays redirection information.

Parameters

apn-name

specifies the APN name

gw-id

specifies the gateway ID

Output

The following output is an example of policy redirection information.

Example output redirect policy

```
# show mobile-gateway pdn redirect-policy gateway 1

```

Context

show>mobile>pdn

Description

This command displays the reference point peers for the router instance.

Parameters

s11 | s11u | s12 | s1u | s4 | s4u | s5 | s5u | s8 | s8u | gx | rf | gn | gnu | gp | gpu | ga | radius | gy | s2a | s2a-gtp | s2b | s6b | swm | swm | sta | sx-n4 | sd | dhcp | n3 | n9

specifies the reference point type

ip-address

specifies the IP address of the peer

Values: a.b.c.d or x:x:x:x:x:x:x

port-number

specifies the port number

Values: 1 to 65535

gw-id

specifies the gateway ID

Values: 1 to 8

peer-type

specifies the peer type

group-name

specifies the RADIUS group name

ref-point-name

specifies the reference point name

sww-type

specifies the SWw type

active

specifies the active peers

radius

specifies the RADIUS as the peer

dhcp

specifies the DHCP peers

group-name

specifies the DHCP group name

dia-routing-table

specifies the configuration of the Diameter routing table

cdbx

specifies the cloud database peers

doic

specifies the realms and hosts with valid Diameter Overload Indication Conveyance (DOIC) parameters

vm-id

specifies the VM ID

Values: 1 to 22

Output

The following output examples show reference point peer statistics and *Show PDN reference point peer common output fields* describes the common output fields. Descriptions of reference-point specific fields are also provided in the applicable sections.

- *Example output cloud database reference point peers*
- *Example output Ga reference point peers*
- *Example output Gn reference point peers*
- *Example output Gp reference point peers*
- *Example output Gx reference point peers*

- *Example output for CMG Gx reference point peers*
- *Example output Gy reference point peers*
- *Example output Gy Diameter routing table reference point peers*
- *Example output N2 reference point peer*
- *Example output N3 and N9 reference point peers*
- *Example output Pi reference point peers*

- *Example output S6b reference point peers Diameter overload indication conveyance*
- *Example output S11u reference point peers*
- *Example output S8 reference point peers*
- *Example output STa reference point peers*
- *Example output SWm reference point peers*
- *Example output SWm Diameter routing table reference point peers*
- *Example output SWw tunnel reference point peers*
- *Example output SWw RADIUS reference point peers*
- *Example output for Sx-N4 reference point peers on session management function*
- *Example output for Sx-N4 reference point peers on user plane function*
- *Example output for Sx-N4 reference point peers on user plane function*
- *Example output for Sx-N4 reference point peers on user plane function (MPAS feature)*

Table 64: Show PDN reference point peer common output fields

Label	Description
Peer address	The IP address of the peer
Peer type	The IP address of the peer
Router	The router name
Port	The port number
Reference point	The reference point name
Path Mgmt State	The path management state For GTP ref-point-peers (s11, s11u, s12, s1u, s4, s4u, s5, s5u, s8, s8u, gn, gnu, gp, gpu, s2a, s2a-gtp, s2b, s2bu, n3, n9) the values are described in Path Mgmt state values These values do not apply to Radius and Diameter reference point types
Create Time	Date and time of peer creation
Gateway Id	The gateway ID
Number of peers	The number of peers retrieved

Table 65: Path Mgmt state values

Peer State	Transition State	Description
disabled	Initial state	A peer remains in disabled state until the path management starts on this peer. The path management starts when a peer changes to up state. One exception is the S2b-PGW and S2a-PGW

Table 65: Path Mgmt state values (continued)

Peer State	Transition State	Description
		peers, where the path management starts immediately after a peer creation.
up	disabled -> up idle -> up	A peer changes to up state when the first session is established on this peer. For an SGW peer, this state change happens when a CS Req is received. For PGW peers, this state change happens when a CS Resp from the PGW peer is received. This is to make sure that a path up trap is generated only for real PGW peers in case of GTP-C redirection. A peer remains in up state as long as it has at least one session.
timeout/retry	up -> timeout/retry	Echo keep alive interval has timed out. The gateway is retrying Echo messages at a faster rate.
fault	timeout/retry -> fault	A peer changes to fault state when a path management failure is detected. It is a temporary state as the peer changes to idle state immediately.
idle	fault -> idle up -> idle	A peer changes to idle state when session cleanup is done due to a path management failure and also when the last call has drained off the peer due to a Detach/Admin delete. A peer does not have any sessions when it is in idle state.
restart	up -> restart idle -> restart	A peer changes to restart state when a peer restart is detected from the

Table 65: Path Mgmt state values (continued)

Peer State	Transition State	Description
		recovery value carried in the incoming messages on the CPM.

aggregate] [failure-codes]

```

Context

```
show>mobile>pdn
```

Description

This command displays reference point statistics. For more information about reference point type definitions, refer to section *3GPP Reference Points* in the *7750 SR MG and CMG Configuration Guide*.

Parameters

s11 | s11u | s12 | s1u | s4 | s4u | s5 | s5u | s8 | s8u | gx | rf | gn | gnu | ga lgp | gpu | gy | s2a | s2a-gtp | s2b | s2bu | s6b | swm | sww | sta | sd | sx-n4 | n3 | n9

specifies the reference point type

NOTE:

In the show outputs,

- the *Number of Bearers* of the gnu/gpu/s1u/s8u/s12 reference point types, is shown only, where the peer filter is used. For the s4u/s5u/s11u reference point types, the *Number of Bearers* is shown even without the peer filter
- the eMPS MP-Flag-priority req and eMPS MP-Flag-priority resp fields count both the MPS and the WPS detected calls; currently, for ePDG these fields count only the WPS calls

ip-address / fqdn

specifies an existing peer IP address/FQDN

Values	ipv4-address	a.b.c.d
–	ipv6-address	x:x:x:x:x:x:x (eight 16-bit pieces)
–	–	x:x:x:x:x:d.d.d.d
–	–	x: [0..FFFF]H
–	–	d: [0..255]D
–	fqdn	[255 characters maximum]

port

specifies a port ID

Values: 1 to 65535

slot-number

specifies the card slot number

Values: 1 to 10 | A | B

gw-id

specifies the gateway ID

Values: 1 to 8

group-number

specifies the group number

Values: 1 to 8

instance

keyword to show statistics per-peer per-card

aggregate

shows aggregated statistics globally

failure-codes

keyword to show failure-code statistics

active

specifies the active peers

radius

specifies the RADIUS reference point

dhcp

specifies the DHCP reference point

radius-group

specifies the RADIUS group

dhcp-group

specifies the DHCP group

peer-type

specifies the peer type

sww-type

specifies the SWw type

vm-id

specifies the VM ID

Values: 1 to 22

cdbx

specifies the cloud database reference point

pi

keyword to specify PI reference point

ipv4

specifies the PI peer IP address

Values: ipv4-address — a.b.c.d

swu

specifies the SWu reference point

throttling

shows the relevant statistics related to IKE overload control state

plmn-black-white-list

specifies the statistics of the PLMN denylist/allowlist

t6c

specifies the reference point between PGW (PCEF) and SCEF

scef

specifies the peer type, *scef* is the only applicable peer type for t6c

Output

The following output examples show reference point peer information.

- *Example output cloud database reference point statistics*
- *Example output Ga reference point statistics*
- *Example output Ga reference point instance statistics*
- *Example output Ga reference point aggregate statistics*
- *Example output Ga reference point card statistics*
- *Example output Gn reference point statistics*
- *Example output Gnu reference point peers*
- *Example output Gnu reference point statistics*
- *Example output Gpu reference point peers*
- *Example output Gpu reference point statistics*
- *Example output Gx reference point statistics*
- *Example output Gx reference point instance statistics*
- *Example output Gx reference point card statistics*
- *Example output Gx reference point failure code statistics*
- *Example output Gx reference point peer statistics*
- *Example output Gx reference point eMPS advance priority calls*
- *Example output Gy reference point statistics*

- *Example output Gy reference point instance statistics*
- *Example output Gy reference point failure code statistics*
- *Example output N3 and N9 reference point statistics*
- *Example output PI reference point statistics*
- *Example output RADIUS reference point statistics*
- *Example output RADIUS reference point aggregate statistics*
- *Example output RADIUS reference point instance statistics*
- *Example output RF reference point instance statistics*

Minor reduction value  : 70 %        Major reduction value       : 30 %
Critical reduction value : 40 %

CPU sampling interval
Overload               : 10          Overload state change       : 2

Current load           : 10 %
Current overload state  : critical
=====
```

5.2.2.57 service-stats

Syntax

```
service-stats nf-type nf-type [service-realm service-realm-name] [service-name service-name] [service-instance service-instance] [remote-nf-id uuid] remote-nf-ip ip-address | fqdn] [gateway gw-id] group group-id] [failure-codes] [instance | aggregate]
```

Context

show>mobile>pdn

Description

This command displays SBA statistics.

Parameters

nf-type

specifies the NF type
Values: amf | bsf | nrf | pcf | udm | chf | sepp | scp

service-realm-name

specifies the service realm name, up to 32 characters

service-name

specifies the service name
Values: nsmf-pdusession | namf-comm | namf-evts | nbsf-management | npcfsmpolicycontrol | nudm-sdm | nudm-uecm | nchf-convergedcharging | nnrf-oauth2 | nsmf-event-exposure | sepp | scp

service-instance

specifies the service instance name, up to 32 characters

uuid

specifies the UUID of the remote NF
Values: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx (x: [0..F]H)

ip-address / fqdn

specifies the IP address/FQDN of the remote NF

Values	ipv4-address	a.b.c.d
–	ipv6-address	x:x:x:x:x:x (eight 16-bit pieces)
–	–	x:x:x:x:x:d.d.d.d
–	–	x - [0..FFFF]H
–	–	d - [0..255]D

– fqdn FQDN, up to 255 characters

gw-id

specifies the gateway ID

Values: 1 to 8

group-id

specifies the group ID

Values: 0 (CPM statistics) | 1 to 15

failure-codes

specifies to display failure code statistics

instance

specifies to display statistics per remote NF per VM

aggregate

specifies to display aggregated statistics per service realm

Output

The following output examples show SBA statistics and *Show NRF service statistics output fields* describes the output fields.

- *Example output AMF service statistics*
- *Example output AMF failure codes service statistics*
- *Example output BSF Nbsf_Management service statistics*

Table 86: Show CHF service statistics output fields

Label	Description
Service Realm	The service realm of the NRF
Service Name	The service name of the NRF
Gateway Id	The gateway ID of the NRF
Service Instance	The service instance of the CHF
NF Instance ID	The NF instance IP address
Active Sessions	The number of active sessions
ConvergedCharging Create	The number of Converged Charging Create instances
ConvergedCharging Create Succ	The number of Converged Charging Create Success instances
ConvergedCharging Update	The number of Converged Charging Update instances
ConvergedCharging Update Succ	The number of Converged Charging Update Success instances
ConvergedCharging Update Fail	The number of Converged Charging Update Fail instances
ConvergedCharging Release	The number of Converged Charging Release instances
ConvergedCharging Release Succ	The number of Converged Charging Release Success instances
ConvergedCharging Release Fail	The number of Converged Charging Release Fail instances
ConvergedCharging Notify	The number of Converged Charging Notify instances
ConvergedCharging Notify Succ	The number of Converged Charging Notify Success instances
ConvergedCharging Notify Fail	The number of Converged Charging Notify Fail instances

Table 87: Show NRF service statistics output fields

Label	Description
Service Realm	The service realm of the NRF
Service Name	The service name of the NRF

Table 87: Show NRF service statistics output fields (continued)

Label	Description
Gateway Id	The gateway ID of the NRF
Service Instance	The service instance of the NRF
NF Instance ID	The NF instance IP address
Port	The port number
Registered	The registration status including date and time
Heartbeat Interval	The heartbeat interval
Cache Validity receive	The cache validity received
Cache Validity applied	The cache validity applied
NF Register	The number of NF Register Request messages that the CMG has sent
NF Register Failures	The number of NF Register operation failures
400 Bad Request	The number of responses received with this error code
404 Not found	The number of responses received with this error code
Rsp dropped oversize	The number of responses dropped because of oversized payload (larger than 2 MB)
500 Internal	The number of responses received with this error code
NF Update Partial	The number of NF Update Partial Request messages the CMG has sent
NF Update Partial Fail	The number of NF Update Partial operation failures

Table 87: Show NRF service statistics output fields (continued)

Label	Description
NF Heartbeat	The number of Heartbeat Request messages the CMG has sent
NF Heartbeat Failures	The number of Heartbeat failures
NF Update Full	The number of NF Update Full Request messages the CMG has sent
NF Update Full Failures	The number of NF Update Full operation failures
NF Deregister	The number of NF Deregister Request messages the CMG has sent
NF Deregister Failures	The number of NF Deregister operation failures
NF Status Subscribe	The number of NF Status Subscribe Request messages the CMG has sent
NF Status Subscb Fail	The number of NF Status Subscribe operation failures
AMF/PCF/UDM Status Subscribe	The number of NF Status Subscribe Request messages the CMG has sent for AMF/PCF/UDM peer
NF Status UnSubscribe	The number of NF Status UnSubscribe Request messages the CMG has sent
NF Status UnSubscribe Fail	The number of NF Status UnSubscribe operation failures
AMF/PCF/UDM Status UnSubscribe	The number of NF Status UnSubscribe Request messages the CMG has sent for AMF/PCF/UDM peer
NF Status Notify	The number of NF Status Notify Request messages the CMG has received
NF Status Notify Fail	The number of NF Status Notify operation failures

Table 87: Show NRF service statistics output fields (continued)

Label	Description
AMF/PCF/UDM Deregister Notify	The number of NF Status Notify Request messages the CMG has received for an AMF/PCF/UDM de-registration event
AMF/PCF/UDM Failure Notify	The number of NF Status Notify Request messages the CMG has received for an AMF/PCF/UDM NF Failure event
AMF/PCF/UDM Restart Notify	The number of NF Status Notify Request messages the CMG has received for an AMF/PCF/UDM NF Restart event
AMF/PCF/UDM Service Fail Notify	The number of NF Status Notify Request messages the CMG has received for AMF/PCF/UDM Service Failure event
NF Discovery	The number of NF Discovery Request messages the CMG has sent
NF Discovery Failures	The number of NF Discovery operation failures
AMF/PCF/UDM/UPF Discovery	The number of NF Discovery Request messages the CMG has sent for AMF/PCF/UDM/UPF discovery
AMF/PCF/UDM/UPF Discovery Failures	The number of NF Discovery operation failures for AMD/PCF/UDM/UPF peer discovery

Example output NRF OAuth2.0 service statistics

The following example shows the NRF OAuth2.0 service statistics output and [Show NRF OAuth2.0 service statistics output fields](#) describes the output fields.

```
# show mobile-gateway pdn service-stats nf-type nrf service-name nnrf-oauth2
